"In holding to such a belief, the public and the newspapers have stood still for about 12 or 15 years. If, say, in 1880, or even a few years later, these two patents had been given to the public, the telephone company would have been robbed of its stock in trade ; but to assume that at this date, or rather two years hence, when the second of the two patents will expire, the same conditions can hold good, is to shut one's eyes entirely to the real facts of the case. If a young firm were to start out in business with a very small capital, its business might easily be ruined in the early stages by the withdrawal of that capital; but if the firm prospered and in the course of ten or twelve years built up an enormous business with widespread connections and a large market for its wares, any man of affairs would smile at the idea of such a firm being seriously hampered in its operations by having to refund the original small amount of capital that enabled it to begin its business career.

The American Bell Telephone Company started out with a very insignificant capital, in the form of a few patents to which nobody but a few wise and discerning spirits attached any particular value. Of course there were discerning spirits on each side, among those who held the patents and among those who wanted them or thought that they had a right to them, and a fight for their possession ensued. By and by the knowledge spread abroad that the patents formed the corner-stone of an industry of great commercial importance, and the fight waxed hotter and fiercer. How the contest was eventually decided is a matter of history and needs no repetition or comment. The telephone company vindicated its right to the possession of the patents and proceeded to build up a vast and powerful industry. The fundamental patents were the nucleus and foundation of this industry, but they no longer hold the same important relation to it that they did in former years. They do not form the key-stone of the telephonic arch, as the public and the newspapers appear to believe that they do.

The expiration of these patents will undoubtedly have a certain effect on the telephone industry, at any rate on some branches of it, which will redound to the benefit of the public. On the principal branch of that industry—the supply of the telephone service in large cities—it will have very little effect, if any. If the public looks for competing systems in large cities in the course of the next few years, it is moderately certain that the public will be disappointed. It does not need a very deep analysis of the telephone industry to prove this, as will presently be shown. On the other hand, what is known as the private line business will receive a marked impetus. At present, all private lines and all telephone instruments used in buildings, private and public, are rented from the telephone companies ; but with the expiration of the fundamental patents, the telephone proper and the right to use will become public property. Telephones are not expensive to manufacture nor difficult to install, and there is no reason why private telephones should not very soon become as common as electric bells.

The telephone industry proper, *i.e.*, that of supplying telephone service in large cities, is quite a different matter. It is an industry that has been built up laboriously, step by step and year by year, upon the slender foundation of the Bell telephone, which now forms a comparatively insignificant item of the total equipment of a large telephone system. It is an integral part of the equipment, of course, but the importance of its position has dwindled until it occupies that of a mere accessory in a vast and complicated organization of apparatus. All this apparatus, the product of years of invention, research and experience, is protected by patents which belong to the telephone interests; much of it is indispensable to the efficient operation of large telephone exchanges. The equipment of these large exchanges and the construction of the general plant of a large telephonic system have been a work of slow growth, carried out under continually changing conditions and at an enormous cost. A telephone exchange to-day is something entirely different from a telephone exchange of five years ago ; it would be safe to mark a shorter period of transition and to say three or four years, but it is generally held in telephone work that the plant undergoes almost a complete change in every five years.

We are generally informed through the newspapers that the telephone companies suppress the improvements that are continually introduced in the apparatus used by them. Like much of the information disseminated through the same channels this is entirely untrue. During the past few years so many improvements and modifications have been made in every detail of the equipment of telephone exchanges, that they amount practically to a complete remodelling of the system, while the extensive introduction of underground wires has wrought a radical change in telephonic engineering and has necessitated the designing and erection of special telephone buildings, of which there are four now in New York City alone. In having forced on it these constant changes and rapid revolutions in its plant, involving large expenditures of capital, the telephone company stands quite alone among the corporate servants of the public ; for it must be borne in mind that such changes are not solely accounted for by additional business nor absolutely rendered necessary by the increase in the number of subscribers, but are brought about by the introduction of improvements in the methods and apparatus, which, by increasing the efficiency of the service, render it more valuable and place the telephone exchange industry on a firmer basis. There is no public service which is liable to the upheavals that occur in the telephone business and there is none that is the object of such constant modification and improvement."

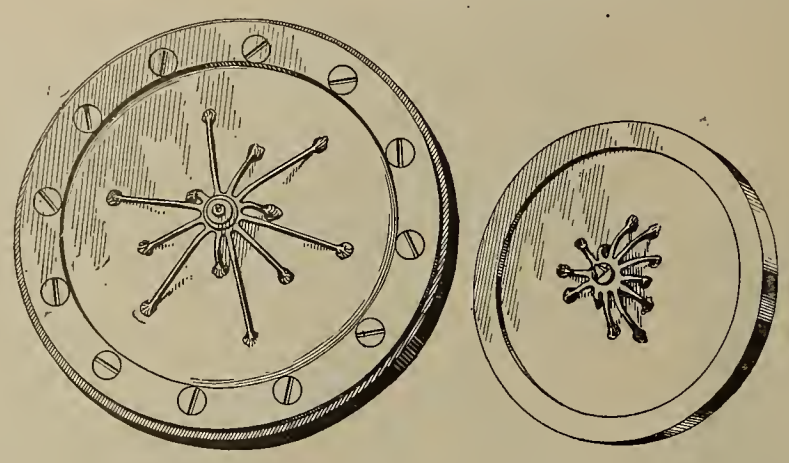
NEW STATION.

Work is being pushed with all possible speed on the reconstruction of the Boston Electric Light Company's plant on Ferdinand street, Boston, which was recently destroyed by fire. The new building will be thoroughly fire-proof. The roof is to be of iron beams with 2-inch planking and ⅞-inch boarding, the flooring will also be of iron, with brick arches. The floors and roof will be supported by iron columns. A new freight elevator, with platform nine feet square, will be put in, and iron staircases will take the place of the old wooden ones. The use of shafting will be entirely obviated. The engines on the ground floor and dynamos on the first story will be directly connected, the belt-boxes to be of iron. The heavy engine formerly used has been disposed of, and in addition to the smaller ones now remaining, five 200-horse power engines of the Armington & Sims pattern, will be added. The boiler-room was not affected by the fire, and the battery will be increased by the addition of two 250-horse power boilers. The plant will be complete in every respect, the ground floor to be devoted to the engines, the fire-room being in the rear, the first story will contain the dynamos and the top room will be utilized for storage purposes.

A NEW PHONOGRAPH.

To Edison belongs in all fairness the honor and glory of having been the first one to invent a machine which would record and reproduce the human voice and other sounds, and ever since the introduction of his phonograph in 1877 many people have been trying to construct a similar apparatus, but in vain. They only succeeded in making improvements in the recording mechanism, the scientific principle ever remaining the same.

At last, however, success seems to have crowned the labors and perseverance of one who has been diligently at work for the past three years, in the person of Lieut. Gianni Bettini, who has invented a machine, which he designates as the micro-phonograph.



Reproducer Recorder

of Lieut^ant Bettini's Micro-phonograph.

The underlying principle of his phonograph is to be really found in the diaphragm. As the result of his researches, Lieut. Bettini discovered that the diaphragm did not vibrate as a whole, but in numerous small sections which happened to be in sympathetic unison with the vibrating organs of the voice or tones directed against it. This led him to make use of a device termed a "spider," which consists of a little frame having several legs, the feet of which rest upon the diaphragm at different points and distances from the centre, instead of having the needle point fixed directly and firmly to the centre, as has hitherto been the practice.

The value of this device is easily explained and understood. Let us suppose, for instance, the centre of the diaphragm not to be in sympathy with some particular sound directed against it and some other section to be exactly so, through the medium of the spider leg resting on that section, the needle would be caused to respond, and not only is the whole diaphragm utilized but the sounds are reproduced with a greater volume of intensity than could be accomplished by the use of a single point of contact only. By its use record of a much larger number of voices and musical instruments may be obtained.

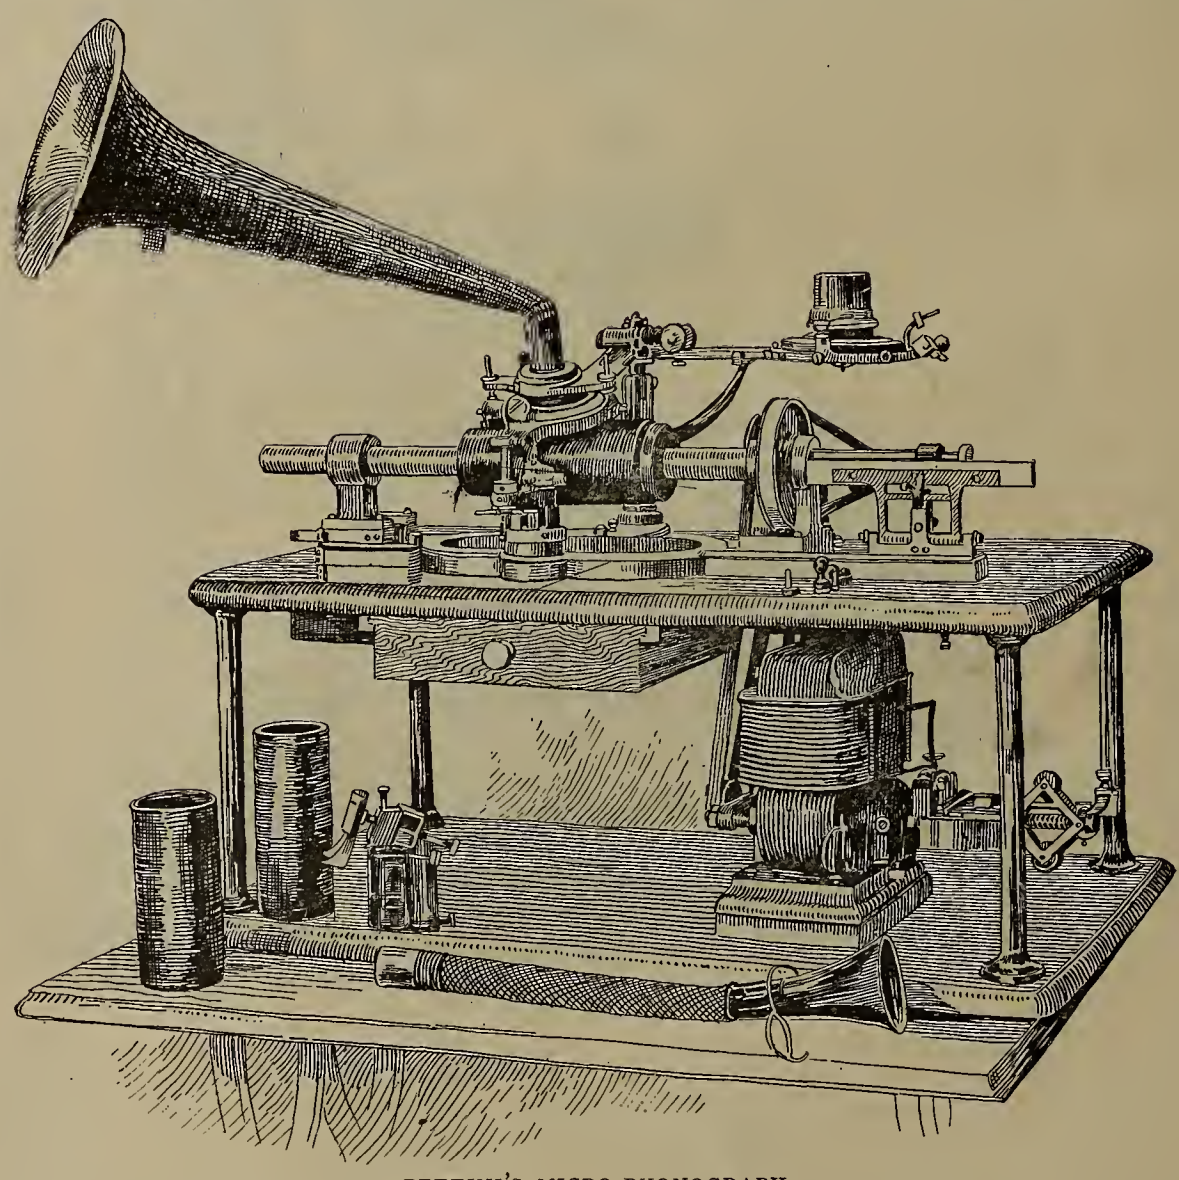
Our first illustration represents the arrangement of the "spider legs" on the diaphragms, the illustration on the left showing the attachment on the reproducer, and that on the right the recorder.

Those who have heard the instrument reproduce the sounds recorded on it state that their volume and distinctness are marvellous, and that it far surpasses the Edison phonograph in this respect.

Lieut. Bettini has rooms in the Judge Building in this city, which are daily visited by scientists and others interested in this novel invention.

Sarah Bernhardt was a recent visitor and spoke into the micro-phonograph. Her words were reproduced with startling clearness and distinctness, and the great Sarah, it is said, was charmed with the result.

Our second illustration gives a view of the micro-phonograph. The recording and reproducing parts of the apparatus, it will be noticed, much resemble those parts of the Edison phonograph, which is a familiar object to all. It is operated by a small Perret motor.



BETTINI'S MICRO-PHONOGRAPH.

THE FIRST TELEGRAPH.

One of the very few persons alive who were prominently connected with the electrical investigations of early days is Dr. Philip Ten Eyck, of Albany, N. Y.

Dr. Ten Eyck was born in Albany March 10, 1802, and is consequently 90 years of age. During his boyhood he was the companion of Joseph Henry, and they attended school together. In 1826, while Henry was Professor of Natural Philosophy and Mathematics in the Albany Academy, Ten Eyck spent his spare moments in the laboratory of the academy, in company with Henry, studying and investigating matters pertaining to the natural sciences. Ten Eyck, who was then a practising physician, abandoned his profession and devoted his entire time to scientific investigations.

While Henry was engaged in the upper rooms instructing his classes in natural philosophy, Ten Eyck was in the basement experimenting with the crude instruments that he had at hand. As opportunity offered between classes and after school hours, Henry would run in to see how Ten Eyck was progressing. The suggestions that led to the experiments in electro-magnetism were of the united minds of Ten Eyck and Henry. Ten Eyck borrowed 1,000 feet of copper wire from the firm of Pruyn, Wilson & Vosburgh, hardware merchants on State street, and arranged it around the upper room of the academy, known as the chapel. Ten Eyck got the instruments in order and made the first experiment by which a current was passed through the wire that sounded the alarm bell that electrified the world. On the sounding of the bell Henry was greatly agitated. To use Dr. Ten Eyck's own words, "Henry was wild when he heard the sound of the bell." There are substantial reasons for believing that these experiments would not have been successful without the unremitting labor of Ten Eyck.

The apparatus used is described by Prof. Henry as follows: "I arranged around one of the upper rooms in the Albany Academy a wire of more than a mile in length, through which I was enabled to make signals by sounding a bell. The mechanical arrangement for effecting this object was simply a steel bar permanently magnetized, of about 10 inches in length, supported on a pivot, and placed with its north end between the two arms of a horse-shoe magnet. When the latter was excited by the current, the end of the bar thus placed was attracted by one arm of the horse-shoe and repelled by the other, and was thus caused to move in a horizontal plane and its farther extremity to strike a bell suitably adjusted."

Regarding this experiment Prof. A. M. Mayer says: "This was the first electro-magnetic telegraph which had been worked through so great a length of wire; it was the first telegraph in which an electro-magnet had worked successfully; it was the first sounding electric telegraph."

In November, 1832, Prof. Henry resigned his professorship in the academy and accepted the professorship of natural philosophy in the college of New Jersey at Princeton. Dr. Ten Eyck was selected to fill the vacancy, which he did with rare ability and distinguished honor until 1848, when he retired to private life. Being possessed of sufficient income, he has since that time devoted himself to the business of his estate and quiet scientific research.

Though Dr. Ten Eyck's brain and hand had largely to do with the great discoveries in electro-magnetism, it is thought by Ten Eyck's friends somewhat strange that Prof. Henry never made any public acknowledgments of the great assistance rendered him by his early friend and associate.

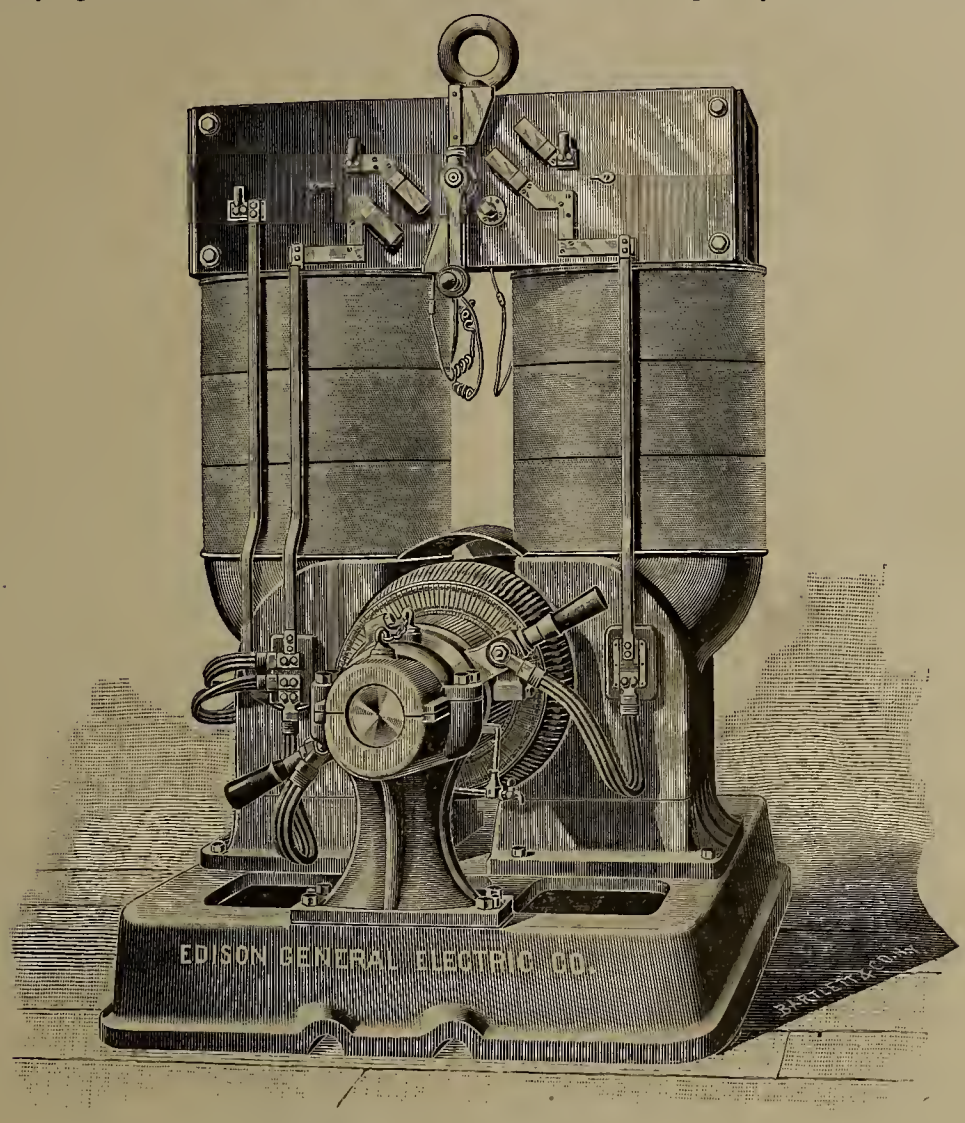
Dr. Ten Eyck has been so modest and so indifferent to his claims in connection with this matter, that he has repeatedly refused to be interviewed on the subject; but there are a score or more of old residents of Albany who were students at the academy at that time, who remember the circumstances which culminated in the great discovery in 1831, and the part taken in it by Prof. Henry and Dr. Ten Eyck respectively.

In the memorial address delivered by Dr. Edward N. Dickerson, June 16, 1885, presenting to Princeton College a tablet designed to commemorate the contributions to the electric telegraph of Prof. Henry, that gentleman, in referring to the means possessed by Henry as compared with those possessed by Faraday, pays this honest tribute to Dr. Ten Eyck: "For thirteen years Faraday had been pursuing his investigations amply supplied, and was in the full career of successful experiment when, in 1826, his great rival first looked upon the course over which he was to run; and even then Henry had to depend upon the meagre facilities of the Albany Academy and the voluntary assistance of an appreciative physician, Dr. Philip Ten Eyck, of Albany—a name to be held in grateful remembrance by all who feel a pride in the achievements of the great scientist, whose early efforts were assisted, and whose hopes encouraged, by this enlightened friend."

Dr. Ten Eyck resides at 9 Hall place, Albany, and enjoys the distinction of being the oldest native-born Albanian.

IMPROVED GENERATOR.*

The elimination of objectionable features from electric lighting and electric power apparatus, and the introduction of improvements, is the present aim of all manufacturers of electrical devices. We show in the accompanying cut an Edison 200 kilowatt



IMPROVED EDISON GENERATOR.

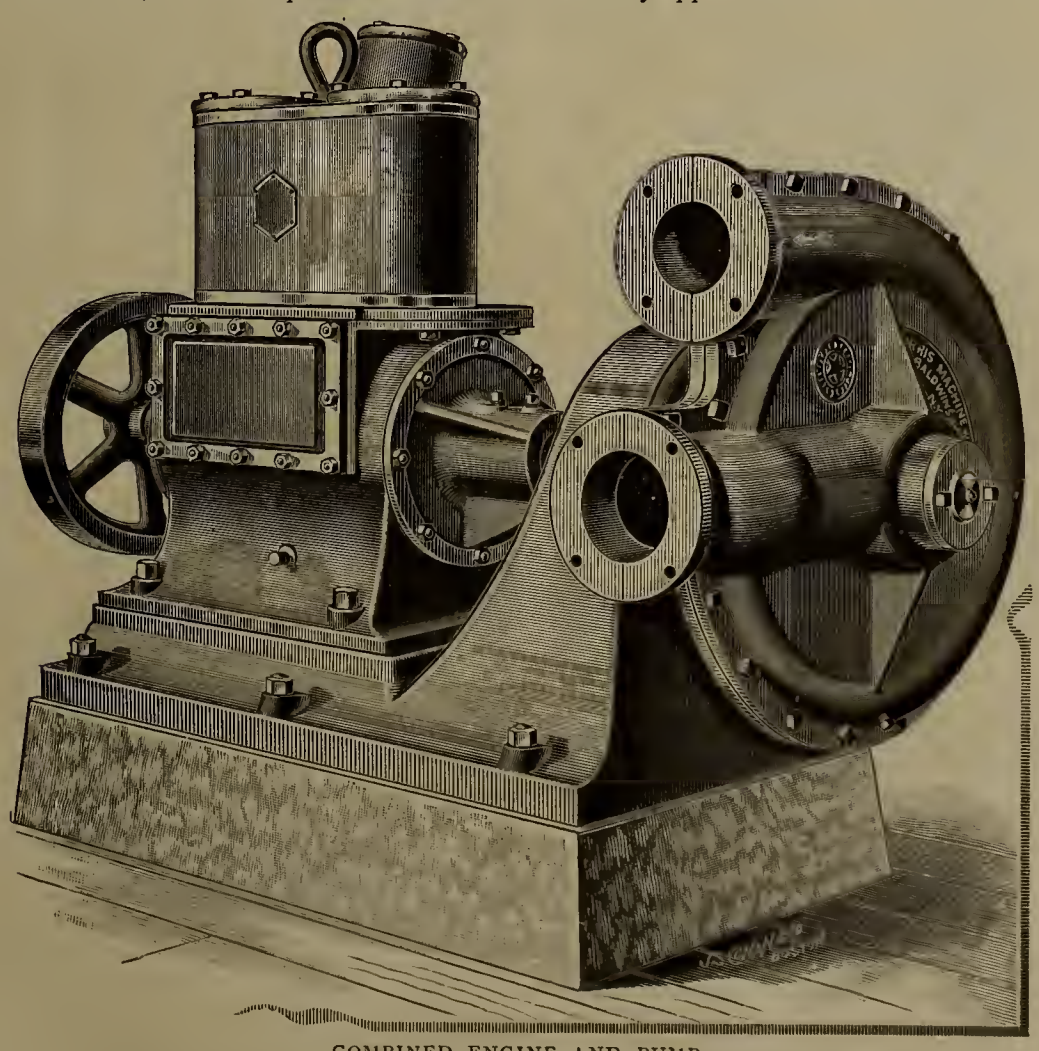
generator of the latest form illustrating this. It is of the well-known bi-parlor type, with the general features of which every practical electrician is acquainted.

The series field is built up of sections, wound on spools which are slipped over the cores and then properly connected up. Should a fault manifest itself, it can be located, and the spool in which it appears can be removed, repaired and replaced, or another substituted at once without loss of time. Expenditure for repairs is thus reduced to a minimum.

To adapt this generator to the demands of electrical railway service, the field has been provided with a compound winding, easily adjusted to meet the necessary requirements by means of a shunt coil, conveniently placed in the back-board of the keeper. The bearings being located close to the base frame, the centre of gravity of the armature is low and great stability is thus secured. Self-oiling bearings and carbon brushes contribute to diminish the attention necessary to the operation of the generator to a minimum.

A considerable number of these high capacity generators have already been installed throughout the country, and the advantages they offer have been duly appreciated.

* Edison General Electric Co., New York.



COMBINED ENGINE AND PUMP.

COMBINED ENGINE AND PUMP.

Before the introduction of high-speed engines, in order to operate centrifugal pumps it was necessary to connect the latter with the engine by means of a belt. Now pumps of any size are run direct from a high-speed engine.

The accompanying illustration shows a contractor's outfit, consisting of a Standard Westinghouse engine and a Morris Machine Works centrifugal pump coupled together. The following are the advantages claimed for this outfit: compactness; lightness, considering capacity; efficiency, giving a greater quantity of water for a given amount of steam in the engine, and simplicity and reliability.

The construction of the pump is such that the passage of solid matter found in water is allowed, as the pump contains no valves or moving parts that will give trouble or be liable to wear.

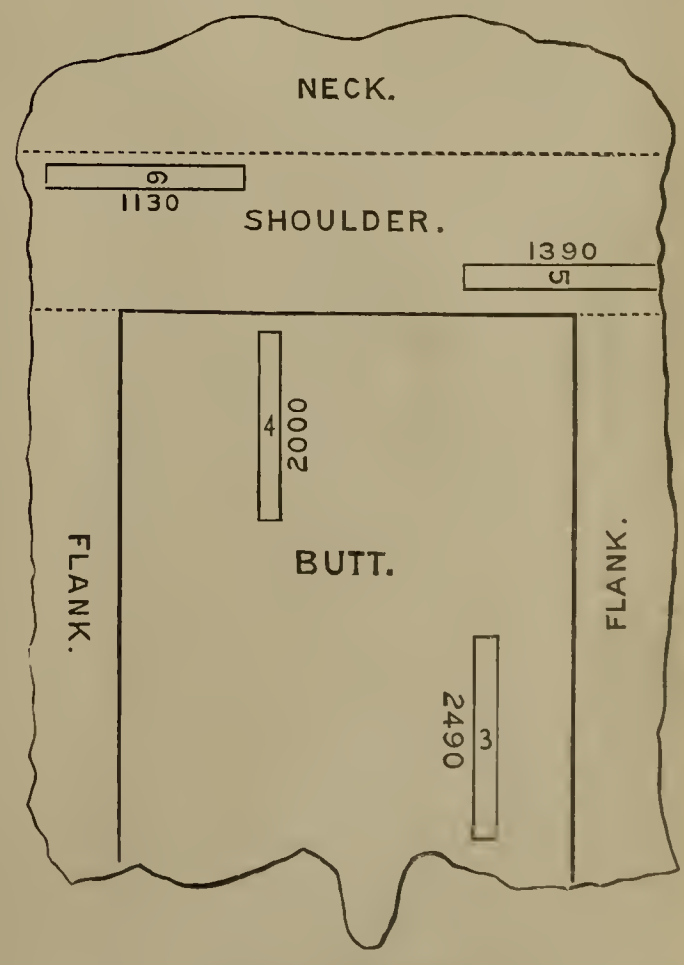
This style of outfit has found favor in tanneries, where a composition pump is used to resist the ravages of the tan liquor; for circulating purposes on ship-board, and circulating brine in freezing tanks of ice machinery; for raising sand and gravel from river-beds, and conveying it ashore by means of a discharge-pipe; for dredging and filling at one operation; for irrigation and drainage purposes; and, in fact, for thousands of places where the maximum quantity of water is to be moved at the minimum of expense.

The pump is manufactured by the Morris Machine Works, of Baldwinsville, N. Y., while the engine is made by the Westinghouse Machine Co., of Pittsburg, Pa.

LEATHER BELT MAKING.

At the meeting of the Polytechnic section of the American Institute of New York, on Thursday evening, March 17, Mr. Chas. A. Schieren read a paper on the "Art of Tanning Leather and Making Belting." He showed in the lecture the various processes through which a hide passes in the tannery, all of which were beautifully illustrated by lantern slides. The various departments through which the hide passes in the tannery, the machinery used for manipulating the leather, as well as the grinding and leaching of the bark, were illustrated and thrown on a large canvas by lantern slides. This made the lecture doubly interesting because the audience could get a clearer idea of the manipulation of leather in the tannery.

In the making of belting Mr. Schieren showed a hide of leather from which were taken four pieces of equal length and width; they had been submitted to a test by a powerful testing-machine of the Fairbanks Scale Co., of New York. These pieces were all eighteen inches long and two inches wide, and were numbered. Number three, being cut from the lower part of the centre, broke at 2,490 pounds strain, which would give the piece a transverse strength of 14,940 pounds per square foot. Number four, cut from the upper part of the centre of the hide, broke at 2,000 pounds. Number five, cut from the lower part of a shoulder-piece, broke at 1,390 pounds. Number six, cut from the upper part of a shoulder, broke at 1,130 pounds.



LEATHER BELT MAKING.

The lecturer explained that very many belts were sold and offered in the market which were made

from one piece of centre on one side and a piece of shoulder on the other side. He clearly proved that such belts were defective because of the shoulder being so much more liable to stretch, and not being able to withstand the strain of a centre-piece by at least 43 per cent., it would be a serious mistake to put the two pieces together for transmission of power, on account of the unequal tension. A belt would be superior if two shoulders were used, or two centre-pieces, separately. He claimed that a belt made from two centres could withstand a transverse strain of nearly 26,940 pounds to the square foot, whereas a belt made from shoulders would hardly stand 15,120 pounds strain, and such belts would not be reliable, especially on dynamos or swift running machinery; in fact, for almost any drive where a belt is subjected to severe strain.

LIGHTNING ARRESTERS, AND THE DISCOVERY OF NON-ARCING METALS.*

BY ALEXANDER J. WURTS.

In designing the arresters already described, I had followed closely the rut of previous practice, which had always been to provide with each discharge circuit a circuit-interrupting device. Upon reflection, however, it was evident that one circuit-interrupter placed in the main-circuit would interrupt the arc on any discharge circuit. For a moment the problem of a simple pole arrester seemed solved, but on second thought the difficulties and inconveniences inseparable from any automatic main circuit interrupter appeared to be insurmountable, and the idea was no sooner conceived than it was abandoned. And yet, poor as it was for practicable purposes, it proved a good stepping-stone, and led to the following plan, viz.: To provide the line with ordinary discharge-circuits, that is, with the well-known saw-tooth protectors, made of carbon, so that they would not easily burn away; and then in the station, between the generator and the first discharge-circuit, provide an automatic device which, upon the passage of an abnormal current from the generator, would instantly short-circuit the dynamo and as quickly open again, the intention being that should a short-circuit occur out on the line through any of the discharge circuits, a short-circuit at the dynamo would so reduce the pressure on the line as to render it impossible for an arc to maintain itself. Then, any such arc having been extinguished, the short-circuit at the generator could be interrupted, and the service would continue as before. This idea meeting with general approval, steps were at once taken to put it to a test in the following manner: To a 1,000-volt alternator there was connected a circuit consisting of about 100 yards of line wire, and in this circuit there was placed a pair of carbon dischargers having saw-tooth edges, and a ^{1} in. air gap, also a switch. In shunt with this circuit, that is, directly across the terminals of the generator, there was connected a single device (it will not be necessary to explain its construction) which, upon the passage of an abnormal current in the circuit containing the dischargers, would instantly short-circuit the generator and as quickly open again. All the connections being made, the air-gap was bridged with a bit of tinfoil to start the arc, and the switch thrown. The actions that followed in an inconceivably short space of time were these: The tinfoil burst with a snap, an arc was formed, the automatic short-circuit device operated, the arc was extinguished and the short-circuiting device opened. So far, this was exactly what was anticipated, but no sooner had the short-circuiting device opened and the electromotive force returned to the line and the dischargers, than the dynamo pressure forced an arc across the air-gap once more, and the whole operation was repeated. This repetition was found to be due to the fact that when the arc was first established between the carbon saw-tooth plates, the carbons were heated to a white heat, which, not having time to dissipate itself before the pressure returned, the dynamo current found a sufficiently easy path over the heated air-gap to re-establish an arc. However, the test being otherwise satisfactory, success seemed assured, for all that was necessary now was to use solid metal dischargers that would readily conduct the heat away, and the trouble above cited would no doubt be avoided. So the test was repeated, using the same apparatus as before, except the dischargers, which now consisted of three solid, round, brass rods, 1 in. in diameter and 1¼ in. long, placed side by side with their axes parallel to each other, and having air-gaps of $\frac{1}{16}$ in. That is, the line was connected to the two outside bars, leaving the middle one idle to be connected to ground, as would be the case in a double-pole lightning arrester. The air-gaps were bridged as before with tinfoil to start the arc, and the switch thrown. The test was successful in the highest degree—too succcessful, in fact, not to arouse suspicion. So I thought I would repeat the experiment, and see how the dischargers would behave without the short-circuiting device. The result was an overwhelming surprise, for at the dischargers there was merely an insignificant spark scarcely larger than a pea. The experiment was tried again and again, with the same result. Any electrician would have predicted a brilliant display of fireworks. The most plausible theory advanced to explain this action was that the electric motor driving the dynamo being small, its speed was probably reduced to such an extent by the overload suddenly thrown upon it, that the electric pressure was at once reduced below that which would be necessary to maintain an arc across the air-gaps. On second thought this theory would have seemed improbable, but at the time it was accepted without a question. In a few days a test was again made, this time a small engine being used for motive-power, and the same results were obtained as before. The afternoon of the same day both engine and generator were charged, with like results. In the meantime a little reflection seemed to indicate that perhaps this strange action was not, after all, due to the slowing down of the motor, but to the possible cooling effect of the metal dischargers on the arc. With this idea in mind I had constructed a set of three dischargers similar to the first, but much larger, $2\frac{1}{2}''$ diameter by $3''$ long, thinking that if a little metal was good more would be better, and that perhaps with a large generator the mass of metal would have to be greatly increased to produce the results already obtained. This large discharger was connected to a 3,000-light 1,000-volt alternator; the air spaces were bridged as before; and the scene which followed beggars description. The large metal bars were melted like beeswax in a great ball of fire. My disappointment was keen, for I thought I was on the verge of making a discovery, and that in the previous cases the comparatively feeble engine had not been the cause of the action. Thinking, however, there could be no harm in melting up the smaller discharger, I connected it in where the larger one had been, bridged the air space, and threw in the switch. Imagine my astonishment on hearing an insignificant snap like the crack of a toy pistol, and seeing an arc as before no larger than a pea. I then pushed a nickel down into one of the air-gaps to short-circuit it, and leave only one air-gap for the arc, and tested again, with the same results. Two questions now presented themselves, viz., what were the differences between the large and small dischargers other than size, and why did the small discharger behave in this altogether unlooked for manner? The answer to the first question was readily found by tracing the two dischargers back to their source, and there learning that the larger one of the two was made of cast brass, containing certain proportions of tin and copper, and that the smaller one was made of hard-drawn brass containing certain proportions of zinc and copper. These facts at once established two differences between the dischargers other than mere size: one was, their physical structure, the other their composition. Which of these two differences caused the difference in their actions? A discharger composed of cast brass containing the same proportions of zinc and copper as the hard drawn brass discharger was made and tested, and found to work perfectly. It was thus determined that the physical structure of the metal had no influence in suppressing the arc. The important difference between the two dischargers then lay probably in their composition, and I was now rapidly becoming convinced that in brass, consisting of certain proportions of copper and zinc, there must exist certain properties which do not permit of an arc being maintained between two dischargers, even with the high pressure of 1,000 volts. It also occurred to me that possibly the shape of the dischargers had something to do with the results obtained. So the next step taken was to have a number of dischargers made up in different shapes and sizes, such as spheres, ovals, solid half-cylinders, tubes and cubes; all worked well with the exception of the cubes. The cubes were placed so their faces were separated by $\frac{1}{16}''$. Now when the tinfoil was placed over their edges, the action was favorable, but if the tinfoil were pushed down between the faces, the arc would hold on indefinitely, and yet without any demonstration whatever, thus, even when the arc did hold on, showing a very different action from the other metals. The size of the dischargers did not seem to affect the results so long as there was sufficient metal to prevent actual melting—$\frac{1}{4}$-in. brass rod melted on the third trial. It was next decided to make dischargers of other metals, and thus learn whether there were any other substances that would give these results, and if so, perhaps some light would be thrown on the real cause of the action. The metals first tested were hard steel, hard-drawn copper, phosphor-bronze, aluminium bronze, and aluminium, all of which failed utterly. The next metal tested was zinc, and with this, most successful results were obtained. Perhaps you will now think the experimenter very slow to put two and two together, but who is there who is at all familiar with the properties of zinc, that would have suggested this metal as one likely to resist an electric arc and 1,000 volts in this manner? With such results before me, I was ready to try anything. The next metals were tin and nickel. Both of these failed. Tin made the most brilliant display of all the metals. The next tried was antimony, and it worked perfectly. The theory now advanced to explain the phenomena was that with the metals that do not allow the arc to be maintained there is formed at the instant the arc is started an oxide of the metal, which, becoming instantly volatilized in the intense heat of the arc, chokes up the air-gap with vapors of high resistance, and so presents an effective barrier to the further passage of the current. With metals that do maintain the arc, instead of the vapor of the oxide of the metal, there is formed a pure vapor of the metal itself, and this offers comparatively no resistance to the passage of the current. When tests similar to the above were made on a 500-volt direct current generator, every one of the metals failed. The arc, however, was small and quiet with the special metals, thus even with the direct current showing a very peculiar action. Another curious phenomenon connected with zinc and antimony is this: the smaller the air-gap the less tendency there is to maintain an arc when using an alternating current at 1,000 volts pressure. In fact, when the air-gap is two inches long the arc, when once started, will be maintained, while at $\frac{1}{2}$ in. or $\frac{1}{4}$ in. the arc will not give up without a struggle, and at $\frac{1}{32}$ in. there is only a small spark caused by the fusing of the tinfoil, and the circuit is instantly interrupted.

The next step taken was to try higher pressure. A short circuit on a 2,000-volt generator, through the double air-gap discharger, failed to be interrupted; five and six air spaces also failed. Six air spaces of $\frac{1}{32}$ in. each interrupted the short circuit instantly, but six air spaces, which would make three on each side of the circuit for the lightning charge to jump through, were strongly objected to as offering too great a resistance. A test was then made to determine the pressure needed to strike an arc across three air-gaps, and was found to be 3,500 volts, measured with a Cardew on an alternating current generator. The experimenter then procured a lightning arrester well-known in the market, and one which is known to take the lightning discharge successfully, and tested it for the striking electromotive force, which was found to be between 8,000 and 9,000 volts. In order, however, to avoid any prejudice that a series of air-gaps might arouse, the following plan was hit upon: Pairs of non-arcing dischargers were mounted upon thermostatic supports in such a manner that the pairs would normally rest in contact with each other, and so that any current traversing the system would be forced to pass through the thermostats and dischargers in series. The thermostats were so arranged as to cause the two dischargers in each pair to open a way from each other upon the passage of the current. If, then, a single and permanent air-gap were connected in series with this system, that is, an air-gap just sufficient to prevent the normal pressure of the line from striking any arc, and if an arc were started across it, the sudden rush of current through the thermostats would instantly introduce a number of air-gaps in the circuit corresponding to the number of pairs of thermostatic dischargers, and thus automatically open the short-circuit. This device was tested and found to work admirably. Of course after the circuit has been interrupted, the thermostatic dischargers at once return to their normal positions. In fact, this action is so rapid that if a series of these dischargers be connected in a short circuit without a permanent air-gap, the circuit will be automatically opened and closed every two or three seconds. In order to appreciate the very remarkable action of this thermostatic device, it must be well borne in mind that a very small air-gap is all that is necessary for the interruption of the circuit.

Thus far, although I had tested a number of metals, my selection had been quite at random, so that by this time I was desirous of making a more thorough and systematic investigation of this new property. The chemical properties of zinc and antimony were carefully compared without any new light. The various groups of metals were examined, and then it occurred to me that of all the metals tested, not one of them belonged to the two groups in which zinc and antimony are found, according to Mendelejeff's grouping. The metals of the zinc group are, zinc, cadmium, mercury and magnesium, and of the antimony group are antimony, bismuth, phosphorus and arsenic. I first tested cad-

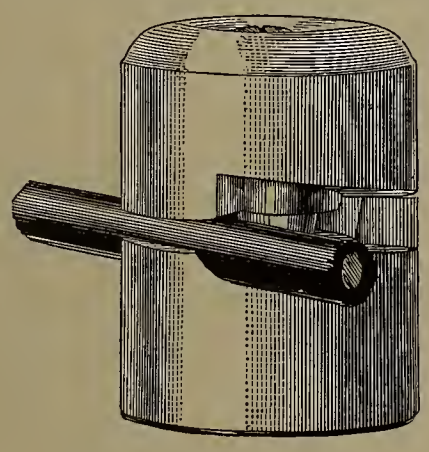
*Abstract of paper read before the American Institute of Electrical Engineers, New York, March 15, 1892.

mium, and found it non-arcing. Then magnesium —more, however, from a sense of duty than because I had hopes of anything but negative results. Fortunately I made this test on much lower E. M. F.'s, and found it non-arcing at 100 volts over two air-gaps of $\frac{1}{32}$ in. each. On 250 volts the magnesium caught fire, which was of course anticipated. I then wanted to try mercury, but for the moment, not seeing how to make such a test with a liquid, I was diverted to the antimony group, and upon testing bismuth found it to be non-arcing. Phosphorus and arsenic were not tested. A final attack was now made upon the zinc group by testing mercury in the form of a copper amalgam. This test was the most successful one of all, for after a number of short-circuits on a 1,000-volt alternator, I found the surface of my dischargers had not been disturbed in the slightest degree. It will thus be seen that all available metals in these two groups are non-arcing. In searching for the non-arcing metals each test was made with two air-gaps, and the E. M. F. at the time of the short circuit was, with the exception of the test on magnesium, 1,000 volts.

THE "SECURITY INSULATOR."*

A very decided improvement over the old style insulators is the one illustrated herewith, and called the "Security Insulator."

This insulator is based upon the mechanical principle of the inclined plane, which is relied on to grasp and hold the wire. In operation, the insulator is fastened in position with a wooden screw in



SECURITY INSULATOR.

the same manner as the old style; the wire is laid in the groove, the top-cap given a half turn and the work is completed. The wire will stay fast and uninjured in the insulator until taken out.

By its use the wires are strung parallel and strained perfectly taut, and a neat and workmanlike appearance assured, and again, it helps to guard against danger of fire.

The chief claims of superiority made for it are improved appearance of the installation, perfect binding of wire and saving of time and labor.

THE KNAPP-MILLER AUTOMATIC CURRENT REVERSER.

Messrs. Knapp & Miller, 840 Jessamine st., St. Paul, Minn., have recently designed a new "Automatic Current Reverser," or Polechanger, which embodies some very neat and important features. This machine is designed for use in the telephone service, experimental and testing purposes. It is capable of a wide range of speed and play between contacts. The larger size is built to carry 10 ampères in the external circuit, 50 to 110 volts. The smaller or pocket size, upon which the makers are experimenting, is intended to carry 3 or 4 ampères, and will be of convenient size for the pocket. The local or actuating terminals of both sizes will not require over 8 volts to work them at maximum power and speed. As the current is reversed by means of a vibrating armature having a play of from $\frac{1}{16}$ to $\frac{1}{4}$ of an inch, there is practically no wear, rendering the machine indestructible. Used in connection with properly-made induction coils, a high E. M. F. can be obtained and sufficient current to operate small lamps, gas-lighting, etc. Amateurs and others in search of a cheap and efficient machine for experimental purposes will find this a great success. Low cost and high efficiency are its chief merits. Recent exhaustive tests have met with very flattering results. The makers will in a short time be prepared to furnish these machines to the trade, wound for an actuating E. M. F. of from 10 to 110 volts, and solicit patronage from those interested.

THE BALL ENGINE CO., Erie, Pa., shipped, a few days ago, three 150 H. P. engines to the Westminster & Vancouver Tramway Co., Vancouver, B. C.

* Security Insulator Company, 136 Liberty street, New York.

MORE PAY, OR OUT GOES THE LIGHT.

Erastus Wiman, on behalf of the Richmond Light, Heat and Power Company, Richmond, Staten Island, informed Messrs. Powers, Connoly and Willcox, the New Brighton Trustees Committee on Street Lighting, that unless they agree to an increase in the price of arc lights from $80 to $100, and incandescent lamps from $15 to $17.50 per year, the company would be obliged to cease supplying the village on April 1.

Messrs. Powers and Connoly refused to consent to anything other than a renewal of the present contract. Mr. Willcox favored giving some consideration to Mr. Wiman's proposition.

NEW BOOKS.

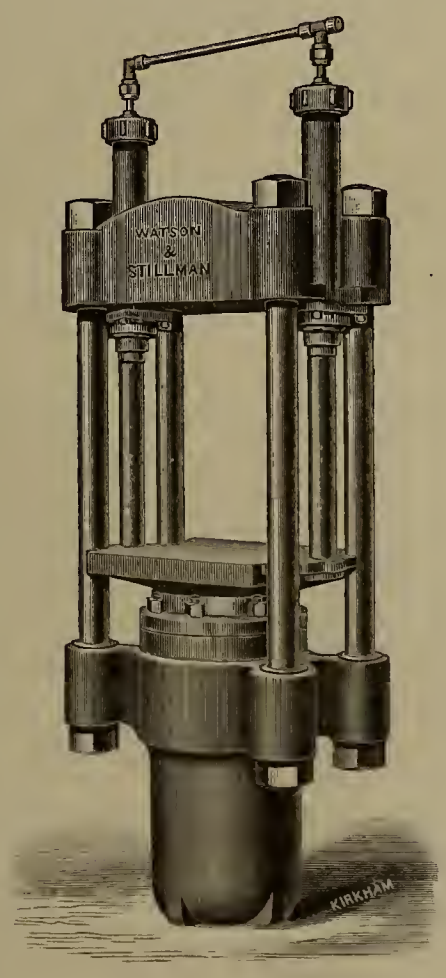
ARMATURE AND FIELD-MAGNET WINDING, by Edward Trevert, 113 pages, with 51 illustrations. Bubier Pub. Co., Lynn, Mass., price $1.50.

The object of this book is to describe in as simple a manner as possible the practical method of armature and field-magnet winding. But little attention has been paid to theoretical subjects, and the book will therefore be found invaluable to beginners and advanced students. It is divided into nine chapters, the subjects of which are as follows: The Armature in Theory; Form of Armature; Drum Windings; Field Winding; Field Formulæ; General Methods of Winding; Field Winding, Concluded; Dynamos; Motors.

The book is for sale by the ELECTRICAL AGE PUBLISHING CO., World Building, New York City.

REINFORCED CYLINDER PRESS.*

Our illustration represents a reinforced cylinder press with automatic reverse-action cylinders used for electrical work. The strain produced by the action of the beam on the cylinder is overcome by reinforcing the body of the cylinder and not by a separate yoke. Owing to the motion being too great to permit the ram being taken out for the purpose of repacking the cylinder without taking the press down, the packing is placed beneath a gland. On each side of the press, small downward-acting cylinders of twelve tons power are placed, by which the ram is



CYLINDER PRESS.

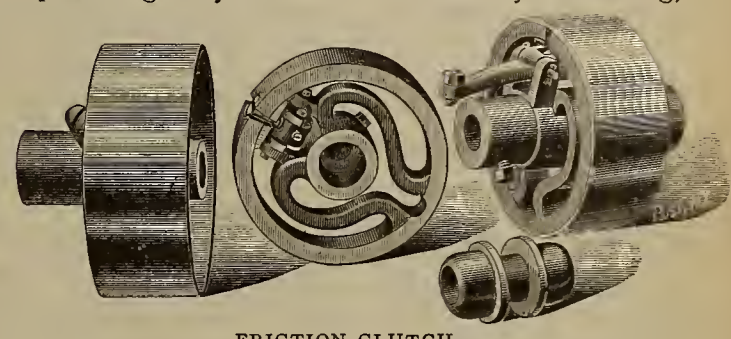
forced back very rapidly and steadily, also clearing the dies which may happen to be in the press if they should stick together. If desired, this cylinder and ram attachment may be placed on any of the presses made by this firm. The press shown in the cut is designed especially for fibre work.

THE 150 H. P. engine, furnished the Kittanning Electric Light, Heat and Power Co., was started a few days ago by F. R. Dravo & Co., Pittsburg agents of the Ball Engine Co., Erie, Pa. The engine gives universal satisfaction.

* Watson & Stillman, 204–210 E. 43d street, New York.

IMPROVED FRICTION-CLUTCH.*

The accompanying illustration represents a new improved friction-clutch, which has been designed especially to meet the requirements of this company's screw-machine and turret lathe work. By reference to the cut it will be seen that the friction proper consists of a spring-ring which is caused to expand by the drawing in of a taper-bolt, this bolt being operated by the usual finger and sliding cone. It will be seen that the friction-ring has no direct connection with the hub, being connected thereto by two curved arms, which extend as far as possible to the opposite side of the hub. The feature in question greatly increases the elasticity of the ring,



FRICTION-CLUTCH.

and allows it to fill in all directions, giving a perfect bearing. Double provision is made for taking up all the wear by means of the usual adjusting screw with set nut on outer end of finger, and also by screwing the taper-bolt into the nut, which is pivoted to the inner end of the finger. This allows of a readjustment, should the clutch wear sufficiently to use the full length of the outer screw, by simply screwing down the taper-bolt and returning outer screw to its original position.

The pulleys are made with long and ample bearings, the inner hub extending inside the friction beyond the face of the pulley, and is provided with an efficient self-oiling device.

These clutches have withstood the most severe usage, and have proved especially serviceable under high speeds and heavy loads, giving a quick and positive reversal with a smooth and easy motion. This latter feature is most important in countershafts, which are constantly reversed. These friction-clutches are made in three sizes.

LIGHTING THE WORLD'S FAIR.

The Chicago *Evening Post*, in its issue of March 16, states that there is good evidence of a combination having been effected between the electric lighting companies with a view to raising prices for the lighting of the World's Fair. It is said that but two bids were received in response to advertisements for the work of lighting the Fair; one from the Western Electric Company and the other from the Thomson-Houston Company. The bid of the former company was subsequently withdrawn, and the figure submitted by the Thomson-Houston Company, viz.: $38.50 per lamp, with a big bill of extras, was twice as high as the figure which Mr. Sunny, the general Western manager, had advised Mr. D. H. Burnham, chief of construction, they would be—$20 per lamp. The bid of the Western Electric Company was $31.25 per lamp.

It is further stated that the notification received from Mr. Sunny, that it would not cost more than $20 per lamp, was made while there was active competition in the field and before the present combination was effected between the Thomson-Houston and Edison General Electric companies. Previously the Thomson-Houston Company had the controlling interest in the Schuyler, Brush and Fort Wayne Companies, all of which were rivals to the Edison Company, which had an agreement with the Sperry Company to manufacture under its patents. We reproduce a statement made by an official of the Fair in connection therewith:

"All the actions of the electric companies in this matter," said an officer of the construction department, "go to prove that they are forming themselves into one big trust. That combination has already been effected, and inquiry about the market will show that electric arc lamps supplies of all kinds have been advanced in price during the last week from 20 to 25 per cent. They have taken advantage of their position to make a big raise on us. The Thomson-Houston Company proposes to furnish light to the Fair at $38.50 a lamp. None of their plant would be used for more than fifteen months, and the greater part of it only six. Under fair competition those lamps can be bought outright for from $41.50 to $45, and it has been done right along.

"The whole tone of their bid shows that they are in a trust and in position to demand whatever they like. They have even inserted in their bid a provision that they be given the sole right to sell lights

* Garvin Machine Co., Laight and Canal streets, New York.

to exhibitors, to renew the carbons and furnish all the other supplies that are required. The exposition officers count on doing that themselves, and will not allow the electric companies the privilege. Nothing was said about it in the specification sent out. The Thomson-Houston people simply wanted that right and demanded it. * * *

"The matter will go before the executive committee to-day and to the grounds and buildings committee to-morrow for settlement. * * * If they persist in trying to hold us up they may succeed in making a good start for Siemens & Halske, the German electricians, who have taken out articles to start a factory in this city. They have patents of their own that have been worked and tested in Germany under which they can manufacture here."

A SUBWAY COMMISSION FOR BROOKLYN.

A bill has been introduced into the New York Legislature by Assemblyman John O'Connor providing for the appointment of a Subway Commission for Brooklyn, N. Y. similar to that of New York City, the object of which is to cut down poles, bury electrical wires and exercise supervision thereof.

The Commission, in accordance with the provision of the bill, is to consist of two "disinterested" persons, each to receive an annual salary of $4,000. They are authorized to employ a sufficient staff of clerical and expert assistants to aid them in accomplishing the work of burying the wires.

NEW PUBLICATIONS.

Science and Commerce is the name of a new bimonthly publication which has just been issued in Paris, France. Its columns will be devoted to chronicling news items and reports of general interest to the electrical fraternity and trade, all technical subjects being avoided. In appearance it is neat and attractive, also well printed. The address of the publication is 24, Boulevard Poissonnière, Paris, France.

OBITUARY.

CHARLES J. VAN DEPOELE.

Mr. Van Depoele, who was well known in the electrical world as an inventor and practical electrician, died in Lynn, Mass., March 18. Mr. Van Depoele was born in Belgium in 1846, and came to this country in 1869, locating in Detroit, Mich. He began the study of electricity when 10 years of age, having access to the batteries and other electrical apparatus on the first telegraph lines between Poperinghe and Bruges.

Mr. Van Depoele is the inventor of the well-known dynamo to which his name is linked. In 1882 he made his first experiment in propelling street cars by electricity, and his first commercial road was equipped in South Bend, Ind., in the same year. In 1888 the company started by him sold its system, patents and business to the Thomson-Houston Company, whose service at the same time Mr. Van Depoele entered.

Mr. Van Depoele has devoted considerable time in recent years to electric mining machinery in addition to other subjects, and he is one of the pioneers in this country in the commercial application of electricity to the propulsion of street cars.

CAUSES FOR A DYNAMO FAILING TO START.

In the failure of a series wound dynamo to excite or yield a current, it may be inferred that the external portion of the circuit presents a very great resistance, which may be attributed to several causes.

If it be found that the armature circuits and insulation are in good condition, then the first place to look for the fault is in the brushes, which may not be properly adjusted to the commutator segments, and which in turn may be short circuited to each other. There is a layer of insulating material placed between the commutator segments which, if of such a substance as to readily absorb copper dust from the commutator, as asbestos, fibre or wood, will in turn become conductive. Such substances should not be used.

In new dynamos mica insulation of the commutators is now used, so that this trouble very rarely occurs in them. In some dynamos, however, they are insulated by air-gaps only, and the spaces between them soon become covered with a paste of copper dust and oil, and a connection thereby established.

The loss of current in a dynamo is presumed by many people to be attributable to dirty contacts or simply oxidized brass contacts of brushes with their brackets at the terminals; such however is seldom or never the case, but it may so happen that, owing to carelessness, the brushes may become coated with a tough film of oil gum, resulting in imperfect contact with their slides.

As the fault of non-starting may be wrongly laid to the dynamo, it is perhaps well to point out that imperfect contacts are likely to happen at fusible safety plugs, fixed for safety near the dynamo. These plugs are very often made of lead wire, pieces of which are placed between pairs of terminals. The use of lead wire is rarely satisfactory, it being almost impossible to secure good contact by its use with an ordinary binding terminal, because if subjected to a pressure it flattens out and is rapidly oxidized, finally burning out at the contact points. Where lead wire is used it should be soldered into brass tubes, so that a hard surface may be afforded for the terminal screw.

Not having been able to locate the fault near the machine, it should be searched for in the external portion of the circuit, beyond switches and cut-outs. It can very readily be determined if the fault actually lies within the machine—that is, within its terminals by short-circuiting it. The safest way of accomplishing this is to secure one end of a few yards of wire in one of the terminals, and bringing the free end against the other for but an instant only. If the machine be excited, a bright flash will mark the breaking of the contact, and sparking will occur at the brushes during contact.

NEW INCORPORATIONS.

Connecticut Pipe Manufacturing Company, Orange, Conn. (P. O. West Haven), was incorporated March 2, with a capital stock of $30,000. Among other things it will purchase, construct and operate electric-light plants. Incorporators: Ed. H. Phipps, New Haven, Conn.; William H. Childs, Manchester, Conn.; George O. Richards, West Haven, Conn.

Fond du Lac Electric Company, Fond du Lac, Wis., was incorporated March 5, with a capital stock of $100,000. Incorporators: F. B. Hoskins, E. A. Cart, William McDermatt, E. Coleman, D. D. Sutherland.

Consolidated Electric Company, Burlington, Vt., has been incorporated with a capital stock of $150,000. Incorporators: A. E. Richardson, U. A. Woodbury, Willard Crane, Edward A. Pope, all of Burlington, Vt.

Peninsular General Electric Company, Grand Rapids, Mich., incorporated March 7, with a capital stock of $30,000. Incorporators: T. C. Harmish, F. M. Champlin, Andrus Bevier, all of Grand Rapids, Mich.

Creede Building and Improvement Company, Amethyst, Col., incorporated March 7, with a capital stock of $10,000. Among other things it will establish and maintain an electric-light plant. Incorporators: George J. Shackelford, George J. Petterson, Alexander C. Foster.

Citizens' Power and Light Company, Ashtabula, O., incorporated March 7, with a capital stock of $5,000. Incorporators: A. J. Beckwith, Ed. S. Henry, R. M. Johnson, J. B. Topky, C. F. Schaffner, John P. Devney, H. M. Kunkle, W. S. McKinnon, E. W. Savage, A. F. Dickinson.

Northern Light Electric Company, St. Paul, Minn., incorporated March 8, with a capital stock of $40,000. Incorporators: H. M. Byllesby, H. C. Levis, William Ely Bramhall, B. F. Meek, Jr., W. P. Johnson, S. P. Wells, Jr., C. K. Stearns, all of St. Paul, Minn.

W. W. McMillan Company, Duluth, Minn, incorporated March 7, with a capital stock of $50,000. Among other things it will manufacture electricity for light, heat and power. Incorporators: W. W. McMillan, W. Horwood, R. Cox, J. T. Boyd, J. J. Burns, J. P. Fairgrieves, D. L. Johnson, all of Duluth, Minn.

Siemens & Halske Electric Company of America, Chicago, Ill., incorporated March 8, with a capital stock of $500,000. Incorporators: C. W. Meysenburg, Edwin F. Bayley, Otic H. Waldo.

Fort Dodge Gas, Electric Light, Heat and Power Company, Fort Dodge, Ia., incorporated March 8, with a capital stock of $50,000. Incorporators: John L. Martin, James S. Cummins, George M. Shearer, J. W. Campbell, L. Brandon, Ft. Wayne, Ind.

Champaign Rapid Transit Company, Chicago, Ill., incorporated March 4, with a capital stock of $50,000. It will operate electric lights and furnish power. Incorporators: John Ahern, S. A. Power, Clint C. Rush.

Helena Water Power Company, Helena, Mont., incorporated February 29, with a capital stock of $2,000,000. to generate electrical currents for manufacturing and other purposes. Incorporators: R. S. Vivian, Kansas City, Mo.; J. H. Lawrence, Ashbum K. Barbour, Helena, Mont.

Lawrence Manufacturing Company, Columbus, O., incorporated March 3, with a capital stock of $30,000. Among other things it will manufacture electrical machinery. Incorporators: William B. Lawrence, E. O. Jones, J. P. Bliss, Edgar W. Wasson, Clarence M. Jones.

Winona Light, Heat and Power Company, Winona, Minn., incorporated March 2, with a capital stock of $150,000, to construct and operate a plant to furnish electricity for light, heat and power. Incorporators: W. E. Bromhall, B. F. Meek, Jr., W. P. Johnson, S. P. Welles, Jr., C. K. Stearns, H. M. Byllesby, of St. Paul, Minn.

Idaho Electric Light and Power Company, Wallace, Idaho, was incorporated March 1, with a capital stock of $500,000 Incorporators: C. W. O'Neil, F. C. Loring, F. E. Lucos.

Pennsylvania Electric Engineering Company, Camden, N. J., incorporated March 2, with a capital stock of $25,000. Incorporators: A. L. Bosley, L. R. Schultz, G. H. Schultz, Philadelphia, Pa.; R. W. Tingley, Germantown, Pa.; C. V. D. Joline, Camden, N. J.

United States Volta Electric Battery Company, Charleston, W. Va., incorporated March 2, with a capital stock of $1,015,000. Incorporators: George F. Jackson, Mineapolis, Minn.; Ellery C. Tankersley, Brooklyn, N. Y.; D. S. Dolbear, New York, N. Y.

Electric Bleaching Company, Jersey City, N. J., was incorporated March 1, with a capital stock of $2,000,000. Incorporators: T. J. Montgomery, Larchmont, N. Y.; C. M. Bowley, Poughkeepsie, N. Y.; R. W. Elliot, Jersey City, N. J.

Puget Sound and Alaska Commercial Company, Seattle, Wash., incorporated February 27, with a capital stock of $25 000. Among other things it will construct and operate electric light and power plants. Incorporators: Lester Turner, Lauron Ingels, E. L. Skog, John Hill, Seattle, Wash.; John C. Boyd, Duluth, Minn.

Nolton and Adams Hardware Company, Port Townsend, Wash., incorporated February 27, with a capital stock of $20,000. Among other things it will deal in electric fixtures. Incorporators: Theron J. Nolton, E. C. Adams, Port Townsend, Wash.; A. H. Adams, Helena, Mont.

Idaho Aluminium Mining and Manufacturing Company, Spokane, Wash., incorporated February 27, with a capital stock of $100,000. Among other things it will construct and operate electric light works. Incorporators: Frank Johnson, J. C. Poetz, N. G. Melmgren, Spokane, Wash.; Henry Melder, Rethdrum, Idaho; D. N. McChesney, Albina, Idaho.

Water and Light Company of Nebraska City, Neb., incorporated March 1, with a capital stock of $300,000. Among other things it will furnish electric power. Incorporators: E. E. Anderson, T. L. Watson, W. S. Downs.

Buffalo, Bellevue and Lancaster Railway Company, Lancaster, N. Y., incorporated March 1, with a capital stock of $90,000, to operate an electric railway. Incorporators: Henry W. Box, John L. Williams, Buffalo, N. Y.

Little Falls Electric Light & Power Company, Little Falls, N. Y., incorporated March 1, with a capital stock of $30,000 Incorporators: James H. Ives, W. F. Lansing, George O. Oppel.

Leonard Avenue Street Railway Company, Columbus, O., incorporated March 9, with a capital stock of $10,000, to construct and operate a street railway to be operated by electric or other power. Incorporators: Theodore Leonard, George E. Roberts, William Shepard, Moses H. Neil, James H. Anderson.

Pennock Battery Electric Light and Power Company, Portland, Me., incorporated March 8, with a capital stock of $1,000,000. Incorporators: George W. Moses, William H. Hunt, Samuel P. Tenney, Chelsea, Mass.

Pennock Electric Company, Los Angeles, Cal., incorporated March 7, with a capital stock of $1,000,000. Incorporators: John P. Culver, W. W. Robinson, Adolph Erdman, A. C. Taylor, R. R. Haines, all of Los Angeles, Cal.

Columbian Launch Company, Chicago, Ill., incorporated March 11, with a capital stock of $200,000, to purchase and operate launches by electricity or otherwise. Incorporators: Thomas B. Marston, Henry N. Tuttle, W. S. Spotton.

Pneumatic Torpedo and Construction Company, New York, N. Y., incorporated March 7, with a capital stock of $250,000, for carrying on any kind of construction, electric or otherwise. Incorporators: William M. Cramp, Philadelphia, Pa.; H. L. Taylor, C. L. Davis, of Brooklyn, N. Y.

Rich Electric Heating Company, Elizabeth, N. J., incorporated March 7, with a capital stock of $250,000. Incorporators: S. M. Weed, Plattsburg, N. Y.; H. N. Bailey, S. H. Gray, J. W. Rich, Mt. Vernon, N. Y.; G. H. Plumb, Elizabeth, N. J.

Shawneetown Electric Company, Shawneetown, Ill., was incorporated March 9, with a capital stock of $20,000. Incorporators: C. C. Travis, W. M. Rikert, Annie J. Travis.

CATALOGUES, ETC.

THE EDISON GENERAL ELECTRIC CO. has just issued a handsome and artistically gotten up little work on Central Station Lighting. It is profusely illustrated and printed on the finest plate paper. Messrs. Geo. W. Walker and R. T. Lozier, of the company, deserve a great deal of credit for this excellent piece of work.

THE STANDARD PAINT CO., 2 Liberty street, New York, has just issued a neat pamphlet containing testimonials from users of the well-known "P. & B." electrical compounds. Telegraph, telephone, electric-light and electric-railway companies are using these compounds with excellent results, as shown by these testimonials. The "P. & B." compounds are perfect insulators, are water, acid and alkali proof, and are constantly growing in favor and demand.

THE CLARK ELECTRIC COMPANY, 192 Broadway, New York, has just issued a neat catalogue descriptive of its system of arc lighting, which it claims to be the cheapest illumination in the world. The advantages claimed for the Clark system are: high efficiency, economical dynamos and perfect automatic regulation. The Clark automatic safety device removes all danger from open circuits. Illustrations of various medals received by the company are also given in the catalogue.

THE PETTINGELL-ANDREWS CO., 192–202 Summer street, Boston, Mass., has issued a circular, directing the attention of its friends and patrons, and the electrical trade generally, to a recent decision of the Patent Commissioners, sustaining its patent of the K.-W. Cut-Out, and notice is given warning every one from selling or manufacturing them. This firm is the sole New England agent for Okonite wires and cables, and sole manufacturer of the "P. A." line and feeder wires, lamps, etc.

MESSRS. F. R. DRAVO & CO., Pittsburg representatives of the Ball Engine Co., Erie, Pa., have made installation of Ball engines in the following office buildings in Pittsburg: Central District Telephone & Telegraph Building, Vandergrift Building, Schmidt Building.

ELECTRICAL SOCIETIES.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

The annual meeting for the election of officers, the reception of yearly reports and the transaction of business will be held at the headquarters of the Institute in New York City on Tuesday, May 17, followed by a dinner in the evening.

The general meeting for the reading and discussion of professional papers will be held at Chicago on Monday and Tuesday, the 6th and 7th of June. programme of papers is now in preparation, and full particulars will be given out as soon as possible.

NEW YORK ELECTRICAL SOCIETY.

The New York Electrical Society will hold a meeting at Prof. Chandler's lecture room, Columbia College, on Friday, March 25, at 8 P.M.

Prof. F. B.Crocker will lecture on "Electrical Measuring Instruments," and will demonstrate the most important points in the construction and application of the principal electrical measuring instruments now in use.

CANADIAN ELECTRICAL SOCIETY.

This Society will hold its convention at Hamilton, Ont., on the first Tuesday in June next.

SEEING BY ELECTRICITY.

One of the possibilities of the future is the transmission of light rays to a distance by the aid of electricity ; in other words, we may some day be able to see over or through an electric wire. Of course the rays of light themselves cannot be transmitted over a wire, but they can be converted into electric waves by the use of properly constructed apparatus, and these equivalent electric waves, after having traversed the wire, can be reconverted into light rays, thus reproducing the original ones. Selenium will be the essential factor in the accomplishment of this wonderful result.

Selenium is a non-metallic element, and, in some respects, resembles sulphur and tellurium. As used for electrical purposes it is crystalline in structure, brittle and black. Its most remarkable property, however, is the variation of electrical resistance under the influence of light rays. This property of selenium was discovered in 1875 by Willoughby Smith, a prominent English electrician.

Selenium is an extremely poor conductor, its resistance, according to Sylvanus Thomson, being very much greater than that of copper. Under the influence of light, however, its resistance varies directly as the square root of the illumination.

The "selenium cells" constructed by Prof. Alexander Graham Bell and Mr. Sumner Tainter consisted of narrow strips of selenium placed between the edges of broad conducting plates of brass. By this method of construction, a reduction of transverse resistance and a large amount of surface for exposure to the action of light were secured. In the dark this cell had a resistance of 300 ohms, and when exposed to sunlight the resistance fell 50 per cent., or to 150 ohms.

ANSWERS TO INQUIRIES.

Can you tell me to whom the credit of copper refining by the electric method is due? R. H. G., Tivoli, N. Y.

The art of refining copper by electrolysis originated with Elkington, to whom patents on the process were issued in England in 1866.

In electro-plating, what is the object of agitating the plating solution, as I have seen done in some plating establishments? G. E., Rahway, N. J.

The object of agitating the solution is to insure the homogeneousness necessary for any even deposit of the metal. In some establishments this agitation of the liquid is maintained by some mechanical device.

OATS VS. COAL.

It has been suggested that engineers try another method of comparing electric power with horse-power. Electric power is calculated on the basis of a pound of coal—that is, the greatest amount of energy that can be obtained from a pound of coal and converted into mechanical energy. This being so, it is argued, Why not calculate animal horse-power on the basis of oats and hay? How much mechanical energy can be obtained from a pound of oats or hay? That is the question, and what is the relative cost of hay and oats and coal? These are economic questions, and many stockholders of street railroads would like to know the answer.

The electric-light plant of the Martins Ferry Construction Company, Martins Ferry, Ohio, was destroyed by fire on March 11. Damage about $25,000. Insurance, $15,000.

TROLLEY CARS ON THE BROOKLYN BRIDGE.

The Brooklyn Bridge trustees are considering a suggestion, which, if adopted, would be greatly appreciated by the thousands who daily cross from New York to Brooklyn and *vice versa*. The suggestion is to extend the Brooklyn trolley system over the bridge to New York and back along the carriage ways. It is believed that the addition of street-cars on the bridge would not interfere with the usual wagon traffic, and that these cars would relieve the traffic on the bridge cable cars which, at certain times during the morning and evening, are crowded beyond their capacity.

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, March 19, 1892.

THE SIMPLEX ELECTRICAL COMPANY, of Boston, which was represented in New York by W. H. Gordon & Co., 115 Broadway, has discontinued the New York agency. Until permanent arrangements can be made the assistant manager of the company, Major Everts, will look after the company's interest in New York City, with headquarters at the Imperial Hotel.

FAR ROCKAWAY, N. Y., is to be lighted by electricity, for which purpose the Citizens' Lighting Company has been granted a franchise. Both arc and incandescent lamps will be supplied, and it is expected that the plant will be in operation by the commencement of summer. The officers of the company are : President, Thomas Henderson ; vice-president, James Caffeny ; secretary, Benedict P. Smith, and recording secretary, David H. Jennings.

THE PHŒNIX GLASS CO., 42 Murray street, city, has put up a board 8 feet by 7 feet, for exhibiting combination globes. Near the top of this board is the monogram "P. G. Co.," made of 150 one C. P. lamps in variegated colors. On the right and left of this are candelabras of beautiful design. In the centre is placed a handsome cut-glass dish, which is illuminated by 4 ten C. P. lamps ; there are also any number of elegant glass shades tastefully distributed, each covering a sixteen C. P. lamp. When lit up entirely it presents a most magnificent sight.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE :

NAMES OF COMPANIES.	CAPITAL.	PAR.	PRICE.
Aluminum Co	$350,000	$100 00	$90 00
American Dist. Tel., N. Y	3,825,000	100 00	62 00
Am. Elec Exercise Mach. Co., N. Y.	100,000	10 00	9 00
Am. Carbon Ins. Mfg. Co., Boston	620,000	5 00	2 50
American Electric Motor Co., N. Y.	1,000,000	25 00	5 00
American Engineering Co., N. Y.	1,000,000	100 00	60 00
American Telegraph and Cable	14,000,000	100 00	82 00
American Telephone Co., D. C.	100,000		*101
Ashley Engineering Co	200,000	10 00	6 00
Aut. Phon. Exb. Co., N. J	25,000	100 00	†20 00
B. & S. Elec. Equipment Co., N. Y.	25,000	100 00	100 00
Barr Electric Mfg. Co., N. Y	50,000	100 00	100 00
Bay Electric Co. 6s, Mich	25,000		*101
Bell Telephone	15,000,000	100 00	204 00
Bell Telephone 7s	2,000,000		*113
Boston Electric Light Co	1,500,000	100 00	108 00

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

All deep-water sailors and some few landsmen have realized the peculiar quiet before the storm, best described as a general desire to go somewhere and do something, accompanied by both mental and physical disability of performance. This is the present condition of the electric telephone stockholders. That a financial change must soon come over the spirit of their dreams is most positive, also that all of the people who use the telephone are dissatisfied with what they feel to be an unjust and exorbitant charge for that which has become a public business necessity. Possible methods of telephoning both long and short distances, and which for years answered the purpose, will soon become public property in the United States. This will reduce the value from proprietary to mercantile property, and may even bring the rates within legislative powers, when, unless the volume of subscribers increases very much, the income must decrease and reduce the current price of the shares on a fair capitalization to an equality with other industries. At present the shares are selling at over 100 ¢ premium, and have ranged in that zone for a long time. Thousands upon thousands are debarred from the luxury of a telephone on their premises by the prohibitive tariff demanded. The present capital, if continued under one general organization, should be increased to something like $75,000,000, and the rates lowered to make it a five to six per cent. security, which can be done within the first year of the new régime. The extra expense requi-

site to accommodate the great influx of new business will not be a heavy tax, while every minute a conductor is idle is a loss. It is proven by actual demonstration that in countries where the telephone is owned or under the control of the State that the greatest portion of the people utilize it. Surely the greatest income to the greatest number of shareholders or investors is the sole, honest intent of financial concentration in the shape of corporations on the one side, and in this country it should be coupled with the people's motto—the greatest good to the general public. That there are scores of schemes ripening and only awaiting the day of deliverance is well known. How the commercial problem of possession will operate alone remains to be seen. Money will certainly be made by some of the experts, and no doubt sufficient competition be stirred up to bring the present shares down to par. The final result will be that like John Bull, Uncle Sam will claim everything that runs on a wire, and its value represented by government four per cent. bonds.

The Superintendent of the Banking Department has presented his report for the fiscal year ending Sept. 30, 1891, showing increased capital amounting to $2,370,000, distributed among twenty new banks. Added to this healthy sum the old houses have increased their capital $1,095,000, aggregating $3,465,000. During the year there was a decrease of $1,294,125, leaving a net increase of $2,170,875. There were also, beside these State banks, nine new national banks started, with a capital of $1,700,000.

The industrial financial issues of the day are assuming a position of such magnitude that investors can, by using a very little judgment, become interested in many of the colossal corporations where their small ventures will have the benefit of the very shrewdest ability coupled with practically unlimited capital. Surprisingly few of them come to grief; one can count them on his fingers. The most notable case lately is, no doubt, the "Hansard Union," a corporation absorbing several large publishing firms, printing among other matter the British Parlimentary Debates, and having as a prominent shareholder and director Sir Henry Isaacs, ex-Lord Mayor of London. A great many people claim to have put their money into this company, from the fact that the lord mayor was its chairman. For once it seems the people were wrong; or, at all events, the matter is to be taken into the courts with the intention of holding the promoters and directors responsible for the losses sustained, estimated at nearly $5,000,000. On the other hand, we have corporations which are winding up their affairs simply because they have grown so large and profitable that their accumulation of wealth under one management is considered by the courts to be inimical to the general good. The Standard Oil Trust management is reported as saying there is but one thing left for them to do, and that is to return the stock in the various companies held by the Trust to the owners. This must of necessity make more work to carry on the business, and either the shareholder or the public must pay for it. The United States and Great Britain differ in one respect in connection with financial matters. In Great Britain, over 600 members of Parliament are directors in public companies; here, I don't believe there are a baker's dozen; certainly there is no corporation in Europe, from the crown down, that has or is liable to accumulate wealth sufficient to cause legislative action, limiting the field beyond which it becomes trespass on the inalienable right of the citizen to support himself and those dependent on him. The great house of Rothschild has never been dictated to by the law, and it is well known that at times they have monopolized production, notably quicksilver, a few years ago, and are more than willing to furnish capital for any exclusive possession if of sufficient magnitude. The Siemens & Halske Company, with its $40,000,000, is sought for instead of repelled. Of its own volition it has crossed the ocean and settled quietly down in Chicago with a few millions to build up a construction and supply business. If the electric industry increases as rapidly as we have every reason to believe it will, before it is ten years old the company may be enjoined, as it will not only have its own capital but unlimited credit at the financial centres of Europe. In an interview with a representative of the company a few days ago, I was told it intended, without any connection with the leading American corporations, to build up a business here competing for all that came within its line, and that it was abundantly supplied with capital and skilled assistants. I shall have more to report relative to its financial influence on the electric and kindred industries after it obtains and fills a few contracts, to show in what ratio it may be able to affect the dividends of the other large companies.

Among the dividends declared and payable in April, is the regular one of the Bell Telephone Co., of $3 per share. Quite a number of the shareholders at the last dividend sent me the $3 received for one share in payment for a year's subscription to the Electrical Age, which accounts for their present happiness and current knowledge of advanced electrical events and improvements. The rest of the shareholders cannot invest their income from one share to better advantage, and keep sober. The directors also voted to issue $2,500,000 new stock in the ratio of one share to each person holding six shares, at par.

WESTERN NOTES.

It is thought that the Siemens & Halske Electric Company will be in operation here by the end of July next. Offices for the company have been rented in the Monadnock Building, and as soon as they are furnished they will be occupied. Mr. O. W. Meysenberg has gone to Berlin on business in connection with the establishment of the new plant.

It is reported that the consolidated Thomson-Houston and Edison General Electric Companies will establish a large manufacturing plant in Riverside, near Chicago. A tract of land 300 acres in extent, owned by Henry Villard, it is said will be purchased by the consolidated companies for that purpose.

It is reported that the National Electric Manufacturing Company, of Eau Claire, Wis., has sold out, and that Mr. G. B. Shaw, the general manager, has resigned. The business of the company, at the present time, is conducted by Mr. Diegh, who signs letters as vice-president of the purchasing company.

The Stewart Heater Co., of Buffalo, has recently received an order for one of its famous heaters for service at the World's Fair, Chicago; also one of the largest size power pumps to run in connection with this heater. The heater weighs 10 tons and has a 14-in. exhaust. Mr. F. Worcester is agent at Chicago for this firm.

PHILADELPHIA NOTES.

W. H. Weston & Co., 830 Filbert street, this city, will soon issue a new price-list of switches and electrical appliances, and report business to be in an excellent condition. They are about to bring out a new snap switch containing many improvements and desirable features. They lately sent out two large slate switchboards, containing over 35 quick-break switches.

Pepper & Register, electrical engineers and contractors, Provident Building, this city, are installing a 1,000 light Westinghouse alternating dynamo at Doylestown, Pa. The steam plant, consisting of one Erie Ball Engine, is being put in by Rufe Bros., of Doylestown. Mr. C. Bragg, Girard Building, Philadelphia, Pa., is agent for the Westinghouse Company in this section.

Leading authors on American steam engineering agree that in connection with the use of steam there is no subject of so much importance as the removing and preventing of scale. Lord's Compound, a chemical preparation, has been successfully used for many years by more than twenty thousand representative establishments throughout the United States and Canada, and is highly recommended for neutralizing the acids in feed waters and also for preventing and removing scaly deposits without in any way injuring the material in the boiler.

BALTIMORE NOTES.

Mr. A. V. Abbott, Blackstone Building, Baltimore, Md., is engineer for the North Avenue Street Railway Company. The lines of this company are operated by the Baxter system.

H. S. Brewington, Baltimore, Md., promoter, Bank of Baltimore Building, is arranging plans for a new company, with a view to purchasing the Wenstrom Company and reorganizing it on a new basis.

Mr. J. L. Blackwell, electrical engineer, 229 East German street, Baltimore, Md., has charge of the engineering for the Central and Curtis Bay and the Richmond and Manchester Street Railways. These companies have just secured franchises for the construction of electrical systems. The Richmond and Manchester Road is to be operated on the Baxter and Edison systems.

J. F. Morrison, formerly president of the Southern Electric Company, while still retaining his large interest in the company, has, with other capitalists, purchased the International Telegraph District and Construction Company, which has for over a year been in the hands of a receiver. No new name has as yet been given to the company. It formerly conducted a large business in arc and incandescent lighting on the Thomson-Houston system. Mr. Morrison is agent in this section for the Fort Wayne system, and the new company, it is understood, will enlarge its plant and introduce the Fort Wayne system.

The Southern Electric Company has enlarged its business to a very considerable extent during the past six months, having added many new lines in electric light, power and railway supplies. It has just completed a large incandescent plant in Ellicott City, Md., installing it with the Edison system. The installation of this plant has been greatly welcomed by the residents of the city as filling a long-needed want. In the salesrooms of this company will be found everything necessary in the electrical line—wire, switches, sockets, cut-outs, fuse-blocks, etc., and many varieties of glass shades. It also deals in the specialties of the Interior Conduit and Insulation Company, and the McCreary Electrical Specialty Company.

WASHINGTON NOTES.

J. U. Burket, 1409 New York avenue, N. W., Washington, D. C., is agent for Perret motors and dynamos, installs complete electric light and motor plants, and carries a full line of electrical supplies.

The Wheless Electric Company is constructing two miles of conduit on its system for the Washington and Arlington Street Railway Company. The work is to be completed within six months. The conduit is to be 16 inches. On the one-half mile section adjoining the power-house in Eckington, of the Eckington and Soldiers' Home Electric Railway, the conduit is nine inches.

Messrs. Royce & Marean, 1408 Pennsylvania avenue, Washington, D. C., are contractors for the installation and wiring of complete central station or isolated electric light plants. This firm recently installed an 800-light plant in the Ordnance Department, using the Thomson-Houston system. They are agents for the Economic Incandescent Lamps, which have given most excellent results, and also carry a full line of household and office electrical supplies and specialties. Mr. Royce, of the firm, is an expert electrician and gives special advice and consultation. He has been the adviser in numerous electrical enterprises in this city.

The Hoosic Tunnel is lighted by 1,250 incandescent lamps. The lamps are arranged in series of 20 each, and are lighted by alternating current.

Commonwealth Iron Co., Commonwealth, Wis., has recently purchased a 35 H. P. Ball Engine from the Ball Engine Co., Erie, Pa.

THE ELECTRICAL AGE'S ELECTRICAL PATENT RECORD.

Issued March 8 and 15, 1892.

470,419. Electric Oven. John V. Capek, New York-N. Y., assignor of one-half to Edward H. Johnson, same place. Filed Aug. 14, 1891.

The combination of an oven which is bodily movable, a stationary electric heater therein, the walls of the oven extending by the heater, whereby the oven may be moved away from the heater to enlarge the heating-chamber without uncovering the heater.

470,428. Electric Store-Service Apparatus. Midbury W. Hassan, Rochester, N. Y. Filed Feb. 2, 1891.

470,441. Electric-Current Meter. Johan W. T. Olán, New York, N. Y., assignor of one-half to Edward H. Johnson, same place. Filed June 6, 1891.

The combination, in an electric meter, of a vessel containing a liquid, a balanced float in vessel and movable therein, float having a forward movement only while the meter is in use, means for disturbing the balance in accordance with the current measured, so that the float will move, and a recording mechanism operated by movement.

470,455. Magnetic Ore-Separator. Charles T. Thompson and Richard H. Sanders, Philadelphia, Pa. Filed April. 16, 1891.

470,456. Magnetic Ore-Separator. Charles T. Thompson and Richard H. Sanders, Philadelphia, Pa. Filed Dec. 5, 1891.

The combination of a rotating drum, having a substantially non-interfering wall, with a plurality of stationary electro-magnets, a plurality of chutes respectively extending from beneath the upper limits of the several fields to different delivery-points, and means, whereby the energy of the fields of one or more of the magnets may be varied.

470,471. Incandescent Electric Lamp. Augustus C. Carey, Lake Pleasant, Mass. Filed Aug. 3, 1891.

In an electric-light lamp, leading-in or circuit wires, an incandescent filament, and a joint therefor composed of a double tube in which the ends of the filament and leading-in or circuit wires are secured.

470,514. Lightning-Conductor. Harvey Simpson, Kenosha, Wis. Filed Sept. 9, 1891.

In a conductor, the hollow adjacent main sections, a pipe-section surrounding the meeting point of the main sections, and indentations formed in the pipe-section, which extend into the main sections.

470,521. Electric Generator. Charles J. Van Depoele, Chicago, Ill. Filed May 13, 1887.

A system of generating and distributing electric currents,

PATENTS—Continued.

comprising a separately-excited generator of the continuous-current type, the armature of which is connected with the working circuit, an exciting generator, also of the continuous-current type and having primary or main field-magnet coils, and connected directly to, and delivering its entire normal output through the field-magnet coils of the generator, magnetizing the same so as to produce the initial potential in its armature, and additional reinforcing coils upon the field-magnet of the exciter, the coils forming part of the working circuit, and acting to increase or decrease the total output of the exciter, and correspondingly affect the field of force of the main generator in accordance with the consumption of current in the working circuit.

470,552. Galvanic Battery. John H. Davis, Detroit, Mich., assignor to the Electrical Fiber-Carbon Company, same place. Filed April 24, 1891.

In a battery-jar, the combination of the outer flexible vessel, the inner flexible vessel, of less diameter than the outer vessel and rendered impervious to moisture, and a filling located between the adjacent walls of vessels.

470,557. Telegraph-Relay. Charles M. Dyer, Cloverdale, Ind. Filed Sept. 9, 1891.

470,596. Electric-Circuit Closer. George W. Price, Baltimore, Md. Filed Nov. 18, 1889.

In a circuit-closer, the combination, with the base of the coiled spring secured to one of the blocks by a screw, and having a straight extension passing through an opening in the other block and having a loop at its extremity, and the spring contact-piece secured to the other block by a screw, and curved upward at its free end, the curved portion lying in the line of extension of the spring, so that when the same is extended electrical contact will be made with the contact-piece and the circuit closed.

470,608. Electric Dust-Collector. Richard E. Wardhaugh, Jacksonville, Ill., assignor of one-half to William W. Allis, Milwaukee, Wis. Filed Oct. 2, 1889.

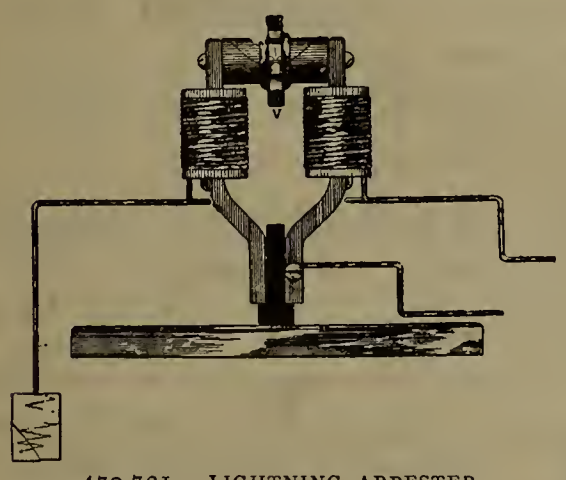
In combination with a dust-collecting chamber, an electric conductor and means for producing a current of electricity through conductor.

470,634. Telephone. William A. West, Bellefontaine, Ohio, assignor of two-thirds to W. H. West and C. G. West, same place. Filed Nov. 12, 1883.

The combination of a continuous main line, transmitting and receiving instruments therein, and a reinforcing device consisting of a local circuit, means controlled by the main and local lines together for varying the current in the local circuit, and an induction-coil having its primary in the local and its secondary in the main circuit.

470,638. Electric Search-Light. Robert S. Dobbie, Brooklyn, N. Y. Filed April 16, 1891.

The combination, in a projector, of an arc lamp having a frame removably held in the projector, a motor in a stationary box or case for feeding the lamp-carbons, and means for adjusting the frame without moving or disconnecting the motor.



470,721.—LIGHTNING ARRESTER.

470,654. Electric Railway. Edward M. Bentley, Boston, Mass. Original application filed Dec. 11, 1885. Divided and this application filed Feb. 25, 1891.

470,656. Motor for Electric Cars. Francis O. Blackwell, Boston, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Dec. 4, 1890.

470,657. Contact Device for Electric Railways. Francis O. Blackwell, Boston, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Jan. 26, 1891.

470,666. Police and Fire-Alarm Signalling Apparatus. Leroy B. Firman, Chicago, Ill. Filed April 1, 1889.

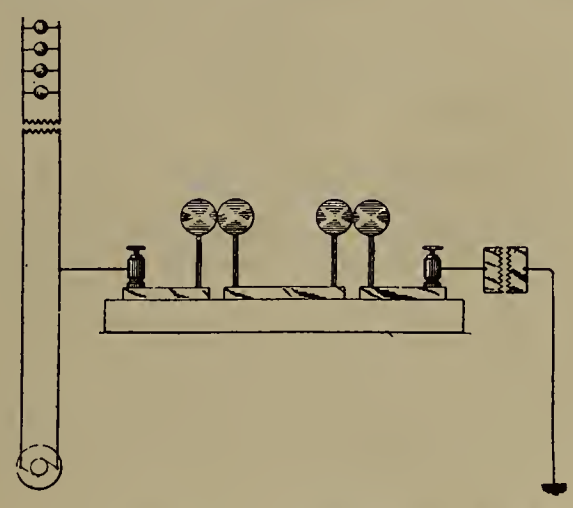
470,667. Combined Police and Fire-Alarm Signal Apparatus. Leroy B. Firman, Chicago, Ill., assignor to the Police Telephone and Signal Company, same place. Filed Nov. 28, 1890.

470,697. Protector for Electrical Apparatus. Charles H. Morse, Cambridge, Mass. Filed Jan. 12, 1892.

470,701. Secondary Battery. George F. Parker and Chas. E. Crapo, Rochester, N. Y., assignor of one-half to Edwin S. Hayward, Jr., same place. Filed April 10, 1891.

The herein-described dome-shaped metallic plate for secondary batteries, provided with tapering recesses for the active material extending through the plate and arranged in the exciting-liquid in the horizontal position with its concavity downward, whereby the gases are retained in the concavity and the liquid is excluded therefrom.

470,721. Lightning-Arrester. Elihu Thomson, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Dec. 26, 1889.



470,772.—CIRCUIT INTERRUPTING DEVICE.

The combination, with an arc-rupturing magnet, of the arcing electrodes connected to a circuit supplied from a source of energy sufficient to maintain a continued arc once formed from one to the other and presented to one another on a line parallel to the lines of magnetism or line joining the poles of magnet.

470,722. Tell-tale Device for Electric Circuits. Edgar Tregoning, Malden, Mass., assignor of one-half to Alvin E. Bliss, same place. Filed Oct. 2, 1891.

In a tell-tale device for electric circuits, the combination of the coil, the insulating-tube, the hollow movable core, the guide, the insulating-plug, the contact, the mercury-cup, and an alarm-circuit.

470,736. Lightning-Arrester. George M. Bacon, Scranton, Pa. Filed Aug. 10, 1891.

A lightning-arrester consisting of discharge-points, the former in circuit with the line, the latter with the solenoid, the core, connected with solenoid, the discharge-point, connected with the core, the point connected to the ground, points located within the receptacle, and the receptacle, in combination.

470,748. Electric Switch. Samuel Deacon, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed March 18, 1889.

The combination, with an electric switch, of an actuating mechanism, a connecting-spring between the switch and actuating mechanism, and a catch or holding device engaging with the switch for holding the same from movement while the spring is being subjected to strain by the actuator.

470,749. Field-Magnet for Dynamos. George E. Dorman, Chicago, Ill., assignor to the Standard Electric Company, of Illinois. Filed Dec. 17, 1890.

470,752. Electrical Hose-Signalling Apparatus. William Fowler, Colorado Springs, Colo. Filed Aug. 24, 1891.

470,766. Arc-Light Hanger. Charles A. Pfluger, Chicago, Ill., assignor by direct and mesne assignments to the Standard Electric Company, of Illinois. Filed May 15, 1891.

470,768. Printing-Telegraph. Edward J. Silkman, Baltimore, Md., assignor of two-thirds to George D. Penniman and Thomas K. Worthington, same place. Filed April 16, 1891.

470,772. Circuit-Interrupting Device. Alexander Wurts, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, same place. Filed Nov. 25, 1891.

The combination of two electrodes normally resting in contact with each other and thermostatic supports carrying the respective electrodes.

470,773. Circuit-Interrupting Device. Alexander Wurts, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, same place. Filed Dec. 1, 1891.

An arc-rupturing device consisting of two or more electrodes of zinc, antimony, or compounds thereof or other materials having a non-conducting vaporous oxide.

470,774. Apparatus for Protecting Circuits. Alexander Wurts, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, same place. Filed Dec. 16, 1891.

The combination, with the circuit of an electric generator, of a rotating discharge device for discharging the respective conductors of circuit to the earth, consisting of a series of contacts connected with their respective conductors and a circuit-closing device connecting the respective contacts with the earth through a relatively high resistance at different times.

470,784. Dynamo. William H. Elkins, Cambridge, Mass. Filed June 29, 1891.

470,785. Dynamo. William H. Elkins, Cambridge, Mass. Filed July 11, 1891.

470,786. Appointment Signal for Telephones. Silas W. Gray, Fort Dodge, Iowa. Filed May 12, 1891.

470,790. Electric Switch. Hugh Moore and Oliver O. Jarrard, Mauch Chunk, Pa. Filed Sept. 4, 1891.

470,792. Galvanic Battery. Francis H. Root, Chicago, Ill. Filed Nov. 5, 1888.

A battery comprising the cell closed at its top and provided with a vent tube, a packing of mineral fibre arranged within the cell, a chloride of-silver electrode, embedded within the packing, a zinc electrode surrounding the packing, and an excitant consisting of a caustic solution.

470,793. Switch for Electric Signalling Apparatus. Leopold Sellner, Vienna, Austria-Hungary. Filed Oct. 17, 1891. Patented in England, France, Germany, Italy and Austria-Hungary.

470,806. Railroad Circuit-Closer. Frank E. Kinsman, Plainfield, N. J. Filed July 30, 1891.

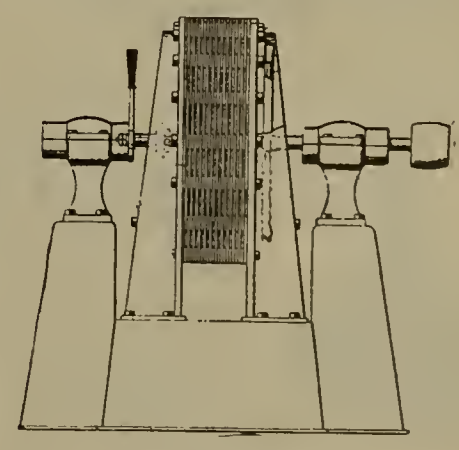
A railway circuit closer suspended from a vehicle and having its operating portion arranged to travel in line with the wheel-flange.

470,810. Employés Time-Recorder. William Lucas and Thomas A. Garrett, London, England. Filed April 21, 1891.

470,813. Electric Railway-Signal. Adoniram J. Wilson, Port Chester, N. Y., assignor to the Hall Signal Company, of Maine. Filed Nov. 9, 1891.

In a block-signalling apparatus, the combination, with a series of normally-closed rail-circuits, of a series of normally open or broken signalling-circuits, each signalling-circuit including a normally open circuit-closer constructed to be closed by the action of the train upon one of the rail-circuits and also including a normally-closed circuit-breaker constructed to be opened by the action of the train upon the next succeeding rail-circuit of the line.

470,817. Electric-Railway Motor. Francis O. Blackwell, New York, N. Y., assignor to the



470,928.—ALTERNATING CURRENT GENERATOR.

Thomson-Houston Electric Company, of Connecticut. Filed Aug. 31, 1889.

470,820. Electric Connector. William H. Garland Chelsea, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Nov. 23, 1891.

An electric connecting-plug consisting of a sleeve or tube with its bore eccentric to its axis, leaving a thin and comparatively yielding wall on one side of the tube.

470,831. Annunciator. Archibald H. Brintnell, Toronto, Canada. Filed Apr. 11, 1891.

470,844. Electric-Wire Support. Francis O. Blackwell, New York, N. Y., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed June 17, 1889.

A holder supporting an electric-railway supply-wire having lips of malleable metal bent down upon opposite sides of the wire and arranged out of line with one another.

470,865. Transmission of Electrical Energy to a

PATENTS—Continued.

Distance. Marcel Deprez and Jules Carpentier, Paris, France; said Carpentier assignor to said Deprez. Filed Nov. 27, 1888. Patented in France and in England.

470,883. Insulation for Electric Wires. Samuel Vanstone, Providence, R. I., assignor to himself and Frederic A. Fairbrother, Jr., same place. Filed March 21, 1890.

An insulating-covering for electric wires, formed of abutting longitudinally-divided sections of rigid non-conducting material, the abutting ends of which form a socket-joint.

470,922. Manufacture of Filaments for Incandescent Lamps. Thomas A. Edison, Menlo Park, N. J. Filed Oct. 10, 1883.

The method of forming blanks or sheets for the purpose mentioned, consisting in treating separately two or more sheets of paper with hydrofluoric acid to form a cementing material and then placing such sheets together.

470,923. Railway-Signalling. Thomas A. Edison, Llewellyn Park, N. J. Filed Aug. 19, 1887.

470,924. Electric Conductor. Thomas A. Edison, Llewellyn Park, N. J. Filed Sept. 30, 1887.

The combination of a wire, a fabric covering thereon, and an outer covering of a mixture of rubber and infusible material.

470,925. Manufacture of Filaments for Incandescent Electric Lamps. Thomas A. Edison, Llewellyn Park, N. J. Original application filed March 20, 1880. Divided and this application filed July 2, 1888. Patented in England, in Italy, in Canada, in Belgium, in Victoria, in Austria-Hungary, in Queensland, in New Zealand, in Portugal, in New South Wales, in Spain and in France.

A filament for forming the carbon incandescing conductor of an electric lamp, consisting of a number of fine filaments welded together by a carbonizable cementing substance.

470,926. Dynamo-electric Machine or Motor. Thomas A. Edison, Llewellyn Park, N. J. Filed Feb. 24, 1891.

A magnet-pole piece consisting of several distinct layers of iron or steel united for a part of their length into an integral mass.

470,927. Driving Mechanism for Cars. Thomas A. Edison, Llewellyn Park, N. J. Filed March 26, 1891.

The combination of an electric motor, an armature having a driving-shaft, a sprocket-wheel thereon, one or more idle-pulleys supported by the field-magnet of the motor, a sprocket-chain passing around wheel and idle-pulleys, and a driven sprocket-wheel outside of the chain and in engagement therewith.

470,928. Alternating-Current Generator. Thomas A. Edison, Llewellyn Park, N. J. Filed Aug. 25, 1891.

In an electro-magnetic machine, the field-magnet having several poles and consisting of overlapping magnetic plates bolted together so that the plates shall be in contact at the ends, but shall be separated throughout a portion of their length, plates having main bodies and projecting legs, the latter constituting the field-magnet poles.

470,929. Magnetic Separator. Thomas A. Edison, Llewellyn Park, N. J. Filed Oct. 1, 1891.

The combination of a receptacle adapted to contain fine magnetic ore and to allow escape of the same, a magnet for changing the trajectory of the magnetic particles in the ore, magnet having two poles in position to act on the falling ore, one pole being below the other and formed by a Z-shaped arm having an end bent to form an extended pole substantially parallel with the falling magnetic material.

470,930. Dynamo-Electric Machine. Thomas A. Edison, Llewellyn Park, N. J. Filed Oct. 10, 1891.

In a multipolar electro-magnetic machine, the combination of the armature core, the armature-coil covering the whole surface of core, a commutator having a number of conducting-blocks, the series of field-magnets forming a succession of alternating like and unlike fields, commutator connections between all portions of the armature-coils situated in corresponding magnetic fields and the same commutator-blocks, whereby a continuous current is produced, and the commutator-brushes taking current from and delivering current to all parts of coil.

470,946. Underground Electric Conduit. James F. Munsie, Jersey City, N. J., assignor to Thomas Leonard Coles, New York, N. Y. Filed Oct. 9, 1889.

An underground electric-conduit system consisting of a through-wire conduit, distributing-ducts extending along conduit and service-ducts leading transversely from the distributing ducts, the through-wire conduit and distributing-ducts being divided up into sections by man-holes spaced at intervals along the line and the service-ducts being provided with man-holes at their ends remote from the main conduit, and devices, whereby the wire may be withdrawn from the main conduit through the service-ducts.

470,994. Contact-Maker. Daniel Draper, Hastings-on-Hudson, N. Y. Filed Sept. 30, 1891.

471,053. Electric-Actuated Vending-Machine. Archie J. Henry, Watertown, N. Y., assignor of five-eighths to Ernest A. E. Meyer, Charles H. Sprague and James B. Wise, same place. Filed Aug. 22. 1891.

471,063. Electric Elevator. Rudolph C. Smith, Yonkers, N. Y., assignor, by mesne assignments, to the National Company, Chicago, Ill. Filed Nov. 11, 1891.

The combination, with a multiple-wire system of electrical distribution, of a shunt-motor and means for changing the connection of motor from one of the wires of the system to another to vary the speed of the motor.

471,064. Electric Elevator. Rudolph C. Smith, Yonkers, N. Y., assignor, by mesne assignments, to the National Company, Chicago, Ill. Filed Nov. 30, 1891.

In an electric elevator, the combination, with the motor and car operated thereby and a switch located on the car, of circuit connections between the field-magnet coils of the motor only and the switch on the car.

BUSINESS NOTES.

The Bodifield Belting Company of Cleveland, O., has lately furnished for the East Cleveland Railroad Co. two 48-inch double belts and six 25-inch double belts. These belts are running, and elicit nothing but words of praise from the company and all who see them. This firm has also furnished for the Short Electric Co., for the East Liverpool & Wellsville, O., Street Railway Company, two 24-inch double belts, each 100 feet long; and has likewise belted up the Ashtabula Rapid Transit Co.'s power plant, Ashtabula, O., and that of the Wheeling Electric Railway, of Wheeling, W. Va.

ELECTRIC FIRES.

In our issue of March 19 we took occasion to refer to an article printed in *The Chronicle*, of this city, in which that journal criticised the figures given by Mr. Allen R. Foote, in his report relative to the fires and injuries caused by electric currents during the year 1890, which was read at the Electric Light Convention at Buffalo last month. *The Chronicle* claims that experienced insurance underwriters believe that electric fires are increasing in frequency, and the language of the article throughout showed that that paper belonged to that class who are skeptical concerning electric light risks.

Reference to fire in the inquiry, which was summarized in Mr. Foote's report, was merely incidental, the object of the investigation being to ascertain the number and extent of injuries to firemen by electric currents while in the performance of their duty. The returns were made by the chiefs of various fire departments and used as they were given, without any effort being made to verify their correctness, and Mr. Foote points out the injustice of *The Chronicle* in using the reference to the number of fire-alarms to sustain its theory that electric fires are increasing in frequency.

The fundamental question is: "Are electric fires increasing in frequency?" From all reports and testimony that we have access to or can command, there can be but one answer, viz.; "No;" on the contrary, they are decreasing in frequency, and very naturally.

IMPROVED TELEGRAPHIC APPARATUS.

The telegraph is an old institution—old compared with the newer electrical industries, such as electric lighting, the telephone and the electric railway—and the public seldom hears of what is going on in the way of improvements in telegraphic apparatus and the methods employed in transmitting signals to distant points. The fact that little is said about such improvements does not indicate that they are few, and that telegraph plants, as they exist to-day, are so perfect that they are susceptible of no further change. Such is not the case, however. Telegraph engineers are not figureheads by any means, and they are just as wide awake in their line of action as their brother electricians are in other departments of electricity. True, no new principles are discovered and few great inventions are made, but the work of improvement in existing apparatus is an endless one. In a general way the instruments now in use are very efficient, and about the only direction in which they can be improved is in simplifying them. Simplicity, of course, means greater efficiency.

We publish on another page a description and an illustration of an automatic repeater for telegraph circuits which, from all accounts, seems to possess decided advantages over the one of which it is a modification, namely, the Milliken.

Ease of handling and manipulation was the object sought in this apparatus, and how far these important points have been accomplished those of our readers who are interested in such matters can judge for themselves by reference to the illustration which accompanies the article.

THE NATURE OF CONDUCTORS AND DIELECTRICS.

What is there in common in certain materials that permits the transference of electric current through their substance with comparative ease, and what is there in common in other materials that resists this action? are questions that are difficult to answer. All substances are conductors of electricity in one sense; that is, they permit the passage of the electric current with more or less facility. Those which resist the electric action the most are termed insulators, and those which resist the least are commonly called conductors. These phenomena are of deep scientific interest, and when they can be explained with certainty we will have reached a degree of knowledge that will afford an explanation to other physical phenomena, the causes of which are yet obscure.

We print on another page an article from the able pen of Mr. Charles P. Steinmetz which throws a good deal of light on this subject, and which will, no doubt, be read with deep interest.

Mr. Steinmetz discusses in a masterly way the electric phenomena as manifested in conductors and dielectrics, and concludes by pointing out the characteristics of these two classes of materials. Conductors, he states, are opaque metallic bodies and decrease in conductivity with increasing temperature, and dielectrics in general, which are called insulators, if in a state where chemical dissociation can occur under electric stress, are able to convey the current by what is called electrolytic conductivity, by means of atomic exchange from electrode to electrode, and when in a condition of great molecular movability, as in rarified gases, transfer electricity by molecular and luminous discharge.

DOES GROUNDING THE NEUTRAL WIRE INCREASE FIRE HAZARDS?

There exists a difference of opinion among electricians as to the advisability of grounding electric light wires. One party contends that such practice increases the fire hazard, while the other argues from the opposite standpoint.

The investigation into this important subject which the New York Board of Fire Underwriters recently undertook, resulted, on March 10, at a special meeting, in the offering of a set of resolutions requiring that electric companies discontinue the practice of intentionally grounding any portion of their equipment, and requiring that all such grounds now existing shall be removed on or before October 1 next.

This action was based upon the report of Prof. Henry Morton in answer to questions propounded by the Committee on Police and Origin of Fires, with reference to fire hazards from the grounding of electric wires, and particularly the middle or "neutral" wire in the Edison system.

Prof. Morton is emphatic in his utterances, and states that in his opinion grounding the middle wire decidedly increases the fire risk. On the other hand, the Edison Electric Illuminating Company, replying to Prof. Morton's report, states that "It is the general opinion of the Edison interest that while absolute insulation, if it can be had, is preferable [to the grounding of the neutral wire], the advantages of grounding the neutral under certain conditions, and particularly on large systems, are such as to make that practice in those cases the best working method, particularly as a precaution against fire risk."

The resolutions will be considered and acted upon at the next meeting of the board, and the result will be awaited with interest, as the interests involved are large and important.

IMPROVED AUTOMATIC TELEGRAPH REPEATER.

BY R. H. WEINY.

The Electrical Age of March 19 contains a very ingenious arrangement for the Milliken-Hicks repeater, but even if, in the operation of the apparatus, it receives the slight benefit claimed for it, that rheumatic old-timer still remains in full possession of all its infirmities, requiring that its extra local adjustments be altered to meet almost every change in the weather, and further demanding that the locals be not only good and strong, but quite constant; in fact, first-class in every particular.

Knowing the weak points of the repeaters now in general use, and the exasperating delays caused by them when in the hands of those not thoroughly familiar with their peculiarities, General Manager W. P. Phillips, of The United Press, had constructed for the wire service of that concern a number of repeaters, so different and so much more satisfactory than the old style, that I thought a diagram and a word or two about them would prove of interest to your readers.

The extra magnet on each relay is a single spool, wound differentially, with an iron cover for a return pole and, as shown in the diagram, is located just above the main-line magnets. Being independent, it remains in the one position regardless of the adjustment of the main-line magnets.

The transmitter is practically the same as those now in use, but its application is different, and as the instrument is built on the sounder plan, it can be used as such; while the switches are so connected that when the repeaters are cut the extra locals are open.

The object of the double-wound extra magnet is to avoid all chances for a "kick" under very heavy adjustments, caused by one magnet discharging quicker than another charges. All the magnets in this case work in the same direction, either charging or discharging, and the result is the repeater will work, and hold without a falter, any line on which it is possible to work a single-line instrument. It will be noticed that when the repeater is cut through, one circuit is constantly through one winding of the extra magnet while the other side is controlled by the front or dead contact point of the transmitter, the current being in the opposite direction. When the transmitter leaves the front contact, one of the extra local circuits is opened, permitting the other side to take hold of the relay armature and hold it to its contact, the main line being opened later. In the reverse motion the main line, of course, closes first and takes hold of the relay armature, but the extra magnet does not release its grip until the transmitter has touched the front contact and the extra magnet is fully charged and balances itself. Thus it will be seen by the action of the magnets that the interval of time between the extra taking hold and the main line letting go, or the main line taking hold and the release by the extra, is of the longest possible duration. As shown in the diagram, the repeater has but one relay adjustment and that is the ordinary single line method. The transmitter points do not have to be *just so*, as the "lapping" of contact-points is not necessary; they practically take care of themselves, and the necessity of giving the armature considerable swing is done away with, permitting a ready response to rapid work. If the extra local on the receiving side should give out (instead of the sender going on his way rejoicing, only to find out later that the receiver had been trying to break for half an hour), the fact becomes known to the sender, and if the extra on the sending side plays out there is no mutilation of signals; the sender can proceed, the trouble manifesting itself when the distant end breaks.

The battery does not have to be in the very pink of condition, as any irregularity balances itself.

The repeater works without a falter and without attention just as long as the locals are in a fairly good condition. The diagram shows the connections of this repeater very clearly, and hardly requires any explanation.

A SPLENDID POWER HOUSE.

The new power-house for the Minneapolis Street Railway Co., Minneapolis, Minn., it is expected will be completed and everything in readiness for operation by the middle of next month. From the outside, the power-house has the appearance of a low brick building covering a large area of ground and surmounted by a tall smoke-stack 165 feet high.

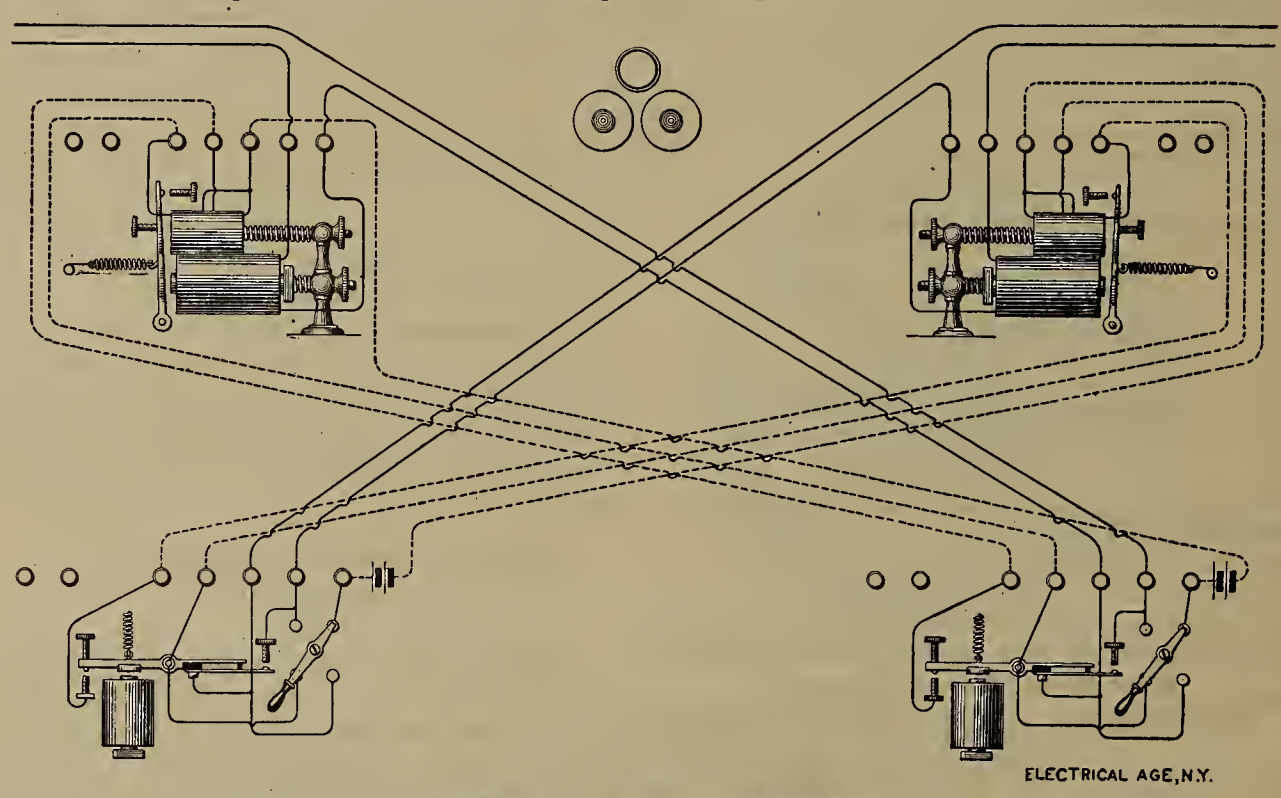
When complete the power-house will have 10 Westinghouse engines of 300 horse-power, which will run 10 Thomson-Houston dynamos of equal power, the engines and the dynamos being rated alike. In the engines 240 horse-power are guaranteed with 140 pounds of steam. With 150 pounds, 300 horse-power will be generated. The engines are compound, with a high-pressure cylinder 16 inches in diameter, and a low-pressure cylinder 27 inches in diameter by 16-inch stroke. The regulation is close, this being required in railroad work. The governor is encased in oil, and all the working parts similarly encased in order to secured the greatest efficiency of the machinery. A steam loop is used for the purpose of bringing back the condensations into the boiler. By this arrangement, it is said, a saving of 20 per cent. in the power is effected.

The ten engines are arranged in two rows, five in each, and facing each engine is a dynamo. These machines are connected by a 24-inch leather belt running around an 82-inch pulley on the engine and a 36-inch pulley on the dynamo.

The advantage of having the power subdivided is that if one machine gets out of order another takes its place, so that there is no interruption. If the power were generated by one huge engine everything would be at a standstill should this break down, until repaired again. When everything is complete, there will be more power generated on the floor of this building than on any space in the country of a similar size. The area of the power-house is 87 by 73, not including the boiler-room.

The boiler-room is nearly as large as the power-room. It will contain seven Stirling high-pressure water-tube boilers when everything is complete. These are of a new pattern and consist of a large number of flues, running between an upper and a lower boiler. By this arrangement a very large surface is presented to the fire, which serves to economize the heat. Each boiler is of 287 horse-power, and rests upon a solid wall which extends eight feet below the floor. The whole will be enclosed by brick walls when finished. The fuel to be used is crude oil, which will be pumped in from two tanks as it is needed. The smoke will be carried to the smoke-stack by means of pipes in the basement. The floor of the boiler-house will be concrete and supported by arches.

The water supply for the plant will be furnished by an artesian well which is now being drilled. A depth of 575 feet has now been reached and the drill is at present working its way through a thick layer of shale.



AUTOMATIC TELEGRAPH REPEATER.

CONDUCTORS AND DIELECTRICS.

BY CHAS. PROTEUS STEINMETZ.

The earliest investigations of electric phenomena made us acquainted with a difference in the behavior of different materials towards this newly discovered force of nature. While some materials, when brought in contact with a source of electricity, became electrified over their whole extension, or, when in contact with the ground did not get electrified at all, but carried the electricity silently off to the ground, other materials became electrified only at the point of contact with the source of electricity. So the distinction between *electric conductors* and *electric insulators* became known. Soon it was discovered also that there exist different degrees in the insulating ability of bodies, and poorer and better insulators were distinguished.

As in the galvanic battery a source of immense quantities of low-pressure electricity was discovered, amongst the conductors differences were noticed also, and good conductors, as metals, and poorer conductors, as solutions of salts, acids, etc., found.

Although we still speak of "conductors" and "insulators," in reality this distinction can not be retained any longer as an essential classification, not because there exists no perfect insulator (even the best insulator has still some conducting quality), but because what were called conductors comprise two or three distinctly different classes of materials, which have nothing whatever in common. If an electric current flows through a copper wire, this is an entirely different phenomenon from that of an electric current flowing, for instance, through dilute sulphuric acid.

In the first case, the current flows through the copper wire in a manner similar to a stream of water flowing through a pipe, that is, it has no effect on its physical or chemical constitution, except that by frictional resistance and a certain amount of pressure—electric-pressure in the one, water-pressure in the other case—is consumed in the conductor, and at the same time a corresponding amount of heat is developed.

Quite different in the second case. A current flowing through dilute sulphuric acid causes therein chemical action directly proportional to the quantity of current flowing, and flows only because it can produce this chemical action; and if we are able to make the chemical action impossible, for instance, by freezing the liquid, it becomes an insulator, and that stops the current.

In the "electrolytic conductors," matter is carried by the current in direct proportion to the quantity of current, so that it seems that the current is not *conducted* through the liquid, but carried by atoms of matter, which travel through the liquid from electrode to electrode. While the first kind of conduction, the "metallic conduction," may be compared with the flow of water through a pipe, this "electrolytic conduction" may be compared with the carrying of water in barrels, and would perhaps, more properly be called "electric convection."

The worst metallic conductors, as bismuth and mercury, are still many thousand times better than the best electrolytic conductors, nitric, sulphuric and hydrochloric acids and caustic potash.

In order to consider more closely the phenomena of electric conduction and insulation, we must strictly distinguish between these quite heterogeneous phenomena, *conduction* and *convection*.

For convenience, we shall call the "metallic conductors" simply *conductors*, and the "electrolytic conductors" *convectors* of electricity.

The *electric conductors are exclusively opaque materials;* they are all *metals*, or *those allotropic modifications which have metallic character*. Their conductivity is a strictly *physical* phenomenon, closely related to their opaqueness, and decreases with rising and increases with decreasing temperature, by such a law, that the resistance—the inverse value of the conductivity—decreases for every degree (absolute) of temperature by the same amount in elementary materials, so that for the absolute zero-point of temperature, — 273° Centigrade, the resistance becomes zero. (For copper, the decrease of resistance by this law has been proved down to below—200°.)

These materials remain opaque and conductive even if their physical condition changes, and they pass from the solid to the liquid state, and inversely.

Quite different is the electric convection or electrolytic conduction. This is a decidedly *chemical*

phenomenon, and the laws of chemistry hold good for it, amongst which the first is: "*corpora non agunt nisi fluida*," which means chemical action takes place only in the fluid state.

Hence electrolytic conduction exists only in liquids, either solutions or melted compounds; and if an electrolytic conductor is solidified it ceases to be conducting and becomes an insulator, a *dielectric*, so called because it lets electro-magnetic oscillations pass through, just as diaphanous materials are pervious to light oscillations; while opaque bodies reflect or absorb the light and heat oscillations and convert them into heat oscillations of the opaque material. So metallic conductors reflect or absorb electro-magnetic oscillations, in the latter case converting them into electric oscillations in the conductor.

Indeed, this law of chemistry does not hold rigidly; even solid substances, especially when near the melting-point, act chemically upon each other, though very much less intensely. So even solid dielectrics sometimes become possessed of slight electrolytic conductivity when nearing their melting-point. Glass, for instance, one of the best insulators, begins to get conducting when heated, and when melted is a good electrolytic conductor.

Hence the electrolytic conductivity is closely allied with chemical action, and for every ampère of electric current passing through the liquid, an exactly determined amount of chemical dissociation takes place, so that this phenomenon is best explained by assuming that the electric potential dissociates the molecules of the compound liquid into their atoms, and by their attraction with the electrodes they travel through the liquid, thereby carrying electric charges from electrode to electrode. We must not think, however, that the atoms of each molecule travel through the whole liquid, but rather that molecule exchanges with molecule its atoms, the electro-positive in the one, the electro-negative atoms in the other direction.

Heat loosens the ties of chemical attraction, hence we find that electrolytic conductivity increases with increasing temperature.

Concerning insulators hardly anything can be added to that what is said of electrolytic conductors, for the difference between electrolytic conductors and insulators is only quantitative, and all the electrolytic conductors become "insulators" when passing into the solid state, while all the insulators have a slight electrolytic conductivity, which increases with increasing temperature, often very rapidly, as in the case of gutta-percha, while indeed very many remain, even in the liquid state, very good insulators, as especially the derivatives of carbon.

We must consider, indeed, that nature knows no classification, and that therefore all these distinctions and classifications, which man is obliged to make for mastering the phenomena of nature, are more or less incomplete. Take, for instance, the metallic modification of carbon, graphite, ranging in its conductivity between metals and electrolytic conductors. It behaves entirely like a metallic conductor, but shows the strange phenomena of an increase of conductivity with increasing temperature, at least for temperatures up to about 700° Centigrade.

Besides the atomic convection of electrolytic conductivity there exists a molecular convection of electricity, especially noticeable in rarefied gases, as luminous discharge, molecular bombardment, etc., which is of less importance for the electrical practice, though scientifically of high interest.

Thus, to summarize, we have *electric conductors* and *dielectrics*. The *conductors* are *opaque metallic bodies* and decrease in conductivity with increasing temperature; the *dielectrics* in general are what we call *insulators*, but, if in a state where chemical dissociation can occur under electric stress, are able to convey the current by what is called *electrolytic conductivity*, by means of atomic exchange from electrode to electrode, and when in a condition of great molecular movability, as in rarefied gases, transfer electricity by *molecular and luminous discharge*.

ELECTRIC LIGHT FOR MAGIC LANTERN.*

PROF. W. C. PECKHAM.

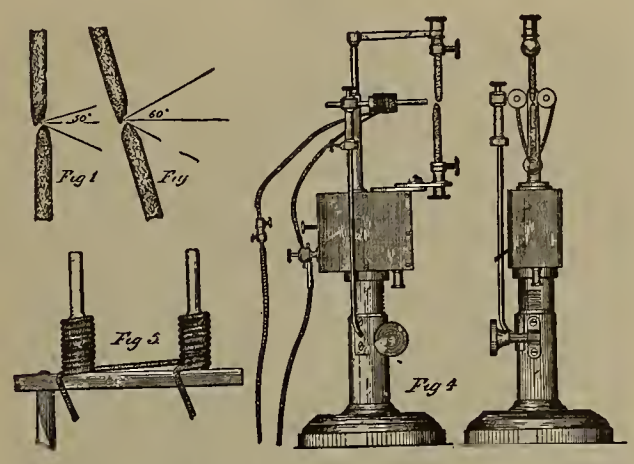
There is great diversity of opinion regarding the candle-power of both the calcium and electric arc lights. Makers and dealers in the calcium light claim as high as 900 candle-power for it as actually used in the lantern. I have made numerous measurements in the laboratory of the Adelphi Academy upon both. The method employed was that of the Bunsen grease spot photometer, with a sight-box by the American Meter Co. The standard of light was the Sugg London Standard Argand gas-burner and a Methven screen, by the same company. These have been compared with standard candles and are correct, or what is called so. The following table is compiled from my notes, each jet being tested three times. 1, A noiseless flame. 2, A medium flame making as much noise as would be allowable in the lantern. 3, A roaring flame, taking all the gas it will use.

CALCIUM LIGHTS.

Jet.	1	2	3	
A	304	304	413	candles.
B	130	205	413	"
C	264	304	491	"
D	264	304	353	"
E	180		304	

Column 3 gives the maximum beyond which these jets cannot be forced and which they cannot long maintain, since the lime would soon crumble away under such a bombardment.

A calcium light which had just been tested with a quiet flame was used as a standard by which to measure the candle-power of the two arc lights for lantern use belonging to the Adelphi Academy, with the results given below.



FIGS. 1, 2, 3, AND 4.

A small lamp made by the United States Electric Lighting Co., requiring about 8 ampères at 110 volts, gave 355 candles. A Clark lamp of full capacity, with a current of about 15 ampères, gave 1,378 candles, and with a full current of 20 ampères on gave 1,758 candles. These figures show that candle-power is much overestimated in all cases. The last lamp measured is what is called a 2,000 candle-power lamp. It gives in the condition in which it would be used 1,300 candles, and this is a magnificent output when compared with the 300 candles of the calcium lights.

In many places current can now be had from lighting and power circuits, while many educational institutions have their own plant, which could easily be employed for this purpose, but as yet no arc lamp of moderate price equal to the work has been put upon the market. Not to mention the old regulators, like the Foucault, with clock-work which requires frequent winding, there are several lamps costing about $100 made for this use, but that price

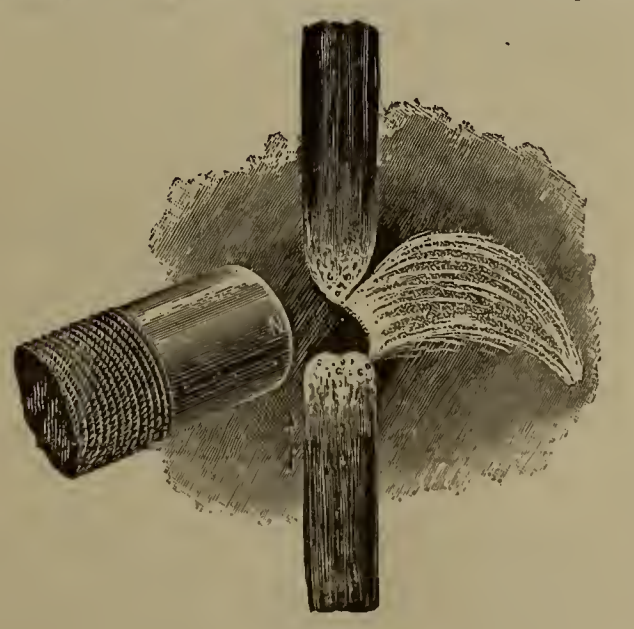


FIG. 3.

for the lamp alone is prohibitory to many. English writers recommend the Brockie-Pell lamp most highly. The Clark lamp, spoken of above, is a favorite here. It, however, is hung down into the lantern, resting on the top of it. Its regulating magnets and mechanism are heavy, rendering the whole somewhat top-heavy. To adjust the light one must reach above the top of the lantern, and if the lamp is to be removed from the lantern a special stand must be provided for it. The lamp I have used for nearly two years was made by the United States Electric Lighting Company. It is simple in construction, rising by a rack and pinion by hand, as the lower carbon is consumed to bring the arc into focus again. Its fault is that it does not "take up" quickly when the current varies through varying resistance in the arc. With a little experience its regulation by hand, to overcome this defeat, is not difficult.

Fig. 4 shows the appearance of the lamp and its interior mechanism, the sides being removed for that purpose when the photograph was made. It stands 20 inches high, with full length of carbons.

It would seem that a focusing lamp might be made for a moderate price which would, with plain, strong and durable workmanship, be as good practically as the highest priced lamp, and that such a lamp would find a good market.

The incandescent lamp has been used in the lantern by some. In its ordinary form with a long loop of filament the light is too widely distributed. A special form has been made for the lantern of 100 candle-power. The carbon filament was coiled into a close spiral of about a half inch in diameter, which is about the size of the white spot on the lime. This lamp is very easy to use, since its resistance would be fitted to the circuit upon which it was to be put, and it would run with the other lamps upon the same circuit and with no more attention. The operator has nothing whatever to do but to turn the key when the light is wanted. Where its light is sufficient nothing better can be desired, nothing cheaper be found. The lamp itself costs very little, and a support for it in the lantern can be made by any one. It is infinitely better than any oil lamp. I have known them to be used in small lecture-rooms in preference to the calcium or the arc light. But it is the arc light alone which can take the place of the calcium light for all uses. It leaves nothing to be desired. I cannot agree with the remark of Mr. Lewis Wright in his recent book on "Optical Projection:" "Such a powerful light is quite useless for exhibitions unless the disc shown exceeds 30 feet in diameter." My experience is that the better lighted a picture is, the less the eyes of the observer are taxed. With the calcium light the deepest darkness is necessary in other parts of the hall to save the picture from indistinctness, and the reading-lamp of the lecturer often blurs one side of it. When the arc light is used the illumination is so abundant that enough lamps, gas or incandescent electric, may be left lighted to enable the audience to see the lecturer and the lecturer to see his audience, so that notes may be taken or a manuscript read, while still the picture can be better seen in all its details than with any other artificial light. The ability to have other lights in the lecture-room is sometimes an important consideration in controlling an audience of students. It is useful always. I often project a slide of a diagram or a machine without wholly darkening the room, and go on with recitation or lecture upon it, while the class attend, copy or take notes as required. In a popular lecture it is far pleasanter. Nothing is more weird for an audience than to sit in deep darkness and listen to a voice coming as from an abyss beyond; nothing more unreal for a speaker than to stand upon a platform and to speak into darkness in which there may be supposed to be interested listeners. With the arc light in the lantern all this is changed, and speaker and hearer may be *en rapport* with each other in a fairly-lighted room.

If the operator is on an arc-light circuit, his lamp is put directly in series with the others on the same circuit, but the high potential used on such circuits makes such an arrangement rather a ticklish one to work with. The low potential generally used with incandescent lights is more safely handled, and there are now many arc lamps used on such circuits. The potential is never above 110–120 volts. At this pressure the wires may be handled as safely as those from a battery. Of course they must not come in contact with each other; for a short circuit will produce a great heat.

If the arc lamp is to be used on an incandescent circuit, additional resistance is required to enable the low-resistance arc lamps to burn in multiple with the high-resistance incandescent lamps. Arc lamps use from 8 to 15 ampères of current at 115 volts. Apply Ohm's law to this, $C = \frac{E}{R}$ or $R = \frac{E}{C}$, and we have $\frac{115}{8} = 15$ nearly, and $\frac{115}{15} = 8$ nearly. So an 8-ampère lamp requires 15 ohms and a 15-ampère lamp 8 ohms approximately of resistance to control the current.

A part of this is offered by the arc itself. The adjusting coils of the lamp furnish something more, differing in different lamps, but not enough to make up the resistance to the amount required to choke off an excessive current through the lamp.

There are two ways of arranging the apparatus:

1. The common way is to place a rheostat in the main circuit whose resistance can be varied at will, and thus more or less current be sent through the lamp. This is the method when the current comes from a central station at a constant pressure.

2. Where there is a separate or isolated plant, as in not a few educational institutions, a coil of No. 12

* Scientific American.

German-silver wire (so that it will carry the required current without heating, with a resistance of three or four ohms) may be put permanently in series with the lamp. The remaining adjustment will be made by the field rheostat of the dynamo. For this purpose the field wires should be brought to the lantern-table, and a field rheostat be connected to them within reach of the operator. By varying the field resistance he can change the voltage of the current and thus adapt it to the lamp.

The only defect of the arc light for lantern use is the "blinking" caused by the change of the position of the bright spot on the positive carbon. This bright spot emits by far the greater part of the light. To see it, place a deep red and a blue glass together and look through both. The bright spot still looks white, but the rest of the carbon looks dark red. This spot is seen frequently to move, sometimes to swing around, sometimes to jump across to the opposite side of the carbon. This motion is attributed to impurities, principally silicon, in the carbon. The best carbons, the Carré French carbons, are not free from this defect.

The blinking does not make much difference for street use. The light flickers and hisses and we endure it, but in the lantern, if the arc goes to the back side of the carbons, the picture is blurred or obliterated entirely. This motion of the arc is fatal to the use of the light for projecting microscopic objects. The light entirely leaves the focus of the objective, and comes back when it gets ready. Several microscopic societies have abandoned the arc light in disgust on this account, though when the arc is in its proper position, the illumination is superb.

The remedy for blinking has been to place the centre of the negative carbon in front of the positive by a distance equal to its radius. This serves two purposes. The distance from the tip of the negative carbon to the front side of the positive carbon is the shortest and easiest path for the arc, and so the arc will remain in front of the carbons, unless something makes it move. A second object which is gained is to form the crater in the positive carbon so that it slopes toward the condenser, as shown in Fig. 1.

In street lamps the axes of the carbons are placed in the same vertical line. The crater tends to be horizontal, and the light is radiated downward and equally all around as it should be. This is just what is not wanted in the lantern. The position shown increases the amount of light sent out toward the condenser and screen. Carrying this idea still further, lamps are made in which the carbons are set on a slope of about 20°, in which position the negative carbon cuts off but little of the light from the crater of the positive carbon, as is seen in Fig. 2. A comparison of Fig. 1 with Fig. 2 shows an angle of opening between the carbons 10° larger in the inclined carbons, although both figures are made from the same negative. The carbons in the focusing lamp used on the tower of the Madison Square Garden are set in this position. It is more convenient for me to tilt my lamp forward and make the lower carbon negative, which answers the same purpose.

According to my observation, this is but a partial remedy for the defect of blinking, and I have devised and constructed a special regulator for holding the arc in its proper position, which so far as I know is new and original, and which has proved successful.

The fact that a magnet strongly repels an electric arc is of course well known. Dr. Samuel Sheldon, now of the Brooklyn Polytechnic Institute, based upon this fact an electric blowpipe shown in Fig. 3.

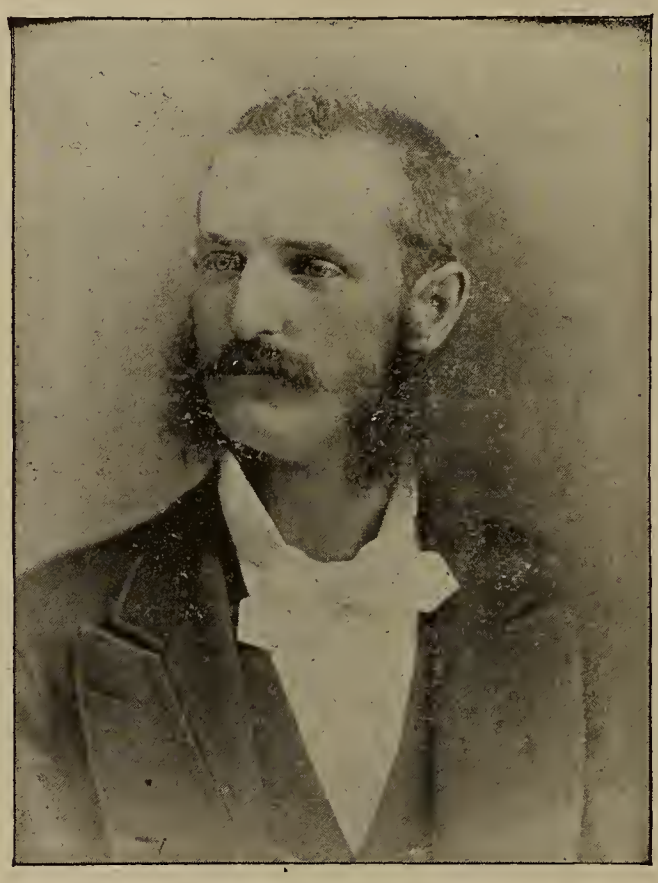
The same force in a less degree will hold the arc on one side of the carbon. At first one pole of the electro-magnet was used. This worked quite well. The apparatus illustrated in Fig. 5 was afterward made, which is an electro-magnet of the ordinary form, except that the soft iron cores extend beyond the coils, so that the coils may be set back far enough that their insulation may not be destroyed by the heat. The cores are of $\frac{1}{4}$-inch rod, 2½ inches long, and set two inches apart. Eight to twelve turns of No. 12 wire on each core will produce a field strong enough when the poles are set about half an inch behind the carbons. The mode of attachment to the lamp is plain from Fig. 4. It will be seen that the rod which carries the regulator is attached to the base of the lamp and that the magnets can be moved forward and backward. If too near, they drive the arc out with a hissing noise. The regulator is adjusted once for all as high as the focus of the condenser, and as the carbons consume, the rack and pinion brings the arc up to its place again, with reference both to the regulator and the condenser. The regulator is in series with the lamp, and the whole current goes throught it. It might be in parallel, but nothing would be gained by this arrangement.

I have had it in use for more than a year with the best results. Any one can easily make one and test its working. It is confidently expected that it will enable the arc lamp to come into use for lantern projections wherever the heavy current can be had.

BIOGRAPHICAL SKETCHES.

D. HERBERT JEFFERY.

D. Herbert Jeffery, Secretary of the Crocker-Wheeler Electric Company, was born at Corning, N. Y., and though but 38 years of age, his business experience has been a wide and varied one. In the early years of the sewing-machine business he became connected with the Remington and Wheeler & Wilson companies. Later turning his attention to the hardware trade, he accepted an engagement with the large house of Sargent & Co., of New York and New Haven. Mr. Jeffery subsequently assisted in the organization of the New York Live Stock Express Company, and was for four years its secretary. This was the first company to build and run cattle-cars through from Chicago to New York, in which cattle could be fed, watered and rested without unloading. It was also the first concern to build and run palace horse cars. Mr. Jeffery was also one of the three originators of the large corporation known



D. HERBERT JEFFERY.

as the Domestic Spring Bed Company, of Jersey City, N. J. He afterward withdrew, and with his brother started, four years ago, the concern known as Jeffery & Co., of Jersey City, manufacturers of wire springs. Mr. Jeffery, seeing the great future in the electrical business, subsequently sold out his spring business to accept his present post with the Crocker-Wheeler Electric Company, as secretary and office manager. Mr. Jeffery is a man of considerable executive ability, an A 1 salesman, and well known to the electrical fraternity, doing the principal part of the buying for the concern with which he is connected.

Electricity offers great possibilities to one of an inventive turn of mind, and Mr. Jeffery's well-known faculty for improving and inventing will, we take it, be turned to good account in his present field of labor.

FIRES AND INJURIES CAUSED BY ELECTRIC CURRENTS.

BY ALLEN R. FOOTE.

1. The difficulty of giving accurate and useful statistical information without asking a great many questions is aptly illustrated by the use made by *The Chronicle* in its issues of March 10 and 17, respecting statistics furnished by myself regarding "fires and injuries to firemen caused by electric currents."

2. The inquiries by means of which these statistics were obtained were originally drawn to include statistics regarding property losses by fires caused by electric currents. But on account of the tremendous pressure continually being brought to bear upon the Census Office *to cut down the scope of its inquiries*, it was decided to omit all reference to property losses in this connection and confine the inquiries strictly to personal injuries to firemen. This course was taken in consideration of two facts. While insurance associations and journals could be relied upon to keep the interested reasonably well informed as to property losses, there was no apparent source of information regarding personal injuries to firemen from electric currents.

3. It must be conceded that the conditions under which firemen work among wires carrying electric currents are more hazardous than any under which the employés of electrical companies or the public have any occasion to come in contact with such wires. The statistics were gathered from 425 cities, each having 8,000 or more population and an abundance of wires carrying electric currents for every form of commercial use. To show the experience of firemen in facing the dangers supposed to be lurking in such wires, it was necessary to show the number of men at risk, the number of times they were at risk, the number of times the risks were alleged to have been caused by electric currents, the number of injuries received, the number received at fires alleged to have been caused by electric currents, the number of injuries alleged to have been caused by electric currents, and the number of fatal injuries. Here are seven inquiries necessary to establish one fact. This was not sufficient, however. Stating that 31 injuries were caused by electric currents does not convey full information. It is important to know whether any or all of the injuries were serious or merely trifling. To ascertain this fact several more inquiries were addressed to each chief of a fire department, who reported an injury, to obtain information fully showing the character of the injury reported. The letters received in reply to these inquiries, covering every case of reported injury, are attached to the statistical information. The showing made by them is instructive. As a result of these inquiries it is shown that in 425 cities, covering about 76 per cent. of the total urban population of the United States, 56,498 firemen are enrolled on the regular and volunteer force. That there were during the year 1890 39,847 fire-alarms for which the whole or a considerable portion of the force was called out. Of this number 518 alarms are alleged to have been for fires caused by electric currents; 1,719 injuries to firemen, received in the line of duty, are reported, 60 of which were fatal; 31 injuries are said to have been caused by electric currents. But the special reports received, covering each of these cases, show conclusively that *not one of these injuries was fatal*, and with two or three exceptions they were so trifling that they were not worthy of being dignified by being called injuries; yet they gave occasion for lurid articles in the public press portraying the "dangers of the deadly wires." It was to remove the prejudice thus so unjustly created against the electrical industries that this investigation was made. This purpose it has accomplished most admirably.

Let it be borne in mind that all reference to fires in this inquiry is merely incidental; that the returns were made by the chiefs of the fire departments, and used as given without any effort to secure verification, and it will be very apparent how wholly unjust the attempt of *The Chronicle* is to use the reference to the number of fire-alarms to sustain its theory "that electric fires are increasing in frequency." If *The Chronicle* had stopped when it had written: "Most of Mr. Foote's 518 fires probably caused trivial losses, being in fact mere alarms. In the same year *The Chronicle* received reports of 121 fires caused by electric currents, in which the property losses and insurance losses were nominal. By our reports the proportion of electric fires in 1890, sizable fires, was only .54 of one per cent., or about one-half of Mr. Foote's percentage," it would have made a perfectly fair statement to which no charge of prejudice could attach.

The dangers of property losses by electric fires cannot be settled in this way. Insurance companies are eminently practical and conservative in their management. Their business depends upon the fact that fires do occur, and their profits depend upon premiums calculated in the first instance upon the theory that they occur more frequently and are more destructive than the actual results show, and in the second place that any particular agent used on the premises is a factor of increased hazard. These two factors are depended upon in insurance calculations to keep the premiums abnormally high. Every per cent. unnecessarily added to the premium by this process is a direct addition to their profits. A new agent like electricity, coming into the field, about which there has been so much popular superstition and so little actual information, has offered an unusual opportunity for this particular method of figuring, and insurance men have not been slow to reap the harvest while they may. The day has come, however, when electricity shall benefit by the opposition it has encountered and overcome.

The interests of those engaged in the electrical industries are the direct opposite of the insurance companies. Risk of loss by fire is not the reason for their existence. They can make no profit out of the difference between the amount collected as premiums and the amount paid for losses. It is to their interest to prevent every fire they possibly can, and so to establish the reputation for *safety* for electric services, that the public, whose interest is identical with their own, will count such feature one of the de-

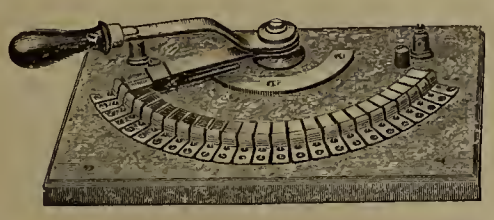
termining factors in adopting the use of electricity for every service that can be rendered by it. The adoption of "*Rules for safe-wiring*," by the National Electric Light Association, is in the interest of the public as well as of those engaged in supplying electrical services. They furnish a guide for this class of work prepared by those who know when wiring is safe, and whose interest it is that it shall be safe. Let these rules be broadly distributed. Let the users of electrical services be fully supplied and posted regarding them, so that they will demand a certificate that the wiring of their premises has been done in conformity with these rules before they pay their wiring bills. They can then show such certificate when wishing to place their insurance, or to renew or change their policies. This is the way to watch electricity as a cause of fire. Such watching no one can object to, and the more thoroughly it is done on these lines the better it will be for electricity. When this is done there will be no trouble whatever in procuring ample insurance from the strongest companies, and their premiums will soon settle down to the basis of legitimate profit on risks *wired as required by the rules of the National Electric Light Association.*

STAGE-REGULATING SWITCH.

The adoption of electric illumination in theatres and the consequent enhancement of the beauty of the scenic effects obtainable has become very general in this country. At first the effects were crude and inartistic, owing to the inefficient apparatus used for controlling the lights. A beautiful sunset effect would be spoiled by the dwindling of the rosy light by jerks, too perceptible to the audience not to cause laughable comment, and the opposite result occurred when the increasing light was supposed to represent a sunrise.

To obviate these objectionable features, the Edison General Electric Company has brought out a new stage-regulator switch by means of which graduations of light are obtained fine enough to satisfy even the most fastidious of stage managers. This switch, mounted on a slate base, consists of fifty clips arranged in a circle in four divided quadrants, with a four-armed contact passing over them, and engaging in a clip every quarter width of the clip.

Contact over the entire fifty clips is made by a movement of the switch-handle through an angle of 45° only, instead of through 120° as in all other stage regulators yet devised, and thus the speed of the operation is considerably increased. These switches are either directly mounted on the sides or the top of the fire-proof stage regulators, or are mounted separately upon a switchboard and connected with the regulators by means of regular fire-proof cables made up of the strands of the connecting wires. They can also be arranged in a special frame in such a manner that the handles can be worked separately, or connected together be all operated as one unit.



ORIGINAL STAGE-REGULATING SWITCH.

We show in the cuts the original type of stage-regulator switch with the semicircular row of clips, and for purposes of comparison, the improved switch with the circle of clips divided into four quadrants.

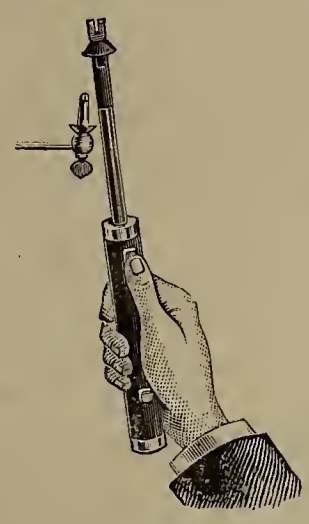
ELECTRICAL GAS LIGHTER.*

An electrical gas-lighter which is at once convenient, easily handled and reliable is a valuable piece of apparatus to have in the house or office, or in any other place where gas is used. The device illustrated herewith embodies all of these qualities, and is, besides, meritorious on account of the ingenuity of its construction and its small size.

This electrical gas-lighter has two cells of capsule battery and a spark coil within the handle. The spark coil is of peculiar construction and is designed expressly for use in this apparatus. In size it is 4¼ inches long by ¾ inch in diameter, and is claimed to be one of the smallest sizes ever made.

The capsule batteries made by this company are well-known for their small size and large current. They are of the "dry" class and they never polarize. Each cell has an E. M. F. of one volt, and delivers a current of 2.20 ampères.

This gas-lighter differs from the old gas-lighting apparatus in that it can be used in all kinds of weather, and its operation is not dependent upon the dryness of the atmosphere. In operating it the button is pushed forward, and this produces an instantaneous spark which ignites the gas in the usual manner. The lighter can be held in any position,



GAS-LIGHTER.

since it has a hood at the top of the extension-tube for the purpose of collecting escaping gas, so as to insure its ignition by the spark.

NOTES ON ELECTRO-MAGNETIC MACHINERY.*

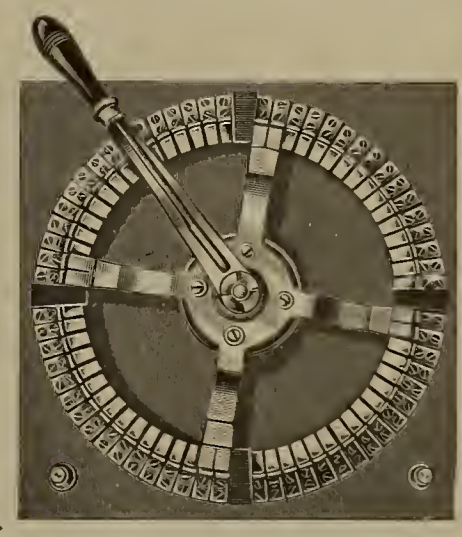
BY WM. S. ALDRICH, M.E.

The terms Machinery, Machines, Mechanisms are scarcely synonymous, though often so used. Early writers on the subject, among which the names of Monge, Carnot and Lanz are prominent, speak of mechanisms as means for altering or changing the direction of motion; such as the conversion of motion from continuous circular to reciprocating rectilinear motion. Ampère defined those mechanisms to be pure which consisted entirely of rigid bodies, limiting, as it were, the definition to the means by which the motion was produced or transferred; and he defines a machine to be "an instrument by the help of which the direction and velocity of a given motion can be altered." Willis, in his "Principles of Mechanism," follows closely, at first with a classification based on comparative motion, subordinating the means and modes of communication by which these motions were obtained; but, later, making the mode of communication primary and the comparative motion secondary in his classification of the elementary combinations of pure mechanism. Rankine, in his "Machinery and Millwork," adheres to Willis' later classification, but includes hydraulic connection as having a legitimate place among the means for the communication of motion in mechanisms. This marks a definite advance, for the means employed to communicate or transmit motion may be quite different, but the kinematic question remains the same—which is that of pure motion.

The Idea of the Kinematic Chain was brought out by Reuleaux, in his work on the "Kinematics of Machinery," as the next step in the development of the science of machinery. He thus defines a mechanism to be "a closed kinematic chain, which is compound or simple, and consists of pairs of elements; these carry the envelopes for the motion which the parts in contact must be given, and by these envelopes all other motions are prevented." The constrainment of motion now becomes a fundamental condition for every mechanism, and subordinates the mere question of directional-relation or of velocity-ratio, as determined by the comparative motion of any two points of the mechanism. A machine is a mechanism so operated as to do work, and is stated by Reuleaux to be "a combination of resistant bodies so arranged that by their means the mechanical forces of nature can be compelled to do work, accompanied by certain definite motions."

The Electro-Magnetic Connection of Moving Parts, in a mechanism or a machine followed naturally upon the inclusion of hydraulic and pneumatic modes of communicating motion. For development in any line becomes apparent when a general identity is to be seen through many special varieties. And, however varied may be the mechanical movements of any machinery, or however simple the relative motions amidst the complicated mechanism, the ultimate analysis shows simple, well-known motions, obtained by well-known pairs of elements and kinematic chains, whether such chains are composed entirely of rigid connecting elements, or of hydraulic, pneumatic or electro-magnetic connection. Seeing, therefore, that the time was ripe for another mode of connection in mechanism, and which should include the electro-magnetic forces of nature as "among the mechanical forces of nature [that] can be compelled to do work, accompanied by certain definite motions," Sylvanus P. Thompson has given us the term "Electro-Magnetic Mechanisms," and considered them somewhat at length in connection with his work on "The Electro-Magnet." It is my purpose in these papers to speak of these mechanisms when put to do work, as electro-magnetic machines; and the general term, electro-magnetic machinery, will include such mechanisms as may be more or less useful in the conversion of motion under constrainment, and such machines as may be useful in the direct transmission of energy—by electro-magnetic means.

The Medium for the Transmission of Energy may likewise serve, as it often does, as the means for communicating motion; and, when energy is transmitted along with the conversion or transfer of motion in any mechanism, that mechanism becomes a machine. Any medium, therefore, which is of such a nature as to admit of its being made a part or link in the mechanism of the energy cycle, will serve, in almost all cases, equally well for the transmission of energy or of motion; provided, that notwithstanding the deformations to which it may be subjected, the medium is capable of returning to its original condition. Some mediums or links are practically incompressible and inextensible, within the usual limits of the transmitted energy; such as iron rods, retaining their form throughout; and a water connection, which retains its volume while altering its volume-form. Other mediums admit of practical extension, but are of little use in compression; such as belts, wire ropes and like flectional elements used as wrapping connectors in mechanism. Compressed air, springs and like flectional elements admit of practical extension and compression, and are of more or less value in the transmission of energy; but of little use as elements or links of a kinematic chain for constrained motion. In all of these energy is transferred by and through matter in some one of its many forms—matter which follows the laws of the continuity of matter and of space, while entering as a medium in the continuity of energy.



NEW QUADRANT SWITCH.

Systems for the Transmission of Energy have therefore become quite definitely established, for long or short distances, and have taken the following broad lines of development:

(1) Mechanical transmission, by belts, wire ropes and other wrapping connectors for long or short distances; and by gear-wheels, links, screws, cams, ratchets and like forms, for more immediate and direct transmission.

(2) Hydraulic transmission, with pumps, accumulators, connections, motors and presses, more or less varied in form for utilizing water-pressure.

(3) Pneumatic transmission, with the compressors and apparatus especially adapted to that medium.

(4) Electric transmission, with dynamos, line connections, regulators and motors, and chiefly used in long-distance transmission.

It is proposed to add:

(5) Electro-magnetic transmission* in which the dynamo and motor, as generator and receiver, or as driver and follower, shall be in the same magnetic circuit; or in which the magnetic circuit shall be used for direct and immediate distribution of energy for very short-distance transmission, in much the same way as the electric circuit is even now used for long-distance transmission.

The Ether as the Medium for the Transfer of Energy, by electric or electro-magnetic means, has

* Read at the meeting of the Electrical Section, Franklin Institute, Philadelphia, held December 1, 1891.

* Paper read before the Electric Club of the Johns Hopkins University, November 9, 1891, on "Notes on Electro-Magnetic Transmission of Energy."

been found to possess many striking analogies to other and better-known mediums. By the modern theory of electricity, the electric energy is supposed to be concentrated in the ether surrounding the conductor, or other core of disturbance, and that a transfer of the ether energy takes place whenever electric energy is being transmitted from point to point. However great may be the contrast between the mechanical, hydraulic and pneumatic transmission of energy and the *etheric* transmission, it remains a fact that energy may be transmitted by all of these means, with varying degrees of efficiency, and accompanied, if desired, by definite conversion of motion. The former three require some material connecting-link between driver and follower—some kind of contact of elements, or some paring of surfaces—while the etheric transmission requires no such material contact or paring; indeed, such contact may kinematically lock the whole mechanism, as an armature, in contact with its core in some special forms of this type of electro-magnetic mechanisms. The ether medium allows of the transmission of constant or varying forces, as now transmitted by more material modes of connection; and with the peculiarities of comparative and constrained motion accompanying such energy transmission. By the displacement theory, electricity seems to act as an incompressible fluid. By the researches of Hertz, the ether appears to be possessed of some peculiar mechanical properties, such as inertia, and stress and strain manifestations. We have even come to conceive of the mechanism of the ether medium and to picture some of the peculiar manifestations of the ether mechanism as analogous to gear-wheel mechanism.

CORRESPONDENCE.

PRIMARY BATTERIES.

Editor Electrical Age:

In my former communications to the Electrical Age upon the subject of primary batteries of strong and constant current, I endeavored to point out some prevailing errors in their construction and the necessity of using mechanical means in part to depolarize the battery in order that the cost of maintenance should not be too great to admit of their use in fields where they are much needed, such as operating motors for the propulsion of various kinds of light machinery. I wish in this article to describe a battery that can be adapted to operating sewing-machines and ventilating fans. In the first place a sewing-machine battery should be contained in a case not exceeding 12 x 7 x 9 inches, containing three cells of high E. M. F. and perfectly depolarized by means that would make the service cost not to exceed 10 cents per day for ordinary continuous work. For usual family work two cells will do the work well.

In this statement I have in view motors like the Perret, the "C. & C." and others like them, wound for from 4 to 10 volts.

For so compact a form the cells would, of course, need to be rectangular which, for many other reasons, is the preferable form. The battery should be free from local or wasteful action when standing on open circuit even for long periods, at least for weeks, and not lose its energy, but be ready for work at all times.

I am aware that many persons are ready to affirm that a primary battery of the kind under consideration is impossible—a battery of high E. M. F., as it must needs be, to do the work with the number of cells named above. I will here call the attention to an opinion extensively entertained even now by many who should have learned better by this time; it is this, that a porous cup on a battery, if its porosity be reduced to such a degree as to be efficient for the work for which it is designed, will so largely increase the internal resistance of the battery that only a small delivery of current can be obtained, and they are thus rendered useless for the propulsion of motors and other work requiring large current. Here is certainly a very strange error and most obstinately adhered to and announced oracularly, and with such assurance as would frighten an ordinary mortal from stating the contrary. Niaudet states the result of several experiments upon this subject and notices the ordinary opinion concerning the same which has now become antiquated. This is what he says: "All this would lead to the belief that the choice of porous jars had great influence upon the intensity of the current by changing the internal resistance of the cell." The results of several experiments show, however, that jars of different states of porosity can change *but slightly* the resistance of the cells.

It is a fact that the battery that to-day in this city is capable of delivering the greatest current continuously is a porous-cell battery, dimensions being equal. Very low internal resistance is attained, and so slight is the porosity that there is no mingling of the liquids while on open circuit that causes any waste of zinc.

Whether a porous-cell battery "is entirely worthless for work on external circuits of low resistance, such as motors," let practical results decide. Three cells of dimensions as follows will operate a sewing-machine well, 3¾ x 7 x 7 inches deep, weight when charged, 12 pounds.

The battery without porous cell, for which high claims are made, requires *ten cells* to do the same work, as is stated in the illustrated catalogue of the manufacturers. Of the comparative *expense* of maintaining, I will say and will prove (if desired) the odds are *very largely* in favor of the said porous-cell battery, as well as the work of caring for it.

We repeat here what we said in a former paper, that very low E. M. F. is a fatal defect in a battery for operating motors, it necessitating the great increase in the number of cells it is rendered *too costly*. It is not likely, Mr. Editor, that I shall have occasion to ask any further use of your columns to discuss the subject that has been our pleasure to offer a few thoughts upon on several occasions. My object has been to make known some things in regard to primary batteries which I had learned by long study and work in improving their usefulness. I have carefully avoided misleading your readers in any statements that I should make.

I have worked *years* in this department of electric improvement; have studied every battery patented in this country and Europe with a view to accomplishing what all authorities agreed were possibilities; and the lines upon which improvement must come are happily indicated by the following passage from Niaudet and Prof. Crocker. Niaudet remarks as follows: "The most important improvements in batteries are those which have had in view the diminution or suppression of polarization. * * *

The principal aim and efforts of inventors worthy of that name has been to depolarize the electrode." Prof. Crocker says, in reference to the whole matter of battery electricity: "The fault is in the apparatus." To improve the "apparatus" and to suppress polarization has been my whole aim and effort.

After working now five full years without giving a thought or an effort to anything else as an occupation, I am more than satisfied with results achieved.

I have not forced myself upon the attention of the public; have steadily refused to do so until all that I thought possible had been accomplished in this department of electric work, so that some persons may be measurably excused for not knowing what has been accomplished but not published. D. N. K.

New York, March 25, 1892.

SINGLE MOTORS FOR CARS.*

BY E. A. SPERRY.

I have been deeply interested in the consideration of car equipment where a single motor has been employed. It has seemed to me from the earliest that a single motor was by all means the best; that it was by far better to employ a single motor where possible, and dispense with the complications involved in using two. There is certainly no trouble in obtaining power enough in one, but inasmuch as it has been suggested by some one that the car equipments had been designed in some instances by the so-called electricians rather than by the mechanical engineer, the mechanical difficulties encountered in transmitting the power after it has been generated, and distributing it to the traction-wheels of the car, have stood in the way of employing one motor rather than two. Not only have I believed in the employment of a single motor for car equipment, but I have undertaken to put my ideas into practical form. For instance, I have employed a single motor for two wheels upon a car, four wheels, six wheels and eight wheels; and these not on models but upon full-grown, full-sized car equipments. Some eight-wheel car equipments which I have been engaged upon have weighed as high as 12 tons, and have been employed on very heavy grades. These equipments have required different powers of motors. For instance, on an equipment of this class—that is, single-motor car equipments—I have installed motors as high as 125 horse-power, in those cases running eight wheels. This principle in operation has been very satisfactory—very much so indeed. These equipments have been used on tracks with heavy grades and in severe service in the way of railway crossings and numerous frogs, and in the heavier motors have been used on extremely sharp curves—that is, curves of low radius; and where employed as locomotives, they have been attached to very heavy trains and have succeeded in doing the work for which they were assigned; in most instances they have been enabled to do a great deal more work than it was at first supposed they were capable.

I am a firm believer in the single source of power and a system of distribution for that power to the various wheels of the car.

The points I will consider in connection with this matter may be stated briefly as follows: A single motor for car equipment is the better, or the best form, from the fact that it is simpler, less expensive, it has a lighter weight, has a higher efficiency, and it has higher efficiency of transmission after the power is generated; it is more economical of current in other ways, as we will see; more economical of repairs; it can be made to give us more traction, and a single motor permits of more elaborate construction to adapt the motor and gearing to the requirements of service.

As to the first point, that it is simpler. One motor is simpler than two, having one armature, which is

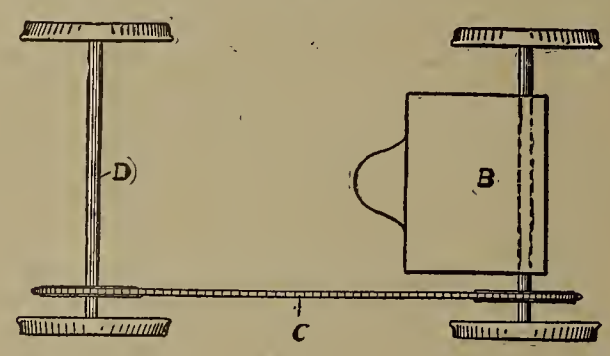


FIG. 1.

the bane of a great many electrical railroads; employing but one set of commutator-brushes, and where the motor is geared to the tractive elements of the combination by a single-reduction gearing, there are less journals, less parts, and taken from every standpoint the equipment is simpler.

The point of its being less expensive is one which needs no elaboration. It will readily be understood that for a given potential a larger motor has less windings upon it and is of quite a little less weight for a given capacity. The windings, for instance, in a 50 horse-power motor need only be about half what it is in a 20 horse-power motor, and we all know that the element of time, especially where expert workmen are employed in the construction of any device, is the feature that very largely controls in the computation of the total cost of the articles, and where fewer convolutions and parts are required for the same power, of course considerable can be saved in the equipment.

That the equipment is lighter in weight I have had ample opportunity to observe from the fact that I have seen equipments operated side by side, and have investigated as to the weight of single-reduction and double-reduction equipment, where one motor

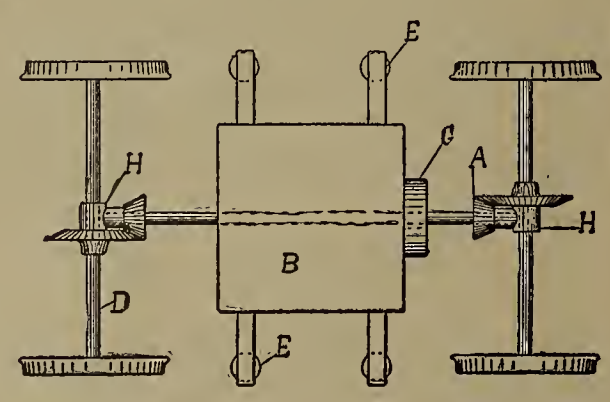

FIG. 2.

and where two are employed, and know that the saving where single-motor equipment was employed is between 1,800 and 2,200 pounds.

This factor is one of importance, inasmuch as it has to deal with the wear and tear upon the road-bed and the total amount of power required by the equipment, especially the total amount of dead weight to be pulled about for a certain carrying capacity in live load. For instance, take an extreme case like the Pike's Peak Railroad. There they have an equipment which weighs about 37 tons. The total capacity of that equipment in live load is somewhere between three and four tons weight—that is, the paying load is between three or four tons for hauling 37 tons. In electric street-car service, especially where the roads are comparatively level, the

* Abstract of paper read before the Chicago Electric Club, March 21, 1892.

paying weight can be greatly increased as compared with the total weight of equipment. This can be accomplished to the greatest extent where a single light-motor may be employed to develop the traction. It may be stated that in the distribution of this weight (suppose we consider a single motor for car equipment as compared with two motors, each hung upon the axle), where two motors are employed, it is usually customary to hang them directly upon the axle, and the consequence is that in some instances it springs the axle. I came across an instance of this kind recently, and there are numerous instances of the sort. I enquired the size of the axle. I said: "Your axle must be extremely small if the weight of the motor is sufficient to spring it." The means of its measurement not being at hand, we, however, found a wheel that had come off of the axle, and measured the bore, and it was a standard $3\frac{1}{4}''$ steel axle that had been sprung by the hammering action of the motor mounted upon it. The axles are much more readily crystallized when carrying this weight, and, as is well known, the road-bed suffers materially, which is a question of great importance—the one that is being talked of and investigated very extensively at the present moment. It is a question that has seemed to dawn on the street-railway people all over the country almost within the last six months, and extreme measures are now being employed to obviate it. They are trying to overcome this bad effect in a number of ways, some of which seem to promise good results.

Now there are two methods in which a single motor may be employed. Let us consider B the motor in Fig. 1, in this case mounted directly upon the axle, its end being supported in any of the usual ways, elastic or otherwise. In that case the power from a single motor may be transmitted by gearing or by a sprocket-chain C to the other axle, letting the dotted line indicate the sprocket-chain. That method was one of the first used by Mr. Van Depoele—the sad news of whose decease has just reached us—and we are all affected with the same feeling of sorrow that so prominent an engineer has passed away. This form of transmission was used at a very early date by Mr. Van Depoele. He placed the motor on the front platform of the car and then transmitted the power back through counter-shafting, first using gearing and then transmitting to one axle by a chain. In numerous instances in Ohio chains were used between two axles, so as to transmit the power to all the axles, thus getting the benefit of all the adhesion. This idea of using a sprocket-chain, while it was one of the first used, has never proven successful, from the fact that wherever in engineering a sprocket-chain is used it requires that the centres shall be adjustable. The distance between the axles in all cases should be capable of adjustment. Of course it is possible in some instances to use a sprocket-chain with an idler, but in that instance it must be a "face-wheel" in almost every case. But in the case here our wheels are small as compared to the distance; the idler brings the chains too near together, and the greatest adjustment possible is very small, and has never been found available. The idea of making both, or one of the axles adjustable with reference to the other, was thought at first not to be good engineering. The proof of this, of course, would be in equipping a car in this manner and watch the operation. I have done this and can report, after some months of use, that there seems to be no trouble at all in allowing one axle of a truck to be adjustable. The main difficulty encountered at first was the fact that sometimes one end would be adjusted further than the other. I found that a very simple expedient to remedy that was to provide a small scale attached to the stationary part of the truck, with a little pointer fastened to the movable pedestal box, and whenever it was adjusted, the pointer would move along the scale, indicating whether the two sides were alike, so that the two axles would not be at an angle.

The other system may be diagrammatically illustrated as in Fig. 2. Suppose B to be a motor, a bevel-pinion shaft connected therewith, and a bevel gear to be attached to each axle as shown. The bevel gear on one axle should be in the opposite position to that on the other, so that all the wheels will move in the same direction. It has been thought by some that the use of bevel gearing is objectionable. It has been thought that a bevel gear will not run on pitch lines. A bevel gear I have found by actual tests to be more delicate than a spur gear. A spur gear is one where the teeth are parallel to the axis of the rotation. I find, however, this fact: that when the pinion in any bevel-gear combination is held so that its lines can be maintained, and maintained in an extremely rigid manner, so that "against all comers" these lines are made to meet exactly at a point of coincidence of the pitch lines and cones, there is no friction of the bevel, even though it is a rough casting, no more than there is in spur gearing under similar conditions.

ELECTRICAL EXHIBITS AT THE WORLD'S FAIR.

The Department of Electricity of the World's Columbian Exposition, of which Mr. John P. Barrett is chief, is mailing to prospective exhibitors a pamphlet containing classification, rules and regulations and other information concerning the intentions of the department. Mr. Barrett has decided to immediately begin the assignment of space, and those who have not already made application should do so at once.

The scope of the department, as set forth in the pamphlet, probably will be of interest to our readers at this time. It is as follows:

"The primary object of the Electrical Department is the demonstration in actual operation of the commercial and economic applications of electricity. It is desired moreover to make exhaustive tests of electrical apparatus in all possible directions with a view to establish the actual efficiency of the same in comparison with other and older methods of accomplishment.

"In addition to these practical features, it is contemplated to present object lessons of interest and instruction, showing the development of the science from its formative or initiatory state to the present time. The accomplishment of this object will take the form of an historical exhibit embodying models, drawings and crude machinery made and used by pioneers in the science. It is the earnest desire of the department to make a full and connected showing in this direction, and the co-operation of all who are interested in the work of the department is solicited.

"Reverting for a brief space to the practical features of the exhibition, a few of the more pressing applications of electricity may be mentioned, in which directions special facilities will be required, and in which an endeavor will be made to meet the requirement.

ELECTRIC LIGHTING.

"The buildings and grounds of the Exposition will be lighted by electricity. It has been estimated that about 8,000 arc lamps of 2,000 candle-power and about 130,000 incandescent lamps of sixteen candle-power will be required. Besides this, from 3,000 to 3,500 horse-power will be required for the operation of the machinery of exhibitors. To furnish and transmit this 24,000 horse-power, the Exposition Company will construct a plant which, though a complete station in itself, will be composed of a number of smaller complete plants installed by those who contract to furnish certain parts of the service. These plants will be primarily for the service of the Exposition, but are not for that reason prohibited from becoming competitive exhibits as well, provided the usual course is taken by their owners of making the proper application as exhibitors, through the office of the Director-General.

ELECTRIC RAILWAYS.

"An intermural railway of five miles in extent, for transporting passengers about the grounds, will be arranged for as part of the service of the Exposition, and, though the question has not been definitely settled, it is expected that electric power will be the operating force.

"In addition to this road, it is contemplated to make provision for the exhibition of electric-motor cars in operation. The necessary space for this purpose has not been located as yet, but exhibitors may feel assured their interests in this behalf are fully appreciated, and will be given proper consideration in ample time to allow all necessary arrangements.

MINING AND MILLING WORK.

"Preparations are being made for the exhibition of motors and other electric machinery, to fully illustrate the possibilities of the science in the direction of mining and milling, the long-distance transmission of power for mining operations and the various applications of the power at the point of usefulness.

METAL-WORK.

"Reducing, refining, separating, welding and shaping metals and all kinds of electro-metal work will be the features of the exibition of this department, and all possible facilities will be furnished exhibitors in this field.

ARTISTIC EFFECTS.

"Art in electricity is becoming popular, and an endeavor will be made to show the newest and most approved fixtures for lighting, as well as the many systems of stage and auditorium lighting, the lighting of art-galleries, etc. Small chambers, illustrating various effects promise to be popular with exhibitors, and all proper aid will be extended by the department looking to the best possible result as well as to the exhibit generally as to the individual exhibitor.

INSULATION WORK.

"Wiring, underground and overhead systems of construction, interior insulation, conduit construction, etc., promise to be greatly benefited by carefully-installed exhibits, showing development in these directions, and exhibitors will be given opportunity for thorough tests of their apparatus."

The chief of the department will be glad to furnish special information to those interested and invites correspondence.

ELECTRICAL SOCIETIES.

NEW YORK ELECTRICAL SOCIETY.

At the meeting of the New York Electrical Society in Prof. Chandler's room, Columbia College, Forty-ninth street, on March 25, a good-sized audience was present.

Prof. F. B. Crocker gave a lecture on electrical measuring instruments, and on the counter before him was an example of almost every class of instruments of this character used. He could not go into details concerning every instrument, there were so many things involved. The Weston instruments alone were well worthy the study of months and even of years. There were, however, general characteristics and facts about electrical instruments which would receive his attention.

Prof. Crocker referred briefly to the fundamental and derived electrical units, and also to Ohm's law. While on the subject of units he referred to the error made by the British Association in determining the value of the unit of resistance—the ohm. The B. A. unit, he said, was equal to .9866 the absolute unit, the error amounting to $1\frac{1}{3}$ per cent.

For accuracy he thought the Weston instruments superior, and preferred them or the Thomson balance to the tangent galvanometer for measuring.

Referring to the results of Tesla's experiments, Prof. Crocker stated that the real effect was electrodynamic in its nature, not electrostatic.

The speaker then briefly described the various instruments and the principles upon which they were constructed, and pointed out their advantages and disadvantages.

The lecture throughout was exceedingly interesting, and was listened to very attentively by the audience. Prof. Crocker handled the subject in a way that showed his complete familiarity with the principles and practice of electrical measurements.

GROUNDING ELECTRIC WIRES.

At a special meeting of the New York Board of Fire Underwriters, held March 10, the chairman of the committee on police and origin of fires, after verbally reporting the results of the committee in reference to their investigations into the dangers from grounding electric wires, offered the following resolutions for adoption:

"*Resolved*, That the committee on police and origin of fires be and they are hereby directed to require all electric companies furnishing current for power and lights (to parties that have received certificates of approval of electric equipments from this board), to make regular weekly reports of the tests of their currents, as called for in the requirements of this board, and in the event of failure on the part of the electric companies so to do, then the superintendent of the survey department is hereby directed to decline to grant certificates, or make inspections of equipments supplied with current by said delinquent companies, and further

"*Resolved*, That said committee give notice to all electric companies receiving certificates from this board, that the intentional grounding of any portion of the equipments is a violation of the rules of this board, and such practice must be discontinued. This board will refuse certificates of approval to all companies who do not comply with this rule, and further

"*Resolved*, That the committee require of electric companies that all grounds now existing on electric circuits shall be removed on or before Oct. 1, 1892."

Action will be taken on these resolutions at the next meeting of the board.

THE CHOICE OF A DYNAMO.*

TRANSLATED FOR THE "ELECTRICAL AGE" BY N. B. G.

Before construction every electrical plant, in order to act regularly and economically, should be studied attentively in all the details of the material employed.

In view of these facts it is necessary that the electrician in charge be familiar with all practical details.

As a necessary preliminary in the judicious choice of a dynamo, one of the most important points to be considered is the work which it will be required to do. We find in an article by Prof. E. P. Roberts, published in a late issue of the *Journal of the Association of Engineering Societies*, several statements which should guide the electrician in the choice of a dynamo. We will give here a summary of the numerous practical hints embraced in his work, as to certain points, and the article in full as to others.

It is indispensable in the critical examination of any dynamo that each of the parts be examined as well from a mechanical as an electrical point of view.

MECHANICAL PART.

From a mechanical point of view, the manner of construction, bearings and rotary portion should be successively examined.

Framework Construction. — The construction should be sufficiently rigid and of a form to allow free access to the commutator and brushes either for the purposes of cleaning or adjusting. It should be placed on a solid foundation and in such a manner as to reduce the centre of gravity of the movable parts (the inducer or inductor according to the type of dynamo). It is equally necessary that it permit of easy and quick repairs of all the parts exposed to constant usage or considerable mechanical effort.

Bearings.—The bearings should be of sufficient surface, easily replaced and lubricated; they should also be placed in such a manner as to prevent the lubricant from running along the shaft or dropping upon parts other than those for which it is intended, and thereby preventing a collection of dirt which would be detrimental to the machine, and further, it would cause metallic dust to enter into the joints of the machine and cause electrical derangements. The waste oil can be filtered in machines specially made or mixed with fresh oil and used again profitably.

Rotary Part.—The rotary part of the dynamo (inducer or inductor) should be solidly affixed to the shaft, and preferably keyed. The shaft should be light, strong and perfectly true, as otherwise it would result in augmenting the friction, and perhaps cause heating, thereby producing a strain on the machine. The pulley of the dynamo should be of a diameter in proportion to the mean linear speed at which the belt is to be run. It is also necessary that the movable part should be perfectly round and the centre of gravity on the axis of the shaft, otherwise vibrations are inevitable.

The disposition of the mechanical parts of the dynamo should be such as to insure the necessary rigidity of all the parts that the electrical currents be given out with regularity; for example, where the inducer is run at a high speed it is indispensable that the wires should be solidly wound and the connections firmly made, otherwise there will be danger of distension on account of the tangential force produced by the fields.

ELECTRICAL PART.

Commercial Value.—The commercial value of a dynamo is fixed by the relation existing between the electrical energy furnished and the mechanical energy absorbed.

The mechanical energy absorbed is easily determined with a dynamometer of transmission placed between the motor and the dynamo. To measure the electrical energy produced it is sufficient to determine, first, the difference of the potential in the exterior circuit with the aid of a voltmeter; second, the amount of current in the same circuit with the aid of an ampèremeter. The two values thus obtained, multiplied by each other, give the value of the electrical energy furnished, in watts, the product thus obtained, divided by 745, gives the same energy in horse-power, since 1 horse-power equals 745 watts. Given on the one hand the electrical energy produced and on the other hand the mechanical energy absorbed, the result will be the commercial value of the dynamo. It is equally necessary to have a dynamo that gives a high yield, whether going at a full or fractional rate of speed.

Practical Yield.—The practical yield can be ascertained by the relation which exists between the electrical energy furnished and the purchase price of the dynamo, cost of the motive force and all other expenses for improvements—in other words the yield in watts per dollar expended.

In the expense for improvements, those relating to the maintenance and repair of the dynamo should be included. It is difficult to determine these expenses precisely, but inasmuch as the dynamo will be kept in good condition and cut-outs placed where necessary to prevent accidents, or in case of aërial lines protection to the line by the use of good lightning-arresters, the repairs will be unimportant and will not amount to more than 2 % of the purchase price, otherwise the figures may be much larger, even reaching to the extent of replacing the dynamo in a short time.

The yield in watts by total kilogrammes of weight, by square meters of surface occupied, and, in certain special cases, as on board ship for example, by cubic meters of space, is generally of secondary importance although it may sometimes be necessary to keep an account of it.

It is well known that a large dynamo costs less and occupies less space per watt furnished than the equivalent in small ones.

Heating.—It is indispensable to take an account of the augmentation of temperature produced by action of the dynamo. When the parts are considerably heated the insulation might become carbonized, rendering the wires very weak and the insulation defective. After running at full speed for some time the temperature should not rise to more than 70° in the inducer and from 50° to 60° in the inductor. These limits are often passed, but it is not prudent.*

When the winding is of a considerable thickness the outside layers are always cooler than the internal ones.

We should not lose sight of the fact that the outside layers of an armature will always be cooler during the time it is in motion than immediately after stopping, because the cooling is less rapid when it is stopped than during the time it is revolving, for the reason that the cool air is not renewed as quickly, nor should we be astonished that the temperature of the outside layers rises gradually to the same degree of heat as the inner layers as soon as the machine is stopped.

The temperature of an inducer can be ascertained with sufficient practical precision by placing on it a thermometer as soon as it is stopped and covering it up with a woollen cloth.

Sparks from the Brushes.—The manner in which the commutator and brushes act is an important point in determining the electrical action of a dynamo. When the dynamo is of the open-coil type—that is to say, when an elementary coil may, during certain times, be out of circuit and which should give a current of feeble intensity and great electro-motive force—sparks will be produced sufficient to damage the commutator.

On the contrary, when the coils of a dynamo are closed and also those which are intended to produce a current of great intensity it is necessary that the production of sparks be minimized.

Brushes and Commutator.—Following the conditions of action found in the dynamo, we will know if it is necessary to modify frequently the wedging of the brushes to conform to the variations of the charge.

In cases where frequent adjustment is necessary it is advisable to learn whether it is more advantageous to adjust by hand or automatically.

In important stations it is preferable to adjust automatically to minimize complications and prevent loss of energy, so that the advantages obtained will be more in accord with the expense incurred, and the necessary complications might at times be causes of troublesome derangements and require the presence of a skilled mechanic.

The commutator should present a smooth and uniform surface.

The peripheral speed should be sufficiently moderated to prevent too great heating due to friction, and the pressure of the brushes should not be too great for the same reason.

The brushes should at the same time be sufficiently tight to insure perfect contact with the commutator and to remain always perfectly flat on the fixed conductor, for that reason it is necessary that the brushes be connected with substances of great conductivity and that the brush-holders be as near the commutator as possible. Brushes and brush-holders should always be in a certain degree elastic.

In some dynamos the brushes rest tangentially on the commutator, but more often they are applied obliquely. When the brushes are well fixed in the brush-holders we should see that they rest uniformly on the commutator and that they are maintained solidly so as not to suffer from a change of position. The brush-holders should be sufficiently accurate and elastic to insure perfect contact with a minimum amount of friction. We should insist on this point.

In machines intended to give currents of great intensity, it is preferable that there should be on each side two or several brushes instead of a single one. In effect, the electrical resistance finds itself sufficiently reduced, owing to the augmentation of the surface of contact between the brushes and the commutator, and imperfect action of the dynamo is to be attributed more to bad adjustment of the brushes than to the speed of the dynamo. When there are several brushes used we should see to it that all of them are suitably fixed side by side so as to be placed on the commutator, as one brush, evenly. Sometimes it is preferable to have the brushes one in front of the other.

Carbon brushes are at times more desirable than copper ones, because they require less attention than the latter. They present also the advantage of suppressing sparks due to the short circuits in the armature when the brushes touch two contiguous segments of the commutator.

The same brush-holders can be used for carbon brushes as are used for copper ones, but special brush-holders should be used.

Isolation of the Dynamo.—It is indispensably necessary that the circuit be well insulated from the metallic portion of the dynamo. During the action of the machine it can be roughly ascertained if the insulation is bad. For this purpose it is sufficient to touch with moistened hands a part of the pedestal not covered with paint and well cleaned and one of the binding posts, when no appreciable shock will be felt. The operation can also be repeated with a copper wire by uniting the binding post to the frame which should produce no spark. The isolation of a machine should generally not be less than 100 ohms per volt developed at the posts when the dynamo is at normal speed in a dry place.

Verificatian of the Dynamo in Point of View of the Usage to which it is to be Put.—The best way to ascertain if a given dynamo comes up to the demands of the service intended is to run it at a normal speed indicated by the constructor, and at full charge. Then running at different speeds, increase in each case the difference between the potential and the volume of the current, the electrical energy developed being absorbed by appropriate resistances. We will then have the elements of the known curves under the name of "characteristics," which are to the dynamo what diagram indicators are to steam-engines. In these trials it is well to verify the effect produced by a slight displacement of the brushes.

* J. A. Montpelier in *L'Electricien*.

* A machine attains the temperature mentioned when the quantity of heat it loses by radiation has become equal to the quantity of heat developed in the parts mentioned.

THE VACUUM IN LAMP BULBS.

BY THOMAS R. TALTAVALL.

One of the most interesting stages in the progress of the manufacture of incandescent lamps is the exhaustion of air from the bulbs, and the life of the lamp depends more upon the success of this part of the work than anything else.

Human beings cannot live without air, but electric-lamp filaments cannot live with air—the oxygen in the air which is so essential to the support of animal life is fatal to the life of an incandescent lamp filament. The carbon of the filament oxidizes very readily when heated in the air, and for this reason it is necessary to confine it within a bulb from which the air has been exhausted.

The exhaustion of air from lamp bulbs is accomplished by means of vacuum pumps, and it must be conducted with great care, as it is at this stage of lamp-making where the greatest difficulties are met. Mercurial pumps are used for the exhaustion of air, among the best known of which are the Sprengel and Geissler. Mechanical pumps are usually employed to hasten the process in its first stages, mercurial pumps being afterwards used to complete the work. The mechanical pump cannot produce as high a vacuum as is necessary for lamps, while the mercurial pump can produce a higher one than needed.

A word about the mercurial pumps will be of interest.

The Geissler mercurial pump is a modification of the apparatus used by Torricelli in his experiments which led to the invention of the barometer, the space between the top of the column of mercury in the barometer tube and the top of the tube itself being called a Torricellian vacuum. The Sprengel pump is somewhat simpler than the one just referred to, and is thought by many of those who have used both to be capable of producing a more refined vacuum.

To give a general description of the action of these pumps in practical operation, it may be said that the bulbs to be exhausted of air are connected with that portion of the tube containing the mercury where the vacuum exists, and then in creating the vacuum the air contained in the bulb is carried off with that in the tube. When the proper degree of exhaustion has been attained the bulb is melted off

at the neck by a glass-blower and the lamp is then ready to be finished.

The process of exhausting the air from lamp bulbs is similar to driving a swarm of flies out of a room. It is a comparatively easy matter to get a large number of them out, but when few remain the hard work begins. So it is with the air in the bulbs. It is easy enough to get most of it out; the hard labor comes when we get to the last of it.

After the air has been sufficiently exhausted from a bulb there remains less than one-millionth part of the original quantity.

RAPID TRANSIT.

Lessons from the Census.*

BY CARROLL D. WRIGHT, A.M.

It is to be hoped that the complete statistics relating to rapid transit in cities will enable the public to determine, with reasonable accuracy, the relative economy of the different powers used. This is a question which is vital to the interest of city and suburban communities, and which leads to the ethical consideration of the problem of rapid transit. That power must eventually be used by which passengers can be transported from their homes to their places of business and return at the least possible expense and the greatest possible safety commensurate with high speed.

The necessity of living in sanitary localities, in moral and well-regulated communities, where children can have all the advantages of church and school, of light and air, becomes more and more evident as municipal governments undertake to solve the problems that are pressing upon them. If it be desirable to distribute the population of congested districts through country districts, means must be provided for safe, rapid and cheap transit to the country districts; or inversely, if it be desirable to build up the suburban areas, the people must be supplied with cheap and convenient means of reaching the localities within which they earn their living.

The reduction of fares, through improved means of rapid transit, however desirable, is really a minor question. It is probably true that by a slight reduction from a five-cent fare the head of a family engaged in mechanical labor, earning perhaps five or six hundred dollars per annum, might save enough to pay taxes, or to offset church and society assessments, or to furnish his family with boots and shoes, in any event extending his power *pro tanto* for the elevation of his family; but he does more than this when speed is taken into consideration. By the old methods of transit from suburbs to the heart of a city, a workingman going into the city of Boston was practically obliged, while working ten hours at his usual occupation, to spend an hour on the horse railway, when now, on one line, by the use of the electric car, he can go to and return from his place of work in half that time, thereby actually adding to his own time half an hour each day, practically reducing his working time from eleven hours to ten and a half hours without reduction of wages and without increased expense for transportation. The question of rapid transit, therefore, as seen by this simple illustration, becomes an ethical consideration; for if there is anything to be gained by adding to the time which men have at their disposal for their own purposes, for intercourse with their families, for social improvement, for everything for which leisure is supposed to be used, then the question of rapid transit is one of far greater importance than that of saving money either to the man who uses transportation or to the company that secures dividends upon its stock. I believe, therefore, that all efforts that are being made to secure convenient and cheap rapid transit in great cities are those which should bring to their support the help of all men who are seeking the improvement of the condition of the masses.

* Abstract from *Popular Science Monthly*, April, 1892.

ANOTHER ELECTRICAL EXECUTION.

Jeremiah Cotto, an Italian murderer, was executed by electricity at Sing-Sing prison, on Monday, March 28.

SHORT RAILWAY EQUIPMENT.

The Short Electric Railway Company announces for February business, orders for original equipment or for additional apparatus from: Beatrice Rapid Transit & Power Company, Beatrice, Neb.; Janesville Street Railway Company, Janesville, Wis.; The Spokane and Montrose Motor Railroad Company, Spokane Falls, Wash.; The Bloomington City Electric Railway Company, Bloomington, Ill.; The East Liverpool & Wellsville Street Railroad Company, East Liverpool, Ohio; The Braddock Electric Railway Company, Braddock, Pa.; The Georgetown and Tenallytown Railway Company, Washington, D. C.; The West End Street Railway Company, Rockford, Ill.; The Jamestown Street Railway Company, Jamestown, N. Y.; The South Covington and Cincinnati Street Railway Company, Cincinnati, Ohio; The Lincoln Street Railway Company, Lincoln, Neb.

The Short Electric Railway Co. announce recent sales to The Braddock Electric Railway Co., Braddock, Pa.; The Union Passenger Railway Co., Chester, Pa.; The Ft. Wayne Electric Railway Co., Ft. Wayne, Ind.; The Schuylkill Electric Railway Co., Pottsville, Pa.

NEW BOOKS.

The bound volume of the *Transactions of the American Institute of Electrical Engineers* for the year 1891, a copy of which we have just received, is a work of great value. The papers read during the year were of extraordinary high character, and the discussions of each developed much additional and valuable information, all of which this book contains.

The volume is gotten up with great taste; the type is clear, the paper of excellent quality and the bindery neat and substantial. An excellent steel engraving of Prof. Elihu Thomson composes the frontispiece.

KILLED BY BANDITS.

Information has been received from Massowah, the Italian colony on the African coast of the Red Sea, that Captain Bettini, an Italian officer, was killed by bandits while returning to Fort Azjohannes. Captain Bettini was a brother of Lieut. Gianni Bettini, the inventor of the micro-phonograph, which instrument was described and illustrated in last week's Electrical Age.

REPORTER'S OUTFIT.

This consists of a box small enough to place in one's inside coat-pocket, containing 4 capsule batteries; a silk cord is attached thereto and connects with a reflector worn as a watch charm. Inside this reflector is a $\frac{1}{2}$ C. P. lamp which can be lighted by turning on a small switch attached to the battery-box. This outfit can be utilized to great advantage by a reporter in writing notes in situations where there is an absence of light, such as in dark streets at night, etc.

These outfits are made by the Nassau Electrical Company, White and Centre streets, New York City.

NEW INCANDESCENT LAMP.

E. W. Applegate, of the Western Union Telegraph Company, Omaha, Neb., has invented a new and valuable incandescent lamp. In this lamp the use of platinum is entirely done away with, and any metal may be used as leading-in wires; the removable head can be lifted out and a broken or burned-out filament replaced and no part of the lamp destroyed. The lamp has no metal in its construction other than the leading-in wires, and the material used is indestructible with the exception of the glass bulb. An advantageous and novel method is employed in exhausting the air from the bulb. Mr. Applegate has also a filament which will soon be ready for the market. This filament is strong and durable, giving more candle-power on a less voltage, and t is claimed the length of life will be double that of any now in use. It is understood that a company will be formed for the introduction of Mr. Applegate's inventions.

NEW YORK NOTES.

Office of the Electrical Age,
First Floor, World Building,
New York, March 26, 1892.

Mr. F. S. Hastings, late treasurer of the Edison General Electric Co., has retired and Mr. S. D. Greene appointed in his place.

Mr. C. August Harsch, electrician of the Edison Illuminating Co., Lancaster, Pa., is in town looking up new specialties for his company.

Mr. C. A. Theller, secretary and treasurer of the Hailey Electric Light Co, Hailey, Idaho, was in town last week and gave this office a pleasant call.

Henry Alexander, the treasurer of Alexander, Barney & Chapin, has tendered his resignation and will sever his connection with the company April 1.

Mr. J. S. Speer, of the Partridge Carbon Co., Sandusky, O., gave the *Electrical Age* a call last week. This company is making a specialty of carbon brushes for motors which are claimed to be superior to all other makes.

Mr. Bayard Whitehorne has resigned his position with Truex & Vail, and accepted an appointment with the Newark Electric Light Co. We wish him every success in his new field, and congratulate the Electric Light Company on having secured so valuable an assistant.

In our issue of March 5, we erroneously noted the death of Mr. George L. Wright, the former president of the River and Rail Electric Company, now the Union Electric Company, of this city. Dr. Randolph, the former treasurer, was the gentleman who died on the date referred to.

The Forrest Silver Bronze Packing Co., 115 Liberty street, this city, has just issued a very unique descriptive pamphlet of the silver bronze rod packing manufactured by it, and which is particularly adapted to steam engines of every description, marine, locomotive or stationary.

H. G. Madden, manufacturers' agent, 18 Cortlandt street, this city, is out with a new adhesive rubber tape, called "Yale tape," which is claimed to be a very superior article. Mr. Madden's business is rapidly assuming large proportions, his New Haven insulated wires and cables are holding their own and he reports large orders ahead. Crown sockets are also in excellent demand.

The New York Carbon Works, 18 Cortlandt street, this city, have issued a notice informing manufacturers, dealers and users of carbon cylinder batteries that they have secured from Mr. Chas. W. Holtzer the sole and exclusive right to manufacture carbon cylinders or cups under his patent, No. 327,825, dated October 6, 1885. All cylinders will bear date of patent, also their trade mark, thereby protecting all users of same from infringement.

The Interior Conduit & Insulation Co., 42-44 Broad street, this city, has issued a cautionary notice to architects, builders, owners and others. It is gotten up in pamphlet form and sets forth that the company is sole owner of a system of interior conduit or tubes, and it is the intention of the company to resort to legal remedies for any infringement of same. The pamphlet contains a synopsis of its patents, and also copy of proceedings brought by it in the Circuit Court of the United States for the District of Massachusetts against the Holtzer-Cabot Electric Company.

W. H. Gordon & Co., 115 Broadway, this city, wish it distinctly understood that they have not gone out of the wire business. A recent notice in one of the trade papers, mentioning the severance of one of their connections, might create a wrong impression. They wish their friends to bear in mind that they have even greater facilities than heretofore for furnishing them any grade or kind of wire they may need. It should be borne in mind that on bare and insulated wire, line material lamps, and several other specialties, Messrs. W. H. Gordon & Co. are manufacturers' agents, and are selling at factory prices.

The stockholders of the Engineering Equipment Co., 143 Liberty street, this city, recently held their annual meeting in Jersey City (the company being incorporated under the laws of New Jersey), and elected the following Board of Directors: F. H. Underwood, C. A. Tinker, E. L. Harriott, F. A. Magee and A. L. Tinker. Mr. A. L. Tinker was re-elected secretary and treasurer, Mr. F. A. Magee, general manager *pro tem.*, and Mr. F. D. Crane was appointed manager of the street railway department. The business of the company shows a very healthy increase, and its progressive policy will be continued by the new management. A full line of electrical and street-railway supplies, including cotton leather belting and fibre conduits, G. & W. line materials, etc., are constantly kept on hand.

Truex & Vail have moved their offices to a suite of rooms on the fourth floor of the Electrical Exchange Building, 136 Liberty street, this city, and have also established a laboratory, where, among other things, the Walker ammeter will be calibrated by an expert of long experieuce in such work. The Walker ammeter is highly endorsed by all who have used them, and are warranted to be correct to within 2 per cent. They are sold at a price which will commend them to all, and we have seen many testimonials from responsible parties, among whom are several professors of physics in leading universities and colleges. Their Swinging Ball Lightning Arrester is having a big sale. A large shipment has been made to the Electric Appliance Co., of Chicago, which is to be agent in the West.

C. H. W. Copeland, 136 Liberty street, this city, is agent for the John T. Noye Manufacturing Co., Buffalo, N. Y., manufacturer of the Rice Automatic Cut-Off Engine. The requirements of an electric light-engine demand close yet stable regulation, a high speed durability during long runs and the best possible steam economy. All of these points the Rice Automatic possesses to as near perfection as any engine built. Since they have been building these engines a very large number have been sold, varying in capacity from seven to five hundred horse-power. They have been distributed all over the United States and show a clear record for general satisfaction. This company also makes tandem compound engines in pairs and a large variety of steam specialties. Mr. Copeland recently rested a five-cent nickel piece on the back cylinder of a Rice Compound Engine in the Thomson-Houston electric light-station at Yonkers, N. Y., and it remained in that position without falling, showing that the engine ran without jarring. Mr. Copeland is installing a twenty-five horse-power Rice Automatic Cut-Off Engine to run an Excelsior dynamo at the Bloomfield factory of the New York Aristotype Company; also putting in boilers, pumps, heaters, etc. The company has received testimonials from all over the country as to the efficiency of and the general satisfaction which its engines give.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor Electrical Age:

Names of Companies.	Capital.	Par.	Price.
Aluminuum Co.....	$350,000	$100 00	$90 00
American Dist. Tel., N. Y.....	3,825,000	100 00	62 00
Am. Elec. Exercise Mach. Co., N. Y.	100,000	10 00	9 00
Am. Carbon Ins. Mfg. Co., Boston	620,000	5 00	2 50
American Electric Motor Co., N. Y.	1,000,000	25 00	5 00
American Engineering Co., N. Y..	1,000,000	100 00	60 00
American Telegraph and Cable...	14,000,000	100 00	82 00
American Telephone Co., D. C....	100,000		*101
Ashley Engineering Co.....	200,000	10 00	6 00
Aut. Phon. Exb. Co., N. J.....	25,000	100 00	420 00
B. & S. Elec. Equipment Co., N. Y.	25,000	100 00	100 00

Barr Electric Mfg. Co., N. Y.....	50,000	100 00	100 00
Bay Electric Co. 6s, Mich.....	25,000		*101
Bell Telephone.....	15,000,000	100 00	205 50
Bell Telephone 7s.....	2,000,000		*113

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

"To be, or not to be, that is the question," whether 'twere better to remain simple New York or to absorb all the outlying territory which the capital of many who, not desiring to remain within New York, reclaimed from the wilderness and divided with people suited to their fancy. The question is purely a financial one; thousands have expressed their opinions, and in every case I have seen they are based on the expense present and future. The great city could without doubt carry on the government with one-half of the present corps of servants, if we leave out the school-teachers, firemen and policemen, and the competition being greater, a closer watch by the outs on the ins would certainly produce more satisfactory results. The pull or influence would be so stretched that it would become invisible and useless. The aldermen and their constituents' interests would be so far separated that the public would be well served. Harlem and Port Richmond, Yonkers and Jamaica, or even Flatbush and the present Eighth Ward could have no more excuse for aiding each other than Maine and Arkansas or Alaska and Florida through their representatives in Washington. More pure justice would prevail. The Mayor might order electric conductors underground on the Bowery, but to do it on the Parkway he would have to study up his city and find out where it lay. I think it would settle the electric question in more ways than one. The great city would of necessity be cut up among the various companies, but the annual bid for light would act as a check against overcharge or poor service. The 16 C. P. gas-burner, which was for so many years accepted without question, and paid for, until the competition of the incandescent lamp caused a measurement conducted by experts to be made, when I believe it was proven that no practical amount of force could produce a 16 C. P. gas-light with a four-foot burner. As a financial problem the 2,000 C. P. arc has been given up long ago by the Common Council who pass the bill and order it paid. The electric railroads within the greater city will also, by competition and expert explanations to the public, produce the desirable *quid pro quo*, by public education and demand. It is, perhaps, early to discuss these financial incidents, but history is moulding itself very fast just at present. The two new bridges across the East river and one across the Hudson are certainties; it is also a foregone conclusion that all of them will be crossed by electric cars, and in a very few years a speculator can, if he finds fortune against him at Guttenburg, step into the car and within the hour step out at Gravesend, Sheepshead or the Coney Island Exchanges and continue his dealings, all for a five-cent fare. There is not a single feature in connection with the consolidation that is not financial. The great mass of those who oppose it do so from pecuniary motives, direct or indirect, and the question will be discussed for yet a little while and then be answered in the affirmative.

The air is full of rumors of rich auriferous discoveries from Alaska to Mexico, and on both sides of the mountains. It is scarcely possible that the great West could have settled up so fast without the excitement caused by the gold mines which were the points to which all were bound, who, for various reasons surveyed and reported back their convictions, or themselves settled down to the life, first of a pioneer, next a farmer, and then a full-fledged city constructor. The millions produced in California have been multiplied many thousand-fold in the values which they practically created. Just at present the rush has changed from Oklahoma's broad acre boom to Colorado's gold and silver deposits. First, when all was quiet, came the rich find at Creede, which aroused the country for scores of miles around, and in a short time started miners and speculators, both from the Atlantic and Pacific coasts. The lone blacksmith shop was joined by the saloon, gambling house, school, church, and before a slow mind could realize it a city was built with its electric-light plant, waterworks, street railway and most of the modern luxuries. Next came the discoveries at Cripple Creek, and a second new city is being built, then as always is the case, mining experts, running over the ground, find other rich mines. One lot half way between Creede and Cripple Creek, named the Empress Josephine and Boss Mammoth, are fine six-foot true fissure veins in porphyry, the whole mass of ore carrying some $30 per ton, which by the new electric processes, are concentrated to some three times that value, with numberless bonanzas of high grade ore worth from $30,000 to $50,000 per ton. New York and Washington capital secured an option on this, and it is offered to-day in this market, some two-thirds being already subscribed. Report has it that no less a personage than Gen. Rosecrans has accepted the presidency. He is a miner by his West Point education, and for many years actively engaged in personally developing the mines of Nevada. He is too old a miner to invest in anything but a mine of merit. There has been a larger percentage of medium fortunes made in mines than any other industry. One should not invest more than he can afford to lose, but the chance of a large quick fortune, and that in actual gold and silver, is an incentive few can withstand. This is followed by despatches from Boulder, near by, announcing still another startling discovery of a three-foot vein in old workings in the old Sunshine property, averaging some $15,000 per ton. These discoveries will, if they have no other effect, settle up the country, and we must not forget that electricity is required wherever any number of people congregate, or that the object of this column is to seek for and point out the place and the circumstances under which money can be earned by the supply of electricity in all its various forms.

NEW INCORPORATIONS.

Edgerton Electric Light Company, Edgerton, Wis., incorporated March 11, with a capital stock of $6,400. Incorporators: F. W. Coon, M. Peltin, W. T. Pomeroy.

Robinson & Moore, Everett, Wash., incorporated March 8, with a capital stock of $5,000. Among other things they will construct and operate electric-light works. Incorporators: Samuel Robinson, Charles P. Moore, Everett, Wash.

Seattle and Everett Railroad Company, Seattle, Wash., incorporated March 8, with a capital stock of $500,000, to build and operate railroads, steamboats and other transportation lines, electric light, telephone and telegraph lines. Incorporators: R. Hilton, John P. Fay, Herman Chapin, Seattle, Wash.

San Francisco and West Shore Railway Company, San Francisco, Cal., incorporated March 9, with a capital stock of $1,000,000, to build and operate street and other railways by steam, animals, wire cables, electricity or otherwise. Incorporators: Henry W. Westphal, C. O. Swanberg, Louis F. Dunand, J. W. Ellis, J. O. Jephson, all of San Francisco, Cal.

Leavenworth Electric Railway Company, Leavenworth, Kan., incorporated March 11, with a capital stock of $300,000. Incorporators: George A. Baker, J. C. Lysle, George Burrows, William Dill, all of Leavenworth, Kan.

Central Construction Company, Baltimore, Md., was incorporated March 11. Among other things it will construct and equip electric, cable and other railways.

Railway Times Publishing Company, Chicago, Ill., incorporated March 12, with a capital stock of $25,000, to publish a journal devoted to the interest of steam and street railway equipment and electrical supplies. Incorporators: William C. Mulvey, Dana A. Patten, Cassius C. Clark.

Philadelphia Rapid Transit Company, Philadelphia, Pa., incorporated March 14, with a capital stock of $300,000, to construct and operate motors, cables and other machinery for supplying motive-power to street railways. Incorporators: Alfred Parrish, John P. Ilsley, W. G. Harding.

Escanaba Electric Street Railway Company, Escanaba, Mich., incorporated March 15, with a capital stock of $50,000. Incorporators: James Lillie, Kankakee, Ill.; John K. Stack, James B. Moran, of Escanaba, Mich.

St. Kanawha Falls Water Power Electrical Manufacturing Company, Charleston, W. Va., incorporated March 14, with a capital stock of $1,000,000. Incorporators: M. Levi, J. C. Alderson, Levi Welch, Charleston, W. Va.

Standard Battery Company, Chicago, Ill., incorporated March 15, with a capital stock of $1,000,000. Incorporators: Fred M. Bailey, Charles A. Haslett, Sterling L. Bailey.

The Pneumatic Fire Alarm Telegraph Company, Philadelphia, Pa., incorporated March 11, with a capital stock of $250,000. Among other things it will manufacture electrical appliances and devices. Incorporators: J. M. Harlan, Franklin H. Hearst, H. N. Day, all of Philadelphia, Pa.

The Ridgway Electric Light Company, Ridgway, Pa., incorporated March 11, with a capital stock of $10,000. Incorporators: C. M. Jackle, Fred H. Ely, E. C. Ross, all of Ridgway, Pa.

Bayonne City Electric Light and Power Company, Bayonne City, N. J., incorporated March 12, with a capital stock of $50,000. Incorporators: W. H. Peddle, Roseville, N. J.; L. Stewart, E. A. Dugan, Jersey City, N. J.; J. T. Olhausen, Elizabeth, N. J.

Electric Launch and Navigation Company, Camden, N. J., incorporated March 14, with a capital stock of $300,000. Incorporators: J. Parker, R. Gihon, Philadelphia, Pa.; J. H. Holloway, Camden, N. J.

Wolverine Electric Light Company, Holland, Mich., incorporated March 16, with a capital stock of $25,000. Incorporators: E. W. Richmond, James Huntley, John E. McKane, all of Holland, Mich.

Greencastle Gas and Electric Company, Greencastle, Ind., was incorporated March 17, with a capital stock of $50,000. Incorporators: James Green, Charles D. McClure, Lewis M. Ramsey, all of St. Louis, Mo.

Electric Construction and Supply Company, Jersey City, N. J., incorporated March 16, with a capital stock of $225,000. Incorporators: F. A Kinsman, Arlington, N. J.; B. B. Ward, T. T. Grover, New York City, N. Y.

Electric Railway Construction Company, Jersey City, N. J., incorporated March 16, with a capital stock of $50,000. Incorporators: G. L. Wiley, Arlington, N. J.; R. C. Carhart, W. H. Browne, Brooklyn, N. Y.

Tower Electric Light and Telephone Company, Duluth, Minn., incorporated March 19, with a capital stock of $60,000. Incorporators: G. H. Claypool, A. C. Batchelor, E. C. Jones, all of Duluth, Minn.

The Elmira Municipal Improvement Company, Passaic, N. J., incorporated March 18, with a capital stock of $1,000,000, to construct and equip electric-light plants, etc. Incorporators: F. H. Mollenhauser, Jersey City, N. J.; H. S. Roll, Hoboken, N. J.; H. P. Doremus, Passaic, N. J.; D. C. Robinson, C. H. Baldwin, G. Brand, Elmira, N. Y.; J. B. Woodward, New York, N. Y.

Spring Garden Mining Company, San Francisco, Cal., incorporated March 16, with a capital stock of $1,000,000. Among other things it will develop and operate electric power. Incorporators: J. W. Shanklin, E. S. Shanklin, Oakland, Cal.; J. D. Widber, A. C. Widber, San Francisco, Cal.; C. R. Thompson, Quincy, Cal.

The Fremont Electric Light and Power Company, Manitou, Col., incorporated March 18, with a capital stock of $50,000. Incorporators: Edward P. Creighton, M. A. Leddy, Colorado Springs; H. H. Brown, Denver, Col.

The Omro Electric Light and Power Company, Omro, Wis., incorporated March 19, with a capital stock of $5,000. Incorporators: C. S. Douty, W. W. Race, H. C. Scott, M. Phillips, F. Dennis.

Western Investment Company, Seattle, Wash., incorporated March 16, with a capital stock of $300,000. Among other things it will operate electric-light works, telegraph and telephone lines. Incorporators: R. C. Elliott, Frank Shelberg, Seattle, Wash.; John D. Boyd, West Duluth, Minn.

BUSINESS NOTE.

Unlike other dealers in typewriters, the Typewriter Exchange, 10 Barclay street, New York City, of which Mr. George A. Hill is manager, does not indulge in those oft-repeated announcements: "to reduce stock, etc;" "owing to removal, etc.," but continues on the even tenor of a legitimate business way, and sells all makes of machines at one-half the manufacturers' prices.

THE ELECTRICAL AGE'S ELECTRICAL PATENT RECORD.

Issued March 22, 1892.

471,100. Electrically-Controlled Elevator. Andrew M. Coyle, Washington, D. C., assignor to Nelson Hiss, Baltimore, Md. Filed May 23, 1891.

In a system for controlling elevators electrically, the combination, with a starting and stopping mechanism, of a main electric circuit controlling the starting and stopping mechanism, a series of main-circuit closers for the several floors or landings, and a series of magnets in branches of an auxiliary circuit for operating the circuit-closers.

471,130. Thermostatic Instrument. Morris Martin, Malden, Mass. Filed June 3, 1891.

In a thermostatic instrument, the combination, with an active member adapted to form part of an electric circuit, of one or more independent hollow terminals to form part of the electric circuit and a fusible connection joining hollow terminal to the active member to complete the electric circuit.

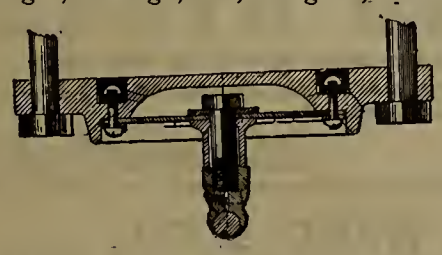
471,151. Trolley-Wire Support. Elmer A. Sperry, Chicago, Ill. Filed July 9, 1891.

In an integral device for supporting a trolley-wire, a wire-clamp, a portion designed to be secured to the supporting medium, and an elastic or yielding portion connecting the two.

471,155. Alternating-Current Motor. Elihu Thomson, Swampscott, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Aug. 17, 1891.

An alternating-current motor comprising an armature and field-coils inductively acting on armature and connected to a single supply-circuit and a condenser shunting some of such field-coils, whereby they are caused to lag behind the other coils in magnetic changes.

471,190. Carbon-Holder for Arc-Lamps. Charles A. Pfluger, Chicago, Ill., assignor, by direct and



471,151.—TROLLEY-WIRE SUPPORT.

mesne assignments, to the Standard Electric Company, of Illinois. Filed Oct. 17, 1890.

In an arc-lamp, the combination of a single carbon at one electrode with two or more distinct carbons rigidly secured to one and the same holder, so as to travel together at the other electrode, and means for keeping the points of such distinct carbons always substantially in contact with each other during the period of burning.

471,206. Trolley-Pole Catcher. Montraville M. Wood, Chicago, Ill. Filed June 4, 1891.

In a trolley-catcher, the combination of a trolley normally upwardly held against the trolley-wire, a rope whereby the same may be drawn down, means for winding the rope to bring the trolley down, ordinarily disconnected from the motor mechanism of the car, and a catch to throw such winding-apparatus into operation, the catch adapted to be operated by the tightening of the rope.

471,210. Electric Striking Mechanism for Clocks. Silas C. Dickinson, Corning, Iowa. Filed Sept. 17, 1891.

In an electric striking device, the combination of the main circuit including the magnet, a source of electric energy, and a circuit-closer controlled by a clock mechanism, a branch circuit including the electric motor, circuit-closers controlled by the main circuit, a second branch circuit including the same motor, and means controlled by such motor for closing the second branch circuit and determining the length of time it shall remain closed.

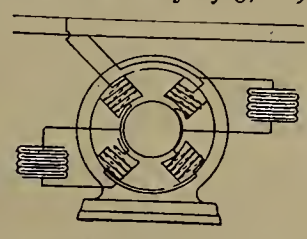
471,230. Electric Railway-Signal. Edgar C. Wiley, Bristol, Tenn., assignor of two-thirds to James A. Dickey and Napoleon B. Ainsworth, same place. Filed June 18, 1891.

The combination, with the base-plate, of the two leaf-springs secured thereto at their inner ends, and a double-inclined depressible bar, supported at its outer end upon the ends of the leaf-springs.

471,234. Electric Arc-Lamp. Hector Dewar, Boston, Mass., assignor to Albert W. Rounds, same place. Filed Sept. 15, 1891.

In an electric arc-lamp, the combination of a non-magnetic floor, magnets secured thereon, an insulating strip between the magnets and the floor, having a depending block and adjusting screw mounted in the floor, and passing through the depending block.

471,237. Vibrating Electric Switch. Jacob S. Gibbs, Hartford, Conn. Filed July 3, 1891.



471,155.—ALTERNATING-CURRENT MOTOR.

In an electric switch, a contact-lever with an angular hub and a reciprocating rod carrying spring-devices, which pass over the angle in the hub and press against the inclines on either side thereof for raising and lowering the outer end of the contact-lever.

471,242. Electrically Welding Metals. Auguste de Méritens, Paris, France, assignor, by mesne assignments, to the Thomson Electric Welding Company, Boston, Mass. Filed Nov. 8, 1887. Patented in France.

The herein-described art or process of joining two pieces of metal together by a welding or soldering operation, consisting in forming an electric arc at those points only of the metal which are to be joined, the heating-current being adjusted at point to the required welding or soldering temperature.

471,271. Electric Switch. Amandus Metzger, New York, N. Y. Filed June 6, 1891.

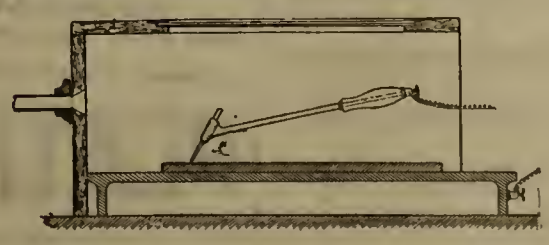
The combination, with an insulating switch-base, of a circuit terminal consisting of a single piece of sheet metal having two arms extending from the base, and having an arm embedded in the base, a second terminal, and a switch-arm adapted to connect the terminals.

471,296. Electric Signal for Railways. Eugene T. Turney, Chicago, Ill. Filed Nov. 10, 1890.

In an electric signalling apparatus for railways, a contact-post, in combination with a switch-lever arranged near the former, both connected up, a battery mounted on the engine, an insulated contact plate or bar also mounted on the engine, connected with battery, and adapted to make contact with the post, an alarm arranged on the engine and set in operation when a circuit is closed by contact between the post and plate, and a suitable device arranged on one of the cars of the train and adapted to set the switch-lever in passing the latter.

471,302. Safety Device for Electrical Conductors. Julius Marx, Nauheim, Germany. Filed July 6, 1891. Patented in England, in Germany, in Switzerland, in Austria-Hungary, in Belgium, in Italy and in France.

The combination of a receptacle, electrical terminals in-



471,242.—ELECTRICALLY WELDING METALS

cluded therein at a distance from each other, and a compound in the receptacle of low resistance, which becomes less conductive or non-conductive upon increase of temperature, and which connects terminals.

471,310. Long-Distance-Telephone System. Eugene Gwosdeff, St. Petersburg, Russia. Filed Feb. 15, 1889.

The telephone system for great distances, characterized by the following arrangements: the microphones and telephones connected with the line by means of the separated condensers and connected with a return-line by means of condensers the electric capacity of which corresponds with the respective resistances of the two lines.

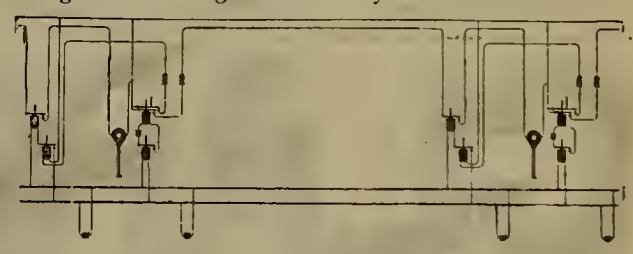
471,352. Telephone System. Anthony B. Ferdinand, Oshkosh, Wis. Filed June 29, 1891.

471,375. Conduit for Electric Railways. Francis O. Blackwell, Boston, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Nov. 8, 1890.

The combination, in an electric-railway conduit, of the slot-rails and transverse yoke placed at intervals, overhanging at their upper ends the air space in the conduit, and having an opening in overhanging portion, with the insulators for the supply conductor removable from the conduit through openings.

471,409. Apparatus for Electric Railway Signalling. Adoniram J. Wilson, Port Chester, N. Y., assignor to the Hall Signal Company, of Maine. Filed May 23, 1891.

The combination of a series of two or more secondary signalling-circuits, one for each block or section, for actuating or controlling a signal or signals for such block or section, a series of four or more primary signalling-circuits, two for each block or section, adapted to be actuated successively by a train while traversing the blocks or sections, the first primary circuit of each block actuating or controlling the second primary circuit of that block and also actuating or controlling the secondary circuit of the preceding block and the second primary circuit of each block actuating or controlling the secondary circuit of that block.



471,409.—APPARATUS FOR ELECTRIC RAILWAY SIGNALLING.

471,410. Electric Railway Signalling Apparatus. Adoniram J. Wilson, Port Chester, N. Y., assignor to the Hall Signal Company, of Maine. Filed June 15, 1891.

In an electric railway signaling system, a series of home-signals, and a series of primary signalling-circuits respectively operating or controlling home-signals and themselves operated successively by the train in passing over the road, in combination with a series of distance-signals, electrically and mechanically independent of the home-signals, and a series of secondary signalling-circuits respectively operating distance-signals, each of secondary signalling-circuits having a circuit-breaker adapted to be operated by one of primary signalling-circuits at a distance and having, also, a short circuit shunting the distance-signal itself and adapted to be operated by the next adjacent primary home signalling-circuit.

471,447. Charging-Table for Electric Railways. Edward P. Usher, Grafton, Mass. Filed Aug. 31, 1891.

The described charging-table, comprising permanent supports adjacent to the car-track and a top adapted to receive the batteries, such top being hinged at one edge and provided with means for adjusting the opposite edge of the table-top vertically to correspond with the battery-recess of the car.

471,454. Process of and Apparatus for Bleaching by Electrolysis. Albert E. Woolf, New York, N. Y., assignor, by mesne assignments, to Rosamond Woolf and Thomas J. Montgomery, same place. Filed Dec. 8, 1891. Patented in England.

In the art of bleaching, the process set forth, which consists in submitting sea-water to electrolysis, forcing atmospheric air into the electrolyte, discharging the same between the electrodes, and submitting the materials to be bleached to the action of the products of electrolysis in the same vat or tank.

471,491. Trolley-Wire Hanger. Thomas J. McTighe, New York, N. Y. Filed July 11, 1891.

A clip for trolley-wire hangers, comprising a metal plate adapted to be folded up around the wire and having at its meeting portions one or more registering tongues and slots forming a key-way, in combination with a suitable key.

471,525. Automatic Electric Block System. Joseph A. Carlton and Henry L. Johnston, Atlanta, Ga. Filed June 16, 1891.

In a device of the class specified, a light circuit cut in two places, one brake held normally closed by a spring-terminal and the other held normally open, but adapted to be closed by contacts carried by a lever set alongside the track and adapted to be operated by a train and carrying an armature and an electro-magnet in circuit, so set as to attract armature on the completion of the circuit by the proper movement of the lever and hold it until the circuit shall be broken by the disruption of the spring-terminals by the passage of the train.

471,526. Disk Carbon for Arc Lamps. Hosea W. Libbey, Boston, Mass. Filed Oct. 17, 1890.

A disk carbon the perimeter of which is of spiral form.

471,527. Machine for Casting Grids for Secondary Batteries. Albert F. Madden, Newark, N. J., assignor, by direct and mesne assignments, to John M. Pendleton, New Brighton, N. Y. Filed Feb. 16, 1889. Renewed July 24, 1890.

In a machine of the character described, the combination, with the crucible, of the chamber communicating with the crucible, the mould at the top of the chamber and adapted to be moved across the latter, and the grate-bars arranged at the upper end of the chamber and having their upper faces contiguous to the bottom face of the mould-plate.

JOHN A. CROSS,
Consulting
Electrical and Mechanical Engineer and Expert,

BUSINESS NOTES.

The Bodifield Belting Company, of Cleveland, O., have just issued a book that will be of interest to users of electrical appliances. The object of the book is to introduce a new kind of leather belting this company has recently perfected, and to explain its merits. This company claims that belting as it has been made in the past is not properly made for electrical work, especially in places where it is hot, dry, or on machines where oil gets on the belts. It is a well-known fact that many belts have been ruined by machinery oil getting on them.

The belt this company has introduced is called "Carbon," and an extract from their book will practically tell what they claim for it. They say:

THE DEMAND OF THE DAY

Is for oil-dressed leather belting; but the oil-dressed belts that have been and are being sold are simply hard, dry leather made into belting, and then drawn through some grease or oil. While this is slightly beneficial for a short time, it does not accomplish the result desired. Why? Because this treatment only gives the belt a surface coating: it fails to make the leather that has been made hard and solid by machine pressure pliable; it fails to soften the grain that has been made as smooth and hard almost as glass. Should enough soft oil be used to produce the result aimed at, a "stretchy" belt would be made, as well as one that would soon become rotten, especially at the laps, excessive oil always having a bad effect on cement.

Three years ago we commenced making, under a process known only to ourselves, a belt that has under the severest tests made for itself, wherever used, a name above any other belt known. This is a filled belt, we forcing into the leather during the currying process a large amount of hard grease; this makes our leather firm and solid, yet perfectly pliable. By this process we escape the bad effects of soft oils. We make our leather almost as pliable as the rawhide, yet have the body and weight of regular oak-tanned belts. We use no machinery to make our leather solid (our filling does that), therefore the grain of the leather is in its natural state, soft and pliable as calfskin. This leather when made into belting will drive fully twenty per cent. more than any of the hard, dry belts will.

While belting made from our filled leather has proved itself the best on the market, there was still room for improvement: many places demanded a waterproof belt; an oil-proof belt was desired on dynamos, etc. Belt oils or dressings were not wanted; a perfect belt for high speed and small pulleys was a necessity. All this led us into experimenting, and the result is our "Carbon" belt, which is the combination of all that can be desired in a belt. About one year after commencing our experiments we perfected our "Carbon" filling, and one year ago we put "Carbon" belting to the most severe tests, so that now, after a year's trial, we offer it to the public as the only perfect belt made.

The compound is made of a carboniferous product held in solution: this material is absolutely oil and water-proof. To this solution we add an extract that is a leather preservative. This combination makes a filling that is not an oil; it has all the good effects of oil, without any of its injurious qualities.

For making our "Carbon" belt, we use our regular filled leather, and add to it the "Carbon" filling. One of the greatest advantages of the "Carbon" belt is its weight: leather that will weigh 16 ounces to the square foot will, when filled with "Carbon" filling, weigh 20 ounces, gaining 25 per cent. This added weight, in connection with our process of currying, makes our "Carbon" belt capable of driving fully one-third more than any hard, dry belt can. The "Carbon" belt is made of heavy, pure oak-tanned leather, cut strictly short lap and from the centre of the hide. Our object is to make belting so good that when good belting is wanted there will be no question regarding where to place orders.

It would be well for those having trouble with oil, etc., to try this company's belting. They are a reliable and gentlemanly house to do business with, and they would not offer anything for sale in which they did not have the utmost faith.

H. WARD LEONARD & CO.

"Secure bid from us for electrical apparatus or construction before deciding. Railways, Lighting, Transmission of Power, Wiring, etc."

Address ELECTRICAL EXCHANGE BLDG., New York City.

VULCANIZED FIBRE COMPANY (Established 1878.
SOLE MANUFACTURERS OF

UNDERGROUND TELEGRAPH LINES.

It is said that the House Military Committee, Washington, D. C., will report favorably a bill providing that any telegraph company may construct one or more underground or submarine telegraph lines from Washington, through Baltimore, Wilmington, Philadelphia and New York and intermediate places, connecting with all arsenals and other military posts adjacent to cities through which it runs, and with military posts in New York Harbor and the western extremity of Long Island Sound, the work of construction to be under the supervision of the Government. One wire is to be rented by the Government, and in case of war one must be furnished to it free of charge.

TO CONTROL ELECTRIC WIRES.

A State Electrical Subway and Control Commission has been created in New Jersey for the purpose of regulating matters pertaining to electric wires. It will have all the powers necessary to deal with the subject in every phase, and its decisions will be final.

The new law requires that no electric wires shall hereafter be constructed along, across or above any street or avenue in the State unless approved of by the Board of Commissioners, except wires owned by the State or used for fire or police purposes.

We think the State should set the example for the corporations by burying its own wires, and compelling the fire and police wires to go underground as well. There is an inconsistency here.

ELECTRICAL CHIMES.

On Easter Sunday (April 17) the air around Grace Church, New York, will reverberate with the sweet notes of the silvery chimes which will be rung by the aid of electric power. Mr. George T. Atwood has been at work for some time on the problem of ringing bells by electricity, and has so far succeeded in his efforts that he promises on Easter Sunday to give the New Yorkers an idea of what he has accomplished. He claims to be able to put musical expression into the ringing, which is something unattainable by the old method.

If Mr. Atwood succeeds in what he has undertaken to do his invention will find a very large field for application. There are many chimes of bells located in different parts of the country which, if musical expression can be added to their silvery notes, will acquire a sweetness of tone and effect by the new method that cannot be obtained in any other manner.

PROSPERITY IN THE STREET-RAILWAY SUPPLY BUSINESS.

The street railway man's time has come at last, and his heart jumpeth with glee at the prospects of a golden harvest. The reason for this exuberance of spirits is plain. When large cities, such as Brooklyn, Boston, etc., adopt the trolley system by the wholesale it means work for somebody. Some one must supply the electrical equipment, the cars, the trucks, the rails, etc., and the concerns manufacturing the various parts of an electric railway plant are the ones enjoying the boom these days.

Trade is said to be exceedingly dull in most all other lines of business, but the electric railway apparatus manufacturing industry is an exception, and those who are interested in such concerns are fortunate, and have good reason to feel joyful and buoyant in spirits. The Brooklyn contracts alone are of unusual dimensions, and it is likely that ere long many others will follow. Philadelphia may before long require a large electric railway equipment, and there is a possibility that Baltimore and Chicago will fall in line in the near future.

THE TELEPHONE INDUSTRY.

The vast proportions of the telephone industry in this country may be faintly judged by reference to some of the figures given in the report read at the annual meeting of the Bell Telephone Company, in Boston, on the 29th of March last.

There are, according to this report, 512,407 telephones in use in the United States, requiring 266,456 miles of wire, which on the average allows a trifle over half a mile of wire to each instrument. This length of wire would circle the earth ten and a half times if stretched out in a continuous length, and dividing it by the number of years the telephone has been in operation (sixteen) would give 16,656 as the average number of miles of wire stretched each year.

The most interesting part of the report to the stockholders is that relating to the revenue. The figures show an increase of over a quarter of a million of dollars in the net earnings over the previous year.

It was decided to increase the capital stock $2,500,000, making the total $17,500,000, and the present stockholders will be given the opportunity to subscribe for the new stock in the proportion of one new share to six of their present holdings, at par.

The next few years will no doubt see some important developments in the telephone service in this country, and it will be extremely interesting to watch the effect upon the existing corporation after the expiration of the Receiver patent next year.

UNDERGROUND WIRES AND CABLES.

In the report of the Committee on Underground Conduits and Wires, which was read at the Buffalo Convention of the National Electric Light Association last February, some very important and interesting facts were set forth, but which on account of being involved with other questions are liable to be lost sight of. Take for instance the statement that, with very few exceptions, the system and plans heretofore adopted in laying wires and cables underground in this country have proved failures.

This assertion, no doubt, was a surprise to many, and the question naturally arises, "Why have they proved failures?" The reasons therefor are numerous, but can be summed up in a few words, viz.: too much economy in the matter of insulation, and carelessness in handling.

The committee found in their investigations that in some cases there was insufficient insulation used, and in many others carelessness in laying the conduit or drawing in the cables and wires caused much of the trouble. They call attention to the fact that it is absolutely necessary that all work and materials in connection with underground wires should be first-class, and that it is poor economy to use any but the best.

More intelligence should be used by the workmen in drawing the cables in and out of the ducts, and working in the manholes. Much of the damage, the committee states, is done at these times.

We give on another page an abstract of this report, which refers particularly to these and kindred subjects, and which is well worth the very careful consideration of every one interested in underground work.

BAILEY CURRENT CONTROLLER.*

A current controller is a very necessary adjunct in galvanic work, and is oftentimes found quite useful in Faradic work. By its use a current may be turned off and on steadily and gradually, and consequently preventing disagreeable and injurious shocks where such should be avoided.

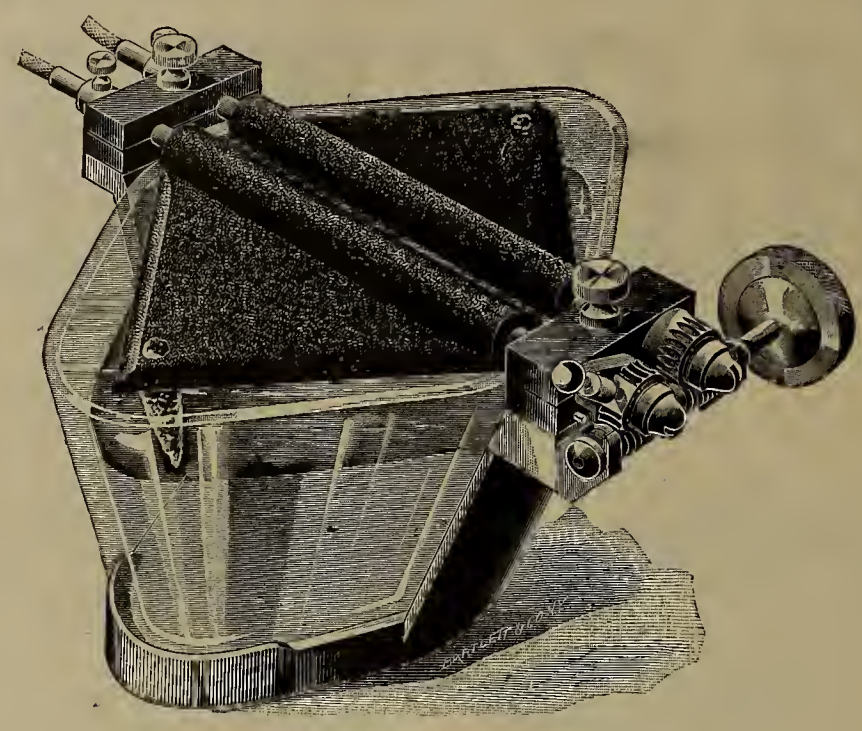
The controller illustrated herewith is known as the "New Bailey Current Controller," and is an improvement on the old Bailey Controller, all the faults in the latter having been eliminated in the new instrument. It consists of two triangular-shaped carbon plates, each carrying a bit of sponge at one of its angles, and so mounted over a small glass cup of water that by means of a worm-gear operated by a hand-wheel, the sponge tips are gradually moved down into the water and toward each other until the plates touch at their lower points. Or, by turning a thumb-screw the left-hand plate may be unlocked from the gear and moved as far into the water as desired, and then the other plate gradually turned toward it. By the latter method a still more gradual increase of current is assured. Each shaft passes through the centre of a hole running the entire length of the longest edge of the plate and is moulded in with pure tin, the tin completely filling the space between the shaft and carbon from end to end. An electrical connection is thus had having an abundance of conductivity, and one which is non-corrodible beyond any question. Each plate is $3\frac{1}{2}$ x $3\frac{1}{2}$ x 4 inches; the whole apparatus is over all 7 x 7 x $4\frac{1}{2}$ inches, and weighs two pounds. The carbons are handsomely moulded and the mountings highly finished and perfectly fitted. This current controller, or rheostat, will give a current at the outset more feeble than any instrument of its kind or character can give, and will increase the current without variation or fluctuation, which has never before been done, and finally will give the full strength of the battery actually without shock, which is also for the first time accomplished. It is the only instrument in which each electrode moves toward the other. At the start they are six inches apart, and at the finish actually in hard contact without having given the least shock. This is attributable to the gradual coming together in water of the two large flat surfaces of carbon. As there is no cover over the plates, and when out of water they are separated by fully $\frac{3}{16}$ of an inch, there is no danger of escape of current by means of water adhering between them, or by moisture of condensation. In construction, no wax or cement is used and no frail parts or connections. As this controller is specially adapted to the use of medical apparatus, we feel sure that its great merits will commend it to the medical fraternity and also for home use.

ALLIED INTERESTS.

The remarkable success which has attended the introduction of electricity into traction, said Mr. Erastus Wiman before the National Electric Light Association in Buffalo last February, should in a large degree be attributed to electric lighting experience. It is clear that much of the perfection in machinery, both electrical and steam, which enables electric roads to start off on a career of abundant success, would have been impossible had not the field been already explored by the light organizations. Hence it is natural there should follow in many localities a union between the two interests, that of electric railways and electric lighting, and in this prospect there is a hope for the future of promise and profit. In the reconstruction of central stations, therefore, the wants of street lines of travel as well as of street lines of light are to be contemplated, making existing properties often more valuable, and bringing into constant use all the facilities, permanent fixtures, fixed charges, expenses of administration, and other expenditures now directly chargeable only to electric lighting. The construction of electric railways into new localities hitherto inaccessible, and the profit possible by the enhancement of value in real estate is a tempting field for the electric light proprietor. The advantage of affording along these new lines a supply of power into every house, equally with a supply of light, begets an attractiveness for these new neighborhoods thus created second only to the advantage which is imparted by the rapidity, the cleanliness, the frequency and economy of the electric railway systems now so universally approved.

The momentous revolution in values as the result of highly improved means of street communication by the aid of electricity, is one of the economic features of the hour. In no department of business activity within the past three years, has there greater profit been made, has there greater good been done. The growth of wealth in numerous cities, of which Boston is one of the best examples, has been very great from this means, while communities have been knit together, the outlying and inaccessible parts brought within easy hail, and solidity, strength, and rapidity of movement made possible, with all that follows in its train.

* Law Telephone Co., 85 John street, New York.



CURRENT CONTROLLER.

CONTROLLING-SWITCH FOR STREET CARS.*

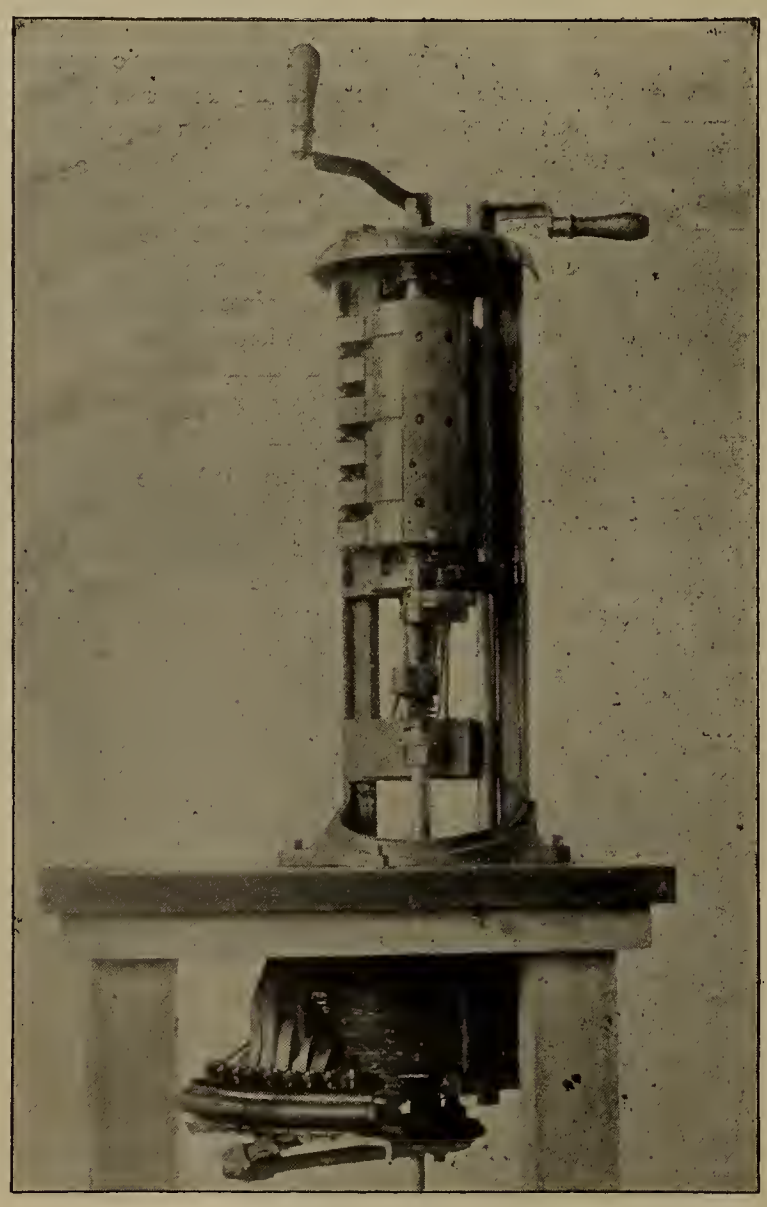
The accompanying illustration shows a new type of street-car controlling-switch recently devised, intended to take the place of the present platform-switch for equipments of large motors of 25 H. P. and upwards.

In starting the car the switch-handle is turned from the position marked "off" with a "counter-clockwise" movement; this has the effect of carrying the arm of the rheostat placed under the switch around on its contact segments and the resistance is gradually cut out of circuit. After this arm has been carried around and all the resistance cut out, it is released from the cylinder shaft and left locked in this position. Further movement of the handle then affects only the cylinder and commutates the field-magnet coils of the motor from series to parallel in the usual way.

In stopping, the field-coils are turned from parallel to series, the resistance-coil is then again put in circuit, and finally the circuit is broken by the contact-lever on the last segment of the resistance-coil, and not, as formerly, upon the cylinder contacts. The only caution to be observed in stopping is to see that the switch-handle is turned to the position marked "off." As the motors are reversed by means of a separate lever operating a reversing-switch placed under the cars, the reversing-lever is connected to a shaft separated from the cylinder shaft, but interlocking with the cylinder shaft in such a manner that it is impossible to reverse the motors until the cylinder shaft is in an "off" position. The cylinder plates and contacts are made of thick iron stampings, as experience has shown that iron is a better material to use than brass, hitherto employed. Sparking does not burn the iron as much as the brass, and greater certainty of good contact is insured. The rheostat is of the regular circular pattern resistance-coil, which has been in use for some months past as the standard slow starting device. This rheostat is protected by a galvanized iron case, made to suit different car constructions. When fitting the switch a sheet of iron and a layer of asbestos should be placed between the rheostat and the car floor. This will prevent any danger from fire either from heating or sparking in case of accident to the rheostat.

The current from the trolley-wire first goes through the field-coils and switch cylinder for commutation, then through the armature and reversing switch, and thence through the switch contact-lever and resistance-coil to ground.

Only six wires are run to the platform switch; these are the field-magnet wires. The three wires running to the reversing-switch are of the same size as the regular armature wires, as is the wire between the metal terminal of the reversing switch and the contact-lever of the rheostat. When fitting switches to cars already wired, the cables can be utilized, but the terminals of the wires left idle should be well insulated.



CONTROLLING SWITCH FOR STREET CARS.

* Edison General Electric Co., New York.

CHIME RINGING BY ELECTRICITY.

G. F. Atwood, who was for three years foreman at Edison's laboratory at Orange, N. J., has invented an appliance for the ringing of chimes by electricity, which is to be tried at Grace Church, New York, on Easter Sunday morning (April 17). The most prominent feature of his invention lies in the fact that not only does he propose to ring the bells by electricity, but also to put musical expression into the ringing. In operation, each bell is to have pendant from its centre two clappers, both of which are to be held near opposite sides of the bell by a firm iron rod fastened to the striking ends of each. One clapper is to do the striking, and the other to dampen the tone.

The chimes will be rung from a small keyboard, which will be placed near the organ and worked by the organist. Each key will connect and disconnect the current for one bell, and will be cut in and out

through different degrees of resistance by foot pedals. Through the agency of such a keyboard, chords may be struck and tunes played which were impossible to accomplish by the use of the old system of levers.

NOTES ON ELECTRO-MAGNETIC MACHINERY.*

BY WM. S. ALDRICH, M.E.

(*Continued from page* 165.)

The Kinematic Conception of the Ether Mechanism, in combination with the peculiar mechanical properties apparently possessed by the ether medium—however far from being a true conception, may serve the passing moment till a better working hypothesis is presented. We know that the ether energy of the electric current and of the magnetic circuit moves at right angles (normal) to the direction of the current or the axis of the magnet; also while the instantaneous direction of motion of a point in the pitch circle of a gear-wheel is tangential to its path, the energy is transmitted radially or normal. These peculiar gear-wheel properties of the kinematics of the ether mechanism, like all good illustrations, leave us in doubt as to many points; especially, as to whether the ether gear-wheels are more or less flexibly mounted, as on springs, but with apparently limited or even fixed distances between centres. Perhaps Oliver J. Lodge may yet point out to us whether these gear-wheels, as elements in the ether kinematic chain of mechanism (speaking in the phraseology of Reuleaux), are pair-closed, force-closed or chain-closed. That is, whether they mesh with each other by reason of some peculiarity of their paired connection or characteristic conformation of their toothed outline, or are by some force kept in geared connection, akin, perhaps, to the manifest tendency of the magnetic circuit to complete or perfect itself—to enclose the greatest possible number of lines of force in following the path of least resistance, and yet to remain as undeformed as possible in the presence of opposing magnetic forces—a kind of electro-magnetic force-closure; or, perhaps, these ether gear-wheels may have their centres connected by a link or chain device, not yet made clear. And the time may come when the kinematics of this hypothetical mechanism of the ether may be as definitely studied as its mechanics, and the paths of its moving elements as clearly laid down as now in the case of link-work, cams, gearing, etc. The ether medium has already been made to yield some of its many possibilities in the applications of electricity and magnetism; and its peculiar characteristics show it to be capable of the widest range of usefulness in the transmission of energy and of motion, for a long or short distance, and by immediate and direct, or by indirect means. And the beautiful electro-magnetic induction experiments of Elihu Thomson, the high frequency alternating-current effects obtained by Tesla, and the researches of Crookes in high vacua—give grounds for hoping that the day is near at hand when these invisible forces will be clearly seen and understood by the things that are made.

* Read at the meeting of the Electrical Section, Franklin Institute, Philadelphia, held December 1, 1891.

Electric Transmission of Energy is shown in simple ideal form. In Fig. 1 for long distances; in Fig. 2 for short distances. In either case, but especially the latter, we may suppose the axes of the two armatures to be placed parallel, or in any given oblique position to each other, being then similar to transmission by belts and wire ropes. The speeds of the two shafts may be maintained constant under changes of load, or varied at will; and the rotations may be in the same or opposite directions, and reversible at will. The current used may be direct or alternating. Power applied to drive one as a dynamo will drive the other as a motor, while if power be applied to both, the output will be current in the external circuit, as given by the two dynamos coupled for any given output. Current supplied to drive one as a motor will serve to drive the other as a dynamo, giving an electric-motor-driven dynamo as a transformer, if the two shafts are in any way coupled or geared; while, if current be supplied to both, the output is power from each machine acting as a motor. More than two machines are often used, and sometimes one dynamo operates several motors in the same electric circuit, but with individual magnetic circuits. In the figures from 1 to 12, inclusive, *P Q R* represent armatures and armatured shafts, and *A B C* fields and field coils.

Electro-magnetic Transmission of Energy is understood to mean that combination for the transmission of energy, in which all the armatures are in the same magnetic circuit. (*a*) One or more of these armatures, as dynamos, may be utilized to generate current, which may be supplied to the remaining armatures, as motors, in the same magnetic circuit; or, (*b*) all the armatures may be run as motors by an external source of supply of current; or, (*c*) all the armatures may be run as dynamos by an external source of power. Figs. 3, 4, 5, 6, 7 and 8 show such combinations of two armatures in the same magnetic circuit, or branches of the same. (*a*) If armature *P* is driven by power, as a dynamo, the current supplied to armature *Q* will drive it as a motor; or, (*b*) if current is supplied to both armatures *P* and *Q*, they will run as motors; or, (*c*) if power is applied to both armatures, current will be generated in the external circuit. This last combination is similar to a separate-circuit self-exciting dynamo (type of Fig. 4), brought out by Ladd, March 14, 1867, which had two shuttle-wound armatures—a small one to excite the common field magnet and a large one to supply currents for electric lighting. We may also arrange any one of the forms shown (Fig. 2, for instance), as a dynamo-transformer, by supplying current to armature *P*, acting then as a motor, and gearing or otherwise coupling the shafts *P* and *Q*, so that armature *Q* acts as a dynamo, giving a transformed current within any given range.

Dynamotors for Electro-magnetic Transmission of Energy are combinations of armatures in the same magnetic circuit, as illustrated in Figs. 3, 4, 5, 6, 7 and 8, which show two armatures in the same magnetic circuit, as dynamo and motor. A dynamo-motor combination, in the same electric circuit, but with *individual* magnetic circuits, as Fig. 2, is really a transformer of mechanical energy; while a motor-dynamo combination, similarly arranged, is a transformer of electrical energy. The dynamotor is also a dynamo-motor combination, in the same electric and the *same* magnetic circuits, Figs. 3, 4, 5, 6, 7 and 8, and as such is also a transformer of mechanical energy; but it may also be used as a transformer of electrical energy. These dynamotors allow of a constant or variable velocity-ratio being electro-magnetically transmitted between two shafts arranged in any way within close proximity, for the immediate and direct transmission of energy. The direction of rotation as well as the velocity-ratio may be varied at will. Direct or alternating currents may be used, but preferably the latter, and very probably some form of the so-called rotary current. The dynamotor may be an independent machine, with no external circuit connections, or it may be more or less dependent upon some external source of current supply, either for regulation of velocity-ratio, or of its operations as an energy transformer.

Mechanical Equivalents of Dynamotors are those mechanical means for the transmission of energy and motion, equivalent, from the standpoint of kinematics, to the electro-magnetic means employed in the dynamotor. Thus Figs. 3 and 4 show dynamotors for parallel shafts, in ordinary proximity, and have their mechanical equivalents in belts, spur gearing and like means for the transfer of circular motion between parallel shafts. Figs. 5 and 6 show dynamotor forms for parallel shafts very close together, as in Oldham's coupling. Shafts intersecting at an angle, such as in bevel gearing, universal joints, Hooke's joint, etc., are mechanically equivalent to the form of Fig. 7. Screw wheels, worm wheels and skew-bevel wheels are mechanically equivalent to the form of Fig. 8 for transmission between non-intersecting axes.

Magnetic circuits in parallel and in series admit of a variety of ways of grouping two or more armatures in electro-magnetic machinery. Fig. 9 shows the simple ideal grouping in parallel or magnetic shunt with one energizing coil. The ends of the field at armature *R* may be closed around, and another coil put in, acting in conjunction with the coil *C*. And with or without this additional coil, separate auxiliary energizing coils, acting in the way of feeders, may be placed between armatures *P* and *Q*, and Q and R. The simple magnetic shunts, to which Sylvanus P. Thompson refers,* may develop into useful industrial applications, such as multiple drills, operated by spindles on armatures arranged in parallel magnetic circuit. Other forms of branch magnetic circuits are shown in Figs. 3 and 5. The simple ideal grouping of armatures in series in the magnetic circuit is shown in Fig. 10, with one energizing coil. As before, auxiliary energizing coils may be placed at the other end, or between the armature *P* and *Q*, and *R* and *S*, but these coils do not here act as feeders as they did before in the parallel arrangement, but rather as separated parts of one large coil controlling the one magnetic circuit. This may be clearly seen by referring to the field coils in Figs. 4, 6, 7 and 8, which shows the arrangement of two coils in series for one magnetic circuit.

The Electro-magnetic Kinematic Chain may be developed by reference to Figs. 11 and 12. Multi-

* "On a Property of Magnetic Shunts," communicated to the Physical Society, April 17, 1891. See *The Electrician* (London), Vol. xxvi., April 24, 1891, p. 764.

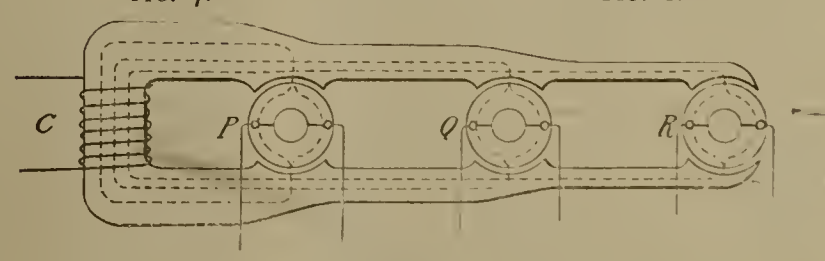

FIG. 9.

polar types are preferably here used. If the arm *L*, connecting the two fields in Fig. 11, be *fixed*, the combination may be used as a dynamotor. And by driving armature *Q* as a dynamo, by power, or by a motor secured to the arm *L*, armature *P* will operate as a motor, turning at a certain definite and predetermined speed with respect to *Q*. Should the armature *P* be slowed down by a *fixed* brake or clutching device, and the armature *Q* rotated as before, there will be a rotation given to the field C_1 of *P*, in the *opposite* direction to which the armature *P* is turning, in order that the lines of force across *P* may continue to be cut at the same rate as before; that is, when the field was fixed and the armature was free to revolve. If armature *P* be wholly stopped, its field C_1 will turn around, carrying the arm *L* and its appurtenances at the same speed at which the armature was formerly turning, but in the opposite direction. If on the other hand, the speed

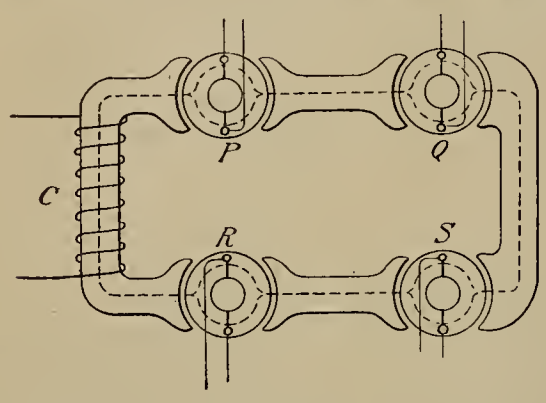

FIG. 10.

of the armature *P* be increased, by applying external power, then, to cut the lines of force at the designed rate, the field C_1 of *P*, and so the arm *L*, will have to turn around in the *same* direction as the armature *P*. The armature and its field form an electro-magnetic turning pair of elements; in the first case above, acting as a motor-turning pair, and in the second case as a dynamo-turning pair of electro-magnetic elements. The placing of two armatures, *P* and *Q*, in the same magnetic circuit makes it an electro-magnetic connecting link between them; while, if placed simply in the same electric circuit, they form a combination of elements electrically linked. The electro-magnetic chain is then built up of electro-magnetic links, which connect electro-magnetic pairs of elements. Two or more armatures may therefore be electro-magnetically arranged in series or in parallel, or any of the usual modifications and combinations of these groupings. And, from the kinematic standpoint, two or more armatures, with their fields, may be kinematically arranged as an electro-magnetic kinematic chain; the mechanical equivalents of this combination may be seen in belt kinematic chains, wheel-kinematic chains, and crank (linkage) kinematic chains. In general, then, an electro-magnetic kinematic chain may be considered as a combination of electro-magnetic connecting links, so connecting pairs of electro-magnetic elements, that all parts of the chain have determinate motions; such motions being determined by the form of the elements carried by the links, and independent of the application of external force when considered merely as a change in position. Fig. 12 shows a simple ideal electro-magnetic chain of three links. Whether the armature *P* is held fixed,

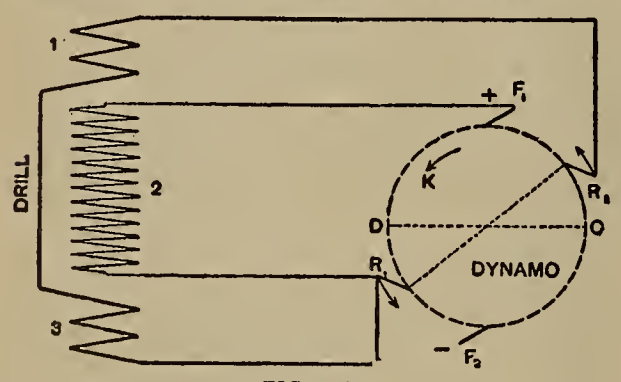

FIG. 14.

or is rotated, certain definite motions may be obtained from the armatures *Q* and *R*, in either case. Fixing the centres of armatures *Q* and *R* (the same as fixing the rigid connecting link between *P* and *Q*, of Fig. 11) would lock this three-link chain, so far as any motion of the centre of *P*, in space, would be concerned, and the armature *P* would then revolve as about a fixed centre. Kinematic chains of four or more electro-magnetic links admit of a greater variety of relative and constrained motions; and, as in any case, become convertible into a mechanism by fixing one link. The extreme flexibility of the electro-magnetic connection admits of many combinations of the simple electro-magnetic pairs for producing rotation, translation or helical motion.

Some Industrial Applications of Electro-Magnetic Machinery have been taken from among the many drills operated directly or indirectly by these means. Drilling operations admit of peculiarly compact and portable machines, and ready adaptation of either rotary or reciprocating motions produced and controlled by electro-magnetic means.

The Rowan Electric Drilling Machine, with an electro-magnetic clamping device, is shown in Fig. 13. The main frame *M F* is easily placed in position, and electro-magnetically clamped by the holding-down magnets *H M*, to the iron or steel plates to be drilled. The drill is then operated through the usual mechanism for increasing or decreasing the speed, from an electric motor, *E M*, mounted on the main frame *M F*. The feed is by hand, through the feed-gear *F G*. The drill can be moved over the work, along the guides *G*, *G*, by the transverse shaft, *T Sh*. The Willet's portable electric drill cuts holes two and three-eighths inches diameter through two and one-half inch steel armor-plates, in position on deck, in twenty-one minutes. This work formerly required two men, working a half-day each.

The Van Depoele Reciprocating Electro-magnetic Mining Drill is a good example of the direct application of a controlled reciprocating movement. The length of stroke is about five and one-half inches, and at every stroke the drill turns automatically one-eighth of a revolution about its axis, so that the drilled hole is truly cylindrical. The forward advance is made by a feeding-screw operated by hand. About two horse-power is absorbed in drilling holes from one and one-half inch to two inches diameter. In experiments at Frankfort, 1.4 inches diameter holes were drilled per minute, in gypsum blocks, to a depth of 7.9 inches with water, and 4.7 inches without water. In Odenwald granite, a hole 1.7 inches diameter and fifteen and three-fourths inches deep was drilled in ten minutes.* Two thick-wire outer-coils, 1 and 3, with a thin-wire inner coil, 2, are wound, side by side, and secured to an iron casing completely closing in the magnetic circuit, and so forming an efficient iron-clad construction. The drill-spindle is attached to an iron core introduced into the coils. The coils 1 and 3 are oppositely wound, so that they are equally and oppositely polarized, and connected up in series with the *rotating* brushes *R* and R_2 of the generating dynamo, or of the distributing motor-dynamo; these coils are therefore traversed by an alternating current. The coil 2 is connected at one end to the *fixed* brush F_2, and at the other end to the junction of the coil 3 with the rotating brush R_1; it is therefore traversed by a pulsating current, and exerts the chief magnetizing effect upon the reciprocating iron core, with a constant polarity. Speaking kinematically of this combination of electro-magnetic elements, forming an electro-magnetic kinematic chain composed of reciprocating pairs, it is seen that the motion of the iron core is determined to a definite extent by the constant direction (polarity) and variable energizing coil 2, in combination with the variable direction (alternating polarity) and variable energizing coils 1 and 3. Moreover, the iron core, as an electro-magnetic link, under the influences of its electro-magnetic pairing with the energizing coils, has its motion completely constrained. This electro-magnetic constrainment of motion of the iron core link of the chain constitutes the combination a true electro-magnetic mechanism; and when the electro-magnetic forces of nature can be compelled to do work through and by this electro-magnetic mechanism, we have a pure electro-magnetic machine. It is to be especially noted that the enveloping forms of the pairs of electro-magnetic elements are such that there is no contact of these elements, while in mechanically-connected pairs of elements the contact of the enveloping forms is a necessary condition to the constrainment of motion. It is therefore possible, in a pure electro-magnetic mechanism, to have constrained motion without the contact of material elements. Oftentimes practical considerations preclude the possibility of using electro-magnetically constrained motion; and it is found best to constrain the motion mechanically by the pairing of material elements; such as the cylindrical turning pair of elements in the dynamo or motor, and the cylindrical sliding pair of elements guiding the drill-spindle in the Van Depoele reciprocating drill.

Direct and Indirect Electro-Magnetic Machines are those in which the transmission of energy, through an electro-magnetic mechanism, is of a direct or of an indirect character, according to whether the electro-magnetic forces act directly at the point of application (as in the Van Depoele mechanism), or indirectly through the intervention of other mechanism, such as a train of wheel-work, as in the Rowan machine. The indirect transmission is, in fact, through electro-magnetically *actuated* mechanisms or devices, which are of themselves essentially of another system, or which call into operation other forces of nature than the electro-magnetic forces; such as the wheel-train of the Rowan machine, transmitting the energy by purely mechanical means, from the electro-magnetic mechanism of the electric-motor to the drill-spindle. It is to be remarked that the self-fixing or clamping device of the Rowan machine, acting as it does by the application of electro-magnetic traction, is an example of a locked kinematic chain, and that in this particular case such a locking, clutching or clamping action is brought about by the contact of material elements in the magnetic circuit. There are, however, examples of such a locking action with no contact of the material elements of the magnetic circuit, as may be seen in the Faraday copper-disc type of dynamo, used as a true electro-magnetic clutch or brake.

The diagram of the cycle of operations of the electro-magnetic mechanism of the Van Depoele machine will be presented in the next paper.

SUBWAY COMMISSION FOR NEW JERSEY.

A State Electrical Subway and Control Com-

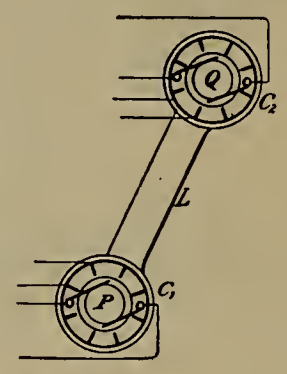

FIG. 11.

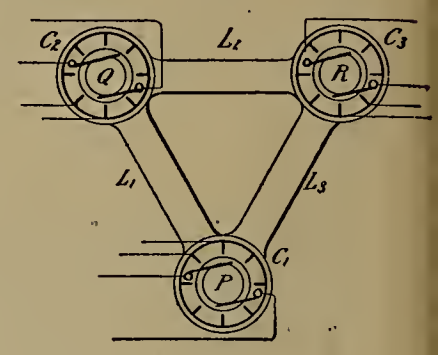

FIG. 12.

mission has been created by the Legislature of New Jersey. The act provides for the appointment of three commissioners for a term of five years, and until the appointment of a successor. The Commission is empowered to appoint a secretary, electrical expert, and such other agents as shall be necessary to carry out the provisions of the act. The duty of the commission is to examine the manner in which telegraphic, telephonic and electric light wires and cables used for the transmission of electricity are constructed and used in the cities of the state, and whenever in the judgment of the commissioners, which shall be final, the public welfare will be advanced by the removal of poles and burial of wires, it shall be the duty of the commissioners to order such poles removed and wires buried. In the event of any telegraph, telephone or electric light company desiring or being required to place its wires, or any of them, under ground, it shall be obligatory upon such company to

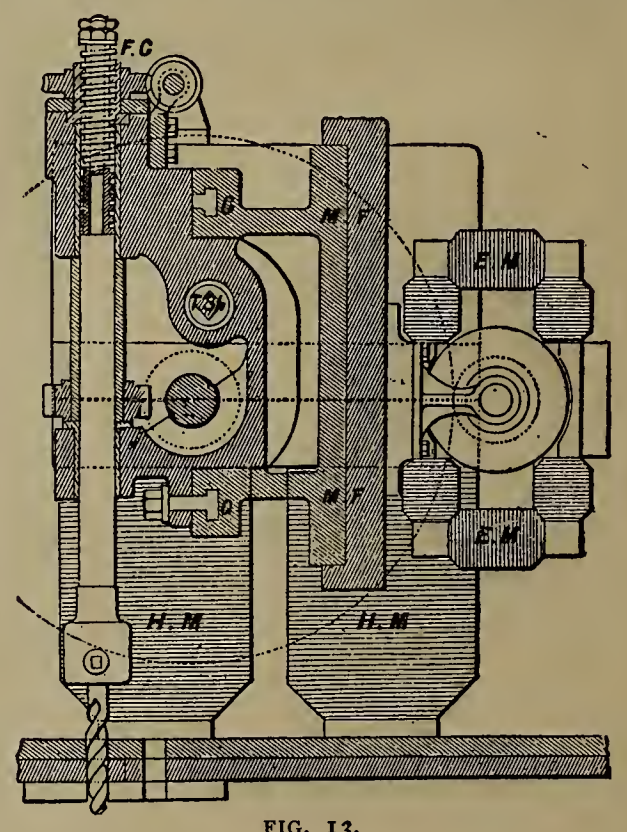

FIG. 13.

file with the commissioners a map or maps drawn to scale, showing the streets, highways or avenues which it is desired to use for such purpose, and giving the general location, dimensions and course of the underground conduits desired to be constructed; and furthermore, no such subway or conduit shall be constructed until a majority of the board shall approve of the plan of construction. It is also provided that the commission, for the purposes of the act, shall have control of all the avenues, streets, and highways of the cities of the state, and may authorize the construction of electrical subways and underground conduits beneath the surface of any such streets and highways, all powers of the local authorities being made subordinate to the powers granted to the board by the act. Hereafter, no telegraph, telephone, electric light or other electric wire shall be constructed along, across or above the surface of any street or any avenue in the State until ap-

proved by the board, other than wires owned by the State, or used for fire and police purposes.

All conduits and subways to be so constructed that they may be used by the city in which they are located without expense other than that of placing the wires in such subways or conduits. The board, after approving of plans for conduits or subways, is empowered to enter into contract with any person or corporation for the construction of same. In addition to the rentals charged there shall be assessed upon the companies using the conduits or subways an amount equal to the salaries and expenses of said board.

Messrs. Allan McDermott, Miles Ross and James Smith, Jr., have been appointed commissioners under the act, and they have appointed O. S. Wiley, of Orange, as the expert electrician of the commission. Mr. Wiley has had a great deal of experience in many branches of electrical industries, besides having been at one time a laboratory assistant of Thomas A. Edison.

SINGLE MOTORS FOR CARS.*

BY E. A. SPERRY.

(*Continued from page* 166.)

Each tooth in Fig. 3 is the line of radius, and all its elements are in the line of the cone. And it is a fact that the teeth of the pinion also point in the line of the apex of the cone, and when the axes coincide, as I have stated, there is no friction over and above

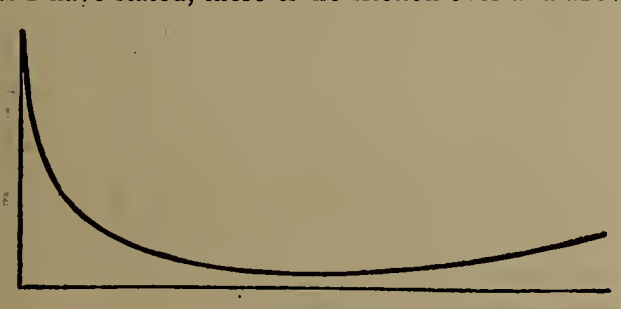

FIG. 4.

a spur-gear, but just as soon as they are allowed to come out of line—and I have drawn Fig. 3 that you may see the effect—those teeth bear on the top at one point and on the under side at the opposite point tending to wedge together and force themselves apart and bind when the axes is an angle as indicated at *II*. This shows the necessity for holding the alignment of the pinion-shaft with reference to the gear absolutely.

Another very serious matter is encountered in designing the equipment. A truck is a very peculiar thing, being one mass of loose joints. It must be so constructed to take short radius curves. Each axle must have lateral play with reference to the truck. It also must have a slight capacity for varying as to parallelism of axle; and at the same time each support at the journal-bearing must have a capacity to rise perpendicularly, individually, without reference to the other. In going over obstructions a wheel will rise, while the other three will maintain their position on the track face. To design gearing which will uniformly and simultaneously rotate these axles, and yet permit all of those motions, is one of the hardest mechanical problems that I have met. It cannot be done by mounting this axle, the pinion-

FIG. 6.

FIG. 5.

shaft, on projections of a truck-frame. If that were attempted the alignment could not be maintained, because the truck-frame rises and falls with reference to the axles, owing to the obstructions on the track; so after casting about, I am enabled to obtain very perfect results indeed by mounting it directly on the axle. For instance, building the armature with its shaft hollow, so that the pinion-shaft may pass entirely through it without touching and allowing thereby an additional advantage of the vibration which is transmitted from the axle to the pinion-shaft to take place freely without being transmitted back to the motor. This involves a peculiar transmitting device between the motor and the axle, one which will allow of the eccentric relation of the two shafts (not an easy thing to design) so that it will at all times perform its functions and at the same time not allow, as I say, the vibration, the hammering blows and concussion in this axle to run back into the motor.

There is one other matter with reference to this gearing that I wish to call your attention to. You will readily see that if either of the axles have an end-wise motion with reference to the truck independent of the other axle, and the end of the pinion-shaft is retained upon that axle and located with reference to the axle in a constant position, the mesh of the teeth will differ.

This difference has been so thoroughly overcome, however, that even a cast pinion and gear will run noiselessly when speeded up to thirteen or fifteen miles. It will run coming down grade even faster than that, with almost no noise whatever, with a thirty-inch wheel. That means that this gear at eleven miles an hour will run about 120 revolutions, and give it quite a high velocity. The gears have been laid out so that even on an irregular track, taking turn-outs, etc., there is no apparent noise from them. So much for the transmission.

Now as to the economy of current. There is one other factor in the absorption of current by two motors per car equipment than the one referring to its direct absorption for the power given. We have here a curve which was drawn by Mr. Pratt, in which the ordinates show the amount of extra current consumption by either one of two motors per car equipment, owing to the fact that they are coupled together and are compelled to revolve in union. It is certain that there is a want of uniformity of absorption of power in the case of two motors. One of the best contemporary authorities on this matter writes as follows: "It is found in practice that if * * * electric motors as ordinarily constructed and connected in circuits are belted to the same shaft, or are otherwise applied to the same work so that they must revolve together, the results are unsatisfactory, because of the fact that the load will be unequally or disproportionately divided. This is occasioned by the fact that it is very difficult, in fact almost impossible, to construct electric motors so that they will, with the same rate of rotation, and when supplied with current at the same potential, have precisely the same counter electro-motor force. Therefore, if two motors are connected, as ordinary, to the same supplying mains, and operated so that they must revolve together, that motor whose armature produces the lowest counter electro-motor force will take a larger current than the other motor. The effect of this increased flow of current is * * * to greatly exaggerate or enhance the difference existing between the motor, because the magnetic field of the motor is disturbed by the increased flow, and its counter electro-motor force is thereby still further reduced. This motor, requiring a higher speed to produce a counter electro-motor force, equal to that of the second motor, takes the bulk of the work and tends to drive the second motor as a generator * * * and the load is unequally divided between the different motors. It is practically impossible to make motors, running under the conditions mentioned, self-controlled by adjustments affecting only their own circuit."

It is a fact in practice, and it has been one of great interest to me, upon several occasions a street railway superintendent has actually removed one of the motors from a double motor equipment and has reduced the destruction of armatures in the neighborhood of 70 per cent. I know an instance, not many miles from this city, where the superintendent is an ideal superintendent, according to the street railway journals, from the fact that he is a civil engineer with railroad experience, a man in middle life. However this may be, this superintendent has made a success in this particular instance. This line has four grades on it, and in conversation with him he stated that he had removed in every instance one motor from the equipment and the burning of his armatures was reduced to 30 per cent. of its former value. This argues that there is no doubt the confusional or see-saw motion exists, and is continuous and persistent in its operation when two motors are coupled and operated together from a constant potential. I can cite other instances where from practice similar results of this kind have pointed to it very directly, and the curve that has been prepared for us to-night seems to me to be the first instance where the question has been worked out mathematically, and where the values have been assigned for motors that vary from each other, differing to the extent of their electro-motor force capacity for given speed.

The next point is economy in repairs. This needs but a passing comment. There are certainly less parts to wear, and if we can, as in a single large motor, run the motor at lower speed, the repairs will certainly be less in number and less in quantity. When taken in connection with the fact that when a single motor is used for car equipment it is possible to mount that motor in an entirely different manner, and in a manner that is calculated to meet the special requirements of the case, as compared with that where two motors are in operation, it is possible to still further reduce the wear and tear. In the case of single motor per equipment, the motor may be elastically supported and may be removed entirely from the sledge hammer concussion of the axle. The insulation, which is a large component of every motor, and which consists of cotton thread, something which cannot by any possibility stand the sledge hammer concussion, in this manner may be protected from the concussion and jar which is constantly going on in the axle.

The point which I wish especially to bring out, and I will try to be very brief in reference to it, is that where we have a single motor we are enabled to get a great deal more traction. The office of the motor on the car truck is for traction; it is placed there for the sole purpose of pulling the car about, and this result is accomplished through the adhesion of the wheels on the rails.

Now, I have been much interested in the increased traction when four wheels, six wheels and eight wheels have been coupled to the same motor, and experimenting along this line I have had an opportunity that has not presented itself to every one, to ascertain what this is. In conversation, not many days since, with one of the best authorities in railroad locomotive engineering, perhaps one of the best authorities in this country, I brought up the matter, and obtained from him a statement something as follows: That it is a well known fact that where two locomotives are used to pull a train the results are not satisfactory. Where two four-wheeled locomotives are used in the place of one eight-wheeled locomotive, and were the same total weight is on the drivers, the engine with the eight drivers will pull much more than the two engines with four drivers, each with one-half the same total weight on the drivers, leaving out of account the boiler running.

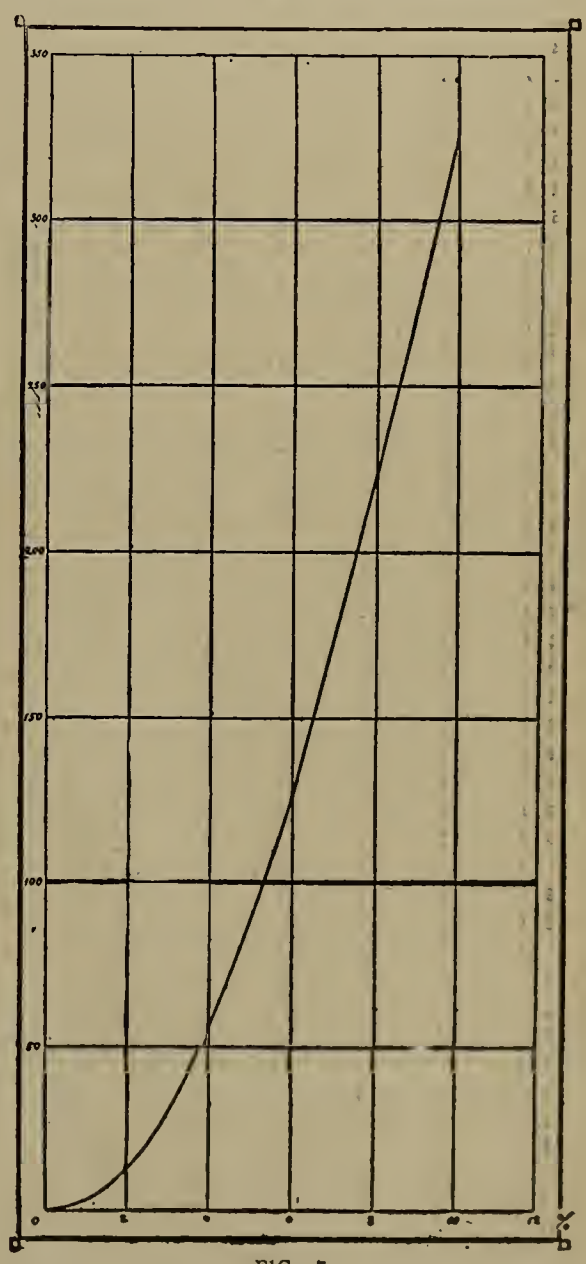

FIG. 7.

The only instance in which this will fail to be a better arrangement is where more speed is required. Where great speed is required two locomotives have an advantage on one, in that the four cylinders have larger total port areas than the two cylinders in an eight-wheeler and the wire drawing is less. This is merely an incidental factor, entirely foreign to the matter of traction. The single locomotive has this advantage over the double locomotive: all the wheels are coupled together and compelled absolutely to revolve simultaneously, especially with reference to their peripheral velocities. One can readily see if any wheel does get down to an actual contact with the rail it finds itself going at exactly the right velocity to help along rather than to slip, as would be the case if the peripheral velocity of the driver were different from the others.

I find different statements with reference to traction. It seems that the idea of adhesion and friction is something like the old idea of static and kinetic electricity, that they are entirely separate and distinct phenomena. I find in some works the state-

* Read before the Chicago Electric Club, March 21, 1892.

ment that adhesion should not be confounded with friction.

The fact is that adhesion and friction are doubtless the same thing, only, as in the case of static and kinetic electricity, it is a matter of degree. The friction not only varies with the pressure, irrespective of the surfaces, but also varies with the velocity; at zero velocity friction is very high. As the friction of quiescence disappears the curve of friction doubtless comes down and goes along almost parallel, and at high speed it is supposed by some to raise again, as shown in Fig. 4. Now, if this is not so I think it would be very difficult to explain one phenomenon, which in Chicago we have excellent opportunity to observe. It is a fact that the friction-brake used on all the South Side cable lines is operated by what is known as the momentum brake system, an invention of Thomas I. Jackson, of Cleveland. Here a double friction phenomenon exists; one controlling the other. On one of the axles is a loose friction disc which is held up by a lever under the control of the gripman against a rotating disc, fastened solidly upon the axle, and to the first disc is fastened the brake-chain which applies the brake-shoe to the periphery of the wheel. Now, in this case we have the reverse of the old way of trying the experiment by taking the resistance of the friction of quiescence and having it come down, as motion is given. It is often said that it is a poor rule that does not work both ways. In this brake-system, if the friction did go up it would be very apparent, much more so than in the ordinary application of brakes. Now what is the fact? The velocity is very great as compared with the loose stationery disc. Therefore we should expect to find the friction low, and we know that the initial reduction of the car is not great. But as the train is brought to a stand-still the curve of velocity drops off more and more quickly, and at last drops off very suddenly, and if you are hanging on the strap, as is usually the case, you feel your body, if you notice carefully, sway further and further, until at last, when rest is attained by the car, you give a sudden lurch ahead, showing that the resistance undoubtedly comes up as we should expect it to do. This gives a most excellent opportunity to observe this interesting fact.

When we speak of journal friction, the value of frictional quality is low as compared with adhesion, or the frictional phenomenon connected with adhesion. In the matter of adhesion on an ordinary 16 foot street car we have about 13,000 pounds per square inch applied; whereas in an ordinary journal we have only from 900 to 1,600 pounds per square inch, which is the highest journal friction in practice. But where we have such a severe application, where only a minute part of the surface is available, and where the wheel would tend to dig itself into or abrade the rail where the velocity differs, the phenomenon that we know as adhesion takes place, we are enabled to know one point on that curve. For instance, we know that friction between chilled cast iron and ordinary soft steel rail is as high as 20–24 per cent., even after a slight motion is attained. Furthermore, that by the application of silicate or sharp sand it can be raised as high as 42 per cent., even after slipping has set in. The idea of adhesion is undoubtedly one of molecular gear. Suppose a wheel surface to be magnified very greatly. In this case we find that the surface is always more or less rough, and when we reduce it to a molecular surface it must certainly be rough, as rudely shown in Fig. 5. In this case we have what may be termed a molecular gear, or gear and rack, and as they roll it might be said that the teeth mash. This is known as the friction of quiescence. We thus obtain the enormous pull that we observe in the high point of the curve. Now, then, why does the curve come down so rapidly? It seems to me that it may be readily explained by saying that the moment a slip takes place, and we can see by the curve that that is the critical moment, these teeth are stripped off; and we have what approximates a surface lift. We can almost illustrate it by an irregular line, moving the straight surface to the rear when the gear teeth has been stripped. See Fig. 6.

In my judgment this all goes to show that we must arrange our truck and our car equipment so that the first or initial slip will be prevented. It is a fact that has been observed that when a train is running double header, just as soon as the driver of one locomotive commences to slip on a heavy grade the drivers on the others will immediately commence to slip, although it has no mechanical connection with it whatever. The tractive power, which was very high, and which was exerting itself upon the load tremendously, just as soon as the slip occurs, is reduced and all the load is thrown on the other drivers, which are not equal to the increased duty required. In the case of an eight-wheeler the advantage exists in the fact that they are all coupled together and all must rotate in unison. When one driver tends to slip, it is held back to its place by its rigid attachment to all the other seven that do not happen to tend to slip at the same instant.

For the purpose of dynamos and motors, cast iron cannot be depended on to within 5%; therefore, two motors with cast iron fields built for the same armature speed when working on the same potential, may easily differ from one another in speed by 10%. There will be a further difference in speed due to unavoidable difference in winding, but this ought not to exceed .1% and may be neglected. Suppose two motors were built to run at 500 revolutions, one may make 475 and the other 525; now if the armatures of these machines are forced to revolve together, either the slower will pull down the speed of the faster, or the faster will increase the speed of the slower, or the speed of both will be affected. Consider the case in which the slower armature reduced the speed of the faster one, the result will be that the counter E. M. F. of the faster will be reduced and a greater current will flow through it. This will increase its torque to such an extent that the slower motor will be unable to hold it down; its speed will increase, raising that of the slower motor beyond its normal. This will raise its counter E. M. F. and a smaller current will flow. All of the work will then fall on the fast machine with the result that its speed will decrease, and then the cycle will be repeated.

Suppose the resistance of each motor were 2.5 ohms and under normal conditions each takes 10 ampères. The drop of potential in each will then be 25 volts, leaving 475 volts for the armature to produce as a counter E. M. F. Now suppose both were designed to make 500 revolutions, but in practice one made 475 and the other 525 when running independently, then, clearly, if the faster one is forced to run 475 revolutions per minute, it will produce an E. M. F. of but 430 volts which leaves 70 volts, and this will produce a current of 28 ampères through the 2.5 ohms of motor resistance. On the other hand, if the slow motor is forced to make 525 revolutions, proportion would indicate a counter E. M. F. of 525 volts, but as this is impossible it will simply run idle while the other motor does the work.

The line in Fig. 7 marked 100 shows height of ordinates of a 15 horse-power motor absorbing 10 ampères when the motor measures two and a half ohms, which is a high efficiency motor for the capacity. The height of the ordinates that intersect this curve at various points shows the amount of power absorbed or the amount of heat put into that motor, which is added to this amount of heat indicated by the above named line, when these motors are run together, and when they vary from each other a differing per cent., measured two, four, eight to ten per cent., so that the height of the ordinate intersecting the curve should be added to the height of the ordinate indicated by 100 to obtain the total amount of heat in the motor.

In the curve the ordinates represent the relative amounts of heat lost for various percentage differences in two motors, over and above the heat normally lost in the motors.

The red line represents the normal heat loss. The curve shows an additional heat loss due to the difference of the motors equal to the normal loss when the machines differ by a little over $5\frac{1}{2}$%.

UNDERGROUND CONDUITS.

"Is there any reliable method of laying electric light wires underground?" is a question that is frequently asked but not easy to answer. A reliable and economical system, it would seem from the report of the Committee of the National Electric Light Association on Underground Conduits and Wires, is yet to be devised.

The report of the committee on this subject, which was read at the convention in Buffalo last February, gave a general description of the various systems in use in this country and various cities in England, and concludes with the following interesting observations:

"After a careful and extensive examination of nearly all underground work in this country the fact has been developed that, with very few exceptions, the system and plans heretofore adopted have proved a failure; in some cases caused by improper materials, insufficient insulation, and in many cases, carelessness in laying the conduit or drawing in the cable, and in a large majority of cases, from using cable with too thin an insulation. High-tension currents can be carried in conduits successfully if the conduits are properly built and cables thoroughly insulated and carefully drawn in, but it is absolutely necessary that all work and materials should be first-class, no half way business or effort to scrimp and save expense by thinly insulated cables or poor construction.

"Investigation plainly shows that a large number of the troubles on underground cables have been caused by workmen in the manholes, as the employés of all companies have access to same; employés of one company have been extremely careless while working over the cables of a competing company and trouble has followed. This shows conclusively that each company should own and control exclusively the conduit in which their wires are placed. The plan of renting conduits is not productive of good results unless the legislatures of the various states pass a law regulating the charges made for rental, and this should be the aim of the National Association, to see that laws, properly controlling the price charged for rental and use of conduits, are passed in all the states where same are used.

"A serious trouble in underground work has been caused by drawing in the cables. This is a very important part of the business, and should only be intrusted to reliable and experienced men, as the least injury to the insulation, while it is being placed in the duct, will surely develop and cause trouble, and many of the burn-outs have been caused in this way. No matter how good an insulation you may have, if it is cut or injured while passing it into the duct, you can depend upon it that this special place will give you notice before long, and in a way that will severely test your ability to obey one of the Ten Commandments.

"Some substance must be used for the conduit that will withstand the action of the gasses, soil, etc., and also resist the affectionate embrace of the Irishman's pick, used in excavating and repairing streets; iron is not desirable, as under certain conditions and places it will be destroyed in a few months, leaving your cable exposed; cement alone cannot be relied upon; wooden conduits soon decay, besides absorbing large quantities of moisture. It would seem that glazed terra cotta, or like substance, set in concrete was the most reliable, and with a cable first insulated with not less than $\frac{1}{4}$ inch of pure rubber, this covered with a heavy braid well insulated, over this a covering of lead, and then a heavy and substantial braid, saturated with a good compound, will give satisfactory results, and can be used with high-tension currents successfully and without being troubled with burn-outs or grounds. But this entails a large outlay for conduits and cables.

"There is one feature of the business upon which all examinations and reports agree—that is, that the underground plan has been in use for so short a time that it is impossible to give a fair comparison of the cost of maintaining aerial and underground circuits; but it is conceded that the expense of maintaining underground cables is far greater than aerial; also that the durability of conduits and cables, in many cases are mere conjecture, as they have not been used long enough to test their ability to stand the action of acids, gases, and various other requirements, which can only be determined after a sufficient time has elapsed.

"In cities of less than 200,000 inhabitants, compelling companies to place their wires underground will practically prohibit the use of electricity for lights, and leave the inhabitants of those cities to meander through the streets, guided by the sickly rays of the kerosene lamp, or the feeble flutter of the gas burner, as no electric lighting company can afford the expense that this would incur, unless they could obtain double the prices now paid for lights.

"The expense of conduits and underground cables is so heavy that they can only be adopted in a few of the larger cities, thickly settled, and then the electric lighting companies adopting them must be paid a higher price for service, or eventually their company will be bankrupted by the expense and loss entailed. Therefore the taxpayers in any city, who demand that wires shall be placed underground, want to realize the fact that this move means increased cost for lights and larger taxes to pay for same. From data obtained, it is evident that nearly all the cities could be served with aerial lines for the high-tension current in a more acceptable manner and at less expense than with underground conduits, and they could be so arranged as to be perfectly secure and not in any way endanger the public or mar the general appearance of the streets."

ANNUAL MEETING BELL TELEPHONE COMPANY.

At the annual meeting of the American Bell Telephone Co., held in Boston, Mass., March 29, it was decided to increase the capital stock $2,500,000, making a total of $17,500,000, and that the present stockholders might have the first chance to profit by the increase in the proportion of one new share for six old shares at par. The right to subscribe will expire at 2 P. M. on May 15, 1892, and all stock not taken by subscriptions then on file at the treasurer's office will be disposed of as the directors shall determine. The report shows net earnings of $3,126,819 against $2,869,418 for the previous year, and $2,661,888 in 1889. There are 512,407 telephones in use in the United States, requiring 266,456 miles of wire and giving employment to 8,376 persons. The estimated number of telephone connections daily in the United States, made up from actual count in most of the exchanges, is 1,584,712, or a

total in the year exceeding 500,000,000. The total revenue reported by all the companies was $1,638,653.29, and of this sum the extra territorial lines included $763,358.71, of which last sum $42,142.33 went to the company. There are 71,506 miles of underground wires in use—one-quarter of all the mileage in the country.

The old board of officers was unanimously re-elected. They are: Clerk, Charles Eustis Hubbard; Treasurer, William R. Driver; Directors, Thomas B. Bailey, Francis Blake, Charles P. Bowditch, George L. Bradley, Alexander Cochrane, William H. Forbes, Henry S. Howe, Charles Eustis Hubbard, Gardiner G. Hubbard, John E. Hudson, Charles E. Perkins, Thomas Sanders.

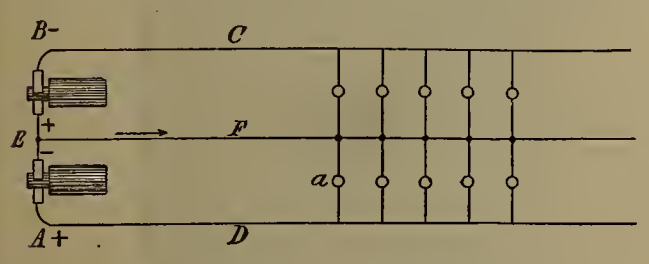
EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

The Edison Three-Wire System.

One of the largest items of expense in an electric-light system is that for the copper wire which must necessarily be used. Copper is used on account of its low resistance. When the current is to be carried a long distance from the generating station the large amount of copper necessary is liable to prove a serious obstacle financially, and various methods have been devised to reduce the amount of copper without impairing the efficiency of the system.

The most effective of these methods is the Edison three-wire system, which is very successfully used in many cities. It consists of coupling two dynamos together in series and connecting the supply mains one each to the outside terminals of the dynamo, as



THREE WIRE SYSTEM.

shown in the accompanying illustration, then running a third wire parallel with the mains, connecting it with the dynamos at the point where the two machines are connected with each other.

Referring to the figure, A and B represent the two dynamos connected in series, the — terminal of A being connected with the + terminal of B, the supply wires C and D being connected respectively with the —terminal of B and the + terminal of A. At the point E the third or neutral wire, as it is generally called (F), is connected. The office of this third wire will be explained presently.

As shown in the figure, there are an equal number of lamps connected between C F and F D. Now so long as the number of lamps on each side of the neutral wire remains unchanged no current will flow along the third wire. The current created by the dynamos, which in this case will have twice the pressure that the current from one machine would have, flows from A along D through the lamp circuits connected with D and F, thence through the lamps on the circuit C F, along C to B, then to the starting-point, none of the current flowing through F, except that portion which it must traverse in order to reach the lamp-circuits on the other side of the system.

Supposing we turn out one lamp between F and D, *a* for instance, there will be then four lamps on one side of the neutral and five on the other. Now the third wire F is called upon to do some work. When the lamps are equal in number on both sides, that portion of F between the lamp nearest the dynamos and the dynamos themselves might just as well be cut out; but in practice it is extremely rare that the number of lamps are exactly balanced. There is always a difference, and it is when this difference exists that F is called upon to perform its important functions.

On extinguishing lamp *a* we increase the resistance of that side of the system as compared with that on the other side, by closing one of the avenues for the passage of the current. When this condition exists a current will flow through F in the direction indicated by the arrow. The value of this current will equal the difference between that required for four lamps on one side and five lamps on the other, and will be just enough to supply the deficiency to the five lamps caused by the extinguishing of the lamp *a*.

Should another lamp be extinguished on the same side with *a* the resistance of that side will increase still further, and less current will be required to supply the remaining three lamps, but the five lamps on the other side will require just as much current as they did before, and F carries double the amount it did for *a* in order to supply the deficiency created by the cutting out of the second lamp.

In case all the lamps should be cut out on one side (which never happens in practice, however), the middle wire F would have to carry all the current necessary to supply the five lamps, and would thus become one of the main feeders.

What has been said with reference to extinguishing lamps on one side applies equally well, of course, to the reverse conditions. In practice the number of lamps installed is made as nearly the same on each side of the neutral wire as possible.

The three wires are confined in one tube and laid underground, and are imbedded in a hard insulating compound, which is run into the tube in a molten condition.

This system affords many interesting points for study which suggest themselves. For instance, it shows that the greater number of paths we present for the flow of current the greater will be the current flow. This is in entire obedience to Ohm's law, which is that the current is equal to the electro-motive force or pressure, divided by the resistance which the latter encounters. If we have but one lamp in circuit it may offer a resistance of, say 10; if we switch another lamp in, we present an additional path for the flow of the current and consequently reduce the resistance to the flow, and, according to the rules for the calculation of derived circuits, the combined resistance of the two lamps will be 5, hence the current will be increased in proportion to the decrease of the resistance.

EXTRACTING METALS BY ELECTRICITY.

One of the most important applications of electrolysis is the separation of metals from their ores, or reduction of ores, as it is usually called. The crude ores are first reduced by chemical means to salts capable of being electrolyzed, or decomposed by the electric current. The principal ores that are reduced in this manner are those of gold, silver, copper, zinc, lead, magnesium, aluminum and sodium.

Bunsen was the first one to separate metals from their ores by electrolysis. This was in 1854. By this process he obtained aluminum, barium, sodium and magnesium, operating on the chlorides of these metals.

Sir Humphrey Davy obtained potassium and sodium from potash and soda, experimentally, in 1807.

Bunsen's method of reducing ores consisted mainly in submitting the fused chlorides to electrolysis in a glazed porcelain crucible, maintained at a red heat, and divided into two compartments by a porous earthenware partition reaching nearly to the bottom. He used coke carbon electrodes, the metals going to the cathode and the chlorine to the anode. Bunsen's method of reducing aluminum was subsequently improved on by St. Claire Deville.

Becquerel, about 1885, obtained silver, copper and lead from their ores by the electrolytic process. He first reduced the silver ore to a chloride and the copper and lead ores to sulphates.

The economical production of current by dynamos has revolutionized the earlier methods of the reduction of ores by electrolysis, which was by battery currents. The batteries were expensive to maintain; but even the dynamo current is not always the most practical or economical.

The salts still generally employed are the chlorides, though the sulphates, nitrates and acetates are preferable for some metals.

The manner of preparing the salts from their ores is by roasting, fusing, pulverizing, treating with acids and other operations according to the nature of the ore and other conditions. The salts are afterwards reduced to liquid form, either by fusion or solution in water.

LEAKAGE IN DYNAMOS.

It is a well known fact that in every dynamo the magnetic force necessary to develop the field in which the armature revolves is always greater than that which is usefully employed, that is to say, more lines of force are generated than actually pass through the core of the armature, the discrepancy being attributable to leakage at different points. To find out the amount and location of the leakage, ascertain exactly the ratio of lines of force actually generated to the lines passing through the core of the armature. This ratio will always be greater than unity. Some of the lines pass directly from one limb to the other, and some leak out of the yoke to the pole-pieces.

By placing a galvanometer in circuit and observing the deflections, the number of lines of force cutting or cut by a coil of wire in two or more given fields can be compared. The galvanometer must be a delicate one, as the resulting E. M. F. is usually comparatively low.

TRANSFORMING MECHANICAL INTO ELECTRICAL ENERGY.

When a wire through which a current is passing is placed in a certain position in any electro-magnetic field, it has impressed upon it a definite mechanical force tending to move it into another part or out of the field; and when a conductor is mechanically moved in a field transversely to the lines of force traversing that field, a certain electro-motive force is determined, which sets up a current in the wire if its two ends are connected. Extensive use is made of both these effects in practice, and on a very large scale. Machines which are constructed to transform energy which exists in the form of electric currents into energy in the form of mechanical motion, and, conversely, machines which are able to transform energy in the form of mechanical motion into energy in the form of electric currents can be included under the generic head of dynamo-electric machinery.

In every machine for the conversion of energy, there is always a certain amount of loss attending the conversion; in other words, less energy appears in the new than existed in the original form. The more perfect the machine the less does this loss become, so that a theoretically perfect machine would be one in which there is actually no loss at all. It is absolutely impossible to construct such a machine, but in every case the chief aim of the engineer should be to make the loss as small as possible, or to make the machine as efficient as possible. The proper way of doing this is to start with the fact established in accordance with the doctrine of the conservation of energy: that energy can never pass out of existence or be destroyed; that, therefore, the whole of the energy put into the machine reappears in some shape or form, although only a part appears in the exact state in which it is desired. Steps should then be taken to ascertain exactly what form the other part takes, and the designer of the machine should study how to reduce that same part, which may be called "waste," to a minimum. In all machines which have moving parts a certain percentage of the energy takes the form of heat, due to friction at the bearings and other surfaces which come into contact. Every dynamo has moving parts, and is therefore subject to loss from this cause, and the well-known methods of reducing friction by good workmanship and design, and by the judicious use of oil or other lubricant, are taken advantage of to minimize the loss. But there are many other causes besides mechanical friction which operate to reduce the efficiency of a dynamo; they are mainly due to electro-magnetic phenomena, and careful study is required in discovering how to eliminate or minimize them, although in some instances the loss may be readily localized, because, like friction, these phenomena convert a certain amount of the original energy of the mechanical motion into heat. One of the principal features, then, by which a dynamo is judged is its efficiency, or by the ratio of the energy reappearing as electric currents to the total amount given mechanically to the machine.

ANSWERS TO INQUIRIES.

EDITOR ELECTRICAL AGE:—I would like to ask you what are the dimensions of arc light carbons, and why are they coated with copper on the outside?

ERIE, PA. J. R. P.

Answer.—The usual length is 12 inches, but the diameter varies according to the strength of the current and candle-power of the light for which the carbons are intended. They range from $\frac{7}{16}$ of an inch for 1,200 candle-power light to $\frac{9}{16}$ of an inch for 3,000 candle-power light. Carbons are coated with copper to reduce their resistance.

EDITOR ELECTRICAL AGE:—I am thinking of getting a dynamo for plating purposes, and I have had so much advice given me regarding the winding, etc., that I know no more about the subject now than I did when I first began my inquiries. Will you please inform me what kind of a machine I should get and in what respects a plating dynamo differs from any other. H. G. D.

EVANSVILLE, IND.

Answer.—A plating dynamo differs from machines used for other purposes in that it is wound for a large current of low tension—that is, with large ampèrage and low electromotive force. Its internal resistance must be kept very low; this is attained by using wire sufficiently large to carry the current without danger. In general terms the resistance of the armature should be about $\frac{1}{20}$ the working resistance of the circuit outside of the dynamo, which includes the electrolytes in the vats, wires, etc., and the field-magnets should have a resistance 20 times greater than that of the working circuit, outside of

the dynamo. The armature coils should be connected in shunt with the field-magnet coils. This is to insure constant current under varying loads, and to prevent reversal of magnetism in the dynamo. All solutions through which an electric current has passed constitute in themselves a galvanic battery with the articles being plated and the anodes of the battery as elements, and unless proper precautions were taken, such as by winding the dynamo field-magnets in shunt with the armature, this current might be sufficient to reverse the polarity of the dynamo.

Editor Electrical Age: In the armature coils of a dynamo is only one current generated; that is, does the current vary between its lowest and highest value in one revolution? R. H. M.

Bound Brook, N. J.

Answer.—Two currents are generated in the armature coils during each revolution; one during each half revolution. Each coil, in one revolution, passes through two neutral points where the currents reverse.

AGAINST THE WESTERN UNION.

Justice Brewer of the United States Supreme Court rendered a decision, March 30, annulling the contract existing between the Western Union Telegraph Company and the Union Pacific Railroad Company, by which the former company conducts the commercial telegraph business on the latter's lines. The case was originally begun in the Circuit Court for Nebraska under the title of the United States *vs.* the Western Union and Union Pacific Companies, in accordance with the provision of the act known as the "Anderson law," which provides that any railroad or telegraph company that had been aided in its construction by the United States shall be required to operate all such lines by their own officers and employés and exercise by themselves all franchises conferred. The primary cause for the suit was the effort of the Postal Telegraph & Cable Co. to secure for itself equal rights with the Western Union Telegraph Co. for the transmission of messages to the Pacific Coast.

It has been stated by Dr. Norvin Green, president of the Western Union Telegraph Company, that an appeal will be taken from the decision of Justice Brewer setting aside the contract made in 1881 between the Western Union and Union Pacific Railway Companies.

AN IMMENSE SUBMARINE CABLE.

The International Okonite Company, Limited, recently shipped from its factory at Passaic, N. J., to go South, a two mile submarine cable in one length, composed of 20 conductors. Its total weight was upwards of 70,000 pounds. Its manufacture was accomplished through the agency of new machines which have recently been put in operation at the Passaic works, and tends to show the progress made by the Company in not being satisfied with remaining quiet, but continually endeavoring to improve its machinery for the production of high class insulated wires and cables.

We are informed that the International Okonite Company (limited) has closed a contract for laying underground in the city of Manchester, England, wires for the purpose of lighting the city. This wire will in all probability be made in its Manchester factory, which is now completed and in running order, thereby relieving the Company of a tremendous strain on its facilities for turning out goods for export and interfering with its American trade.

NEW BOOKS.

A Guide to Electric Lighting. By S. R. Bottone. 189 pages, profusely illustrated. Published by Macmillan & Co., New York. Price 75 c.

In this work the author has endeavored to demonstrate in a clear and succinct manner the means by which electricity can be made subservient to the purposes of illumination and the transmission of power. He has certainly succeeded in the attempt, and the book will be found to contain invaluable information to both amateur and householder.

STORM.

On March 26, during a storm which was the heaviest ever experienced in Omaha, Neb., nearly all of the overhead wires, with which the principal streets of the city were filled, broke down. The electric street railroads had to suspend operations, owing to the mass of telephone and telegraph wires which kept constantly breaking and falling across the circuits. Many horses were killed by coming in contact with the live wires, and several persons received severe shocks. A number of telegraph poles between the city and Council Bluffs were blown down, and telegraphic communication interrupted until the damage was repaired.

"SEA BREEZE" ELECTRIC FAN.

As summer is fast approaching with its accompanying evils of flies, mosquitoes and all the other etceteras which tend to make man's life miserable during the heated term, preparations should be made in good season to prevent these annoyances as much as possible. Nothing will help to accomplish this so much as the possession of a good electric fan. The one described herewith possesses advantages claimed not to be equalled by any other fan.

It is called the "Sea Breeze"—minus the salt—and when in operation, even though the thermometer be well up in the nineties, its gentle zephyrs will soon permeate the heat-laden room with most delightful results. The special feature which it is claimed makes these fans superior to all others invented is to be found in the patent oscillating and rotary motions, which, while creating a current of air, distributes the same so equally that the temperature is the same in all parts of the room, at the same time overcoming the objections and unhealthy effects of being under a continuous current of cool air as produced by the ordinary revolving fan.

In construction, the field-magnets are forged and the armature well constructed, resulting in the highest efficiency with least amount of current. The armature is of the Gramme ring pattern, and attached to the shaft by an improved method. A new process is used in hardening the commutator segments, by which their life is greatly prolonged. All parts liable to excessive wear are hardened and ground. All brass portions are finished in nickel, and the best of material and workmanship used throughout. These fans will be found invaluable in the home, office and public resorts. They are made by the La Boiteaux Electric Motor Fan Co., Cincinnati, O., in different sizes to suit the requirements.

PORTABLE TACHOMETER.

Queen & Co., Philadelphia, are just placing on the market a new portable tachometer which has peculiar advantages that render it of great value for instantly determining the speed of rotating shafts.

Three spindles are geared to the rotating parts inside of the case, each one of them having a separate scale on the dial, so that the indications are direct reading throughout. A detachable point, with slightly flexible end, to fit any of the spindles, is supplied, the flexibility of which acts as a safeguard, for if made perfectly rigid there is danger of breakage when not appled exactly at right angles to the shaft.

A scale to correspond with each spindle is graduated on the dial, and the ranges covered are: 40 to 200, 120 to 600, and 600 to 3,000, which gives a maximum capacity of 40 to 3,000 turns per minute. A conveniently shaped handle is attached to the body of the instrument, so that it can easily be held in the hand.

The apparatus is well made and presents a handsome appearance, the different parts being nickel-plated.

A tachometer like this is very desirable for both expert and practical work, and those interested in the subject should write to the makers for a copy of circular No. 310.

INSULATION OF HIGH VOLTAGE CURRENT.

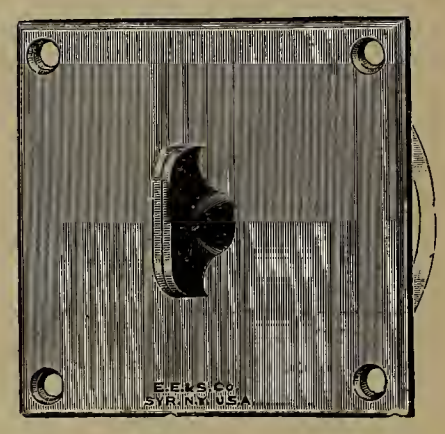
The success of the long-distance transmission of power between Lauffen and Frankfort, Germany, last year, and the recent experiments of Mr. Nikola Tesla before the Royal Institution, London, have awakened considerable interest among electricians on the subject of insulation of currents of very high voltages.

Some interesting experiments were made on March 11 last at the Central Institution, London, by H. B. and W. Fox Bourne, with a view to determining the insulating properties of many of the substances commonly recognized and accepted as insulators.

The Messrs. Fox Bourne on this occasion, by means of a transformer of a new pattern, obtained a current of about 75,000 volts. The following account of the experiments is given in the London *Daily News* of March 12:

The principal materials experimented with were an ordinary telegraph insulator, such as is employed for the wires overhead, plates of glass, ebonite, slate, asbestos fibre, wood, and various kinds of oil. The telegraph insulator having been placed in circuit, the pressure was gradually increased, and at 70,000 volts the current cracked it. With regard to this experiment Mr. H. B. Fox Bourne explained that with a transmission plant working by means of overhead wires at even 40,000 or 50,000, it would be difficult to avoid "creeping discharges" over the surface of the insulators. The insulator might insulate if it could be kept absolutely clean and dry; but this was an impossibility. While the experiment was in progress, indeed, with the lights in the lecture-room lowered, the creeping discharge referred to became visible some little time before the breaking pressure was reached. The best of all insulators, the experimenter added, was air, if you could get enough of it; but as to this it was now doubtful how much was required, the "sparking distances" recently obtained being such as to upset all established notions on the subject. An experiment was here made with a view to showing that the sparking distance across ebonite was much greater than across air. It was also sought to be shown that a plate of ebonite $\frac{1}{8}$ of an inch in thickness was penetrable. The current did, in fact, pass with the ebonite in circuit, but as the plate of this material was small there was a doubt as to whether the electricity did not jump round it, and this experiment was not regarded as conclusive. Plates of glass were, however, penetrated easily, and slate, asbestos fibre and wood were shown to be very inferior as insulators.

The experiment with the piece of wood, which was a thin board about two feet in length, yielded some peculiar results, due apparently to the fact that this substance is a sort of mosaic of conducting and non-conducting areas. As the pressure was increased,



FLUSH SWITCH.

beads of fire appeared in the wood at intervals of a few inches, showing that a number of small arcs were being formed inside, and these increased until the whole block burst into flame. The heating effect, it was explained, manifested itself in most solid insulators, and was very marked in glass.

With regard to fluid insulators, the experiments did not seem to show much difference between one kind of oil and another, though if this material were employed in the insulation of cables, as has lately been suggested, it would of course be necessary to select oil which had no chemical action on copper. Castor oil, paraffin, and resin oil were shown to have a very good insulating effect. When some dust was thrown into the fluid it was found that the current used the floating particles as so many stepping-stones in order to pass through it, and the insulation practically ceased. The heating effect, so marked in the solid insulators, appeared in these fluids to be almost absent. At the conclusion of their insulating experiments, the Messrs. Fox Bourne expressed the opinion that, owing to the danger of "creeping discharges," a cable overlaid with a coating of rubber a foot thick would be useless for the conveyance of a pressure of 30,000 or 40,000 volts if the insulating material contained the smallest crack.

FLUSH SWITCH.

We illustrate herewith the new Flush Switch recently designed and put upon the market by the Electric Engineering and Supply Co., Syracuse, N. Y.

The time is rapidly approaching when the clumsy devices which have heretofore been tolerated, in connection with electric lighting apparatus, will become things of the past. The unsightly bumps on the wall which have for many years answered the purpose for controlling incandescent lamps will, we think, within a very short time be superseded by switches with a much more beautiful design; and this style of switch we think at least a step in advance of what has heretofore been used for this purpose.

NEW INCORPORATIONS.

Metropolitan Duplex Fire Alarm and Police Signal Co., Portland, Me., incorporated March 19 with a capital stock of $500,000, to manufacture and deal in fire-alarm systems and other electrical apparatus.

Incorporators: Albert Watts, Boston, Mass.; James Stephenson, Philip K. Dumaresq, Brookline, Mass.

Electrical Piano Company, Newark, N. J., incorporated March 19, with a capital stock of $300,000. Incorporators: J. Stahl, L. Schiff, J. Schoenhaar, F. A. Feld Kamp, Newark, N. J.

The Mexican Electric Steam Boiler Compound Company, Chicago, Ill., incorporated March 21 with a capital stock of $100,000. Incorporators: C. M. Lawson, John H. Pritchard, J. R. Perry.

The Delafield Construction Company, Jersey City, N. J., incorporated March 23, with a capital stock of $100,000, to construct, build and equip railways and electric light works. Incorporators: T. Delafield, W. G. Cook, New York, N. Y.; R. N. Billings, Passaic, N. J.

Portland West Side Railway Company, Portland, Ore., incorporated March 21, with a capital stock of $600,000, to construct and operate railways and tramways to be operated by electricity, steam or otherwise. Incorporators: R. L. Durham, T. A. Wood, F. R. Cardwell, all of Portland, Oregon.

Kingston City Electric Railway, Kingston, N. Y., has been incorporated with a capital stock of $175,000. Incorporators: L. S. Wenne, E. H. Loughran, C. W. Deyo, all of Kingston, N. Y.

The Hinton Electric Light and Power Company' Hinton, W. Va., incorporated March 24, with a capital stock of $50,000. Incorporators F. R. Van Antwerp, J. A. Parker, L. P. Graham, all of Hinton, W. Va.

Storm Lake Electric Light and Power Company, Storm Lake, Ia., incorporated March 24, with a capital stock of $25,000. Incorporators: Edgar E. Mack, Z. C. Felt, E. C. Coles, Storm Lake, Ia.

The Electric Company of America (incorporated in W. Va.), New York, N. Y., incorporated March 23, with a capital stock of $3,000,000. Incorporators: Egbert Titus, W. E. Osgood, Worth Osgood, Brooklyn, N. Y.

Austin Electric Company, Austin, Minn., incorporated March 23, with a capital stock of $50,000. Incorporators: H. M. Byllesby, H. C. Levis, B. F. Week, Jr., W. P. Johnson, St. Paul, Minn.; W. S. Pierce, Austin, Minn.

Glenwood Electric and Power Company, Glenwood, Ia., incorporated March 24, with a capital stock of $20,000. Incorporators: W. H. McClusky, J. H. Howe, Glenwood, Ia.

The O'Neil Crossing Alarm Company, Chicago, Ill., incorporated March 28, with a capital stock of $500,000, to manufacture, buy and sell railway crossing alarms and electrical railway appliances. Incorporators: W. D. Drake, J. C. O'Neil, W. P. Johnson.

The Johnson's Creek Electric Light and Power Company, Johnson's Creek, Wis., incorporated March 26, with a capital stock of $2,000. Incorporators: J. D. Bullock, G. C. Mansfield, H. C. Christians, H. J. Grell.

White Fish Bay Water, Light and Power Company, Milwaukee, Wis., incorporated March 26 with a capital stock of $50,000. Among other things it will build and operate electric light plants. Incorporators: C. R. Gether, D. Harlow, H. W. Gilbert.

E. F. Brooks Gas and Electric Light Fixture Company, Alexandria, Va., has been incorporated with a capital stock of $25,000. Incorporators: E. F. Brooks, W. F. Brooks, L. H. Schneider, C. W. Meyers, E. T. Bates, Washington, D. C.

ENGLISH EXHIBITS AT THE WORLD'S FAIR.

At a recent meeting of the Committee on Display at the World's Fair, held in London, William Henry Preece, F.R.S., the distinguished expert, being in the chair, it was developed that there was every prospect of British electrical interests being adequately represented at the Fair. It is understood that the display of engines and dynamos will be particularly good, and it is expected that the room devoted to the exhibits will be lighted with furnishings of English pattern similar to the style which proved to be such a great attraction at the recent Crystal Palace exhibition.

CHICAGO NOTES.

The electric subway laid at the Fair grounds up to date is 2,850 feet, which comprises 351,964 square feet of lumber.

Night work has been begun on the Electricity Building at Jackson Park and will be kept up from now on.

Work at the World's Fair site is being pushed with all possible speed and vigor. The Electricity Building is well advanced, the framework for all the towers up to the main entrance line is completed, about one-third of the gallery floor has been laid, and the roof boarding completed over the gallery trusses.

Four electric stamp cancelling and post-marking machines have been ordered by the Government for use in the Chicago Post Office, and will be put in operation April 1. It takes nearly one hundred boys to do the work of cancelling as it is done to-day, but by the use of these machines the number will be greatly reduced, each machine requiring only four boys to feed it. The capacity of each machine is 30,000 per hour.

It is given out that the surveyors engaged in lining out the route of the Chicago and St. Louis Electric Railway have reached less than one mile distant from Fairbury, in this State. The party is progressing at the rate of about six miles a day, and will reach Chicago about April 10 next. The incorporators of this road claim to have control of a patent on a high speed motor capable of making one hundred miles an hour, from which they expect to make enormous amounts of money, after they have demonstrated the practicability of the invention, which they claim will revolutionize railroading. They expect to have the road in operation by May, 1893.

A new telephone ordinance for a corporation known as the Long Distance Two-Wire Telephone Company has been introduced into the Board of Aldermen by Alderman Plowman. A franchise is to be granted the new company to construct, maintain and operate for a term of twenty-five years a line or lines of conduits and wires or other electrical conductors with all necessary feeders and service wires, to be used exclusively for the transmission of electricity for the purpose of transmitting sounds and signals. Provision is also made regulating the charges, which shall be $75 for the first year, $70 for each subsequent year and $65 per year for a three-years' contract.

If the Thomson-Houston Company wishes to supply any of the electric generators for furnishing power at Jackson Park, it will have to do so free of cost. Its bid for furnishing generators was at the rate of $15.78 per horse-power. The Eddy Electric Manufacturing Company, Windsor, Conn., has agreed to furnish 1,000 horse-power at $2.50 per horse-power, and the Mather Electric Company, of Manchester, Conn., an additional 804 horse-power at the same rate. The entire amount required is 3,351 horse-power, and the construction department has decided that the remaining 1,547 horse-power must be supplied as exhibits, and without cost to the Exposition Company.

NEW YORK NOTES.

Office of the Electrical Age,
First Floor, World Building,
New York, April 2, 1892.

The Brush Electric Light Company has moved its office from 36 Union square to 115 Broadway.

Mr. Andrew L. Riker, electrician of the Riker Electric Motor Company, 45 York street, Brooklyn, N. Y., gave the Electrical Age a call during last week.

Mr. Henry Hine, manager of the Stanley Electrical Company, Pittsfield, Mass., and Mr. L. Warfield, manager of the Detroit Electrical Works, Detroit, Mich., were in town during the week.

H. G. Madden, manufacturers agent, 18 Cortlandt street, has moved to Rooms 109–110 Electrical Exchange Building, 136 Liberty street, where he has greater facilities for carrying a much larger line of supplies.

The Mather Electric Co., Manchester, Conn., manufacturers of the celebrated Mather system of incandescent lighting, has found it necessary to open an office in the Bennett Building, Nassau street, owing to the phenomenal demand in this city for the installation of its system.

The Perkins Electric Lamp Co., of Boston, Mass., manufacturers of the famous Perkins' Lamp, has, owing to its increasing business, opened an office in the Bennett Building, Nassau street, this city. The efficiency of the Perkins' Lamp is so well known that comment is unnecessary.

Mr. G. G. Ward, vice-president and general manager of the Commercial Cable Company, accompanied by his son, Dr. Ward, sailed for Europe on the *City of Paris*, April 6. Mr. Ward goes to Europe on business of the Commercial Cable Company, while his son is off on a vacation made necessary by the years of hard and constant study while in the medical colleges.

Dr. J. B. De Lery, president and manager of the Electric City, South Lakewood, N. J., is highly elated at the great progress being made at the "City." The company is grading and improving Edison, Thomson, Westinghouse, Kennedy, Faraday, Watt, Ohm and other avenues. A fine residence occupies a prominent place, and a number of handsome ones are under course of erection. The place is noted for its temperate and healthful climate, pine groves and dry soil. The Doctor has received many flattering cash offers for his interest in the "City."

Hatzel & Buehler, 29 W. 26th street, will on May 1 move to 114 Fifth avenue, where they have secured large and handsome quarters, their present ones having long since proved inadequate for their largely increasing business. They have recently closed a contract with the New York Hospital Society for the installation of a 1,200 light incandescent plant. Two straight-line engines and Detroit dynamos, for which they are agents, will be used. The following contracts have also been closed: Installation of one 30 H. P. and one 15 H. P. Detroit motors for Austin, Nichols & Co.; wiring for 400 incandescent lights, Saint Mary's Church, Williamsbridge, N. Y.; wiring for quarters of the Society for the Prevention of Cruelty to Children, 106–108 E. Twenty-third street; wiring residence of H. F. Noyes, Glen Cove, L. I., and many others.

The Essick Printing Telegraph Company has removed its offices from No. 170 Broadway, corner Cortlandt street, to No. 1 Broadway, Rooms 91, 92 and 105, on the fifth floor. The Essick system is the only machine telegraph that is in actual operation at the present time. The company is transmitting messages between Boston and Providence and other towns in New England, and it is stated that it is doing exceedingly well, financially, considering its limited facilities. Mr. Abner McKinley, the general manager of the company, expresses himself much pleased with the outlook. The company is now beyond the experimental stages, and is making a large number of machines for actual operation. It is stated that this was the only printing telegraph system ever used successfully, and by reason of the large expenditures of money made during the past six years it is deserving of the success which is now assured.

Mr. William A. Rosenbaum, who has been for the past five or six years the manager of the patent business heretofore conducted by the W. J. Johnston Company, Limited, publishers of *The Electrical World*, has recently purchased from that company the entire "good-will" of the patent business, together with the extensive library and office accoutrements used in connection therewith, and will hereafter conduct the business in his own name. Mr. Rosenbaum is well and favorably known among the electrical fraternity and especially by the inventors. His excellent work for the clients while with the Johnston Company will no doubt insure him a continuance of their patronage, especially so as the Johnston Company will not hereafter conduct a patent business. We trust his new venture will win the success he so well merits. He desires that all communications regarding patent matters hereafter be addressed to him personally at 177 Times Building, New York City.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor Electrical Age:

Names of Companies.	Capital.	Par.	Price.
Aluminum Co.	$350,000	$100 00	$90 00
American Dist. Tel., N. Y.	3,825,000	100 00	62 00
Am. Elec. Exercise Mach. Co., N. Y.	100,000	10 00	9 00

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

Consolidation has received a new accession since our last issue, the sweetest of the lot. Spreckels held out until the business end of his composition admonished him that the time had arrived for him to surrender, and $7,000,000 overcame all of his scruples, patriotic, charitable, personal or otherwise. It was a long and determined fight. The sugar corporation is now the largest and most powerful organization in existence of its kind, since the Standard Oil as a single trust or company has ceased to exist. For the purpose of absorbing all the sugar interests under one management it was determined, as long ago as last January, to increase the certificates of the trust from $50,000,000, which was the limit of capital stock fixed in the original deed of trust, to $75,000,000, although it is estimated that the actual value of the sixteen original companies was only $25,000,000. The amount of crude molasses or natural water is apparent, but is justified by the fact, that despite all opposition, the stockholders received in profits from 1887 to 1890 the snug sum of $28,000,000 net. Prior to the consolidation the old corporation's capacity was about 65 per cent. of the total refining business of the United States, and with the entire industry in hand it is quite safe to conclude the profits will correspondingly increase. The Board of Trustees consists of H. N. Havemeyer, Franz O. Matthieson, J. E. Searles, Jr., J. A. Stersburg, Theo. A. Havemeyer, J. B. Thomas, J. Ferguson, John E. Parsons, W. E. Havemeyer, Wm. Dick and C. O. Foster. Following immediately on the heels of this is the incorporation of the United States Rubber Co. under the laws of the State of New Jersey (I wonder how soon the little State over the river will put an extra tax on them), with a capital of $50,000,000, with William Barbour, Wm. L. Trenholm, John J. Watterbury, J. Edward Simmons and John P. Townsend as incorporators. Report has it that the corporation owns the stock and patents of every rubber company in the country except one in Boston, and that, like poor checkmated Spreckels, will soon fall in. The rubber industry, perhaps next to copper, is more closely allied to the electrical industry than any other. Rubber enters so largely into all insulation that as a factor for all calculations of electric equipment its price may often determine the profits of investments. The public are to be congratulated on the fact that the management of both of these corporations is composed of men of broad, liberal views, who will reduce the price of their product and increase its merits, while the investors can also rely on the safety of their stock and a larger income than can be obtained from interest on deposits in any of the ordinary banking or kindred institutions. I await with considerable unsatisfied curiosity the development of the electrical consolidation which to-day is unchristened, and of that peculiar structure one hardly knows whether to write of as He, She or It. This month will probably decide the problem and make public name, component parts and capital.

The financial difficulties of the Panama Canal have been a source of great annoyance, and to say the least, questionable profit for over a generation, and they will not cease for several years to come. M. De Lesseps should have rested on his laurels when he rendered it financially possible to complete—ready for British occupation—the Suez Canal. To-day and for some time past his fair fame has been smirched and his fellows seek to brand with disgrace and dishonor his gray hairs now so near the tour to the great unknown. In the courts of France he is charged with, mildly speaking, "breach of trust," particularly in connection with the purchase of the Panama Railroad, which was necessary to his canal enterprise. It is alleged that he, in collusion with many noted American financiers and investors, obtained for the road more than its value, and retained the surplus. The French Government has obtained an order from the New York Supreme Court to compel the American to testify as to the methods adopted and prices paid or money disbursed in conveying the railroad to the Canal Co., among them are Messrs Seligman, Winslow, Francklyn, Drexel, Morgan & Co., Leverich, Leverich & Co., Whitehouse & Co., Russell Sage, Leland, Bayard Brown, Joseph Ogden, Kernochan and Samuel C. Thompson, who were all shareholders, and who are expected to supply the missing link between the current value and price paid for the road, and such details regarding the matter as they may be possessed of.

TRADE NOTES.

The Peckham Motor Truck and Wheel Co., Kingston, N. Y., has closed contracts to supply 60 trucks for the New York and Morrisania road, 20 for the Brooklyn and Coney Island road, and 50 for the Atlantic Avenue road, Brooklyn, N. Y. They are all of the standard radial-gear non-oscillating type.

The Interior Conduit and Insulation Co., of 42 and 44 Broad street, does not confine its operations to this country alone, as its foreign agents are placing large and satisfactory orders all the time. Mr. Everett Frazer, of 124 Water St., N. Y., the company's agent for China and Japan, is shipping extensively to the above-named countries. The Chinese and Japs are not behind the age, and evidently know a good thing when they see it.

Mr. E. A. Sarran, late of the Thomson-Houston Company, Cincinnati, O., has opened an office at 145 Central avenue, that city, where he will carry a full line of electrical supply goods. Mr. Sarran is agent for the Keystone Electric Company; the "Backus," an electrical combination exhaust ventilation and ceiling fan; the Daisy Fan Motor, and the Kester Electrical Co. Mr. Sarran reports business good and prospects very bright.

A contract for 150 typewriters, has been awarded by the War Department, Washington, D. C., to the Smith-Premier Typewriter Company, of Syracuse, N. Y. Before awarding the contract, the Department appointed a board of experts to hold a competitive examination of the various machines manufactured. After an exhaustive examination the board decided that the Smith-Premier excelled all the others in point of improvements and mechanical construction, and the contract was therefore given that company.

The descriptive price-list recently issued by the H. W. Johns Mfg. Co., 87 Maiden Lane, this city, contains full and complete descriptions of its universally known paints, and also of its various manufactures of asbestos, for structural, mechanical and electrical purposes. In each copy of the price-list is enclosed a very handsome miniature color-chart, on the back of which is printed an interesting digest on colors, definitions, principles and rules. The company will be pleased to furnish samples and prices of any of its manufactures upon request.

BIDS FOR LIGHTING.

Bids for lighting Hopkinsville, Ky., with electric arc lamps will be received by the city clerk until noon, April 25. W. P. Winfree, City Clerk, will give all the necessary information.

The Stillwell & Bierce Mfg. Co., Dayton, O., have issued a circular which contains a copy of a decree issued by Judge George R. Sage, District Judge for the Southern District of Ohio, in their favor in the suit brought by the company against S. N. Brown & Co., declaring that a Hoppes Live Steam Feed-Water Purifier used by that company to be an infringement of the Stillwell patent.

THE ELECTRICAL AGE'S ELECTRICAL PATENT RECORD.

Issued March 29, 1892.

471,534. System for Transmitting Signals. Henry A. Chase, Boston, Mass., assignor to Albert Watts, same place. Filed Nov. 27, 1891.

471,535. Telephone-Receiver. James A. Christy and Elias J. Baldwin, San Francisco, Cal. Filed March 16, 1891.

In a telephone-receiver, the combination, with the diaphragm and chamber in which it is mounted, of a system of perforated magnetic tubes in chamber connected to the actuating electro-magnet and extending up to the diaphragm.

471,538. Storage-Battery Plate and Process of Making the Same. William W. Donaldson and Roderick Macrae, Baltimore, Md. Filed Aug. 13, 1891.

A storage battery plate having perforations through both the active and inactive material and a space between the adjacent inner surfaces of the active material.

471,543. Electric Railway. William C. Goss, Lynn, Mass. Filed April 3, 1891.

In an electric-railway system, a supply-conductor, a slotted inclosing housing comprising a bottom wall having upwardly-extending sides provided with horizontal and vertical flanges, side walls resting thereon, and a series of insulators supported at intervals along housing in contact with the conductor for supporting the same.

471,549. Attachment for Telephones. James E. Hills, New York, N. Y. Filed April 27, 1891.

A support for a telephone receiver or transmitter, consisting of an elongated loop having normally-distended curved sides, a lower coil and an upper closed end, and a slide adjustably mounted thereon.

PATENTS—Continued.

471,564. Current-Motor. Lemuel C. Neal, Lewiston, Idaho. Filed Oct. 16, 1891.

In a current-motor, the combination, with suitable floats, of a funnel-shaped sluice or water-way connected with float, a rectangular gate and guard pivoted to the front flared end of sluice and provided with fenders across the front thereof, an endless chain paddle-wheel located within sluice, and means for raising and lowering gate and guard over the front end of sluice.

471,576. Manufacture of Incandescent Electric Lamps. Frank S. Smith, Pittsburg, Pa. Filed Dec. 22, 1890. Renewed Oct. 5, 1891.

An incandescent electric lamp consisting of a carbonized conductor, an inclosing bulb of glass, leading-in conductors of iron wire, glass fused upon the wires and to which the bulb is fused, and a cement or ceiling substance surrounding the iron wires at the point of entrance into the glass.

471,587. Insulated Electric Conductor. James B. Williams, Oakland, Cal. Filed July 10, 1890.

The combination of a conducting-wire and a corrugated covering of insulating material surrounding wire.

471,588. Insulated Electric Conductor. James B. Williams, Oakland, Cal. Filed April 9, 1891.

The combination, with the electric conductor and the insulating-layer, of the intermediate cover provided with bosses or projections.

471,590. Secondary Battery. Charles F. Winkler, Troy, N. Y. Filed Nov. 8, 1890.

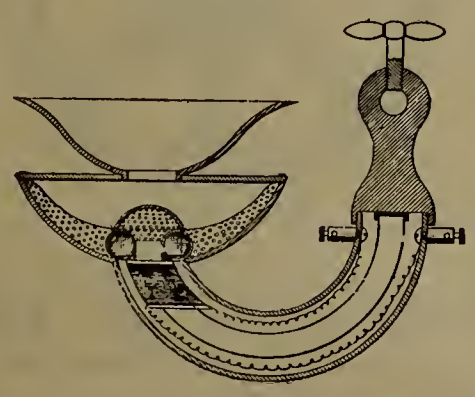
In a secondary battery, the combination, with plates containing active material and an acid solution in the form of a jelly serving to hold the active material in place, of a non-oxidizable su'phate, such as the sulphate of ammonia, contained in the solution.

471,591. Secondary-Battery Electrode. Charles F. Winkler, Troy, N. Y. Filed June 26, 1891.

A secondary-battery electrode consisting of a non-conductive supporting element in the form of a series of troughs or shelves, in combination with active material and electrical conductors supported by said troughs or shelves.

471,592. Secondary Battery. Charles F. Winkler, Troy, N. Y. Filed Sept. 29, 1891.

In a secondary battery, a horizontal supporting-plate made of insulating material and provided with a main



471,535.—TELEPHONE-RECEIVER.

trough, and a series of branch troughs therefrom with free spaces between the troughs of the series for the circulation of the electrolyte, in combination with an electric conductor having a main strip, wire, or back-bone and branches extending therefrom, the backbone being located in the main trough and the branches located, respectively, in the branch troughs, and active material deposited in the troughs and surrounding and embedding the conductor.

471,612. Electric Switch. Harvey Hubbell, Bridgeport, Conn. Filed Oct. 5, 1891.

The combination, with a spindle carrying a cross-piece and a contact-bar turning freely on spindle, cross-piece and contact-bar having depressions, of a spring acting to force the cross-piece downward and pins engaging, respectively, the depressions in the cross-piece and contact-bar.

471,625. Joint for Electric Wires. Roger H. Smith, Lexington, Ky. Filed Aug. 24, 1891.

The coupling for trolley wires, consisting of the two truncated cone-shaped end pieces having longitudinal openings for the passage of the wires and bored bases having vertical walls at their inner ends bored bases being formed with ininternal right and left screw-threads, respectively, and the outer or tip ends of end pieces having slots by which they may be soldered to the wires, a connecting piece having horizontal projections formed with threads corresponding with and adapted to engage the threads of end pieces, and the wires having upset ends adapted to engage the vertical walls of bases.

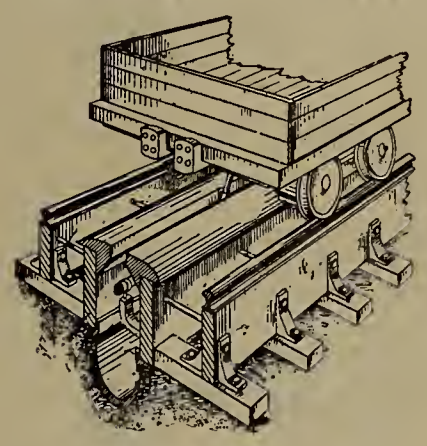
471,645. Support for Electric Lamps. Charles J. Klein, New York, N. Y. Filed Dec. 1, 1890.

The combination, with a lamp-support having a neck-like portion provided with a metal strip and a centrally-located nipple insulated from metal strip, of a shell detachably secured thereto for fastening an electric lamp to support.

471,655. Device for Transmitting Motion. George S. Strong, New York, N. Y., assignor to James N. Gamble, Cincinnati, Ohio. Filed May 29, 1891.

471,656. Device for Transmitting Motion. George S. Strong, New York, N. Y., assignor to James N. Gamble, Cincinnati, Ohio. Filed May 29, 1891.

As a device for transmitting motion, the combination of a shaft having a pinion, a tight casing inclosing pinion but free to turn on the shaft, casing having a chamber fitting neatly around the pinion, one or more communicating chambers and communicating ports arranged along the connecting-line at the end or ends of chambers, a pinion fitting neatly in each chamber arranged to engage pinion, a valve or valves arranged to regulate the opening between ports,



471,543.—ELECTRIC RAILWAY.

electro-magnetic armature-windings secured to the casing, and a relatively fixed magnetic field arranged around the casing.

471,686. Automatic Guest-Call. William H. Perry, Chicago, Ill. Filed May 9, 1890. Renewed Nov. 12, 1891.

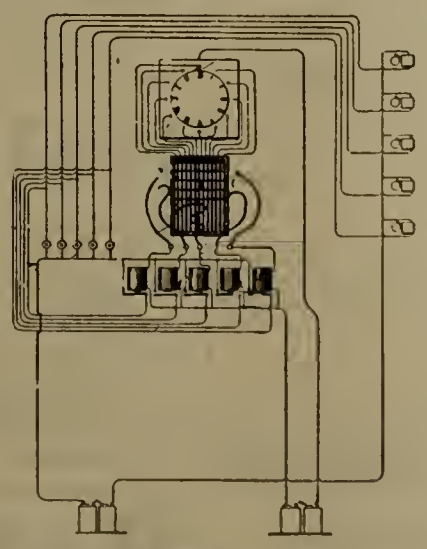
In an electric guest-call, the combination with clock-circuits and insulated time-strips in circuits, of a series of relay-magnets permanently included in the normally-open clock-circuits, circuits being closable by flexible conductors attached to one side of the relay-magnets and insertible in the time-strips, and a corresponding series of bell-circuits connected through the relay-armatures.

471,691. Dynamo-Electric Generator or Motor. Claude W. Atkinson and Llewelyn B. Atkinson, London, England. Filed Aug. 18, 1891. Patented in England and in France.

In a dynamo-electric generator or motor, the combination of a commutator having contact-strips on its face at or about at right angles to the axis of rotation, with a casing adjustably attached to the framing of the machine carrying the brushes, the casing being capable of adjustment toward the face of the commutator to compensate for wear and maintain the smallest volume, the space between the rotating periphery of the commutator and the casing being as small as possible and of such a length as to prevent the passage of flame.

471,693. Dynamo-Electric Machine or Motor. Walter T. Goolden and Llewelyn B. Atkinson, London, England. Filed Aug. 18, 1891. Patented in England.

In a dynamo-electric generator or motor, the combination, with the commutator, of a fixed air-tight inclosing cover, making absolute stationary and rubbing joints throughout and carring the brushes, the cover being capable of adjustment by slotted bolt-holes in the fixed frame, through a suitable angle to give required lead to the brushes.



471,686.—AUTOMATIC GUEST-CALL.

471,725. Governor for Marine Engines. Ernest F. Wallgren, Philadelphia, Pa., assignor of one-half to Axel H. Engström, same place. Filed Dec. 8, 1891.

An electric governor for marine engines, comprising a throttle-valve for regulating the admission of steam to the engine, a vane hinged to the hull adjacent to the propeller and water-line and held out of normal position by the resistance of the water and by currents engendered by the revolutions of the screw and returning to normal position upon withdrawal from the water, and electrical connections interposed between vane and valve for causing the movements of the former to actuate the latter.

471,730. Mast-Arm Switch for Electric Lamps. Thomas Dillon, Indianapolis, Ind., assignor of one-half to John Caven, same place. Filed Nov. 4, 1891.

In a mast-arm switch for electric lamps, the combination of the bracket, the shaft mounted in bracket so as to turn thereon, the arm rigidly secured to shaft and carrying an electric lamp, two pairs of segments mounted upon shaft so as to turn therewith, arranged in line in the plane of rotation, and electrically disconnected from each other, one pair of segments being arranged in form terminals of an open circuit in which the lamp is included and the other pair of segments being electrically connected with each other so as to form a short circuit in which the lamp is not included, and the pair of metallic strips mounted in a fixed position on the bracket and forming the terminals of an electric line circuit, all arranged to co-operate, whereby the lamp is included in the line-circuit when the mast-arm is raised and is excluded therefrom and the line-circuit is maintained when the mast-arm is lowered.

471,732. Bracket for Incandescent Electric Lamps. John H. Goehst, Chicago, Ill. Filed March 9, 1891.

471,745. Telephone. James H. Howard, Medford, Mass. Filed Sept. 21, 1891.

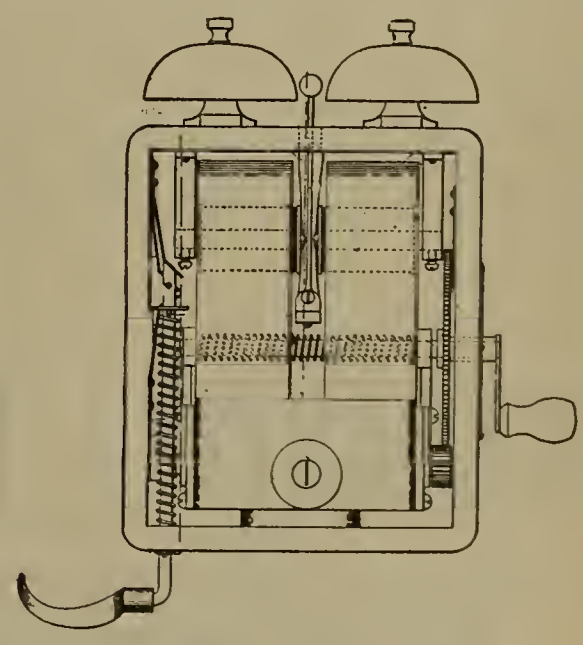
A telephone having the bell-ringing or ringer-actuating coils or magnets arranged inside of the curve of the horse-shoe-magnets.

471,759. Pole for Supporting Electric Wires. John H. Huntress, Janesville, Wis. Filed Oct. 24, 1891.

In a post, the combination, with a series of corner-pieces, of sides secured thereto composed of wire.

471,760. Electric Switch. Charles G. Perkins, Hartford, Conn. Filed July 24, 1888.

In an electric switch, the combination, with two circuit terminals, of a curved contact-plate constructed of spring



471,745.—TELEPHONE.

metal, and moving block or plug, to which the contact-plate is swiveled midway between its two ends, so as to bear with a yielding or spring pressure upon one or both of the terminals.

471,790. Electric Telpherage Apparatus. Midbury W. Hassan, Rochester, N. Y. Filed Dec. 29, 1890.

The combination of the conductor-wire, provided with spiral grooves or threads, the ground-wire, the car, provided with armature and field-magnets, the armature engaging with the spirals, and the trolley attached to the car and engaging with the ground-wire.

471,792. Commutator-Brush. Robert Hirsch, Milwaukee, Wis., assignor of one-half to Herman Meminger, same place. Filed Oct. 29, 1891.

The herein described commutator-brush, comprising a suitably-shaped body, composed of a plurality of strips or bars, each independently coated with a film or covering of electrically-deposited metal, and the series of strips or bars united together by means of a second film or covering of metal.

471,812. Power-Transmission. John F. Devold and Gustav Monrath, Chicago, Ill.; Theodor Devold and Olaf E. Ray, administrators of said John F. Devold, deceased. Filed Feb. 2, 1891.

In a power-transmitter, the combination, with a motor, of double driving-pulleys, one of which is fixed and the other of which is loose upon the shaft, and springs for connecting pulleys.

471,819. Brush-holder for Electric Motors or Dynamo-electric Machines. Charles A. Hussey, New York, N. Y. Filed May 6, 1889.

PATENTS—Continued.

The combination, with an electric motor or dynamo-electric machine, of the brush-holder supported and rotating in the bar, an arm on said brush-holder, a spring, connected to the arm, a windlass, inserted in the bar, a connection between the spring and windlass, and a carbon-strip inserted in the brush holder.

471,837. Support for Electric-Lights. James J. Walsh, Paris, Tex. Filed Sept. 15, 1891.

The combination, with an arc-lamp or other device to be suspended, of a cord attached to the same for raising and lowering, a support for lamp, such as a cable or mast-arm, and a V-shaped lever pivoted eccentrically to the lamp or device, one arm of the lever having a hook adapted to engage with cable or mast-arm and the other arm of the lever being arranged to strike the cable or mast-arm and throw the hook into engagement therewith.

471,850. Electro-therapeutic Electrode. Harry Bonis, Blanchard, Ontario, Can. Filed Aug. 10, 1891.

In an electro-therapeutic electrode, the combination, in one and the same electrode, of an electrolytic fluid and the means for introducing high artificial resistance into the circuit.

471,913. Electric Lock. James G. Thompson, Boston, Mass. Filed Aug. 12, 1891.

A combination electric lock comprising an electro-magnetic controlling device, a suitable source of electricity, a circuit including controlling device and source whose respective wires are divided, a set of conductors interposed between the two parts of each wire of the circuit, and means for connecting the two ends of each circuit-wire with opposite ends of any wire in the interposed sets.

471,929. Automatic Electric Fire-Alarm. Leonidas G. Woolley, Grand Rapids Mich. Filed Dec. 14, 1891.

An automatic electric fire-alarm comprising a permanent magnet, an armature therefor, an induction-coil, a stored power for suddenly separating the armature and magnet, and a thermostatic releasing device.

471,945. Galvanic Battery. William Burnley, North East, Pa. Filed June 13, 1891.

In a galvanic battery, the combination, with an electro-positive element consisting of an outer containing-jar, of an electro-negative element, a porous cup of less depth than the containing-jar, a depolarizing compound consisting of manganese and carbon packed in porous cup around that part of the electro-negative element inclosed by cup, a semi-solid exciting material packed around the porous cup, and a seal formed of suitable wax closing the mouth of the outer jar.

471,947. Electrically-Controlled Trap-Door. Frank C. Callahan, Bridgeport, Conn., assignor of one-half to Jacob B. Klein, same place. Filed Dec. 14, 1891.

The combination of the doors, a spring device for automatically opening them, armatures carried by doors, and electro-magnets which attract armatures and thereby maintain the closed position of the doors against the resiliency of the spring element.

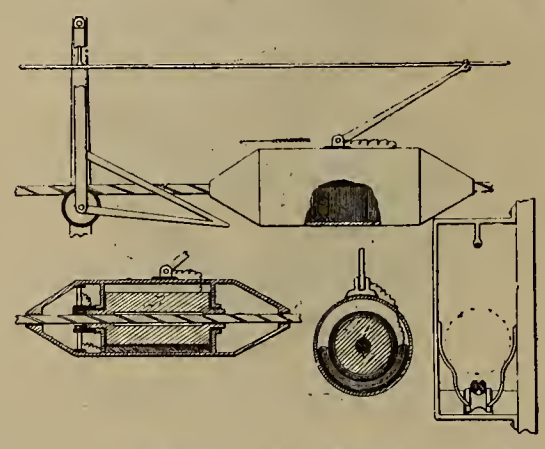
471,968. Electric-Light Crane. James Gallagher, Oakland, Cal., assignor of one-half to John A. Britton, same place. Filed July 13, 1891.

471,986. Electrical Annunciator. Nelson M. Watson, Detroit, Mich., assignor of three-fourths to Alfred H. Heath, William B. Heath and Sarah A. Millard, same place. Filed Jan. 2, 1891.

471,987. Electrical Annunciator. Nelson M. Watson, Detroit, Mich., assignor of three-fourths to Alfred H. Heath, William B. Heath and Sarah A. Millard, same place. Filed Aug. 17, 1891.

471,990. Endoscopic Instrument. John W. Daily, Denver, Col. Filed Oct. 14, 1891.

An endoscopic instrument having a recess formed therein, an incandescent electric lamp located therein, and a removable fenestrated plate secured to the instrument in such a manner as to permit the light to illuminate the cavity during use.



471,790.—ELECTRIC TELPHERAGE APPARATUS.

471,993. Reciprocating Snap-Switch. Jacob S. Gibbs, Hartford, Conn., assignor to the Perkins Electric Switch Manufacturing Company, of Connecticut. Filed July 3, 1891.

In an electric-switch, the combination, with the base, the line-terminals, and the bracket secured to the base, of a reciprocating rod, having a cross-bar at its lower end provided with downwardly-projecting levers having an unobstructed space between them, a tension-spring located in space and bearing at its ends against the levers, and the angular plug carrying contact-points at its outer ends and provided at its interior with angular opposing faces, the angle which slopes from the top of the same being less acute than that which slopes from the bottom, the said angular faces forming a bearing and guide for the lower ends of the levers.

471,997. Automatic Electric Cut-Out. Edward A. Manship, Minneapolis, Minn. Filed June 30, 1891.

In an automatic cut-out, the combination with a solenoid, of a core therefor, an electric-switch, means for holding the same in a closed position, levers arranged to trip switch to release the same, and means whereby core acting in one direction engages one of levers to trip switch and acting in the other direction engaging the other lever to trip the switch, whereby switch is opened by a maximum current in solenoid or a loss of current therein.

471,999. Valve-Controller. Nathan E. Nash and George A. Eddy, Cleveland, Ohio, assignors to the National Electric Valve Company, same place. Filed Nov. 20, 1890.

The combination, with a valve, valve-stem, and pistons, on the opposite side of the valve, of a spring-pressed balance valve controlling the supply of fluid to both pistons, an armature connected with the latter, and an electro-magnet or equivalent device for actuating the armature, whereby the balance-valve is moved.

472,019. Method of and Apparatus for Producing Musical Tones by Electro-Magnetism. Eli C. Ohmart, Detroit, Mich., assignor to Melvin L. Severy, Boston, Mass. Filed April 28, 1890.

The method of producing musical tones, which method consists in producing musical vibrations in strings, wires, reeds, diaphragms, or any other sonorous body by the action upon these bodies of attracting or repelling forces produced in electro-magnetic or inductive devices by intermittent impulses of electricity, either pulsatory or undulatory, corresponding in frequency to the number of vibrations, being a multiple or sub-multiple thereof, in the musical tone produced by the vibrating sonorous body and automatically determined by the movements of the sonorous vibrating body and when the circuit conveying these intermittent, pulsatory, or undulatory electric impulses does not include the vibrating body.

IMPROVED APPEARANCE.

The absence of electric poles on Broadway is quite noticeable, and it is hardly necessary to say that the improved appearance of that thoroughfare is decidedly great. Some of the buildings that are going up, however, might, in the dark, be taken for poles.

THE ELECTRIC CLUB.

At a largely attended meeting of the Electric Club in this city on Monday night, April 11, it was decided to give up the present house on 22d street and procure new quarters down-town, in the business section of the city. The Board of Managers will report at a meeting to be held on April 18. The club's financial difficulties were straightened out, and its successful continuance is assured.

A ROYAL INVENTOR.

The American notion of the Sultan of Turkey is that he lives a life of perpetual indolence, and that such a thing as a practical idea ever entering his royal brain is quite impossible; but, judging by a recent report, our royal Oriental friend must possess some ability that few of his American friends credit him with. It is stated that he is the inventor of a telegraph instrument, and that he is desirous of exhibiting it at the World's Fair next year. It will indeed be a novelty to see a telegraph instrument invented by a Turk.

ELECTRICAL ACTIVITY IN MONTREAL.

Those who attended the convention of the National Electric Light Association in Montreal last September, and who noted, with considerable surprise, the lack of street-car facilities in that city, will be glad to hear that better times are in store for its citizens. There is a lively competition there now for right-of-way through many of the streets for the purpose of running electric cars on the overhead trolley system.

Who dares to say that this awakening on the part of our Canadian friends is not the result of the convention? Matters electrically have taken a decided turn for the better since the convention was held. This fact has been generally noted.

THE WORLD'S FAIR ELECTRICAL EXHIBITION.

A vast amount of thought and work will be necessary to make the electrical exhibition at the World's Fair as successful as its projectors have planned it to be. Those of the exposition authorities who have this department in charge must be aided in their laudable efforts by those in accord with its purposes, and intending exhibitors—in other words, they must have outside co-operation. They cannot be expected to do all the work alone and make a success of the exhibition; yet, no doubt, there are many who look at the matter in that light.

A thorough awakening on this subject should be inaugurated at once, and as soon as all those who are interested have the matter properly brought to their attention, and they begin to talk and think about it, a good deal will have been gained in the direction of co-operation.

It is gratifying to learn that the Electrical Congress Committee of the World's Fair is already actively at work, and has issued a preliminary address (which we publish on another page) calculated to arouse enthusiasm among those interested. If all do their part, this and all other departments of the electrical exhibition will, without question, far surpass anything the world has ever seen. All who intend to make exhibits, read papers, take part in the discussions in the congress, or in any way contribute towards making the electrical portion of the Fair a success, should lose no time in arranging their plans and getting into action.

ARMATURE BURNOUTS.

It is not always the case that the burning out of armature coils is due to overload. Such accidents are liable to occur from various causes which are avoidable, and it often happens that burnouts which are ascribed to overload are really due to something else.

A prominent case of this character is described on another page in an article by Mr. E. E. Stark, an electrician of this city. Last Fall there was a remarkably large number of burnouts in alternating-current dynamos in this city for a short period. It was during a cold, dry spell, and among the machines under Mr. Stark's charge the trouble occurred with a frequency that was serious, and which led to the suspicion that it was not due to overloading at all, but something entirely different. It seems that the true cause of the trouble at this particular time was discovered by an accident. One of the workmen about one of the dynamos received a Leyden jar shock while touching some parts of the machine, which at once opened the way to a determination of the cause of the trouble. It seems that the static electricity generated by the rapidly-moving belt accumulated on the iron framework of the machine, and when it attained a sufficient potential it broke down the insulation of the armature-coils, thus burning them out. The remedy for this trouble was found in grounding the base of the dynamo, but as this expedient was inadvisable on account of the possibility of developing other trouble through the use of a ground connection, experiments were made which resulted in a complete solution of the problem without the necessity of maintaining a direct-ground connection.

A small Geissler tube, constructed to discharge at a potential lower than that capable of piercing the insulation of the armature-coils, was connected between the base of the dynamo and the ground, and the battle was won. These Geissler tubes are now doing good service in this direction, and no doubt their general adoption would save a great many armatures.

ART IN ELECTRIC LIGHTING.

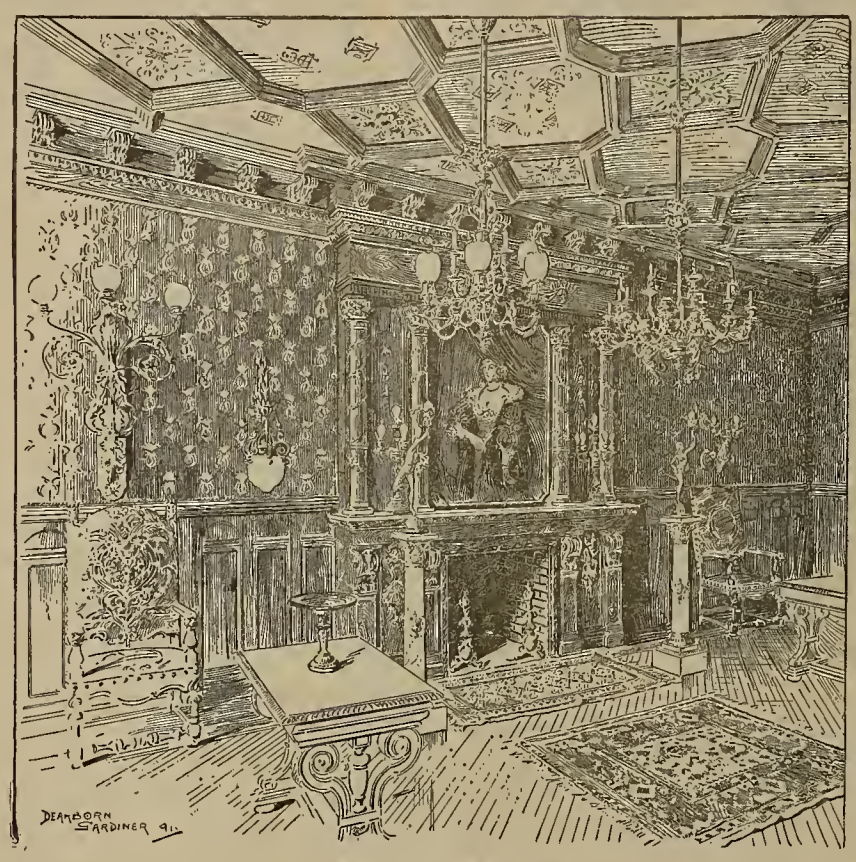
The flexibility of the electric system of lighting is one of its greateat features, and it is surprising to see how artistically incandescent lamps can be combined with the decorative art to produce most beautiful effects, unattainable by any other known means of illumination. The light can be placed in most inaccessible places, and be controlled in a manner that will produce varying results and effects. For decorations it is incomparable by any other light, and in this field it clearly stands alone, master of the situation.

Having learned of these valuable features of electric lighting, our wealthier classes, who are constantly looking for something novel and beautiful, have not been slow to use the incandescent light for the attainment of the highest possible artistic effect in the adornment of their homes, and the result has been that accessories of the most elaborate kind, and rich in construction, have been wrought in order to meet this growing demand. There seems to be no end to the variety of ways in which the incandescent light can be applied for decorative purposes, and a visit to the sample-rooms of the modern electric manufacturing concerns is a delight and a study.

We give some illustrations of electric illuminating effects on another page, which tell their own story. Words cannot convey to the mind any idea of the beauty and skill of these displays; they must be seen to be appreciated. Even on paper they have an artistic and pleasing effect; so what must they be in reality?

ÆSTHETIC ELECTRIC LIGHTING.

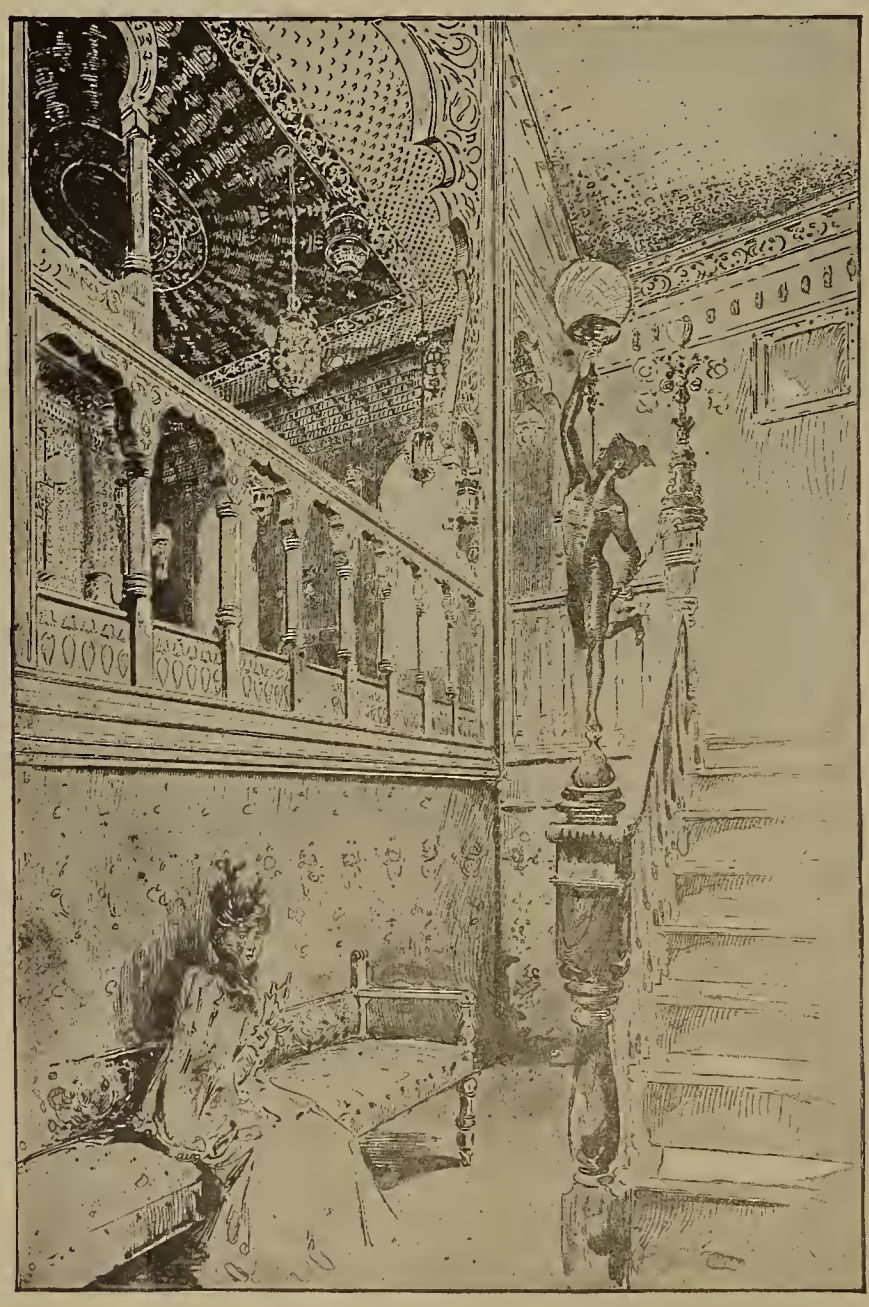
The uses of the great new illuminant, electricity, in the lighting of house interiors, have during the past few years progressed rapidly from the experimental stage, until to-day they may be said to have almost reached perfection. Most of the stately mansions in towns of this country where electricity is available have had the beauty of their interior decorations strikingly enhanced by the substitution of the electric lamp for the less desirable gas-jet. The light that will only burn upwards is fast being superseded by that which will burn in any position which can possibly be given to it. The æsthetic possibilities of electric lighting having once been admitted, the realization of them has been speedily brought about. All the varied styles of interior decoration, each marking its own distinctive era, have been in their turn adapted and utilized. The Renaissance with all its glow of delicate and intricate tracery; the more staid styles of Louis XIV.; the less sober characteristics of the Louis XV. period, inflating and degenerating into the wild curves of the rococo; the revulsion of the Louis XVI. period, finding its highest expression in the classic lines of the empire; each one has contributed. Instead of abortions in the shape of chandeliers, appliques, standing lamps, brackets, swinging and entrance lamps which characterized American house decoration twenty years ago, we now find perfect forms of true artistic conception.



RENAISSANCE ROOM.

COLONIAL ROOM.

The Edison General Electric Company, recognizing the advent of a new artistic era, has made the production of the highest art work in this branch an object of deliberate policy. It would be impossible to give in so short a space as this any adequate conception of the numerous beautiful designs manufactured by this company. The entire building at No. 275 Fifth avenue has been fitted up with a view of illustrating the finer decorative and illuminating effects that can be produced by the electric fixture in its varied forms, and we give some interior views of this building. Each room is fitted up in the style representing its period. There is an Oriental room, decorated with rich arabesques, and replete with Saracenique ornamentation; the Colonial room, with the distinctive characteristics of the early colonists' taste; the Renaissance room, with the rich portrait of Henriette d'Entragues and profuse ornamental decorations; the Den and its intimate surroundings; the library, in which the light is softened, and the decorations fitted to the requirements of repose and study; the Louis XVI. salon in which, against the pearl gray ground, the golden and white ornaments stand out in bold relief, and the delicately sculptured furniture completes a truly artistic picture; and lastly, the coquettish Louis XV. boudoir, in which the rococo style runs merry riot. Indeed, the entire house, from the entrance, where light-footed Mercury stands a-tiptoe on the newel of the staircase to the roof, is fitted up with a view of enabling those desirous of decorating their houses to choose their lighting fixtures, with every opportunity for careful and artistic discrimination.



STAIRWAY.

LOUIS XVI. SALON.

The fixture manufactory is the New York works of the company, at No. 292 Avenue B, and occupies a huge building six stories high. Here under careful management and expert superintendence is effected the realization of the many artistic conceptions, which, in their concrete form are sent thence to all the points of the United States. The White House fixtures, as well as those of the palace of the Mikado of Japan; those of the Vanderbilt mansions as well as of the Whitney palace; those of the stately Holland House, and of the Trenton Capitol are excellent examples of what can be done by artistic minds, aided by expert hands, all informed by a guiding managerial energy.

STARTING AND CONTROLLING RHEOSTAT.*

We give below a description of a new starting and controlling rheostat for motors running on high-voltage currents, which has been recently designed.

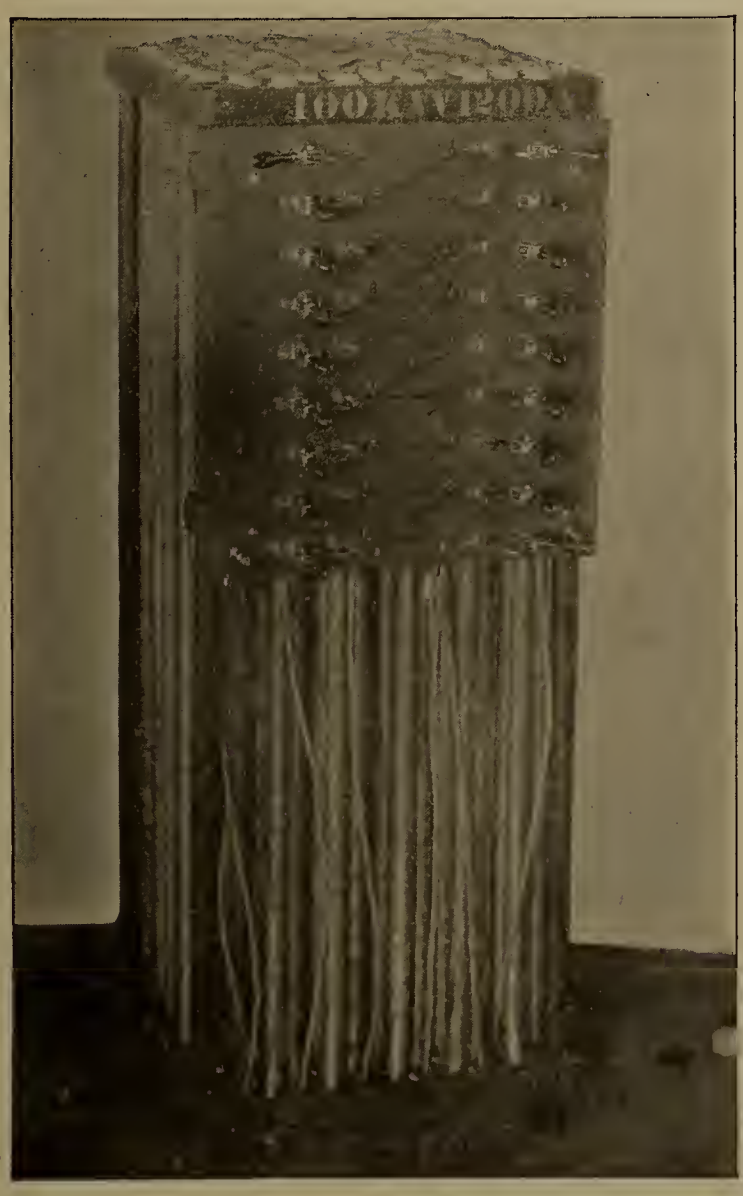
This rheostat is a modification of the standard Edison starting-box for motors of large current capacity, which is furnished with an ordinary switch base, fitted with a number of contact-blocks and plates arranged in a semicircle around the pivot upon which turns the switch-arm.

The formation of arcs between the contact-blocks, resulting in their deterioration and destruction when the rheostats were used on high-voltage circuits, constituted a difficulty which it became necessary to eliminate. The arcing could be avoided by employing a larger number of blocks on the board, but this would necessarily increase the cost of manufacture as well as the size of the board.

The modification consists in the substitution of a switchboard with several separate and distinct switches in place of the ordinary board just mentioned. By the employment of several separate switches it is possible to arrange the coils of the rheostat in multiple with themselves, so that if it is required to carry a larger current, or remain in circuit constantly for the purpose of reducing the speed of the motor, it is comparatively simple to manipulate the switches according to requirements. The resistance is built up of tinned-iron wire wound in spirals arranged in sections. Each of these sections can be thrown in or out by means of its proper switch.

The rheostat shown in the cut is designed to start and control the speed of a 100 K. W. motor, working on a 1,200-volt circuit. The range of resistance is very wide, its greatest resistance being 72 ohms, while with the switches properly arranged it can be reduced to .25 of an ohm; the current-carrying capacity for the smaller resistance being increased in the same proportion. The over-all dimensions of the box shown in the cut, designed for an electric-mining plant, are: height, 5 feet 6 inches; width across switch-board, 25 inches; depth, 26 inches

Rheostats of this design are absolutely fire-proof, are strong and substantial in construction, and have been arranged with a view to securing a high, insulation resistance.



STARTING AND CONTROLLING RHEOSTAT.

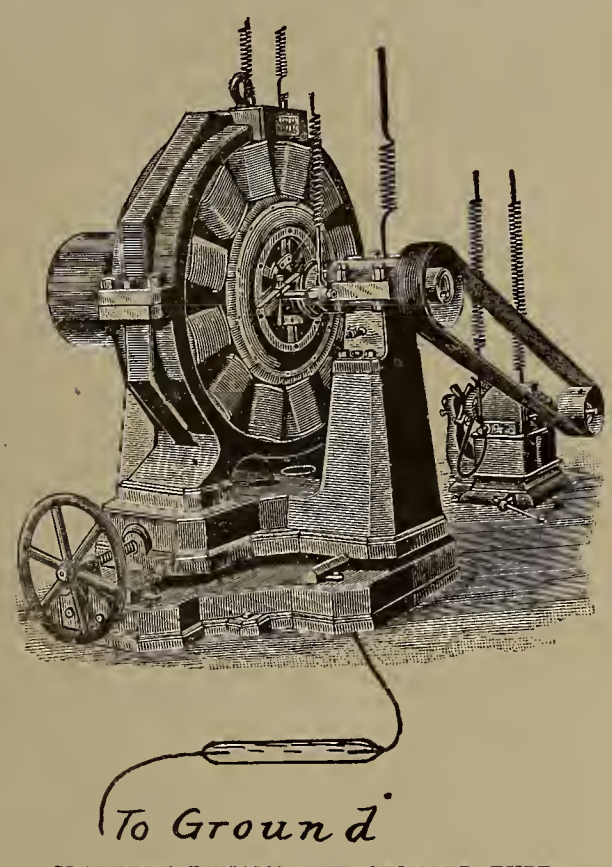
The Coatesville Electric Light, Heat and Power Company, Coatesville, Pa., incorporated March 28, with a capital stock of $25,000. Incorporators: Charles H. Speakman, M. W. Pownall, of Coatesville, Pa.; J. V. Penneger, Lancaster, Pa.

* Edison General Electric Co., New York.

REMEDIES FOR ONE OF THE CAUSES OF ARMATURE BURNOUTS.

BY EDGAR E. STARK.

All those having alternating-current dynamos under their charge probably have noticed, much to their distress, that at certain times there seems to



SLATTERY DYNAMO AND GEISSLER TUBE.

be an epidemic of armature burnouts. The burnouts follow each other in rapid succession for a while, and the close observer, who puts this thing and that thing together in his effort to arrive at the cause of the effect, has settled on the significant fact that these burnouts occur in dry, cold weather.

During a dry spell in New York about the middle of last October, a remarkable number of alternating-dynamo armatures were lost by the different electric lighting companies in the city. The company with which the writer is connected, the Manhattan Electric Light Company, New York, lost no less than five armatures in one week. These machines were Slattery dynamos with drum armatures, wound with two layers of wire. The burnouts were invariably at the core and between the two turns of the adjacent coils, at the point of greatest potential difference.

In following out the history of loads on armatures at the time of burnouts, with the hope of finding a clue which would lead to the determination of the cause of the breaking down of the insulation in these cases, the records show that not one armature was ever burned out during overload. This fact, no doubt, will be a surprise to many, but such is the record.

Another peculiar feature about these wholesale burnouts in our machines was that, during the early part of the dry spell, they were confined to a certain portion of the building, and it was noticed that the machines having long belts were more susceptible to the trouble than the others. One in particular was extremely troublesome, and it was not until the remedy, which will be described presently, was applied that the armatures placed in it would run a reasonable length of time.

Extraordinary precautions were taken in the matter of insulation, etc., in the winding of the armatures to replace the ones burned out, so as to ensure immunity from a repetition of the trouble should that be the weak point.

One of these new armatures was put in one of the machines having a long belt, and showed no weakness during its first run, but on starting it up for its second run there was evidence of impending trouble. We watched the armature carefully, and finally discovered small blue flames or sparks passing from the field-cores to the armature band wire. As yet, however, no definite results could be determined.

The machine was shut down and a very close and critical examination was made of it. All that was noticed of an irregular nature were a few rough places in the banding wire and the field-cores, caused by the sparks in the passage across the space between the cores and the armature. The mica and other insulating substances bore not the slightest evidence of being burned or even scorched.

Up to this time we were still groping about in the dark, so to speak, when an accident occurred which lifted the veil from before our eyes and comprehension. During the examination of the machine just referred to, one of our men received a very severe Leyden jar discharge through his head and hand from the brush to the machine frame. This occurrence revealed the secret of all the trouble. It was all caused by the static charge generated by the rapidly moving belt accumulating electricity until it attained a potential sufficient to puncture the insulation of the armature conductors.

Having at last found the cause of our troubles, the next step was to devise means to prevent their recurrence. Mr. E. A. Leslie, the general manager of our company, and the writer at once entered upon a series of experiments. We first rigged up grounded collections of pointed wire on the running-on side of the belt, then the working side and then on both, but a ground wire still gave a discharge from the bed of the dynamo. Tin plates with pointed collections grounded were afterwards tried. All of these expedients, however, decreased the discharge but slightly.

We next tried grounding the machine bed through a fine fuse wire, and the sparking phenomenon at once disappeared; thus the problem was solved. We tested the efficacy of our method by trying it on old armatures which would sooner or later have yielded had they been allowed to keep on discharging the static electricity through the core insulation. On these old armatures we could not draw a single spark from the machine frame with a ground wire while the dynamo was carrying a circuit.

It was therefore settled that grounding the frames of the machines would obviate all the trouble from static electricity; but dead grounding frames, in our opinion, was not good practice, since it opened up another avenue to possible trouble both inside the armature and outside of the circuit. We therefore carried our experiments further with a view to securing the effect of a ground without an actual ground connection.

We substituted the fine fuse wire by a Geissler tube three inches in length, which would discharge by test at 3,000 volts. This potential was generated by a "step-up" converter and measured by a series of incandescent lamps. This tube was found to discharge all the static electricity that accumulated on the frame and yet act as insulation for lesser voltages. The armatures as wound by this company withstand an alternating current of 4,000 volts between the wire and core; it is obvious, therefore, that a tube that will discharge at 3,000 volts is a sure protection for the armature.

After further experimentation, the tubes finally settled upon as giving the best results are four inches long by about ½ inch in diameter. The vacuum break, *i.e.*, the distance between the platinum electrodes inside the tube, is 1½ inches, which, with the proper vacuum, will discharge at a potential of 3,000 volts.

OLAN RECORDING CURRENT METER.

A simple, reliable and cheap electric-current meter which will measure the current passing through it and make a permanent record of such measurements, is an apparatus for which there has always been a need, but which, up to the present time, has not yet made its appearance.

Many devices planned with this object in view have been invented, but so far as we know none has fulfilled every requirement; they fail in one important respect or another.

It needs no argument to demonstrate the value such an instrument would be where electric currents

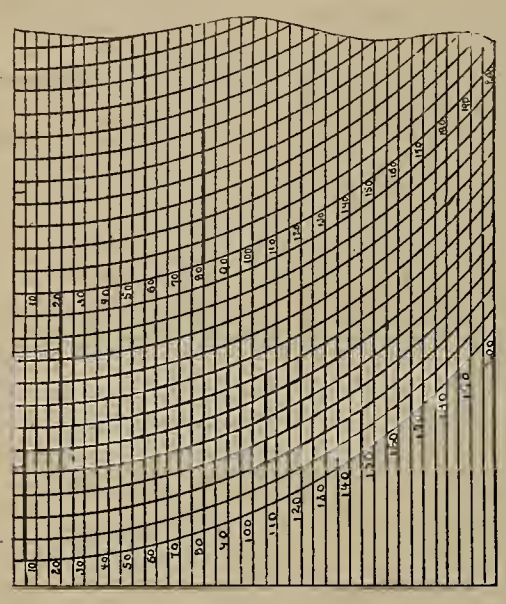


FIG. 3.

are used and measured. There are plenty of instruments, and excellent ones, that will measure the current, but do not make a record which can be referred to at any future time. Records, of course, can be made of their readings by hand, but that requires the service of an attendant who must be paid a salary. In ordinary work, therefore, it would be out of the question to keep a special corps of attendants to make records of the readings of the meters. What is needed is an instrument that will make the record itself.

Mr. J. W. T. Olan, of New York, has recently obtained letters patent on an instrument of this instrument is the manner of making the record, which we will now describe.

The parallelogram in Fig. 1 indicated by *d* represents the paper on which the record is made. This paper is unrolled (by clock mechanism in that portion of the illustration shown at *e*) from the large roll *f* in Fig. 2 and wound on roll *g* (Fig. 2).

By tracing the course of the paper from the roll *f* to roll *g*, it will be seen that it must present a moving surface to the action of the needle or pointer, and in this way a continuous record is made while the instrument is in action. *i* (Fig. 2) is called the time-wheel, and its speed is so regulated that it will make one revolution an hour. It is evident,

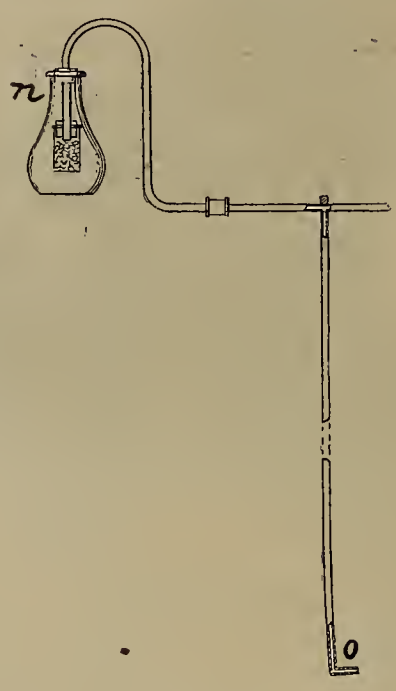

FIG. 4.

therefore, that a certain length of the paper will pass by the needle-point in one hour when the instrument is in continuous operation, and in this way a record is made of the duration as well as strength of current in a manner which will be explained presently.

Roller *m* (Figs. 1 and 2) prints the curved and vertical lines on the paper as it passes between the two rollers *m* and *i*. These lines, as has already been explained, represent the time and current strength respectively. A small ink-roller, shown in Fig. 2, keeps the large roller *m* supplied with fresh ink.

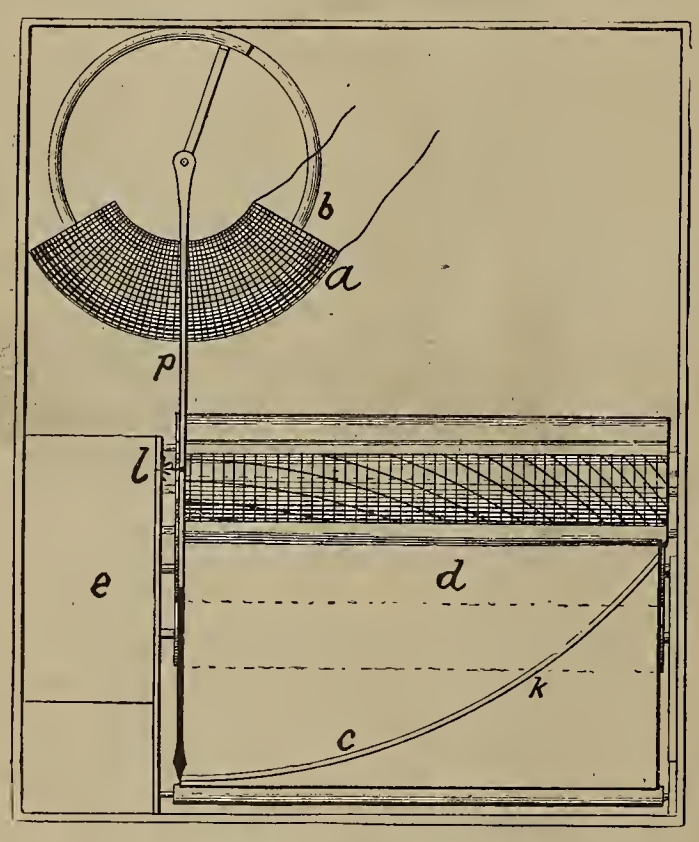

FIG. 1.

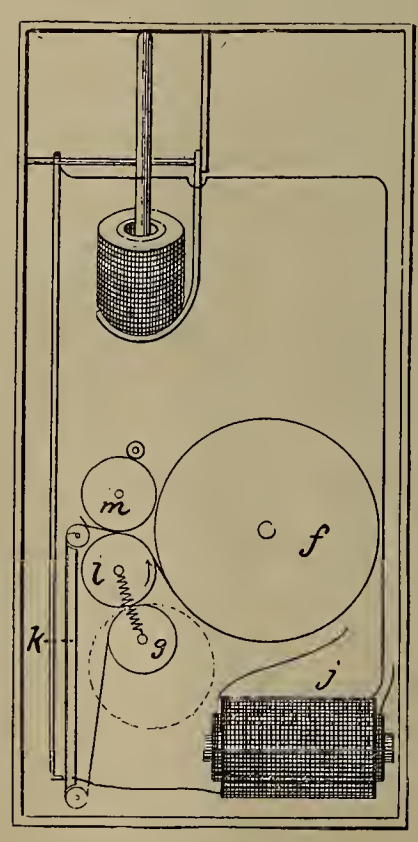

FIG. 2.

character which seems to meet every one of the points referred to at the beginning of this article.

The operation of this device will be understood by reference to the illustrations which accompany this description.

Fig. 1 shows a front view of the meter, and Fig. 2 a sectional view of the same.

a is a solenoid of the well-known form, and *b* is the iron core which is drawn into the coil by the electro-magnetism generated by the current. To this core is attached the pointer *p*, which in its movement over the face of the recording sheet describes an arc of a circle, as shown at *c*.

These parts of the apparatus do not differ essentially from corresponding parts of other measuring instruments. The important feature of the *j* (Fig. 2) is an induction coil, one of the secondary poles of which is connected with the strip or plate of metal *k* which lies under the path of the needle-point in its oscillations—but underneath the paper and the other secondary pole is connected with the pointer as shown in the figure. The primary wire of the coil is connected in the usual manner with a source of current.

Having described the essential parts of the apparatus, we will now consider the operation of the instrument.

Suppose now a current flows through the solenoid, the needle is deflected and at the same time a catch *l* (Fig. 1) which controls the clock-work, is released and the clock mechanism operates. The pointer takes a certain position which represents a definite strength of current, and while the paper is moving past the point small sparks generated by the induction coil pass from the needle-point through the paper to the metal strip *k*, and in this way a record is made on the paper. The length of the record on any one of the vertical lines shows how long a period the current remained at that strength. For example, we may assume that the space between the curved transverse lines (Fig. 3) indicates five minutes of time, and by reference to the record we will see that the current was at first 5 ampères for thirty minutes; or, in other words, the record shows two and a half ampère-hours; then the current jumped to 20 ampères for another half hour (10 ampère hours), and so on.

One very important feature of the instrument needs to be explained here. The needle is so constructed that there is a little air-space between its point and the paper through which the perforations are made for the record. This feature Mr. Olan claims as the most important one of his meter, as it makes a record without friction. The delicacy of the needle adjustment is therefore unimpaired.

Mr. Olan has provided another method of making the record in place of the induction-coil apparatus. This is shown in Fig. 4. It consists of a bottle or receptacle *n*, in which sulphuric-hydrogen gas, or any other gas to the same effect, and with low pressure, may be developed by using the proper chemicals, which gas passes through the hole of the hollow needle to the point *o*.

The escaping gas forms an atmosphere at the needle-point, and this coming in contact with the paper, which is previously treated with lead salts, preferably acetate of lead, a discoloration of the paper is effected, and the record is thus made.

In both methods of making the record it will be noticed that the needle-point does not touch the paper at all.

From this description of the meter it will strike the reader as being an ingenious device, and if it performs all the functions that are claimed for it, we think it will meet with a long-felt want; it seems to be a very practical and meritorious instrument.

COMBINED SWITCH AND CUT-OUT.

The Interior Conduit and Insulation Co. of New York, has recently placed upon the market an arti-

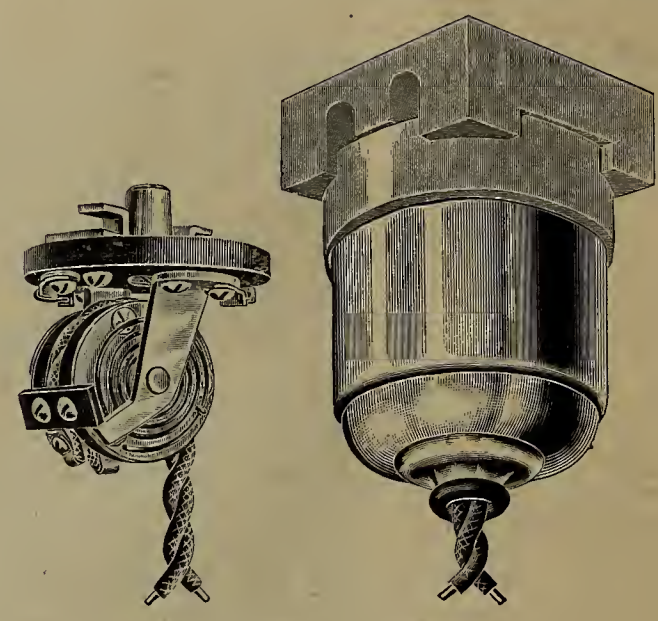

FIG. 1. FIG. 3.

cle which is meeting with instant recognition and commendation from the trade. We refer to its new

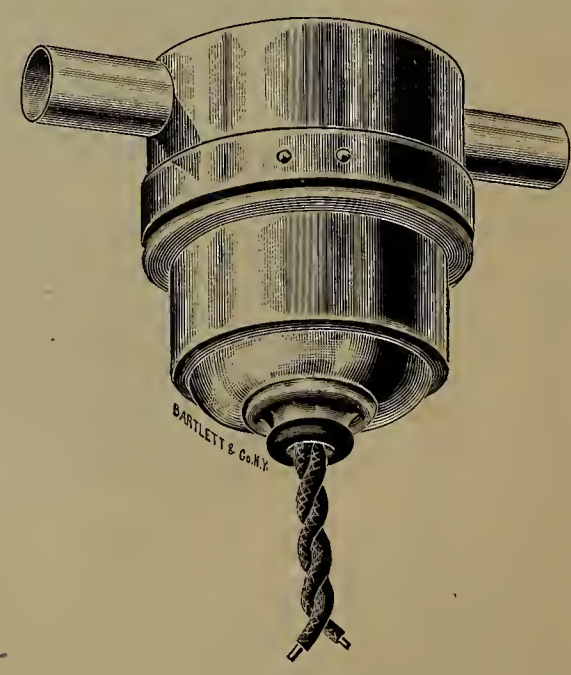

FIG. 2.

Combined Pull-switch and Ceiling Pendant Cut-outs, and its new Pendant Pull-switches, invented

by Mr. E. T. Greenfield, the electrician of the company. These goods, made in a variety of forms, are illustrated and briefly described below.

Fig. 1 illustrates the interior mechanism which is employed in the different styles of switches and is concealed within the shells of the same. This new form of switch overcomes in every way the difficulties experienced in turning on and off any style of key socket suspended from flexible pendants. Grasping either the cord or the lamp with the hand, the light may be turned on or off by a slight pull only. This form of switch will be found very advantageous for use in place of a key-socket or other switch in circuit, as in clothes closets and in like places where the lamp is within reach of the hand.

Fig. 2 illustrates the switch made to fit the Standard Conduit Branch Junction Boxes and Cut-outs

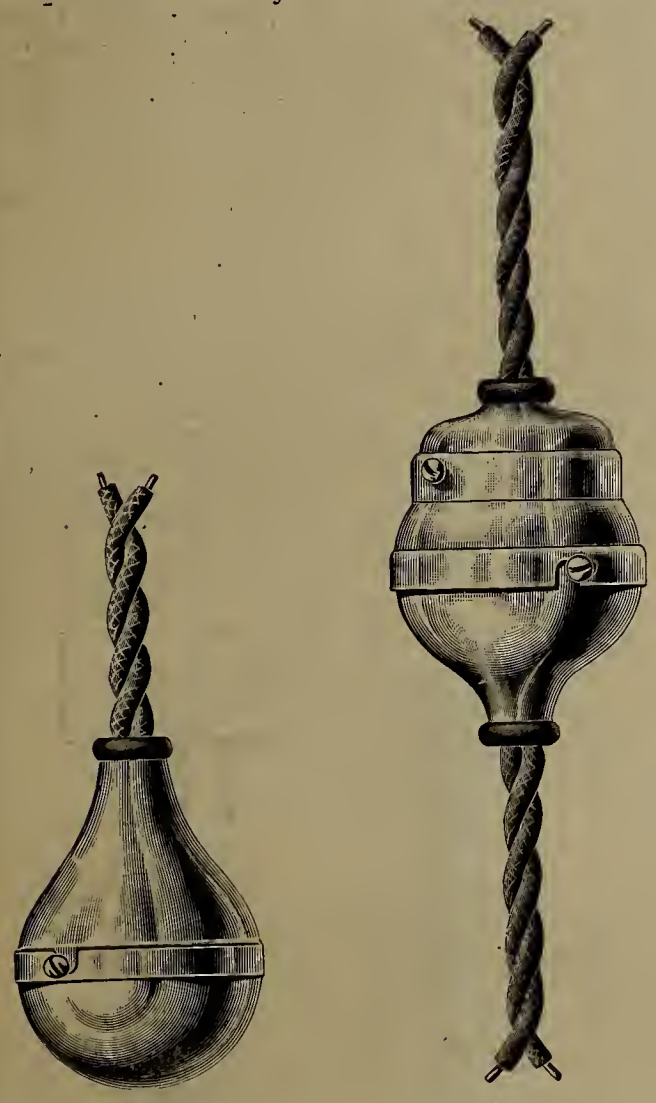

FIG. 4. FIG. 5.

manufactured also by the Interior Conduit and Insulating Co., and Fig. 3 represents the switch as adapted to the base of their "V.V." Ceiling Cut-out. The same mechanical principle employed in the Combined Pull-switch and Ceiling Pendant Cut-out is used to great advantage in the Pendant Pull-switches, cuts of which appear herewith.

Fig. 4 is a pendant Pull-switch designed for attachment to flexible cords for controlling incandescent lamps with the same freedom and safety as is experienced in handling an ordinary push button on an annunciator circuit. The switch may be used as a pendant from the centre of electroliers, thus dispensing with key-sockets, and affording ready means for easily controlling the current.

In general, it serves to bring within control lamps that are otherwise out of reach, permitting them to be turned on and off from any point that may be reached by a flexible cord.

Fig. 5 illustrates another application of the same mechanical principle embodied in the foregoing designs, and may be used with advantage in flexible cord pendants where it is not convenient to substitute the Combined Ceiling Pull-switch and Cut-out for the ceiling-block already in use. This switch may be inserted in any flexible cord pendant by simply cutting the cord and attaching the terminals to the binding screws provided for that purpose. As in the other forms of the same switch, the light may be turned on or off by a slight pull of the cord only. These switches are easily and quickly wired and are thoroughly reliable in every respect.

A CANADIAN ENTERPRISE.

The Royal Electric Company, of Montreal, Canada, has decided to carry out a most extensive and important undertaking. A charter has been obobtained for utilizing the Chambly Rapids, and operations will be commenced as soon as the water is low enough. The rapids are susceptible of developing at lowest water over 20,000 horse-power, and it is the intention of the company to distribute in Montreal not only arc and incandescent lights, but also to supply power for manufacturing purposes, operation of elevators, mills, etc. Work is to be vigorously pushed, and it is expected that at least one-third of the power will be developed by the end of the coming summer, but it will probably take two years to develop the full power. It is said that one of the effects of this scheme will be the reduction of the price of electric lights at least 25 per cent. below that of gas. In addition to supplying the city with lights, the company will also manufacture railway motors and all other electrical appliances, and will have charge of equipping the new electric railway service which is to be inaugurated, supplying it with power, etc. The Hon. R. Thibeaudeau is president of the company.

ELECTRICAL SOCIETIES.

BROOKLYN INSTITUTE.

On April 15 Prof. Robert Spice will deliver a lecture on "Long-Distance Transmission of Electric Power" before the Department of Electricity of the Brooklyn Institute. Prof. Spice will illustrate his lecture, which will be held in the large lecture-room, 502 Fulton street, Brooklyn.

OBITUARY.

A. B. ULINE.

The many friends of Mr. A. B. Uline, general manager of the Hudson River Telephone Company, Albany, N. Y., will regret to hear of his sudden death from heart disease at Nassau, New Providence, on April 4. Mr. Uline was born at Sand Lake, N. Y., on July 17, 1836, and was a resident of Albany since 1863, in which year he assumed control of the Merchants' Dispatch and Transportation Company. He was appointed Fire Commissioner of Albany in 1883, which office he retained up to the time of his decease. Mr. Uline became associated with the telephone industry at its inception. He left New York a short while ago in company with Mr. Sargent, of the New York and New Jersey Telephone Company, and Mr. Hall, Manager of the Bell Telephone Company, of Buffalo, N. Y., on a visit to Nassau, in search of recreation, and expected to be away about two months, when he was suddenly stricken down. He leaves a wife and three children, one, a daughter, being married.

WORLD'S FAIR NOTES.

The officials of the World's Fair enterprise announce that the Exposition Company will pay $20 per lamp for the 5,000 to 6,000 arc lamps required for electric lighting. The 100,000 incandescent lights which will be needed have not yet been contracted for.

Regarding the arc lamps, it will be remembered that there was a dispute regarding the price per lamp between the Fair officials and the Thomson-Houston Company. The differences have been settled.

Contracts for a boiler capacity of 10,000 horse-power have been let by the World's Fair Company at $79,300. Oil will be burned for fuel instead of coal, and 225,000 barrels of it will be required. The oil will cost the Exposition Company 72½ cents a barrel.

DESANT CASH REGISTER.

A reliable and simple cash register has long been a *desideratum* in the mercantile world, and the demand for such an apparatus has naturally led to the invention of various devices of this character. They all, however, have one or more objections—they are either expensive, complicated in construction, or are not free from the possibility of being tampered with so as to return false records.

Mr. W. F. Z. Desant, a well-known electrician, who resides at 316 East 119th street, New York City, has invented and recently perfected a cash register which is now about to be put upon the market. This register seems to meet all of the objections raised against every other, and has advantages of its own which render it of great value to store-keepers and business houses. It will keep any number of accounts, either at the point of sale or at a distance. For instance, the sales made in the store can be recorded at the proprietor's house, whether it be above the store or situated several blocks away from it. The proprietor in this way can keep a record before him of all cash transactions at his place of business.

The mechanism of this register is extremely simple; it consists of an ordinary clock-spring and three gear-wheels. The action of the machine winds the spring sufficiently to move the mechanism connected with the make-and-break contact-wheels of the electrical part of the apparatus. The counting is done by a pair of magnets and an armature connected with five wheels that engage with each other, and any amount can be registered, from one penny up to $999.99.

The cash-drawer is opened automatically by the action of the lever in the act of registering the sale. The drawer can be opened and change made without registering, but every time it is opened a record is made of the fact; that is to say, if the drawer is opened simply to make change there is no record made of a sale, but a record is made of the fact that the drawer has been opened for the purpose of making change.

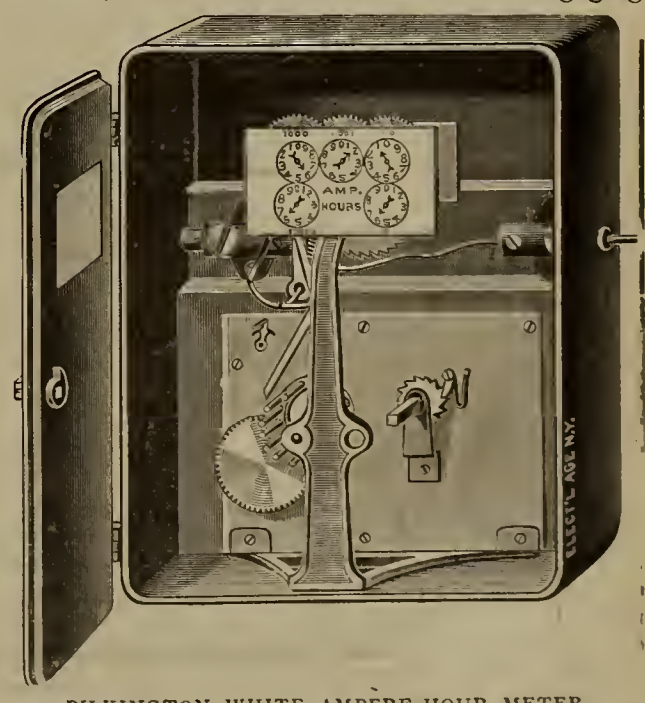
There is no possible way of "beating" the machine. If any attempt is made to tamper with it the bell rings, and it rings whenever anything gets out of order, and continues to do so until attention has been given to the machine. No money can be taken from the drawer without detection.

The main points of this register are cheapness, reliability and simplicity of construction. There are very few parts, which necessarily implies simplicity and less liability to get out of order. This also implies that the device can be made very cheaply, and it is expected by the inventor that the apparatus will find a very large and rapid sale in all classes of business houses. The battery will last 16 months without recharging, and the only expense in that time will be about 30 cents for a new charge. On account of the simplicity of the machine there is absolutely no repairing necessary.

The device is so simple in construction and so reliable in its results that there seems to be no reason why it should not meet with an excellent demand.

DIRECT-READING AMPÈRE-HOUR METER.

The "Pilkington-White" direct-reading ampère-hour meter, recently put on the market by the Electric Construction and Supply Co., of 18 Cortlandt st., New York, is of special interest to private consumers and central stations. It is of very simple construction, consisting of a solenoid ammeter, to the core of which is fastened a lever, pivoted in the center. When one or more lamps are turned on a spring-actuated wire drum, with wires of unequal length, is brought in contact with the lower end of the lever, the other end at the same time engaging



PILKINGTON WHITE AMPÈRE-HOUR METER.

a toothed wheel connected to a counter-gearing similar to the index of a gas-meter. The pins of the drum are so arranged that the smallest fraction of an ampère-hour is recorded on the index. The meter is compact, and combined with its commercial utility, is accurate, economical and reliable, and as it registers in direct ampère-hours it enables a customer at any time to know the exact amount of current used. It is made in different sizes, ranging from five to forty ampères.

ASSIGNMENT OF PATENTS.

In the case of an assignment of the whole interest in an invention, or of the whole interest in the patent to be granted, the patent will, upon request of the applicant, issue to the assignee; and if the assignee hold an undivided part interest, the patent will, upon like request, issue jointly to the inventor and assignee; but the assignment in either case must first have been entered of record, and at a day not later than the date of the payment of the final fee; and if it be dated subsequently to the execution of the application, it must give the date of execution of the application, or the date of filing, or the serial number, so that there can be no mistake as to the particular invention intended. The application and oath must be made by the actual inventor, if alive,

even if the patent is to be issued to an assignee. If the inventor be dead, it may be made by the executor or administrator.

If it appear that the inventor, at the time of making his application, believed himself to be the first inventor or discoverer, a patent will not be refused on account of the invention or discovery, or any part thereof, having been known or used in any foreign country before his invention or discovery thereof, if it had not been before patented or described in any printed publication.

Joint inventors are entitled to a joint patent; neither can claim one separately. Independent inventors of distinct and independent improvements in the same machine cannot obtain a joint patent for their separate inventions; nor does the fact that one furnishes the capital and another makes the invention, entitle them to make application as joint inventors; but in such case they may become joint patentees upon the condition above named.

THE ELECTRICAL CONGRESS.

The Electrical Congress Committee of the World's Columbian Exposition, consisting of Professor Elisha Gray, Col. R. C. Clowry and Professor H. S. Carhart, Professor Gray, chairman, has issued its preliminary address as follows:

"It is eminently fitting that at suitable times and on suitable occasions men in all departments of science and industry should come together for interchange of thought, and for the discussion of subjects that have to do with the great activities of life—practical and intellectual.

"What more fitting time to hold a series of congresses than during the great World's Columbian Exposition at Chicago in 1893? In pursuance of this object the World's Congress Auxiliary of the World's Columbian Exposition has been organized under the support of the exposition corporation, and has been recognized and approved by the government of the United States. Under this organization committees have been appointed to organize a series of congresses. Among others, a general committee, consisting of a local committee and an advisory council, selected from men eminent in the science, both in this and in foreign countries, has been appointed by the World's Congress authorities to organize a World's Electrical Congress, to be held at Chicago some time during the summer of 1893.

"The movement is as yet in a formative stage, and much thought must be given to it before a detailed programme can be formulated. It is the intention of the general committee to so organize the congress that the greatest good to the science and to all interested in electrical progress may be attained. It is desirable that the work of the congress should be divided into sections, the number of which will be determined after consultation with the advisory council. The first and most important section should give its time and thought to the more purely scientific phases of the subject, such as the revision of the existing electrical units, and the addition of such others as the state of the science may require. Other sections should be devoted to the more practical questions of applied electricity.

"In addition to the meetings of the various sections, there will be general meetings, where all will come together to listen to papers from men eminent in the science from all parts of the world. An audience-room will be furnished, where such general meetings of the congress will be held, in connection with which will be smaller rooms, suitable for the meetings of the various sections.

"In order that their conclusions may have the authority both of scientific ability and of official sanction, the members of the first or scientific section should be appointed by the respective governments from which they come. The delegates having this very important work in charge should represent the best talent from all parts of the world or from such countries as, by reason of achievements in the domain of electricity, are entitled to a voice.

"We invite the hearty co-operation of all persons interested in electrical progress, not only by any suggestions they may have to make, but also by their presence at the congress in 1893. Already there is a lively interest felt in the matter, in this and other countries; for the idea of holding an electrical congress at the time of the World's Fair is not a new one either to European electricians or to the profession in this country. Several associations of electricians have suggested it; for three years past the American Institute of Electrical Engineers has had an active committee on this subject; and at the electrical congresses of Paris (1889) and Frankfort (1891) its delegates extended a formal invitation to their European associates to come to America in 1893. Since those invitations were extended, the present authorities have been appointed by the World's Congress Auxiliary of the World's Columbian Exposition. When these authorities presented the matter officially to the Institute, they immediately saw the fitness of having the congress held under the auspices of the World's Fair; and by a formal and unanimous vote of its council and special congress committee it has pledged itself to give all possible support to the agencies now intrusted with the responsibility of making a success of the proposed electrical congress at Chicago in 1893. It is the hope and expectation of the Committee on the Electrical Congress that other electrical associations at home and abroad will give us the same hearty co-operation.

"The time of meeting will be most auspicious, as the representatives of the world's best thought and best work will be centred here, and the congress will meet under the shadow of the greatest palace of electricity the world will ever have seen. Other announcements will follow this one, from time to time, as the work of organization goes on. All communications in the way of suggestion or otherwise should be addressed to the chairman."

The following names of those composing the advisory council of the Electrical Congress, as it is at present constituted, are appended to the address:

Sir William Thomson, F.R.S. (Lord Kelvin), The University, Glasgow, Scotland.
William H. Preece, F.R.S., electrician-in-chief, General Post-Office, London, England.
Prof. W. E. Ayrton, F.R.S., City and Guilds of London Institute, Central Institution, Exhibition Road, London, S. W., England.
Lord Rayleigh, Terling Place, Witham, Essex, England.
Prof. S. P. Thompson, D.Sc., City and Guilds of London, Technical College, Finsbury, London, England.
Prof. E. Mascart, College de France, No. 176 Rue de l'Université, Paris, France.
E. Hospitalier, No. 6 Rue de Clichy, Paris, France.
Dr. Werner Siemens, Berlin, Germany.
Prof. H. Von Helmholtz, Berlin, Germany.
Prof. Galileo Ferraris, Turin, Italy.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Armature Cores.

The core of the armature of a dynamo-electric machine plays a very important part in the system. Soft iron is the only metal that can be used with advantage in the construction of the core. Wood, china or any other substance could be used, but it would have little or no effect in the resultant electrical currents, as compared with soft iron. Any of these substances would serve only the purpose of giving a foundation for the armature coils, whereas an iron

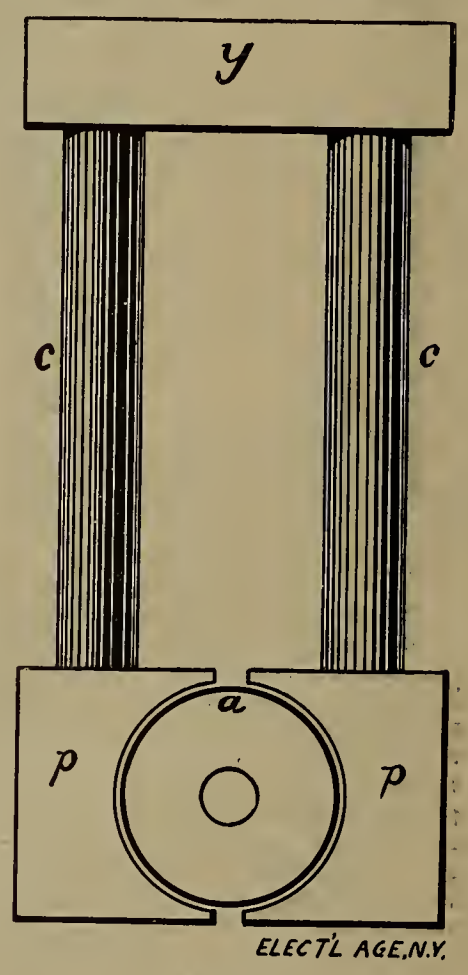

FIG. 1.

core not only serves as a foundation, but also nearly completes the magnetic circuit in the manner which will be described later on. Every dynamo has what is known as a magnetic circuit. Soft iron is the medium through which the magnetic action can take place with the least resistance, in the same sense that an electric current meets with the least resistance in a copper wire.

The magnetic circuit of a dynamo consists of the core and yoke-piece of the field-magnets and the air-gap between the pole-pieces (see Fig. 1). If the air-gap did not exist and the space was filled with iron by the extension of the pole-pieces, the magnetic circuit would be complete and unbroken, and the resistance to the flow of magnetic lines of force would be the least possible to attain. But the existence of the air-gap interposes a great resistance to their flow, and the reduction of this resistance is one of the functions performed by the core of the armature. Being of the same material as the field-cores

(iron), it largely fills the gap and so reduces the resistance. The lines of force are projected from one pole-piece to the other, and as the iron of the core offers a path of less resistance to their flow, more of the lines are concentrated through its substance than would pass through the same space of air were the armature removed. The effect of this power of concentration is to render the field denser than it would otherwise be, and consequently the wire on the armature-coils have many more lines to cut through in its revolutions.

The denser the field the greater will be the current generated in the armature-coils, because there will be a greater number of lines of force to cut through, from which it is evident that the gap should be as small as possible.

In the practical dynamo there yet remains an air-space between the surfaces of the pole-pieces and the armature-core, which is unavoidable. We cannot entirely fill the space with the armature because the latter must revolve freely. It must not touch the pole-pieces, and it is desirable to construct it in such a manner that it will fill the space as much as possible without touching either of the pole-pieces. The space between the pole-pieces and the circumference of the armature is therefore made very small.

Then there is the space occupied by the coils on the armature-core which adds to the gap through which the magnetic lines of force must be projected before they reach the iron of the core itself. It requires nice calculation to have all the parts balanced properly, so that the best results may be obtained. The space between the pole-pieces must be as small as possible; it is desirable to have the armature-core as large as possible, to fill the space, and as much wire as possible in the armature-coils is desirable, within certain limits. All of these factors can be calculated exactly by the proper method. The formula for these calculations can be found in most of the text-books on dynamo construction.

The core of the armature must be laminated—that is, it must be built up of discs of thin iron, separated from each other by some insulating substance, such as mica, air, ebonite, shellac-paper, etc. The discs or laminations should also be perforated to admit of a free circulation of air to keep the temperature as low as possible.

Fig. 2 shows one form of disc, with projections on the circumference for the purpose of retaining the coils in place, and also gives a longitudinal sectional view of the core built up of such discs, with the armature-shaft running through the centre.

The object of constructing the core in this manner is to avoid eddy currents in the iron as far as possible, which cause a useless expenditure of energy. The energy dissipated in this way appears in the form of heat.

In a future article we will consider the subject of eddy currents.

ANSWERS TO INQUIRIES.

Editor Electrical Age: Will you kindly inform a young student how it is that electric currents are generated in a dynamo-electric machine? Also please give the name of a good book on electrical engineering, and oblige, T. M.

Maumee, Ohio.

Answer.—The wire on the armature of a dynamo in its rapid motion in the space between the two pole-pieces of the field-magnets cuts the magnetic lines of force which fill the space. The simple fact of cutting a magnetic line of force with a wire induces an electromotive force, and consequently a current in the wire. The wire, however, must pass through the line of force at right angles. An excellent work on electrical engineering is "Electrical Engineering," by Slingo and Brooker, which can be had at this office. Price $3.50.

Editor Electrical Age: Are the products of combustion of an arc light as deleterious to health as those of gas-jets? T. D. P.

Woonsocket, R. I.

Answer.—No; they are very much smaller in quantity and far less harmful. While the carbons are consumed by ordinary combustion some of the particles unite chemically with the constituents of the atmosphere.

Editor Electrical Age: I have an electrical machine (static) for experimental purposes which is rather uncertain in its action. It is at times very difficult to get a charge from it, while at others it works very well. Can you tell me what is the trouble and what I should do to secure more uniform results? E. R. M.

Elkton, Md.

Answer.—The machine must be kept scrupulously clean and dry. The dampness in the atmosphere is probably the cause of the irregular behavior of your machine. The glass is hygroscopic, and should be dried by the application of warmth so as to dissipate the film of moisture which collects on the surface. Keep your machine free from dust and dampness and you will get better results.

BIOGRAPHICAL SKETCHES.

SAMUEL S. BOGART.

One of the best-known men in the electrical field, particularly that department which relates to telegraphy, is Mr. Samuel S. Bogart, the subject of this sketch.

Mr. Bogart was born in Plainfield, N. J., 47 years ago, and received an education at Blair College. In 1863 his first experience in the telegraph service is recorded, and his first office was on the Delaware,

SAMUEL S. BOGART.

Lackawanna and Western Railroad, the telegraph lines of which were operated by the United States Telegraph Company. During the building of that company's system Mr. Bogart worked as climber and foreman, and at this time he received his first experience in line building, for which he has become celebrated in late years.

He was afterwards the manager of the office at Trenton, N. J., and later on worked in Philadelphia, Baltimore and Washington. During the war Mr. Bogart was for some time in the military telegraph service, and afterwards was appointed chief operator on the Lehigh Valley Railroad.

We next hear of him as flagman and conductor on the Erie road, and he subsequently filled the offices of yardmaster and train dispatcher. After service on this line he took positions on the Central Railroad of New Jersey as night, then day operator, and later on was connected with the engineering corps of the Lehigh and Susquehanna Railroad. Between 1869

OSGOOD S. WILEY.

and 1884 Mr. Bogart was in the service of the Western Union Telegraph Company, first as night operator, then day operator and afterwards chief operator. He was finally appointed wire chief of the company in New York, which position he filled with extraordinary ability, and displayed great tact in the performance of the exacting duties of this position.

After leaving the service of the Western Union Company he was appointed general traffic manager of the Baltimore and Ohio Telegraph Company, and subsequently became superintendent of telegraph and signals for the New York, West Shore and Buffalo Railway; New York, Ontario and Western Railroad; Wallkill Valley Railroad; Syracuse, Ontario and New York Railroad, which were combined with the New York State and part of New Jersey superintendency of the Baltimore and Ohio Telegraph Company. He afterwards became connected with the Edison General Electric Company as inspector, and at the present time is the electrician of the Electric Secret Service Company, of New York. Mr. Bogart is the inventor of the individual selecting system, controlled by this company, for picking out any office, electric light or motor and cutting the same in and out without disturbing the others on the same circuit.

This is only one of the many inventions which Mr. Bogart has devised for the greater convenience and simplicity of the telegraph and railroad professions. He has sought rather the advancement of the service than his own personal advantage.

Mr. Bogart is an expert in electrical and railway matters, and though he has had great experience he is still young looking. He is well known in the electrical fraternity, and is as well liked as he is known. He is a good companion and an entertaining talker, and is stocked with a fund of electrical information such as is possessed by no other living mortal.

Mr. Bogart lives at Greytop, Schraalenburgh, N. J., which is said to be one of the finest places in Bergen county. His family consists of wife and five children, and his home is a happy one.

OSGOOD S. WILEY.

Osgood S. Wiley was born in Orange, N. J., in 1855. After having finished at a high school, he entered the University of New York in 1872, taking an eclectic course, devoting most of his time to chemistry and electricity under Professor Draper. In 1876 he went to New Orleans where he was employed as a telegraph operator until 1877, when he returned to New York and for five years occupied a similar position with the Western Union Telegraph Company at 195 Broadway, up to 1883, when he was appointed Train Dispatcher on the New York and New England Road, at Hartford, Conn. In 1888 he went to Europe for Mr. Edison with the phonograph and his magnetic ore separator, and was one of the assistants who exhibited the phonograph to the Prince of Wales at Sandringham Palace. Returning in 1889, he had charge of the electric lighting on the Chicago, Milwaukee and St. Paul Road, which system was used on the cars between Chicago and Minneapolis for lighting the cars. Mr. Wiley, has just received the appointment as electrical expert of the Board of Subway Commissioners recently created in the State of New Jersey.

IN WOODS' FAVOR.

In the suit of J. S. Zerbe, superintendent of the American Engineering Company, which was tried in the Gates Avenue Police Court, Brooklyn, on April 3, against Granville T. Woods, the colored inventor, for criminal libel, a verdict was rendered by the jury in Woods' favor. The evidence showed that Zerbe had made a contract with Woods by which he was to be employed at a stated salary and receive part of the capital stock, for the invention of an electric system for the propulsion of street cars. Zerbe, according to Woods, did not fulfil the terms of his contract, and Woods accordingly withdrew, but could not secure his patents, which he claimed had been pocketed by Mr. Zerbe. He then published a warning in Street Railway News, and it was the publication of this warning which resulted in the trial. A full and complete description, with illustrations of Mr. Woods' system, was published in Street Railway News of February 27.

F. P. Little & Co., Buffalo, N. Y., report business very brisk with them. A contract has been closed with the Connecting Terminal Railroad Co., of that city, for installing a plant consisting of one 500 light Thomson-Houston dynamo, one 38 H. P. engine of the John T. Noye Mfg. Co.'s make, twenty-four 2,000 C. P. Mosher arc lamps and 125 16 C. P. incandescent lamps, all equipped complete, ready to operate. A contract has also been closed for wiring the Columbia Bank building for incandescent lights; and they are wiring the City Elevator for 300 incandescent lights and 5 arc lights complete with engine, dynamo, etc.; the Bell Telephone Co.'s building for 150 lights and rewiring Weyand's Brewery for 225 lights, all of that city.

Buffalo and Hamburgh Railway Company, Hamburgh, N. Y., was incorporated March 31, with a capital stock of $150,000. Incorporators: T. Cyrus Wheelock, John H. Meech, Buffalo, N. Y.; Amos Baker, Hamburgh, N. Y.

NEW INCORPORATIONS.

Canton Electrical Company, Canton, Mo., incorporated March 30, with a capital stock of $4,500. Incorporators: W. E. Agee, T. L. Durhee, W. B. Horton, all of Canton, Mo.

Hope Electric Appliance Company, Portland, Me., was incorporated March 29, with a capital stock of $300,000. Incorporators: Augustus Wright, Robert Fessenden, P. Gifford, Providence, R. I.

York Manufacturing Company, Portland, Me., was incorporated March 29, with a capital stock of $500,000, to manufacture and deal in electrical apparatus and appliances of all kinds. Incorporators: John W. Fletcher, Chelsea, Mass.; Henry Wellington, Charles E. Millke, Brooklyn, N. Y.

American and Foreign Electrotype Company, Portland, Me., incorporated March 29, with a capital stock of $30,000. Incorporators: Dana Estes, Brookline, Mass.; Eugene C. Batchelor, Quincy, Mass.; Louis C. Page, Brookline, Mass.

The Felt Electrical Light and Power Company (incorporated in W. Va.), New York, N. Y., incorporated March 30, with a capital stock of $5,000,000 Incorporators: George H. Felt, N. B. Armory, G. L. Felt, all of New York, N. Y.

The Foreign Storelectro Company (incorporated in W. Va.), Cleveland, O., incorporated March 30, with a capital stock of $1,500,000, to manufacture and sell electrical instruments, etc. Incorporators: J. C. Hoyt, A. C. Dustin, M. L. Black, all of Cleveland, O.

Electric Light and Water Company, Hillsboro, Ore., incorporated March 26, with a capital stock of $40,000. Incorporators: H. V. Gales, D. Rankin, W. E. Pruyn, all of Hillsboro, Ore.

The Lewiston and Reedsville Electric Railway Company, Lewiston, Pa., was incorporated March 24, with a capital stock of $24,000. Incorporators: A. B. Spanegle, James C. Hazlett, J. M. Goodhart, all of Lewiston, Pa.

The Crafton Light and Power Company, Crafton, Pa., was incorporated March 28, with a capital stock of $10,000, to supply light, heat and power by means of electricity. Incorporators: S. A. Duncan, Pittsburg, Pa.; William M. Galbraith, Chartiers, Pa.; J. A. Langfilt, Wilkinsburg, Pa.

Kenosha Electric Street Railway Co., Kenosha, Wis. Incorporated April 2, with a capital stock of $100,000. Incorporators: J. W. Munson, H. Pennoyer, H. B. Robinson.

The Wheeling & Belmont Railway Co., Martin's Ferry, Ohio, incorporated April 1, with a capital of $100,000. Incorporators: Harry Northwood, Jos. T. Hanes, Theo. Keller.

The South Williamsport Railway Co., Williamsport, Pa., incorporated March 31, with a capital stock of $ 5,000. Incorporators: J. Henry Cochran, James B. Krause, Henry C. McCormick, all of Williamsport, Pa.

Vallamont Passenger Railway Co., Williamsport, Pa., incorporated March 31, with a capital stock of $10,000. Incorporators: Jas. B. Krause, E. R. Payne, Henry C. McCormick, all of Williamsport, Pa.

Buffalo, North Main Street & Tonawanda Electric Railroad Co., Buffalo, N. Y., has been incorporated with a capital stock of $60,000. Incorporators: Louis F. Warend, Buffalo; Albert T. Fancher, Little Valley; Frank D. Smith, Springfield.

The Syracuse Storage Battery Co., Syracuse, N. Y., has been incorporated with a capital stock of $300,000. Incorporators: Charles L. Pack, Jacob M. Warner, all of Syracuse, N. Y.

Iona Manufacturing Co., Portland, Me., was incorporated March 31, with a capital stock of $15,000, to manufacture and deal in electric gongs, bells, batteries, etc. Incorporators: Norman Marshall, Boston; Henry P. Stanwood, John O. Holman, both of Brookline, Mass.

Arnold Novelty Co., Tacoma, Wash., was incorporated March 30, with a capital stock of $2.500. Among other things it will manufacture, buy and sell all kinds of electrical appliances. Incorporators: A. F. Esperson, W. S. Arnold, P. N. Boeringer, J. E. Small, E. N. Castillo, all of Tacoma, Wash.

Columbian Underground Electric Traction Co., East St. Louis, Ill., incorporated April 4, with a capital stock of $1,000,000. Incorporators: D. J. Murnane, George L. Van Beek, Stephen Von Phul.

The American Magnetic Boiler Cleaning Company (incorporated in W. Va.), Pittsburg, Pa., incorporated March 28, with a capital stock of $150,000. Incorporators: James Andrews, W. W. Andrews, E. E. Andrews, all of Allegheny, Pa.

The Waddell Entz Company (incorporated in W. Va.), Bridgeport, Conn., incorporated March 28, with a capital stock of $5,000,000, to manufacture and sell electrical batteries, dynamos, motors, insulated wire, etc. Incorporators: Mont. Waddell, W. A. Phillip, Justus B. Entz, all of Bridgeport, Conn.

Citizens' Lighting Company, Hempstead, N. Y., incorporated March 22, with a capital stock of $25,000, to manufacture and use electricity for light, heat and power. Incorporators: Thomas Henderson, Fred. L. Richmond, Samuel B. Althanse, Jr., all of Far Rockaway, N. Y.

NEW YORK NOTES.

Office of the Electrical Age,
First Floor, World Building,
New York, April 9, 1892.

Mr. D. H. Bates, well known in electrical and telegraph circles, is now connected with Bradstreet's Mercantile Agency, New York.

Mr. Cummings, of the firm of McDougall & Cummings, of Chicago, was in town last week. This firm is the agent for the "Ward" Arc Lamp in the West.

J. W. Dickey, recently of Rochester, N. Y., is in New York with a view to making an engagement. Mr. Dickey is an old and experienced electric-light and railway expert, having installed some of the largest plants in the country. He was also superintendent of the Rochester Electric Railway.

E. W. Applegate, a well-known Western electrician, is now in New York experimenting with his new incandescent lamps and filaments preparatory to placing them on the market. This lamp is constructed of inexpensive and durable material, and it promises to cheapen incandescent lighting very materially.

James H. Smith, electrician of the Park Theatre, Brooklyn, N. Y., was badly burned on the face and hand a few nights ago by an arc which formed on one of the switches that was represented to be ample to carry the load. The switch was melted. It is doubtful if Mr. Smith will again have control of his left hand so badly was it burned, while he had a narrow escape with his eyesight.

The New York office of the Short Electric Railway Co., of Cleveland, O., has been changed from the *World* Building, where its quarters were found to be inadequate to the demands of its rapidly increasing business, to the Mills Building, 35 Wall street. Here large and beautiful rooms have been secured, where will be found the same genial and gentlemanly representatives of this enterprising company, Mr. Edward E. Wessels, manager of the office, and Mr. C. C. Curtiss, confidential agent of the company, who are rapidly making themselves a power in the street-railway fraternity of New York and New England. These gentlemen have in their offices a fine display of the electric-railway apparatus which they are installing.

FINANCIAL.

It is estimated that over $45,000,000 in dividends were paid out in New York on or about the 1st of this month, and April is not by any chance a comparison as a prolific income period to January or July. As the years advance, these incidents increase both in the number of securities and the amount of their earnings. Electrics more than hold their own, and investors are every year becoming more and more pleased with them. There has never been a time when a greater variety of thoroughly sound opportunities to reap large profits from comparatively small ventures in the electric art was possible. Experiment has practically ceased, as there are so many who, from even a cursory examination of the specifications as published in the Electrical Age, can detect any defect in the combination of claims if such exist, and on the other hand, if the assembling of the elements are on correct lines, it is well known that only two other things are requisite—money and brains, or expenses and management. There are a great many completed problems seeking capital with orders to fill, and which are without raw material or cash for labor and machinery, and in some cases a full half interest is offered for a few thousand dollars for this purpose. There are engineering and manufacturing companies owning their own patents and in possession of the requisite models, moulds or patterns, but not able to supply goods, for the lack of from one to five thousand dollars. These supplies all show a profit of at least fifty per cent., and the demand is good. Another prime investment on the top at the moment is the motor, or system which shall take the place of the overhead trolley. A very few thousand dollars will test a system within twenty-five miles of New York, and if not proven of sufficient utility in hard, regular operation, the material will bring in a considerable return, while if successful, with the full positive knowledge of the fact, and a few thousand more to exploit the corporation, a large fortune is assured. The older companies do not seem disposed to aid the impecunious inventor, but on the other hand to ride roughshod over him and his, which is to the detriment of the public. It is even rumored that sufficient capital has been secured by some of the colossal corporations to cause them to ignore patents altogether; that they propose to manufacture and use any of them, and if sued to defend themselves with a part of the profits. There is plenty of room for small fortunes outside of these monopolies, whose shareholders are not receiving more than their share of the $45,000,000 first above written, and as large oaks from little acorns grow, so also do rich bond-holders from small investors. At this writing there is no positive conclusion to report in connection with the consolidation of the Edison and Thomson-Houston Companies; each has lately declared its regular dividends, and the Edison General is practically no longer dealt in on the Stock Exchange, the dealings being more generally in the unlisted receipts. Rumor comes from Boston that parties supposed to be acting in the T.-H. interests are quietly buying up the Westinghouse shares, with a view to carrying it into the consolidation. This will all be settled before the fall business commences on the Exchange, and when the brokers return from their summer outing I predict they will find only one electric stock representing all three of these, and that known simply as the Edison Electric Co., having a capital of $75,000,000, and a long tail of bonds with different names, dates and rates.

PHILADELPHIA NOTES.

The Star Electrix Company, 639–643 Broad street, Philadelphia, Pa., manufacturer of incandescent electric-light specialties in switches, lamp-sockets, cut-outs, fuse-blocks, etc., has added a variety of new lines which it will specially deal in hereafter, carrying, however, its old line of stock which it will continue to manufacture in the interest of old patrons. Both the old and new lines will be sold at prices sure to appeal to the trade and purchasing public generally, and we have no doubt its business will largely increase.

H. T. Paiste, of Philadelphia, the manufacturer and patentee of the Paiste Switch and other specialties, has sold to the Bryant Electric Co., of Bridgeport, Conn., his patents on the Paiste Single-Pole Switch, together with the business of the same. The transfer took place April 1. Mr. Paiste continues business in the specialty line, and will shortly introduce to the electrical trade a number of new devices that he thinks will be appreciated by all.

WESTERN NOTES.

Mr. Thomas Pray, Jr., formerly of 193 *Times* Building, New York, N. Y., is now connected with the Chicago Incandescent Light Company, 75 N. Clinton street, that city.

The Westinghouse Electric Company, of Pittsburg, has secured a contract to furnish the electrical equipment for street railways in Fort Wayne, Ind.; Lincoln, Neb., and Evansville, Ind. The contract will amount to about $218,000.

The Short Electric Railway Company, Cleveland, O., announces recent sales to the Braddock Electric Railway Company, Braddock, Pa.; the Union Passenger Railway Company, Chester, Pa.; the Fort Wayne Electric Railway Company, Fort Wayne, Ind.; the Schuylkill Electric Railway Company, Pottsville, Pa.

Electric headlights for locomotives are rapidly growing in favor in the West. The National Electric Headlight Company, of Indianapolis, Ind., has already placed 70 lights on nine different roads, and an order has recently been received to equip the engines of the "Royal Blue" trains on the Philadelphia and Reading road, between New York and Washington, with electric headlights.

In a very artistically executed card, the Edison General Electric Company announces that it has established a branch of its fixture and decorative bronze department in connection with its ware-rooms in the Masonic Temple, 41 Niagara street, Buffalo, and invites those interested to inspect the stock. Mr. H. B. Oakman is the resident agent. Mr. Oakman made it very pleasant for many of those who attended the recent Electric Light Convention in Buffalo.

TRADE NOTES.

The Rollason Gas Engine Co. will on May 1 remove from its present quarters, 134 Liberty street, to 15 Dey street.

The Germania Electric Co., Boston, Mass., has removed the manufacturing department from Cambridgeport to its new factory at Marlboro, Mass.; all correspondence should be addressed as heretofore to the company's office, 505 Exchange Building, Boston, Mass.

The Ansonia Brass and Copper Co., 19–21 Cliff street, has issued a descriptive pamphlet relating to the celebrated Tobin Bronze, of which it is the sole manufacturer, and which is adaptable to many different purposes. Special attention is directed to pages 10, 11, 12, which contain details of various tests, tensile, torsional and corrosive, to which it was subjected.

Mr. Thos. F. Clohesey, president of the Metropolitan Electrical Corporation, 415–417 Whitney Building, Kansas City, Mo, which was recently organized, announces that the company is prepared to act as consulting and contracting electrical engineers, furnish plans, specifications and supervision for complete steam and electrical installations. It is also agent for first-class railway equipment, high-grade arc, incandescent and alternating dynamos, electrical motors of any capacity and voltage, automatic high-speed engines, single cylinder, compound, condensing and double-tandem compound, gas, gasoline and petroleum engines.

The following letter, received by the Shultz Belting Company, of St. Louis, Mo., from A. R. Cogswell, superintendent of the Halifax Illuminating and Motor Co., Limited, speaks for itself:

"Please send us, per express, one Endless Covering for 18-inch diam., 13-inch face pulley. Also send us one pint tin of your belt cement, as we have had nothing to equal it. If it was not for your covering on pulley we would not be able to run without increasing our length of belt, and that we can't do. Belt has slipped on 6-ft. driver, and stuck well without slipping on small pulley with your covering."

THE ELECTRICAL AGE'S ELECTRICAL PATENT RECORD.

Issued April 5, 1892.

472,026. Galvanometer. Sigmund Bergmann and George A. Scott, New York, N. Y., assignors, by mesne assignments, to the Interior Conduit and Insulation Company, same place. Filed Feb. 25, 1891.

In an electrical meter, the combination of a magnet, a metal strip longitudinally curved and gradually widened from one end to the other and supported adjacent to the pole of magnet, and a weight or its equivalent for moving the strip in the reverse direction to that in which it would be moved by the magnet.

472,027. Switch and Switch-Box. Sigmund Bergmann, New York, N. Y., assignor, by mesne assignments, to the Interior Conduit and Insulation Company, same place. Filed March 13, 1891.

In a conduit system, the combination of a cylinder or receptacle for a switch, a base-piece removably fitted in cylinder or receptacle, a switch made complete in one structure secured to the base-piece and removable therewith from the cylinder or receptacle, a cap-piece for holding switch and base in place, and a spring surrounding a rotary part of the switch and serving to press cap-piece outward and bearing inward on switch.

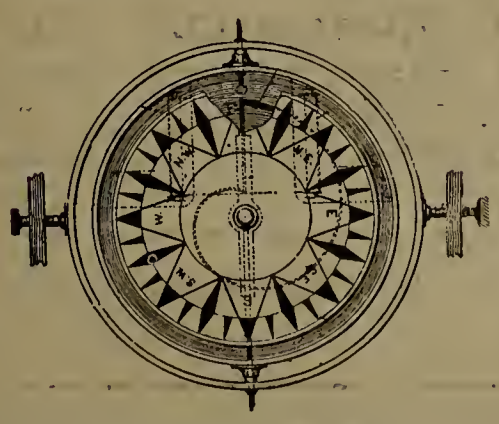
472,037. Thermo-Electric Element. Edward N. Dickerson, New York, N. Y., assignor to the Thermo-Electric Company, of West Virginia. Filed Feb. 27, 1890.

In a thermo-electric element, a series of parallel plates of different metals held firmly in contact with each other and adapted to be heated at one end.

472,055. Carbon-Holder. Henry Howard, Halesowen, near Birmingham, England. Filed Oct. 21, 1891.

In a carbon-holder, the combination of a support for the carbon, a screen of colored glass carried by the support, and an opaque bar interposed between the carbon and the screen.

472,062. Rheostat. James R. Masury, Providence, R. I., assignor of one-half to Lawrence J. McCarty, Boston, Mass. Filed June 29, 1891.



472,124.—ELECTRIC RECORDING DEVICE FOR COMPASSES.

472,064. Electric-Arc Lamp. John A. Mosher, Chicago, Ill., assignor to the Mosher Arc Lamp Company, Abilene, Kan. Filed June 20, 1891.

In an electric-arc lamp, the combination, with the guide-tube and the carbon-holder arranged to move in the tube, of the movable frame carrying feed mechanism and a chain or cord attached to and supporting the holder and the other end attached to the movable frame and passed over a pulley on the tube.

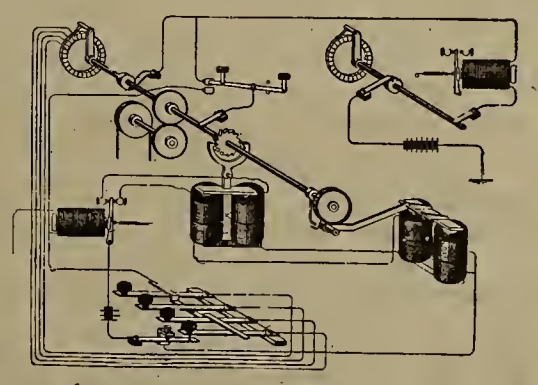
472,084. Safety Cut-Out. Mandeville Thum, Louisville, Ky. Filed June 5, 1891.

472,124. Electric Recording Device for Compasses. Charles L. Jaeger, New York, N. Y. Filed April 14, 1891.

472,135. Lightning-Arrester. Edward G. Miller, Wilkinsburg, Pa. Filed Aug. 27, 1890.

472,169. Toll-Collecting Apparatus for Telephones. Jesse J. Kato and Thomas H. Rhodes, Los Angeles, Cal. Filed March 28, 1890.

In combination with a telephone, a toll-collecting apparatus comprising a coin-receiver, a normally-closed local electric circuit, means for breaking circuit by the deposit of a coin, a second normally-closed local electric circuit, clock mechanism, and connections for breaking second circuit by winding the clock, and means whereby clock mechanism is adapted to simultaneously close both of circuits at a predetermined point in its movement.



472,237.—UNISON APPARATUS FOR PRINTING-TELEGRAPHS.

472,193. System of Electrical Distribution. William Marshall, New York, N. Y. Filed Feb. 28, 1891.

In a system of electrical distribution, a direct-current generator and a translating device in the circuit of the generator, a condenser in a branch of the circuit, and an automatic circuit-changing device having connections both to the branch or condenser circuit and to the main circuit containing the translating device, the connections being such that the circuit is alternately set for charging the condenser and for discharging the same through the translating device.

472,207. Apparatus for Propelling Vessels. Frank G. Curtis, New York, N. Y. Filed Oct. 24, 1890. Renewed Dec. 1, 1891.

472,220. Hanger for Electric Wires. Henry H. Luscomb, Boston, Mass. Filed July 20, 1891.

472,237. Unison Apparatus for Printing-Telegraphs. Henry Van Hoevenbergh, New York, N. Y. Filed July 20, 1891.

In a printing-telegraph, the combination, with a main line circuit of a step-by-step transmitter organized to drop or intermit one of a series of breaks or impulses and a receiving-instrument organized to supply the break or impulse omitted by the transmitter.

472,243. Telephone-Transmitter. Edward G. Acheson, Pittsburg, Pa. Filed June 29, 1887.

472,261. Thermo-Electric Battery. Robert J. Gülcher, Berlin, Germany. Filed June 18, 1891.

472,265. Electrical Meter. John F. Kelly, New York, N. Y. Filed Aug. 18, 1891.

A coulomb meter consisting in the combination, with a motor having a constant field, of a shunt or path of low resistance around the terminals of the motor, whereby the difference of potential at the terminals will be determined by the shunt, a load consisting of such a device as a fan, and means for indicating or registering the revolutions of the shaft.

472,274. Electric-Arc Lamp. Samuel W. Rushmore, Brooklyn, N. Y. Filed July 27, 1891.

The combination, in an arc lamp, of a movable carbon or carbon-carrying rod, a shunt-coil, a clutch ring or plate controlled thereby, a series coil, and a separate feeding device controlled thereby, one of devices acting as a check on the other.

472,283.. Switch-Box for Electric Motors. Parvin Wright, Denver, Col., assignor of one-half to Joseph W. Kinsey, same place. Filed Jan. 31, 1891.

An electric motor having its field-magnets located directly in circuit with a source of electrical energy and its armature in a derived circuit thereto, in combination with a pole-changing switch for reversing the direction of the current through the armature, and a second normally-open independent circuit operatively connected to the armature with circuit connections, whereby the first-named circuit may be broken and the second closed, and vice versa.

472,326. Automatic Telegraph. Frank Anderson, Peekskill, N. Y.; Annie L. Anderson, administratrix, and Gilbert H. Anderson and Homer Anderson, administrators of said Frank Anderson, deceased. Filed March 8, 1890.

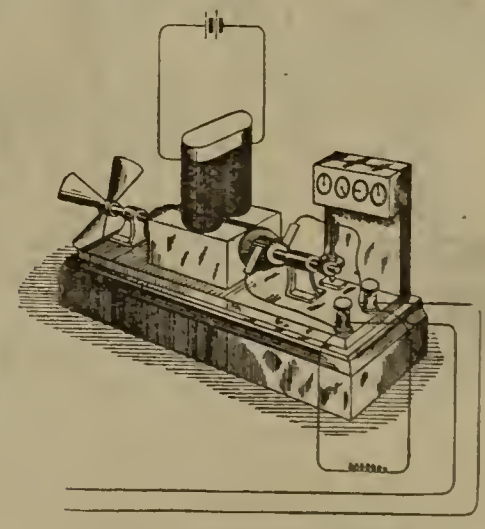
A perforating-machine having perforating devices, key-levers, and fillet-feeding mechanism, in combination with a rotary driving-shaft carrying a driving-pulley rigidly secured to it and having a loose driving-belt, which normally slides over the pulley, and mechanical connections between the key-levers and it, whereby the shaft is allowed to rotate one revolution only for each depression of a key and the fillet is perforated and fed forward.

472,329. Electric Wheel-Locking Device. George W. Blanchard, Waterville, Me. Filed Aug. 10, 1891.

In combination with a rotating wheel, a disc turning therewith, dogs or locking devices engaging the disc, and electrically-actuated means for drawing them into such engagement.

472,346. System of Arc Lighting. Horatio A. Foster, New York, N. Y. Filed Jan. 29, 1891.

In an arc lamp, the metallic-lamp mechanism box insulated from the current-carrying parts of the lamp and provided with a flange for the upper edge of the lamp-globe, the yoke, the negative-carbon holder insulated from the



472,265.—ELECTRICAL METER.

lamp-box walls, a globe inclosing the yoke and holder, and a globe-support secured to the yoke by suitable means, and lamp-terminals suitably insulated and inclosed in metallic casings.

472,352. Compound for Insulating Electric Wires. Louis Hill, Waterbury, Conn. Filed July 11, 1891.

A compound for insulating wire, consisting of pittizite pitch, candle-tar, coal-tar, asphalt pitch and rosin.

472,359. Electric Indicator for Railroad-Blocks. Robert W. Jaggard, Philadelphia, Pa. Filed April 6, 1891.

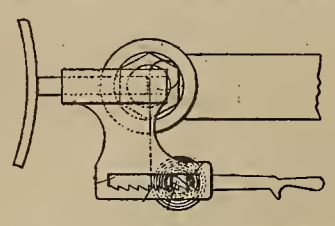
472,379. Production and Distribution of Electricity. William Marshall, New York, N. Y. Filed Nov. 23, 1889. Renewed Sept. 3, 1891.

The method of distributing electrical energy from an electric source, which consists in alternately charging an

electrical condenser from the said electric source and throwing into the line beyond the condenser the currents of both the condenser and the electric source, these acts being performed with such rapidity as to make the effects in the line appear continuous.

472,435. Brush-Holder. John R. Coffman, Detroit, Mich., assignor of one-half to C. A. Benton, same place. Filed Sept. 30, 1891.

The combination, with the commutator-brush fixed movably in a slideway to be pressed against the commutator and the spring pressing the brush therein, of a holder for spring also fixed movably in a slideway toward the commutator, and means to adjust holder and maintain substantial



472,435 —BRUSH-HOLDER.

uniformity of pressure of the brush on the commutator by the spring.

472,439. Annunciator. William C. Dillman, Brooklyn, assignor to Owen Walsh, New York, N. Y. Filed Dec. 22, 1891.

472,440. Annunciator. William C. Dillman, Brooklyn, assignor to Owen Walsh, New York, N. Y. Filed Dec. 22, 1891.

472,444. Electric Mining Pick and Drill. John Fish, South Bend, Ind., assignor of one-half to George M. Fish and Manning Fish, Joliet, Ill. Filed April 29, 1891.

The combination, with an electric motor, of a drilling device and supporting-frame therefor hung upon the extended armature-shaft of the motor, and devices connecting the shaft and drill for operating the drill.

472,447. Inclosed Supply System for Electric Railways. John C. Fyfe, Denver, Col. Filed Dec. 26, 1890.

In combination with the main conductor, the feeder-wires extending therefrom at intervals along the line of conductor, normally open local-circuit connections correspondingly arranged along the line of conductor, adapted when closed to take current through mercury in contact with feeder-wires, and mechanism actuated by a moving car for making contact between circuit connections and the mercury in contact with feeder-wires, so as to automatically close the local circuits.

472,461. Electro-Magnetic Valve Controller. Olof E. Lundstedt, Brooklyn, N. Y., assignor, by mesne assignments, to the New York Electrical Device Company, of Virginia. Filed Aug. 6, 1890. Renewed Oct. 14, 1891.

The combination, with the spindle of a rotating valve and an arm extending radially therefrom, of a pivoted bent lever having arms of unequal lengths, an armature upon the shorter end of lever, an electro-magnet attracting armature, a spring retracting it, a single lever pivoted at one end at a point beyond the long arm of the bent lever to extend thence toward the pivotal axis thereof, a link coupling the long arm of the bent lever with single lever near to its pivotal axis, and a link connecting the outer end of single lever with the radical arm of the valve-spindle.

472,466. Rotary Transmitting - Dynamometer. Franklin Van Winkle, Paterson, N. J. Filed Nov. 11, 1891.

In a rotary transmitting-dynamometer, the combination of a plate adapted to be made fast to the shaft and provided with a central hub, the exterior surface of which is spherical, and a loose plate adapted to be mounted upon spherical hub and capable of changing its angular position relatively to the fast plate around the axis of rotation of the dynamometer and also of assuming positions in different planes inclined to the plane of the fast plate.

472,480. Adjustable Armature for Electro-Magnets. Emil Hofmann, Ballard Vale, Mass., assignor to the Craighead & Kintz Company, same place. Filed Sept. 22, 1891.

The combination, with an electro-magnet, of an armature-carrier having recessed side arms, an armature, guide-pins thereon to enter recessed side-arms, and a screw having an annular groove connecting armature and carrier, and a screw or pin entering groove.

472,494. Automatic Electric-Lamp Lighter and Extinguisher. John H. Caughy, Baltimore, Md., assignor of one-half to Frank J. Caughy, same place. Filed Nov. 17, 1891.

An apparatus for making or breaking an electric circuit at a predetermined time, comprising a clock provided with an alarm movement, a spring-actuated switch-arm in the circuit, a pivoted latch to separately engage and hold switch-arm against the spring action, and means actuated by the alarm-movement for tripping the latch, and thereby disengaging it from the switch-arm and releasing the latter.

472,500. Electrical Indicator. John W. Henderson, Philadelphia, Pa., assignor to the Wharton Railroad Switch Company, same place. Filed Nov. 13, 1885.

In a railroad-signal, the combination of the signal-arm contacts, circuits, battery and an electric detector to indicate the position of said arm and sound an alarm while arm is passing from one of its extreme positions to the other, the detector and alarm consisting of electro-magnets armature, pointer, contacts, local circuits and alarm.

INJUNCTION DISSOLVED.

The injunction which was obtained by the W. J. Johnston Company on February 18, 1892, by unfair means, restraining Mr. W. T. Hunt from soliciting advertisements for the ELECTRICAL AGE, and the ELECTRICAL AGE Publishing Company from employing Mr. Hunt as its advertising solicitor, was dissolved by Judge Truax, of the Supreme Court, this city, on April 14.

The plaintiff sought to restrain Mr. Hunt from working for the ELECTRICAL AGE Publishing Company as its advertising solicitor, and the ELECTRICAL AGE Publishing Company from employing Mr. Hunt as such from the date of the injunction until June 1, 1895.

It had been arranged between the attorneys on both sides that Mr. Hunt should receive due notice when the argument for the injunction was to be made, but no such notice was given by the Johnston Company's attorney. The consequence was, the plaintiffs attorney, taking advantage of Mr. Hunt's absence, secured the injunction. The motion to dissolve the injunction was finally heard and granted as above reported, the Court deciding that the Johnston Company had no grounds for a case.

The causes which led to this suit, although of a somewhat personal nature, will be of interest to our readers, on account of the prominence of the parties concerned.

Mr. Hunt had made a contract with the Johnston Company June 6, 1890, to serve for it until June 6, 1895. He claims that the terms of the contract were violated by the W. J. Johnston Company, and on this ground he felt at liberty to sever his relations with the company whenever he deemed it desirable to do so. On January 11, 1891, Mr. Hunt bought an interest in the ELECTRICAL AGE Publishing Company, and became its solicitor for advertisements. From that time to this he has been pursued and harassed with a vindictiveness that is seldom met with in this enlightened age in any line of business.

The idea that a man should be restrained by one individual or company from earning an honest living simply because he chooses to give his services to another savors too much of barbarism or slavery to find any justification these days; yet, such a notion seems to linger in the minds of some. But, thanks to the law, society is protected from such unwholesome conceptions of man's relations with man.

We may be pardoned for giving these details of the case because we have very good reason to believe that the sympathies of the trade at large were in our favor, and it is but fair to our friends and ourselves that the result of the action should be known. We are glad to take this opportunity to thank our friends for the kindly interest they have shown towards us, and we feel that they will rejoice with us in our victory.

CARELESS LEGISLATION.

Some one should go to Washington and give the people's representatives in Congress a few points on electricity and its use and abuses. When the subject of electricity comes up for discussion in any form, the nation's lawmakers become electrified or stupefied, or something else of an extraordinary physical nature happens to them. They do one thing to-day and undo it to-morrow.

In 1888 Congress passed a bill prohibiting the erection of overhead wires within the limits of the city of Washington, and further decreed that existing overhead wires should go underground. Now the House turns around and passed a bill the other day, which, among its other provisions grants the right to the Metropolitan Street Railway Company to erect trolley overhead wires. This action on the part of the House caused considerable surprise, and no wonder. It simply goes to show how carelessly legislation is carried on sometimes, even in Congress.

A GOOD RECORD.

The annual report of the Thomson-Houston Electric Company contains many figures of general interest, outside of those concerning the finances of the company. During the first year of its existence, 1883, it established 5 electric light companies, with 365 arc lamps. At the present time there are no less than 873 companies operating its system, with an aggregate of 100,293 arc lamps. In 1887 the first incandescent work was undertaken, and in that year 11,275 incandescent lamps were installed. There are now 806,500 incandescent lamps in use on this system, showing a marvellous expansion of the business.

The greatest yearly increase in the number of incandescent lamps installed, as shown by the report, was during the year 1890–91, when 335,000 new lamps were put into operation.

The comparative figures show a steady increase in the number of companies started, which must be very gratifying to the stockholders. They also show the preference of the people in the matter of light.

The Thomson-Houston Company has very good reason to be proud over its record, and the report shows what wise and conservative management of so vast a business can accomplish.

EFFECT OF ELECTRIC ROADS ON SOCIETY.

An interesting article from the pen of that prolific writer, Mr. Otis K. Stuart, is printed on another page in this issue. Mr. Stuart's subject concerns the effect on society of electric railroads, and he handles his theme in a novel and interesting manner.

Granting the truth of the proposition that about five cents per car mile are saved by using electric instead of horse-power on street railways, Mr. Stuart calculates that the aggregate amount of money that would be saved were all the street railroads in the United States operated by electricity, would be $25,000,000 per annum. He then very clearly resolves this aggregate saving into different units, and shows that it is equal to the labor of 20,000,000 men for one day, at the rate of $1.25 to each, or about 55,000 men for one year; and he estimates that the stockholders of the various street-railway companies in the United States—if all roads were operated by electricity—would each receive over $200 a year increase to his income.

Mr. Stuart's argument is an ingenious one and full of instruction; moreover, it bristles with facts that are of deep concern to street railway men, and we commend the article to their thoughtful consideration.

DIRECT-COUPLED ENGINES AND DYNAMOS.

One of the most important factors in calculations touching the cost of an electric-light plant in any large city is that of ground space, or in other words, the land on which the station is to be erected.

The larger the city the larger does this element of expense become, and it is natural that electrical engineers should turn their attention to devising ways and means to economize as much as possible in the matter of space.

In large cities where the incandescent service is in thickly populated districts, an abundance of room for a central station cannot as a rule be obtained except at fabulous prices, and it is sometimes a serious question as to how the business can be carried on successfully in limited quarters.

The Edison General Electric Company has given considerable attention to this question as well as many others affecting the practical and successful operation of illuminating stations in cities. It has to some extent solved the economy of space problem in a very satisfactory manner by combining electrical and mechanical apparatus.

We give on another page an example of what has been done in this direction by this company. Two multipolar dynamos are coupled direct, one on either side of a triple expansion engine. Such a combination avoids the necessity of using belting and countershafting, and effects a great saving in floor space. In addition to the saving in space greater efficiency is, it is said, secured.

The increased diameter of the multipolar type of machine gives a very large heat radiating surface, which permits carrying heavy loads for any length of time without danger of overheating.

The engine and dynamos are mounted on one bedplate, which is extremely massive and especially designed with a view to securing perfect alignment and rigidity of the machines with reference to each other.

This excellent arrangement will be easily understood by the illustration and description of the apparatus.

THE EDISON TRIPLE EXPANSION ENGINE AND MULTIPOLAR GENERATORS.

One of the most serious problems that to-day confronts the management of electric illuminating companies in large cities, is the cost of the land necessary to accommodate the large station buildings. When land costs $1,000 and upward a foot-front, every square foot of ground space that can be saved materially reduces the necessary investment of the company. Recognizing this fact, the Edison General Electric Company has recently brought out a new line of central station units, consisting of two multipolar dynamos coupled direct, one on either side to a triple expansion engine, and ranging in capacity from 100 to 1,500 indicated horse-power. This combination does away with all belting and counter-shafting, and thus secures an increase of efficiency, and a great saving of floor space—two most important factors in central station practice.

The important features of this type of generator are given in the following description, which will undoubtedly prove of interest to central station managers.

THE GENERATOR.

The saving of floor space being one of the chief objects, the necessity of coupling the generator directly to the engine naturally suggests itself; but as the armature of the bipolar generator now in general use must, of necessity, be run at a comparatively higher number of revolutions per minute, it is evident that unless a special engine is employed, another design of generator is called for.

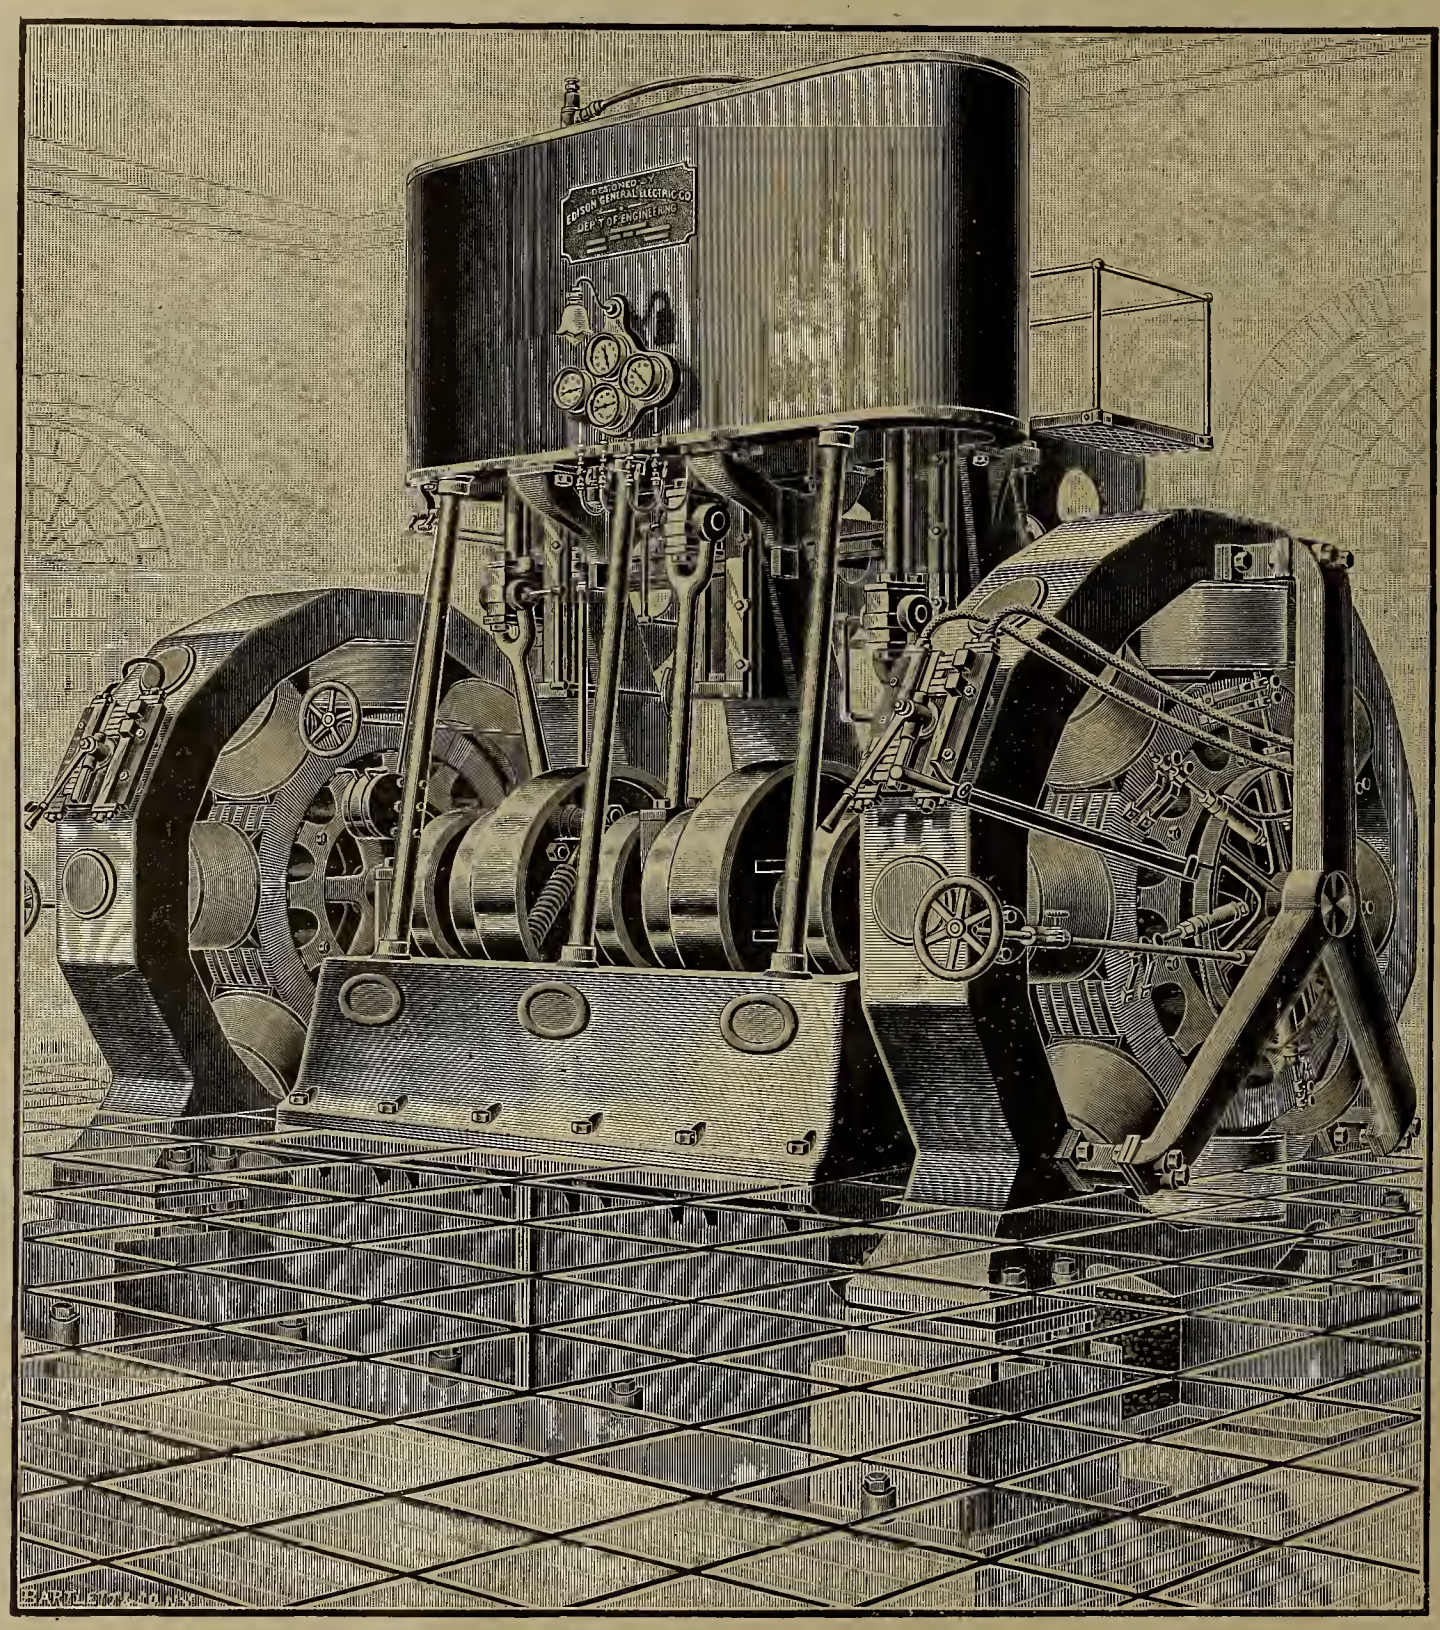
The multipolar generator is peculiarly adapted to this purpose, as it may be designed to generate any desired electrical output, at an armature speed corresponding to that of a slow speed engine. This type presents the additional advantages of requiring but small floor space, of being able to withstand sudden variations of the load, and of carrying heavy loads continuously without danger of overheating.

The armature is of the German ring type, of very simple construction; it is built up of ⊏ shaped copper strips, which are slipped (in a single layer) over the laminated wrought-iron core, the upper end of one being connected with the lower end of the adjoining loop by a copper bar of corresponding thickness, these bars acting as the segments of the commutator. The number of brushes corresponds to the number of poles of the generator, and it is found that the large current output can be divided among these brushes much more conveniently than if only one set of brushes were used to carry the whole current generated. The mechanical device for controlling these brushes allows of their being operated together, so that when once adjusted, the whole can be handled as though but one set were used.

The field coils are wound on separate spools, which are slipped over the field magnets; these field magnets are then inserted in an annular or polygonal field frame, mounted on the bed-plate of the engine. The bed-plate being heavy and massive and of special design, perfect alignment and rigidity of the field-frame with relation to the engine is secured.

The increased diameter of the armature in the multipolar type of machine gives a very large heat radiating surface. This point, in connection with the special construction outlined above, allows the Edison generators to maintain heavy loads for periods of any duration, a factor that will be admitted as eminently desirable in central stations where such conditions exist.

The armatures are mounted directly on both ends of the crank-shaft, and act as the fly-wheels of the engine.



TRIPLE EXPANSION ENGINE AND MULTIPOLAR GENERATORS.

THE ENGINE.

The engine is of the triple-compound 3-crank inverted cylinder, automatic condensing type, well proportioned throughout, having large wearing surfaces which can be easily adjusted. The bed-plate to which the main bearing boxes of the crank-shaft are cast is strong and is firmly bolted to a massive foundation box, which also carries the dynamo frames; thus perfect rigidity between engine and generators is insured. The crank-shaft is of forged steel; fitted with cast-iron balanced discs to which the crank-pins are fitted. There are two bearings to each crank and an additional large bearing on each end of the shaft to carry the armature. On the shaft are three eccentrics, each operated by its own independent governor, so that the point of cut-off in each cylinder is changed equally with the load, thus doing away with any tendency to race, in case the total load is at any time thrown off, or any accident happen. Strong cast-iron columns carry the cylinders, which are bolted together, and the engine made strong, compact and well arranged; indeed, these engines are almost fac-similes of the latest and most improved types at present in use on the finest ocean steamships, with necessary additions to render them as highly efficient for electric generating purposes as their prototypes are for marine work. They are calculated for the maximum efficiency point at about 12½ per cent. below the normal maximum capacity of the generator, and have a range to a maximum capacity of 20 per cent. above the normal maximum output of the generator at 160 pounds initial pressure and vacuum of 24″—thus allowing each engine, in case of an accident to the condensing apparatus, to operate the generator satisfactorily non-condensing. In addition to the many advantages already mentioned, these engines when connected to a suitable condensor will reduce the con-

umption of fuel considerably. This is an item of vast importance in electric light stations, increasing their storage, boiler and engine capacity. The compactness of this arrangement, as shown in the following table, proves the advantages to be gained by the use of the dynamos and engine thus combined.

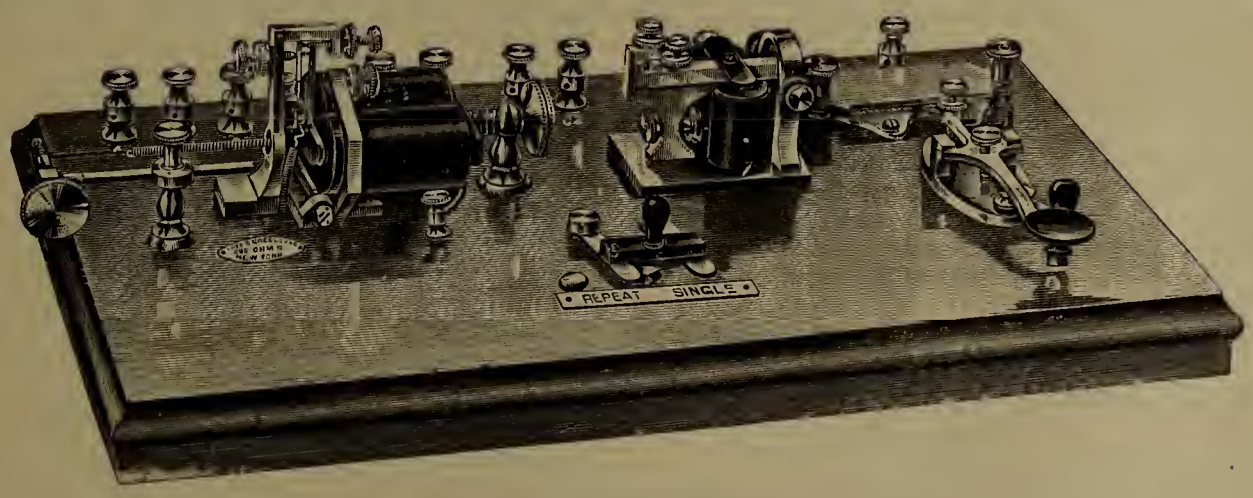
NEW TELEGRAPH REPEATER.

Those who have handled telegraph repeaters of certain kinds, and studied their characteristics, have noticed that there exist complications in their arrangement and construction which might be simplified. The Milliken-Hicks is an example of this class, and while it is an excellent apparatus, yet it is complicated, and requires the services of some one who specially understands it to keep it in working order. What is wanted in every-day work is a repeater which will give the best service with the least attention.

Mr. W. M. Miner, an electrician of New York City, once watched the operation of a Milliken-Hicks repeater, and the thought occurred to him that there were a good many parts to the instrument, and that it might be simplified. He studied over the matter and produced a repeater which is said to meet every requirement of such an instrument. We give herewith an illustration of one half-set of the instruments all ready for operation.

The most noticeable feature about Mr. Miner's repeater is the absence of the repeating sounder. The repeating is accomplished by an extra contact-point on the regular relay armature, which arrangement greatly simplifies the apparatus and necessitates fewer connections. Any operator can keep the instrument adjusted as easily as he can keep ordinary instruments in proper working order.

One feature of special value in this repeater is, that when the line resistance changes, necessitating a change in the adjustment of the relays, the fact manifests itself by producing a "kick" on the sounder, before the repeating functions of the relay are affected, however. Thus the attention of the attendant is attracted when readjustment is required, before the operator at the receiving end of the wire notices any difference in the working of the circuit.



MINER'S TELEGRAPH REPEATER.

The repeater has been practically tried, and gave excellent results. The range of adjustment is very great, as may be appreciated by the fact that the magnets may be drawn away from the armature a quarter of an inch before the warning "kick" is produced.

This repeater requires no extra local batteries, part of the main battery being used as the "holding battery."

Mr. Miner has worked one of the relays, wound for 200 ohms, from one cell of battery, and a poor one at that, and there was no overloading, as might be supposed.

This repeater is certainly a simply constructed one.

BIOGRAPHICAL SKETCHES.

ELMER STILLMAN SMITH.

Mr. Elmer Stillman Smith, the subject of this sketch, is an Ohio boy, born in the year 1853. He has followed in the footsteps of his father in engaging in a mechanical trade, his father having added many designs and improvements to various inventions now in use.

Mr. Smith, as the records of the Patent Office show, has invented numerous machines, the latest of which is the American High-Speed Engine, which is destined, no doubt, to make him very widely known. He has made a study of mechanical and steam engineering from his youth up, not only in a practical way, but in the searching out of the best theoretical and practical methods known to the science of engineering at the present date. He was always a hard worker, and was obliged to work his way by incessant toil, as the start was not made with the proverbial silver spoon. By constant perseverance and application, however, he has been able to accomplish much that only comes by hard work.

ELMER STILLMAN SMITH.

Mr. Smith is not unknown in engineering circles. He was the superintendent of the Central Placer Mining Co. and consulting engineer in the construction of the Big Bend Tunnel, Butte county, Cal., which was constructed under the mountains three and a half miles up a heavy grade, and ventilated entirely from below, which was due wholly to his ingenuity, and marked a long step forward in the history of practical tunnel and mine ventilation.

He has been an extensive traveller, having visited nearly every part of the civilized world, studying methods and examining mining property, as well as the mechanical methods of the Old World. He is now the general manager of the extensive works of the American Engine Company, at Bound Brook, N. J.; treasurer and director of the Nayac Cottage Association, on Peconic Bay, Eastern Long Island; also the superintendent of a large enterprise undertaken by the Hon. R. V. Pierce, of Buffalo, N. Y., which embraces the opening up of 235 acres of land in well laid out streets, with complete system of sewer and water pipes; with large electric-lighting plant to light up the entire village, which they propose to make an ideal suburban town; containing all the modern conveniences and the best sanitary arrangements; with telforded roads and stoned sidewalks throughout the grounds. This land lies high and rolling along the banks of the beautiful Raritan river, away from the mosquito-breeding marshes of Jersey, and flanked on the north by a spur of the Blue Ridge mountains, which renders the climate moderate and at all times agreeable.

This place is only one hour from New York and seventy-five minutes from Philadelphia, and the junction point of the Lehigh Valley, Jersey Central, Phila. & Reading and Port Reading Railroads. The Baltimore & Ohio also passes through this village.

The accompanying cut gives an excellent likeness of Mr. Smith, who has a large circle of friends and is a gentleman well worth knowing.

INSULATION RESISTANCE.

The underground wire question is an important one in this country at the present time, and the difficulties met with in construction work of this class sometimes assume an alarming aspect to those who are not thoroughly familiar with the work.

Passing over the mechanical considerations of the question, we come to the part which concerns the transmission of the electric current, namely, the conductors.

The insulation of underground conductors is, of course, the first and most important desideratum. What, then, should the insulation resistance be?

At the last convention of the National Electric Light Association, which was held in Buffalo last February, Mr. E. A. Leslie, general manager of the Manhattan Electric Light Co., of New York City, gave some interesting facts and figures on this sub ject in a paper which he read.

Concerning insulation tests Mr. Leslie said:

"The initial tests of cables laid by any of the companies in New York City must show an initial insulation resistance of not less than 15 megohms per mile per 100 volts of current used. This means that, with an alternating current of 1,000 volts, the cable must show, before the current is turned into it, to have an insulation resistance of not less than 150 megohms per mile, with an arc circuit of 2,500 or 3,000 volts, or even 4,000 volts initial insulation resistance must not be less than 375 megohms, 450 megohms and 600 megohms respectively. Taken into consideration with the fact that on an ordinarily humid day, overhead circuits will not show an insulation resistance of more than from 200,000 to 500,000 ohms per mile, the above requirements seem altogether impossible of attainment and to be ideal rather than practical, but this is not the case. On the contrary, it is rare, indeed, that the initial tests of cables laid in New York City do not show from three tofour times the initial insulation resistance required by the rule, and, of the hundreds of miles of cable actually in operation at the present time and which have been in operation from two to three years, and with which I am personally familiar, I do not believe that there is one that will show, under like conditions, nearly, if not quite the same high degree of insulation as when the original test was made. In fact, I have proved this to be true many times."

A GOOD SHOWING.

One of the most interesting features of the last annual report of the Thomson-Houston Electric Company is that portion relating to the electric railways operated on that company's system.

The company has been putting out street railway apparatus for three years, and the figures show that it has been remarkably active in this direction. Up to the present time it has equipped no less than 204 companies with electrical apparatus, and when it is considered that this has been accomplished within a period of three years, the enterprise of the company is apparent. It is certain that no company could make such a record, unless its apparatus possessed merit.

During the first year of the railway business 92 roads were put into operation on this company's system, and in the second year the number had been increased to 145, showing that the increase is steady.

The number of cars at present in use is 2,769, as against 701 the first year and 1,532 the second.

This record shows an extremely healthy growth of the business, and there is every reason to believe that it will continue to expand.

ELECTRIC RAILROADS AND THEIR EFFECTS ON SOCIETY.

BY OTIS K. STUART.

If any one will reflect for a moment he will see that the general adoption of electric lighting in cities and towns has necessarily had deep effects on society in those places. And the general adoption of electricity as a motive-power for street cars must likewise have important sociological effects—effects which are due not only to decreased cost of operation, but also to the time saved and to the novelty and relative efficiency of the system. There are in operation daily in this country alone nearly 34,000 street cars, all kinds included. Each of these cars travels on an average about 40 miles a day, or nearly 14,600 miles a year; so that the total yearly service of the street cars of these United States is not far from 500,000,000 miles.

Now experience with something like 400 electric street railways has proven that a trifle less than five cents per car mile is saved by using electric instead of horse power. Let us assume that five cents could be saved on every mile a street car travels if electricity were to take the place of horses entirely, and if electricity has ever done anything, it has proven thoroughly, proven beyond all question, that it is not only cheaper but also better than horses for street railways, and that the horse is bound to go.

We will suppose that this change will be made, and that a dollar and a quarter is the money value of a man's labor for one day on street railways, which is certainly not too high. We would then save about five cents on each of 500,000,000 car-miles, or $25,000,000 per annum. This means that 20,000,000 man-days, of the value of one dollar and a quarter each, would actually be saved to the people.

Now, 20,000,000 man-days means the work of 20,000,000 men for one day, or of about 55,000 men for a year; so that if electricity were to become the sole power used on street railways, 55,000 men could stop work, and the world would go on just as it does now; we should have just as good things to eat, just as good clothing to wear, just as many amusements, just as many books and newspapers. In fact, these very 55,000 men would be just as happy and just as well off as ever! Of course, it is not at all likely that 55,000 men really would stop working, and as this money would be saved let us see where some of it might go.

Those most directly benefited would undoubtedly be the stockholders of the various railway companies. If we knew the number of stockholders in the street railways of the country, we could easily tell how much increased income each one would have on the average as the result of the introduction of electricity; but such information is not easy to get. So far as I am able to ascertain, the average number of stockholders of such companies in Pennsylvania is 114; in Massachusetts the average number is about 106, and it is probable that this latter figure is not far wrong, taking in the whole country. As there are about 1,200 roads in the United States, we see that more than 120,000 stockholders would be directly benefited by the change. If the whole sum of $25,000,000 was to be distributed to these stockholders, each would receive over $200 per year increase to his income, without a single extra stroke of work, or one additional effort or worry. And as the greater economy of electric as compared with horse power renders it practicable to successfully operate street cars in localities where horse cars could not begin to be even self-supporting, this number of benefited stockholders will doubtless be swelled into an army of vast proportions. We shall then have hundreds of thousands of men, with increased means of doing good; of endowing colleges; establishing free schools; encouraging sculpturing, painting, and other forms of art; of advancing our knowledge of the sciences, and all of this will have been done without making any one poorer, without the expenditure of a single extra foot-pound of energy.

Speaking of energy reminds me that coal must be burned in order to generate steam, with which to get electric power, and that men are necessary to mine and transport and handle this coal. A conservative estimate places four pounds of coal as the amount necessary to run a car one mile. Therefore about one million tons of coal will be required to make the total of 500,000,000 car-miles. To bring this from the earth's depths will take the work of nearly 1,500 miners for 300 days, and to load it on freight-cars, haul it to destinations, and place it under boilers will require the labor of a vast army of workmen. If the coal is worth an average of $2.50 per ton when delivered under the boilers, then the total labor for coal may be represented by 3,000,000 man-days per year, or by the labor of nearly 6,000 men per day. These 6,000 men are, of course, simply drawn from some other sort of work to that of mining, freighting, firing, etc.

Mr. O. T. Crosby has shown that about 80,000 men are in fact thus to be diverted from their ordinary or previous callings to the work of installing and maintaining the electric railways of this country. He says: "As to just how this total of 80,000 will be divided among the various occupations, we may judge from the actual distribution of the total population of this country as reported in our census. Not having at hand the figures for 1890, I find from the census of 1880 that out of 17,500,000 people, men and women, engaged in the various occupations, 7,600,000 are reported as agriculturists; 3,800,000 in mechanics and mining; 1,800,000 in trade and transportation; 4,000,000 in professions and other personal services. [This last item covers all individual personal services, from the high-priced lawyer to the humble domestic.] Some such distribution as this would doubtless follow for the 80,000 whom we have discussed above.

"The forces which are supplanted we may estimate about as follows: There are 4½ horses per car on all horse railways throughout the United States, or a total of about 115,000 horses. The average life of these in service is five years, which requires a supply of 23,000 per year. To feed and groom the total number engaged, at the rate of 50 cents per day, costs $57,500 daily, while the supply of 23,000 horses per year, at the rate of $150 each, requires daily $9,500. Thus 67,000 man-days are then substantially diverted from their original use for simply maintaining the horse as a motive power." *

Thousands of these men are, of course, merely to do the work of supplying clothing, food, etc., to the machinists and others mentioned above. It is the agricultural class that will be, as it always is, the most vitally affected. "A large part of those now engaged in raising grain and horses are now to be drafted into machine-shops to make motors or, on a smaller scale, are drafted into coal-mining, etc."

But these are not the only economies and effects which the universal adoption of electricity for the motive power of street railways would bring about. By abolishing the oil lamp and substituting the incandescent for it; by banishing the coal stove and using the electric heater instead; by avoiding huge, bad-smelling stables; by lessening the amount of manure in public highways—in all of these, and in a thousand other ways, the health of the whole community will be improved; and by increasing the speed of the cars thousands of days will be added to the total yearly life of the nation. Nor is it difficult to show just *how* much time can be saved. As the average speed of a horse car has been found to be less than six miles per hour, and the average speed of electric cars to be over nine miles per hour, the gain in time is at least 3½ minutes per mile. As our street railways carry nearly 2,000,000,000 passengers annually, and as each passenger can be assumed to travel three-quarters of a mile, it is clear that something like five and a quarter billion man-minutes, or nearly a hundred million man-hours, equivalent to ten million man-days per year, would be saved. This time is about equal to the total lives of nearly six hundred men, or the useful working time of about 2,500 men! That is, electric railways give us the power of granting to the entire working population of this country, every man and woman of them, a whole holiday from their present employment each year without cost to any one—not even to themselves!

* The value of a man-day, as estimated by Mr. Crosby, is $1.00.

MECHANICAL EFFECTS OF MAGNETIZATION.

When a steel or iron bar is powerfully magnetized it grows a little longer than before; and, since its volume is the same as before, it at the same time contracts in thickness. Joule found an iron bar to increase by $\frac{1}{72000}$ of its length when magnetized to its maxium. This phenomenon is believed to be due to the magnetization of the individual particles, which, when magnetized, tend to set themselves parallel to the length of the bar. This supposition is confirmed by the observation of Page, that at the moment when a bar is magnetized or demagnetized a faint metallic clink is heard in the bar. Sir W. Grove showed that when a tube containing water rendered muddy by stirring up in it finely divided magnetic oxide of iron was magnetized, the liquid became clearer in the direction of magnetization, the particles apparently setting themselves end-on, and allowing more light to pass between them. A twisted iron wire tends to untwist itself when magnetized. A piece of iron when powerfully magnetized and demagnetized in rapid succession grows hot, as if magnetization were accompanied by internal friction.

AN EARLY CONCEPTION OF THE MAGNETIC FIELD.*

BY PROF. EDWIN J. HOUSTON.

It may interest the members of the electrical section to know, that as early as 1668, Robert Boyle, the eminent physicist and chemist, published, concerning the magnetic field, exceedingly advanced ideas which closely resembled the modern ideas of magnetic flux and lines of magnetic force.

Boyle's publication, so far before the time of Faraday, shows the exceedingly advanced position he must have occupied at that early date, as a thinker and investigator in physical science.

Boyle was an indefatigable worker and a voluminous writer, both in the domain of physics and chemistry, as well as in that of medicine. He taught that absolute rest had practically no existence even in bodies in apparent rest, since there existed in such bodies what is called an intestine motion of their particles. He also had original notions of what was called, in his time, effluvia, and it was in connection with these so-called effluvia that he advanced an explanation concerning the magnetic action of the loadstone, which bears a remarkably close resemblance to the modern ideas of a magnetic field and lines of magnetic force.

The quotation referred to is from the second of two essays "Concerning the Unsuccessfulness of Experiments," published in 1668. In these essays he has been pointing out the necessity for care in conducting scientific experiments, and urges that the failure to experimentally reproduce any natural phenomenon should not necessarily call in question the accuracy of the first observer of such phenomenon, until all the sources of error that might have led to obscuring or vitiating it had been eliminated. In this connection he cites, in a quaint manner, some of the numerous experiments that he had been led to try on the assertion of well-known scientific men, but in which he failed to obtain the results alleged to have been observed. He describes in this connection the magnetization produced by touching a steel knife-blade to the armed pole of a loadstone, as resulting in different polarities according to whether the point of the blade is drawn towards or from the equator of the loadstone.

I will quote Mr. Boyle's remarks in full in this connection:

"If on either of the Extremes or Poles of a good armed Load-stone, you leisurely enough, or divers times, draw the back of a Knife, which has not before received any Magnetick influence, you may observe, that if the point of the blade have in this affriction been drawn from the middle or Æquator of the Load-stone towards the Pole of it, it will attract one of the Extremes of an equilibrated Magnetick Needle; but if you take another Knife that has not yet been invigorated, and upon the self-same Extremity or Pole of the Load-stone, thrust the back of the Knife from the Pole towards the Æquator or middle of the Load-stone, you shall find, that the point of the Knife has, by this bare difference of Position in the blade whilst it past upon the Extreme of the Load-stone, acquired so different a Magnetick property, or Polarity, from that which was given to the former Knife by the same Pole of the Load-stone, that it will not attract, but rather seem to repel or drive away that end of the Magnetick Needle which was drawn by the point of the other Knife. And this improbable Experiment not only have we made trial of, by passing slender Irons upon the Extremities of armed Load-stones, the breadth of the whose Steel-caps may make the Experiment somewhat less strange, but we have likewise try'd it by affrictions of such Irons upon the Pole of a naked terella, and we have found it to succeed there likewise. How strange soever it may seem, that the same point or part of the Load-stone should imbue Iron with contrary Properties, barely as they are, during their passing over it, drawn from the Æquator of the Load-stone, or thrust towards it. But whether, and how far this Observation insinuates the operations of Load-stone to be chiefly performed by streams of small particles, which perpetually issuing out of one of its Poles, do wheel about and re-enter at the other; We shall not now examine (though this seem one of the most likely Phænomena we have met with, to hint a probable Magnetickal Hypothesis) contenting ourselves to have manifested by what plainly appears, how much influence a circumstance, which none but a Magnetick Philosopher would take notice of, may have on an Experiment."

* Read at the stated meeting of the Electrical Section, Franklin Institute, January 5, 1892.

Mr. Boyle had obtained an insight into the actions which occur during magnetization far beyond that of his contemporaries. This fact appears to be clearly indicated by the above statement as to what he believed to be the actual operation of the load-stone; namely, that it produced magnetization by means of streams of small particles coming out of one pole and re-entering at the other pole. Change the phraseology but a trifle and leave the ideas as expressed, and we have at this early date a fair idea of the modern notion of magnetic flux.

Boyle's notion seems to have been that when other bodies were brought into this magnetic stream, they became endowed with magnetic properties by the particles or corpuscles forming the stream, passing through them, just as we now explain magnetization by the passage through a magnetizable substance of the lines of magnetic force.

In a later paper, published in 1669, on "The Absolute Rest of Bodies," he asserts that the particles even in exceedingly dense substances that are apparently at rest, are, in reality, in rapid motion. He urges that although such motions cannot be seen, yet they must exist, and cites as a proof of such assertion the following experiment, which I will give in Mr. Boyle's language:

"I briefly answer (for I would not here repeat what I have elsewhere said on this point) by this clear Experiment, that though your Eye can discern no change in the outward and visible, much less in the more latent and internal Corpuscles of Iron: a vigorous Load-stone by passing along its Axis from one Pole of the Stone to the other, and back again, yet the Texture of the Iron is by that action of the Load-stone so changed, that it acquires, and then loses those admirable Qualities we call the Attractive and Directive virtue or faculty peculiar to Magnetick Bodies."

And further on, in the same paper, in speaking of the well-known fact that a mass of steel when allowed to stand in an upright position for some time on the earth, is endowed with magnetic properties, he ascribes these properties to the action which the streams of corpuscles exert on it.

"To this purpose I shall only observe to you, that though a Bar of Iron having one of its ends held perpendicularly, and at a fit distance to the Lily or Northern point of the Mariner's Compass (I mean that which points towards the North), it will, as I elsewhere mention, drive it away towards the East or West: and if this same lower end of the Bar of Iron be put into a contrary posture, it will presently lose its temporary magnetism, as I elsewhere declare. Yet if this Bar be very long kept upright in a Window or other convenient place, then, as some late Magnetickal Writers will tell you, it will have acquired a constant and durable Magnetick power. Which is a phenomenon which makes exceedingly for our present purpose, since it hence appears both that the Air together with the magnetickal effluvia of the Earth that it receives in its Pores, is able without outward force to work durable changes in so solid a Body as Iron, and that the motions of the internal Parts, for these are requisite to change the Metal's Texture, are performed with a wonderful slowness, since the Bar must be very long exposed to the air, perhaps before it acquires any durable magnetism at all but at least before it acquires so vigorous and fixt a magnetism as by this means it may attain to."

In another paper on "The Nature, Properties and Effects of Effluvia," reproduced by Shaw at a later date, in vol. I., p. 411, of the Philosophical Works of the Honorable Robert Boyle, Esq., 1725, Boyle writes as follows:

"To clear this matter, I caused some needles to be hermetically sealed up in glass pipes, which being laid on the surface of the water, whereon they wou'd lightly float, the encluded needles did not only readily answer to the load-stone externally applied, tho' a weak one, but comply'd with it so well that I cou'd easily lead, without touching it, the whole pipe to what part of the surface of the water I pleased. I also found that by applying a better load-stone to the upper part of the seal'd pipe, with a needle in it, I cou'd make the needle leap up from the lower part, as near to the load-stone as the interposed glass wou'd give it leave. But I thought it more considerable to manifest, that the magnetickal effluvia, even of such a dull body as the globe of the earth, wou'd also penetrate glass. And this I attempted after the following manner. I took a cylindrical piece of iron, about the bigness of one's little finger, and between half a foot and a foot long; having formerly found that the quantity of unexcited iron forwards its operation upon excited needles; and having hermetically seal'd it up in a glass pipe, but very little longer than it, I suppos'd that if I held it in a perpendicular posture, the magnetickal effluvia of the earth, penetrating the glass, wou'd make the lower extrême of the iron answerable to the North Pole; and, therefore, having applied this to that part of the needle, in a dial or sea-compass, which looked towards the North, I presum'd it would drive it away, which accordingly it did. And having, for further trial, inverted the included iron, and held it in a perpendicular posture, just under the same point, that extreme of the iron rod, which before had driven away this point, being, by inversion, become a South Pole, attracted it; from which sudden change of the poles, merely upon the change of the situation, it also appeared that the iron owed its virtue only to the magnetism of the earth; not that of another load-stone which would not have been thus easily alterable."

I need not call your attention to the marked similarity between the manner in which Boyle conceives magnetic induction to take place, and our modern notions concerning the same phenomenon. His streams of magnetic effluvia correspond exactly in direction and action to our present conceptions of magnetic flux and lines of magnetic force.

Coming now to the time of Faraday, we find in a paper published by Faraday in the *Philosophical Transactions*, in 1852, the following:

"From my earliest experiments on the relation of electricity and magnetism, I have had to think and speak of lines of magnetic force as representations of the magnetic power, not merely in the points of quality and direction, but also in quantity. * * *

"A line of magnetic force may be defined as that line which is described by a very small magnetic needle, when it is so moved in either direction correspondent to its length, that the needle is constantly a tangent to the line of motion. * * *

"These lines have not merely a determinated direction recognizable as above, but because they are related to a polar or antithetical power, have opposite qualities or conditions in opposite directions. These qualities, which have to be distinguished and identified, are made manifest to us either by the position of the ends of the magnetic needle, or by the direction of the current induced in the moving wire."

As to the direction of the lines of magnetic force, Faraday, as is well-known, regarded them as coming out of one pole of the magnet and passing in at the other pole, and referred to this in a paper printed in the *Proceedings of the Royal Institution*, on the 23d of January, 1852, as follows:

"The lines of force already described will, if observed by iron filings or a magnetic needle or otherwise, be found to start off from one end of a bar-magnet, and after describing curves of different magnitudes through the surrounding space, to return to and set on the other end of the magnet."

There is, of course, a danger in quoting from an early writer, of reading into the quotation a significance that it could not have had, save by the light of subsequent researches. It is far from my purpose or desire to belittle the researches of Faraday. I merely desire to show by comparison of the writings of these two philosophers, the remarkable advance that Boyle had made as to the manner in which a magnet acts.

In the above quotation from Boyle it must be remembered that Boyle referred to certain effluvia which he believed were given off by the magnet. His conception, however, of these particles coming out at one pole and re-entering the other, and his mentally endowing streams of such particles with polarity, or the possession of opposite properties in opposite directions, was certainly a remarkable advance for his times, and shows how far he was beyond his contemporaries.

It is possible that other writers before the time of Boyle, or between his time and that of Faraday, may have expressed somewhat similar ideas. I merely call your attention to the quotations from Boyle as showing the remarkable grasp of magnetic phenomena possessed by this early philosopher.

OVERHEAD WIRES IN WASHINGTON.

In the National House of Representatives on April 12, the bill providing for an extension of time to the Metropolitan Street Railway Company, for the purpose of changing its motive power from horses to some other system in accordance with a previous act of Congress, was taken up and provoked a great deal of discussion as to the wretched service rendered by the company, which resulted in the offering and adoption of an amendment by Mr. Outhwaite, of Ohio, providing that hereafter no fare should be collected of a passenger not furnished with a seat. The adoption of this amendment created a surprise, which was still further increased when, on motion of Mr. Washington, of Tennessee, another amendment was adopted granting the company permission to use overhead electric wires.

In view of the fact that in 1888 Congress enacted a law providing that from and after the date mentioned in the act no overhead wires should be erected within the limits of the city of Washington, and it was further ordered that all overhead wires then in existence should be removed, the reason for the surprise may be well understood.

At the present time there is but one surface road operating its lines by overhead wires, and arrangements have been made to substitute the storage battery system within the time specified by the act. Congress followed this law with another passed a year or two ago, providing that on or before July 1, 1892, every surface railroad in the District of Columbia should abolish horse-power, and that no road should hereafter be chartered with authority to use horses for the movement of cars. Acting in accordance with this law, the two largest street car lines in the city prepared to change their motive-power. One of these lines began in June, 1891, to lay a cable system from the Navy Yard to Georgetown, and from Pennsylvania avenue along Fourteenth street, to Mount Pleasant, in the suburbs, a distance of about eight miles, and the work has just been completed. An immense power-house is building on Pennsylvania avenue at Fourteenth street, and the company expects to have cable cars running on the entire system on August 1 next. The total cost of the change is $3,000,000. The other of the two extensive lines made preparations for adopting the storage battery system. The company has erected an immense plant in Georgetown, at the western end of its line, and had practically demonstrated the utility of the storage battery cars. It was unable, however, to complete its arrangements within the time specified in the law, and so it came to Congress for an extension.

It is said that even the officials of the company were surprised at the adoption of the amendment, because the last official document sent to Congress on the subject of the proposed change of motive-power states that the engineer of the road has reported that the storage battery has been demonstrated to be a complete success, and that the company has spent a very large sum of money in erecting one of the largest storage battery plants in existence, and that it is ready to put it into operation if it can have a few months more for perfecting details.

As the Senate is strongly adverse, and public sentiment unanimously opposed, to the use of overhead wires of any description in the District of Columbia, it is not at all likely that the bill will become a law.

RESISTANCE STANDARDS: THEIR MANUFACTURE AND ADJUSTMENT.*

BY ELMER G. WILLYOUNG.

I shall speak to you for a very brief time this evening on the subject of electrical standards of resistance. The standard of resistance is, to my mind, by far the most valuable standard with which we have to do in actual work. Considering only the quantities involved directly in Ohm's law, which are about the only quantities of any particular value or meaning to four electricians out of five, the standard of resistance is almost the *only material* standard which we can possess. The unit of current is a standard, but it is a standard which only exists by definition and is not an actual tangible and physical thing, while the standard of E. M. F., which shall give an exact unit or multiple of a unit, is yet to be discovered; a standard cell, to be sure, giving a definite E. M. F. at a definite temperature and whose rate of variation with temperature is accurately known, is now a comparatively easy thing to secure, but the care necessary in its use together with the decimal value of its E. M. F. are both considerably against its being rated as high, practically, as the standard of resistance. It must also be borne in mind that, having a standard of resistance, we may obtain the value of any E. M. F. by the solving of $E = CR$ where C is known from the amount of electrolytic deposition taking place in a given time out of a suitable solution; the amount of copper, silver or other metal deposited out of such a solution in a given time by a given current being always a definite and exact one to be found in any text-book upon the subject.

The standard of resistance, as generally known, is a length of wire of one kind or another, wound upon a spool, mounted in a convenient case to protect it from injury and moisture, and having its resistance at some given temperature definitely determined; a true standard also has its rate of variation of resistance for change of temperature accurately known. Sometimes one coil is mounted up alone and sometimes many coils of different values are put up in the same mounting.

In the manufacture of standards of resistance a great many qualities are required of the resistance-wire which shall be used. It should have high

* Read before the Electrical Section, Franklin Institute, Philadelphia, November 3, 1891.

specific resistance, in order that the standard may not have too much bulk; it should have as small a temperature coefficient of resistance as possible, in order that its value may be easily obtained at any reasonable temperature without the making of troublesome calculations; it must not change its resistance in time; it must not be oxidizable by the air or by the medium in which it may be enclosed, since this would change the constitution and hence the resistance of the wire; and it must be of a hardness suitable for handling in manufacture and adjustment without injury. The requirement of high specific resistance immediately compels us to reject copper, iron, aluminum, silver and all other pure metals except lead, antimony and bismuth. The softness, difficulty of working and high temperature coefficient as well as many other reasons would throw these last three out of the account. The matter of temperature coefficient alone, in fact, would compel us to reject all pure metals since they all increase roughly about 25 per cent. in resistance between 0° and 100° C., except iron, which increases about 40 per cent. We are, therefore, led to try alloys. Dr. Matthiessen, chairman of the sub-committee (of the Committee on Electrical Standards of the British Association), from 1862–65, having in charge the investigation of the properties of wires with reference to the selection of a suitable one to be used in the standard of resistance, decided upon by the British Association and now known as the B. A. Ohm, examined very exhaustively a large number of wires, among which were pure iron, silver, copper, thallium and other metals, and a great many alloys ; he finally concluded that silver alloyed with 33.4 per cent. of platinum was the best alloy obtainable. This alloy, known as platinum-silver, is still used by English makers; it has a specific resistance of twenty-four microhms and a per cent. variation per degree C, of $\frac{31}{100}$. In selecting this alloy we see that the requirements of high specific resistance and low temperature coefficient have both been observed, the resistance of platinum silver being about sixteen times that of copper and its temperature coefficient less than $\frac{1}{100}$ that of copper.

With reference to the constancy of resistance in wires it may be well to mention that many metals and alloys seem to alter in electrical resistance with time, or on being subjected to change of temperature. In an investigation carried on by J. Bergmann, a German electrician, in the latter part of 1889, he reports that, after raising to and maintaining at 300° C, for one hour and then cooling, the resistance of several substances changed as follows :

	Per Cent.
Copper decreased,.....	2.4
Aluminum "	5.0
Magnesium "	6.8
Zinc "	2.4
German-silver increased.....	$\frac{2}{10}$

Mr. Tomlinson, a little earlier, found a somewhat similar result in the case of iron wire, which decreased in resistance about one-quarter per cent. after several heatings to 100° C., and subsequent cooling. Dr. Matthiessen, in the investigations previously alluded to, found a considerable time change in a number of the alloys and wires which he experimented upon. It may be of interest to state here that three of the original platinum-silver coils determined by the British Association through Dr. Matthiessen and his colleagues at the time of the adoption of the B. A. Ohm were found last year, when carefully examined, to have developed an increase of resistance of about six parts in 10,000, or about $\frac{6}{100}$ per cent., quite an appreciable amount as standards go. The committee having these last comparisons in charge suggested that this change in resistance was only temporary, and due to strains in the wire produced by lowering it to 0° C., at which temperature the measurements were made ; they have, however, not yet been able to verify this idea. A time change is, however, to be noted in a large number of metals and alloys where strains are not taking place. This time change in resistance, as Dr. Matthiessen suggested, is probably very largely due to a gradual annealing effect, as it is particularly noticeable in hard-drawn wires. It has also been observed to be in a marked degree a property of wires containing zinc and to be lacking, except to a very small extent, in wires free from zinc ; here it is possible that zinc may gradually crystallize out, since it does easily crystallize, and the homogeneity of the wire thus being altered, the change in resistance may be accounted for.

It is almost self-evident that the resistance of a metal or alloy is a function of its density ; hence, all causes tending to change the density of the resistance metal will also tend to change its resistance. It is quite reasonable to expect, therefore, that an increase of resistance should be observed after a wire is wound upon a spool. A wire wound upon a spool not over eight times its own diameter will increase from $\frac{1}{2}$ to 2 per cent. in resistance ; a part of this increased resistance is due to the increased hardness caused on the inside of each turn, by the bending stress, and hence gradually falls away as the wire slowly anneals. For this reason, it is unsafe to send out a resistance standard as correct until several months have elapsed after winding.

Several years ago a wire was brought out in England known as "platinoid." It was said to be an alloy composed of ordinary German-silver with one or two per cent. of metallic tungsten added. It has a specific resistance of about thirty-two microhms and a temperature coefficient of $\frac{22}{100}$ per cent. per degree Centigrade. I have analyzed this several times but have never been able to detect any tungsten ; two or three friends have done the same with the same result. Whether or not any tungsten is used as the wire is now made, is, therefore, not certain. During the week since reading this paper, I have been informed by an electrician that the tungsten "burns out" in the process of manufacture. The properties of this alloy are, however, about as reported. It is nearly as cheap as German-silver, and during the time over which my own observations have extended shows no time change ; at least if any change has taken place in the coils in our possession, it has been by less than $\frac{1}{100}$ per cent. The wire is hard, practically non-oxidizable and easily handled. It is now being used in all the standards sent out by Queen & Co., and proves satisfactory in every way. I have here in my hand a wire recently sent me by the Aluminum Brass and Bronze Company, of Bridgeport, Conn., and claimed by the manufacturers to have thirty-five times the resistance of copper together with an extremely small temperature coefficient, less than $\frac{1}{10}$ that of German-silver. I have not had an opportunity to test the accuracy of these statements as yet, having been too busy with other work, but hope soon to be able to do so. According to the *Electrical Engineer*, of Oct. 21, 1891, there is also claimed for this wire a tensile strength of 70,000 to 100,000 pounds per square inch, with eighty twists in six inches, and with a lower resistance, a tensile strength up to 140,000 pounds per square inch. You see it is of a pale-rose color and looks as if it might contain considerable copper. I suspect it is a variety of manganese copper made up of about 70 per cent. of copper and 30 per cent. of manganese, with perhaps a small percentage of nickel. Mr. Edward Weston experimented on some of these alloys a couple of years ago and found one of them to have a negative temperature coefficient ; his statement to that effect was received with considerable incredulity at the time, but has since been thoroughly verified. According to Drs. Feusner and St. Lindeck, in *Zeitschrift für Instrumenten Kunde*, February, 1891, an alloy composed of 70 per cent. copper, and 30 per cent. manganese had a resistance of about five times that of German-silver and a temperature coefficient of but $\frac{4}{1000}$ per cent. per degree Centigrade, while an alloy of 73 per cent. copper, 3 per cent. nickel, and 24 per cent. manganese had a specific resistance a little less than three times that of German-silver, and a *negative* temperature coefficient of $\frac{8}{1000}$ per cent. We see, hence, that it ought to be entirely possible to obtain a wire having a zero coefficient, *i.e.*, not changing resistance at all for change of temperature by properly combining the constituent metals of this alloy. The obtaining of such an invariable standard is a "consummation devoutly to be wished" in electrical work, as accurate work is very troublesome and tedious where long decimal coefficients have to be applied, and this becomes particularly the case where several sets of coils are used in the same investigation having different temperature coefficients. Dr. E. S. Nichols, of Cornell University, and others have made successful attempts to obtain resistances having a zero coeffieient working along another line ; they have taken a rod of carbon and soldered to its extremities a length of wire of some metal or alloy ; since carbon decreases and wires increase their resistance with rising temperature, it is evident that by using a suitable wire and proper proportions a combination might be found which when placed in a circuit in parallel would remain of the same resistance at any temperature. The difficulty of soldering to carbon as also the care necessary in adjusting prevent, however, such resistances from becoming commercial possibilities ; the carbon is also too sensitive to changes of pressure and to strains.

A strictly standard resistance is, according to the practice of the best makers, adjusted to anything within from $\frac{1}{10}$ to $\frac{1}{100}$ per cent. of absolute accuracy. A *single* coil would not be considered a "standard coil" unless it were accurate within from $\frac{1}{10}$ to $\frac{1}{100}$ per cent. absolute accuracy. To obtain this high accuracy of adjustment it is easily seen that very exact methods of measurement must be employed ; should we attempt to measure an inch within this limit of error, the error could not be over $\frac{1}{10000}$ inch, an exceedingly small quantity. Various methods have been suggested and employed by different parties at different times. An apparatus designed by Prof. Fleeming Jenkin, and used somewhat by the British Association Committee of 1862, consisted of essentially, an ordinary Wheatstone's Bridge with the connection between two adjacent arms, consisting of a short, straight length of resistance wire. If, now, one galvanometer contact be on this straight wire and the other at the junction of the two opposite arms of the bridge, and S, one of these opposite arms, be the coil to be adjusted to R, the other of the opposite arms, and the arms adjacent to the straight wire be designated C and A we will have

$$\frac{C}{A} = \frac{R}{S}$$

we now interchange R and S and have

$$\frac{C}{A} = \frac{S}{R}$$

this will demand a new position of the galvanometer contact upon the straight wire and the distance moved over on the straight wire is a measure of the difference in resistance between R and S.

Suppose that C and A each have 100 inches of the same wire as the straight wire and that we have had to move over one inch in reversing R and S, then R and S agree within one per cent. Now we adjust S closer to R and substitute for C and A two new coils C' and A' each of 1,000 inches wire. If now we again adjust so as to move over one inch in reversing we are within $\frac{1}{10}$ per cent. of accuracy ; and so by continually adjusting S to R we may obtain gradually closer approximations to accuracy if we, at the same time, substitute other coils for C and A. But this process is, at the best, but a cut-and-try one and exceedingly tedious. A complete description of this method and convenient apparatus will be found on p. 38 of *Reports of Electrical Standards*, published by Spon.

I have here a piece of apparatus first designed several years ago during my student days. It is a modification of an arrangement devised by Prof. S. P. Thompson, and described in "Stewart & Gee," 2d vol., p. 160. The one I have here was first suggested to me by Prof. H. S. Carhart, of Michigan University, and has since been somewhat modified by myself. If we take an ordinary slide-wire bridge having four openings for coils at the back and (the slide wire being in front) fill these spaces, beginning at the left, with coils designated P, R_1, R_2 and Q, respectively, connect the battery from between P and R_1, to between R_2 and Q and the galvanometer from between R_1, and R_2 to a point on the slide wire, we have substantially the method which is known as the Carey-Foster method. Designating the resistance of copper connector at the left by r_1, and of copper connector at the right by r_2, and letting P be the resistance of unit division of the wire,

$$\frac{R_1}{R_2} = \frac{P + r_1 + X_1 \rho}{Q + r_2 + (L - X_1)\rho} \qquad (1)$$

where X_1 is the reading on the bridge wire and L the total number of divisions. Reverse the position of P and Q and we have

$$\frac{R_1}{R_2} = \frac{Q + r_1 + X_2 \rho}{P + r_2 + (L - X_2)\rho} \qquad (2)$$

From (1) we have

$$\frac{R_1}{R_1 + R_2} = \frac{P + r_1 + X_1 \rho}{P + Q + r_1 + r_2 + L\rho} \qquad (3)$$

and from (2) we have

$$\frac{R_1}{R_1 + R_2} = \frac{Q + r_1 + X_2 \rho}{P + Q + r_1 + r_2 + L\rho} \qquad (4)$$

From (3) and (4) we get

$$Q + r_1 + X_2 \rho = P + r_1 + X_1 \rho$$
$$Q - P = \rho (X_1 - X_2)$$

which is an expression independent of the resistance of the end pieces of the bridge, being merely the resistance of that portion of the wire over which we must move in obtaining our two balances. Thompson's device is merely for quickly and conveniently interchanging coils P and Q; with it we must change the position of four copper connectors in four mercury cups; this is tedious and increases the danger of a change of temperature between the adjustments. The modification which I have here has reduced these changes to two which can be almost instantly made. With this device and a carefully calibrated bridge wire it is an extremely simple matter to attain an accuracy of $\frac{1}{100}$ per cent., while much higher percentages of accuracy may be gotten with care. Of course, in this method the coils P and Q must be at a definitely known temperature which shall not change during the taking of the two readings; hence the two coils are placed in well-stirred water or oil baths. The other coils R and S are wound together and left in the open air, as if they change at all, they will probably change about equally and the result be of no appreciable importance. This device is also the best thing to use in determining temperature coefficients of wires; a

length of wire is wound upon a spool, immersed in oil at a definite temperature and compared with a standard. The temperature of the oil is then raised and the resistance of the wire again determined; knowing the difference of temperature and the change of resistance, the temperature coefficients follow.

THE GENERAL ELECTRIC COMPANY.

Governor Flower, of New York, with his approval of the Senate bill, entitled "An Act to Incorporate the General Electric Company," filed a memorandum the substance of which is, that the approval of the bill must not be considered as a precedent for future legislation of similar character. The cause for approving the bill was due to the representation that it would keep within the State a corporation ready to invest a large amount of capital which, without the concessions granted by its proposed charter, would be incorporated under the laws of New Jersey. A reduction of incorporation tax from one-eighth of one per cent. to one-twentieth of one per cent. was therefore provided for to coincide with the laws of that State.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

"Dead Wire" on Armatures.

Although the modern dynamo is very nearly perfect in its construction, both scientifically and mechanically, yet there exists in certain machines some dead or inert material, which cannot be avoided. We refer to what is known as the "dead wire" on drum armatures.

As may be inferred, this "dead" wire is dead as far as practical results are concerned, and is simply a dead load to carry.

This "dead" wire is located at the end of the armature opposite the commutator, and consists of the continuation of the windings of the conducting wire from one side of the armature to the other. It is "dead" because it produces no practical results for the reason that it does not come within the influence of the magnetic field; it is therefore a sort of necessary evil, because it is, as far as known at the present time, the only practicable means of carrying the current from one side of the core to the other.

In the case of large armatures, when the conductors are of large diameter, or of such form and mass as to render them comparatively inflexible, it is impracticable to continue the windings over the end of the core in the manner adopted on ordinary sized armatures. Some special devices are employed; such as half-circle segments, discs, etc. In any case the cross-diameter connections cannot be dispensed with, hence the necessity of making them as short as possible so as to reduce the resistance. This is necessary in order that as little energy as possible may be consumed, because the greater the resistance of a wire the more the current strength will be expended in passing through it.

The active wire on drum armatures is located parallel to the axis, and the more wire we can pass through the magnetic field at right angles the better.

The percentage of active wire of the total length varies greatly—from 30 to 60 per cent. That portion of the wire which is wound over the end of the core is not wholly inactive, however, but the electromotive force produced therein is so slight that it has little effect on the general result; what little electromotive force is produced is due to the fact that these portions of the wire cut the magnetic lines obliquely. (The electromotive force varies inversely as the obliquity of the wire with reference to the field of force.) The greatest electromotive force is produced when the wires cut the magnetic lines at right angles, and none is produced when the conductors pass through the field of force parallel to the lines.

THERMO-ELECTRIC CURRENTS.

In 1822 Seebeck discovered that a current may be produced in a closed circuit by heating a point of contact of two dissimilar metals. Thus if a piece of bismuth and a piece of antimony be soldered together, and their free ends be connected with a short-coil galvanometer, it is found that if the junction be warmed to a temperature higher than that of the rest of the circuit, a current flows whose direction across the heated point is from bismuth to antimony, the strength of the current being proportional to the excess of the temperature. If the junction is cooled below the temperature of the rest of the circuit a current in the opposite direction is generated. The electromotive force thus set up will maintain a constant current so long as the excess of temperature of the heated point is kept up, heat being all the while absorbed in order to maintain the energy of the current. Such currents are called thermo-electric currents, and the electromotive force producing them is known as thermo-electromotive force.

In 1834 Peltier discovered a phenomenon which is the converse of that discovered by Seebeck. He found that if a current of electricity from a battery be passed through a junction of dissimilar metals the junction is either heated or cooled according to the direction of the current. Thus a current which passes through a bismuth-antimony pair in the direction from bismuth to antimony absorbs heat in passing the junction of these metals, and cools it; whereas, if the current flow from antimony to bismuth across the junction, it evolves heat, and the junction rises in temperature.

This phenomenon of heating (or cooling) by a current, where it crosses the junction of two dissimilar metals (known as the "Peltier effect," to distinguish it from the ordinary heating of a circuit where it offers a resistance to the current, which is sometimes called the "Joule effect"), is utterly different from the evolution of heat in a conductor of high resistance, because (1) the Peltier effect is reversible, the current heating or cooling the junction according to its direction, whereas a current meeting with resistance in a thin wire heats it in whichever direction it moves; and (2) because the amount of heat evolved or absorbed in the Peltier effect is proportional simply to the strength of the current, not to the square of that strength as the heat of resistance is.

The complete law of the heat developed in a circuit will therefore require to take into account any Peltier effects which may exist at metal junctions in the circuit. If the letter P stands for the difference of potential due to the heating of the junction, expressed as a fraction of a volt, then the complete law of heat is

$$H = 0.24\ 4\ (C^2Rt + PCt).$$

The quantity called P is also known as the coefficient of the Peltier effect; it has different values for different pairs of metals, and is numerically equal to the number of ergs of work which are the dynamical equivalent of the heat evolved at a junction of the particular metals by the passage of one ampère of electricity through the junction.

THEORY OF CONTINUOUS-CURRENT DYNAMO.

The electromotive force of a dynamo depends (1) on the number of magnetic lines N which the field-magnet forces through the armature core, passing into it from the north pole of the field-magnet on one side, and out of it into the south pole of the field-magnet on the other; (2) on the number of conducting wires or bars wound upon the armature; (3) on the speed of rotation. If we use the symbol C for the number of armature conductors counted all round the periphery, and n for the number of revolutions per second, then the electromotive force of the dynamo (in absolute units) will be given by the rule

$$E = nCN;$$

but since one volt is taken as 10^8 absolute C. G. S. units, the electromotive force as expressed in volts will be

$$E\ (\text{volts}) = nCN \div 10^8.$$

The number N of magnetic lines through the armature can be calculated by the rule for the magnetic circuit, proper allowance being made for inevitable leakage of some of the magnetic lines.

All and any of the continuous-current magneto-electric and dynamo-electric machines can be used as electromotors, the armature rotating and exerting power when a current from an independent source is led into the machine.

LAWS OF ELECTROLYSIS.

Faraday's Quantitative Laws of Electrolysis are important in their bearing on the art of depositing metals by electrolysis. They are as follows:

1. The amount of chemical action is equal at all points of a circuit.

2. The amount of an ion liberated at the electrode in a given time is proportional to the strength of the current.

3. The amount of an ion liberated at an electrode in one second is equal to the strength of the current multiplied by the "electro-chemical equivalent" of the ion.

In addition to these laws the following are important:—

1. Every electrolyte is decomposed into two portions, an anion and a cathion, which may be themselves either simple or compound. In the case of simple binary compounds, such as fused salt (Na Cl), the ions are simple elements. In other cases the products are often complicated by secondary actions. It is even possible to deposit an alloy of two metals—brass for example—from a mixture of the cyanides of zinc and of copper.

2. In binary compounds and most metallic solutions, the metal is deposited by the current where it leaves the cell, at the cathode.

3. Aqueous solutions of salt of the metals of the alkalies and alkaline earths deposit no metal, but evolve hydrogen, owing to secondary action of the metal upon the water. From strong solutions of caustic potash and soda Davy succeeded in obtaining metallic sodium and potassium, which were before unknown. If electrodes of mercury are employed, an amalgam of either of these metals is readily obtained at the cathode. The so-called ammonium-amalgam is obtained by electrolyzing a warm, strong solution of sal ammoniac between mercury electrodes.

4. Substances can be arranged in a definite series according to their electrolytic behavior; each substance on the list behaving as a cathion (or being "electro-positive") when electrolyzed from its compound with any other on the list. In such a series of oxidizable metals, potassium, sodium, zinc, etc., head the list, after which come the less oxidizable or "electro-negative" metals; then carbon, oxygen, phosphorus, iodine, chlorine, sulphur, and lastly ozone.

5. From a solution of mixed metallic salts the least electro-positive metal is deposited first, unless the current be very strong.

6. The liberated ions appear only at the electrodes.

7. For each electrolyte a minimum electromotive force is requisite, without which complete electrolysis cannot be effected.

8. If the current be of less electromotive force than the requisite minimum, electrolysis may begin, and a feeble current flow at first, but no ions will be liberated, the current being completely stopped as soon as the opposing electromotive force of polarization has risen to equality with that of the electrolyzing current.

9. There is no opposing electromotive force of polarization when electrolysis is effected from an anode of the same metal that is being deposited at the cathode. The feeblest cell will suffice to deposit copper from sulphate of copper if the anode be a copper plate.

10. Where the ions are gases, pressure affects the conditions but slightly. Under 300 atmospheres acidulated water is still electrolyzed; but in certain cases a layer of acid so dense as not to conduct collects at the anode and stops the current.

11. The chemical work done by a current in an electrolytic cell is proportional to the minimum electromotive force of polarization.

12. Although the electromotive force of polarization may exceed this minimum, the work done by the current in overcoming this surplus electromotive force will not appear as chemical work, for no more of the ion will be liberated; but it will appear as an additional quantity of heat (or "local heat") developed in the electrolytic cell.

13. Ohm's law holds good for electrolytic condition.

14. Amongst the secondary actions which may occur the following are the chief: (*a*) The ions may themselves decompose; as SO_4 into SO_3+O. (*b*) The ions may react on the electrodes; as when acidulated water is electrolyzed between zinc electrodes, no oxygen being liberated, owing to the affinity of zinc for oxygen. (*c*) The ions may be liberated in an abnormal state. Thus oxygen is frequently liberated in its allotropic condition as ozone, particularly when permanganates are electrolyzed. The "nascent" hydrogen liberated by the electrolysis of dilute acid has peculiarly active chemical properties. So also the metals are sometimes deposited abnormally; copper in a black, pulverulent film; antimony in roundish, gray masses (from the terchloride solution) which possess a curious explosive property, etc.

ELECTRIC OSMOSE.

Porret observed that if a strong current is led into certain liquids, as if to electrolyze them, a porous partition being placed between the electrodes, the current mechanically carries part of the liquid through the porous diaphragm, so that the liquid is forced up to a higher level on one side than on the other. This phenonenon, known as electric osmose, is manifest when badly conducting liquids, such as alcohol and bisulphide of carbon are used. The transfer through the diaphragm takes place in the direction of the current; that is to say, the liquid is higher about the cathode than round the anode.

THEORY OF THUNDERSTORMS.

Solids and liquids cannot be charged throughout their substance with static electricity; if charged at all, the electricity is upon their surface. But gases and vapors being composed of myriads of separate particles, can receive a bodily charge. The air in a room in which an electric machine is worked is found afterwards to be charged. The clouds are usually charged more or less with electricity, derived probably from evaporation going on at the earth's surface. The minute particles of water floating in the air being better conductors than the air itself become more highly charged. As they fall by gravitation and unite, the strength of their charges increases. Suppose eight small drops to join into one. That one will have eight times the quantitity of electricity distributed over the surface of a single sphere of twice the radius of the original drops; and its electrical potential will therefore be four times as great. Now a mass of cloud may consist of such charged spheroids, and its potential may gradually rise, therefore, by the coalescence of the drops, and the electrification at the lower surface of the cloud will become greater and greater, the surface of the earth beneath acting as a condensing plate and becoming inductively charged with the opposite kind of electrification. Presently the difference of potential becomes so great that the intervening strata of air give way under the strain, and a disruptive discharge takes place at the point where the air offers least resistance. This lightning spark, which may be more than a mile in length, discharges only the electricity that has been accumulating at the surface of the cloud, and the other parts of the cloud will now react upon the discharged portion, producing internal attractions and internal discharges. The internal actions thus set up will account for the usual appearance of a thunder cloud, that it is a well-defined flat-bottomed mass or cloud which appears at the top to be boiling or heaving up with continual movements.

ANSWERS TO INQUIRIES.

Editor Electrical Age: I am just beginning to post myself on electricity, and what limited facilities I have for acquiring electrical information are not the best. Will you please tell me what is meant by magnetic saturation; also, if a straight magnet can be made as strong magnetically as one of the horse-shoe type? D. P. L.

Lima, Ohio.

Answer.—Magnetic saturation means the maximum amount of magnetism that the magnet is capable of holding or retaining. All things being equal, the horse-shoe magnet is stronger than a straight-bar magnet, the reason of this being that the lines of force have a less air space to act through in the case of a horse-shoe magnet than in a straight-bar magnet. Air space offers resistance to the flow of the magnetic lines of force just as a small conductor offers a resistance to an electric current.

Editor Electrical Age: Please explain why, on closing an electric telegraph circuit, the current does not rise to its full strength at once, but does so gradually? J. H. G.

Tacoma, Wash.

Answer.—The current does not rise to its full value at once on account of the extra current which is induced on closing the circuit This extra or induced current is in the opposite direction to the main current, and acts as a resistance or counter-electromotive force, which retards the development of the main current. This phenomenon is very noticeable on lines where there are many magnets (relays) in circuit. The close proximity of the windings of wire on the relay magnets magnifies this phenomenon.

WENT ON A STRIKE.

Three hundred electric wiremen in this city recently went on strike, demanding that they be paid $3.00 per day hereafter, instead of $1.50 and $2.50, which they have been getting. The men are employed in wiring buildings and houses for incandescent lights, electric bells, burglar alarms, etc., and are members of the Electric Wiremen's Union. About 200 gained their demand without trouble, and it was expected that the remaining 100, principally employed by small firms, would also succeed.

REPORTED RESIGNATION.

A rumor from Chicago has it that Mr. John P. Barrett, the city electrician and chief of the World's Fair Electrical Department, intends to resign these positions to accept an appointment as director-general of the National Board of Underwriters at New York at a salary of $50,000 per year.

NEW PUBLICATIONS.

The March and first number of *Electrical Progress and Development*, successor to *Modern Light and Heat*, of Boston, has been received. It is a neat looking and well printed journal. Mr. R. F. Ross is the editor and proprietor.

DESTRUCTIVE FIRE.

The buildings and machinery of the Altham Motor Company, in Swansea, Mass., were totally destroyed by fire on the night of April 12. Loss, $12,000 to $15,000; insurance, $5,000. In the shops was an Altham motor nearly completed, and which was expected to produce phenomenal results in the development of power.

BIG CANADIAN CONTRACT.

The Edison General Electric Company, of New York, has secured the largest electrical contract ever awarded in Canada. It was received from the syndicate which controls the Toronto and Montreal street railways, and is for 170 motors of fifteen horse-power each, which will be used in the operation of the Toronto roads. The Edison Company also expects to secure the contract for the Montreal service. The contract now awarded covers, it is believed, $1,500,000, and will probably be succeeded by others. Last year the Edison people did nearly $800,000 of the business in Canada, and in Peterboro they employ 600 men in their factories.

MAGNETIC VANE METERS.

Queen & Co., Philadelphia, Pa., have recently received an order for more than 200 magnetic vane volt and ampère meters from a large manufacturing concern, which instruments are to be installed with the light and power plants put up by this company. The transaction is especially satisfactory to the makers, as a sort of competitive examination was instituted and the magnetic vane type was adopted after the most careful comparison with other types.

NEW INCORPORATIONS.

The Lawrenceville and Schenly Park Street Railway Company, Pittsburg, Pa., incorporated April 6, with a capital stock of $100,000, to operate an electric railway. Incorporators: S. J. Wainwright, M. F. Leslie, P. C. Byrne, of Pittsburg, Pa.

Gallatin Light, Power and Railway Company, Bozeman, Mont., was incorporated April 5, with a capital stock of $150,000, for generating and using electricity for any purpose to which it is adapted. Incorporators: W. G. De Celle, S. M. Houghton, Helena, Mont.; W. H. Clark, St. Paul, Minn.; C. J. Clark, Minneapolis, Minn.

Citizens Electric Company, Green Bay, Wis., was incorporated April 8, with a capital stock of $25,000. Incorporators: J. H. Ebeling, H. W. Hart, F. B. Warren.

The Denver Electric Company, Denver, Col., was incorporated April 7, with a capital stock of $500,000. Incorporators: Job A. Cooper, Charles L. McIntosh, George W. Trinible, Absolam V. Hunter, Charles Boettcher, all of Denver, Col.

Patterson Electric Light Company, Mifflintown, Pa., incorporated April 4, with a capital stock of $3,500. Incorporators: Ezra C. Doty, John J. Patterson, Jr., B. F. Burchfield.

Mifflintown Electric Light Company, Mifflintown, Pa., incorporated April 4, with a capital stock of $2,500. Incorporators: Ezra C. Doty, John J. Patterson, Jr., B. F. Burchfield, all of Mifflintown, Pa.

The Waldron Electrical Company, Berwick, Me., incorporated April 6, with a capital stock of $50,000. Incorporators: Charles H. McIntire, Ezra C. Pratt, Jesse J. Smith, all of Lowell, Mass.

Eastern Compound Wire Company, Jersey City, N. J., incorporated April 5, with a capital stock of $100,000, to manufacture and sell electrical conductors of all sorts. Incorporators: C. Stewart, W. F. Pascoe, Easton, Pa.; C. H. McIntire, Newark, N. J.

Electrical Advertising and Display Manufacturing Company, Camden, N. J., incorporated April 4, with a capital stock of $500,000. Incorporators: B. E. Tifft, T. W. Snowder, W. A. Prissinger, J. W. Jennings, Philadelphia, Pa.; S. H. Morrison, Camden, N. J.

The Rocky Mountain Electric and Power Company, Pueblo, Col., incorporated April 4, with a capital stock of $500,000. Incorporators: Moses L. Stern, David B. Urmy, George H. Hobson, E. C. Humphrey, George W. Robinson, all of Pueblo, Col.

The Metropolis Water Co., Metropolis City, Ill., incorporated April 11, with a capital stock of $5,000. Among other things it will furnish electric light heat and power. Incorporators: George C. Morgan Arthur M. Morgan, Henry A. Gardner.

Interior Wiring and Fixture Co., New York, N. Y., incorporated April 7, with a capital stock of $20,000, to wire and equip for electric lighting. Incorporators: Phil. H. Klein, Charles F. Duffy, James F. Doyle, all of New York, N. Y.

Independent Plumbing and Electrical Co., San Antonio, Tex., incorporated April 5, with a capital stock of $10,000. Incorporators: William Schuwirth, Ad. Wagner, John Zadich.

The Hart & Cooley Manufacturing Co., Chicago, Ill., incorporated April 9, with a capital stock of $40,000. Among other things it will do annealing and electro-plating. Incorporators: Norman P. Cooley, Howard S. Hart, George P. Hart.

The Marseilles Electric Street Railway Co., Marseilles, Ill., incorporated April 9, with a capital stock of $12,000. Incorporators: Frank Montgomery, Richard Hughes, S. J. Gum.

The Bryan Heights Railway Company, Bryan, Tex., has been incorporated with a capital stock of $25,000, to operate a street railway by electric, steam or horse-power. Incorporators: J. P. Bryan, Fred. S. Robbins, Guy M. Bryan, Jr.

The Omaha Thomson-Houston Electric Light Company, Omaha, Neb., was incorporated March 31, with a capital stock of $1,100,000. Incorporators: E. S. Wiley, H. E. Chubbuck, John L. Martin, Omaha, Neb.

The Palestine Water and Power Company, Palestine, Tex., has been incorporated with a capital stock of $100,000, to supply water, manufacture electricity and furnish the same for light, heat and power. Incorporators: Carlos S. Greeley, Dwight Treadway, Melvin L. Gray, Samuel G. Kennedy, N. Oscar Gray, St. Louis, Mo.

Fulton and Montgomery County Electric Railroad Company, Johnstown, N. Y., was incorporated March 28, with a capital stock of $75,000. Incorporators: Robert Wemple, Fultonville, N. Y.; M. B. Northrup, Johnstown, N. Y.; J. E. Sitterly, Fonda, N. Y.

The Winona Electric Light Company, Winona, Minn. Incorporated April 12, with a capital stock of $50,000. Incorporators: T. T. Hayden, J. H. Jenkins, R. T. Dond, of Winona, Minn.; C. L. Bonner, of Minneapolis, Minn.

The Egg Harbor City Water, Electric Light and Power Co., of New Jersey, Camden, N. J. Incorporated April 11, with a capital stock of $30,000. Incorporators: W. W. Taylor, J. M. Mays, W. R. Cason, Philadelphia, Pa.

THE LARGEST TURBINE.

The James Leffel & Company are building at their works in Springfield, O., what, it is believed, will be the largest turbine ever manufactured, either in this country or abroad.

It measures about fifteen feet in diameter, and the height of its casing, with its surmounted iron bridge-tree arrangement for carrying a huge pair of gears, and the short horizontal shaft, will reach twenty-two feet. The wheel will be of the strongest and most substantial construction, and condensed in the smallest and most practical space. It will give, when in operation, 600 H. P., under a comparatively low head. It is expected to weigh, when completed and ready for shipment, forty-five tons, and will require four cars for its transportation. This wheel is intended to drive a large lumbering and house-furnishing manufacturing plant.

The James Leffel & Company have recently greatly enlarged and improved their works; the buildings have been extended, and extensive additions have been made in several departments, including new and heavy machinery for handling the heaviest class of work in the company's line.

They have very nearly completed the shipment of nineteen large James Leffel water-wheels (five carloads), sold to one company in Wisconsin, to drive a mammoth wood-pulp and paper mill. This transaction comprises the largest order that was ever given for water-wheels, and was obtained, we are informed, under exceedingly close competition, at a handsomer figure than was proposed by others.

DETROIT NOTES.

The Electrical Fibre Carbon Company, manufacturers of carbon specialties, 1228 to 1234 Michigan avenue, Detroit, Mich., manufactures and handles various specialties of which the following are a few: Carbon plugs, for the production of aluminum; round, square and fluted carbons; solid, hollow and cored commutator brushes; carbon cups; carbon buttons; rheostat carbons of any resistance, and all requisites for the manufacture of primary batteries. This firm makes a specialty of the manufacture of primary carbon batteries, of which it has different styles, viz.: the "Eureka," "Paragon," "La Grand," "Unique" and "Referee"—the latter two having screw-cap tops. The company is having a great run on these batteries, having made 68 shipments last week, the orders for which were from the principal cities of the United States. In addition to the above orders it filled one from Russia.

Mr. Robert B. Watson, late travelling salesman for the Detroit Electrical Works, has recently been appointed to the position of vice-president and general manager of the same company. It would be hard to find a better man for the position. Mr. Watson is a thorough gentleman, good business man, and has a large acquaintance among the electrical people.

N. D. W.

NEW YORK NOTES.

Office of the Electrical Age,
First Floor, World Building,
New York, April 16, 1892.

The Clark Electric Company, 192 Broadway, has issued an illustrated and descriptive pamphlet of its system of arc-lighting, which it claims to be the cheapest illumination in the world.

M. Alexander von Bobo, representative of Siemens & Halske, Berlin, Germany, will on May 1 next remove his office from the Times Building, this city, to the Monadnock Block, Chicago, Ill.

The Fire Commissioners of this city have made a contract with the Standard Underground Cable Company, of Pittsburg, for placing fire alarm electrical conductors underground at a cost of $63,895.38.

Mr. H. W. Seller, of the Seller Water Tube Boiler Co., 136 Liberty street, has secured an order for two boilers from the United States Naval Observatory, Georgetown Heights, Washington, D. C., for running the electric light plant. This order was secured in a competitive bid.

McLeod, Ward & Co., 91 Liberty Street, have moved to the first floor of the same building. They have enlarged their factory facilities, and are making a specialty of ventilating fans, electric motors and blowers for factories and large rooms. They also make ceiling and column fans.

B. W. Payne & Sons, 45 Dey street, are making preparations to move on May 1 to 41 Dey street, where they have secured more commodious quarters. They will occupy the entire front portion of the main floor and intend to have an engine running electric lights in the show window. A full line of their various sizes of engines will be exhibited on the floor.

W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor Electrical Age:

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

Just at the moment, with the exception of less than half a dozen securities, probably the dullest spot in the United States is the New York Stock Exchange. In swinging around the circle something must of necessity be on top; new stocks are created frequently or combinations perfected by which a new name is given to an old stock and a blind pool formed of more or less magnitude; the new baby is discovered all of a sudden, its merits extolled, and the price goes way up in the air before it is fairly christened; then the possibilities of its immediate future are mysteriously explained by the tape-chaser, and thus proving the old saying that "every little helps," dealings increase. The public is loaded, and the newcomer is either absorbed by a standard corporation or literally abandoned by the market, in which case it sinks into utter oblivion, leaving the lambs to hold their purchases with no possible chance of realizing anything in reason. Meanwhile new enterprises are whipped into shape. One of those to have its day before the end of the current year, and with the extraordinary good chances of staying, is Tin. The miners have found it from Idaho and Dakota clear down into Mexico; they have learned more of its nature in the past year than was known before, and being found, more capital stands ready to develop it as is shown by the following list of tin-plate works in process of construction, or running in whole or part in the United States: The American Tin and Terne Plate Company, Philadelphia, Pa.; American Tin Plate Company, Elwood, Ind.; Anderson Tin Plate Company, Anderson, Ind.; Apollo Iron and Steel Company, Apollo, Pa.; Blairsville Rolling Mill and Tin Plate Company, Blairsville, Pa.; The Britton Rolling Mill Company, Cleveland, Ohio; Cincinnati Corrugated Company, Piqua, Ohio; Coates & Co., Locust Point, Baltimore, Md.; Cleveland Tin Plate Company, Cleveland, Ohio; Columbia Tin Plate Company, Piqua, Ohio; Falcon Iron and Nail Company, Niles, Ohio; Fleming & Hamilton, Pittsburg, Pa.; Griffiths & Cadwallader, Twenty-third ward, Pittsburg, Pa.; P. H. Laufman & Co., Apollo, Pa.; Marshall Brothers & Co., Philadelphia, Pa.; Matthai, Ingram & Co., Baltimore, Md.; McKinley Tin Plate Company, Limited, Philadelphia, Pa.; New Philadelphia Iron and Steel Company, New Philadelphia, Ohio; Norton Brothers, Chicago, Ill.; Pioneer Tin Plate Company, Joliet, Ill.; Pittsburg Electro-Plating Company, Limited, Pittsburg, Pa.; Pittsburg Tin Plate Works, Strawbridge & Beaver, Kensington, Pa.; Record Manufacturing Company, Cincinnati, Ohio; W. T. Simpson, Cincinnati, Ohio; Somerton Tin Plate Works, Brooklyn, N. Y.; Strauss, J. E., Philadelphia, Pa.; Scott, J. B., & Co., Pittsburg, Pa; Summers Brothers & Co., Struthers, Ohio; N. & G. Taylor, Philadelphia, Pa.; Union Tin and Terne Plate Company, Allegheny Pa.; United States Iron and Tin Plate Manufacturing Company, Demmler, Pa.; Wallace, Banfield & Co., Irondale, Ohio; Western Tin Plate Company, Joliet, Ill. When in full operation these works will have a capacity of 50,000 boxes per week.

I had the pleasure of an interview with an expert who has examined for capitalists several of the mines, and he — a man I have known intimately for nearly thirty years — assured me that there was sufficient tin being developed to supply the whole market, the lack of experienced management at the mines being the only trouble. The stocks are all low, and now is the time to invest in as much as you can afford to law away until fall or next year.

Notwithstanding the great desire of the investing public to know before the long summer stagnation sets in what the result of the consolidation of the Thomson-Houston Electric Company with other large interests will be, and under what guise or disguise they will be allowed to participate, the company met in solemn conclave in Middletown, Conn., on the 11th inst. and elected the following Board of Directors: T. J. Coolidge, S. E. Peabody, E. Griffin, S. A. Barton, C. H. Newhall, B. S. Spinney, J. L. Smith, H. A. Pervear and C. A. Coffin. It would have been exceedingly satisfactory to the thousands of investors all over the country who are interested either in the parent company, subcompanies or company-customers of the Thomson-Houston corporation to have had a full report of this (probably their last) annual meeting as a separate company in the financial column of the Electrical Age. Publicity is strength, aided by conscious knowledge; it holds a bond firm, be it a general government or a business corporation, and I long for the day when a silent mentor of the press shall record, condense and publish without fear or favor, the uncolored facts as stated by the chairmen of public companies at their annual meetings. I have heard this publicity approved of by such men as Sir Edward Watkin, Sir John Lubbock and a host of equally well-known and accepted chairmen, when presiding at their several meetings. It gives strength to your enterprise, and through the press only can you reach the people. If Mr. Gould's name were dropped by the newspapers for ninety days he would be forgotten and correspondingly happy. The Thomson-Houston Company did an immense business during the past year, amounting to $10,340,000. The company's assets are $20,263,417. The capital stock amounted to $10,000,000, surplus $6,022,333, profits $2,760,780. The company claims 2,364 miles of street railway run by its electric system. When we look back and remember that it was but yesterday that the first electric motor was attached to a car, and that a single company has accomplished so much with many competitors, we wonder how men can keep their surplus money in the bank practically idle. There are bushels of unimpeachable electric bonds in this market to-day seeking capital, and which pay from 5 to 8 per cent., and equally safe stock which pays 6 to 8 per cent., with certain improvement year by year.

PERSONALS.

Mr. E. J. Hall, vice-president of the Bell Telephone Co., of Buffalo, N. Y., is taking a rest at Nassau, N. P., accompanied by his family.

W. A. Giles, contracting engineer, of Pittsburg, Pa., was in town last week.

WESTERN NOTES.

Mr. W. R. Mason has resigned the position as president and general manager of the Electric Merchandise Company, of Chicago, and Mr. W. L. Adams has resigned as secretary and treasurer of the same company. Mr. Mason has opened a temporary office until May 1 at 617-619 Pullman Building, Chicago.

ELECTION.

The annual meeting of the Electric Club, New York, will be held at the Club's quarters April 21, at which officers and a board of managers will be elected for the ensuing year.

A franchise has been granted to Messrs. J. H. Wilson and G. C. Rogan, of Mobile, Ala., for the construction and operation of an electric-light plant in that city. Work will be commenced immediately after a meeting, which will be held on April 25.

The Wilmot & Hobbs Mfg Co., Bridgeport, Conn., manufactures a very unique rule out of the cold rolled etched steel made by it. On the back of it will be found several interesting rules for figuring the weight of sheet steel, weight of sheet brass, weight of sheet copper, wire gauges, etc.

THE ELECTRICAL AGE'S ELECTRICAL PATENT RECORD.

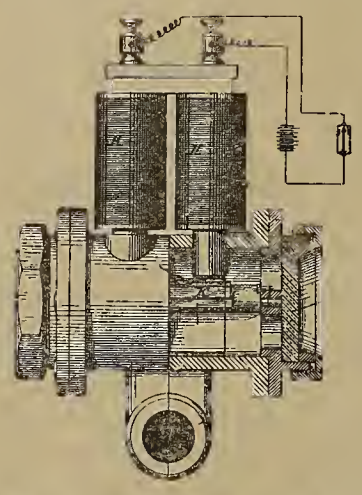
Issued April 12, 1892.

472,524. Motor for Propelling Cars. Walter L. Davis, Chicago, Ill. Filed May 16, 1891.

472,529. Insulator-Support. Dennis Doren, New York, N. Y. Filed July 20, 1891.

472,579. Electro-Magnetic Valve-Controller. Olof E. Lundstedt, Brooklyn, N. Y., assignor, by mesne assignments, to the New York Electrical Device Company, of Virginia. Filed Aug. 6, 1890. Renewed Oct. 14, 1891.

472,610. Electric Switch. Lucius T. Stanley, Brooklyn, N. Y., assignor to the Cutter Electric and Manufacturing Company, Philadelphia, Pa. Filed Nov. 7, 1890.



472,579.—ELECTRO-MAGNETIC VALVE-CONTROLLER.

472,611. Flexible Supporting-Arm for Electric Lamps. Lucius T. Stanley, Brooklyn, N. Y., assignor to the Cutter Electric and Manufacturing Company, Philadelphia, Pa. Filed Oct. 17, 1891.

472,623. Electric-Lighting System. John M. Lockwood, San Francisco, Cal. Filed June 22, 1891.

472,628. Dynamo-Electric Machine. Lazarus S. M. Pyke and Harry T. Barnett, London, England, assignors to said Pyke and Edward Stephen Harris, same place. Filed Feb. 5, 1892. Patented in England.

472,634. Bracket for Electric Heaters. George D. Burton, Boston, Mass., assignor to the Electrical Forging Company, of Maine. Filed June 26, 1891.

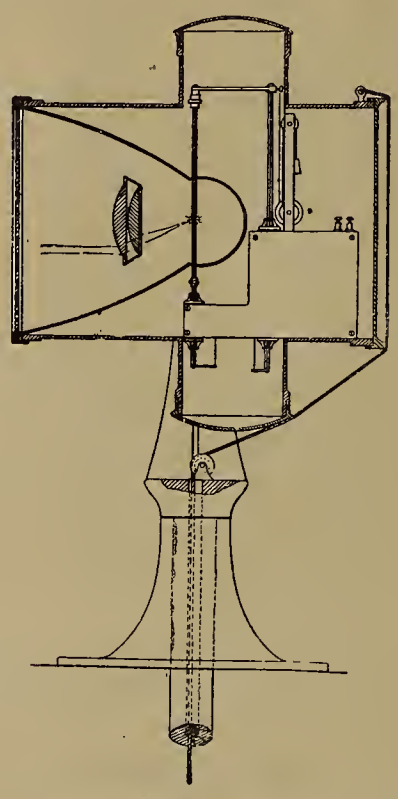
472,643. Electric Conductor. William R. Patterson, Chicago, Ill. Filed Aug. 31, 1891.

472,708. Electric Motor or Generator. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Nov. 12, 1891.

472,721. Electric Search-Light. Barton B. Ward, New York, N. Y., assignor, by mesne assignments, to the Scott Electrical Manufacturing Company, of New Jersey. Filed Jan. 13, 1890.

472,747. Electric-Arc Lamp. Royal E. Ball, New York, N. Y. Filed Oct. 10, 1891.

472,772. Circuit for Multiple-Switchboard Systems of Telephone-Exchanges. John A. Seely, New York, N. Y, and Charles E. Scribner, Chicago,



472,721.—ELECTRIC SEARCH-LIGHT.

Ill., assignors to the Western Electric Company, Chicago, Ill. Filed Nov. 15, 1886.

472,784. Safety Attachment for Overhead Electric Wires. Charles D. Brown, Minneapolis, Minn. Filed Jan. 8, 1891.

472,800. Incandescent Electric Lamp. George C. Baillard, New York, N. Y. Filed Sept. 22, 1891.

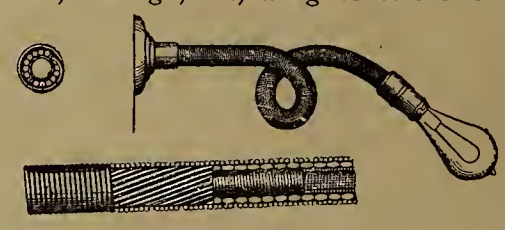
472,801. Incandescent Electric Lamp. George C. Baillard, New York, N. Y. Filed Sept. 22, 1891.

472,909. Electric Elevator. Charles R. Pratt, New York, N. Y. Filed April 8, 1891.

472,933. Joint for Electric Conductors. Thomas F. O'Connor, New York, N. Y., assignor to the Standard Underground Cable Company, Pittsburg, Pa. Filed Jan. 2, 1892.

472,935. Arc-Light Hanger. Charles A. Pfluger, Chicago, Ill., assignor, by direct and mesne assignments, to the Standard Electric Company, of Illinois. Filed May 11, 1891.

472,943. Dynamo-Electric Machine. George E. Dorman, Chicago, Ill., assignor to the Standard



472,611.—FLEXIBLE SUPPORTING-ARM FOR ELECTRIC LAMPS.

Electric Company, of Illinois. Filed Dec. 17, 1890. Patented in England.

472,947. Cable-Rack. William M. Goodridge, Highland Park, assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 30, 1888.

472,956. Canopy Telephone-Exchange Switchboard. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 22, 1889.

472,968. Electric Surgical Instrument. Stephen R. Bradley, Nyack, N. Y. Filed Feb. 4, 1892.

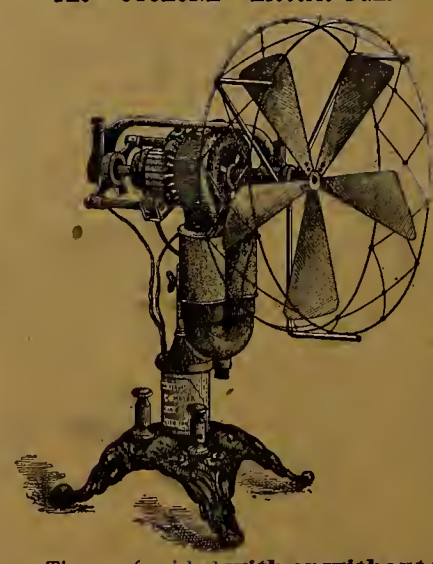
THE LA BOITEAUX
Electric Motor and Fan Co.

The "CYCLONE" Electric Fan.



The La Boiteaux Electric Motor and Fan.

Patented May 5, 1891.

The superiority of these Electric Fans, compared with any heretofore invented, is in our Patent Oscillating and Rotary motions, which, while creating a current of air, distributes same so equally that the temperature is the same in all parts of the room, at the same time overcoming the objections and unhealthy effects of being under a continuous current of cool air, as produced by the ordinary Revolving Fans.

They are also entirely noiseless, and do not create the unpleasant grinding sound usually accompanying the motion of the ordinary Centrifugal Fan.

The accompanying cut illustrates our Patent Electric Fan with Rotary Motion, as adapted for use in Offices, etc.

This style is constructed to rest upon an Enamelled Iron Pedestal, or may be set on the top of partitions usually in offices to divide same into compartments. While the **Fan** is in motion, **the Motor as well as the Fan revolve on their base at the slow speed of Ten Revolutions per Minute** (while the speed of the Fan is 2,000 Revolutions per Minute), the double motion thereby causing a cool wave of air, the effect of which can be readily felt at a distance of ten yards from the Motor in all directions, and it is distributed in such a gradual manner, that the unpleasant effect of a continuous current in one particular spot is overcome.

The Oscillating Fan is constructed to be placed on a sideboard, shelf, or elsewhere against the wall. The speed of the Fan is the same as in the preceding style, viz., 2,000 revolutions per minute; but in place of the Motor and Fan revolving on the centre of its base, it has an Oscillating motion, **from right to left in a half circle,** thereby distributing the air throughout the room equally in all directions, with the same effect as the Rotary motion style.

They are furnished **with or without** the Electric Lamp attached, as desired.

All our Motors can be attached to any incandescent circuit by a flexible cord, and may be moved at pleasure to any part of the room.

All Motors carried in stock are wound 110 volts constant potential.

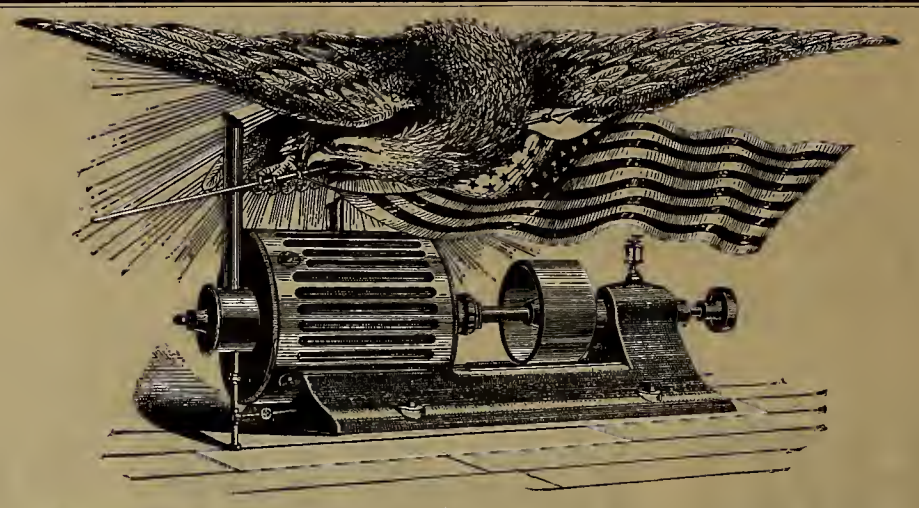
CORRESPONDENCE SOLICITED.



AMERICAN HIGH SPEED ENGINE.

This Engine revolutionizes the manner of applying steam in generating power. It can be regulated so as to run at any speed desired, up to

1000 OR MORE REVOLUTIONS PER MINUTE!

It is not a rotary Engine, yet the motion of its parts is such that there are no "dead centers." It takes steam and exhausts four times at each revolution. For

SPEED, SIMPLICITY AND ECONOMY,

this Engine has no equal. It possesses many striking advantages over all other Engines, either slow speed or so-called high speed. Its speed is closely regulated by a sensitive and reliable automatic governor. Built of any required size,

FOR ALL STATIONARY AND MARINE PURPOSES.

It can be **coupled directly** to dynamos, fans, blowers, fire engine and other rotary pumps; in fact, to **any** machine requiring great velocity. It is smooth running and **noiseless.** Being light and compactly built, it takes up less room than any other Engine of equal power. No heavy foundations are requred. This Engine is

THE ACME OF SIMPLICITY.

No skilled engineer is required.

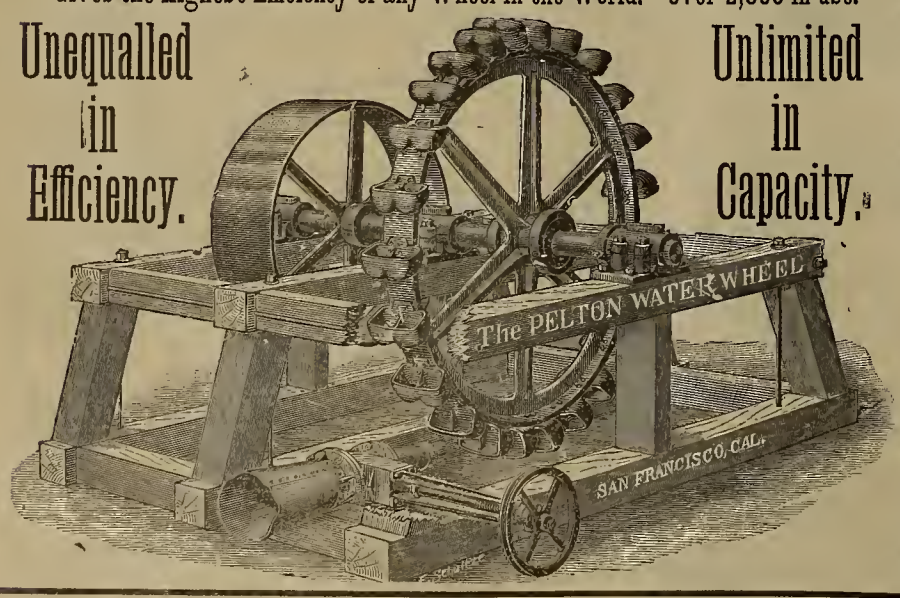
THE PELTON WATER WHEEL

Gives the Highest Efficiency of any Wheel in the World. Over 2,500 in use.

Unequalled in Efficiency. Unlimited in Capacity.



Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2,000 or more feet. From 20 to 30 per cent. better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work. All applications should state amount and head of water, power required, and for what purpose, with approximate length of pipe line. Send for Catalogue.

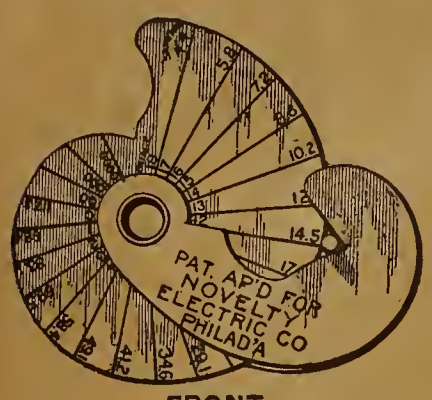
THE STAR ELECTRIX COMPANY,

639, 641, 643 North Broad Street,

PHILADELPHIA, PA.

NOVELTY ELECTRIC CO., 50, 52, 54 N. Fourth St., Philadelphia.



FRONT.

These cuts represent in full size, the two sides of our recently perfected **PATENT POCKET WIRE GUAGE.** It is finely finished and graduated with extreme accuracy.

Electricians, Linemen and all having occasion to use wire for any electrical purpose, will find this guage invaluable.

PRICE, $1.00.

HOW TO USE IT PLACE the wire in the V-shaped opening between the movable rm and the edge of the Guage, and move the arm around until the wire is tightly bound against the edge of the Guage. The short square shoulder near the centre of the arm, and its radial line will indicate:

1st.—The American (B. & S.) guage of the wire.

2d.—The Safe Current the wire will carry in amperes.

3d.—The Ohms resistance per foot of copper wire, from which the resistance of iron or German silver wire can be found.

4th.—The number of lamps a wire will carry

Having this valuable information, by formula as stamped on the arm, the size of wire required to carry any number of lamps, any distance, with any loss, can be readily obtained, and by other simple formula, many problems that are met in erecting and maintaining Electric Lighting Systems can be solved.

If you are in want of any description of Electric Work or Supplies, favor us with your orders. As large manufacturers of our own extensive line of Electrical goods, and as Agents for other Electrical manufacturers of valuable specialties, we are prepared at all times to offer the best Electrical goods in the market at the lowest going prices.

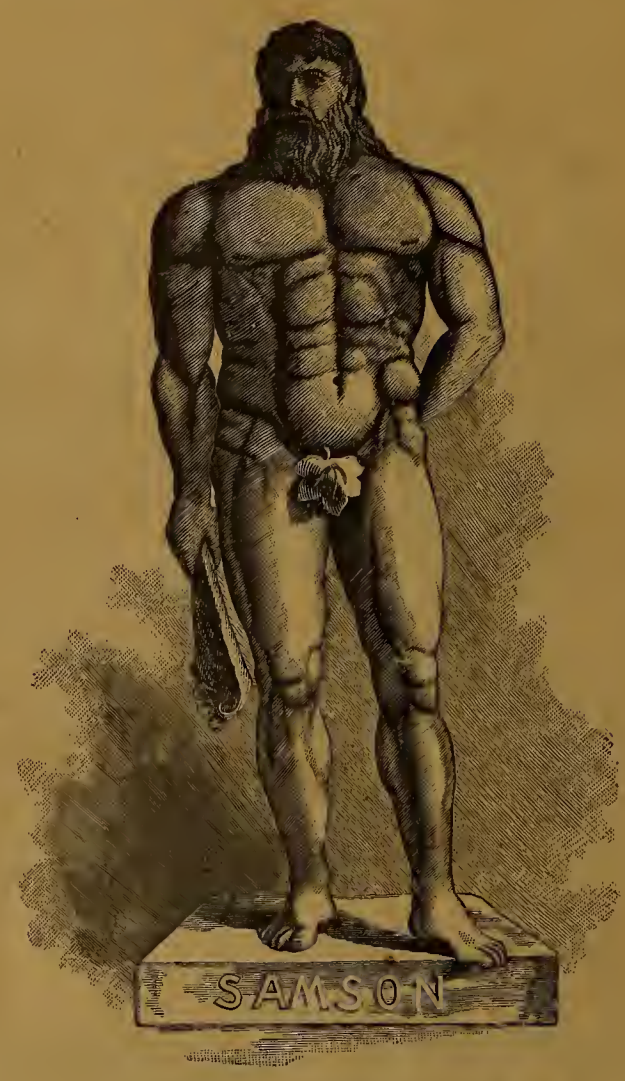
BACK.

IT IS INDEED A SAMSON IN STRENGTH!

Practical Electricians Enthusiastically Adopt The SAMSON.

No higher praise could be accorded it than the **continued and constantly increasing orders** received from those who early ventured to try it. Indeed, it is now quite the conservative thing to use the SAMSON Battery.

After all, this selection of batteries **is simply a matter of dollars and cents.** As for instance, if one style of cell costs 65 cents, and the SAMSON costs 75 cents, but lasts **three times as long,** and requires only half the care and attention, you don't need higher mathematics to help you to determine which it will pay you best to use.



'AND YET SOME HESITATE!

As there are yet some battery users who hesitate to use the great SAMSON Cell, and as we would benefit them all in our power, we continue to publish **fresh evidences of its great superiority over all other open-circuit cells.** If we could afford it, we would ship each doubter a dozen cells gratis. Indeed, we have thought perhaps this would be the cheapest way to secure their patronage, since all who once try **the SAMSON continue to use it.** We will consider the matter, though doubtless the surest way to obtain the SAMSON will be to **send in your orders,** as hundreds of others are wisely doing, to

Interior Conduit and Insulation Co.,

EDWD. H. JOHNSON, Pres.

42 and 44 Broad Street, NEW YORK.

An Old Friend in a New Dress.

The more you see of the "Ward" Lamp the more you become interested. Mechanical and electrical perfection. It is all that. Are you aware that we are combining these features with a line of ornamental lamps that surpass in beauty of finish and design any arc lamp ever offered to the trade, and equal to the handsomest electrical fixtures manufactured?

You need such lamps for interior lighting and decoration. They increase the output of your Station and delight the consumer. How about prosperity? Of course you're through with experiments. Why need you injure your business and add personal worry by the purchase of any other style of lamps which are so imperfect that they will have to be changed every month and brought out as a "New Lamp."

The "Ward" Lamp, in all cases, is specially designed to meet the varying conditions demanded, and had passed the experimental stage when first offered to the public by this Company. The thousands of "Ward" Lamps in use prove it to be the only lamp that works satisfactorily on an incandescent circuit.

Electrical Supplies, Bells, Annunciators, Burglar Alarms, etc., etc.

No. 9 Bartholdi Automatic!

WITH LAVA TIP:

ARGAND OR CANDLE.

AS PER ORDER.

40,000 IN USE,

AND NO FAILURE.

SMALLEST! CHEAPEST! BEST!

This instrument includes in itself a complete electric Gas Lighting Apparatus applicable to the ignition of every gas jet in a building; all condensed into a simple device which can be employed by a child without training.

No Battery, Acids, or Liquids.
No Wires or Special Apparatus on Fixtures.
Entirely Mechanical in Construction.
Always in Order and Ready for Use.
You Push the Button and the Torch Does the Rest.

Absolute safety from risk of fire. Obviates entirely the dangerous use of matches or the torch. Endorsed by fire underwriters, and reduces premiums where exclusively used for lighting.

Not only a blessing, but an absolute necessity In Hotels, Theatres, Halls, Warehouses, Factories, Stores, Railway Depots and Dwellings.

Can be introduced into the most closely stocked show-windows, or amongst the most inflammable combustibles without the least danger. For this reason the Bogart Torch has been adopted exclusively for gas lighting by all of the principal DRY-GOODS HOUSES, as well as SILK AND COTTON MILLS in the UNITED STATES.

The cut shows the improved straight stem lighter.
The curved stem lighter shown in advertisement on front cover.

12 Murray Street, N. Y. City.

DEAR SIR: In regard to the quality of the insulation of the "BENEDICT" wire which you have supplied for use on the Harlem Bridge, Morrisania & Fordham and the Lynn & Boston Railroad Companies, I take great pleasure in saying that I find this brand of stock to be superior to anything that I have heretofore used in connection with electric railways. I unhesitatingly recommend it as giving the very best of satisfaction.

Very truly yours,
(Signed) L. H. McINTIRE, Chief Engineer.

The Electro-Faradic Hair Brush Co.,

Room 13, World Building.

THIS brush is furnished with one of our well-known Faradic batteries, placed under the cover on the back, and supplies what has long been a great desideratum, *a genuine Electric brush*. Unlike other so-called electric brushes *its action does not depend on the imagination*, but on an actual Fadaric current applied in an efficient and agreeable manner to the scalp.

For over-fatigue, congestion, nervous headache, neuralgia, and other nervous affections of the head, this brush will be found of the greatest value. It is also strongly recommended as the most efficient means of promoting hair growth. Dr. J. O. Affleck, of the Edinburgh University, one of the leading European authorities on the subject, advises "moderate brushing and *the application to the scalp of currents of electricity* as of service in promoting the growth of the hair." See Enc. Brit., vol. 22, p. 129.

Price, in black Fibrone.....$5.00
Price, in black and gold Fibrone..... 5.50

Address Room 13, World Building, New York.

Benedict & Burnham Mfg. Co.,
12 Murray Street, N. Y. City.

DEAR SIR: In regard to the quality of the insulation of the "BENEDICT" wire which you have supplied for use on the Harlem Bridge, Morrisania & Fordham and the Lynn & Boston Railroad Companies, I take great pleasure in saying that I find this brand of stock to be superior to anything that I have heretofore used in connection with electric railways. I unhesitatingly recommend it as giving the very best of satisfaction.

Very truly yours,
(Signed) L. H. McINTIRE, Chief Engineer.

HARD DRAWN TROLLEY WIRE A SPECIALTY.

Our New "Benedict" Feed Wire is the Highest Insulation of any Feed Wire in the Market.

In high Insulation, "BISHOP" leads.

CHICAGO, May 18, 1892.

"The 2,000 feet Bishop White Core wire put in Washington street tunnel three years ago forms part of a circuit carrying forty high-tension arc-lamps. The two sides of the circuit are laid together in a 1¼ inch pipe for part of their length, and the remainder of the distance they are suspended rrom the roof of the tunnel — always damp and exposed to dripping water. Thus far I have heard no complaint of insulation giving out."

ELECTRICAL AGE

Established 1883. An Illustrated Weekly Electrical Journal. 10 cents per copy.

VOL. X.—No. 47. NEW YORK, NOVEMBER 19, 1892. Subscription, $3.00 per year. Foreign Countries, $4.00 per year.

The high insulation "BISHOP" leads.

CHICAGO, May 18, 1892.

"The 2,000 feet Bishop White Core wire we put in Washington street tunnel three years ago forms part of a circuit carrying forty high-tension arc-lamps. The two sides of the circuit are laid together in a 1¼ inch pipe for part of their length, and the remainder of the distance they are suspended rrom the roof of the tunnel—always damp and exposed to dripping water. Thus far I have heard no complaint of insulation giving out."

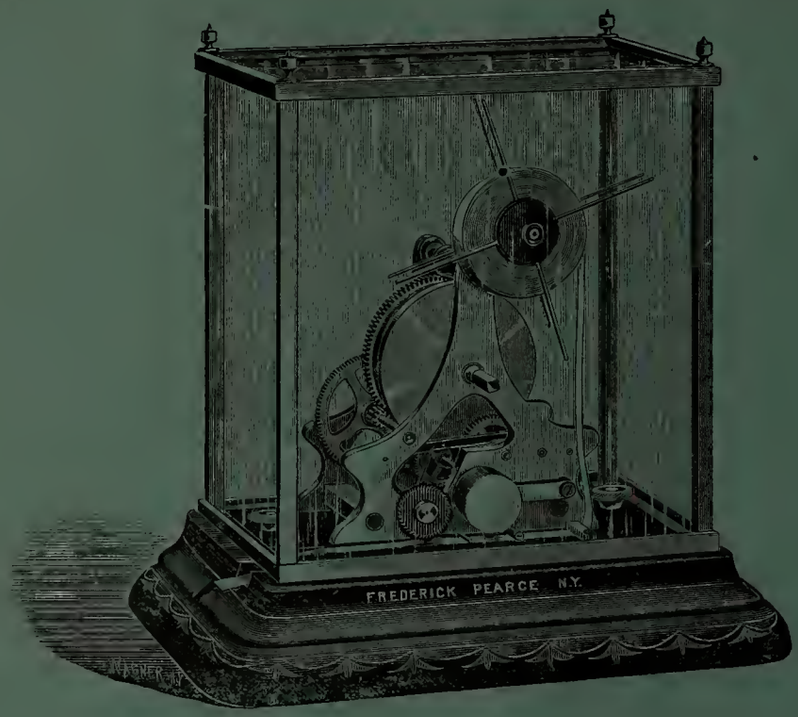
BEST REGISTER IN THE WORLD.



ONE-FOURTH THE SIZE.

SPECIALLY ADAPTED FOR DISTRICT MESSENGER SERVICE.

Your attention is called to our No. 3 Spring Inking Register, with glass case.
The Register is made with one or two pens, and when so ordered, it can be arranged for a wide or very narrow line.
Either black oil or aniline ink can be used, which makes the registration very distinct.
It has been found much more preferable than the Embossing Register, as the pen can be worked with greater rapidity.
The writing is very pleasing to the eye, and it can be seen at quite a distance, which is due to the great contrast in color.
When once the record is made, it cannot be removed, which is possible with the Embossing Register.
Instead of the old style of glass shades, we have substituted a metal nickel-plated case. If a glass should break, it could be replaced at a small cost, compared with the expensive glass shade.
All the electrical parts are well insulated, and the base is made of metal to prevent warping and getting out of adjustment by any change in temperature.
This style of Register is considered the best in the market, and it is the result of long practical experience in manufacturing Registers of various kinds, combining the latest improved principles.
Arranged to work on open or closed circuits. Wound for main line or local purposes. Further information furnished on application.
Write or Send for Illustrated CATALOGUE with full and complete description of all practical Electrical Appliances.
Please mention ELECTRICAL AGE.

DEAR SIR: In regard to the quality of the insulation of the "BENEDICT" wire which you have supplied for use on the Harlem Bridge, Morrisania & Fordham and the Lynn & Boston Railroad Companies, I take great pleasure in saying that I find this brand of stock to be superior to anything that I have heretofore used in connection with electric railways. I unhesitatingly recommend it as giving the very best of satisfaction.

Very truly yours,

(Signed) L. H. McINTIRE, Chief Engineer.

OFFICE OF

Harlem Bridge, Morrisania and Fordham Railway Co.,
No. 2389 THIRD AVENUE,

NEW YORK, Jan. 28, 1892.

MR. W. A. HUNGERFORD, Agent,
Benedict & Burnham Mfg. Co.,
12 Murray Street, N. Y. City.

DEAR SIR: In regard to the quality of the insulation of the "BENEDICT" wire which you have supplied for use on the Harlem Bridge, Morrisania & Fordham and the Lynn & Boston Railroad Companies, I take great pleasure in saying that I find this brand of stock to be superior to anything that I have heretofore used in connection with electric railways. I unhesitatingly recommend it as giving the very best of satisfaction.

Very truly yours,
(Signed) L. H. McINTIRE, Chief Engineer.

HARD DRAWN TROLLEY WIRE A SPECIALTY.

Our New "Benedict" Feed Wire is the Highest Insulation of any Feed Wire in the Market.

In high insulation, "BISHOP" leads.

CHICAGO, May 18, 1892.

"The 2,000 feet Bishop White Core wire put in Washington street tunnel three years ago forms part of a circuit carrying forty high-tension arc lamps. The two sides of the circuit are laid together in a 1¼ inch pipe for part of their length, and the remainder of the distance they are suspended from the roof of the tunnel—always damp and exposed to dripping water. Thus far I have heard no complaint of insulation giving out."

ELECTRICAL AGE

Established 1883. An Illustrated Weekly Electrical Journal. 10 cents per copy.

VOL. X —No. 40. NEW YORK, OCTOBER 1, 1892. Subscription, $3.00 per year. Foreign Countries, $4.00 per year.

In high insulation, "BISHOP" leads.

NEW YORK, April 11, 1892.

BISHOP GUTTA-PERCHA CO.,
420 East 25th St., New York.

Dear Sirs: We have used Bishop White Core Wire in the installation of electric-light and power plants for a number of years, and it has always proved entirely satisfactory.

We known of no wire in the market we could use with greater confidence for all work. It is always accepted by the Board of Fire Underwriters and expeits, and no make stands higher in the general esteem of best au horities.

Very truly yours,
HATZEL & BUEHLER,
Electrical Engineers and Contractors.

ELECTRICAL AGE

Established 1883. An Illustrated Weekly Electrical Journal. 10 cents per copy.

VOL. X—No. 53. NEW YORK, DECEMBER 31, 1892. Subscription, $3.00 per year. Foreign Countries, $4.00 per year.

In high insulation, "BISHOP" leads.

MUNICIPAL ELECTRIC LIGHT CO.,

BROOKLYN, N. Y., July 19, 1892.

BISHOP GUTTA-PERCHA CO.

Gentlemen: We can candidly vouch for the superior quality of the Bishop Insulation, as it has withstood the weather, falling wires, etc., during our two and a half years' service without accident or trouble of any nature on our aëriel lines or in our house wiring. The severe storm of the winter of 1890–91, which obliged all other plants to "shut down," caused no injury to our alternating circuits.

Yours respectfully,

JAMES FERGUSON, *Supt.*

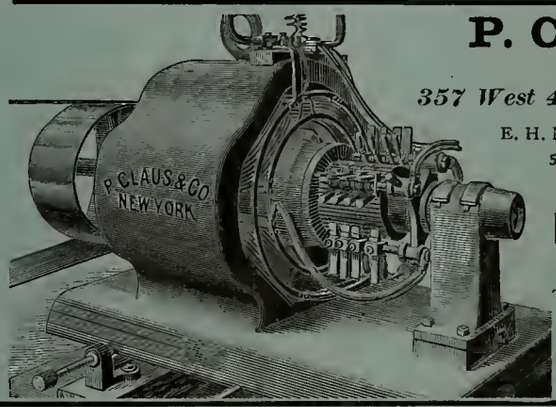
ELECTRIC ELEVATORS AND HOISTS,
THE D. FRISBIE CO.,

Works: New Haven, Conn. New York Office: Mail & Express Bldg,

AJAX THE STANDARD STATION SWITCH.

Never Reaches the Scrap Heap.

C. S. VAN NUIS, 136 LIBERTY STREET, NEW YORK CITY.



P. CLAUS & CO.,

Factory and Office:

357 West 40th Street, New York.

E. H. MURPHY, NORTHWESTERN AGENT,
5 Drake Block, St. Paul, Minn.

Manufacturers of

MULTIPOLAR AND BI-POLAR DYNAMOS.

The Best, Simplest, Cheapest aod Most Economical Dynamos ever put on the Market. Over 100,000 16-C. P. Lamps Capacity in daily operation. Cao be seeo in detail and runniog at our factory.

Write for Circular and Estimate.

OUR CLAIMS

1st. We were the Pioneers in advocating the system of single wires in conduits and demostrating the Duplex or double conductors unreliable and dangerous.

2d. That the VULCA ELECTRICAL WIRE DUCTS will stand the action of CEMENTS, PLASTER, ACIDS, etc.

3d. We guarantee our customers absolute protection against all suits for infringements in using our Vulca Wire Ducts and appliances for interior wiring.

NEW YORK INSULATED WIRE CO., 13, 15 and 17 Cortlandt Street, New York. 78, 80 and 82 Franklin Street, Chicago.

Agents: Toronto Construction and Electric Supply Co., Toronto, Canada.

Electrical Test Instruments,

Ammeters and Volt Meters

For Direct and Alternating Currents.

Queen's New Portable Testing Sets.

A full line of measuring Instruments to meet all requirements.

OUR NEW FORM.

On general principles we are opposed to radical changes of any sort in a well-established business, but there are times when it is justifiable and proper to cut loose and discard old forms and take on new.

We have just passed such a period of transition, and in a new form the ELECTRICAL AGE is presented to our readers to-day.

It has always been our aim to improve the ELECTRICAL AGE in every way possible, and while we are opposed, as we said at the beginning, to any great changes in methods and practice unless some decided advantage is to be gained by our patrons, we have, after long and thoughtful consideration, deemed it advisable and proper to alter the form of the ELECTRICAL AGE at this time. This change, we believe, is a decided improvement and will be appreciated for the following reasons:

First—The new size renders the paper far more convenient to handle; our friends can now lay back in their chairs and read its pages with comfort. This was hardly possible with the old size on account of its being larger and possessing a greater tendency to double up, unless it was laid out flat on the desk or table.

Second—While the pages are of smaller size there is the same amount of reading matter as there was in the old, consequently the new form partakes more of the material character of a magazine on account of the greater number of pages and thickness.

Third—The new size is a better one for binding purposes, and a bound volume will not be so bulky and unwieldy as the old. It will be of nearer conformity to library size, and will not require special space for its preservation.

Fourth—The smaller size of the pages will be appreciated more by advertisers and business men, for the reason that advertisements thereon will stand out more prominently and be more attractive than on a larger page. The less cost of a page advertisement of the new size will be a sufficient inducement for advertisers to indulge in this luxury with greater frequency than heretofore, and with greater benefit to themselves. There are other advantages in the small pages which will readily occur to the advertiser and the business man who reads the advertisements.

The change was determined upon only after a thorough canvass of the trade, and the concensus of opinion seemed to be largely in its favor. We think the new pages of the ELECTRICAL AGE can be made more attractive to all classes of readers, and we assure all of our friends that nothing will be left undone that will tend to produce this result. We have in contemplation many other improvements which will be developed in due time.

THE Electric Club, New York, will remain at its present quarters, on 22d street, for another year at least, and there is every reason to believe that the club will prosper, as the members have nobly come to the rescue.

ALUMINUM.

The excessively vaunted and puffed-up aluminum has not figured in any perceptible degree of late in the papers, particularly the daily press. Within the past two years or more, until a few months ago, the "aluminum age" seemed to have been ushered in with a rush, on all fours. Bolstered up by the sensational and imaginative stories published about this metal in the daily papers, people began to think that aluminum was destined to settle all the material difficulties ever encountered by man, and that unheard-of or undreamed-of wonders would be accomplished by its use—at 50 cents a pound.

Little by little, through the instrumentality of these fabulous stories, the great mass of people formed exaggerated opinions of aluminum, which they soon realized would never materialize. The consequence was these notions reacted, much to the discredit of the metal.

Mr. Alfred E. Hunt, a well-known authority on the subject of aluminum, recently delivered a lecture before the Franklin Institute, Philadelphia, on the subject of the manufacture and uses of aluminum, an abstract of which will be found on another page. Mr. Hunt therein states in plain terms what the metal is good for and what it is not good for, and had not the public press fanned the flame of imagination concerning aluminum, that metal would undoubtedly be now in the enjoyment of a better standing in the arts than it has. However, it will find its place in due time, now the public mind is in a more reflective mood concerning it. The same papers which aided in the dissemination of the aluminum fairy tales should now as freely use their columns in spreading the truth.

THE CONTROL OF ELECTRIC CARS.

One of the most difficult problems met with by electrical engineers in the development of the electric railway, has been the proper control of the motors, and after years of experimenting it is but recently that the problem seems to have been satisfactorily solved.

The paper of Mr. H. T. Parshall, read before the meeting of the American Institute of Electrical Engineers last week, on the methods of electrically controlling street-car motors, describes a system which, the author thinks, fairly represents what is now generally accepted by principal designers as being the most efficient method of accomplishing the object under consideration.

The control of the motors, Mr. Parshall thinks, is probably the most difficult question in electric railway practice, and on this question, in no small degree, the design of the motor depends. To start a car under any conditions of track, a certain torque is required, but beyond a certain limit, fixed largely by the convenience of passengers, this torque cannot be exceeded.

After a general discussion of the problem and the principles involved, Mr. Parshall gives a description and illustrations of some controlling apparatus recently devised. Essentially it consists of an improved form of platform switch combining both the "field commutation" and "series resistance" methods of starting cars.

This paper in full, with the illustrations, will be found elsewhere in this issue, and no doubt will be of especial interest to electric railway people.

NO TRUTH IN THE REPORT.

In our issue of April 23 we published a rumor that Prof. J. P. Barrett, city electrician and chief of the electrical department of the World's Fair, had resigned those positions to accept an appointment as director-general of the National Board of Underwriters at New York. Since then Prof. Barrett has emphatically denied the rumor, stating that his interests in Chicago were such as to preclude all thoughts of making a change.

SIAM'S FIRST ELECTRIC RAILWAY.

The first electric tramway will before very long be in operation in Siam. The entire installation is now being shipped by the Short Electric Railway Company, of Cleveland, O., who secured the contract from the Bangkok Tramways Company, of Bangkok, Siam. The company may flatter itself on having secured this contract, as it was awarded after an exhaustive examination had been made of the different railway apparatus in Europe and this country, by M. Aage Westerholz, who is considered to be the finest engineer in Siam. The road is six miles long, practically level, and very picturesque throughout its entire length, crossing fourteen of the many canal bridges in Bangkok. The poles, and in fact all the wood used in construction, will be of teakwood. The track will be 30′ gauge. The installation will consist of 20′ generators, two steam plants complete, six car equipments and extra parts to last for six months.

ELECTRICAL SOCIETIES.

NEW YORK ELECTRICAL SOCIETY.

A large number of the members of this society met at the Metropolitan Telegraph and Telephone Company's Central Exchange, 18 Cortlandt street, on the night of April 21, and inspected this vast institution.

Mr. J. J. Carty, the company's electrician, took charge of the party, and in his well-known clear and masterly style explained every detail of the telephone exchange.

The testing-room was first visited. Here Mr. Carty explained the long-distance telephone and other apparatus. A large number of receivers were connected up and switched in on a Boston wire, so that the members could hear conversation with Boston.

The operator at Boston could be plainly heard, and an interesting running talk was carried on between the two cities for some minutes.

The magnificent operating-room was next visited, and here Mr. Carty described in detail the practical operation of the telephone. This object lesson was a most effective one. Having the actual apparatus before them and described so ably, the members were able to get a better comprehension of the telephone than they could in a lifetime by reading books. All the details of the immense switchboard were fully explained by Mr. Carty.

The long-distance room was next visited and the apparatus explained and examined in a like manner. The party then went into the cellar and examined the subway connections, lightning-arresters, etc., and found everything of the most approved order and workmanship.

The visit was a highly interesting and instructive one, and the courtesy of the company in affording the opportunity to make this inspection was appreciated by the members individually and collectively.

METHODS OF ELECTRICALLY CONTROLLING STREET-CAR MOTORS.*

BY H. F. PARSHALL.

While in many respects the controlling apparatus for street-car motors and the general requirements of the same do not differ greatly from some other cases, there are some features that demand the closest attention if the car is to be handled either efficiently or comfortably, so far as the passengers are concerned. While the number of methods proposed and tried in times past has been great, at the present time there seems to be sufficient agreement between the principal designers and sufficient data at hand to warrant the writing of a fairly comprehensive paper on the subject.

The problem of controlling the motors is probably the most difficult one in the whole range of street-car work, and in no small degree determines the electrical design of the motors; or to be more specific, to start a car under any given conditions of track a certain torque is required. Beyond a certain limit, fixed largely by the convenience of passengers, this torque cannot be exceeded. The smaller the current with which the motor is able to develop this torque, the smaller the rheostat or other starting devices may be, and the more efficient the car equipment. Should the motor, therefore, be incapable of developing a comparatively powerful torque per ampère, the amount of energy dissipated either in the magnetic windings, armature windings or rheostat becomes excessive, the results being the more or less rapid deterioration of these parts.

It may not be out of order just here to discuss the design of the motor with reference to getting this torque most efficiently. The average H. P. exerted by a street-car motor at the car wheel probably does not exceed 20 per cent. of the maximum it is expected to do in starting the car under the various conditions encountered. Now, to get the highest efficiency from a motor run under these conditions it is necessary to get the highest possible efficiency at that H. P. at which the greatest amount of work is to be done, and inasmuch as the loss in the conductors for this averege H. P. is necessarily low (otherwise the motors would burn out in doing the maximum work to which they are subjected), the question does not resolve itself into how to get the least possible motor resistance of armature and magnets, but, rather, how to minimize the constant loss of hysteresis, eddy currents and friction. While all of these losses vary somewhat with the speed in series-wound motors, the variation of these losses is not great, since for an increased speed there is in general a diminished intensity of magnetization and pressure. To render these losses a minimum, and at the same time to get the requisite torque to handle the car efficiently, there is but one solution, that is, to put the maximum number of turns on the armature compatible with good running as to heating and sparking.

While the truth of these statements may be more or less apparent to all when stated in plain terms, but little attention was paid to this matter in the earlier motors designed. The numerous measurements made, however, have so uniformally been in favor of motors with comparatively a large number of conductors on the armatures, that the importance

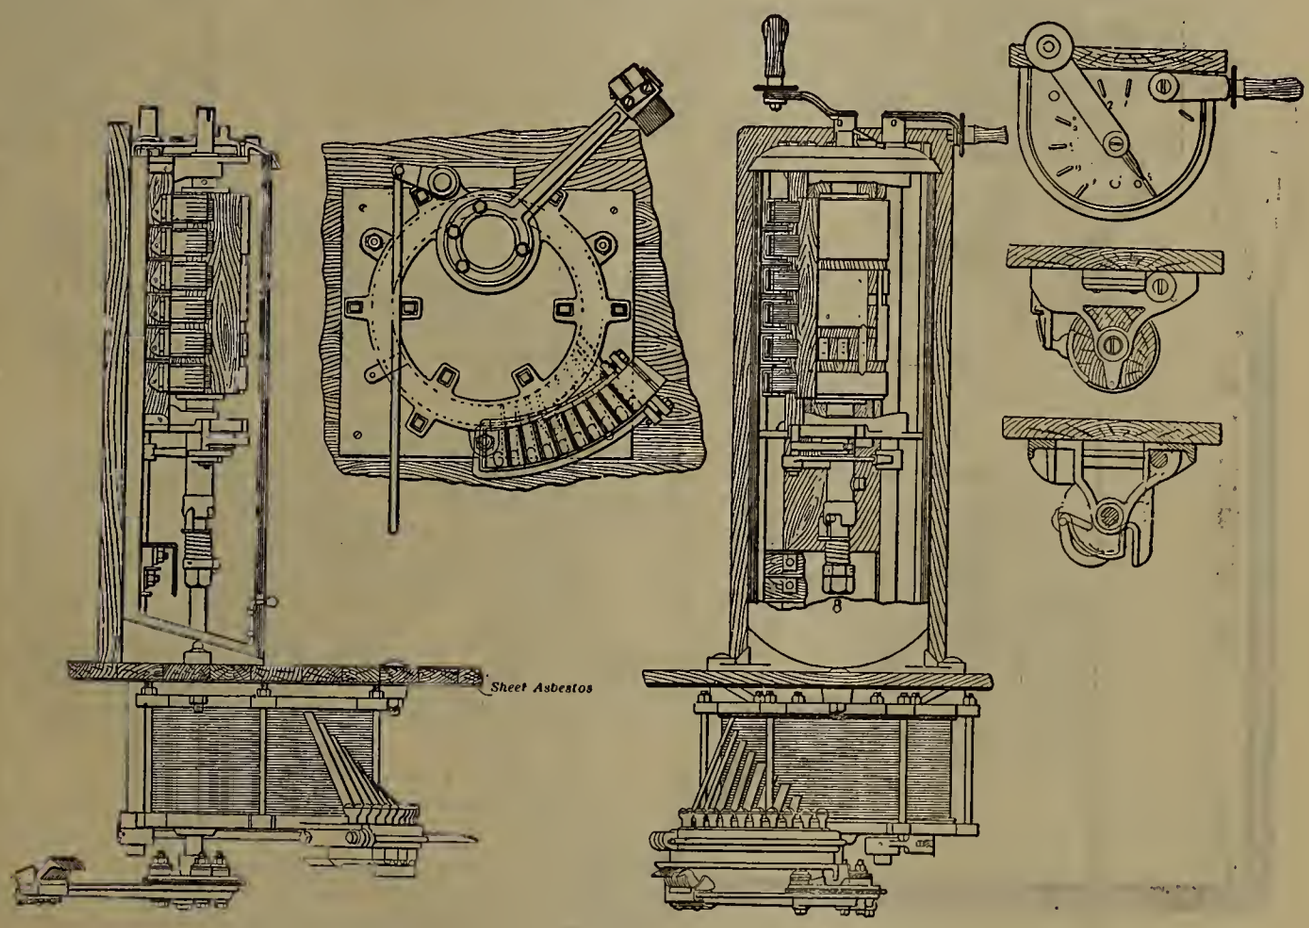

FIG. 1.—COMBINED RHEOSTAT AND PLATFORM SWITCH.

* Paper read before the American Institute of Electrical Engineers, New York, April 19, 1892.

of this matter is now pretty generally understood. This agreement as to the general design of motors has in no small way been influential in bringing electricians into agreement as to how the motor should be controlled, since with an armature of a comparatively large number of turns, less turns are required in the field magnets to produce a given torque with a given number of ampères. The function of the magnets, therefore, has become of less importance. It is always, however, to be borne in mind that, other things being equal, the motor with the greatest number of turns in the magnets will develop the greatest torque for small currents. With a given electromotive force acting on the armature circuit, and a given torque developed by the armature per ampère, it does not matter, so far as efficiency is concerned, only necessary to increase the number of coils. In practice it has been found that this number could not be very great, otherwise the car wiring becomes too complicated and too expensive. This same holds true of the controlling-switch. Three magnet coils or sets of magnet coils seem to be the practical limit, since there is a general agreement between street-railway managers that the present number of magnet connections (6) should not be increased, and even with this number there is occasional trouble with broken wires or terminals. With a 15 H. P. motor it is possible with three sets of coils to run under most conditions met with in practice without employing external resistance. It is occasionally necessary, however, when the car is to be run at two or three miles an hour, to make use of the resistance coil

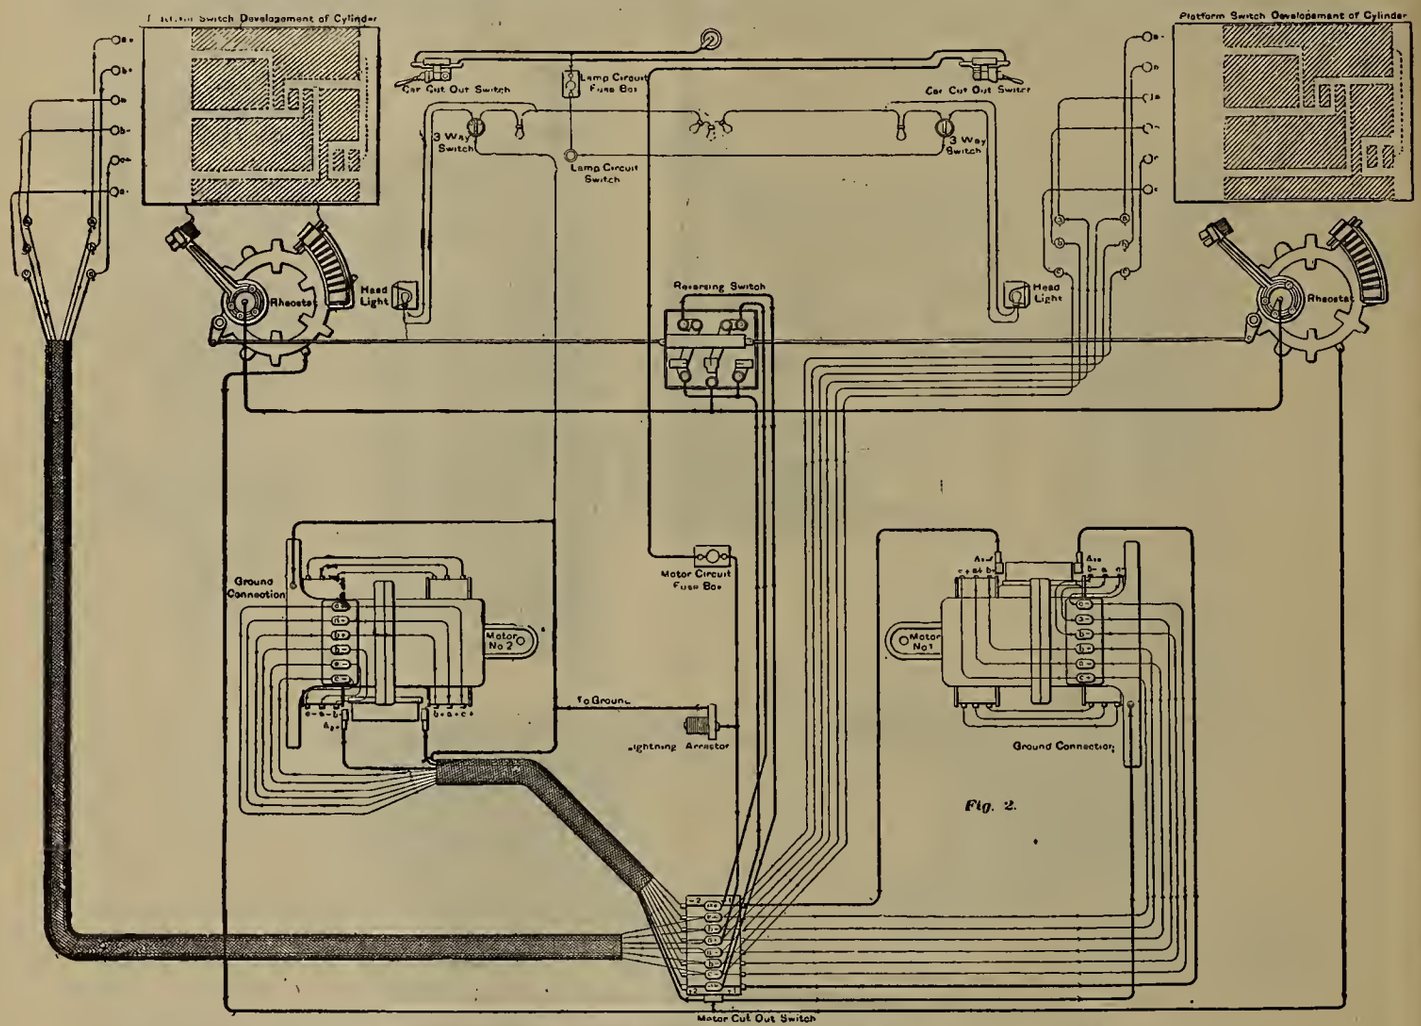

Fig. 2.

FIG. 2.—DIAGRAM OF CONNECTIONS FOR TWO MOTORS IN PARALLEL.

whether the difference in electromotive force at the armature terminals and the line is due to drop in external resistance, or to drop in the magnets. This point determines, once for all, that motors with commutated fields are not necessarily more efficient than other motors.

The particular advantages of the commutated field method are, that with a limited number of pounds of copper, or in the case of street-car motors, with the limited space available for field-magnet windings, it is possible to adjust the magnetizing force of the field coils, so that the rate of doing work of the motors may be made to correspond with the rate this work is required by the car for the various speeds and conditions of track. This adjustment may be made for any size of motor with any required degree of precision by varying the number of magnetic coils. To increase the range or precision it is that is ordinarily used only when starting. With 25 H. P. motors it is necessary, with three sets of magnet windings, to make use of this resistance coil very considerably in ordinary practice, since without this it is not possible to get a speed of less than one-third the maximum speed of the car, which is generally taken to be about 18 miles an hour.

The range of speeds without the use of a rheostat is determined by the limit to which it is safe to heat the magnets. The temperature of the magnets should not in any case exceed 65° C. This would put the increase of temperature at about 30° C. This increase corresponds to an average loss in the magnets of about 0.3 of a watt per square inch of radiating surface. For the few seconds generally taken to start the car the loss may be as high as two watts per square inch without dangerous heating. Experience, however, has demonstrated that to exceed this limit,

even for very short periods, there is considerable risk. Having the maximum number of watts that may be dissipated in the magnets, the series resistance of same may be calculated from the properties of the motor on the supposition that each ampère taken by the motor produces a certain number of pounds pull at the periphery of the car-wheel. In a well-designed motor with commutated fields it is easy to get from 35 to 40 pounds pull at the periphery of a 30″ car-wheel with the coils in the series position. These coils are either wound side by side, or one on top of the other, according to the necessities of the case as determined by the general design of the motor. Experience has shown the advisability of winding these coils in independent spools whenever the general design will permit, since in case of trouble it is cheaper and easier to replace the damaged coil, and there is less liability of crosses between the coils. As an example of a design that has been found to give general satisfaction in practice, I give the following figures from a series of tests made on a Sprague No. 6, S. C. motor, the mag-

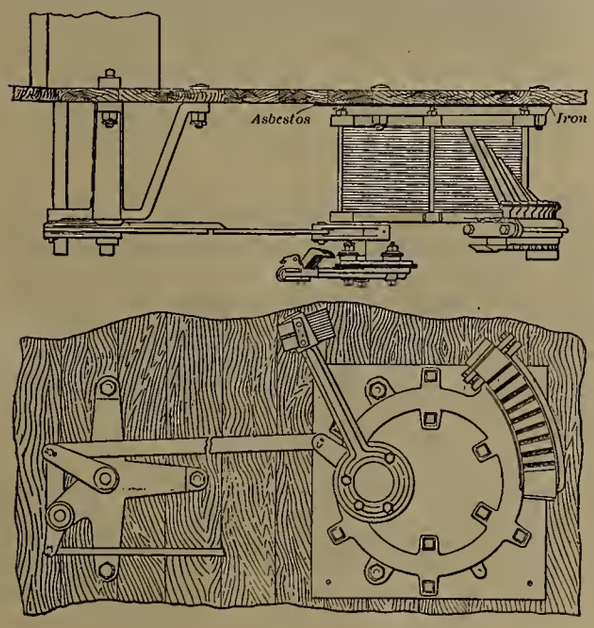

FIG. 3.—DETACHABLE RHEOSTAT.

netic data of which has already been published by myself: *

EFFICIENCY OF STREET CAR-MOTOR NO. 6.

Brake H. P.	Efficiency.	Speed.	Remarks.	Res.
14.3	87 Per Cent.	1110	3 coils in parallel.....	0.8
11.8	87 "	1174	3 " "	.8
11.4	86 "	1184	2 " "	1.4
9	84 "	1309	2 " "	1.4
8.25	82 "	955	2 in parallel, 1 in series.	3.24
6.35	79 "	1040	2 " 1 "	3.24
4.9	72 "	1070	2 coils in series.....	4.86
3.9	70 "	1014	3 " "	7.42

It is to be noted especially that it is possible to get an approximately constant speed with a wide range of loads, and yet have the energy dissipated in the magnets remain approximately constant, and that it is possible to get a torque corresponding very approximately over a wide range, to that required to propel a car under conditions met with. This is the solution of the question how to get the highest efficiency. For instance, suppose a car is to be run between two points in a given space of time, and this is not an infrequent requirement, and that the magnet windings of the motor are such that either the car runs the distance in too short a time or in too long a time, it will be necessary then to accelerate the car for a time beyond the limit required, then to allow it to slow down, then to accelerate it again, or go through some such cycle of operations to get the required results. More power will be required with such windings than when such a torque can be had at the motor, that will produce the required speed by an approximately uniform acceleration. To get the same results given above for the No. 6 motor, with the magnet coils arranged in loops instead of separate coils, would require upwards of three times as many pounds of copper as was used in the present case (110 lbs.). This motor was designed to give a maximum car speed under ordinary conditions of from 12 to 15 miles an hour. At present it is thought advisable to have a maximum car speed of from 18 to 20 miles an hour,† since numerous measurements have shown the economy of running street cars at as high a speed as the conditions of track, etc., will permit. In a series of measurements made by myself it was found that the watt hours per car-mile decreased very considerably with the speed of the car up to 30 miles an hour. To get this high speed (20 miles per hour), it has been found necessary to vary the proportions of the magnet coils from that given in the above for the No. 6 motor. Thus for a single reduction 15 H. P. motor the resistance of the last coil to be turned from series to parallel is only 15 per cent. of the total resistance of the magnets, and the turns of this coil only 20 per cent. of the turns in the other two coils. The reason for putting this low resistance coil inside, is to get the greatest number of turns when the coils are all in series, and the least resistance when the coils are all in parallel. Further, under ordinary conditions, this coil has the least expenditure of energy in it, and the least radiating surface. With a winding of this proportion, it is necessary with 15 H. P. motors to use an external resistance of 6 or 8 ohms. With 25 H. P. motors an external resistance of from 10 to 12 ohms is required. This resistance should be so subdivided that there is not more than 20 volts E. M. F. between adjacent contact pieces, and so proportioned that the increase of temperature is not in any case above 150° C.

A method that is receiving a great deal of attention now is that known as the "series parallel method." While it has not yet been introduced very largely in practice, numerous experiments have indicated the desirability of doing this as soon as some of the troublesome features of the switch have been overcome. The method of operating is as follows :

In starting, a rheostat of from 8 to 20 ohms is used, according to circumstances, in series with the motors, which are in series with each other. After this resistance is thrown out of circuit the magnet coils of one of the motors are short-circuited, a section at a time. To make the start smooth, 3 or 4 coils at least are required. The magnet coils being short-circuited, the armature is then short-circuited, and the magnet coils thrown in circuit simultaneously with the armatures being thrown in parallel. It is just at this point where the difficulty with the switch has been encountered, since either the switch has to be operated with great rapidity or the contacts act in perfect unison, otherwise unpleasant results as to short-circuiting occur.

* *Transactions*, vol. vii, p. 218.

† All car speeds are quoted for straight and level tracks. These when calculated for a new motor are determind from the speed and H. P. curve of the motor, assuming the resistance to be 30 lbs. per ton. The methods of measuring these speeds are in general such that the probable error is too great to determine the percentage slip of the wheels.

The advantages of the method are that a very wide range of speeds are obtainable at a comparatively high efficiency, and that the energy required to be dissipated by the rheostat is small for the low speeds frequently required in city practice. This lessening the duty of the rheostat is a very important point, since as yet it has been found exceedingly difficult to construct a cheap rheostat that could be placed under the car in the small space available and dissipate so large an amount of energy as is required when the car is to be run for a considerable time at a speed as low as 2 or 3 miles an hour. Any method of control that has lessened the energy to be dissipated in the rheostat has in general been considered with favor, since there has been a corresponding diminution of trouble in each case that the energy to be dissipated has been lessened.

Having now given a general discussion of the problem a brief description of some of the apparatus recently devised may prove of interest.

Figure 1 shows the general design and arrangement of an improved form of platform switch, which combines both the "field commutation" and the "series resistance" methods of starting cars. To start the car the switch handle is turned from the position marked "off" with a counter clockwise movement; this movement carries the arm of the rheostat, which is placed under the switch, around and over the contact segments, so that the resistance is gradually cut out of circuit. After the contact arm has been carried around to 135 degrees and all the resistance has been cut out, it is released from the cylinder shaft and left locked in this position. A further movement of the switch handle then affects only the cylinder, and commutates the sectional windings of the field-magnets of the motor from series to parallel in the usual way. In stopping the car the field coils are turned from parallel to series, the resistance coil is then again put into circuit and the circuit broken when the contact lever leaves the last segment of the resistance coil, and not, as hitherto, upon the cylinder contacts. The only caution to be observed in stopping is to see that the switch handle shall be turned to the position marked "off," for the motors are reversed by means of a separate reversing switch placed under the car and operated by a lever connecting with a separate shaft in the controlling switch case. The shaft of the platform switch interlocks with this reversing shaft in such a manner that it is impossible to reverse the motors until the cylinder is in the "off" position. The use of this separate controlling switch has been objected to, but to combine both the advantages of the rheostat and commutated fields the switch mechanism becomes too complicated and the switch too large to have the reversing performed by a reverse movement of the controlling switch handle.

The cylinder plates and contacts are made of thick iron stampings, as experience has shown that iron is more durable than brass for this purpose. The burning, due to the formation of arcs, does not have so much effect upon iron as it does upon brass, and there is more certainty of good contact. The contacts on the cylinder consists of a number of stampings arranged in a brass frame, each stamping making an independent spring contact with the switch cylinder. The rheostat employed is built up in a circular form from a large number of flat rings stamped from thin iron sheets. The rings are built up in the form of a cylinder, each ring of iron being separated from the adjacent rings by a ring of mica, except at point where it makes contact with the ring on other side of it. Instead, however, of being arranged in a continuous spiral circuit the coil is divided into a number of parts so arranged that the direction of rotation of the adjacent spirals is reversed, this being done to make the inductance of the coil as small as possible. A coil wound up in a continuous spiral having a mean diameter of 12″ and a radial depth of 1″, 6″ long, and composed of 400 plates, was found to have an inductance of 40 millihenrys. The coil was then wound up in 12 sections, the direction of each section being reversed, and the inductance in this case was found to be 8.5 millihenrys. These sections are stamped from different thicknesses of metal, so that those coils which are in circuit the shortest time and have the least current to carry are of highest resistance and least ampère capacity, and those that are liable to be in circuit for some time are thicker and have less resistance and greater ampère capacity. Copper connections are made at different points in the coil, all these connections being brought to a number of small iron contact pieces fitted in a spiral form and arranged so that the switch contact lever can slide over them. The contact pieces are insulated from the frame with sheet mica and from one another with small slate slabs. The rheostat is entirely fireproof and can expel with safety the heat evolved within it under all ordinary conditions. As a point of practical importance it is, however, advisable to place a sheet of metal and a layer of asbestos paper between the rheostat frame and the car floor. This will prevent any danger from fire, either from heating or sparking, should such occur. It is to be noted that the general design of this rheostat is such that those parts having mechanical functions and energy-dissipating functions have been separated as much as possible. Of course the mechanical functions of a

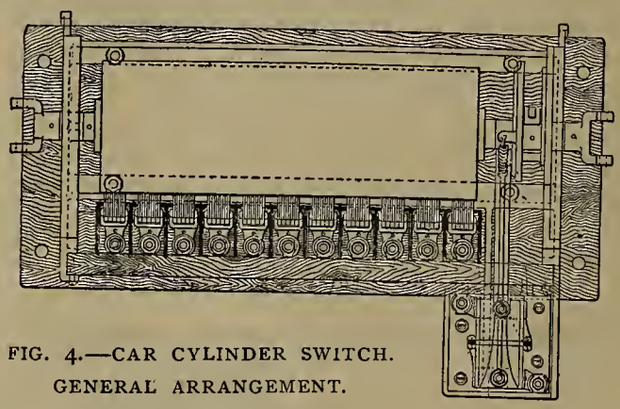

FIG. 4.—CAR CYLINDER SWITCH. GENERAL ARRANGEMENT.

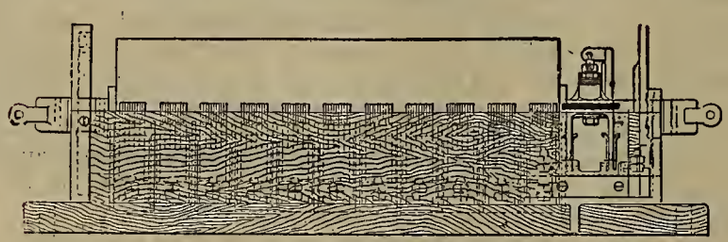

FIG. 4 *a*.

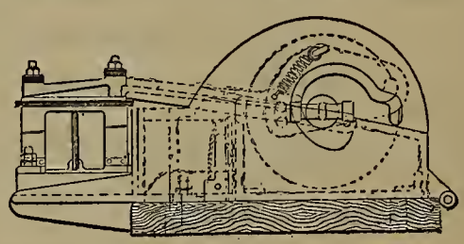

FIG. 4 *b*.

rheostat are more or less limited; it is evident, however, this effort is in the right direction. It is with respect to this particular point that the rheostat has a decided advantage over any form of mechanical clutch in starting a car. The clutch, of course, has its advantage in starting quickly bodies that have a great amount of inertia. In ordinary practice, however, the amount of energy dissipated in a clutch is approximately equal to that necessary to dissipate in a rheostat, but the clutch has in addition to its energy-dissipating function, a very exact mechanical function, and these two functions are interdependent on the same wearing parts. For this reason, if no other, clutches have not yet been made to compete favorably with rheostats.

Figure 2 gives a diagram of the car connections for this switch. It will be seen that the current from the trolley wire first goes through the field coils and switch cylinder for commutation, then through the armature and reversing switch, and thence through the switch-contact lever and resistance coil (in starting) to ground. It will be noticed that by use of the separate reversing switch the armature wires and field wires are each kept separate and distinct from one another. Formerly there was considerable trouble from the breaking of these wires, especially where the wire entered the brass terminals at the various terminal boards. This has been almost entirely obviated by using 49 strand cable wherever wire was subjected to bending.

In some cases the construction at the platform ends is such as to make it inconvenient to place the rheostat used with this form of switch immediately underneath the cylinder. This is the case when certain kinds of draw bar or step constructions are used. In these cases a modification of the switch arrangements is made that is shown in Figure 3. Instead of the rheostat a light frame is placed directly under the cylinder. This frame serves to support the switch shaft, upon which is placed a crank connecting with a bar, which is carried off to the rheostat contact lever. With this arrangement the rheostat can be placed under any convenient part of the car flooring and operated as well as when directly under the platform.

Figures 4, 4*a* and 4*b* show general plans of a car switch designed to be placed under the car and about half way between the motors, when the car construction permits. This design, while open to the criticism that the switch is somewhat inaccessible for inspection, meets the demand that has sometimes been made when it has been thought the space ordinarily occupied by the platform switch could not be sacrificed. The principle is the same as the platform switch already described, but it is modified in form and shape to suit the particular condition under which it is to work, and it is to be noted that the mechanical adjustments required are much more exact, otherwise there would be considerable burning of the contacts, since the motorman would be unable to tell whether or not the switch contacts were on proper positions.

The rheostat is arranged in sections and connections brought from them directly to cylinder contacts. A cylinder is used to commutate both resistance and field-magnet coils.

An important point that has been attended to in this switch is the breaking of the circuit on a separate switch instead of on the cylinder. A snap switch, of the knife-blade pattern, is employed to break the circuit at four points. It operates in connection with the cylinder shaft, to which it is connected with a special locking and releasing gear of similar design to that shown in Fig. 1. The first movement of the cylinder shaft closes the snap switch and completes the circuit through the coil. Further movement then disengages the snap switch from the shaft (leaving it closed), and the different commutations are affected. When breaking the circuit the snap switch is again brought into action.

When this form of car-controlling switch is used, the platform lever is fitted at its lower end with a bevel gear-wheel meshing into another gear-wheel placed on the cylinder shaft. When necessary an extension shaft fitted with one or more universal joints makes connection between the platform lever and the cylinder shaft. When this switch is placed in the middle of the car the amount of car wiring is materially lessened and the car inspection made more easy.

With reference to controlling switches in general, it is evident that a great number of designs may be prepared that will give approximately the same electrical results in point of efficiency. In deciding, then, upon the merits of a new design of switch, the commercial factor relating to repairs has therefore to be very largely considered, and had designers been able to guide their work more closely from the balance sheets of railroad companies, when such had been properly kept, instead of conforming to popular notions, very much more progress would have been made in this line during the last few years.

In closing this paper it might be well that I should remark that my experience has been largely confined to what is known as the commutated field method of control, and that I have naturally expressed many of the qualities of other methods in terms of this method. If these expressions are not judged satisfactory, I leave it for those who have had a similar experience with other systems to express in their criticisms the qualities of the commutated field system in their own terms.

ALUMINUM: ITS MANUFACTURE AND USES, FROM AN ENGINEERING STANDPOINT.*

BY ALFRED E. HUNT.

IN my judgment, the aluminum problems of by far the greatest moment yet remaining to be solved are in connection with the development of the uses of aluminum in the arts. Much has already been done in this matter; the demand for the metal increased tenfold over any previous year in 1891, yet very much more remains to be done. Undoubtedly much has yet to be developed in details in the economical production of aluminum; probably very few realize that more than your lecturer. At the same time, the problems involved in the development of the uses of aluminum in the arts have been underestimated, and have not received the intelligent consideration that the importance of the subject warrants. The world has been centuries learning to use other metals; we have a right to expect more rapid development with the increased general knowledge of to-day, yet it will at best take time to open the entire field that the metal is destined to fill. Within the past ten years there have been two popular widely-spread ways of solving this portion of the "aluminum problem" which are superficial, erroneous and a hindrance to the true solution of the problem; the first assuming properties for the metal that it did not possess, proclaimed that aluminum

* Abstract of lecture before the Franklin Institute, Philadelphia, Pa.

would, as soon as it could be produced in sufficient quantities, replace all the other metals in the arts, not only for the special purposes where the higher-grade metals are now used, but also for structural and building purposes to replace iron and steel; the second view of the subject (the natural reaction from the first erroneous one has become current within the past year or two, as the people began to use aluminum, and found their ideals regarding it shattered) is to the effect that the metal has little or no use in the arts.

The reasoning for the first popular erroneous answer to the problems involved in the development of the uses of aluminum in the arts, was that aluminum was by far the most abundant of all the metals in its distribution in the earth's crust, and *consequently* should be the cheapest. Confusing the comparison of strength of materials, section for section, with equivalent weights, forgetting to take into account its low elastic limit and modulus of elasticity, or modulus of resilience, or its lack of rigidity under compression strains or its natural softness; but noting that the metal withstood the ordinary atmospheric and other usual conditions of corrosion with considerable efficiency over other metals commonly used in the arts, the enthusiastic conclusion was reached that we were rapidly leaving the "steel age," as we had the "iron age" before it, and were advancing upon the "aluminum age," "where this wonderful metal should supersede all others for almost all the uses of mankind." It is surprising that some of the hopeful ones did not propose to mould up the clay banks into buildings and railroads and other useful contrivances, and turn on the electric current and produce the aluminum structures *in situ*.

As instances of the second view of the case, that, I am sorry to say, has become quite fashionable of late, as shown by the frequent publications in trade journals, a writer in a recent German publication, disappointed in his ideals regarding the solubility of the metals in acids, and finding that aluminum could not be used as a substitute for platinum in acid stills, immediately jumps to the conclusion (and publishes his conclusions broadcast) that the metal is entirely unsuitable for culinary utensils, seemingly forgetting that cooking operations are not conducted in muriatic, nitric or even in sulphuric acids, as dressings or gravies, and not considering it necessary to investigate the action of these acids or their salts upon the metal in quantities, and under conditions similar to those the metal would in any likelihood be subjected to in actual use in culinary utensils.

Another writer has gone through a long list of experiments, heading his table of results "Solubility of Aluminum in Acids," using aluminum *foil*, and finding that in from two to four days the foil was dissolved in from one to ten per cent. solutions in water or many organic acids, such as formic, acetic, butyric, lactic, tartaric, citric, oxalic, palmitic, stearic, gallic, salicylic, carbolic, boric, etc., he wisely proclaims that these results show that this metal is unfit for canning materials, cooking utensils or any chemical laboratory purposes. This writer forgets to investigate the differences between foil and thicker plates before drawing his conclusions, nor did he inquire as to the action of these same reagents upon the equally thin foil sheets of other metals, now used for the operations he describes. Had he done so, he would have found that in the sections used in utensils of other metals, aluminum withstands the action of all the reagents mentioned as well as do the metals now in common use; and as for the action of ordinary solutions on thin foil, tin, iron and copper are fully as rapidly acted upon as is aluminum. Aluminum has neither taste nor odor, nor are its salts (in small quantities) especially poisonous, as are the salts of other metals now more commonly used.

Aluminum is not much more acted upon than is tin, copper or silver by salt water, and even by such solutions in vinegar as the metal is liable to be subjected to in ordinary culinary vessels. The salts of tin or copper thus dissolved are very poisonous; but not only are the aluminum salts that are formed less in amount, but the acetate of aluminum formed resolves itself on boiling into either an insoluble subacetate or into pure alumina, neither salt having either taste or injurious toxic action. For these reasons, quite surely aluminum will have a large future for cooking utensils.

The principal impurity of the commercially pure aluminum of to-day is silicon, which exists in two forms, one seemingly combined with the aluminum, as combined carbon exists in white pig iron, and the other in an allotropic graphitoidal modification. These two forms of silicon seem to exert somewhat different effects by their presence in the aluminum; the combined form of the element rendering the metal much harder than the graphitoidal variety. The combined silicon ordinarily preponderates, being fifty-five per cent. to eighty per cent. of the total silicon in the metal of ninety-nine per cent. purity made by the Pittsburg Reduction Company. The graphitoidal silicon is separated on dissolving aluminum in hydrochloric acid as a black insoluble residue, and appears like graphitoidal carbon on similarly treating gray cast iron. In fact, it has been mistaken for carbon by many superficial or ignorant observers. Carbon does not unite with aluminum except at very high temperatures, and its influence seems to be to make the metal very brittle. Metal containing carbon can readily be told by its abnormal crystalline and peculiar colored fracture.

In the electrolytically made commercially pure aluminum of to-day, the only other impurity is iron, which, if it exists in larger quantity than five, or at most ten-one-hundredths of one per cent., is the result of carelessness in the manufacture, or the selection of needlessly impure alumina ore or carbon anodes. The presence sometimes found of copper or lead in any quantity in the metal, is the result of needless contamination with these elements in the preparation of the ore or the carbon anodes, or in the manipulation of the pots. By allowing the pots to run for a considerable time without ore, and with a high current and very hot electrolyte, as sometimes occurs in careless working of the pots, metallic sodium has been alloyed with aluminum in noticeable percentages. Upon placing such metal in hot water, the sodium will be rapidly dissolved out with considerable effervescence, and the pure metal left spongy, honeycombed and weak.

For many purposes the purest aluminum cannot be so advantageously used as that containing three per cent., or even four per cent., of impurity, as the pure metal is very soft, and not so strong as the less pure. It is only where extreme malleability, ductility, sonorousness or non-corrodibility is required that the purest metal should be chosen. For most purposes a small percentage of other elements than silicon and iron are advantageously added in producing hardness, rigidity and strength. Titanium, chromium and copper can readily and cheaply be added, and are constituents that will not detract from the non-corrodibility of the metal as much as do these natural impurities that come from the ore and apparatus—additions that will give the aluminum a better color and greater strength and hardness, with proportionately less sacrifice of malleability, ductility, etc.

The properties of aluminum which will probably give it the greatest availability in the arts are:

(1) Its relative lightness.

(2) Its non-tarnishing quality as compared with many other metals, aluminum not being acted upon by sulphur fumes at all, and being very much more

slowly oxidized by moist atmosphere than most of the metals.

(3) its extreme malleability.

(4) Its easy casting qualities.

(5) The influence of the metal in various alloys will give it advantages, some of which I will try to enumerate and call to your attention.

(6) Its high tensile strength and elasticity when weight for weight of the metal is compared with other metals, and especially when alloyed with a small percentage of titanium, silver or copper, and properly worked by being rolled or hammered or otherwise drawn down.

(7) Its high specific heat and electrical and heat conductivity.

Unfortunately, aluminum is not, section for section, as has been widely claimed, comparatively a very strong metal. It is only about as strong under tensile strain, section for section, as cast iron, and has less than one-half the strength of wrought iron under ordinary conditions. Under compression, the metal, unfortunately, has a very low elastic limit, although its extreme ductility allows the metal to flow on itself so freely as to make it for special purposes a very safe metal to use in compression. I show a series of cylinders of one and one-half inch diameter, which have each had a compressive strain of 200,000 pounds applied to them, together with the result of a compression strain of 180,000 pounds upon similar cylinders of cast iron.

The same remark applies to transverse tests on aluminum. It is not a rigid metal at all, and bends under transverse strains very readily.

SAFETY-CATCH HOLDERS.*

In order to facilitate the control of the electric wires in buildings, and further to safeguard them against accidents, these centre of distribution safety-catch holders have been recently invented and perfected. It is often necessary, in wiring a large building, to run a main line from the dynamo-room

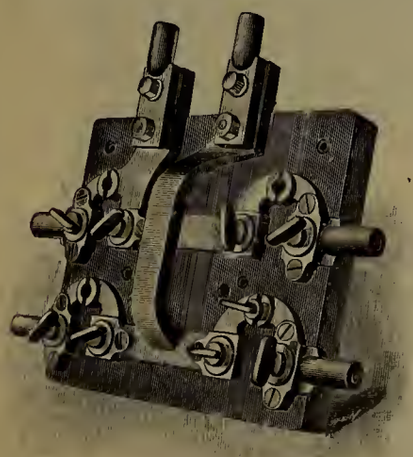

FIG. 1

FIG. 2.

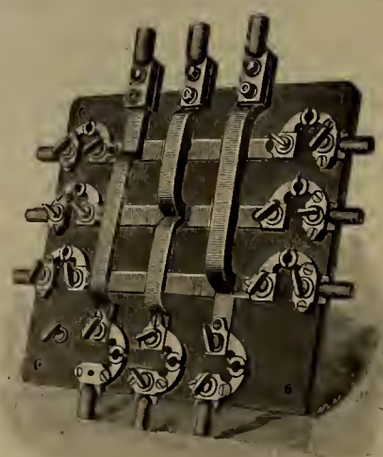

FIG. 3.

or street-service wires to some point or points as centres of distribution whence smaller taps can be taken. Previous to the invention of these devices, a number of porcelain cut-outs or ordinary safety-catch holders of large capacity were used, As the capacity of the ordinary cut-out or safety-catch holders was not sufficient to meet all requirements, the construction of a special device became necessary to carry the heavy current and distribute it to the various requisite points through the building. The centre of distribution safety-catch holders were the outcome of this necessity.

Each branch of the device has a capacity of 250 ampères, and thus one of the appliances can be used where formerly several appliances would have been employed to effect the same end, the saving in cost of construction and improvement in general appearance being a natural sequence. These devices are mounted on slate bases. The lugs are so constructed that they can be easily detached from the appliance, the necessary wires soldered in them, and then returned to their places and screwed fast.

Provision is made of a small plug which, when inserted in its place carries the current around the

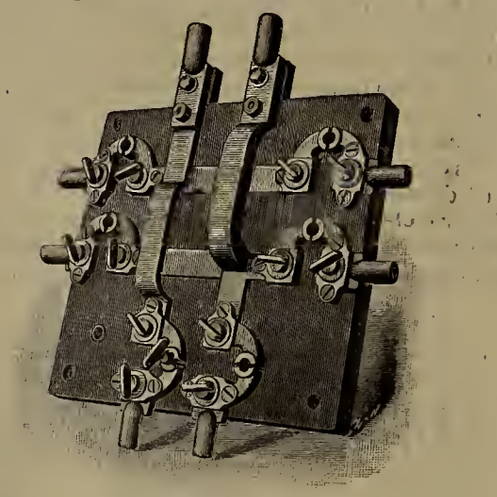

FIG. 4.

safety catch when required. This short-circuiting plug is not intended for use for any length of time, and is only employed when changing the fuses, in order that danger from arcing may be obviated.

If it is necessary to have light after one fuse has blown, the use of the short-circuiting plug still leaves a single-pole protection on the line, but as one plug only is furnished with each device, it would be impossible to have more than one safety catch short circuited at one and the same time.

The thumb-screws are provided with large flat-heads in order that they may be operated by hand, pliers or a monkey-wrench. The specially designed washer under the head rises with the screw without turning on it, and the annoying operation of raising the washer with a screwdriver is eliminated.

The centre of distribution safety-catch holder need not be set up outside of the dynamo-room, nor where the meter is attached to the street service, as it is frequently necessary to run two or more separate mains from this point to sub-centres of distribution in other parts of the building at which points these appliances could be placed.

They are made in four sizes—two for the two-wire system and two for the three-wire system, for two and for three branches.

* Edison General Electric Company, New York.

This invention should prove a powerful incentive in assuaging the rampant timorousness of the fire underwriters against the electrical wire, and should moreover have an excellent effect in reducing the rate of insurance on electrically wired buildings.

SAFETY DEVICE FOR ELEVATORS.

The frequent occurrence of accidents in connection with the operation and use of passenger and freight elevators in buildings has had the effect of directing the attention of inventors towards providing some means for preventing the same.

As usual, the aid of electricity has been invoked to perform this valuable service, and we present to our readers a description and illustrations of a device of this character which, owing to its simplicity, will be readily understood.

Most of the elevator accidents are due to persons falling down the shaft through the doors which have been carelessly left open, and the object of the invention described herewith is to prevent the elevator car from being started until all the doors, or entrances at the different floors, are properly closed and secured.

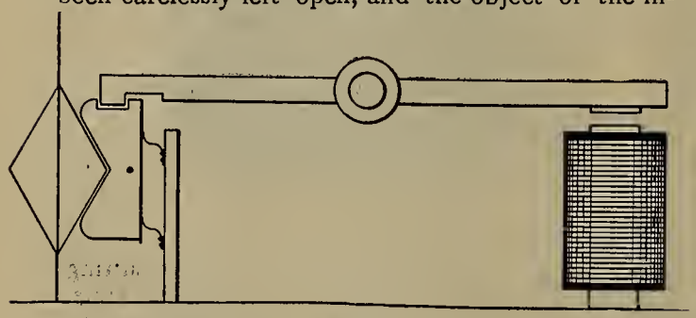

FIG. 1.

This simple and novel device, invented by Mr. Robert W. Magrane, of New York, will fill a long-felt want, and compel careless or incompetent conductors to close the door before the machinery can be started.

We say "careless or incompetent conductors," because the elevators in numerous buildings in this and other cities are run by mere boys or inexperienced persons, notwithstanding that it is in direct violation of the law. In some cases, in factories, for instance, no regular man is employed to control the elevator car.

The management of a large amusement hall in this city until recently compelled the employés to run the car in this fashion. The result was, one of the waiters, carrying a tray of refreshments, and having to wait for the elevator, looked into the shaft to ascertain the position of the car. It happened to be coming down, and before he could withdraw his head the car struck him and he was frightfully injured.

This is an example of one of the commonest dangers attending the operation and use of elevators, and it is manifest that all such accidents are the result of carelessness, either on the part of the employé or the victim.

Mr. Magrane's invention consists of a quadrant with projections placed on the wheel of the starting machinery, together with an electrical arrangement by which the door of the elevator shaft on each floor is connected with a pair of magnets controlling the armature lever, which lever prevents the starting wheel from moving unless every door to the shaft is closed and locked. On opening a door the current is broken, thus releasing the armature lever (shown in the accompanying illustrations) which, coming in contact with the projections on the quadrant (see Fig. 2), prevents the operation of the elevator machinery, and not until the door is closed again and the armature lever is withdrawn can the machinery be started.

This invention can be applied to elevators in any building. The cost of fitting up an elevator with this device is nominal, and there is no reason why every elevator in use should not be equipped with it, thus placing one more safeguard around human life.

Referring to the accompanying illustrations, Fig. 1 represents a simple locking arrangement, applied to the hand or check-rope. The armature-lever shows its position when the door is open. In closing the door, the magnet attracts said lever, thereby releasing the block and permitting the check or hand rope to be moved, starting the car either way.

Fig. 2 represents a complete working-plan of the invention, as applied to the American Express Company's building at 65 Broadway, New York. A quadrant, *c*, is placed on the main check wheel, *b*, with two adjustable wedges, *d*, *d*. The electric instrument, *j*, is placed on the engine base, *f*. The projections or wedges *d* and *d*, are arranged so that when the elevator car is at rest the armature-lever, *e*, will have a free play between, and be in way of said projections, thus preventing the car from being started either way until the armature-lever, *e*, is drawn towards the magnets by the closing of the doors to elevator shaft and consequent closing of the circuit.

In this particular case, a metallic circuit is run and the doors are connected in series.

ELECTRICITY IN INDIA.

"Inventions Likely to 'Take' and 'Pay,' in India and the East," is the title of a pamphlet issued by H. H. Remfry, solicitor and patent agent, 5 Fancy lane, Calcutta, India. Mr. Remfry says that the telephone is increasing in daily use in India. He also says that "enquiries are now being made for a primary battery economically available for heavy work." Such a battery is hoped for in this country, but it has not yet appeared. Mr. Remfry thinks India would be a good field for the introduction of electrical inventions of various kinds.

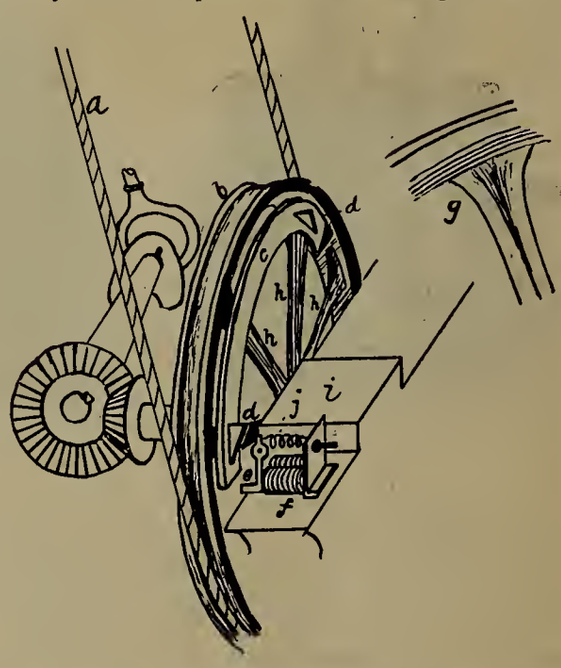

FIG. 2.

BIOGRAPHICAL SKETCHES.

FRANK B. RAE.

We take pleasure in presenting to our readers a brief epitome of the career of Mr. Frank B. Rae, the well-known inventor of the celebrated "Rae" system of electric railways, which is meeting with great success throughout the country. Energetic, ambitious and persevering, he has won for himself through uprightness and honorable dealings an enviable reputation.

Mr. Rae was born in Elmira, N. Y., on July 25, 1854. He attended the common schools up to his twelfth year, at which time his parents moved to Syracuse, N. Y. In his fifteenth year he managed to secure a three months' course in mathematics at a business college. At sixteen he became a messenger for the Atlantic and Pacific Telegraph Company, at Syracuse, and by gradual degrees became successively batteryman, repairer for the division, and finally became an operator on the New York Central Road.

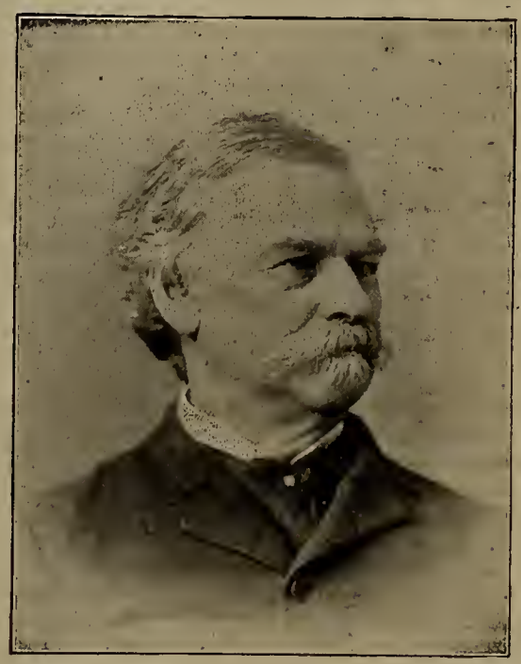
FRANK B. RAE.

After having spent several years in the telegraph service, during which time, in conjunction with Mr. C. H. Davis, he published a work, entitled "Diagrams and Connections," that met with a very favorable reception, Mr. Rae entered the service of the Brush Electric Light Company, of San Francisco, in 1880, and in 1882 was placed in charge of the company's plant at San José.

In 1883 he left for the East to secure patents on several devices which he had invented, and was induced by Mr. Stephen D. Field to remain in New York. He was afterward sent to Chicago by Mr. Field to take charge of the building of the electric railway for the Chicago Exposition of railway appliances, which was equipped with the motor, "The Judge."

On his return to New York, Mr. Rae was associated with Mr. Field in perfecting and bringing out the Field system of stock printing telegraphs, which was subsequently acquired by the Commercial Telegram Company, Mr. Rae for some time having charge of the company's New York offices. As soon as the plant was in good running order he joined Mr. C. O. Mailloux in the electrical engineering business, the partnership continuing until 1886, when he became electrician for J. H. Bunnell & Co. Shortly after this, Count Mitkiewicz, who had obtained concessions from Li Hung Chang, the Chinese premier, made him a very liberal offer to go to China with other electrical engineers, which he accepted. The failure of the Count's plans to materialize, however, after the party had arrived in China, compelled Mr. Rae to return home, which he did by way of San Francisco. He then went to Chicago, and applied the dynamo to use on the stock printing telegraph lines for the Western Union Telegraph Company. Mr. Rae subsequently became identified with the Detroit Electrical Works, with which concern he remained until a few months ago. He is now engaged in business entirely on his own account, as electrical engineer, with his office at 302 Hammond Building, Detroit, Mich.

With his large experience in electrical engineering, particularly in that department which relates to electric railways, Mr. Rae is bound to find future success. He is eminently competent to undertake the installation of electric railways and other electrical enterprises, of any magnitude, and those for whom he may render service of this character may rest assured that his work will be conscientiously and properly performed.



LOUIS W. BURNHAM.

LOUIS W. BURNHAM.

The subject of this sketch, whose portrait adorns this column, Col. Louis W. Burnham, was born in Canterbury, Conn., in April, 1831, and in this case it can be truly said that he is a self-made man.

From the age of ten until twenty he was employed alternately at farming and shoe-factory work, and had very limited opportunities for schooling. At the age of twenty he secured a clerkship with Col. John M. Fisk, of West Brookfield, Mass., in what was then the largest general merchandise establishment in Worcester county. Young Burnham remained here over three years under the most stringent training. After three, he was compelled to give up his position on account of inability to do the hard work required of him.

Determined, however, to be up and doing, he began giving special attention to penmanship; and, with the view of regaining health, he soon began

travelling over the New England and Middle States, giving lessons to classes in writing, and at once met with encouraging success. During this time he was employed as teacher of writing in several of the most prominent academies and seminaries of learning in the East, and he also here again improved his spare hours in study.

During the winter of 1853, after having taught a most successful series of classes in the vicinity of Albany, N. Y., he engaged to take charge of the writing department at the New York Conference Seminary, in Schoharie county, N. Y., where there were at that time over 800 students, and where an average of 300 were daily under his instruction.

Col. Burnham remained here until the winter of 1855, and then entered the Mercantile College at Worcester, Mass., from which he graduated in May. In June following, he migrated to Northern Illinois, and opened a commercial institute at Rockford, which was conducted with marked success for six years. He was elected city clerk of Rockford in 1856–7. During the summer seasons here he devoted much time to the study of law. In the spring of 1861 he opened another school in Freeport, Ill., which was also very successful until the breaking out of the Civil War, at which time a large number of his students enlisted for the war.

After this, in connection with the conduct of his college in Freeport, Col. Burnham turned attention to the collection of war claims, and was thus, on account of influences at Washington, enabled to do many a good turn for disabled soldiers. In the summer of 1862, the ill-health of Mrs. Burnham and death of two children had caused them to think of giving up their many pleasant associations West, and returning East, which was finally brought about in February, 1863.

In the East, Col. Burnham was at once appointed principal of the commercial department of the Hudson River Institute, at Claverack, N. Y., and afterwards opened a college in Hudson, N. Y., which he conducted with success for a year. In 1865 he opened the American Business College, in Springfield, Mass., and at one time had as many as 260 students, so popular was the institution.

Finally, in the spring of 1868, on account of ill-health, Col. Burnham was again forced to give up the college business, and soon after accepted the management of a New York life insurance company's agencies for New England, with headquarters in Boston. In this, as well as all other ventures, he was successful, and continued in the business until 1881.

During this year the National Electric Gas Lighting Company was organized, and Col. Burnham was elected its president and manager. Through his instrumentality the company was reorganized in April, 1882, under the name of The Electric Gas Lighting Company, its capital stock reduced to more reasonable dimensions, and the means provided to start business. Col. Burnham was its first president and business manager, which position he held until 1886, when he was elected vice-president and manager, and Mr. Joseph S. Fay, of Boston, Mass., was induced to accept the presidency in order to enable Col. Burnham to devote his whole mind and energies to the company's trade interests, which he has done up to the present time.

It is through Col. Burnham's indefatigable energy and perseverance that the Electric Gas Lighting Company has been built up to what it is undoubtedly now, the largest and most prosperous concern devoted strictly to the manufacture and sale of domestic electrical apparatus and supplies in the country, its trade covering every State in the Union, while it exports very considerable quantities of its products.

At the present time, Col. Burnham, who is now sixty years of age, is hale and hearty, and apparently possesses as much energy and activity as ever.

Col. Burnham is ably assisted in his numerous duties in connection with the Electric Gas Lighting Company by his son, Mr. Wm. W. Burnham, who is also treasurer of the company, and also by Mr. Arthur Drew, the able secretary and accountant.

OBITUARY.

DR. GRAHAM SCOTT.

Dr. Graham Scott, well-known in the electrical fraternity as the President of the Scott Electrical Works, New York City, died at his home, No. 17 East 21st street, New York, April 18, of acute rheumatism of the heart.

Dr. Scott was born in Philadelphia, and received his early training in the public schools of that city, and was one of the scientists who imbibed the first elements of scientific knowledge at the Central High School of Philadelphia.

At the age of 17 he matriculated at Jefferson College, where he studied for four years, earning the respect of both professors and students, and graduated as

DR. GRAHAM SCOTT.

Doctor of Medicine at the head of a class of over 500.

After graduating, the Doctor was appointed Interne at Berkley Hospital, after a competitive examination, where he served several months. He practised medicine in Philadelphia for a few months, when a desire for new fields seized him. He determined to move to California, where he settled in San Francisco and practised his chosen profession with distinguished success for nearly 15 years. During his residence in California all of his leisure time was spent in the study of science—electricity and magnetism occupying most of his thought. He organized a private telephone association with a number of professional and scientific friends, among whom were Doctors Molech, Hunter, Bettencourt and Decker. The bi-monthly meetings of The Hypocratic Telephone Association were very in-

teresting, and the records would be attractive reading to those engaged in the study of telephony, magnetism, the microphone, etc.

Dr. Scott retired from the practice of medicine several years ago, and returned to New York where he, during the past three years, engaged in scientific investigations of the mysteries of electricity. He organized the Scott Electrical Manufacturing Company of this city, the maker of the well-known Huntington search-light, photo-engraving focussing lamps, and electro-calcium lights.

The Doctor at the time of his death was negotiating for a large tract of land on the Hudson with a 200 H. P. water-power, where he proposed to establish the factory of the Scott Electrical Company and a large storage-battery manufactory.

He proposed to found a model manufacturing village—one of the dreams of his life—where every comfort would be provided for workmen and their families in the most approved co-operative manner.

Dr. Scott was a frequent contributor of articles on medical and electrical subjects to many trade journals.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Field Magnets.

THE field magnets of a dynamo electric machine constitute one of the two of its most essential parts. The other part is the armature.

The field magnets are constructed of several parts, namely, the magnet cores (of which there are usually two), the yoke piece, the pole pieces and the wire with which the magnets are wound.

The accompanying illustration shows these various parts and the manner of assembling them to make the field magnets complete.

There are many forms of dynamos in use, but the one illustrated in the diagram is in no essential respect different to all the others.

The function of the field magnets is to create and maintain a magnetic field in which the armature may revolve. As a rule, dynamos are so built that the field magnets are stationary while the armature revolves. Some machines are made, however, with stationary armatures and revolving magnets. One part *must* move ; this is manifest when we think for a moment that in order to create a difference of potential in the wire of the armature, or, in other words, generate a current, that wire must cut through the magnetic lines of force in the magnetic field. This implies motion.

The material used for the different parts of field magnets is the softest iron procurable, except in the case of the wire, which is of copper. Soft iron is used, because with it, it is possible to produce a much more powerful magnetic field than if any other quality were used. Iron is the essential metal to use always for magnets in all classes of electrical instruments on account of its high magnetic properties ; that is to say, it is the best conductor of magnetism. Metals are divided into two classes with reference to their magnetic behavior, viz. : magnetic and non-magnetic. Copper is classed as a non-magnetic metal, while iron is the most magnetic; hence the importance of iron in the construction of magnets will be readily understood.

There are as many different forms of dynamos as there are makers—no two being alike. As the field magnets usually constitute the most prominent part of dynamos, the difference in form of machines relates wholly to the shape of the field magnets, although there are structural differences in different makes of armatures as well. These, however, are not readily noticeable to the observer.

The form of dynamo illustrated in our figure requires a yoke, the function of which is to effect continuity in the magnetic circuit. Without the yoke the magnetic field surrounding the armature would be infinitely weaker, and the machine would be practically valueless. All dynamos do not possess a yoke piece ; indeed, some dynamo field magnets are constructed on the typical horseshoe form, and consequently require no yoke. The form shown in the figure is a modification of the horseshoe ; instead of the curve it has corners.

The pole-pieces are really enlargements of the

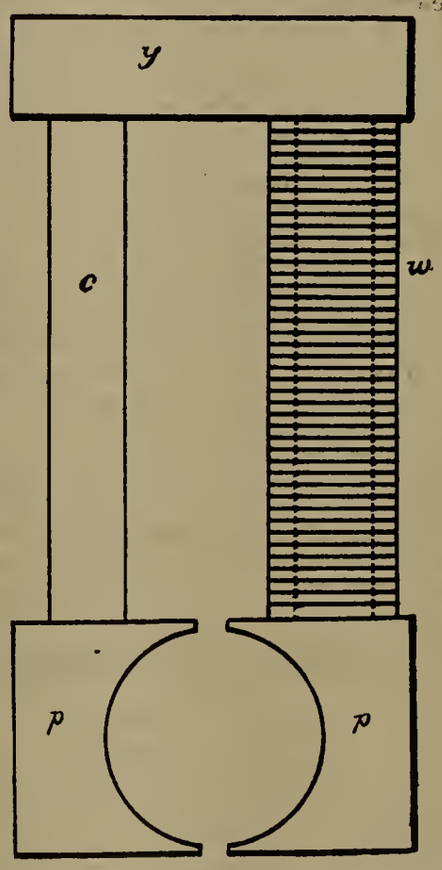


DIAGRAM OF FIELD MAGNETS.

Y, Yoke. *C*, Magnet core. *W*, Magnet windings. *P*, *P*, Pole pieces.

core, so as to increase the surface of magnetic action, and are constructed with curves on their inner surfaces, so as to cover the surface of the armature as completely as possible, and yet have a break in the continuity of the magnetic circuit.

These pole pieces are really the "poles" of the electromagnet. We all know that a horseshoe (permanent) magnet is strongest at its poles ; so in the case of a dynamo, the magnetism is strongest at the pole pieces, and as the lines flow from one pole to the other, according to the direction of the current flowing in the magnet wire, they must necessarily flow or act through the space between the pole pieces. As this place is filled with the magnetic lines of force, and as the wire on the armature must cut lines of force in order to effect a difference of potential, and consequently generate a current, the armature is placed in this space, or magnetic field, as it is usually called.

Concerning the magnetic field we will say more later on.

The core of the field magnets are generally made round. Some, however, are elliptical in shape. They are never made square or in any other form possessing points or corners, because such projections became "poles" themselves, and as it is essential to have all the magnetic influence concentrated at two points, namely, the pole pieces, the importance of adopting every means possible to convey the magnetic lines to these points is manifest; hence the round form is adopted for magnet cores. In the case of the yoke piece the magnetism is very weak, or practically *nil* at that part of the magnetic circuit, hence the existence of the corners makes no material difference in practical results.

The magnetism is strongest between the pole pieces and weakest at the yoke.

As to the winding of the magnets, of course, that involves many factors in its calculation, and as it is not within the scope of these articles to consider intricate problems of this nature, we refer those of our readers who desire to go into the subject further to any one of the text-books which are now published, giving all such information. An excellent work of this class is "Principles of Dynamo-Electric Machines," by Carl Hering.*

Copper wire, of course, is always used for magnet windings. It is covered with some insulating material in order to keep the windings from touching one another. The copper must be of the purest quality obtainable in order to keep the resistance down to a minimum. The size of the wire is determined by calculations based on the work that will be required of the machine.

Some dynamo field magnets are wound with two coils. Such machines are known as compound-wound dynamos.

It is important to have all joints between the parts of a field magnet very secure and reliable, so as to interpose no resistance in the magnetic circuit.

ANSWERS TO INQUIRIES.

Why is it that copper wire is always used on electro-magnets? Would not iron wire do as well? It seems to me that if iron wire were used no core would be necessary, as the iron would act as a conductor and a core combined. U. R. T.

EASTON, PA.

Answer.—The principal reason why iron wire is not used is because of its higher resistance, being six times greater than that of copper. Iron wire has been tried for this purpose, but it does not seem to have met with much success. Iron wire coated with copper and copper wire overlaid with iron have also been tried, and, we believe, with good results, but why it is not more extensively used we are unable to say.

What is the meaning of the word "inductor" as applied to dynamos, and what is meant by "inductor velocity?" T. H.

TUSCALOOSA, ALA.

Answer.—The wires of an armature which move in the magnetic field are the inductors, because it is in them that the induction takes place. Inductor velocity is the speed with which the inductors move through the magnetic field. It is usually measured in feet per second.

* Price, $2.50. This book, as well as all others on electrical subjects, can be obtained at the office of the ELECTRICAL AGE, World Building, New York.

Silver plated and other metallic vessels—sugar-bowls, for instance—are often plated on the inside with gold. How is this done without getting a deposit on the outside? M. V. L.

DETROIT, MICH.

Answer.—Inside gilding is accomplished by filling the vessel with the gilding solution, and suspending in it an anode of gold, the vessel itself being connected to the negative pole of the electric generator.

THE ELECTRIC CLUB.

At the annual meeting of the Electric Club, New York, held at its club house, 17 East 22d street, April 21, the following named gentlemen were elected officers and managers for the ensuing year: President, Samuel Insull; vice-presidents: Edward Weston, E. A. Leslie, W. L. Candee, H. J. Smith; secretary, Stephen L. Coles; treasurer, Geo. M. Phelps; Board of Managers: Chas. D. Shain, Joseph Barré, James Kempster, H. D. Cheever, T. C. Martin, John A. Seely, R. B. Corey, W. J. Morrison, E. F. Peck, Dr. J. B. DeLery, E. E. Bartlett, Frank R. Chinnock; Committee on Membership: Charles Dutton, C. E. Stump, Geo. T. Manson, Jos. Wetzler, C. O. Baker, Jr.

CORRESPONDENCE.

REMEDIES FOR ONE OF THE CAUSES OF ARMATURE BURNOUTS.

EDITOR ELECTRICAL AGE: I was very much interested at an editorial and an article by Edgar E. Stark which appeared in the ELECTRICAL AGE of April 16 last, relating to "Remedies for One of the Causes of Armature Burnouts." The idea is neither new nor original to a great many Philadelphians. I have been using the process for over three years. You New Yorkers call us slow, but in this case, I think, New York, "takes the cake." If you or Mr. Stark will take the trouble to look in the issue of the *Electrical Review* of February 16, 1889, you will find an article on the first page which describes in a modest way my "electrical dissipator" (a name I gave it, not knowing what else to call it). In Mr. Stark's article he did not explain to the novice the difficulty in securing a perfect ground before the discharge passed through the Geissler tubes Care must be taken not to let your wire come in contact with metal before it passes through the tube, such as nail heads embedded in boards on floors, as it is a well-known fact that nothing has yet been discovered which will insulate static electricity. In experiments with my "electrical dissipator," I found out that static electricity can be used for a great many purposes with satisfactory results, as, for instance, in preventing a boiler from scaling. Let Mr. Stark do some more experimenting with my "electrical dissipator," and see if he can find out how it is done. Some day I may give an explanation.

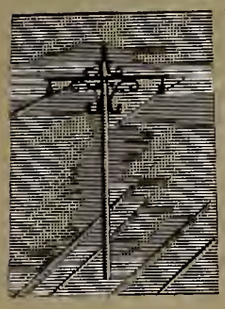
RICHARD L. SMITH, *Engineer.*
200 NORTH 3d STREET, PHILADELPHIA.

Silver Bow Electric Light and Power Co., Butte, Mont., incorporated April 15, with a capital stock of $200,000. Incorporators: W. F. Bartlett, James W. Forbis, J. R. Wharton, Butte, Mont.

Mauston Electric Light and Power Co., Mauston, Wis., incorporated April 20, with a capital stock of $15,000. Incorporators: R. H. Davis, G. S. Cooper, J. T. Heath.

FRENCH AND GERMAN STREET CAR SERVICE.

BY J. M. BATCHELOR.



THROUGH the Department of State we are in receipt of advance information, which will shortly be published, about local transportation in European cities.

In Marseilles, France, omnibuses and horse cars are in use. All of the horse-car lines are owned by one company, which has eight different lines of track, and charges in fare from two to nine cents a trip, according to the distance. The municipality contracted in the franchise for 2¼ per cent. on the gross receipts, and stipulated that the fare should be limited to 0.621 cents per mile. The municipality, through the mayor, also regulates the routes to be taken and gives the company the privilege of reducing the fare below the maximum rate mentioned. The cars are said to be unclean and frequently over-crowded, which is explained as due in part to the custom among the better classes to patronize cabs, which charge 20 cents per course, or 40 cents per hour. Last September 26, the stock of this company was quoted at one per cent. premium. The population of the city is 407,000.

Lyons, France, has steam as well as horse trams, the former running through the city to the suburbs; but no speed is permitted within the city limits exceeding five miles an hour. The summer of last year witnessed a strike by the 300 operatives of the General Omnibus and Tram Company, the chief demand being for hours of service not to exceed eleven hours and twenty minutes per day. The government and the public were in sympathy with the strikers; and after 4½ days, during which time no buses or trams were run, the company conceded the strikers' demands. No personal violence was used and no destruction of property took place worth noting. The affair was managed by the officers of a syndicate of workmen, and excited surprise at its orderliness. The city has a population of 500,000. Where the same company has more than one line, transfer tickets are given at one cent extra; the ordinary fare is four cents for first-class, and two cents for second. Members of the army pay one-half of the regular rates.

Paris, the capital, has a great variety of systems; trams operated by horses, steam cars without firegrates, steam with firegrates, compressed air, electricity, one experimental line—cable, buses, etc. The fare is uniform throughout the city limits; six cents for first-class, and three cents for second; but the first-class rate includes a transfer to connecting lines. Outside of the city the maximum fare is two cents first-class and 1½ cents second-class, per kilometre. The city collects a tax of about $400 annually on each vehicle in circulation, and one-half of the profits when dividends exceed eight per cent. of the value of each share, which is 875 francs. Newer lines pay a tax of about six cents for each round trip; whether this is in addition to the other taxes is not stated. Franchises are regulated to suit the State, and not the companies; out-of-the-way routes are imposed upon the companies, and the government fixes the trips and time tables. The street-car companies are classed as profitable in spite of the many restrictions.

Aix-La-Chapelle, Germany, has one horse-car line, which pays an annual tax of $125 and 6¾ per cent. of its profits to the city and three per cent. of its profits to the state of Prussia. Police are carried free, and army officers and school-children at one-third rate. Rates are fixed by mutual agreement between the government and the company, and are very low: fifteen pfennigs—3¾ cents—within the city, which affords a very small profit. The municipality requires no compulsory service.

Berlin, Prussia, has one elevated steam road, and four street-car lines. The elevated road belongs to the government. Rates of fare on the street-car lines are divided into sections, or zones; the lowest rate is 2.4 cents, and each increase is about 1¼ cents. On the elevated road they have first and second class cars, but inside or outside places cost the same. The companies are permitted to reduce rates, but not increase them, as all rates are subject to the government's approval. Car companies are required to keep the pavement between tracks, and a little on each side in order, although one company pays a rent to the city for the purpose of compensation for pavement repairs, allowing the city to do the work. The Berlin Steam Street Car Company is not required to keep pavements in order. Scholars, police and postal officials are allowed reduced fares if they take out monthly tickets in advance. The cost of such tickets is 72 cents per month. For 1890 the Great Berlin Street Car Company paid a dividend of 12½ per cent., but the other companies made little or nothing. The elevated railroad profits are not known.

Bremen has eight lines of street cars, belonging to three companies, and they are constructing an electric line, Thomson-Houston system. One horse line charges five cents fare for full distance—about five miles (English), and 2½ cents for any distance not exceeding one-third way; two horse-lines charge 7½ cents full distance, and 2½ cents for third way. The municipality makes no tax charge against the companies, almost the only instance of the kind in Europe. But the authorities regulate maximum fares, and oblige the car companies to keep their part of the streets in repair. These car companies are considered financial successes; profits not advertised.

Cologne, Germany, has one company of horse cars only. Fare is a matter of agreement between the company and the authorities; the lowest being 2.38 cents, and the highest, 5.9 cents, with two intermediate figures. The municipality receives lump sums for the franchise—in the neighborhood of $250 per year. At the end of the franchise, 1916, the city comes into possession, but reserves the right of purchasing the plant. The company may be compelled to build additional lines if the city thinks they are necessary; and the company cannot extend without the city's consent. Dividends are 6 per cent.

Dresden has one company, the Tramways Company of Germany, which in 1890 had 86½ cars in use. Horses worked, 671; passengers carried, 14,051,804; passengers per day, 38,496; which is an increase of about 15 per cent. over each immediate preceding year; that is, in passengers. Uniforms are supplied by the company; one cloak costs $11; coat $5.40; one pair of trousers $2.40; vest $1.40; cap 70 cents; total about $21; but the men are taxed 5 per cent. of their wages for uniforms, and they receive a new suit once a year. The horses make 15 miles each day. Conductors work 12 hours per day on the average, with pay varying from sixty cents to seventy-five cents per day, according to length of service. The average cost of the car horse is $205.

NEW ELECTRIC FAN.*

It is truly said that electricity can be adapted to meet almost every requirement of man. It can, when properly utilized, keep him warm in the winter time, and in the summer time it can be harnessed to devices which will keep him cool.

Electric fans have become very popular in the past two or three years, and it is the exception now to find a restaurant or other public place which is not equipped with these useful machines.

The electric fan illustrated herewith has just been brought out, and judging from the favor it has already met with, there will likely be a great demand for it. It is of beautiful and artistic design, and is driven by an electric motor, which may be placed in any convenient place independent of the fan.

The illustration is that of a ceiling fan. These fans, however, can be made to suit any style of decoration and for any position. The company makes a pillar fan of the same general design, which is excellently adapted to situations where a ceiling fan would not be desirable. For restaurants and other similar places these fans are especially adapted, and we understand from the makers that there is already a great demand for them.

ELECTRIC FAN.

One of the ceiling fans is in practical operation in the firm's office, where it may be seen and its merits tested.

LARGE ORDERS FOR MOTORS.

The Short Electric Railway Company, of Cleveland, O., is rapidly securing a solid foothold in the New England States. Mr. Edward J. Wessels, of its New York office, has just closed a contract for the installation of its apparatus with the Norwich Street Railway Company, the New Haven and West Haven Horse Railway Company, of New Haven, Conn., and from the Natick Street Railway Company, of Natick, Mass., the latter road already operating three Thomson-Houston motor cars. The contract with the New Haven and West Haven Railway calls for 19 single equipments of 25-H. P. single reduction motors and 7 double equipments of the same type. Westinghouse, Church, Kerr & Co. will supply the engines and dynamos, consisting of 3 large-sized direct connected engines and dynamo units. The Norwich Street Railway will have 15 25-H. P. single reduction motors. The Short Company has promised to deliver the 52 motors with all possible speed, so as to enable the roads to be operated with their new systems early in June.

* McLeod, Ward & Co., 91 Liberty st., New York.

FRANCHISE SOLD.

The franchise for the construction and operation of an electric railroad on Staten Island from Port Richmond to Prohibition Park and South Beach, which was secured on February 11 by Mr. F. R. Chinnock, State Agent of the Edison General Electric Company, has been sold by him to a syndicate, which will operate the road under the name of the Prohibition Park Railway Company. Messrs. Royal C. Vilas, president of the New York Air Brake Co.; C. A. Starbuck and J. C. Thompson, president of the Eames Vacuum Brake Co., comprise the syndicate which purchased the franchise.

NEW INCORPORATIONS.

The Harvey Steel Car and Repair Works, Chicago, Ill., incorporated April 15, with a capital stock of $250.000. Among other things it will manufacture and dispose of electric motors. Incorporators : T. W. Harvey, Elmer E. Kaulman, Robert Titus.

City Plumbing and Construction Co., Chicago, Ill., incorporated April 15, with a capital stock of $15,000, to do a merchandise and contracting business, consisting of electric lighting and other things. Incorporators : William Holgate, Albert A. Campbell, Frank F. Fox.

Menominee Electric Light and Railway Co., Menominee, Mich., incorporated April 13, with a capital stock of $110,000.

Citizens' Electric Lighting Company, of Pontiac, Mich, principal office, Detroit, Mich., incorporated April 15, with a capital stock of $40,000. Incorporators : G. E. Fisher, O. D. Chase, Detroit, Mich.; George H. Foster, Pontiac, Mich.

The Cyclo Clock Co., Jersey City, N. J., incorporated April 13, with a capital stock of $250,000, to manufacture, sell and let electric self-winding clocks, etc. Incorporators : E. Erschell, Long Island City, N. Y.; C. W. Myer, Brooklyn, N. Y. ; E. Klahn, Jersey City, N. J.

Wisconsin Electrical Construction Co., Milwaukee, Wis., incorporated April 14, with a capital stock of $12,000. Incorporators : W. N. Stewart, A. E. Slocum, C. A. Kanister.

Indianapolis Street Railway Co., Indianapolis, Ind., incorporated April 14, with a capital stock of $1,500,000. Incorporators : Edward F. Leonard, John W. Dunn, Edwin Armstrong.

National Electric Brake Co., St. Louis, Mo., incorporated April 13, with a capital stock of $50,000.

Incorporators : William Koedding, G. L. Van Beek, J. H. Grimen, all of St. Louis, Mo.

The Hull Electric Light and Power Co., Hull, Mass., incorporated April 13, with a capital stock of $10,000. Incorporators: Henry F. Holland, Z. T. Harrington, George A. Beatey, George E. Davis.

American Electrical Co., Portland, Me., incorporated April 14, with a capital stock of $500,000. Incorporators: Fred. Balcom, Philadelphia, Pa.; George F. Gould, John Fagan, Portland, Me.

Rockville Electric Light and Power Co., Rockville and Indianapolis, Ind., incorporated April 16, with a capital stock of $20,000. Incorporators: Charles E. Thornton, W. W. Hubbard, W. J. Hubbard, all of Indianapolis, Ind.

Cajon Mining and Water Co., Los Angeles, Cal., incorporated April 14, with a capital stock of $250,000. Among other things it will deal in electricity, lighting, etc. Incorporators: F. A. Marcher, I. E. Lucas, J. E. Lane, B. E. Toler, Los Angeles, Cal.

The Massillon Street Railway Co., Massillon, Ohio, incorporated April 13, with a capital stock of $50,000, to construct a street railway to be operated by electricity or other suitable means. Incorporators : William Lynch, J. W. McClymonds, C. A. Gates, Charles M. Russell, Warren E. Russell.

SPECIALTY NO. 18.

The Canton-Massillon Electric Railway Company, Canton, Ohio, incorporated April 13, with a capital stock of $200,000. Incorporators : William A. Lynch, A. J. Underhill, H. M. Lyman, L. A. Soichot, T. R. Catlin, J. W. Underhill.

The Catasauqua and Northern Street Railway Co., Catasauqua, Pa., incorporated April 11, with a capital stock of $50,000. Incorporators: G. H. Campbell, George W. Mansfield, Boston, Mass.; R. E. Wright, Allentown, Pa.

The Hamburg Electric Light and Power Co., Hamburg, Pa., incorporated April 12, with a capital stock of $15,000. Incorporators: Milton L. Ritter, Windsor Castle, Pa.; George F. Meharg, Frank S. Correll, Hamburg, Pa.

The Manor Electric Co., Manor, Pa., incorporated April 14, with a capital stock of $6,000. Incorporators: W. J. Beamer, F. L. Fry, W. H. Gress, Manor, Pa.

The Connecticut Tramway Co., New London, Conn., incorporated April 12, with a capital stock of $20,000. Among other things it will construct electric-light plants and electric railways in Connecticut. Incorporators : Dwight Townsend, New York, N. Y.; Tracy Waller, New London, Conn.

Pasco Union Land Co., Pasco, Wash., incorporated April 15, with a capital stock of $750,000. Among other things it will maintain and operate electric light works. Incorporators: Louis C. Frey, R. Olney, W. P. Gray, Pasco, Wash.

A NEW SPECIALTY.

The McCreary Electrical Specialty Company, 136 Liberty street, New York, has just brought out several new specialties. The cut shows what is known as specialty No. 18, and represents a new special ceiling fixture for utilizing reflector shade and half shades combined. This fixture is so arranged that each lamp can be used separately or jointly. In the latter case, by using colored lamp shades a beautiful effect is produced. These fixtures are of elegant design and workmanship.

COAL MINING MACHINES.

There is a great demand for the coal mining machines operated with electrical power, manufactured by the Jeffrey Manufacturing Co., Columbus, O. There are now fifty-one of these electric machines in daily use and giving complete satisfaction. It is claimed to be the only successful coal mining machine operated by electricity, up to the present time, and with the aid of practical, experienced men, combined with an experience gained during the past three years, the company is enabled to contract for complete plants under guarantee to accomplish all that is claimed for them. The following are a few of the orders recently received: Second order, for one Jeffrey electric mining machine, from the Congo Mining Co., Congo, Ohio. Third order, for one Jeffrey electric mining machine, from the Redstone Oil and Coke Co., Grindstone, Pa. Also three orders, first equipment, for complete Jeffrey electric coal mining machine plants for the Hocking Valley, briefly described as follows: Two plants each, consisting of boilers, engines, dynamos and all necessary connections to run four Jeffrey electric mining machines, with a daily tonnage capacity of 800 tons. Also, a third plant complete, to run six Jeffrey electric coal mining machines, with a daily tonnage capacity of 1,200 tons.

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, April 23, 1892.

PROF. GEORGE FORBES, of London, England, is in the city on a visit.

MR. W. R. MASON, general manager of the Railway Equipment Co., Chicago, was in town last week.

FIRE recently destroyed the Long Island Railroad Company's electric-light plant at Long Island City.

A CONTROLLING interest in the Tropical American Telephone Company has been acquired by the Western Electric Company, and hereafter the affairs of both concerns will be conducted on such a basis as to prevent conflicting with each other's interests. Under the new arrangements the following officers have been elected: Chas. N. Hough, president; H. B. Thayer, general manager, and Mills H. Lander, treasurer. The offices of the Tropical Telephone Company are now at 125 Greenwich street.

A BILL has been introduced into Congress for an appropriation to increase the illuminating power of the torch in the Statue of Liberty from 54,000 to 100,000 C. P. It is claimed that the present light is useless in foggy weather.

MR. E. L. BRADLEY, of the Delaware Hard Fibre Co., Wilmington, Del., manufacturer of pure hard fibre for electrical and mechanical purposes, was in town a few days ago.

BURGLARS recently made an unsuccessful attempt to force open two safes containing a large quantity of platinum in the office of Baker & Co., metal refiners, of Newark, N. J.

THE firm of Julian Scholl & Co., mechanical engineers and general contractors, including the installation of complete power plants, etc., and the New York managers of the celebrated Weston Engine, have removed from 40 Cortlandt street into a suite of large and well-adapted offices at No. 126 Liberty street.

THE "Roy Valve," manufactured by the Roy Valve Company, 15 Cortlandt street, has given such universal satisfaction that the company is kept constantly busy attending to the great number of orders which are being received daily from all parts of the country. The superior merits of the valve are so well known that it needs no further recommendation.

WOODBRIDGE AND TURNER, contractors and expert engineers, Times Building, this city, are constructing the track for the Paterson Central Electric Railway Company, Paterson, N. J. They are also putting up the trolley systems of the Brooklyn and Coney Island Street Railway Co., and Portland City Railroad Co., Portland, Me. This firm has an enviable reputation for first-class work.

BENJAMIN BLUM, of this city, has brought an action in equity in the United States Court of the State of Maryland against the Wenstrom Consolidated Dynamo and Motor Company and Edwin L. Tunis (formerly president of the company); also John E. Semmes and B. Howard Haman, who were appointed receivers of this company by the Circuit Court of Baltimore, to set aside certain assignments of patents made by B. Blum. This action is brought against the company for failure to carry out the terms of sale. An application has been made restraining the defendants from making any transfer of patents pending the trial of this action. Ex-Judge A. J. Dittenhoefer and D. Gerber, of this city, and Messrs. Savage & Taylor, of Baltimore, are attorneys for the plaintiff. Messrs. Gans & Haman, and Steele, Semmes & Carey, of Baltimore, are attorneys for defendants.

THE following named gentlemen, well-known in the electrical trade, gave this office a call last week: R. D. Nuttall, of Pittsburg, Pa.; H. B. Oakman, of the Edison General Electric Co., Buffalo; F. R. Chinnock, of the same company, and E. D. Carter, New York manager of the Ball Engine Co., of Erie, Pa.

TRUEX AND VAIL, 136 Liberty Street, this city, report an active trade in swinging ball lightning arresters and Walker ammeters. These arresters are said to be the best and cheapest in the market, and are highly endorsed by the many who use them. The Walker ammeter is an excellent instrument. It is accurate and reliable, aud can remain in circuit without affecting its calibration.

THE CLARK ELECTRIC COMPANY, of No. 192 Broadway, this city, reports a great increase in business. This company is said to be the only one in the United States that makes a specialty of manufacturing under its own patents electric arc lighting apparatus. One of the latest and strongest testimonials received by the Clark Co.is from Mr. R. Stewart (an electrical expert), Superintendent of Telegraphs of the Central Railroad of New Jersey. He states that he has had no trouble in any respect with the lamps put in at his large station in Communipaw.

W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE:

NAMES OF COMPANIES.	CAPITAL.	PAR.	PRICE.
American Dist. Tel., N. Y.	3,825,000	100 00	63 00
American Engineering Co., N.Y.	1,000,000	100 00	60 0

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

Among the dividends which have been earned and declared payable early in May, I note the regular quarterly one of the Edison General of 2 per cent. The holders of the trust receipts will receive theirs in common with the holders of the old shares; this is in full accord with the circular agreement of February 9, and is the first payment on account of the receipts. The Edison Electric Illuminating Company pays 1¼ per cent. for the quarter on the same day, May 2. The Thomson-Houston declares its regular quarterly dollar per share dividend, payable May 14. The next dividend of this and the Edison General Company will probably be paid on the shares of the General Electric Company. I do not find the old well-known names of the Brush Electric, Brush Illuminating, United States and United States Illuminating among the list. Now is the time to invest in the General Electric Company in any one of the various methods offered; there will be a big boom as soon as the consolidation is perfected and the company in working order. Many new improvements, which have lain practically dormant on account of actual or possible conflict in ownership, will be vigorously introduced, and competition on many lines will cease to exist, consequently larger profits and better public service will result. The present understanding is that the new corporation will issue $4,000,000 30-year 5% gold bonds and retire the floating debts of the Edison and T.-H. companies, and offer these bonds at 95%; they will be convertible into General Electric stock, taking the stock at 120. The Governor of New York took a long step in the right direction when he kept the corporation in this State, one which only a banker-governor would be apt to do.

EASTERN NOTES.

An order for a 1,000 horse power electric light plant, to be used in a Milwaukee brewery, is being filled by the Mather Electric Light Company, of Manchester, Conn. It will consist of six 150 horse power generators, each weighing 18,000 pounds, and are the largest the company has so far made.

A plot of ground containing 10,000 square feet has been purchased by the Malden, Mass., Electric Light Company, on which will be erected,a duplicate electric lighting plant at an expense of $50,000. On completion of the station a day power and lighting service will be put into effect.

WESTERN NOTES.

The R. D. Nuttal Co., Allegheny, Pa., reports great demand for its new style steel trolley pole. A new department for the construction of armatures has been recently opened.

The offices and store-room of the Pittsburg Reduction Company, Pittsburg, Pa., have been removed from 95 Fifth avenue to 116 Water street, where a full line of aluminum supplies will be kept in stock.

Mr. Wilton, the popular secretary, treasurer and manager of the Peninsular Electric Light Co., Detroit, Mich., sailed for Europe on the 16th inst. He will remain away about four months. It is said to be a trip of pleasure.

The Electric Appliance Company, Chicago, has been appointed agent in the West for the Security Insulator Company, of New York. The merits of this insulator were fully described in a previous issue of the Electrical Age.

The Western office of the Electric Construction and Supply Company, of 18 Cortlandt street, New York, which has heretofore been located in the Phenix Building, Chicago, has been removed to the Unity Building, in the same city.

Mr. L. E. Myers, the Chicago representative of the Detroit Electrical Works, has closed a contract with the Sioux City and Leeds Railway Company for the equipment of its road into an electric system. The contract includes motors, overhead trolleys, poles, car bodies, etc., with the exception of rails.

The telephones for the World's Fair are to be furnished by the Chicago Telephone Company at a rental of $25 per quarter; 300 instruments will be used. The company will do the wiring at its own expense. Private subscribers will be charged city rates only, and a fee of ten cents from the public exchanges.

Kuhlman & Co., of Cleveland, O., who make a specialty of street car work, are at the present time, building a large number of motor car bodies for the East Cleveland Railway Company, and it is stated they will be as fine a lot as ever graced the streets of any city. Kuhlman & Co. pride themselves on this class of work.

The Government of France, through its consul at Chicago, applied for 20,000 square feet of space in the Electricity Building, but was awarded only 6,000. The request for 20,000 square feet was made on the ground that Germany had been awarded that much space. Germany's grant was made months ago, when it was not thought great demands for space would be made, and it is now thought the allotments made to that country and England will have to be reduced.

The Electrical Equipment Co., of Detroit, Mich., reports business very good. One of its most recent installations is that of a 25-light plant on the steam yacht *Grace*, which plant consists of C. & C. dynamos and Blake engine. The dynamo-room is only four feet square by 1¾ feet in height, and is encased in plate glass. It is said that the workmanship on this plant is the finest in this part of the country, which reflects great credit upon the company. Mr. J. J. McKenna is the manager, and, in the language of the Westerner, he is a "rustler."

John Wood, Jr., of the Schuylkill Foundry and Machine Works, Conshohocken, Pa., reports an active business in his patent water tube boilers at the main works, also at the branch works at East Saginaw, Mich., and Zanesville, O. Recent shipments are as follows: 1,000 H. P. to Duncannon Iron Co., Duncannon, Pa.; 600 H. P. Windsor Locks Steel Co., Windsor Locks, Conn.; 200 H. P. New Haven Rolling Mill Co., New Haven, Conn.; 1,000 H. P. J. Wood & Bros. Co., Conshohocken Pa.; 400 H. P. Hughes & Patterson, Philadelphia, Pa.; 600 H. P. Chester Pipe & Tube Co., Thurlow, Pa.; 500 H. P. John & James Dobson, Philadelphia, Pa.; 500 H. P. Alex. Kerr, Bro. & Co., Salt Works, N. Y.; 100 H. P. Pottstown Iron Co., Pottstown, Pa., and 150 H. P. to Pottsville Steel & Iron Co., Pottstown, Pa. The greater number of orders now in hand are for electric light and railway purposes, for which these boilers are particularly adapted. The increasing demand for these boilers will necessitate the establishment of other works in addition to those now in operation.

FUSE WIRE INTERESTS.

On April 16 the Massachusetts Electrical Engineering Company, Boston, sold all the material and machinery which it used in the manufacture of fuse wire, together with the good will of the business, to the Shawmut Fuse Wire Co., of Boston.

This company has been organized expressly for the purpose of manufacturing fuse wire and links of the highest grade, and will have every facility for filling orders in a prompt and satisfactory manner.

All the wire and links which it manufactures will be tested, as heretofore, at the laboratory of the Massachusetts Electrical Engineering Company, and a certificate of test signed by the same company will accompany each spool of wire and lot of links sold.

The Shawmut Fuse Wire Co., 85 Water street, Boston, has issued a notice to the effect that it has purchased of the Massachusetts Electrical Engineering Co. its present fuse wire business, including all machinery, apparatus, etc., used in the manufacture of fuse wire and links.

The company intends to devote itself exclusively to the manufacture and sale of the different forms of fuses used for electric lighting, street railway and telephone purposes.

LARGE POWER FROM A SMALL AMOUNT OF WATER.

The Pelton Water Wheel Company has recently furnished the Commercial Mining Company, of Arizona, a power plant which affords a good illustration of the extraordinary results that can be obtained from a small quantity of water under a high head, as also the estimate of value placed upon water-power where so large an outlay is made for a comparatively small amount of power. This plant consists of a 4-ft. Pelton wheel, which runs under a 1,200 ft. head at 699 revolutions a minute, developing 45 H. P., using a nozzle tip $\frac{53}{100}$ of an inch in diameter. Also a 24-inch Pelton wheel running under the same head at 1,380 revolutions, developing 20 H. P., with a nozzle tip $\frac{35}{100}$ of an inch diameter.

These wheels run a concentrating and smelting plant, including rock-breaker, blowers, pump, etc. The pipe line is 20,000 feet in length, the upper end being 6 and 5 inch casing, and the lower end 5-inch lap-weld pipe.

All the water supply that can be counted on during the dry season is a flow of about 30 cubic feet a minute. The large expenditure here made in pipe line for results obtained will indicate the advantage that water-power has over steam under much more unfavorable conditions than generally exist.

NEW "A. B. C." CATALOGUE.

The New "A. B. C." catalogue is just out. It is a book of over 270 pages, handsomely bound, and contains prices and descriptions of almost every article required in the construction and operation of electric light, power and railway plants.

Part of the book is devoted to railway appliances, and shows a number of insulating devices and other specialties which will be kept in stock at the New York store.

From an examination of this book, it is apparent that there have been during the past year many novelties brought out in the line of electric light fittings and fixtures, about 50 pages of the catalogue being devoted to new goods.

The subject of fan motors is given special prominence, several new forms of machines being described, among them a $\frac{1}{10}$-horse-power motor and fan for 110 volts, direct current, which appears to be the most compact outfit of the kind yet put on the market. The catalogue also describes a new alternating fan motor which has several advantages, and on account of its superior efficiency is likely to be largely called for by stations using the alternating system.

A WONDERFUL PERFORMANCE.

The "C. & C." motor comes to the front with a wonderful record again. One day last week the *Star* newspaper building of Washington, D.C., was the scene of a very large fire, which entirely destroyed the steam plant and rear end of building. While the fire was still burning, Mr. C. W. Messner, the local agent for the "C. & C." Motor Company, received orders to at once examine the condition of the motor (a 20 H. P. "C. & C.," which was purchased some three years ago for just such emergencies) and to report the possibilities of running off the next day's edition. The motor was found surrounded by fire, with water flowing in torrents all around and over it. After the fire the motor was tested and found all right; came out without a scratch.

The Saturday's edition of 60,000 copies, of 12 pages each, was run off on the two large Hoe presses, which alone require 30 H. P. to start and 20 H. P. to run.

Considering that the presses were rusty and all the shafting stiff, and that the paper was gotten out on time, it is indeed a wonderful performance of this motor. It also shows the push and enterprise of the *Star* people.

NEW EQUIPMENT COMPANY.

The Street Railway Equipment Company, 617–619 Pullman Building, Chicago, Ill., has just been organized with Mr. W. R. Mason as general manager, for the purpose of manufacturing and dealing in electric railway supplies for use on all systems. As the company's representatives have had long and practical experience in all branches of the business, its ability to successfully meet all requirements is unquestioned, and railway officials about to equip their systems will no doubt find it to their advantage to correspond with the company before giving out their contracts. A catalogue will soon be issued by the company, fully illustrating and describing material of its manufacture, also containing data of great interest to builders, owners and managers of electric roads.

Mr. Mason has a host of friends in the trade, and no doubt there will be a great desire among them to see him make an unqualified success of his new venture. These are our sentiments, exactly.

BALL ENGINES.

The following letter to the Ball Engine Co., Erie, Pa., maker of the well-known Ball engines, is self-explanatory:

WARRENTON ELECTRIC COMPANY,
WARRENTON, MO., April 18, 1892.

BALL ENGINE CO., Erie, Pa.

DEAR SIRS: We started the engine purchased from you for our electric plant last night, and the way it moved off was beautiful to behold. It is certainly a very fine and powerful piece of machinery. No vibration, no noise; in fact and in short, it is perfect in every part and way. The satisfaction it gives is a pleasure to us, and must be gratifying to you.

Yours respectfully,
C. E. PEERS, *President.*

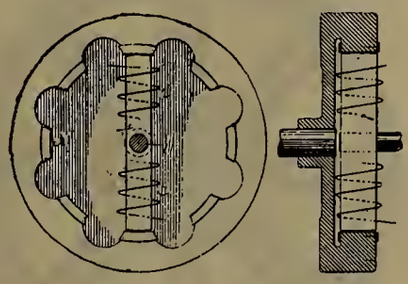
The Electrical Age's Illustrated Patent Record.

Issued April 19, 1892.

473,003. Heating and Welding by Electricity. Henry Howard, Halesowen, near Birmingham, England. Filed Oct. 21, 1891.

473,024. District-Telegraph Box. Charles Selden, Baltimore, Md. Filed June 15, 1885.

473,042. Electric Clutch. Peter W. Willans, London, England. Filed July 21, 1891.



473,042.—ELECTRIC CLUTCH.

473,045. Lightning-Arrester. Montraville M. Wood, Chicago, Ill. Filed June 20, 1891.

473,061. Electric Lock. Charles H. Crockett and Chancellor C. Allen, Boston, Mass., assignors to the Boston Electric Company, same place. Filed May 5, 1888.

473,076. Electric-Arc Lamp. Octave Patin, Paris, France. Filed April 11, 1891.

473,077. Armature-Core for Electric Motors. David Pepper, Jr., Philadelphia, Pa. Filed July 24, 1891.

473,078. Armature-Ring. David Pepper, Jr., Philadelphia, Pa. Filed Dec. 3, 1891.

473,089. Testing-Apparatus for Trunk-Lines of Telephone-Exchanges. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed March 13, 1885.

473,105. Electrolytic Apparatus for Separating Gold and other Metals from their Ores. George J. Atkins, London, England. Filed April 28, 1891. Patented in England, in France, in Germany, in India, in Cape of Good Hope, in Natal, in Canada, in Victoria, in New South Wales, in South Australia, in Tasmania, in Queensland, in New Zealand, in Spain, in Austria-Hungary and in Transvaal.

473,117. Electrode for use in Electro-Metallurgical Processes. Paul Héroult, Neuhausen, Switzerland, assignor to the United States Aluminium

473,228.—ELECTRIC SWITCH.

Metal Company, of New York. Filed Sept. 3, 1889. Patented in England.

473,121. Electrical Annunciator. Thomas W. Lane, Boston, Mass., assignor to the Electric Gas Lighting Company, of Maine. Filed Dec. 15, 1890.

473,132. Electric Switch. Francis H. Soden, Chicago, Ill. Filed July 2, 1891.

473,133. Electro-Therapeutic Heating-Pad. Francis H. Soden, Chicago, Ill. Filed Sept. 1, 1891.

473,134. Electric Switch. Francis H. Soden, Chicago, Ill. Filed Oct. 26, 1891.

473,146. Secondary Battery. Harry E. Dey, New York, N. Y., assignor to Phœbus H. Alexander, same place. Filed Sept. 10, 1890. Renewed July 8, 1891.

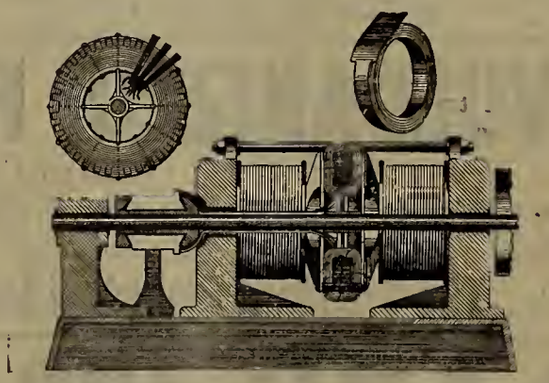
473,147. Secondary Battery. Harry E. Dey, New York, N. Y., assignor to Phœbus H. Alexander, same place. Filed Sept. 17, 1890. Renewed July 8, 1891.

473,158. Hanger for Electric Wires. Thomas Imeson, Lewis D. Tibbets and Charles L. F. Kellogg, Seattle, Wash. Filed Feb. 2, 1892.

473,174. Electric Indicating System and Instrument. Henry J. Haight, New York, N. Y. Filed Dec. 15, 1891.

473,195. Commutator-Brush. George Meyer, Indianapolis, Ind., assignor to Fred L. McGahan, same place. Filed June 6, 1891.

473,208. Incandescent Electric Lamp. Augustus



473,363.—ARMATURE FOR DYNAMO-ELECTRIC MACHINES.

C. Carey, Lake Pleasant, Mass. Filed Dec. 1, 1891.

473,228. Electric Switch. Edward H. Johnson, New York, N. Y. Filed Aug. 25, 1891.

473,229. Electric-Light Support. George M. Kim, Allegheny, Pa., assignor to the Keystone Mast-Arm Company, same place. Filed Oct. 10, 1891.

473,240. Lamp-Shade and Holder for Incandescent Lamps. George F. Seavey, Boston, Mass. Filed Aug. 6, 1891.

473,253. Converter System for Electric Railways. Mark W. Dewey, Syracuse, N. Y., assignor to the Dewey Corporation, same place. Filed June 25, 1889.

473,256. Telephone-Receiver. Edwin C. Hess, Camden, N. J. Filed July 1, 1891.

473,267. Electric Cable. William H. Sawyer, Providence, R. I., assignor to the American Electrical Works, same place. Filed Oct. 27, 1891.

473,282. Cut-off for Electrical Machines. James P. Woolley, Simcoe, Canada. Filed Nov. 23, 1891.

473,283. Electric-Arc Lamp. Thomas E. Adams, Cleveland, Ohio, assignor to the Brush Electric Company. Filed July 8, 1890.

473,288. Electric Railway-Signal. John M. Brasington, Morven, N. C. Filed July 24, 1891.

473,341. Electric Odometer and Speed-Indicator. William A. Phillips, U. S. Army. Filed March 19, 1891.

473,351. Electric Cable. William H. Sawyer, Providence, R. I., assignor to the American Electrical Works, same place. Filed Oct. 27, 1891.

473,352. Electric Cable. William H. Sawyer, Providence, R. I., assignor to the American Electrical Works, same place. Filed Oct. 27, 1891.

473,353. Electric Cable. William H. Sawyer, Providence, R. I., assignor to the American Electrical Works, same place. Filed Oct. 27, 1891.

473,361. Multiple-Arc Railway System. Sidney H. Short, Cleveland, Ohio, assignor to the Short Electric Railway Company, same place. Filed Jan. 8, 1890.

473,362. Trolley Switch. Sidney H. Short, Cleveland, Ohio, assignor to the Short Electric Railway Company, same place. Filed Jan. 8, 1890.

473,363. Armature for Dynamo-Electric Machines. Sidney H. Short, Cleveland, Ohio. Filed June 10, 1891.

473,364. Armature for Dynamo-Electric Machines. Sidney H. Short, Cleveland, Ohio. Filed June 19, 1891.

473,365. Gearless Motor for Electric-Railway Cars. Sidney H. Short, Cleveland, Ohio. Filed June 24, 1891.

SUBWAYS.

There will be some activity in subway work in this city during the coming summer. About fifty streets have been named in which subways will be built, although in those that have been repaved by Commissioner Gilroy the ducts will have to be laid under the sidewalks. If some reliable method of placing them under the sidewalk can be devised we see no reason why greater satisfaction should not result, because wires thus laid should be more accessible than when laid in ducts under the roadway.

NEWS FROM PHILADELPHIA.

With the opening of spring Philadelphia returns to life and activity. The *Press* of that city, on April 27, announced that a "gigantic electric combination has been effected by the Thomson-Houston and Edison General Electric Companies," going into all the details with which the public all over the country outside of Philadelphia were made familiar two or three months ago.

What care the Philadelphians, any way, about electrical trusts or any other kind of trusts during the chicken-hatching season, and when the golden creamery butter is being churned for the voracious New Yorkers?

ADVERSE INFLUENCES AGAINST STREET RAILROADS.

In recent times the sentiment has developed among the masses that railway and other corporations are not entitled to any consideration when they are brought to court on the complaint of an individual or individuals. They seem to be a sort of prey for unscrupulous lawyers who, in order to create business for themselves, make it their duty to urge legal action against railroad corporations on the most trivial grounds, and too frequently they win their case simply because of this unaccountable and unreasonable prevailing sentiment.

This class of lawyers is found in all large cities and is growing rapidly. If a person gets a slight injury or even a scratch on a street car, whether it be due to his or her own carelessness or not, legal proceedings against the company are urged by one of these predatory lawyers, and the chances are the trial jury will decide against the company, so prevalent is this inordinate feeling against corporations.

In an article which will be found on another page the author very ably points out the tendency of juries to decide against corporations whether the evidence warrants such action or not; in short, justice is not dealt out as it should be, owing to this prejudice, and unscrupulous lawyers are constantly on the lookout for cases of injury, however trivial they may be, in order that they may incite an action against the company in behalf of the injured one, and they are apparently a thriving lot. The fact that many juries are so prejudiced is what emboldens these lawyers and prompts them to carrying on their unjust business.

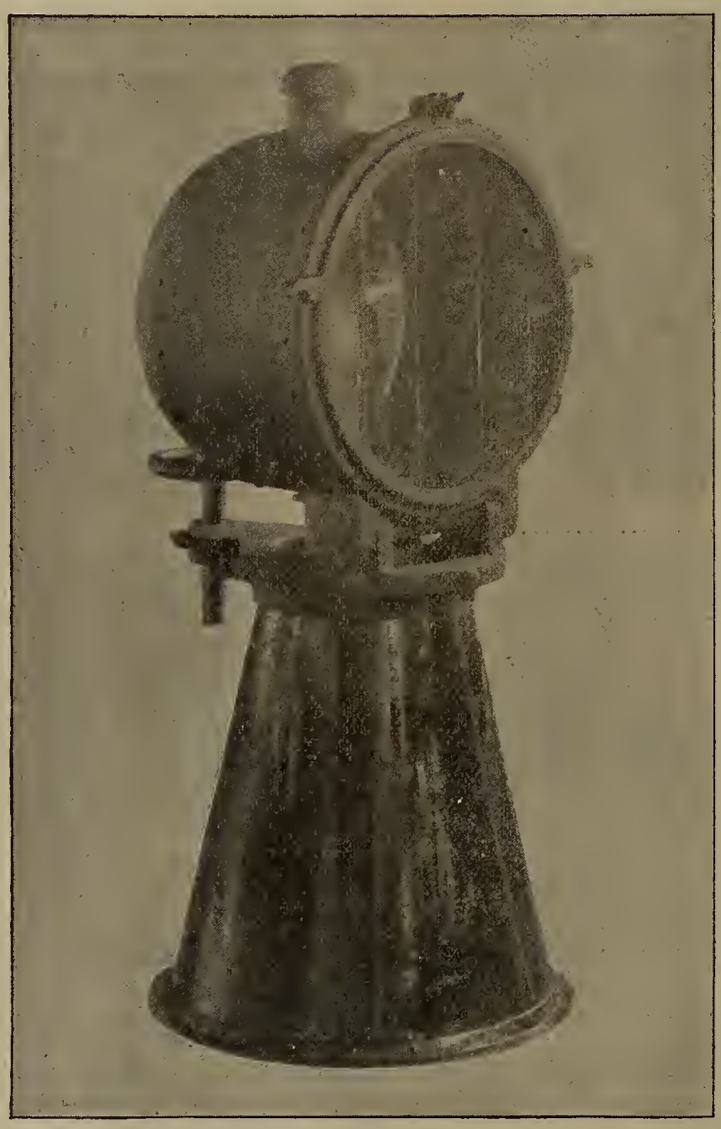
It is not fair that street-railroad companies should be held responsible for accidents which are due to the carelessness of the victims themselves, but very often they are by biassed juries.

It is often said that corporations have no soul. It is a good thing for them that they have not; if they had they would be sorely tried with lawyers, juries and politicians against them.

SEARCH-LIGHT PROJECTOR.*

A search-light projector, recently designed by this company, and known as the new "D" type, is described and illustrated below. Figure 1 shows the side and front view, and Figure 2 the lamp mechanism, which will give a good idea of the general style of this projector.

The lamp is designed to run on an incandescent circuit with a potential of 50 to 55 volts, at which it requires about 15 ampères of current and gives a light of 3,000 C. P. A suitable resistance is placed in series with the lamp to permit its adjustment to the potential of different circuits upon which it may be used. The lamp is both self-regulating and self-focusing. The lower carbon is pressed upwards against fixed stops by a spiral spring, thus maintaining the arc in the focus of the reflector. A hand adjustment is provided for raising and lowering these stops, by which the vertical position of the arc can be altered. The upper carbon falls by gravity, its descent being perfectly regulated by the lamp mechanism, so that great steadiness of light is obtained. The negative carbon being placed a little back of the line of the positive carbon, a crater is thus formed on the side of the latter, and nearly all the light is thrown toward the reflector. A ventilating hood on the top of the drum provides an escape for the heat.



SEARCH-LIGHT PROJECTOR.

The drum is of iron and 18 inches in diameter. A highly polished silver-plated parabolic reflector 17 inches in diameter, with 5-inch focus, is mounted at one end of the drum on a finely threaded screw-piece, by which it can be moved to or from the arc. By this means the light can be concentrated in a narrow beam or be widely diverged. The usual focus in projectors of this class is from 2 inches to 3 inches, and considerable advantage is derived by the increase in focus obtained in this projector. A fine hole is drilled through the screw-piece on which the reflector is mounted, through which the exact position of the arc is shown on a small piece of ground glass.

The drum is provided with vertical and horizontal adjustments. The vertical adjustment is effected by means of a hand-wheel operating a double-threaded screw. It has a vertical movement of thirty degrees, 15 degrees above and 15 degrees below the horizontal line, which is sufficient for ordinary purposes.

The horizontal adjustment permits a complete revolution of the drum upon its base, so that the light can be readily thrown toward any point of the compass. By means of a clamp-screw the drum can be quickly fastened in any position.

Provision is made for a card attachment in order that the projector may be operated from a distance if preferred, as for instance from the pilot house, when the projector is set at the bow or any other part of a vessel.

The connecting terminals for the lamp are placed on opposite sides of the drum, the conductors can therefore be brought up in the form of spirals without risk of their "crossing."

The height of the projector is 48½ inches, and the centre of the reflector is 36 inches above the bottom of the base. The floor-space required for the base is 22 inches in diameter. This projector is simple, strong and substantial, and all the parts have been arranged with a view to secure efficient and easy operation. It is estimated that in clear weather the beam of light will have an effective range of 2,000 yards. The compactness of the entire apparatus renders it especially advantageous for use on vessels, wharves, etc.

* Edison General Electric Co., New York.

AMENDING THE PATENT LAWS.

The United States patent laws will likely be amended and revised during the present session of Congress, the House Committee on patents having on April 23 ordered a favorable report on a bill introduced with this object in view. The bill allows a patent to any person who has invented or discovered any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement thereof, not known or used by others in this country and described in any printed publication in this or any foreign country before his invention or discovery, and not in public use or on sale or described in any patent or printed publication issued in this country for more than two years prior to his application, unless it is proved to have been abandoned.

No person shall be debarred from receiving a patent for his discovery or invention, nor shall any patent be declared invalid by reason of its having been patented or caused to be patented in a foreign country prior to the application for a patent on the same invention in this country, but every such patent granted hereafter is to be limited in duration to the term for which any such prior patent had been granted, or, if there be more than one foreign patent prior to the filing of the application

in this country, then the patent granted is to be limited in duration to the shortest term for which the prior foreign patent had been granted, but in no case is any such patent to be granted for a term exceeding seventeen years.

It is also provided that whenever a patent is altered to be infringed, the patentee is to seek his remedy by bringing suit in the first instance against the manufacturer or vender of the article alleged to have infringed on the patent, and is in no case to bring suit against any individual who has purchased in good faith an article of a regular dealer in the open market for his own use; provided, that the individual purchaser must give to the patentee, at his request, the name and residence of the party from whom the article was purchased. The exemption from liability of the individual purchaser is not to apply to any corporation, firm, or company, nor to any corporation or party as to any patented machine or process made or used by them for the manufacture of an article or product for sale.

WATER WHEEL.

One of the most remarkable mine water-power plants in existence is that in the Chollar shaft in the Comstock lode. There are six Pelton water-wheels running under a vertical pressure of 1,680 feet, giving an efficiency of 88 per cent. With the exception of replacing a few buckets, no repairs have been needed in three years. Pelton wheels are guaranteed to give an efficiency of 85 per cent. under all heads and from every variety of application.

INTERESTING LECTURE.

Dr. W. M. Hutchinson gave a very interesting lecture on "Electric Lighting" at a meeting of the Plymouth League, held in the Sunday-school room of Plymouth Church, Brooklyn, on April 25. Several experiments were made during the course of the lecture, and clicited much applause.

The doctor was furnished the material for his experiments by the Baehr Electric Manufacturing Co. and General Manager Barstow, of the Edison Co., of that city.

MECHANISM OF SEARCH-LIGHT PROJECTOR.

STREET RAILWAY SUPERINTENDENTS ORGANIZE.

The Massachusetts Street Railway Superintendents' Association was organized at Spencer, Mass., on April 26.

At the invitation of Mr. George A. Murch, Superintendent of the Worcester, Leicester and Spencer Street Railway Company, fourteen street railway superintendents visited Worcester on April 26, and in company with some twenty-three invited guests took a special car for Spencer. A stop was made at Leicester for the purpose of inspecting the car and power station and the offices of the company. On arrival at Spencer the party repaired to the Massasoit House, where arrangements had been previously made for a collation. After the wants of the inner man had been satisfactorily taken care of, the party adjourned to the parlors of the hotel, which were temporarily turned into a meeting room, and the business of the day, that of forming the organization, was thereupon proceeded with.

Superintendent Murch presided over the meeting, and explained the objects of the proposed organization. Great benefit, he thought, would be derived, both by the companies and themselves, by being brought more closely into communication with each other, as they would thereby be enabled to profit through the interchange of ideas and experiences.

After several other speeches in favor of the movement had been made, Mr. Murch was unanimously elected president. The other officers elected were: B. J. Weeks, superintendent of the Boston and Quincy Road, vice-president; F. G. L. Henderson, of the Newton Street Railway Company, secretary and treasurer.

It was voted to authorize the officers of the association to formulate rules and by-laws for the guidance of the organization. The admission fee was placed at $5, and the secretary was instructed to invite all superintendents to join.

Those present were: B. J. Weeks, Quincy; F. G. L. Henderson, West Newton; M. E. Carter, Attleboro; N. Wentworth, Malden; S. S. Heywood, Salem; C. E. Smith, Boston; N. A. Morton, Lawrence; R. E. Morton, Lawrence; J. O. Sherwin, Woburn; James J. Hennessy, Framingham; R. E. Bradford, Providence; R. Sennette, North Carolina; Charles Page, Toledo, Ohio; Hon. Samuel Winslow, G. A. Murch, I. E. Bigelow, H. J. Newton, S. Lamoine, of Worcester; Edwin Watson, J. B. Gorman, W. S. Wittemore, of Leicester, and O. A. Freeman and George F. Madison, of Spencer.

A large warehouse at the corner of 31st st. and Blaisdell avenue, for use as a supply depot, at a cost of about $7,000, is to be built by the Minneapolis Street Railway Company, Minneapolis, Minn.

GILLETTE MAGNETO BELL.*

A constant source of annoyance to the occupants of residences, apartment-houses, offices, hotels, factories, etc., is the incessant failure of electric bells and door-openers to operate, due principally to improper care of the batteries. Our illustrations and description, then, of a new system of operating electric bells, etc., without the aid of a battery, and claimed to be absolutely reliable and efficient, requiring practically no attention and on which time and wear has no appreciable effect, will appeal to

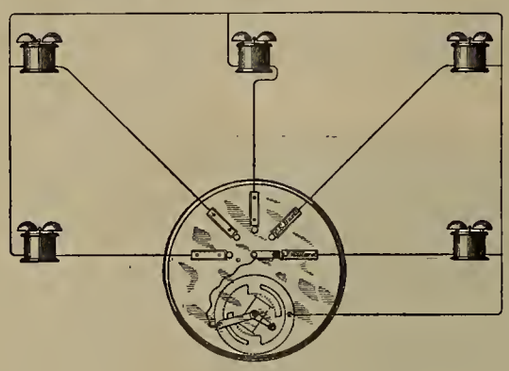


FIG. 1.

the sympathies of a long-suffering humanity. This system is that of the Gillette magneto bells, and in Fig. 1 will be seen a diagram of its operation in flat-houses. It consists of a dial, on which is placed the name-plate and a corresponding number of points, also a switch or handle to place on any one of the points opposite name, and by turning the lower handle it will ring the bell in the apartment or on the floor desired. The diagram represents a five-bell connection, and it can be readily seen how the circuits are run from each name-plate or point. One or all of the five bells may be rung simultaneously or separately.

The active principle of this system is electro-magnetism, a constant and powerful resource on which time and wear have not the slighest effect.

Fig. 2 gives a side view of the generator by which the system is operated, and in Fig. 3 will be seen a face view of it.

Fig. 4 is a cut of the bell used, which is a little larger than the common three-and-one-half-inch electric bell, and rings as loud. These bells are claimed to be equal

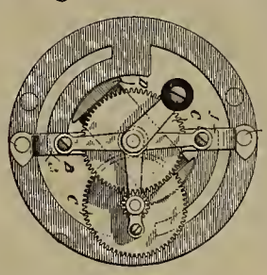

FIG. 3.

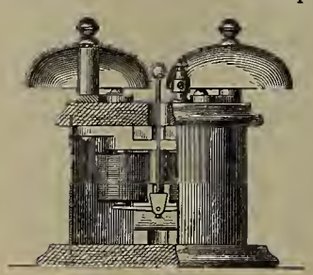

FIG. 4.

if not superior to the best in the market in every particular, and specially adapted for a variety of uses.

Fig. 5 shows them as applied to telephones.

In houses or places already wired for electric bells, the Gillette system may be substituted by simply removing the old bells, leaving the wires as they were.

ELECTRIC COTTON-GIN.

We have received from the Department of Electrical Engineering, Agricultural and Mechanical College, Auburn, Ala., a sample of the first cotton ginned by electricity.

*Joseph F. Bray & Co., 221 8th avenue, New York.

QUARTZ FIBRES FOR SUSPENSION PURPOSES.

In the electrical laboratory of Queen & Co., Philadelphia, have recently been made a series of careful experiments upon the properties of quartz fibres for use in suspending galvanometer systems and in other physical measurements as compared with fibres of glass, metal and cocoon silk. These tests have shown conclusively that quartz fibres are so greatly superior to all

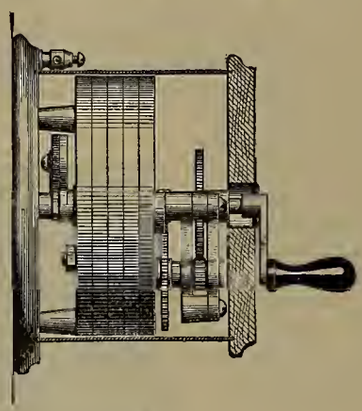

FIG. 2.

others in every way, that the above-mentioned firm has decided to prepare them for sale, and the following details will be of much interest to our readers.

These fibres are drawn in the oxy-hydrogen flame from pure rock quartz, their diameter being regulated by the speed of drawing. As to size, it is possible to draw them from those too fine to manipulate (less than $\frac{1}{10000}$ inch) up to rods $\frac{1}{10}$ inch in diameter, and in lengths (for diameters less than $\frac{1}{10000}$ inch to $\frac{1}{100}$ inch) as desired. Inspection with a microscope shows that they are extremely uniform in diameter and contain no "fishes" or flaws of any kind.

The principal advantages possessed by quartz fibres over all others are, first, perfect elasticity; they show absolutely no "Nachwirkung" or "set," and when twisted come back to the same position immediately; it is thus possible to reach a much higher degree of sensi-

FIG. 5.

bility with a galvanometer using a quartz fibre in place of unspun silk, for, as is well known, a cocoon fibre, to which is attached a system under small controlling force will not return at once to the zero point within 5 % of the total deflection. Quartz fibres are also absolutely unaffected by ordinary changes of temperature or atmospheric conditions, whereas silk fibres, absorbing greater or less amounts of moisture at different times, will have correspondingly different zero points.

The tensile strength of quartz fibres is from 50 to 70 tons per square inch, which is nearly as great as the best steel, and many times that of silk. Fibres of extreme fineness may consequently be used; as for example, a quartz suspension $\frac{1}{10000}$ inch in diameter will sustain a weight of $\frac{1}{2}$ gram. They are, however, very easily broken by lateral stress, and it is therefore raised or lowered as a whole instead of attempting to bend them around a spindle, although the finer ones can be successfully wound upon spindles of $\frac{1}{2}$ inch or greater diameter.

The uses of quartz fibres are various; they can be employed advantageously for the suspension of all delicate electrometer and galvanometer suspensions. They may also, as suggested by Mr. Boys, be used to suspend very small bodies, the specific gravities of which are required to be ascertained, as there is practically no capillary attraction between the fibre and water. Being unaffected by heat and of very uniform diameter, they are excellent for use as cross-hairs in telescopes and microscopes.

For further information regarding quartz fibres, our readers are referred to a paper by V. C. Boys "On the Production, Properties and Some Suggested Uses of the Finest Fibres," *Phil. Mag.*, 1887; also a paper by Prof. Richard Threlfail on "Elastic Constants of Quartz Threads," *ibid.*, 1890.

"THE HOLE IN THE JAR."

Every one who has had anything to do with gravity batteries knows how difficult it is to keep the copper elements in place in the cells. The least disturbance will cause them to get on top of the bluestone, in which condition the cell naturally becomes inefficient. Some simple means, therefore, of avoiding this difficulty would meet with a hearty welcome by those whose duty it is to care for batteries of this type and who appreciate the vexations caused by this tendency of the copper and bluestone to exchange places.

A very simple remedy for this difficulty has been designed and patented by J. Jones & Son, 602 and 604

FIG. 1.

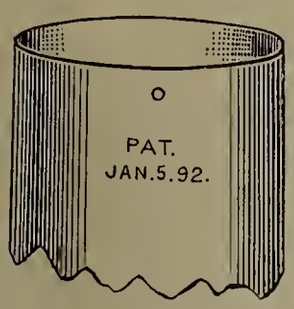

FIG. 2.

West 22d street, New York City, illustrations of which are given herewith. It consists of providing a hole in the side of the jar near the top, through which the insulated conductor connected with the copper is passed. This is accomplished by passing the wire over the edge of the jar, then bending it over backwards and putting it through the hole, then bending it again upwards. It will thus be seen that a sort of a half-hitch is made with the wire, which holds the copper securely against the bottom of the jar and prevents its easy displacement by ordinary handling of the cells.

This simple remedy means a more efficient battery and longer life; the current is of course steadier and the internal resistance of the cell remains practically invariable.

Fig. 1 shows a cell of the old style of gravity battery, with the copper displaced by the bluestone, throwing the copper well into the solution above the copper line.

Fig. 2 shows the hole cut in the side of a jar, and Fig. 3 represents the advantage of the new style, showing that it is possible to lift a cell up by the wire without displacing the copper.

This simple but ingenious remedy should take well in the trade, and will be a boon to battery-men. It is known by the name of "Hole in the Jar."

A PROPERLY MADE FAN.

We illustrate below a brass fan made by Holmes, Booth & Haydens, of New York, and Waterbury, Conn., for electric motors.

FIG. 3.

Such fans heretofore made were so out of balance that a perceptible jarring accompanied their use, and the blotches of solder carelessly affixed to the blades to effect a balance, produced noise enough to shame a Japanese humming-top.

Experience has been availed of to form a fan that

BRASS FAN.

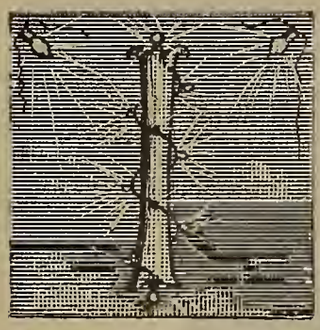
will distribute the breeze from it, and not throw it as a gleam from a search-light, as many fans do.

The high speed of a motor-fan requires absolute mechanical efficiency to insure safety.

Being finished by the Lamp Department of this firm, an elegance is secured which makes these fans decidedly ornamental.

They are of all sizes from 5 to 15 inches, and lacquered or silver-plated. Fan-guards are also made for any size fan.

SMALL LAMPS FOR DECORATIVE PURPOSES.



IMPROVEMENTS in the methods of electric lighting and new and novel changes in their adaptation are now being made so rapidly that the finite mind of the average electrician finds difficulty in becoming acquainted with their protean developments. The old and fast-disappearing illuminant which our fathers considered as the *ultima thule* of lighting has been put to many and varied uses, but they are as nothing when compared with the multifold duties which electric incandescent illumination has been called upon to fulfil. The supersession of the light which can only burn in the upright position is an accomplished fact, which but a short time more will render universal. Retrospect with our unveiled eyes reveals a great step in advance—a material progress of such vast magnitude that the bewildered brain almost withholds credence.

The incandescent lamp with bulb and hair-like filament, which has glowed itself into our high appreciation during the past eight years, has been subject to stresses of evolution similar to those which every other department of practical electrical adaptation has undergone. The familiar luminous pear-shaped lamp of sixteen candle-power is not, however, suitable for every requirement in these increasingly fastidious times. Occasions have arisen where decorative effects have been desired but have remained unattained, the sixteen candle-power lamp being inappropriate on account of its size. As, for instance, in dainty boudoirs or salons where side-brackets are used instead of the centre pendant chandelier, or in a palace, where the interior decorations are splendidly ornate. The use in these cases of the larger lamp would justly be considered an anomalous inartistic intrusion. The character of electric illumination is fast changing. Instead of the large 16 candle-power lamp we can now have a number of smaller lamps of varying intensity, so distributed as to render the same amount of light, but more diffuse and agreeable and less obtrusive.

This change the Edison General Electric Company has not been slow to recognize. In its lamp works at Harrison, experiments have been proceeding for the past six or eight months, all pointing to the invention and perfection of smaller lamps, which could appropriately be used for almost all requirements. The success which has crowned their efforts has been signal, and the perfected small incandescent lamp is now an accomplished fact.

The uses to which these small lamps can be put are too numerous to catalogue. Socketed in a wall-bracket at the top of an imitation candle they simulate the flame of the wax light highly intensified. Studded in numbers in the ceiling of some vast ball-room, they diffuse a soft radiance unattainable by any other means, or they can be concealed in flowers and under leaves in a table-piece with exquisite effect.

Their purely commercial adaptation will, however, appeal most strongly to the practical man. The theatre manager is heartily tired of his stained-glass transparency with the flickering gaslights behind it, over the entrance to his play-house. He wants something more novel and effective. This the use of these small lamps will give him. The retail storekeeper desires some sign characteristic of his business. It can be artistically devised, and the little incandescent sparkles flashing from it will give it a value of peculiar attraction.

These small lamps can be grouped to form any letters of any size or shape, in any colors. By the aid of a special switch actuated by electricity or otherwise, they can be made to flash and die out alternately at fixed intervals, or all can be flashed at a time.

The Actors' Fund Fair at Madison Square Garden will afford electricians the first opportunity of beholding and appreciating the progress that has been made in this direction. The entire illumination of the Fair and the booths has been confided to the Edison General Electric Company in so far as the lamps and special designs and apparatus are concerned, and every lighting effect produced will be absolutely novel. Each stand will be especially illuminated by means of the beautiful small lamps, and among the wonders of the Fair, the great electric decorative illumination will be, perhaps, the greatest and most worthy of attention.

THE BROOKLYN ELECTRIC ROADS.

Preparations for the conversion of its various lines into electric systems are being rapidly pushed by the Brooklyn City Railroad Company, Brooklyn, N. Y. The Second avenue, Fort Hamilton and Hamilton avenue lines will start out with 55 new 34 ft. open cars; 20 to be made by the Lewis & Fowler Mfg. Co., Brooklyn, N. Y.; 20 by the J. M. Jones' Sons Co., Troy, N. Y., and 15 by the J. G. Brill Co., Philadelphia, Pa. They will each be equipped with two 25 H. P. Thomson-Houston waterproof motors. The Lewis & Fowler and Jones cars will have Robinson radial trucks, and the Brill cars maximum traction trucks.

For the present, the old road-beds will be used, and it is said that the new system will surely be inaugurated by Decoration Day, if not before. The power-plant will consist of 4 McIntosh & Seymour 400 H. P. engines, with 4 Thomson-Houston 75 K. W. generators connected to each engine. A new 10,000 horse-power plant is being built, the foundation having been already commenced, and every effort will be made to have two engines running by October next. This plant will be used to run the Third avenue, Flatbush avenue, Fulton avenue and Court street lines. The company will repair the old cars and dummies for the new road to run from Ridgewood to Richmond Hill, L. I.

A SUCCESSFUL ROAD.

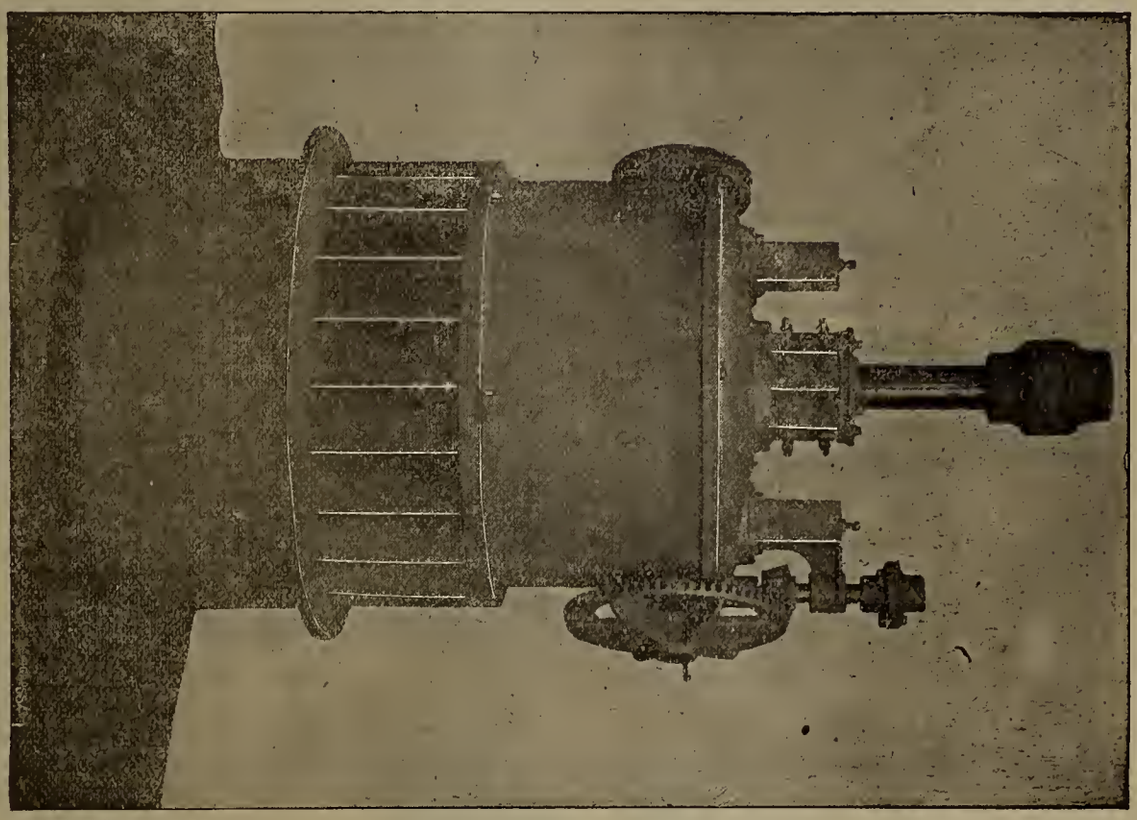
The electric road between East Liverpool and Wellsville, Ohio, although only opened for traffic about five months ago, has met with such phenomenal success as to necessitate the doubling of its equipment. This road, which consists of eight miles of overhead construction and eight cars, was completed in exactly three months from the day when the ground was broken, the work being superintended by Mr. Al. Johnson, an indomitable worker, and it is said to be one of the finest to be seen. Messrs. Al. Johnson, S. H. Short and C. E. Grover, all of Cleveland, compose the company, and have awarded the contracts necessary for this additional equipment. The J. G. Brill Company, Philadelphia, are just completing eight fine open cars, somewhat unusual in the fact that they are eight instead of seven bench cars, and for these cars the Short Electric Railway Company, of Cleveland, Ohio, will furnish 16–20 H. P. single-reduction motors and two additional 133 H. P. generators.

E. H. Jones & Company, of Cleveland, who put in the first steam plant, are also doubling their part of the equipment.

It is a curious fact, to be explained only by the character of the manufactories in Wellsville and East Liverpool, that these towns, the total population of which is 16,000 people, can support a street-railway system larger than that to be found in some cities of 40,000 and 50,000 inhabitants.

VICTOR TURBINE.*

The Victor Turbine has achieved remarkable success, being used extensively in all parts of the world, its superiority having been demonstrated not only in the testing flume, but in the vast number of promi-



CYLINDER GATE.

REGISTER GATE.

nent manufacturing establishments of all kinds which have it in use. Until recently only turbines with a register-gate were made by the manufacturers, and in a great majority of cases that style meets all the requirements admirably, and is preferred on account of its simplicity, ease of operation, quick regulation, etc. There are, however, situations where a cylinder-gate is preferred, and to meet this demand the manufacturers have perfected and put on the market the style known as the "Cylinder-Gate" Victor Turbine. Our illustrations show both the "Register-Gate" and "Cylinder-Gate." A separate catalogue is published for each one of these wheels, and will be furnished by the manufacturers to interested parties on application.

The "Cylinder-Gate" Victor Turbine has been carefully tested in the Holyoke testing flume with

* Stilwell & Bierce Mfg. Co., Dayton, O.

gratifying results, not only as to high efficiency, but as to power, it being developed that the power of this wheel was very much larger for its diameter than any known turbine. This is a very important feature, as by using this wheel a manufacturer wishing to increase his power by using a turbine of same diameter as the one he had in use, could do so, thus avoiding any change in gears, etc.

The tests also developed a remarkably high efficiency at part gate in all stages of the gate opening from one-half to full gate.

These turbines are built in sizes ranging from six inches to sixty inches diameter, on vertical or horizontal shafts, in a great variety of plans adapted to all classes of establishments, from the simple country mill requiring fifty horse-power or less, up to the mammoth cotton-mills, paper-mills or electric plants consuming many thousand horse-power.

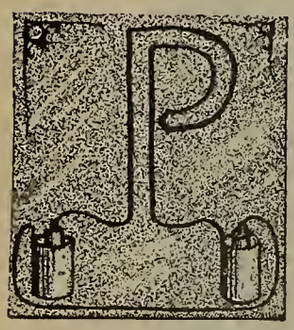
The manufacturers are also provided with a very complete line of patterns of all kinds of modern appliances for transmitting power, and make a specialty of complete water-power plants for all purposes.

The electrical transmission of power over long distances is a demonstrated commercial success. This fact gives an immediate value to water-powers, which have hitherto remained unimproved because located more or less remotely from transportation lines, or because the local demand for power was not sufficient to justify the expense. Our country abounds in such water-power, many of them of immense magnitude, and it is only a question of time when they will be improved and the power generated, transported by wires to the surrounding cities and towns, and utilized for light, heat and power. In view of these facts, a new and increased interest attaches to the question of turbines, their construction and application.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Primary Batteries.



RIMARY batteries will always have a useful place in the active and rapidly expanding field of electricity. It is not many years ago that the primary battery was the only practical source of electricity that we had, but the invention and development of the dynamo has had the effect of somewhat limiting its uses and application.

Still, the dynamo has not encroached on the primary battery field to the extent that many suppose. The primary battery will always be useful for many purposes where it would be impracticable to use a dynamo for the generation of current.

The cost and expense of operating a dynamo is the greatest barrier to its use for small work; and there is no danger that it will to any great extent take the place of batteries in such work as ringing bells, making delicate tests, operating medical apparatus, etc., etc. In these applications the primary battery will likely hold its own for a long time to come, and particularly for experimental work in the laboratory or at home; therefore, it is by no means a "thing of the past."

In our previous articles we have considered subjects pertaining to the dynamo and its operation; for a change, we propose to direct our attention briefly to primary batteries, in view of the fact that this form of electric generator still occupies an important position in the electrical field.

The word "battery" properly refers to more than one cell; a battery, therefore, is composed of two or more cells, although the word is commonly applied to one.

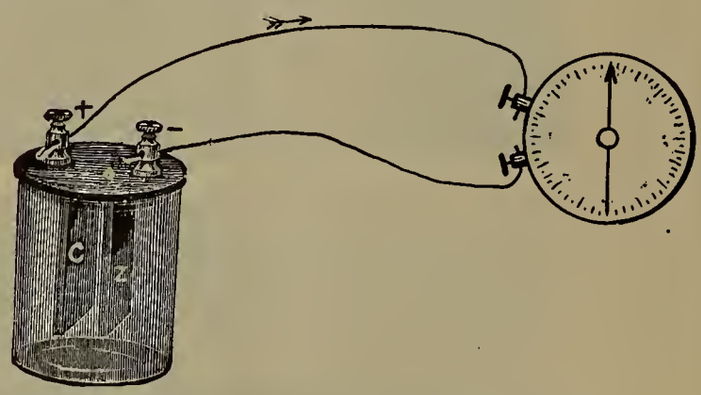
A cell, as is well known, consists of a vessel which contains the fluid, or electrolyte, and the electrodes. There are many makes of batteries, but for our present purpose we will consider the simplest form, namely, a cell containing water with a little sulphuric acid in it, and elements of zinc and copper; all other batteries are modifications of this one.

If we take a jar of any material—glass, earthenware, hard rubber, etc., and put into it sulphuric acid diluted with from 10 to 20 times its volume of water, and in the water put a plate of copper and one of zinc—both metals being kept apart in the liquid—we have a simple voltaic cell.

So long as the metals are kept apart no apparent action takes place, but if we take a piece of bare wire and connect the two metal plates, a vigorous and visible action at once occurs in the cell, which continues as long as the copper and zinc are kept in contact by the wire.

The visible result of this action is the collection on that portion of the copper plate in the liquid of large numbers of bubbles. These bubbles are composed of hydrogen gas which is set free by the chemical action in the cell. As soon as the connection between the two plates is broken by removing the wire, the chemical action within the cell ceases and the evolution of hydrogen discontinues.

If we pass the current generated by this cell through



TEST FOR "POLARIZATION" OF SIMPLE VOLTAIC CELL.

a galvanometer (which is an instrument to measure galvanic current), we will notice that the current attains its full strength at the time the circuit is first established, and that it gradually grows less until it practically ceases. We will notice, moreover, that as the hydrogen bubbles multiply on the copper plate that the current grows correspondingly weaker. There is, indeed, a direct relation between these two phenomena; the current grows weaker on account of the collection of hydrogen bubbles on the copper for the reason that the bubbles form on the surface of the plate a film of gas which prevents the liquid from touching the plate—direct contact being essential to the generation and maintenance of the current. As soon as the hydrogen disappears or is removed from the copper plate, the current will be as strong as ever, only to be weakened again, however, as in the first place.

This phenomenon—*i.e.*, the collection of hydrogen bubbles and the consequent deterioration of the current, is termed "polarization." The effect of polarization is to weaken the current in two ways: first, because hydrogen being a poor conductor of electricity interposes a resistance to the flow of current from the liquid to the copper plate; and second, because it sets up an electromotive force in the cell in the direction opposite to that of the original current. Hydrogen, when freshly deposited, is a substance almost as oxidizable as zinc is,

hence the tendency is to start a current in the reverse direction, resulting in the reduced original current.

A continuous-working battery therefore should be provided with some means of preventing polarization; or, in other words, the accumulation of hydrogen gas at the copper plate. There are several ways in which the hydrogen may be either removed or prevented from accumulating. It may be accomplished mechanically by brushing the bubbles away, or by making the surface of the plate rough, with points; the gas, collecting with great freedom at these points, escapes and rises to the surface of the liquid, where it dissipates. The first means is, of course, impracticable, and the second has been used with partial success.

The accumulation of hydrogen can be prevented by chemical means—by adding to the acid some highly oxidizing substance which will destroy the hydrogen bubbles while still in the nascent state. ("Nascent" means the condition the hydrogen is in immediately it is freed from a previous chemical combination.) Such a substance is bichromate of potash. Inasmuch, however, as the various substances used for this purpose attack the copper as well as the zinc, the copper is substituted by a carbon element or plate.

It is possible also to prevent polarization by electrochemical means—that is, by using proper substances, so that metallic atoms shall be liberated instead of the hydrogen. The Daniell battery is an example of this kind of cell. A porous cup or cell containing the zinc element is placed in the liquid, which in this battery is a solution of sulphate of copper instead of dilute sulphuric acid. On the copper element metallic copper is deposited instead of hydrogen; this battery is practically constant in its output of current, and does not polarize.

Reverting to the original simple cell, it will be of interest to consider the reactions that take place within and without when the circuit is completed (by connecting the zinc and copper plates by a wire).

The zinc plate, dilute acid and copper plate form a combination capable of producing chemical action under certain conditions. Zinc is an element, and is symbolized in the list of elements by the letters Zn. Sulphuric acid is a compound substance; one molecule of the acid is composed of two atoms of hydrogen, one of sulphur and four of oxygen, and the chemical expression for it is H_2SO_4. Copper is an element, and is expressed chemically by the letters Cu, which stand for *cuprum*, Latin for copper.

Now when the plates or elements are not connected by a wire there is practically no chemical change in the constituent parts of the cell, but the moment a metallic connection is made between the elements, chemical reaction immediately takes place. This reaction is expressed chemically by the following formula:

$$\underset{\text{(circuit open)}}{Zn+H_2SO_4} = \underset{\text{(circuit closed)}}{ZnSO_4+H_2},$$

which means that the four atoms of oxygen and one of sulphur in the sulphuric acid combine with the zinc, setting the hydrogen free, which appears at the copper plate as bubbles. The combination of the zinc, sulphur and oxygen forms sulphate of zinc, which is expressed by the symbols $ZnSO_4$.

On a little reflection it will be evident to the beginner that if these reactions are continued a sufficient length of time the sulphuric acid will be entirely consumed or broken up, and its constituent parts separated, and in its place sulphate of zinc will be formed; such is the case.

Having considered the elementary form of a voltaic cell, we will now refer briefly to a type of cell which is a modification of the one just discussed, and which is very extensively used in experimental work, namely, the bichromate battery.

Sulphuric acid treated with bichromate of potash or sodium, in solution, forms chromic acid, which is rich in oxygen. This acid gives up its oxygen readily to nascent hydrogen, and for this reason is valuable as a "depolarizer" for batteries. A depolarizer is a substance which will prevent polarization of the cell.

The simplest form of bichromate battery consists of a glass or earthen cell, a plate of zinc, a plate of carbon (instead of copper) and the bichromate of potash solution as the electrolyte. It is usual to withdraw the zinc plates from the liquid when the battery is not in use, to prevent needless consumption of metal, which takes place within the cell.

The initial electromotive force of this battery is a little more than two volts, but the current gets weakened by continuous action on account of the exhaustion of the liquid in immediate contact with the plates. It, however, may be increased by agitating the liquid.

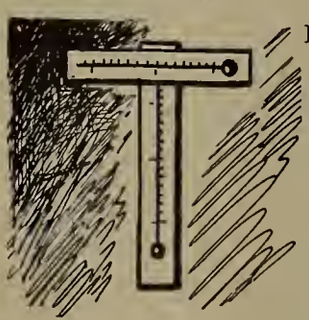
This battery gives a powerful current when the parts are properly assembled. By placing the zinc and carbon plates as close together as possible the internal resistance of the cell is reduced, and consequently the amount of current increased.

This battery is valuable for experimental purposes and half a dozen such cells will give a brilliant light by using a small incandescent lamp.

If any of our readers desire to more fully familiarize themselves with the different kinds of batteries made, their constitution, characteristics, uses, etc., the little book gotten up by Prof. H. S. Carhart, of the University of Michigan, will give them all the practical points they need. The title of the book is "Primary Batteries," and the price is $1.50. It can be obtained at the office of the ELECTRICAL AGE.

DEVELOPMENT OF HEAT.

BY J. H. GLOVER.

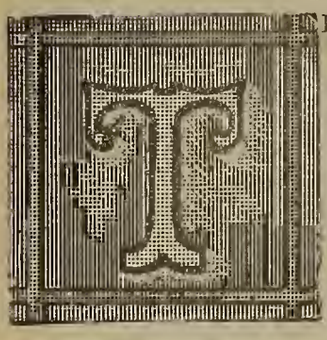


THE amount of heat developed by the urging of a current of electricity through a solid conductor is proportional to the total energy expended in the conductor, and this energy is proportional to the product of the strength of the current C, and the difference of potential E, between the extremities of the conductor necessary to produce that strength — or, the heat H developed is proportional to EC; but by Ohm's law, $E=CR$, therefore $EC=C^2R$. This shows that the heat developed varies directly as the resistance, and directly as the square of the current strength, and may be said to also vary directly as the potential difference; as, for example, by maintaining in two uniform conductors, A and B, a potential difference at the ends of one of them, A, twice that of the other, B, the heating effect will be quadrupled, for the current strength with equal resistances will also be doubled, and the rate of energy being expended in A will be four times that in B. On the other hand, if, with both conductors being equal in length and sectional area, the specific resistance of B is twice that of A, with the same potential difference being maintained in both of them, the resistance of B being twice that of A, the strength of current flowing through B will be halved. Therefore, if in A, $H=EC$, or C^2R, then in B, $H=\frac{1}{2}CE$, or $2R(\frac{C}{2})^2=\frac{1}{2}C^2R$. In this example there is developed twice as much heat and twice as much energy expended in A, as compared with B. Should the current in B be made equal to that in A, through the potential difference in the former being doubled, we would then have in A, $H=EC$ or C^2R, and in B, $H=2EC$ or $2C^2R$, which goes to show that the heat developed is doubled, and twice the amount of energy expended by doubling the resistance and keeping the current strength constant. The lesson here taught is that never by any possible means

can the amount of energy obtained by heat more than equal or exceed the amount of electrical energy expended or absorbed in the conversion.

THE INFLUENCE OF JURIES AGAINST STREET-RAILWAY CORPORATIONS.

BY J. M. BATCHELOR.



HERE are many facts to prove that there is a growing class of unscrupulous lawyers in nearly all the larger cities of the country who make it their special business to hunt up cases where people have sustained some injury, directly or indirectly, by means of steam or street railways, in order that they may have an opportunity to feed upon such railways through the prevailing tendency of juries to decide against corporations whenever the excuse offers. This habit of juries is well illustrated in the words of a Western judge, who recently said : "We affirm a good many unjust judgments against railways because juries will find verdicts against them if there be any pretext for so doing, and unless on a record there is such a want of evidence to support the verdict, or what evidence there may be in that direction is so overwhelmed by opposing evidence that the verdict is glaringly wrong, we have no right to disturb it."

It is difficult to learn where this jury prejudice originated ; that is, why a jury prejudice should exist against railway corporations as a class rather than against firms. But it exists, whatever the reason or its justice, as the above extract taken from the *Railway Review* well testifies, and the worst of it is, unscrupulous lawyers are in plenty to take advantage of it for the purpose of not only inciting cases into activity where the natural sense of the complainant would not dream of there being a case, but these lawyers make it their business to take up a case whether there is any justice on their side or not, well knowing that juries will give them the benefits of all doubts. A good instance in point is a suit brought against an ice company last month in Brooklyn, where, according to the complaint handed in, a boy was running after an ice-wagon to steal a ride, and while clinging to the wagon one of the cakes of ice worked loose and fell out on him and injured his head. The boy, through his guardian, brought suit against the ice company for ten thousand dollars damages. With such a precedent we may reasonably expect that burglars may be the next on the list to bring suit for any damages they may sustain while robbing corporations of their property. Of course it was unfortunate that the boy was injured, but the idea that the company is responsible under such circumstances is merely a part of that injustice which the judge above so well describes.

While this ice company is not a street railway, it is a good illustration of the same kind of suits brought against street railways and for precisely the same cause. Boys will steal rides, and many of them get injured while doing it ; in fact, boys worry bob-tail car drivers sometimes to an unbearable extent, and we have ourselves witnessed instances where we have thought the driver would have been justified in using some pretty severe measures to stop it. Yet if any injury happens to one of these painfully annoying children, an injury which they have wholly brought on themselves, a jury nine cases out of ten will decide against the company. Injustice of this kind is not in behalf of the public good ; it is a breeder of vice in itself. If a corporation is flagrantly or justly in fault not a word is to be said, but there is no sense in making a corporation responsible for accidents which are due to the carelessness or the mischief of the injured, or where every reasonable care has been taken by the corporation to avoid them.

Only a few days ago an honest and intelligent man was on one of these juries—his name is Henry George, well known in all parts of the country—and this man had the audacity to decide in favor of a street-railway company, greatly to the astonishment of the court, the jury and a large part of the press as well as the public. We say astonishment of these people, not that they were astonished through the nature of the evidence, as that was not a question in their minds, but the fact that Henry George, a professed champion of the people, should decide in favor of a street-railway corporation, whatever the nature of the evidence, seemed to be a point beyond the average understanding. When called upon to explain, to a reporter Mr. George said he decided in favor of the company because the evidence did not permit him to decide in any other way. This was a new view of the subject, and those who lost an absurd case that had according to evidence no excuse for existence, have not yet got over the striking impression made upon them by Mr. George's originality.

The elevated railway of New York City has hundreds of suits now against it which are awaiting their turn in the courts, aggregating in amount almost enough to swamp the entire corporation if all are decided against it. Lawyers are fattening on these cases, not because of their justice, but because there seems to be an opportunity to incite legal controversy and damages, which in most of them is more imaginary than real, oftentimes relating to some shadow that is cast on a neighboring property by the road's plant. The point we make here is not against any real damage to property recovering its loss, but that unscrupulous attorneys go about and incite factitious cases into existence—a practice which the attorneys think will pay because juries generally decide against corporations on principle.

Nor have we stated the worst of this issue. Politicians note this jury sentiment as an expression of the popular will, and in seeking votes to retain office they, when elected, look upon such decisions as models for their own conduct ; consequently, whenever any legislative measure is introduced at all calculated to antagonize transportation companies, without considering the justice of the issue before them they strive to flatter what they suppose is the voice of their constituents by voting against railway progress.

It is a sad confession to make, but it must be said the majority of the legislators, both state and national, do not vote upon the questions put before them from a standpoint of strict justice, but chiefly look upon all issues brought up for their consideration in the light of how they will affect the "party," or they vote in accordance with what they suppose will give them the best political "pull." So long as such a state of political morality more or less rules this country, unjust laws and decisions are likely to prevail. The only complete remedy is in the press, in the instruction the press can give the public by exposing the short-sightedness of everything contrary to a strictly just or honest policy. The root of the trouble is in compromising with crime, or compromising with oppressions, be such oppressions against corporations or against the humblest individual, and until the people themselves, their juries and their caucuses, rigidly stand by honesty in every form, it cannot be expected that legislators will so much oppose their own pockets as to antagonize the average will, wherever they are able to learn what that may be.

Electric locomotives are to be used in drawing trains through the tunnels on the Belt Railroad in Baltimore. The Thomson-Houston Electric Co. will equip the road.

ELECTRICAL SOCIETIES.

BROOKLYN INSTITUTE.

Mr. Douglass Burnett read a paper before the Department of Electricity, Brooklyn Institute, on Friday evening, April 29, entitled "The Electric Trolley and How it Will Benefit Brooklyn." The subject was illustrated by lantern photographs and apparatus.

THE MAGNETIC CLUB.

The spring meeting of this club was held at the "Columbia," on 14th street, New York, on the night of April 30, and was very largely attended, between 150 and 175 members and guests sitting down to the tables. The guest of the club was the Hon. James D. Reid, U. S. Consul to Dunfermline, Scotland, who has recently returned to this country on a vacation.

Mr. W. H. Baker, vice-president of the Postal Telegraph Cable Company, and vice-president of the club, occupied the chair in the absence of the president, Mr. E. C. Cockey.

After dinner Mr. W. J. Dealy, manager of the Western Union Telegraph Company, New York, made a few felicitous remarks of welcome to the honorable guest, who is probably the best-known man in the telegraph service to-day.

When Mr. Dealy had finished, the company sang "Home Again" with great effect, after which Mr. Reid responded to the hearty and enthusiastic welcome tendered him by his friends, and thanked them. He then spoke briefly of the early days of the telegraph. He learned to make the Morse alphabet from Alfred Vail.

Mr. Reid referred to the attempt now being made by Alfred Vail's son to have his father recognized as the inventor of the telegraph instead of Morse. "It is claimed by his son, Alfred Vail," continued Mr. Reid, "that his father was an inventor; nothing could be more false." The first time Vail ever saw the telegraph, said Mr. Reid, was when Morse showed it to him in a complete and working condition. "Vail was a machinist and did his work well, but did nothing more," continued the speaker.

Mr. Reid then told how he had rejected Vail's work; the machines the latter made were unsuitable and impracticable, the magnets weighing 150 lbs., which was too much for him (Reid) to carry around. "Don't let Vail or any other man take the honor away from Morse," he said in conclusion.

Col. C. A. Tinker, general superintendent, and W. C. Humstone, district superintendent of the Western Union Telegraph Co., also made appropriate speeches, which were enthusiastically received. The speeches were interspersed with music, both vocal and instrumental, and humorous recitations.

The event was one of the most successful ever held by the club, and the utmost good feeling and cordiality prevailed.

Among those present were: Hon. James D. Reid, W. H. Baker, W. J. Dealy, A. S. Brown, J. C. Hinchman, H. H. Ward, Col. C. A. Tinker, D. Doren, W. C. Humstone, F. W. Jones, Gen. Fowler and many others well known in the telegraphic and electrical world.

PHYSIOLOGICAL ACTIONS OF THE ELECTRIC CURRENT.

Currents of electricity passed through the limbs affect the nerves with certain painful sensations, and cause the muscles to undergo involuntary contractions. The sudden rush of even a small charge of electricity from a Leyden jar charged to a high potential, or from an induction coil, gives a sharp and painful shock to the system. The current from a few strong Grove's cells, conveyed through the body by grasping the terminals with moistened hands, gives a very different kind of sensation, not at all agreeable, of a prickling in the joints of the arms and shoulders, but not producing any spasmodic contractions, except it be in nervous or weakly persons, at the sudden making or breaking of the circuit. The difference between the two cases lies in the fact that the tissues of the body offer a very considerable resistance, and that the difference of potential in the former case may be many thousand of volts; hence, though the actual quantity stored up in the Leyden jar is very small, its very high E. M. F. enables it at once to overcome the resistance. The battery, although it might, when working through a good conductor, afford in one second a thousand times as much electricity, cannot, when working through the high resistance of the body, transmit more than a small fraction, owing to its limited E. M. F.

After the discovery of the shock of the Leyden jar by Cunæus, in 1745, many experiments were tried. Louis XV. of France caused an electric shock from a battery of Leyden jars to be administered to 700 Carthusian monks joined hand in hand, with prodigious effect. Franklin killed a turkey by a shock from a Leyden jar.

In 1752 Sulzer remarked that "if you join two pieces of lead and silver, and then lay them upon the tongue, you will notice a certain taste resembling that of green vitriol, while each piece apart produces no such sensation." This galvanic taste, not then suspected to have any connection with electricity, may be experienced by placing a silver coin on the tongue and a steel pen under it, the edges of them being then brought into metallic contact. The same taste is noticed if the two wires from the poles of a voltaic cell are placed in contact with the tongue.

Ritter discovered that a feeble current transmitted through the eyeball produces the sensation as of a bright flash of light by its sudden stimulation of the optic nerve. A stronger current transmitted by means of moistened conductors attached to the battery terminals gave a sensation of blue and green colors, in flowing between the forehead and the hand. Helmholtz, repeating this experiment, observed only a wild rush of color. Dr. Hunter saw flashes of light when a piece of metal placed under the tongue was touched against another which touched the moist tissues of the eye. Volta and Ritter heard musical sounds when a current was passed through the ears; and Humboldt found a sensation to be produced in the organs of smell when a current was passed from the nostril to the soft palate. Each of the specialized senses can be stimulated into activity by the current. Man possesses no specialized sense for the perception of electrical forces, as he does for light and for sound; but there is no reason for denying the possibility that some of the lower creatures may be endowed with a special electrical sense.

The following experiment shows the effect of feeble currents on cold-blooded creatures. If a copper (or silver) coin be laid on a picce of sheet zinc, and a common garden snail be set to crawl over the zinc, directly it comes into contact with the copper it will suddenly pull in its horns and shrink in its body. If it is set to crawl over two copper wires, which are then placed in contact with a feeble voltaic cell, it immediately announces the establishment of a current by a similar contraction.

QUEBEC NOTES.

Quebec City is calling for tenders for electric lighting, to be addressed to Charles Baillairge, city engineer, and handed in before 4 o'clock the 4th of May. Two responsible names must be given in guarantee of the fulfilment of contract; tender to state price per year for arc lights of 2,000 candle-power (to be tested and proven) to burn all night and during every night in the year regardless of moonlight. The tenderer must provide power and complete plant; the present number of lights is 308, which may be increased to say 400, more

or less ; the separate price per light per annum shall be stated, whether for underground or for overhead system, also a separate price for a five years' and for a ten years' contract, and an accepted check for $4,000 must accompany each tender.

The city street-car system is to be improved and extended, and electricity will be partly adopted, but the town is very conservative and will probably take another year to begin the improvement.

MONTREAL NOTES.

Matters in connection with the Montreal street electric railways came up before the Municipal Committee on April 21, and it was decided to call for tenders ; at the same time there was a disposition to give Mr. Mainwaring and Mr. Bickerdike consideration in reference to their offer to build the lines that they were the promoters of.

The Montreal Elevated Railroad Co. asks for privileges as follows : To run electric cars from city limits on Mount Royal avenue, thence by Park avenue to Sherbrooke street ; thence by Bleury to Craig, laying a double track ; a single track from and on Bleury to Sherbrooke and St. Kathrine streets ; to have power to run over present street-railway track and to make running arrangements with said company ; fare 5 cents, and speed 8 miles limit per hour, paying to the corporation $100 for first 4 years, $200 next 5 years, $300 following 5 years, and $400 remaining 5 years.

The mayor has sent circulars to the larger American cities for information concerning their systems of electric railways.

There is a great deal of sparring for wind going on ; but from a significant remark made by the mayor "that there was a syndicate backed by $25,000,000 ready to build 100 miles of railway in Montreal," and the announcement in the ELECTRICAL AGE of April 23 that the parties who control the Toronto and Montreal street car system had placed an order with the Edison Company, of New York, and that that company hoped to have the Montreal furnishing contract, you can set down "the syndicate" as being the winner.

Tenders are called for the electric railway, to be handed in Tuesday, May 17, to assistant city clerk of Montreal, to construct and operate electric railways in the city for a period of 18 years in streets mentioned in specification, in whole or in part. Each tender must be accompanied by a deposit of $2,000 per mile of track to be laid, said deposit to be returned after consideration of tenders. Specifications have not been printed, but may be summarized. Description of routes, privileges of running over certain parts of present system, periodical time-table, speed not to exceed 8 miles per hour, give power to city surveyor to decide on the number of passengers each car shall accommodate ; forbids carriage of freight ; provides for a 5-cent fare ; transfer to all parts without extra charge—six tickets for 25 cents, 25 tickets for $1. If sleighs are to be run in winter tenderer must specify where and what difference it will make in the contract conditions ; the "special tax clause" is left open ; the accepted tenderer will have preference if extension is granted after the 18-year term.

The Council committee met April 23, and it was decided to refuse Mr. Mainwaring's offer, likewise Mr. Bickerdike's ; they must take the chances with the others. The $2,000 per mile clause was amended and $25,000 was to be the limit ; that is, tenders must be for a 12½ mile section.

OTTAWA (ONT.) NOTES.

Ottawa has had the trolley system for over nine months, and no accident to life is reported.

The City Council is having trouble with the Bell Telephone Company and the electric railway in reference to the removal of a pole, and on the night of April 19 Alderman Cluff proposed that the city engineer be instructed to remove said pole ; his object, he claimed, was to ascertain if the citizens of Ottawa had a right to their own streets. He understood that the city engineer had asked an official of the Electric Railway Company to remove this pole, but the official informed the engineer that it would not be removed.

NEW INCORPORATIONS.

Electric Power and Transmission Co., Baker City, Ore., incorporated April 18, with a capital stock of $150,000. Incorporators: B. W. Levens, F. L. Giroux, William H. Packwood, Jr., Baker City, Ore.; George Amslie, Boise City, Idaho.

The Columbian Electric Co., Camden, N. J., incorporated April 18, with a capital stock of $200,000. Incorporators: S. J. MacFarren, Pittsburg, Pa.; F. H. Elder, Philadelphia, Pa.; T. P. Curley, Camden, N. J.

The Electrical Protection Co., Jersey City, N. J., incorporated April 18, with a capital stock of $100,000. Incorporators: H. W. Spang, N. B. Amory, New York, N. Y.; W. Bruns, J. N. Bruns, P. Sury, Jersey City, N. J.

The Muncie Electric Street Railway Co., Muncie, Ind., incorporated April 20, with a capital stock of $100,000. Incorporators: David Cammack, William L. Little, Darius C. Mitchell, Roscoe C. Griffith, John M. Kirby.

National Investment and Improvement Co., Davenport, Ia., incorporated April 13, with a capital stock of $2,000,000. Among other things it will operate electric light and power plants. Incorporators: Charles F. Hathaway, Henry G. Davis, Azel C. Buell, all of Davenport, Ia.

La Grange Light and Water Works Co. (incorporated in W. Va.), New York, N. Y., incorporated April 20, with a capital stock of $125,000, to construct and operate electric light and water-works at La Grange, Ill. Incorporators: H. C. Hodgkins, C. T. Moffett, Charles F. McLain, Syracuse, N. Y.

The National Automatic Fire Alarm Co., of Chicago, Ill., incorporated April 21, with a capital stock of $300,000. Among other things it will construct and operate lines of electric fire-alarm telegraphs, alarm signals, etc. Incorporators : Frank C. Elliott, Horace C. Alexander, Fremont Hill.

Tuna Creek Land and Water Co., Los Angeles, Cal., incorporated April 18, with a capital stock of $100,000. Among other things it will generate and supply electricity. Incorporators : E. G. Kun, E. W. Abbott, L. R. Patty, W. L. Willis, George L. Willis, Los Angeles, Cal.

American Battery Company, Chicago, Ill., incorporated April 25, with a capital stock of $1,000,000. Incorporators: George F. More, Charles S. Kaufmann, Samuel E. Hibben.

The Phœnix Consolidated Gas and Electric Light Co., Denver, Col., incorporated April 23, with a capital stock of $300,000. Incorporators : Frank Evans, D. Albert Abrams, Charles F. Musgrove, Denver, Col.

New England Electric Therapeutic and Alarm Co., Biddeford, Me., incorporated April 21, with a capital stock of $100,000. Incorporators : John H. Roberts, Chelsea, Mass.; George E. Fowle, Wilbur L. Libbey, John Winn, all of Boston, Mass.

York Cliffs Improvement Co., York, Me., incorporated April 23, with a capital stock of $300,000. Among other things it will deal in electric light and gas-works. Incorporators: J. D. Vermeule, C. C. Vermeule, New York, N. Y.; Samuel W. Junkins, York, Me.

The Wichita Falls Electric Light and Power Co., Wichita Falls, Tex., incorporated April 16, with a capital stock of $30,000. Incorporators: D. J. Calkins, W. C. Heath, A. Zundelowitz, J. A. Kemp, Wichita Falls, Tex.

Centre and West End Passenger Railway Co., Williamsport, Pa., incorporated April 19, with a capital stock of $18,000, to operate an electric street railway. Incorporators: W. W. Champion, William C. King, James B. Coryell, Williamsport, Pa.

Chester and Media Electric Railway Co., Chester, Pa., incorporated April 18, with a capital stock of $100,000. Incorporators: Samuel A. Dyer, George B. Lindsay, J. G. Dyer, all of Chester, Pa.

Rochester and Beaver Electric Railway Co., Beaver, Pa., incorporated April 16, with a capital stock of $60,000. Incorporators: Thomas Darragh, Rochester, Pa.; Alfred C. Hurst, Bridgewater, Pa.; Almond R. Leyda, Beaver Falls, Pa.

Liberty Avenue Street Railway Co., Pittsburg, Pa., incorporated April 23, with a capital stock of $50,000, to operate an electric road. Incorporators: S. J. Wainwright, M. F. Leslie, P. C. Byrne, Pittsburg, Pa.

OPPOSED TO LANDING A CABLE.

Secretary of State Blaine was heard by the Senate Committee on Commerce, on April 28, on the question of granting the right to the French Atlantic Cable Company, of Paris and New York, to land a cable on the shores of Virginia or South Carolina, thence to Cuba and San Domingo.

Secretary Blaine made a vigorous protest against favorable action, or any action at all, on the resolution, urging that it should be killed in the committee. The United States wanted to secure direct cable communication with Brazil, and there were reputable men ready to build such a line. If the Senate gave the French company the right to land in Virginia or South Carolina this could not be done. The Brazilian Government had given the French company the exclusive right to land for thirty-five years, and if the right to land in the United States were given by Congress a monopoly would be given the company, and the United States would be prevented from having cable entry into Brazil during the period of exclusiveness. The sending of all messages by way of London and Paris would place the United States merchants under great disadvantage and at great expense, and the construction of the line would prevent the establishment of an American line. Such a line, he believed, would be under way in a year if Congress did not give to the French company the right asked. All cable lines, he said, sought to preserve a monopoly, and where there was a monopoly the service was usually bad. When the United States had a line in competition with the French and English lines, then this country would get cheaper ates.

The Hon. Jeff Chandler and Gen. Eppa Hunton, counsel for the company, made brief arguments in support of the resolution. They contended that Congress had no right to interfere in the right granted to the company to land by the Legislatures of Virginia and South Carolina.

THE ADVISORY COUNCIL OF THE WORLD'S ELECTRICAL CONGRESS.

Upon the invitation of Dr. Elisha Gray, chairman of the Committee on the World's Electrical Congress, an informal meeting of the Eastern members of the Advisory Council was held at the rooms of the American Institute of Electrical Engineers, New York City, on Tuesday, April 26. It was the object of Dr. Gray to consult with the members previous to his departure for Europe on business of the Congress. The following were present: Dr. Elisha Gray, chairman; Prof. F. B. Crocker, Prof. A. E. Dolbear, Dr. William E. Geyer, Mr. G. A. Hamilton, Mr. A. E. Kennelly, Mr. Thos. D. Lockwood, Mr. T. C. Martin, Mr. Geo. M. Phelps, Mr. Franklin L. Pope, Dr. M. I. Pupin, Mr. R. W. Pope. Letters of regret were read from Professors Alexander Graham Bell, Geo. F. Barker and John Trowbridge. It being simply a gathering of a portion of the council, no formal action could be taken, but it was unanimously agreed that the last week in August, 1893, would be the most suitable time for the meeting of the Congress, and this date will doubtless be recommended. Dr. Gray sailed for Europe on the *Majestic*, April 27. He is accompanied by Prof. H. S. Carhart, secretary of the committee.

ELECTRIC STREET RAILWAYS AS INVESTMENTS.*

BY LEMUEL WILLIAM SERRELL, M.E.

The value of street-railway securities as safe investments is only beginning to be generally appreciated. In the past they seldom have been offered to the public. The fact that a road once located upon a principal thoroughfare in a city is fixed upon the line of personal travel, which cannot be changed by the building of a parallel line upon another street, has not been brought forcibly enough before us to be generally appreciated The fact is that a street railway located upon a principal thoroughfare, equipped with modern appliances for rapid transit, runs upon a highway through which people move, and they will ride on these cars rather than those of a parallel line on another street. The securities on such a property, when once on a paying basis, make a safer investment than steam-railroad bonds, the value of which are always liable to be impaired by rate wars and by the building of parallel lines. Steam railroads run between terminals and not upon fixed lines of personal travel, and where terminal facilities can be secured in cities parallel lines are always likely to be built.

When a city reaches a population of 25,000 its growth and business prosperity may safely be expected to increase steadily, and the securities on street railroads on a paying basis and located as above described, are sure to rise in value. The tendency of human nature is also to locate and build close to this line of travel, causing the thoroughfare to become more important as the city grows.

The introduction of electricity as a means of rapid transit has done, and is doing much to bring this class of securities before the investing public. * * *

The remarkable cheapness with which electric roads can be operated as compared with horse roads and the cheapness of the first cost as compared with cable roads has led to the building of more than 3,600 miles of such roads within the past five years. The earnings for the capital invested are larger for electric street railways than for steam, horse or cable roads, and the securities on such properties are now beginning to attract the attention of the general public. The cost of building and equipping street roads varies considerably with different local conditions. A comparison of the average cost of building and equipping cable, electric and horse railways per mile of track, taken from the recent census reports, is given below:

Cable roads	$350,000
Electric roads	30,000
Horse roads	41,000

The above represents a fair average for paved streets in cities proper. For suburban travel the cost per mile of track and electric equipment need not exceed $20,000.

The earnings of the various properties may best be expressed by the ratio of their operating expenses to their gross receipts. It is hard to get figures giving this

*Abstract from the *Engineering Magazine* for May, 1892.

ratio for cable roads. The only ones published that I have been able to find are for Denver, Col., where this ratio is reported as 77 per cent., while for the electric lines owned by the same company it is reported at 55 per cent. Cable roads cost almost as much as elevated railroads, yet in some places they both are bonded for more than $1,000,000 per mile and have dividend stocks. The same ratio for horse railroads we find, by taking the average of over fifty roads from the reports of railroad commissioners, is 80 per cent.

A large number of reports have been published on electric roads, placing this ratio at about 50 per cent. From my own investigation I have found that these figures were true for certain months, but they do not represent the average for the whole year, and that in the section of the country where snow must be removed from the tracks the year's average is from 60 per cent. to 65 per cent. The increase in the net earnings in cities like Boston per revenue car-mile run for electric road over horse roads averages 50 per cent. This enormous increase of earning capacity has given a well-merited "boom" to the electric railway, but at the same time has opened an opportunity for objectionable speculation, the same as surrounded the steam railroads, which caused the wrecking of so many fortunes and gave the opportunity for great railroad steals, followed by reorganizations and "freeze-outs."

NEW YORK NOTES.

Office of the Electrical Age,
First Floor, World Building,
New York, April 30, 1892.

The United Electric Traction Company has secured fine new quarters at 126 Liberty street.

J. Stanford Brown, the well-known electrical engineer, is now associated with the Duplex Rail Co., 51 Wall street.

F. Van Winkle, who has an excellent reputation as an expert engineer, has opened an office at 126 Liberty street.

The Shaver Corporation, manufacturer of the well-known acoustic telephones, has moved its office from 207 to 1 Broadway.

J. Randolph Hard, who is a practical electrician and model-maker, does all kinds of experimental and repairing work, and will be found at 24 Howard street.

H. H. Hungerford, manager of the J. H. McEwen Mfg. Co., 141 Liberty street, has installed one of that company's 80 H. P. automatic engines in the new Akron Iron Co.'s building, Fulton street, this city, for electric light and power service.

The Premier Electric Co., of Brooklyn, has moved into its new factory, 17 and 19 Whipple street, where it has greatly increased its facilities for turning out motors, batteries and electrical novelties. All orders will receive prompt attention.

F. S. Blackall, general district agent for the Crocker–Wheeler Electric Co., has recently opened an office at 126 Liberty street. Mr. Blackall also represents the Carpenter Electric Heating Co., of Minneapolis, Minn., and carries a full line of samples of this company's goods.

Mr. W. H. Eckert, general manager of the Kerite Cable Co., 16 Dey street, city, resigned his position on April 30 to accept an appointment as general superintendent of the Gray National Telautograph Co., with offices at 80 Broadway. This company is prepared to organize sub-companies for the introduction of its system.

Mr. W. R. Brixey has been appointed general manager of the Kerite Company, with headquarters at New York, to take the place of W. H. Eckert, who resigned on May 1. Mr. Brixey was formerly superintendent of the company's factory at Seymour, Conn., and is well and favorably known in the electrical trade. The company's interests could not have been placed in better hands.

In our issue last week we stated that the Western Electric Co. had acquired a controlling interest in the Tropical American Telephone Co. This was an error. The gentlemen named in the original article, individually and collectively, now control the telephone company in the capacities named, and while they are also connected with the Western Electric Company, that company has nothing to do with the telephone company's affairs.

Mr. A. E. Davis, for the past two years manager of the advertising department of *Electric Power*, has resigned his position with that publication and left for Troy, N. Y., where he has taken up the management of the advertising of two large concerns. Mr. Davis while a resident of this city made himself extremely popular in the electrical fraternity. His departure is much regretted.

F. C. Timpson, manager of the Electrical Engineering and Supply Co., Syracuse, N. Y., has secured the offices formerly occupied by Wing & Co., on the main floor of 126 Liberty street, where he will carry a full line of the well-known electric light and railway supplies manufactured by his company. Mr. Timpson reports an excellent business during the past few weeks, with very promising prospects ahead. Purchasers of any of the specialties carried by Mr. Timpson will do well to consult him before closing contracts.

The New York office of the Wainwright Mfg. Co., of Massachusetts, will after the 1st of May be located in the Electrical Exchange Building, No. 136 Liberty street. Mr. F. B. Aspinwall, who has represented this company for the past three years in this city, will still retain his connection with the company and have under his control the entire trade for its goods for the States of New York, New Jersey, Pennsylvania and Ohio. It is the intention of this company to push its trade in the most vigorous manner, which with the steadily increasing demand for its goods and the improved facilities that it has at its command to fill orders promptly, predicts for it a very large increase in business over all previous years. Mr. Aspinwall reports that the demand for its heaters was never better than it is now, and the coming year's sales bid fair to be greatly in advance of last by a very large percentage. W. T. H.

CATALOGUES.

A very handsome illustrated catalogue and price-list has been issued by the American Telephone Booth Co., 18 Cortlandt street, New York, in which will be found full details of the various designs of telephone booths manufactured by it for office use, and which will be sold to regular telephone subscribers at a moderate cost.

The J. H. McEwen Mfg. Co., of Ridgway, Pa., has issued a very complete illustrated and descriptive catalogue of the various automatic engines and steam-boilers manufactured by it. On pages 18 and 19 will be found two very interesting tables, one showing dimensions, powers and speeds, and the other indicated horse-power of single-cylinder engines at different speeds and pressures.

The Interior Conduit and Insulation Co., 42–44 Broad street, New York, has just issued its new illustrated general catalogue No. 7, which contains full and complete descriptions of the interior conduits and special light, heat and power appliances for use in connection therewith, manufactured by it. The catalogue is of a handsome design, printed on very fine paper and divided into two departments, A and B. This company's reputation for turning out first-class work is so well established as to need no further commendation.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE:

NAMES OF COMPANIES.	CAPITAL.	PAR.	PRICE.
American Dist. Tel., N. Y.	3,825,000	100 00	62 00
American Engineering Co., N.Y.	1,000,000	100 00	60 00
American Telegraph and Cable	14,000,000	100 00	84 00
Ashley Engineering Co	200,000	10 00	5 00

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

The dénouement of the amalgamation of the Edison General and Thomson-Houston corporations approaches completion rapidly, and under the plain name of the General Electric Company, the public will soon become familiar with the advancement of electrical science. Investors will not have to bother their heads as to whether certain patents on which they are enthusiastic, or certain contracts with which they feel somewhat familiar, are in the interests of one or the other securities, but accept for granted that any part of the business can be supplied by and will redound to the emolument of the one company; consequently both speculation and permanent investment in the stock will be active. The present capital stock of the Edison is $15,0000,000 and of Thomson-Houston $10,000,000, with $650,000, the capital of the Thomson-Houston International Co., thrown in. Almost as a matter of course the capital has been doubled for the new company to start off with, and is $50,000,000. It will be remembered that this column has advocated $75,000,000 and the name to be simply Edison Electric Co., but one can't always have all they want, and the issue as above stated is accepted as final. The hundreds of thousands of readers of the ELECTRICAL AGE are scattered all over the world, and we take some considerable pride in informing them that after full consideration the company is incorporated under the laws of New York, with its head office in the city. A grand victory was gained at the outset in reducing the corporation tax to reasonable dimensions. There seems little room to doubt but that Mr. C. A. Coffin, of Boston, will be the first president of the company. His experience renders him the most desirable man of all who have been mentioned for the position. It is expected that all arrangements will be completed and the work all brought under the management of the new officers on the 1st of June. The various offices in the large cities will be occupied as fast as possible, and here is one of the great savings for the shareholders; a reduction of one-half in rent and office expenses means a good dividend in itself; added to this is the immediate settlement of a large number of law-suits and the cessation of that expense. Further than this, all competition between not only the companies themselves, but all they each control is dispensed with, and for a great many large contracts there will not be any opposition, although separate organizations will for a limited period be kept up. The stock will soon be issued, and in the first scramble should go some distance above par, and it will take a full year for them to find their legitimate value, while several years must elapse before they can be run up and down at the whim of a few brokers. Next comes the question as to whether the Westinghouse will join or not. Personally, I am inclined to believe, and risk a reputation, that once the stocks are listed on the New York Stock Exchange under separate names, no influence can be brought to bear, short of the sheriff, capable of joining that which is separated in this manner. Another month will settle the whole matter, and in that month the rush for these securities should be exactly the same as the late land rush in Oklahoma.

On the 27th ult. the New York Stock Exchange, by the governor's proclamation, closed its doors at noon. The legal cessation of business only covered greater New York, but I note the Boston Exchange also took a half holiday. I am often abused for saying there is but one Stock Exchange in America and that no country is large enough to support two. If I am wrong I would like to know why it is that if the New York Stock Exchange for any reason closes its portals, practically all other stock dealings cease.

A point of interest and showing that there is still money in the quick electric transmission of financial news

is that from the second day of May the Gold and Stock Telegraph Co. is charging for tickers $20 per month below Chambers street, $25 from there to Fifty-ninth street, and $30 for points above there.

Now is the time, as will be readily seen by noting the new incorporations, extensions, alterations and new equipments in electric plants, to invest small amounts when of necessity continuous profits must accrue. To this statement there is no exception; they are developing the whole country; the ocean, lakes and rivers are also included. No new vessel carrying steam leaves port without an electric apparatus of at least one description, many being equipped with several. The spring flood of new inventions include quite a number of marine devices, all requiring money to manufacture, the orders in most cases being already obtained. The annual exodus of Americans has set in, and every passenger on an ocean steamer is personally interested in the ship's electrical plants and electrical engineers to the extent of their personal safety at all events. I am not aware that any marine law has been enacted on either side of the Atlantic governing the use and application of electricity. There is a grand field open for some young Plimsoll to make a reputation in. Both life and capital require special attention in this direction. The master of a ship at sea is still the most autocratic individual in existence until accident comes, when he at once sinks to the level of the others on board. It is full time to change the ancient style of dying inactive on the bridge, to saving the ship by engineers who have to-day to meet a different state of things from that which obtained twenty years ago. The passenger traffic is immensely in our favor but with this difference, the Americans go abroad with a full purse and leave at least $100,000,000 of our capital before they return, while the immigrant comes without money but remains in the country; each is entitled to far more protection by the carriers than they receive, and the capital invested in the business is worthy of special legislation all round.

There are probably more patents of an electric nature being secured just now than in any other single direction, and consequently more money is required to exploit them. The great majority which after the usual delay acquire a patent, seem to find capital quite ready to manufacture enough to fully test the device, and then when orders come in the alleged investor is crazy to realize a large profit, instead of pushing it on until the demand is sufficiently urgent to create a market which must be satisfied, and with nothing but these particular goods. We all know that the inventor's and patentee's life is not passed in a bed of roses, as was proven early this month when a French electrical inventor, having concluded to marry an American lady, came here to do it, and naturally brought with him his invention, a dynamo. To his great surprise he found he could not bring in his own invention free; it was appraised at $116, and $52 duty demanded, the dynamo not having been made here, according to law. Either this was more money than monsieur had to spare or he acted on principle, for the creation of his brain and muscle lies in the United States public stores.

NEW ANTI-FRICTION BABBITT METAL.

Mr. A. C. Stiles, for six years the superintendent of the brass foundry of the N. Y., N. H. & H. R. R. Co., is the inventor of a formula for the manufacture of an Anti-Friction Babbitt Metal, the success of which has been phenomenal. Tried as it was for a long time on the locomotives and cars of the above-mentioned road and in competition with many other metals, it soon proved itself far superior in its ability to withstand the severest tests, and its durability in the long runs of the through Boston express trains, eliminating the long dreaded hot-boxes which cause so many vexatious and expensive delays; for one of the best features of this metal is its ability to run *long* and *cool* without wearing out.

It has also had many tests on electric motors and rapid-running machinery of all kinds with great success.

Mr. Stiles is also the originator of a formula for bronze for heavy bearings that sustains a record on locomotive driving-wheel bearings now in use of 7,000 miles per month for 27 months, and cannot be equalled for heavy work.

All mixtures of both of these metals are made by the originator of the formula, and insure a uniform quality—always the best

The real merit of these bearings becoming more widely known, a company has been recently formed called the Stiles Smelting Co., with A. C. Stiles, pres.; Newton H. Cox, sec.; James R. Lyon, treas. New York office, 136 Liberty street. F. H. Alling, manager.

The already numerous orders would indicate the large and ever-increasing business in store for it.

THE
"CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, under date of March 29, 1886, he says:

"A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weatherproof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use we make all sizes of stranded and flexible cables with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

EASTERN ELECTRIC CABLE CO.,

61 to 65 Hampshire Street, Boston, Mass.

HENRY A. CLARK, Treasurer and General Manager.
HERBERT H. EUSTIS, President and Electrician.

TRADE NOTES.

We extract the following notice from the *Baltimore American* of April 22, regarding the conduit system of the Interior Conduit and Insulation Company, of New York: "The contract for the electric equipment and interior wiring of the new City Hall, at Richmond, Va., was awarded yesterday to the Southern Electric Co., of this city. This is one of the largest contracts of the kind ever made. The company will use the Interior Conduit Company's system throughout, which comprises a method of insulated tubing, together with all the modern appliances for safety and convenience, giving full control of the electric plant at one central point in the building. The contract was awarded to the Baltimore house owing to the superiority of their work, although they were not the lowest bidders."

The following copy of a letter received by W. R. Fleming & Co., 174 Fulton street, New York City, from H. C. F. Koch & Co., the well-known dry-goods firm on West 125th street, is self-explanatory:

NEW YORK, Jan. 28, 1892.

Messrs. W. R. FLEMING & Co.,
New York office Hbg. Foundry and Machine Works,
174 Fulton street, N. Y. City.

GENTLEMEN: We beg to state to you the the entire satisfaction we experience in the every-day service of the 13″ x 12″ and 10½″ x 10″ Ideal Self-Oiling Automatic Engines we have now been running for nearly a year past. We cannot detect throughout the building the slightest vibrations or noise of any kind outside of the engine-room when outlets to same are closed.

We find after a careful test made lately under an expert employed by us that the engines from a mechanical standpoint are economical in fuel consumption, carry their maximum load smoothly and quietly, and in regulation are perfect.

We are entirely satisfied with your liberal and capable treatment of us, and will take great pleasure in exhibiting your work to any parties in search of first-class equipment. We believe our plant unequalled for its purpose, and believe also in recognizing merit and giving credit to whom it belongs. Yours very truly,

H. C. F. KOCH & Co.

The Electrical Age's Illustrated Patent Record.

Issued April 19 and 26, 1892.

ISSUED APRIL 19.

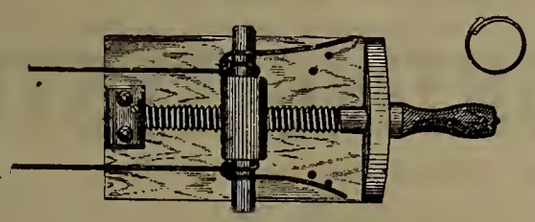
473,366. Armature for Electric Generators or Motors. Sidney H. Short, Cleveland, Ohio. Filed June 24, 1891.

473,367. Dynamo-Electric Machine. Sidney H. Short, Cleveland, Ohio. Filed June 24, 1891.

473,373. Incandescent-Electric-Lamp Socket. Craig R. Arnold, Sharon Hill, Pa. Filed Dec. 17, 1891.

473,378. Electric Stop-Motion for Looms. John C. Brooks, Paterson, N. J., assignor to George Draper & Sons, Hopedale, Mass. Filed May 14, 1891.

473,386. Electric Battery. James E. Emley, Laredo, Tex. Filed Jan. 27, 1891.



473,528.—DEVICE FOR STRETCHING WIRE.

473,393. Electrode. Paul L. T. Héroult, Schaffhausen, Switzerland, assignor to the United States Aluminium Metal Company, of New York. Filed Aug. 8, 1889. Patented in England.

473,435. Electric Switch. Ernest P. Warner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Feb. 2, 1889.

ISSUED APRIL 26.

473,463. Plunge-Battery. James H. Howard, Medford, Mass. Filed Dec. 1, 1890.

473,504. Electric Switch. Halbert K. Hitchcock, Louisville, Ky., assignor of one-half to Chas. W. Kellogg, Brookline, Mass. Filed Sept. 16, 1891.

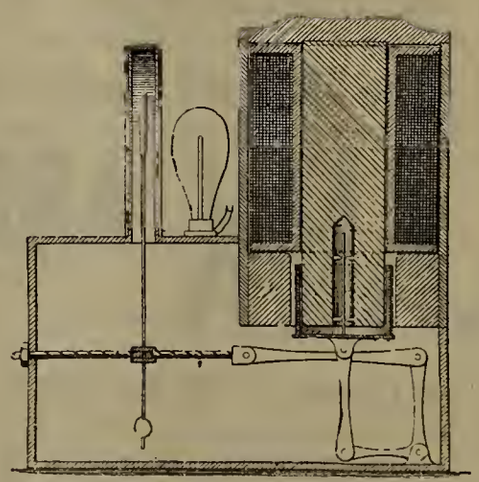
473,514. Induction-Discharge Protector for Welding Apparatus. Hermann Lemp, Lynn, Mass., assignor to the Thomson Electric Welding Company, of Maine. Filed Aug. 14, 1889.

473,522. Telegraph or Other Pole. William Pitt, London, England, assignor to the Sectional Standards Limited, same place. Filed Nov. 27, 1891.

473,527. Wire-Stretcher. Herbert S. Shaw, Dudley, Mass. Filed May 29, 1891.

473,528. Device for Stretching Wire. Fred H. Speed, Rockland, Me., assignor to Edmund N. Wilcox, Meriden, Conn. Filed Feb. 18, 1891.

473,536. Alternating-Current Arc Lamp. Barton B. Ward, New York, N. Y. Filed March 28, 1891.



473,538.—ELECTRICAL MEASURING INSTRUMENT.

473,538. Electrical Measuring Instrument. Edward Weston, Newark, N. J. Filed Jan. 8, 1891.

473,539. Electrical Measuring Instrument. Edward Weston, Newark, N. J. Filed Jan. 24, 1891.

473,547. Dynamo-Electric Machine. Ward Decker, Owego, N. Y. Filed Nov. 25, 1891.

473,567. Commutator Connection for Electric Motors or Generators. Charles G. Curtis, New York, N. Y., assignor to the Curtis Electric Manufacturing Company, of West Virginia. Filed Aug. 26, 1891.

473,568. Armature for Dynamo-Electric Machines or Motors. Charles G. Curtis, New York, N. Y., assignor

to the Curtis Electric Manufacturing Company, of West Virginia. Filed Nov. 12, 1891.

473,587. Car-Replacer. James M. Morris and Sumner J. Harkness, Scofield, Utah. Filed June 3, 1891.

473,594. Electric-Circuit-Controlling Device. Mandeville Thum, Louisville, Ky. Filed June 5, 1891.

473,595. Circuit-Controlling Device. Mandeville Thum, Louisville, Ky. Filed June 5, 1891.

473,614. Electric Railway-Signal. Charles E. Corporan, Colorado City, Col. Filed June 17, 1891.

473,618. Dynamo-Electric Machine. Rudolf Eickemeyer, Yonkers, N. Y. Filed June 13, 1888.

473,619. Dynamo-Electric Machine. Rudolf Eickemeyer, Yonkers, N. Y. Filed Dec. 23, 1889.

473,637. Coupling for Electric Wires. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, Wheeling, W. Va. Filed Nov. 24, 1891.

473,661. Combined Gas and Electric-Light Bracket. John Fitzgerald, Montreal, Canada. Filed July 14, 1891.

473,674. Electric Locomotive. Sidney H. Short, Cleveland, Ohio. Filed May 26, 1891.

473,693. Electric Locomotive. Joseph I. Conklin, Brooklyn, N. Y. Filed March 4, 1891.

AT THE ACTORS' FUND FAIR.

We give on another page an interesting account and illustrations of the electrical decorations at the Actors' Fund Fair which was held in this city last week. By the aid of small incandescent lamps with bulbs of various colors some most beautiful and artistic effects were produced. The little lamps were arranged with extraordinary skill, and the scene in Madison Square Garden was as charming as it was beautiful, and what gave it these pleasing qualities was the tiny incandescent lamps.

AMERICA FOR AMERICANS.

Secretary Blaine is to be commended for his true American patriotism. "America for Americans" is his motto, and he carried out this idea in a practical way the other day before the Senate Committee on Commerce, when he opposed the proposed bill to grant to a foreign company the right to land its cable on American shores *en route* to Brazil. Mr. Blaine's objection was on the ground that if this right were granted to the foreign company it would frustrate the plans of an American company which proposed to lay a cable to the same objective point, namely, Brazil. We understand that the foreign company's petition stands no chance whatever of being granted.

PROTECTION AGAINST LIGHTNING.

Lightning had its own way in the station of the Allegheny County Electric Light Company, Pittsburg, the other day, notwithstanding the protective devices which are supposed to be provided in all well-regulated stations. Protection against lightning is one of the most important things to look after in station operation, and too much care cannot be bestowed in the selection of lightning arresters.

No less than seven dynamos were burned out in the case above referred to, and the damage to the station amounted to about $7,000.

This should be a lesson to all station operators; it emphasizes the importance of having reliable lightning arresters and other protective devices.

EARTH CURRENTS.

A few weeks ago general interest was excited by the appearance of a group of immense "spots" on the face of the sun, and those experienced in the telegraph service knew that this meant a magnetic storm. Magnetic storms invariably follow the appearance of sun spots, and sometimes they become so violent as to seriously interrupt the working of telegraph wires.

On February 13 last considerable difficulty was experienced in the operation of telegraph wires in this country owing to the existence of strong earth currents in consequence of a magnetic storm then prevailing. In some cases it is possible to work telegraph lines by these earth-currents alone, the regular source of current being entirely cut off. Earth-currents, however, vary too much in their intensity to be of any practical value while they last; they come and go in waves, surcharging the wires one minute and disappearing entirely the next.

Fortunately, however, these abnormal currents do not make their appearance very frequently. Normal earth-currents exist all the time, but they are so feeble as to have practically no effect on ordinary telegraph instruments.

Mr. William Finn contributes an interesting article on this subject in this issue, and by the aid of diagrams shows the relative intensity of the normal and abnormal earth-currents. Mr. Finn has made a special study of these phenomena, and concludes that a great deal of the trouble experienced in working telegraph lines in ordinary times is due to these mysterious visitations. These experiences simply emphasize man's littleness and weakness in all his works compared with nature's might. Nature cannot be controlled.

EARTH CURRENT DISTURBANCES IN TELEGRAPH LINES.

BY WILLIAM FINN.

FOR some time past, and at intervals more or less periodic, serious disturbances due to earth currents have again been experienced on the telegraph lines of this country. A long period of immunity from these troublesome visitors had been enjoyed prior to Saturday, Feb. 13, last, on which date the first of the series of recent phenomena was observed. On the evening of that day a very brilliant display of aurora borealis was observed in various parts of the United States. During the day strong earth currents had appeared in many of the wires, being of sufficient strength on some circuits to completely demoralize the service.

Their existence on the Western Union lines was first noticed about 8:30 A.M., by means of the sensitive galvanometers with which the Wheatstone automatic circuits are provided. These galvanometers are used to balance with, and also serve the useful purpose of enabling the receiving offices to detect whatever "bias" there may be on the distant transmitting apparatus through lack of proper adjustment, etc. On this particular morning the bias was very pronounced and variable, and the sending offices were continually called upon to readjust their transmitters with a view to remedying the trouble, but all to no purpose. It was not until a number of other circuits became similarly affected that the real cause began to be suspected; and eventually by grounding a number of the wires at their opposite extremities, earth currents of considerable magnitude were found to exist in them. Some readings taken of their value at that time on a wire between New York and Buffalo showed a variation in current strength of between 5 and 21 milliampères, representing a maximum difference of potential between those points of about 50 volts. No subsequent measurements were made, but it is calculated that during the height of the storm (between 3 and 4 P.M.) the current strength exceeded 40 milliampères.

Circuits running east and west were more generally influenced than those extending in other directions, though the latter were by no means entirely free from interruption.

It is worthy of note that during the course of the afternoon, when nearly all the wires between New York and San Francisco were completely prostrated, a Wheatstone automatic circuit between Chicago and St. Louis—or one running approximately at right angles to the easterly and westerly line—worked at a high rate of speed without apparently any interference whatever.

Scarcely any disturbance was noticed on the New Orleans automatic circuit until about 4:30 P.M., after which time this, as well as other lines north and south, became more and more affected, until it was possible between 7 and 8 P.M. to work the circuits with the earth currents alone, as was actually done in one or two instances.

The storm disappeared, or at least ceased to influence the regular working, shortly after 8 P.M.

From information received it appears that the magnetic storm began as early as 12.40 in the morning, as shown by the magnetographs in the observatories at Washington and Toronto; and that between midnight and morning, as well as during the evening of that day, a fine red aurora was visible.

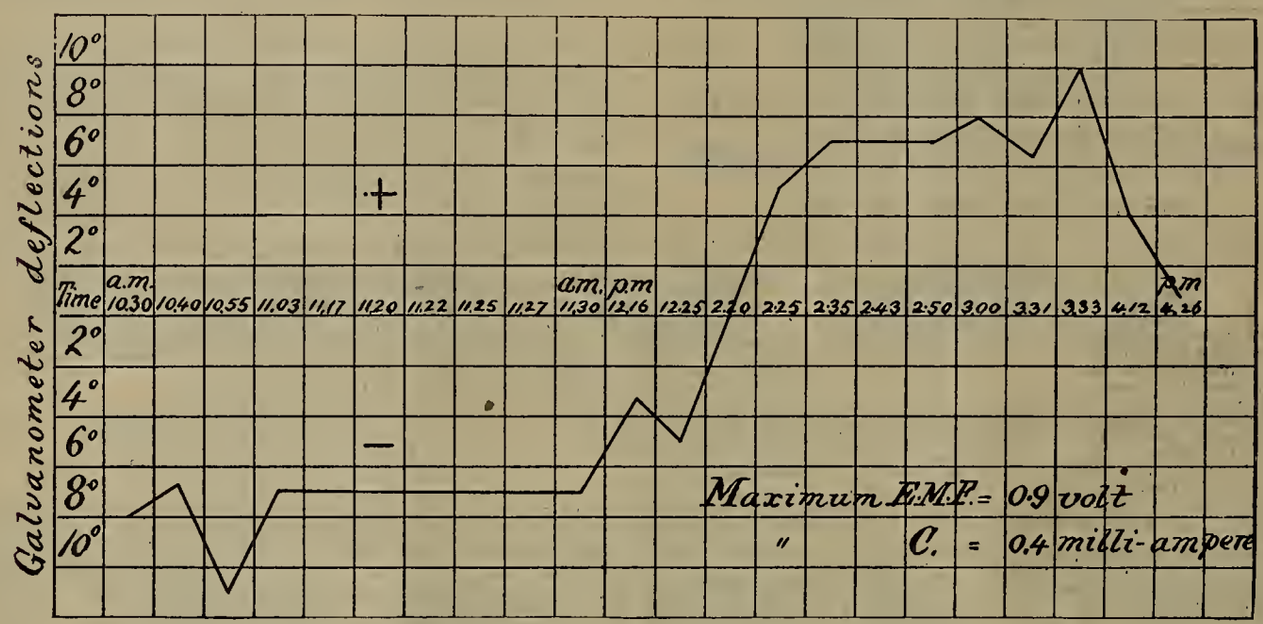

FIG. 1.—CHART SHOWING VARIATIONS OF NORMAL CURRENTS.

A less vivid auroral display occurred on Sunday evening, March 6, and several instances are recorded of interruption to the telegraph service during the prevalence of the aurora, especially on circuits west of the Missouri river.

On Saturday afternoon, March 12, there was a recurrence of the phenomena, but telegraph circuits were affected to a limited extent only, and in a direction mostly east and west. It is a singular fact that the Morse instruments were to all appearances indifferent on this occasion to the earth currents, which appear to have acquired an intensity sufficient only to visibly affect the comparatively weak signalling currents of the automatic system.

On April 24, 25 and 26 similar occurrences, but more spasmodic in character, interfered to a greater or less extent with certain wires running as usual in an easterly and westerly direction.

Since that time nothing further has been heard from them, though it is not in the least likely that we are altogether rid of their unwelcome visits, judging from past experience.

It has been demonstrated beyond all question that the closest relationship exists between the condition of the

sun's surface on the one hand, and earth currents, auroræ and the phenomena of terrestrial magnetism on the other.

In September of the year 1859 a bright spot broke out on the face of the sun, and exactly at the same time telegraph wires and magnetic needles in all parts of the world were disturbed, followed by auroral displays.

In February and August, 1872, and again in August, 1880, similar phenomena occurred.

The electric storm of January 31, 1881, which was quite cosmical in character, developed earth currents of remarkable intensity. On the same day a disturbance of unprecedented magnitude was observed in the sun's photosphere: one of those violent phenomena of solar excitements which occasionally become visible during the maximum sun spot period. We are passing through that period now, and the usual results may therefore be anticipated for yet some time to come.

In view of this circumstance it may be interesting to discuss one or two of the most plausible theories advanced by scientists to account for these strange and mysterious visitations.

The cause of these periodic solar perturbations is still a matter of conjecture; but since they are so intimately associated with earth-current phenomena, it is not improbable that a study of the vagaries exhibited by the latter may lead to a better understanding of the nature and cause of the former.

It is partly on this account that so much scientific interest is attached to the recurrence of these phenomena, and why it becomes a matter of considerable importance to collect such data and information as can be secured from observations of their effects upon telegraph lines. Records of the recent storms, for instance, show that, generally speaking, the wires proceeding north and south were not nearly so much excited as those extending in other directions. This fact affords us some idea regarding the distribution of the equi-potential surfaces in this section of the globe; or in other words, indicates between what points the electric potentials were nearly, if not quite alike, making it possible to deduce therefrom the direction taken by the originating disturbance.

To make this statement perfectly clear, let us consider what happens when a stone is dropped into a pool of

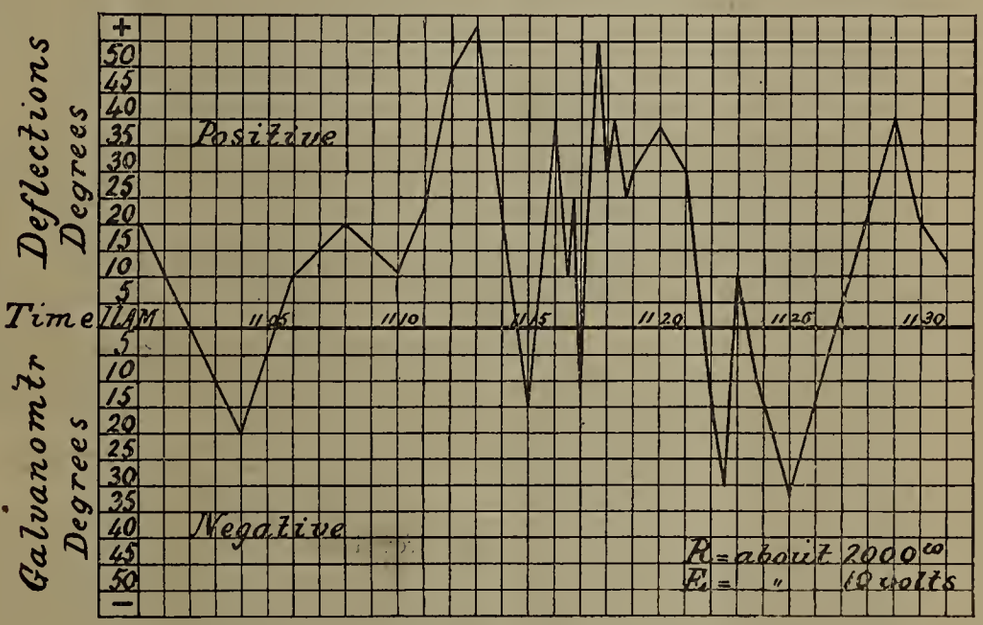

FIG. 2.—VARIATIONS OF ABNORMAL EARTH CURRENTS.

It has been proved by the result of careful observations made upon the electrical condition of our globe that the air is always more or less charged with electricity; so that the earth may be regarded as a highly electrified sphere, with electrostatic lines of induction radiating from it in all directions into space. It may be accepted as highly probable that the sun and other members of the solar system are similarly charged, to a greater or less extent; and that between all planetary bodies an electric force is exerted, which varies with their respective charges and the distance separating them.

Now any alteration in the static distribution of electricity upon a conductor will set up an electric current in it; so that the earth in its motion relatively to say the sun, will have its electricity continually in motion, thus giving rise to electric currents. Under ordinary circumstances these currents would undergo regular periodic changes corresponding with the variations in the relative densities and distances between the charged bodies; but under exceptional circumstances, when great and sudden changes are occurring in the solar atmosphere, we should expect to find sympathetic fluctuations in the magnetic field between the earth and the sun, which would create the conditions requisite for the generation of strong and variable earth currents.

still water. By observing the waves on the surface of the water as they proceed outward from the disturbed centre, it will be seen that they carve the surface into a series of circular waves alternately depressed and elevated. If you select any particle forming a portion of one of these waves, it will be evident that it will form part of a circle of particles all at the same height as itself and equally distant from the centre of disturbance. Between any two points on this circle, therefore, there will be no tendency for water to flow. Moreover, it will be equally evident that the disturbing force acts across these circles in a direction perpendicular to their surfaces.

Now, the equi-potential surfaces created in the case of an electric force may be likened to the series of concentric circles set up by the water disturbance. A body electrically excited may in fact be regarded as a centre from which lines of electric force radiate in all directions. At any distance from this centre a circle may be drawn, all points of which (being equally distant from the centre) will be at the same electric potential. Hence such a circle will represent an equi-potential surface, along which there will be no tendency for electricity to flow. If, then, we find upon the surface of our globe a number of places connected by telegraph lines, where the effects

of the late storms were less marked than on others, or between which no disturbing influence whatever was felt, we should be justified in regarding such points as near the line of, or actually forming parts of equi-potential surfaces.

Such is the deduction drawn in the case of those circuits which were least affected by the late electric storms, and these circuits were found to run mostly north and south.

Since electric forces always act across, or at right angles to the equi-potential surfaces, it is possible to mark the direction taken by the propagating force, and finally to trace it to its origin.

In this way it has been shown beyond peradventure that the sun is mainly responsible for those singularly erratic performances of an electric character, which are more prevalent during the period of maximum sun spots than at any other time.

It is highly probable that at such periods something akin to volcanic eruptions are taking place in the sun. It is a well-known fact that terrestrial phenomena of any such character are always accompanied by electrical discharges and displays, and that these volcanic forces are in some cases characterized by having periods of considerable regularity.

This is what probably happens on a much larger scale in the sun, the excited portion of whose surface is undoubtedly concerned in the production of those peculiar electrical and other phenomena which occur in eleven-year cycles, as well as at other intervals both regular and irregular.

There are other currents of natural electricity which may be found in any telegraph wire, at almost any time (by inserting a suitable galvanometer in the wire) that are the very antithesis of the intense and fitful currents we have just been considering.

These are the *normal* earth currents which differ from the *abnormal* ones in several particulars; they are not transient visitors like them, but permanent residents in the earth; they are very much less intense and variable; show greater regularity in their fluctuations, and appear to be controlled by some invariable and general law. Early observations showed that these currents ebb and flow in a manner like the tides of the ocean, which led many investigators to suppose the cause to be of lunar origin. It was believed, for example, that this tidal action was brought about by the earth's electricity following the moon in her relative motion with regard to places on the earth's surface.

A striking confirmation of this view was apparently afforded by the record of some observations on earth current variations made upon the Atlantic cable in 1858. Readings showing the direction and strength of the current flowing through the cable were taken once every 15 minutes for a period of 36 hours, and compared with the tidal variations during the corresponding period. The curves showed a remarkable coincidence between the earth current variations on the one hand, and the times of high and low water on the other; from which it was argued that the same force which directed the tides was also concerned in the production and variation of earth currents.

I shall not attempt to dilate upon the many other interesting and characteristic features of these normal currents, but proceed to discuss another class of earth current that is not so well known, and which exercises somewhat of a discriminating effect upon the working of circuits.

The abnormal earth current is one whose presence is readily detected on account of its decided action upon the working of the circuit.

The normal earth current on the other hand is exceedingly feeble, and does not as a rule affect the working in the least. (See Fig. 1.)

What may be termed the intermediate class of current is one whose strength does not bring it within the range of visibility, as it were, of the ordinary Morse apparatus, and whose existence is not therefore even suspected, but which has nevertheless a disquieting effect upon Morse circuits, as well as more serious consequences upon other circuits equipped with apparatus of greater susceptibility. This was particularly evident in the case of the storm of March 12, which, as previously mentioned, interfered in a marked degree with the operation of the automatic system without *apparently* affecting the working of the Morse wires.

This circumstance placed the automatic service and those connected with it in rather an unfavorable light; but when the real cause of the trouble was found, it was also discovered that though there had been no *actual stoppage* on the Morse circuits, *there had been considerable bad working*, which had been attributed to everything but the proper cause.

The result of some earth current readings obtained on a wire between New York and Buffalo on the morning of that date is graphically shown in Fig. 2. They were taken some hours prior to the advent of the storm referred to, and were probably much less intense than those subsequently encountered, but yet of sufficient variability to account for the fluctuating "bias," and other annoyances, which so perplexed and worried the chiefs in charge of the Wheatstone circuits at the time.

The writer has many records, taken at various times, of such like variations in the value of earth currents; and while they rarely exceed 4 or 5 milli-ampères, they appear to be sufficiently strong to produce at least some of the unsatisfactory results mentioned.

It is quite certain that a great deal of the trouble experienced on telegraph circuits is never satisfactorily accounted for; and while it is not intended to hold up the earth current as a scapegoat for all the unaccountable troubles that telegraphy seems heir to, there is hardly a doubt but that its influence is frequently exercised to a greater extent than is generally supposed.

THE GENERAL ELECTRIC COMPANY.

The General Electric Company, in accordance with the provisions of the law recently passed by the New York Legislature, granting it the privilege of increasing its stock from $100,000 to $50,000,000, filed with the Secretary of State, on May 2, a certificate of increase of capital to $50,000,000. The documeut is signed by Eugene Griffiin, S. Dana Greene, Joseph B. Ord and James Jackson, a majority of the directors, and recites that the meeting at which the stock was increased was held in the Drexel building on Saturday, April 30. It is believed that the company intends to absorb all of the small companies in the State. The Cantor act, under which the company is incorporated, forbids the formation of a trust. The bill referred to also provided for the payment of a tax of only one-twentieth of one per cent. of the capital, instead of two per cent. exacted by the State. On this basis the corporation tax amounts to $25,000, which the company has paid into the State Treasury.

The first meeting of the General Electric Company, which is the Thomson-Houston and Edison General Electric Combination, took place on May 4, at which the following officers and directors were elected :

Officers : C. A. Coffin, president ; Eugene Griffin, first vice-president, and Samuel Insull, second vice-president. A. S. Beves was made treasurer and assistant secretary ; E. J. Garfield, secretary ; J. P. Ord, controller ; E. Clark, auditor, and B. F. Beach, Jr., and W. F. Pope, assistant treasurers.

The directors elected were: J. Pierpont Morgan, C. A. Coffin, Thomas A. Edison, D. O. Mills, F. L. Ames, T. Jefferson Coolidge, Eugene Griffin, Henry L. Higginson, H. McK. Twombly, C. H. Coster and F. S. Hastings. Mr. Twombly was made chairman of the board.

DECORATIVE ELECTRIC LIGHTING AT THE ACTORS' FUND FAIR.

The possibilities in decorative electric lighting were shown in an extremely brilliant and interesting manner at the Actors' Fund Fair, which was held in Madison Square Garden, New York, during last week.

The electric light is unique in that it can be used in situations and under circumstances which preclude the possibility of using any other form of light. For instance, tiny bulbs can be scattered amongst flowers and foliage without detriment to these delicate structures, and they can be combined with the lightest fabrics for artistic effect without danger. With what other light can such beautiful results be accomplished?

The Edison General Electric Company has for some time past been making a specialty of tiny lamps for decorative purposes, and the public is now quite familiar with the beautiful displays in this line that the company has made from time to time in the recent past, notably the towers of light at the Woman's Exchange Fair held at the Lenox Lyceum, in New York City, three years ago, and the industrial exposition held in Minneapolis in the fall of 1890.

At the Actors' Fund Fair just held the electrical decorations were various in their application, and all of great splendor, showing what beautiful combinations may be effected in this style of embellishment. The great brilliancy of the light was remarkable, and yet it was so delicately subdued and rendered so soft that it was totally devoid of any unpleasant features.

On entering the great amphitheatre the first electrical decoration to meet the eye was a signboard placed over the arch erected in the arena, with the words "Actors' Fund Fair," composed of tiny bulbs, with a background of black cloth; and at the farther end was the name "Edison," wrought in red letters; while over the main entrance to the Garden, under the boxes, were the words "Edison Light," in blazing white letters.

ACTORS' FUND FAIR—AMERICAN EAGLE AND SHIELD.

One of the most effective designs was that over the entrance to the booth representing in its exterior the old Globe Theatre. It consisted of a twelve-pointed star of sage-green silk, rayed, on which were the letters "A. F.," of fancy form, composed of tiny blue, yellow and red bulbs the light from which reflected against the green silk, producing a most delightful harmony of color, which could hardly be matched by the painter's brush.

Adjoining "The Old Globe Theatre" was a model of Shakespeare's house, in which the electric illumination

was exceedingly attractive. Around the room were distributed wall-brackets representing candles, the flame of which, instead of being the smoke-producing and fickle light of "ye olden times," was the light of lights, the incandescent lamp. Each bracket was composed of three candles, each of which was surmounted with a tiny frosted bulb from which a soft but brilliant light emanated. In one corner of the room was an attractive novelty in the shape of what might be called an electrical kaleidoscope. It consisted of a revolving wheel on which lamp bulbs of many different colors were arranged spirally, and on each revolution of the wheel the lamps of one set of colors would be extinguished and another set crown of bulbs no bigger than bird eggs, shedding beautiful soft light.

At the silverware booth some beautiful candelabra of chaste designs were lighted with the omnipresent incandescent bulb, with remarkably rich effect. Hanging lamps were displayed around the edges of the booth with small frosted bulbs elegantly combined with the rich metal-work. The "Old Curiosity Shop," immortalized by Charles Dickens, or rather a representation of it, was lighted in its interior by wall-brackets with electric candles in pairs, the bulbs being frosted, which diffused a soft light throughout the room.

In the jewelry booth of Charles Seale & Co. some

ACTORS' FUND FAIR—ELECTRICAL FAN DESIGN.

lighted, the effect of the constantly changing colors being very beautiful. On the counters were pedestals on which were grouped small frosted bulbs, which shed a beautiful soft light on the wares.

Next door to Shakespeare's house stood a model of the exterior of the old Park Theatre, New York, which was built in the year 1796. At one entrance stood a large and beautiful standard lamp, illuminated with a group of small bulbs. The interior was lighted with wall-brackets similar to those in the Shakespeare house, and the upright pole in the centre of the room was encircled with a very pretty effects were produced. The show-cases in which the gems were displayed were lighted on the inside with tiny bulbs of different colors attached to the top of the cases, and scattered amongst the precious stones were other bulbs, the light from which served to show the goods to the best advantage.

Over the entrance to the model of the old Chambers Street Theatre were the words "Chambers Street Theatre," wrought in red and green bulbs, which was very brilliant and attractive. The interior was illuminated with side wall-brackets.

Around the candy booth were frosted bulbs backed with five-pointed stars, the combination of the two being beautiful. The effect was that of many stars of soft white light. Inside the booth were several standard lamps with shades of delicate fabric, the texture of which was clearly brought by the soft electric light underneath.

Five A's, in different colored letters made up of small bulbs, the initials of the "5 A's Club," over the entrance to the model of Harrigan's Theatre, attracted considerable attention.

Probably the most effective display of all was that at the flower-stand of the New York Florists' Club. The flowers and foliage plants were dotted here and there with little bulbs which produced a scene of great beauty, the soft light against the green foliage giving a restful effect to the eyes. Over the stand was the American eagle and shield made up of small bulbs of appropriate colors, and five-pointed stars of blue and red were conspicuous attractions.

Over the wine booth hung a cluster of grapes composed of small bulbs of a purplish blue color.

A unique design in green lamps was that at the Japanese booth. The word "Tea" was made to represent, as nearly as English would permit, Japanese characters.

The principal thing in the line of decorative effect was the representation of a fan over the entrance arch in the arena. On the fan was a sheaf of wheat made up of green and red lamps, and a spider's web, with a huge spider in the centre. The ribs of the fan were of brown bulbs, and the lights were turned on and off in such a manner as to give the effect of opening and closing the fan.

The scene, viewed as a whole, was a most entrancing one, and reflected great credit upon those who had the work of planning and execution in hand. Mr. A. Page and Mr. Wilson S. Howell executed the designs and superintended the lighting effects, while Mr. Martin, the electrician at the Garden, did the wiring, which was an excellent piece of work. Not a wire was visible anywhere, the work being all concealed. Under the skilful management of A. M. Palmer and A. B. De Freece the Fair was one of the most successful ever held in New York.

ACTORS' FUND FAIR—ENTRANCE TO "OLD GLOBE THEATRE."

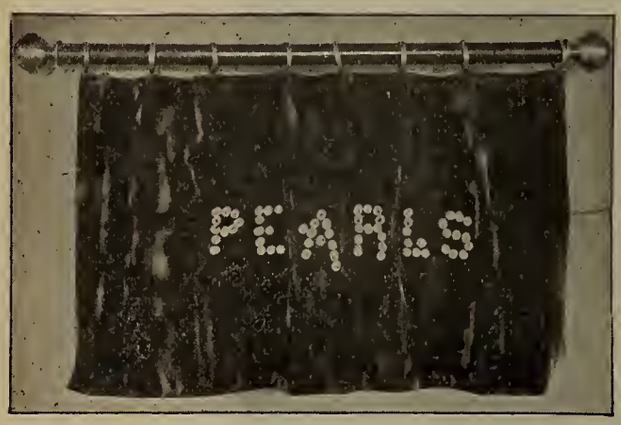
The Columbus Street Railway Co., Columbus, O., was incorporated April 25, with a capital stock of $3,000,000, to construct and operate street railroads in Columbus to be operated by electric or other power. Incorporators: Philip H. Bruck, Edward Dermead, Irvin Butterworth, C. P. L. Butter, Charles G. Lord.

ELECTRICAL SOCIETIES.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

The annual meeting of the Institute for the reception of yearly reports, the election of officers and other business of a similar character, will be held at the headquarters of the Institute, No. 12 West 31st street, at 4 P.M., Tuesday, May 17. It is expected that the session will occupy about two hours. After adjournment, those who desire to do so will assemble at "The Arena," 41 West 31st street, where a subscription dinner will be served, the price of which has been fixed at $2.00 per plate. This will be a purely social gathering, and it is hoped that all who can do so will be present.

The general meeting will be held at the Grand Pacific Hotel, Chicago, on Monday, Tuesday and Wednesday, June 6, 7 and 8. The following papers are in preparation for that occasion and others are promised, which will be announced in the regular programme to be issued later.



ACTOR'S FUND FAIR—DESIGN IN JEWELRY BOOTH.

1. "*Electric Coal-Mining Machinery*," by MR. ELMER A. SPERRY, of Chicago.
2. "*On the Electro-Magnetic Field*," by M. I. PUPIN, Ph.D., of Columbia College, N. Y. City.
3. "*Long-Distance Transmission for Lighting and Power*," by Mr. CHARLES F. SCOTT, of Pittsburg, Pa.
4. "*A New Rheostat*," by Mr. C. E. CARPENTER, of Minneapolis, Minn.
5. "*A Dynamo Indicator, or Instantaneous Curve Writing Voltmeter*," by PROF. GEORGE S. MOLER, of Cornell University, Ithaca, N. Y.
6. "*Electro Technical Education*," by PROF. R. B. OWENS, of the University of Nebraska, Lincoln, Neb.
7. "*The Magnetic Properties of Sheet Iron*," by MR. MILTON E. THOMPSON, of Cornell University, Ithaca, N. Y.
8. "*Selective or Individual Signals*," by MR. THOMAS D. LOCKWOOD, of Boston, Mass.
9. "*Railroad Train Lighting*," by MR. A. H. BAUER, of Chicago.
10. "*A Discussion of Circuits Containing Resistance, Self-Induction and Capacity*," by MESSRS. FREDERICK BEDELL and ALBERT C. CREHORE, of Cornell University, Ithaca, N. Y.
11. "*A Life and Efficiency Test of Incandescent Lamps*," by PROF. B. F. THOMAS and MESSRS. P. MARTIN and R. H. HASSLER, of the Ohio State University, Columbus, Ohio.
12. "*Notes on Wiping Contact Methods for Current and Potential Measurement*," by PROF. B. F. THOMAS, of Columbus, Ohio.
13. "*Series Electric Traction*," by MR. NELSON W PERRY, of New York City.
14. "*Oil vs. Air as Insulation*," by DR. J. B. WILLIAMS, of New York City.
15. "*On the Electrolytic Refining of Copper*," by LIEUT. F. B. BADT, of Chicago.
16. "*The Photography of Alternating-Current Curves*," by DR. EDWARD L. NICHOLS, of Cornell University, Ithaca, N. Y.
17. "*The Reversal of Polarity in Plating Dynamos*."
18. "*Dynamos for Continuous-Current Circuits*," by PROF. HARRIS J. RYAN, of Cornell University, Ithaca, N. Y.
19. "*The Technical Education of the Electrical Engineer*," by PROF. D. C. JACKSON, of the University of Wisconsin, Madison, Wis.

Papers are also expected from MR. H. WARD LEONARD, MR. NIKOLA TESLA, PROF. ELIHU THOMSON and PROF. GEO. D. SHEPARDSON, the subjects of which cannot be announced at present.

The convention rate of transportation, at one and one-third the regular fare for the round trip, can be secured in case the attendance is sufficiently large to comply with the rules of the Central Traffic Association. Members will be informed subsequently whether such arrangements can be perfected.

All sessions of the general meeting at Chicago will be open to the public and a general invitation is extended to all who are interested in electrical progress to attend this meeting, which on account of the various topics to be considered, has been extended to cover the dates of June 6, 7 and 8. Those who are not at present members of the Institute but who desire to attend are requested to send their names to R. W. Pope, secretary, 12 West 31st street, in order that they may receive copies of the official programme and secure the privilege of reduced rates of transportation in case the necessary arrangements are perfected.

BUFFALO ELECTRICAL SOCIETY.

A class-meeting of this Society was held May 2 in the lecture-room of the Library Building, and the study of physics was continued under the direction of Mr. Frank Kitton, of the Western Union Telegraph Co. On May 16 a meeting will be held at which interesting galvanometer tests of incandescent lamps will be made, and Mr. Kitton will at the same meeting lecture on the use of the voltmeter and ammeter in practical work.

EDISON TELEPHONE PATENTS ISSUED.

On May 3 the Commissioners of Patents issued to Mr. Thomas A. Edison three patents on "Speaking Telegraph." One application was filed April 27, 1877, and the other two on July 20, 1877. These patents are better known as Edison's Telephone, and were assigned to the Western Union Telegraph Company.

The granting of these patents terminates a long-standing contest. The improvements covered by them have been in use by the Bell Company for ten years. Two of them are embodied in the Blake transmitter. The other is for a microphone in which the electrodes have broad surfaces. There were applications pending from other persons for the same inventions, so that the Edison patent could not issue until the rights of the others had been determined. Foreign patents for the Edison invention have been issued, some of which have expired, and there will be a question whether an American patent issued after a foreign patent has expired is valid. As it has already passed through various Circuit Courts, it is likely that the question will be brought up before the United States Supreme Court for final disposition.

ELECTRIC TIME CALL.*

Any one who has arrived at an hotel late at night after a long journey, tired out and anxious to retire, well knows how annoying and exasperating it is to have to stand on a long line with a number of others who have arrived on the same train, before the hotel clerk waiting for his turn. Nearly every one desires to be called or have attention at some particular time, and the clerk is kept busy writing these instructions in his blotter, while those on the rear end of the line grow impatient and irritable. It was during such an experience as this that the apparatus designed and illustrated herewith had its inception, the inventor being forcibly impressed by the slowness of the old method in handling things. His impressions were still further increased by an experience of the risk a guest takes in depending upon the clerks having him called at a specified time. Wishing to catch

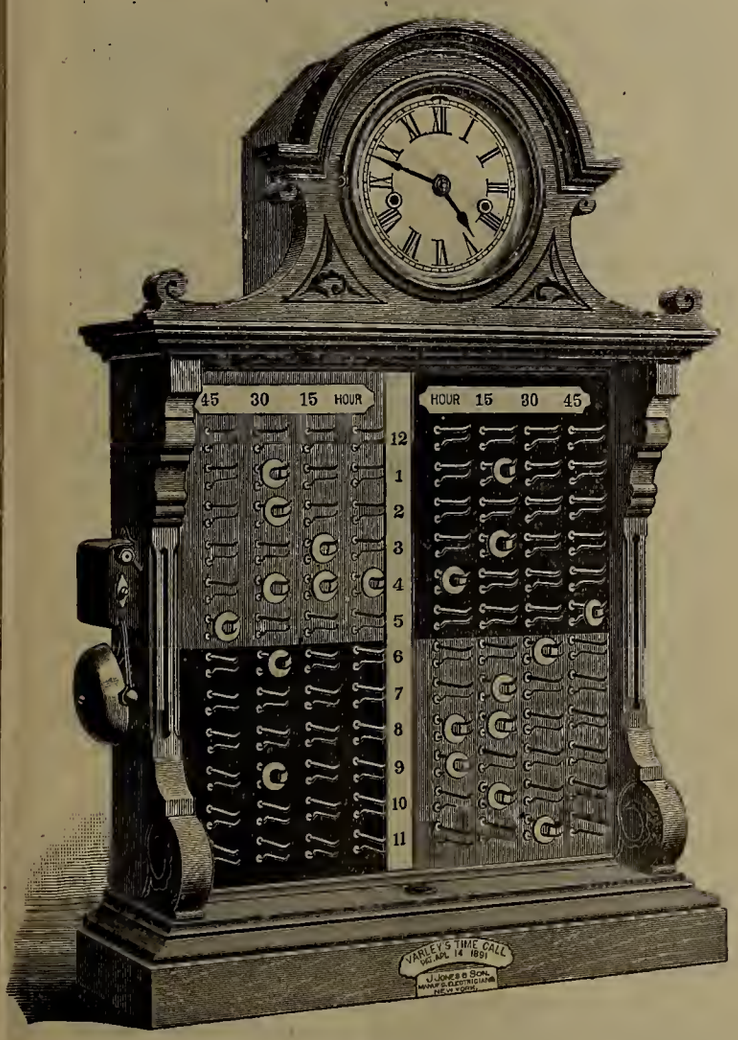


FIG. 1.—ELECTRIC TIME CALL.

a train at 9 A.M. the following morning, he instructed the clerk to have him called at 8 A.M., but was not awakened. Investigation developed the fact, that while the room had been correctly entered in the blotter, a mistake had been made in transferring to the paper handed to the bell boy. All this can be avoided by the use of the apparatus above mentioned. It is known as the Varley Electric Time Call, and has been designed as a labor-saving apparatus and to make absolute, calls and service in hotels, livery stables, and other places in which it is desired to give prompt attention and security to customers.

The Time Call is of use also in hospitals, factories, offices, sleeping-cars, steamboats, public institutions, schools, railroad stations, and in fact in any place where punctuality is necessary.

The general arrangement of the Call is shown in Fig. 1. Beneath the clock are the pins arranged in line with the hour, quarter, half and three-quarter hour lines. When a guest desires to be called at 5:45 A.M., the clerk takes the tag Fig. 2 numbered in accordance with his room from the key board, slips it over the two metal pins under the figure "45" and to the right of the figure "5," these two forming the hour for call. Nothing further is required until the clock reaches the time of 5:45, when the bell will ring, and continue to ring until the tag is removed. This tells at once the room to be called, and there is no possibility of mistake if there is any one about to hear the bell. Fig. 3 shows the diagram of connections.

When ten guests are to be called at the same time, ten little room tags are placed on pins in the same manner as one. The dark portions of board represents night and the light portions day.

The machine is within reach of all, small as well as large hotels, as it is not a large and elaborate article, and is as useful in one as in the other. In stands 28 inches high, is 18½ inches in width, and is 6 inches deep. It is complete within itself, with the single exception of

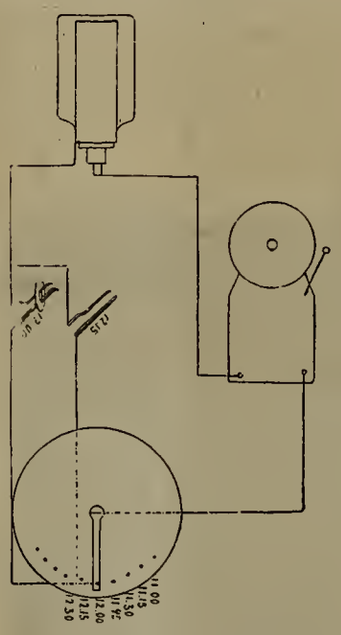

FIG. 3.—DIAGRAM OF CONNECTIONS.

FIG. 2.—TAG.

battery, which may be placed in any convenient locality near the machine, or at a distance from it.

The number on the tag as will be seen in the cut is very plain and distinct, thus overcoming the trouble of mistakes caused by the difference in handwriting.

The many different uses to which this apparatus can be applied will be readily suggested to the reader, and we have no doubt but that after it becomes generally known any hotel not using one will be looked upon as being behind the times.

*J. Jones & Son, 602-604 West 22d street, New York.

TO LOCATE THE MAGNETIC POLE.

A movement is on foot to organize an expedition to locate the north magnetic pole, and it is quite probable that the result will be successful. The American Geographical Society is taking great interest in the matter, and is putting forth every effort to ensure success. Part of the money estimated that will be necessary to carry the work to a completion has been subscribed, and owing to the general interest manifested in scientific circles the the balance, it is thought, can easily be secured.

A few words concerning the magnetic pole will be of interest. It is located about 1,200 miles south of the

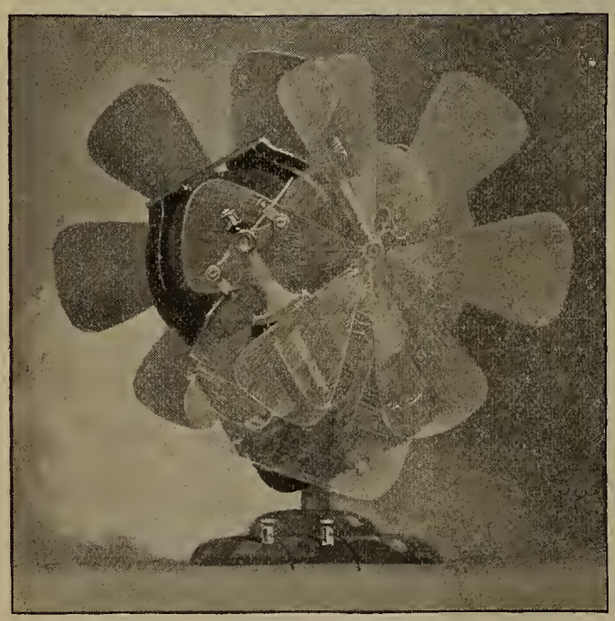
geographical pole, somewhere in the neighborhood of King William Land, and it may be under water. Several years ago efforts were made to determine the true position of the magnetic pole by English and other European explorers, and it is said they got within a few miles of the spot. This fact was proved by the position of the magnetic needle, which stood at an angle of 89° 59′, or very nearly vertical. It will stand vertically directly over the magnetic pole. It is believed, however, that the pole is unstable, that is, it is not always in exactly one locality, but it is thought that the change of position occurs through regular periods which can be determined by observation.

It will be a valuable addition to our knowledge on this subject to know just what variation to allow at any time, and surveyors and mariners will appreciate its importance.

With greater experience and improved instruments there would seem to be no difficulty of great magnitude in the way of the success of such an expedition.

CROCKER-WHEELER PIVOTED FAN MOTOR.

Those who, during the past summers, have enjoyed the artificial breeze stirred up by an electric fan outfit, and the better ventilation which results therefrom, will thoroughly appreciate the merits of this recent invention of the Crocker-Wheeler Electric Company, New York. The illustration almost explains itself.



CROCKER-WHEELER PIVOTED FAN MOTOR.

The pivoted fan motor is mounted upon an ornamental base of dark red wood and swings slowly around the circle upon a pivot, throwing the breeze to every corner and part of the room. It will be readily understood that the ventilation is therefore complete, while the motion imparted to the atmosphere more closely resembles the cooling breezes of nature than the steady blast from a stationary fan. The pivoted fan motor is equipped with the Crocker-Wheeler Variable Speed Switch, thus giving either a gentle zephyr or a strong breeze, as may be desired. These outfits are furnished, 1-12 H. P., 115 volts, and 1-6 H. P., 115, 230 or 500 volts, with self-oiling bearings. The 1-6 H. P. 500 volt motor has only one speed.

Orders have already been booked for a number of these outfits, and those wishing to enjoy the luxury and comfort during the heated term which the employment of such a device insures, will find it advantageous to get into line with their orders early. For use in offices, restaurants, kitchens, sick-rooms and badly ventilated apartments, these fan outfits should prove of great value.

BIOGRAPHICAL SKETCHES.

JOHN A. SEELY.

We present to our readers herewith the features of one well known among the electrical fraternity, and who hardly needs any introduction—Mr. John A. Seely.

Mr Seely is a Virginian by birth, and is quite young, being thirty-six years of age. His first appearance in the electrical field was in 1879, when he held a position with the American Union Telegraph Company. The following year, 1880, he became connected with the City and Suburban Telegraph Company, of Cincinnati, O., as its electrician. This position he filled until 1882 with marked ability, when he resigned to accept a place with the Metropolitan Telephone and Telegraph Company of

JOHN A. SEELY.

New York. He entered the service of this company as general inspector, and filled this position from 1882 to 1883, when he was promoted to the position of electrician.

In 1889 Mr. Seely resigned from the telephone business to enter the electric-light field, in which he has already made for himself a name as an engineer of marked ability.

During his connection with the Telephone Company as electrician he wonderfully simplified the telephone service under his charge, and during the construction of the great Telephone Exchange, at 18 Cortlandt st., New York, he introduced many novel features, which will always be of great value in telephony.

Mr. Seely is a well-known and active member of the New York Electric Club, and is also identified with other institutions of like nature.

That he is a busy man may be inferred from the fact that he, at the present time, fills various positions as follows: General manager of the Complete Electric Construction Company, of New York; secretary of the Heisler Electric Light Company, Union, N. J.; secretary of the Rockaway, N. J., Electric Light Company; president of the F. M. Ricketts Cable Laying Company, of New

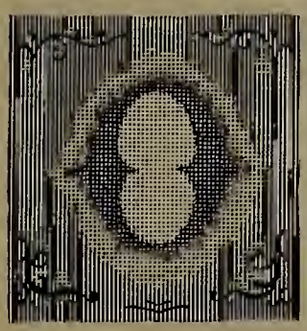
York; president of the Seely & Taylor Manufacturing Company, of New York, and president of the Newtown Electric Light Company. In all of these organizations Mr. Seely is a stockholder to a considerable extent, besides filling the position of consulting engineer for several large corporations and municipal bodies.

Mr. Seely is a prominent member of the National Electric Light Association, and is always ready to take part in its deliberations. He is a man of varied and extensive ability, and has a host of friends in the electrical fraternity.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Electrolysis.



ONE of the most interesting phenomena in the science of electricity is that of electrolysis. This name was given by Faraday to the effect produced by passing an electric current through water and many other liquid chemical compounds. This effect consists of a chemical decomposition of the liquid, and such decomposition is always in proportion to the current.

The term electrolysis is derived from the Greek λυω which means to loosen or separate, combined wit ηλεκτρον, *electron*, and Faraday gave the name of *electrolyte* to substances capable of decomposition by an electric current. He also gave the name *ions* to the products of such decomposition, and those which appeared at the positive pole, or anode, of an electrolytic cell he designated as *anions*, while those appearing at the negative pole, or cathode, he called *cations*.

The transfer of the atoms of an electrolyte in opposite directions is supposed to occur in accordance with a theory proposed by Grotthuss in 1805, and afterwards modified by Clausius. In every electrolyte the molecules and atoms of which they are composed are supposed to mutually interchange relationship constantly, producing motion in every possible direction, old groups being continually dissolved and new ones formed.

In the accompanying illustration a graphical idea of this action is given. On line 1 each oval represents a molecule of water, the two hydrogen atoms which compose the hydrogen molecule being shown by the shaded part and the oxygen atom by the unshaded part; infinite number of such chains making up the mass of the liquid.

In line 2 these molecules, under the influence of an electric current from A to B, are supposed to be reduced to a symmetrical phase, in which the oxygen part of each is turned towards the anode and the hydrogen part towards the cathode. Now a new grouping is supposed to take place, the oxygen of each molecule moving to the left to recombine with the hydrogen of the adjoining left-hand molecule, and the hydrogen moving to the right to recombine with the oxygen of the adjoining right-hand molecule; the new formation being represented by line 3, in which the oxygen part of the molecule at the left end of the chain and the hydrogen part of the molecule at the right end are each left without a mate, and being prevented by the electric action from combining with each other, each is given off as a gas. Thus, while an interchange of atoms and molecules is taking place all along the infinite number of lines of electric action throughout the entire mass, the opposite ions make their appearance only at the electrodes.

The decomposition of every other electrolyte is supposed to take place in a similar manner.

Different compounds vary greatly in their relations to electrolysis. Thus, in some cases the feeblest current will produce electrolysis, while in others the most powerful current fails to effect decomposition; pure water, for instance, possesses the power of resistance to electrolytic action to the greatest degree, while water slightly acidudulated with sulphuric acid becomes one of the easiest combinations to decompose. The acid itself seems to remain unchanged, but its presence reduces the electrolytic resistance of the water.

It has been maintained that the electrolysis of water is influenced by pressure, and that under a pressure of 300 atmospheres, equal to about 4,500 pounds to the square inch, even acidulated water cannot be decomposed, while in vacuo its decomposition may be effected by comparatively weak currents. On this point, however, authorities do not agree.

Electrolysis depends upon the existence of certain conditions. The electrolyte must be liquid, a conductor of electricity, and a compound. Ice, though of the same chemical constitution as water, cannot be decomposed by the current because it is solid

The temperature has a very important influence on electrolysis, and both the electrolytic action and the

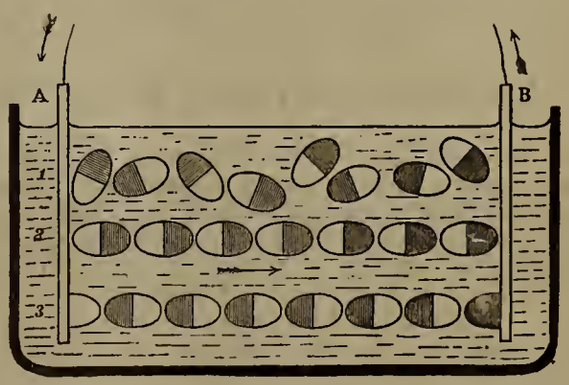


Fig. 158.

THEORY OF TRANSFER OF ATOMS IN ELECTROLYTE.

electric conductivity of the liquid are increased by an increase of temperature and conversely decreased by a decrease of temperature.

Referring to the hypothesis of Grotthuss, Clausius sought to bring the ideas of the former into conformity with the modern kinetic hypothesis of the constitution of liquids. This is, essentially, that in the usual state of liquid the molecules are always in motion, and their constituent atoms, also in motion, are continually separating and recombining into similar groups, their movements taking place in every possible direction throughout the liquid. Under the influence of an electromotive force, however, these actions are controlled in *direction*, so that when, in the course of the usual movements, an atom separates from a group it tends to move either toward the anode or cathode, and if the electromotive force be powerful enough to prevent recombination, these atoms will be permanently separated and will accumulate around the electrodes.

AN EVERY DAY MEMORANDA.

The American Telephone and Telegraph Company (the Long Distance Telephone Co.), 18 Cortlandt street, New York City, is distributing a very original and useful every day memoranda from May '92 to May '93, gotten up in book form, which is sure to be appreciated by all who are fortunate enough to secure a copy. There is a page for each day, and the book is very beautifully and substantially bound.

COMBINATION OF INTERESTS.

A dispatch from Chicago states that a combination of interests has been effected between the Westinghouse Electric Manufacturing Company, of Pittsburg, Pa., and Siemens & Halske, the great German electrical manufacturers, who recently opened offices in Chicago, for the purpose of opposing the Edison-Thomson-Houston combination. It is expected, the dispatch says, that a war of prices, especially in street-railroad devices and decorative illumination appliances, will be the result of this move. It is also said that President Harrison and Secretary of War Elkins are stockholders in the new concern.

This announcement was followed on May 2 by a dispatch from Chicago which states that George Westinghouse, Jr., and the Westinghouse Electric Company have $550,000 at stake with the directors of the World's Fair. Mr. Westinghouse, the dispatch states, was not satisfied with the award of contracts for incandescent electric lamps at the Fair. The Edison Company, a branch of the Thomson-Houston combine, got the work at $5.95 per lamp Mr. Westinghouse has offered to put up a personal bond of $50,000 that he will furnish a lower bid than that of the electric combine, and he agrees to deposit an additional bond of $500,000 to insure against any raise of the bid of the Trust. The propositions were accepted.

EQUIPMENT CONTRACT AWARDED.

The Short Electric Railway Company, of Cleveland, O., has closed a contract for the construction and equipment of an electric road in Fort Wayne, Ind., for the Fort Wayne Electric Railroad Co., which is composed principally of a number of gentlemen interested in the Cleveland Cable Company, of Cleveland, O., who secured a franchise for that purpose. The Short Company feels quite elated over having secured this contract, in view of the fact that strong efforts had been made by all the electric railway companies in the country to induce the Cable Company before it installed its plant in Cleveland, to adopt electricity as a motive-power without avail. Having succeeded in inducing them to adopt electrical propulsion on the Fort Wayne system is quite a feather in the cap of the Short Company. The installation will consist of 32 car equipments complete, comprising 64 20 H. P. single-reduction motors and ten miles of overhead construction. Shipment of the apparatus has already begun, and the work will be vigorously pushed, every effort being made to have the road completed and ready for operation by June 1.

EXHIBITION OF PATENT MODELS AT THE WORLD'S FAIR.

A circular, of which the following is a copy, has been issued by the Commissioner of Patents, inviting patentees to contribute toward an exhibition of models of patents at the World's Fair:

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
WASHINGTON, D. C., March 8, 1892.

To the inventors and manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts, which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts, and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which, indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the office in this matter, either by loans of models already built or by the construction of such models not in the possession of the office as should properly be placed in such a collection. Of course, where models are loaned to the office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a williness to co-operate with the office in this matter, and it is confidently expected that such a response will be made to the general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the development of American invention.

W. E. SIMONDS, *Commissioner.*

"An outline history of invention in model form" is what, according to Mr. James Q. Rice, the special agent of the Patent Office, will be attempted, and it must be accomplished within the next six or eight months. It will be a painstaking classification such as has never been attempted with the models in the halls of the Patent Office, and it will be immeasurably easier to look over it and apprehend its significance as a page of history. The task of doing this work would be comparatively easy if the Patent Office possessed a complete set of models of the inventions patented in the last hundred years. But besides that few models have been required or filed since 1880, the fire of 1877 destroyed many of the older models, and made great breaches in some of the most important parts of the collection. To fill the gaps for the purposes of the projected exhibit a Patent Office Committee, working under an appropriation of $7,500 from the Exposition, has a force of fifteen men at work cleaning and burnishing old models, and making new ones when that can be done with little expense.

They are also appealing to inventors and manufacturers all over the country for assistance in their work. They have already received promises from some of the large manufacturing companies of models of great value that have been carefully preserved for many years, and others have expressed a willingness to make, at whatever cost, such models as the committee may desire. We are authorized to say that the committee will be glad to receive suggestions from any one who may wish to communicate with them without a direct application on their part. The object is to make the exhibit fulfil its purpose, and the committee will welcome assistance from every source.

There will be from 3,000 to 4,000 models exhibited in the space (6,000 feet floor) assigned for the display. It promises well for the high educational value of the collection that the examiner in charge of each class is called upon to select the inventions which mark the successive stages of growth. In the class of sewing-machines the principal models are already arranged, beginning with the Greenough model of 1842 and running down to date. We urge all our readers who can to co-operate with the committee in securing the best exhibit

possible. The representative of the department is Mr. H. A. Taylor; John M. Ewing is chief special agent, and the Patent Office Committee consists of James Q. Rice, special agent; J. B. Marvin, R. C. Gill, Malcolm Seaton and A. P. Greely. Correspondence should be addressed to Mr. James Q. Rice, United States Patent Office, Washington, D. C.

SPECIFICATIONS FOR WIRING.

The following specifications for wiring for electric light employing the conduit system of the Interior Conduit and Insulation Company, of New York City, will be of general interest.

SYSTEM.

The building to be thoroughly equipped from the source of supply to each outlet with the metal-sheathed insulating conduits of the Interior Conduit and Insulation Co., in such manner as to provide continuous insulating channels or race-ways for the wires. The continuity of each tube employed for this purpose shall be such as would be required if it were to be used for conveying water or gas.

Strict compliance with this requirement will be demanded, since one of the chief advantages of the system herein specified is to exclude water and gas from the wires, and therefore to afford adequate protection against their injurious effects.

ACCESSIBILITY.

To the end that each and every wire may be at all times accessible for inspection, repairs or renewal, the location, sectional division, joining, intermediate and terminal elbowing, the placing of switches, cut-outs and junction-boxes, and the final emergence of the tube beyond the finished surface at the fixture outlet must be done in strict compliance with the rules and regulations herein contained.

APPLIANCES.

In order to secure safety, durability and convenience, and to give a finished character to the work, all appliances employed shall be such as are designed especially for use in conjunction with this system.

SUBDIVISION OF RISERS.

The building must be divided into a number of sections, and each section provided with an independent group of risers, thus avoiding the multiplication of elbows, intersection boxes and long runs of the taps or branches.

Every conductor in each group of risers must be provided with an independent tube.

BRANCHES.

For all branches, the standard twin or the standard triple conductor (according to the system of distribution employed) of the Interior Conduit and Insulation Co., requiring but one tube, must be employed. The current limit of the branches must be that fixed by the Fire Underwriters' rules.

SIZE OF TUBES.

All tubes must be of sufficient size to allow the wires to be readily drawn in, withdrawn and reinserted at will.

A quarter ($\frac{1}{4}$) inch tube will be permitted only where space is extremely limited, as under a thin plaster finish, and even in such cases the $\frac{5}{16}$ tube should be used when possible.

CLIPS.

Tubes, whether concealed or on the surface, must be held in place by metal "clips;" the use of staples for such purpose will not be allowed where it can be avoided.

JOINTS.

The tubes must be cut squarely and then reamed out smoothly and the ends joined in the manner and by the use of the special tools and couplings designed for that purpose.

ELBOW LIMITATIONS.

Where more than four elbows are unavoidable an intersection box must be inserted to relieve both the wires and the tubes of strain when the wires are being drawn in.

OUTLETS.

All tubes must emerge at outlets in terminal boxes, thus leaving the outlets so protected as not to be injured by the plasterers.

FIXTURE SUPPORTS.

Where no gas-pipe or other support for the fixtures exists, the special form of terminal box designed to furnish such support must be employed, and must be substantially fixed to a suitable foundation in the ceiling or walls.

JUNCTION BOXES.

Main circuit junction boxes must be placed on each floor in each section; from these junction boxes all branches in that section must ramify.

CUT-OUTS.

Standard non-combustible cut-outs must be used within the junction boxes, and each branch wire leading from the same must be protected by a safety fuse.

FLOOR WORK.

To guard against mechanical injury and the destructive action of cement, all tubes used under floors must be our metal-covered conduit tube. In case of contact with cement under tile floors and in like places, brass-covered conduit tube must be used and must be further protected by being laid in a bed of plaster of Paris.

As a further protection against mechanical injury, all floor tubes must be covered during construction with a light board.

WIRES.

For mains, a conductor having a standard insulation, and for branches, the standard twin or triple conductor of the Interior Conduit and Insulation Co. must be used.

ANNUNCIATOR WIRING.

All annunciator or bell wires must be placed within conduits, and such of the foregoing rules and regulations as are applicable to rendering them accessible and affording suitable protection shall be followed.

INSERTING WIRES.

After the conduiting is completed, powdered soapstone must be blown into the tubes in order to facilitate the drawing in of the wires.

INSPECTION AND ACCEPTANCE.

As a guarantee that the wiring will be properly done, it is required that the contractors, in event of their being unfamiliar with the system, communicate with the Interior Conduit and Insulation Co., of New York, or their authorized representatives, and obtain the requisite instruction. The right is reserved to subject the work of the contractor to the inspection and approval of the Interior Conduit and Insulation Co. as a condition of acceptance and final payment.

HOW OUR NEW FORM IS APPRECIATED.

The following letter from Mr. J. Stanford Brown, the well-known electrical engineer of this city, represents the sentiments expressed in the trade generally on the new form of the ELECTRICAL AGE:

May 6, 1892.

The ELECTRICAL AGE, New York:

GENTLEMEN: Permit me to congratulate you on the present *convenient* form of your paper.

I hope it may result in a large increase in your already well-established circulation.

Very truly yours,

J. STANFORD BROWN.

HAULING TRAINS WITH ELECTRIC LOCOMOTIVES.

The Baltimore Belt Railroad has accepted a proposition presented by the Thomson-Houston Electric Co. to install electric locomotives and the necessary plant for the purpose of operating freight and passenger trains on a portion of that road.

The following details of the plans will be of great interest, since this project may be regarded as the first instance where electricity will be applied to heavy traction work.

That part of the road upon which it is proposed to employ electricity as a motive-power begins at Henrietta street, its southern junction with the Baltimore and Ohio Railroad, and extends to Huntingdon avenue, a distance of 14,700 feet. From this beginning it descends from the surface with a grade of 7 per 1,000 in an open-walled excavation for 2,000 feet with four tracks. Here the two western tracks, devoted to freight, enter one portal, and the two eastern ones, devoted to passengers, enter another adjoining. The first continue on a straight line and a uniform grade of 8 per 1,000 under the centre of Howard street to the northern portal at Brevard street, a distance of 7,070 feet. The second diverge toward the east and become parallel with the first after passing for 450 feet in tunnel. From this point they remain parallel with the first for 800 feet under the roof of a passenger station 200 feet wide, after which they enter the bell-mouth at Lombard street, the front of this passenger station, and become common with the two freight tracks in the tunnel under Howard street. Calling this en trance a portal, the length of the tunnel between it and the northern portal will be 6,250 feet.

After passing the Brevard street portal, the two passenger tracks branch out and deviate again to the east far enough to allow a fifth track to be laid between the two pairs, all being parallel through the north passenger station, which will extend between Brevard street and Mt. Royal avenue, a distance of 650 feet. After passing under Mt. Royal avenue through two adjoining arches, the four tracks continue to Huntingdon avenue, the two pairs remaining separated by the same distance as that required at the two arches. The distance from the north end of the station to Huntingdon avenue is 4,980 feet, 480 feet of which is on the same grade as that of the tunnel, 8 per 1,000; the remainder 4,500 feet is ruled by a grade of 15 per 1,000, terminating at Huntingdon avenue, from which point to the northern junction with the Baltimore and Ohio, and thence to Philadelphia, the ruling grade is 8 per 1,000.

The arrangement for operating the motors is, in the case of freight trains whose maximum weight is specified at 1,200 tons, to get connected at the rear of the train at Henrietta street and to descend the grade with the steam locomotive connected in front with a full head in the boiler, but with the furnace door open and no steam used. The motor will then do all the work through the tunnel, pushing up the grade at the rate of 15 miles per hour, a pressure or draw-bar pull of 32 thousand pounds being specified. This train will pass without stop and without steam through the northern passenger station shed on the west side, but after passing this the steam locomotive will get into operation 480 feet in advance of the 15 per 1,000 grade so, that upon reaching this grade both steam and electricity will be at work, the motor taking the place of a steam helper, which would otherwise be required. Upon reaching the 8 per 1,000 grade at Huntingdon avenue the motor will fall back on the south-bound passenger track immediately before or behind a passenger train, and after passing Mount Royal avenue will pass on the fifth track around any south-bound passenger train waiting in the station, thence on the south-bound tunnel track alone, unless there is a freight train going in that direction, in which event the motor will be coupled to the rear and act as brake down the grade.

If the motor is going for another freight train it will proceed to Henrietta street; if for a passenger train it will enter the south-bound passenger station from the bell-mouth at Lombard street and couple to the steam locomotive at the head of the train, pulling both to the north end of the north station, when the motor will fall back to the fifth track in that station. For passenger trains the steam locomotive is sufficient for the 15 per 1,000 grade.

The descending grade from Henrietta street to the southern end of the south passenger station will enable the trains to enter it with steam cut off and the furnace door open. All through trains will stop at this station for passengers bound north, who have arrived by local trains south and west, and local trains south and west will start from it, while local trains north and east will start from the north station, so that the tunnel will be used only by through trains. If a through passenger train stops only at the south station the motor will act in the rear, as in the case of freight trains, but go no further than the north station. The motors will be used promiscuously with either passenger or freight, as the greater speed specified for the passenger trains, 30 miles per hour, will require much of the power required for the greater weight at 15 miles per hour.

The motors are to be constructed in simplest manner; the armatures to be fastened directly to the axles of the driving-wheels, so that all gearing is dispensed with and each driver can act independently of the other, and can be multiplied indefinitely and carry all the weight. The power-house will be located at a point about 6,000 feet from each limit of the expenditure of the power, and the engines will indicate 2,400 horses, supplying more power than will be required for propelling two maximum freight trains up the grade at the rate of 15 miles per hour, and a greater number of lighter trains. This section of the road will be operated on the most perfect block system, so that the available electric power will be more than sufficient to propel the trains determined by the block system. It is estimated that three motors, each capable of a draw-pull of 32,000 pounds, will be more than ample for every requirement of the passage of 200 trains a day, one of them being provided as a reserve.

The tunnel is to be thoroughly lighted with incandescent lamps at short distances on each side, so as to illuminate not only the tracks but the interior of the passenger cars.

The Thomson-Houston Company will erect and equip the power-house with steam engines and boilers of the most approved character, and furnish motors and all the electrical appliances for their most perfect operation, and guarantee a thoroughly practical and successful operation of the entire plant after a successful trial period. Mr. Richard Randolph is the chief engineer of the Maryland Construction Company, which is building the Belt Railroad. As far as we can learn the belief seems to be general that the electrical enterprise will result successfully.

OPENED FOR TRAFFIC.

The Yonkers Electric Railroad was opened for traffic on May 2, and has been running continuously since then, without a hitch or break, and is pronounced a complete success, much satisfaction having been expressed as to the smooth and noiseless working of the cars.

The station is fitted with two Edison 100 K. W. generators, belted directly to Ball high-speed engines. Eickemeyer-Field 20 H. P. gearless motors are used, and by directly driving from the slow-speed motor to both car-wheels through means of parallel rods, the wear and

tear and all other disadvantages incidental to high-speed machinery are thus avoided.

The old horse-car rails which have been in use for many years are still employed after being bonded, it not having been deemed necessary to substitute heavier ones, as with the gearless motor of the Eickemeyer-Field pattern the whole weight rests upon the car-springs, and in this manner avoiding the destructive blow which otherwise would be given to the rails by the momentum of the motor.

NEW INCORPORATIONS.

The Kankakee Electric Light Co. (incorporated in W. Va.), New York, N. Y., was incorporated April 23, with a capital stock of $10,000. Incorporators: J. F. Moffett, Watertown, N. Y.; J. V. Clarke, New York, N. Y.; H. C. Hodgekins, Syracuse, N. Y.

Waldon Electric Light and Power Co., Montgomery, N. Y., incorporated April 13, with a capital stock of $10,000. Incorporators: Joseph Broadhead, West Cornwall, N. Y.; Nicholas J. Fowler, Irving H. Longhran, Walden, N. Y.

The Oxford Electric Light Co., Oxford, N. Y., incorporated April 14, with a capital stock of $10,000. Incorporators: Frederick L. Gamage, Charles A. Gilman, James G. Van Wagenen, all of Oxford, N. Y.

Van Choate Electric Car and Light Co., Portland, Me., incorporated April 23, with a capital stock of $6,000,000, to manufacture and deal in electrical appliances and machinery of all kinds. Incorporators: C. Henry Kimball, Chelsea, Mass.; Oscar Lowe, Boston, Mass.; Edward H. Hill, Brookline, Mass.

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, May 7, 1892.

BARONESS BLANC obtained an execution in the Supreme Court to satisfy a judgment held by her against Baron Frederic N. Blanc's Litofuge Mfg. Co., 62 John street, the property of which has been levied upon by the sheriff.

MR. J. W. MCLAREN, the well-known electrician and general construction man, called to see us the other day. Mr. McLaren is at present unemployed, having recently completed his last contract. Here is an opportunity for some concern to pick up a live man.

MESSRS. A. and F. BROWN, who lately moved from Park place to 17 Dey street, have much larger space in their new quarters for the display of the shafting, pulleys and friction-clutches manufactured by them. Purchasers will do well to give them a call.

THE MANHATTAN ELECTRICAL SUPPLY CO., 38 Cortlandt street, city, has its new factory in operation. The factory is situated at 14 and 16 Morris street, Jersey City. Last week the company was moving its machinery and manufacturing supplies, and the sales-rooms were somewhat in a disordered state in the process of enlarging and fitting out with a new line of supplies.

PAUL HOENACK, of 191 and 193 Worth street, this city, is a very busy man at the present time. He is about finishing a set of 4 double-plug high-tension Italian marble switchboards for the Mount Morris Elec. Lt. Co. There are, all told, 288 plugs in the 4 boards. Mr. Young, the superintendent of the Mt. Morris Elec. Lt. Co., is very proud of these switchboards, and we are inclined to believe that he has every cause for feeling good. Mr. Hoenack has lately done some fine model-work, for which he deserves great credit. W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

DAMAGE BY LIGHTNING.

During a heavy electrical storm which occurred at Pittsburg, Pa., on the morning of May 3, the works of the Allegheny County Electric Light Company were struck by lightning, burning out seven dynamos, and injuring the plant to the extent of $7,000. Five hundred telephones were also burned out and numerous buildings struck, but so far as known no lives were lost.

FINANCIAL.

The dividends paid to bond and shareholders in New York for the current month are quite satisfactory to those receiving them, and are estimated to reach the fair sum of $27,640,980, as against $22,817,500 for May, 1890, and $24,625,665 for the month of May, 1891. The earning qualities of the many industrial corporations are accountable for the increase, and stands as a lesson to investors. We are at the beginning of the flood-tide, which will bring up a great and prosperous floating of this class of securities. They will include all which will profitably employ combined or amalgamated capital over personal credit and energy. As in nearly all other matters, we are following in the footsteps of Europe, where a company is formed on the shadow of an opportunity, and the general management being educated, it is simply a question of the first capital being obtained. That being subscribed and in sufficient quantity for the business in view, the rest is plain sailing. There are, and no doubt always will be, a few who will wait, tempting the Canadian tourist until his moral nature gives way; but the foregoing figures speak in thunder tones in favor of our advice, to invest in these securities while young and reap the whole benefit. The interest and dividends paid this month by the state and municipal organizations will swell the total for the month in this city to quite $35,000,000. Boston will disburse about $3,600,000, which is a fair improvement on 1891. If the legislature of this State would pass an equitable statute governing the tax on corporations as corporations, the headquarters of a great many more companies would be in this city. Governor Flower has got the wedge entered in the exception of the electric corporation just at the close of the session, but I contend there should be only a general law under which all should be permitted to incorporate at a minimum charge, then collect the regular tax on all real and personal assets. To the State the result will be at least as large an income, and the right of the citizen to exercise his judgment will be enhanced.

About a year ago it was suggested in this column that the quickest way to make money in heavy electric traction was for one of the wealthy corporations to manufacture a generator and motor of sufficient size, take it out on the plains where long distances were available, and practice a season with the heavy freight trains. For some unknown reason this was never acted on. Now I am happy to state that the proposition of the T.-H. Co. to run trains through the Baltimore Belt Railroad Co.'s tunnel has been accepted and is expected to be carried out about the end of the year. Eighty-ton electric motors will be used, and if successful it will be the death-knell of the steam locomotives. There is a vast sum of money in locomotives, and they will disappear as quietly as the horses on the street lines. I don't believe any money will be lost in either case. A new industry will be created, also new or enlarged securities for investors. The life of the electric will be greater than the departed steam-motor, and being in every way more economical will produce larger dividends, besides giving increased speed and luxury to a cinder, smoked and oil-scented public.

The following, condensed from the *Investor's Guardian*, the leading public company authority published in London, carries with it a lesson worthy the study of all who are interested in Stock Exchange business wherever located: "Whatever may have been the profits (or losses) made by the individual members of the Stock Exchange during the past year, those made by the managers of the Exchange on behalf of the proprietors show no signs of falling off. The total available balance this year is £129,648, out of which dividends amounting to 50 per cent. have been declared on the paid up capital of £240,000. The rent paid by the company is £11,575 per annum. No diminution has taken place in the membership of the Exchange during the year. On the contrary, there has been an increase of twenty-nine in the number of members, and of thirteen in the number of clerks, so the totals are now, members, 3,332; clerks, 1,923. Only 966 of the members are shareholders or proprietors of the building." It will be seen from this that the corporation is in a happy financial condition.

AN INTERESTING EXHIBIT AT THE WORLD'S FAIR.

One of the most notable features of the World's Fair at Chicago next year will be a complete model of the entire plant of the H. C. Frick Coke Company, of Scottdale, Pa. This company employs about forty million dollars capital in its business, and is the largest of the kind in the world. The contract has been let to the Jones Bros. Company, of 30 Court street, Cincinnati, Ohio, who is expert in the making of models. The estimated cost of this model is between three and four thousand dollars. The plant will occupy a space about 20 x 50 feet, made on a scale of one-twentieth of an inch to the foot, and will be an exact fac-simile of the original, including boilers, engines, piping, elevated tracks, cupolas, cars and all other machinery, and will be in operation; the motive-power, however, will be electricity.

SOUVENIRS.

We have to acknowledge the receipt of a copy of the beautiful souvenir pamphlet just issued by the Brush Electric Company, of Cleveland, O. As a specimen of the lithographer's and engraver's art, it is without doubt one of the finest we have ever seen. It is profusely illustrated and descriptive of six complete incandescent electric light plants in six of the largest office buildings in the country installed with the company's system. The souvenir may be well considered as an exemplification of the remarkable development of electric industries and the growth of electric lighting, and also as a demonstration of the success of the Brush system.

We have received a handsome celluloid envelope opener and paper cutter from the Perkins Electric Lamp Co., Boston, Mass., manufacturer of incandescent lamps for all purposes and systems.

CATALOGUES.

The Electric Engineering and Supply Co., Syracuse, N. Y., is out with a handsome illustrated catalogue and price-list of its specialties, prominent among which are a variety of sockets for incandescent lamps, cut-outs, switches of all descriptions, hoods for incandescent and arc street lamps, line equipments, testing apparatus, motors, etc.

The New York Insulated Wire Co., 13–17 Cortlandt street, New York, is out with a new illustrated and descriptive price-list of the Vulca wire ducts, of which it is the sole manufacturer, porcelain cut-outs, couplings, elbows, junction angle and distributing-boxes, Vulca insulating coupling compound, etc. The last three pages are devoted to a short résumé of the value of its system for electric-light wiring installations.

In the new illustrated catalogue and price-list of the H. W. Johns Mfg. Co., 87 Maiden Lane, New York, N. Y., will be found full details of the large range of insulators sufficient to meet every requirement, manufactured from its celebrated vulcabeston and moulded mica preparations.

TRADE NOTES.

The Railway Equipment Company, 617–619 Pullman Building, Chicago, Ill., has, through its general manager, Mr. W. R. Mason, purchased the capital stock, merchandise and, in fact, the entire business of the Electric Merchandise Company, the affairs of which will hereafter be conducted under the name of the Railway Equipment Company.

The following letter explains itself :

HOTEL MARLBOROUGH, NEW YORK, October 21, 1891.
Messrs. W. R. FLEMING & Co.
New York office Hbg. Foundry and Machine Works,
174 Fulton street, N. Y. City.

GENTLEMEN: About one year ago we placed two of your 70 H. P. Ideal Self Oiling Engines in this hotel for driving two No. 16 Edison Dynamos, on your guarantee that they should run perfectly smooth and entirely free from noise or vibrations to the hotel building anywhere outside of engine-room. After running these continually since installing same, we can assure you of our entire satisfaction with them.

We have never shut these engines down from any cause whatever due to the engines, nor have they cost us one cent for repairs. So pleased are we with their perfect regulation and efficiency that we have decided without hesitation to place with you a second order for another 100 H. P. Ideal Engine, which we desire to have delivered as speedily as possible.

We do not think there is a plant to equal ours in New York City. Hotel service is, as you are aware, extremely exacting. Yours truly,

C. A. BLANCHARD & Co.

The Electrical Age's Illustrated Patent Record.

Issued May 3, 1892.

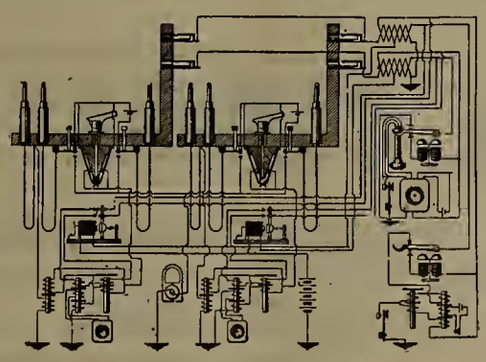
473,911. Telephone-Exchange Apparatus. John J. Carty, New York, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 25, 1889.

473,929. Solenoid and its Electrical Connections. Henry H. Hosford, Cleveland, Ohio. Filed June 3, 1891.

473,932. System of Electrical Conductors. Charles J. Kintner, New York, N. Y. Filed April 18, 1890. Renewed Sept. 30, 1891.

473,955. Electric-Arc Lamp. Charles A. Pfluger, Chicago, Ill., assignor, by direct and mesne assignments, to the Standard Electric Company, of Illinois. Filed July 16, 1890.

473,956. Electric-Arc Lamp. Charles A. Pfluger, Chicago, Ill., assignor, by direct and mesne assignments, to the Standard Electric Company, of Illinois. Filed Nov. 13, 1890.



473,911. TELEPHONE-EXCHANGE APPARATUS.

473,960. Electric Clock-Motor. Anthony Reckenzaun, Stockwell, England, assignor of one-half to James A. Pentz, Philadelphia, Pa. Filed Dec. 16, 1889.

473,966. Telephone-Switch. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Aug. 19, 1884. Renewed Oct. 16, 1891.

473,975. Electrical Annunciator. Frederick W. Steeg, St. Paul, Minn. Filed Oct. 24, 1890.

474,003. Electric-Lamp Hanger. Elbert Dills, Sprague, Wash. Filed Sept. 8, 1891.

474,037. Trolley-Wire-Circuit Breaker. Johan M. Andersen, Boston, Mass., assignor of one-half to Albert Andersen, same place. Filed Nov. 11, 1891.

474,049. Insulating-Support for Electric-Railway Wires Abraham A. Shobe and William Embley, Jerseyville' Ill. Filed Oct. 29, 1891.

474,050, Electric Switch. James J. Wood, Fort Wayne, Ind. Filed Nov. 3, 1891.

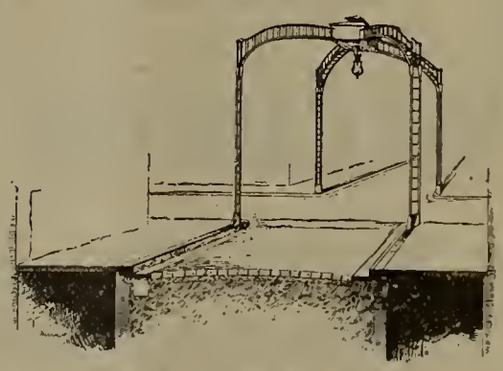
474,067. House-Telephone System. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 22, 1889.

474,073. Electric Resistance-Box. Aloys Wirsching, New York, N. Y. Filed March 18, 1891.

474,091. Electric-Arc Lamp. William B. Luce, Brookline, Mass. Filed Aug. 8, 1891.

474,165. Regulator for Dynamos and Motors. William H. Elkins, Boston, Mass., assignor to Henry E. Irvine, New York, N. Y. Filed Feb. 6, 1890.

474,166. System of Electrical Distribution. William H. Elkins, Cambridge, Mass. Filed July 11, 1891.



473,932. SYSTEM OF ELECTRICAL CONDUCTORS.

474,214. Telephone-Receiver. Arthur T. Collier, Caterham Valley, England. Filed June 30, 1891.

474,218. Conduit-Trolley. James J. Cosgrove, Jr., Philadelphia, Pa. Filed June 3, 1891.

474,230. Speaking-Telegraph. Thomas A. Edison, Menlo Park, N. J., assignor to The Western Union Telegraph Company, New York, N. Y. Filed April 27, 1877. Patented in England, in Canada, in France, in Belgium, in Austria-Hungary, in Italy, in Germany, in Spain and in Russia.

474,231. Speaking-Telegraph. Thomas A. Edison, Menlo Park, N. J., assignor to The Western Union Telegraph Company, New York, N. Y. Filed July 20, 1877. Patented in England, in Canada, in France, in Belgium, in Austria-Hungary, in Italy, in Germany, in Spain and in Russia.

474,232. Speaking-Telegraph. Thomas A. Edison, Llewellyn Park, N. J., assignor to The Western Union Telegraph Company, New York, N. Y. Original application filed July 20, 1877. Divided and this application filed Feb. 18, 1886. Patented in England, in Canada, in France, in Belgium, in Austria-Hungary, in Italy, in Germany, in Spain and in Russia.

474,266. Electrical-Arc Lamp. Alfred L. Shepard, London, England. Filed Aug. 6, 1891.

474,319. Insulator. Charles F. Goodrich, Chicago, Ill., assignor of one-half to John G. Thompson, Milwaukee, Wis. Filed Dec. 29, 1891.

474,323. Telephone-Circuit. Hammond V. Hayes, Cambridge, assignor to the American Bell Telephone Company, Boston, Mass. Filed Jan. 13, 1892.

474,328. Electric-Motor Mechanism. Samuel E. Mower, New Haven, Conn., assignor to Henry G. Thompson & Sons, same place. Filed May 21, 1891.

474,331. Bicycle Electric Car. Eben M. Boynton, West Newbury, Mass. Filed April 20, 1891.

ELECTRICAL ENGINEERS' MEETING AT CHICAGO.

The preliminary programme of papers to be read at the general meeting of the American Institute of Electrical Engineers, which is to be held this year in Chicago on June 6, 7 and 8, indicates that the meeting will be of unusual interest. The subjects of the papers, so far announced, are most practical and instructive ones, and as many members as possible should attend. If a sufficient number of members from the Eastern cities attend the meeting, reduced rates will be given in accordance with the rules of the Central Traffic Association.

The members will have an excellent opportunity to witness the progress on the World's Fair buildings at Jackson Park; and the Electricity Building, particularly, will have an attraction for them.

Members should make a special effort to be present in person, and thus guarantee a successful meeting.

THE GREAT TOKIO FIRE.

Japan is a country of earthquakes and fires, and between the two the inhabitants are kept pretty busy repairing damage. It is but a few months ago that our Japanese correspondent gave some details and illustrations of the damage done at Nagoya, Japan, by the great earthquake during the latter part of last year, and in this issue we give from the same source some details of the great fire in Tokio on April 10 of this year, which destroyed over 4,000 buildings. A station of the Tokio Electric Light Company was burned with the other buildings, and it is natural to presume that the Japs who depended upon that station for their light never before saw such darkness as they did at this time, in the absence of the electric light.

Other electrical interests as well suffered more or less by the fire. Telephone poles were burned down and the musical "Hello" (or its equivalent in Japanese) of the Central girls was not heard by many of the subscribers for several days.

THE GENERAL ELECTRIC COMPANY.

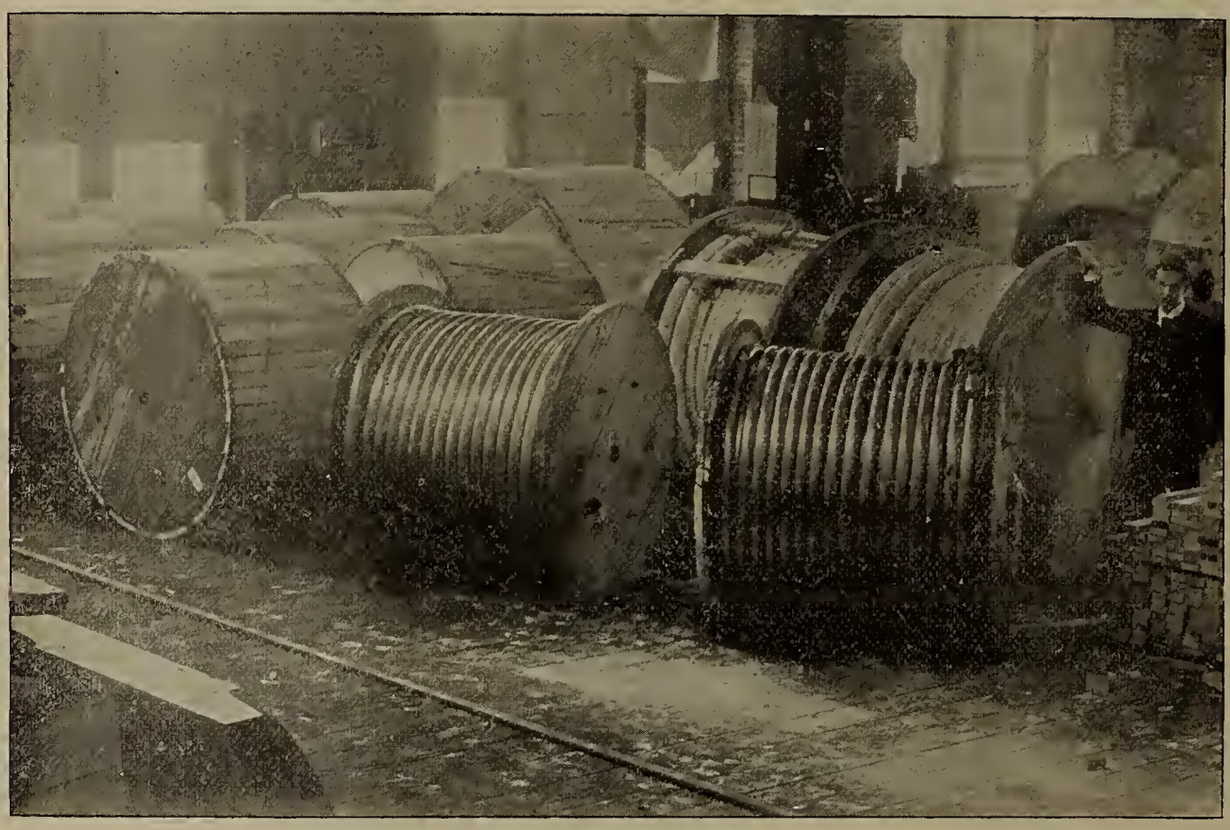
Probably very few can realize the vastness of such an undertaking as the consolidation of two very great interests. In the combination of the Edison General Electric Company and the Thomson-Houston Company a task of stupendous proportions has been accomplished with a skill that is rarely equalled in these days of large enterprises. To adjust all the parts and departments of two great concerns like these, so that they will work together in harmony and without friction, requires the direction of a master mind, and very few, indeed, are equal to such a task. Gradually the identity of the two great partners in this combination has been disappearing, and now we hear the use of the new name, "General Electric Company," very frequently. On account of its likeness with the name "Edison General Electric Company," it requires a little mental effort to determine the difference between the two, but the potency of the name, General Electric Company, will soon assert itself, and there will be no more ambiguity.

It is evident that the Edison General Electric Company, as far as its name is concerned, will be more completely absorbed by the new name than will the Thomson-Houston, on account of this very similarity of titles. The name Thomson-Houston is so intimately associated with a system and apparatus, unique in many respects, that it is doubtful if the name will ever be dropped completely.

Whatever may happen, it is certain that the combination is one of the strongest of the day, and there is no doubt that under the guidance of Mr. Coffin, the newly elected president and general manager of the new company, this vast concern will greatly prosper.

LEAD-COVERED TELEPHONE CABLES.

As electrical knowledge progresses and becomes more widespread, and the manufacture of electrical apparatus rises towards perfection, customers become increasingly fastidious and anxious that their requirements should not only be satisfied, but even surpassed. Fully posted as to the new developments which are now being constantly manifested, and provided with the latest measuring devices as they are invented or perfected, their demands call forth new efforts on the part of the manufacturers. This has been especially true of wires and cables. Considerable difficulty has been experienced in lowering the static capacity to the figure stipulated in the specifications of the telephone and other companies. A short time ago a figure of .20 or .21 microfarads was considered satisfactory, but this has been decreased year by year, until now .080 microfarads is required.



LEAD-COVERED TELEPHONE CABLE READY FOR SHIPMENT.

Although the Edison General Electric Co. has for many years past been manufacturing telephone cables, it has only recently put in the immense lead presses which now enable it to turn out complete lead-covered cables. With these new facilities the difficulties in the direction just mentioned have been overcome, and several cables lately shipped have shown a static capacity of not more than .075 microfarads. In striving to lower the static capacity the matter of insulation has not been neglected, and a remarkably high insulation has been obtained in the case of every cable which has left the works.

While these points are excellent in themselves, they do not alone constitute superiority when compared with the best cables of other manufacturers. The one feature, however, in which they may be considered to excel all others is their lead cover. It has been customary, and indeed is still the custom with all manufacturers of cables in this country, except the Edison General Electric Co., to press the lead over the core in a semiviscous state, the molten lead being poured into the press. Lead in this condition in every case carries on its surface a thick scum consisting of various impurities, oxides, etc. This can be partially removed by a ladle, but it is impossible to remove it entirely, and even when pouring the lead into the press considerable oxidation necessarily takes place, as lead oxidizes immediately on contact with the air, especially when in a melted condition.

Recognizing that such a cover could not be homogeneous and would be far more subject to attack by gases and acids than a pipe consisting of pure lead, the Edison Company determined to adopt the process of Siemens & Halske and their presses, and use absolutely cold lead. From the slugs of lead every particle of oxide is removed before insertion in the press, and as the atmospheric pressure is increased the lead is pressed out over the cable, enclosing it in an armor which is impermeable either to air or water. Comparison between cables armored by the cold-press process and those covered by the hot-lead process redound to the credit of the former in every instance. It is an undisputed fact that if two pipes filled with water be taken, one made by the hot process and the other by means of the cold press, and subjected to high atmospheric pressure, the fluid will ooze through the former while the outside of the latter will remain perfectly dry. This has been very prettily shown by coloring the water in the pipes with aniline, which could be plainly seen on the outside of the hot-press pipe after subjection to great pressure.

Cable recently supplied to the Metropolitan Telephone Company, of New York, has received unqualified approval, and although dry core was used, the cable could be handled as well as one made with the saturated core. The uniform gauge of the cable and its smoothness were also matters of appreciative comment.

The Pacific Telephone and Telegraph Company, of San Francisco, recently placed a large order for this

cable, the lead sheathing enclosing no less than 100 pairs of wires.

We show in the cut a corner of one of the cable shops at Schenectady with several drums of this cable awaiting shipment. The larger drums are 5 feet 16 inches in diameter by 3 feet 6 inches wide, the smaller ones 4 feet 8 inches in diameter and 3 feet 6 inches wide. Telephone companies all over the continent are now alive to the special advantages of the Edison telephone cable, and the Schenectady Works find it a difficult task to keep abreast of the demands upon them.

BIOGRAPHICAL SKETCH.

H. C. ADAMS.

The subject of this sketch, H. C. Adams, was born in Schuyler county, New York, on September 29, 1845. He attended school until the breaking out of the rebellion, when he enlisted in the United States Army, in August, 1861, being at the time less than sixteen years old. Mr. Adams served in the army until the close of the war, and was mustered out in August, 1865, after a service of four years. He then entered Lowell's commercial college at Binghamton, N. Y., from which he graduated, and on March 9, 1867, accepted a position

H. C. ADAMS.

with the well-known firm of Holmes, Booth & Haydens, as collector, and remained in their employ until 1887, having been with the firm for a period of over twenty years, during which time he had risen to the very responsible position of New York agent. He left their service to accept a position with the American Electric Manufacturing Company, which was at that time becoming a factor in electric lighting circles. With this company Mr. Adams became successively factory manager and purchasing agent, secretary, treasurer, and finally president. In 1888 he took charge of the New York office of the Fort Wayne Electric Company, at 115 Broadway, which position he now holds.

ELECTRO-PLATING DYNAMOS.

In electro-plating it is found, in practice, that there is a limit to the magnitude of operations capable of being carried to a successful issue with current obtainable from batteries. The current is not constant, even from the most constant battery. From the time of setting up the cells in the morning, up to the conclusion of the day's work in the evening, there are forces at work inside the cells which tend towards a gradual diminution of the current in the working circuit. These are, mainly, increased internal resistance, due to alteration of the exciting liquid consequent upon its increasing charge of zinc salt, and a similar alteration in the depolarizing liquid caused by an abstraction of its oxygen and conversion of this, together with hydrogen, into water. These alterations are most rapid when the resistance of the outer circuit is low, as when a number of articles to be plated are placed in the vats at one time. Therefore, just as a larger volume of current is needed to meet the larger demand, it falls lower from a battery, because of increased internal resistance of the cells. Batteries also entail the employment of much time and labor in setting up the cells and in putting them away after the work is finished. They are also costly in working, since the price of zinc and its excitants is high, and the wear and tear very great.

All these objections to the use of batteries have led to the adoption of dynamo-electric machines as generators of current whenever the work in hand has demanded a large and constant current. The current from a dynamo, when properly constructed and driven, is constant, varying only with the speed at which it is driven, or with the resistance of the bath. The volume of current obtainable from a dynamo constructed specially for electro-plating purposes is very large, and the tension of the current is so arranged as to be just high enough to deposit the metal in good condition. When the machine is so constructed as to have its field magnet coils connected in shunt with those of its armature, the strength of its current (within a certain limit) is self-regulated by the work to be done in the outer circuit. This provision makes the dynamo a most valuable generator of current for electro-plating purposes.

In designing a plating dynamo, as in all others, the resistance of the outer circuit has to be taken into consideration. The probable resistance of the plating solution, slinging wires, and wires conducting the current from the dynamo to the vat being known, the armature must be wound with a coil of wire offering a resistance of $\frac{1}{20}$ the working resistance of the outer circuit. This being done, we must wind the field magnets with coils of wire having a total resistance 400 times that of the armature, or 20 times the total working resistance of the outer circuit. The armature coils should be connected in shunt with the coils of the field magnets, to insure constancy in the current under varying loads, and to prevent reversal of the magnetism in the dynamo by the current being sent through the field magnet coils in the wrong direction. It should be understood by every plater that all solutions through which a current has been passing form in themselves a galvanic battery, with the articles being plated and the anodes as elements. As a rule, the plated articles are the positive elements, and the anodes the negative elements, in this battery. The current generated by these is, therefore, opposite to that employed in the work of electro-plating. If the coils of the field magnets of a dynamo are connected in series with those of the armature and the outer circuit, this back current from the solution will rush around the coils immediately on stopping the machine, or on slowing it down, and will reverse the poles of the field magnets by inducing in them an opposite condition of magnetism to that existing whilst the machine is in proper working

order. After such an accident, the machine will generate a current flowing in the opposite direction, or in unison with the solution current, and thus dissolve off the metal deposited on the plated articles. This is prevented by connecting the field magnet coils in shunt with the armature ; should the back current from the solution become sufficiently powerful to pass round the field magnet coils, it passes in the same direction as it is sent by the dynamo itself, and therefore does not reverse the sub-permanent magnetism of the field magnets.

In a machine wound for electro-plating, with the coils connected in shunt, the magnetism of the field magnet cores will be proportionate to the resistance in the outer circuit. If there are several articles suspended in the solution, and a proportionate surface of anode, the resistance of the outer circuit will be low, and the greater volume of current will flow by the path offering least resistance, which will be, in this case, through the solution. As a consequence, only a small portion will pass around the field magnet coils, and thus the magnetic intensity of the fields will be low. If, on the contrary, the resistance in the outer circuit is high, as when only a few articles are immersed in the solution, the path of least resistance will be by way of the field magnet coils ; the armature current will flow by this path, increase the intensity of the magnetic field, and raise the tension of the current, thus enabling it to overcome the increased resistance in the outer circuit. Hence the necessity of having the resistance of the field magnet coils so many times greater than that of the estimated highest resistance likely to be placed in the working circuit.

IMPROVEMENT IN ELECTRIC BELLS.

A cheap way of assembling bells is known as the Varley method. In the old system of attaching an adjusting screw to a bell eight parts were necessary, but by this new method it is accomplished with the use of three only, consisting of a flexible rubber stopple, an adjusting screw and a combination washer and clamp. A hole is passed through the entire length of the stopple, admitting the adjusting screw, and in the inner portion there are two other but smaller holes into which the prongs of

FIG. 1.

FIG. 3.

the combination washer-clamp fits, and on the round or side surface is a depression to hold about the edge of the hole in the side of the box, or that in the upright, if a skeleton bell. In applying this method, which is shown in Fig, 1, the operation consists, first, of forcing through the hole the rubber stopple, which is simply done by giving the stopple a slight twist, either to the right or left, at the same time pushing it inwards. After it is once in it is firmly locked by the expansion of the rubber, and great difficulty will be encountered in any attempt to withdraw it. The stopple in position is there to stay, and no amount of jarring or vibration will move the screw, as it is always firmly locked by compression of the rubber. In connection with these bells a dust-protecting device has been lately introduced, which consists in having the contact points enclosed in rubber.

Fig. 2 shows a bell fitted with the rubber dust-proof attachment, and Fig. 3 shows the attachment in detail. It is claimed that this dust-excluding device greatly improves the service of electric bells, since the accumulation of dust on the contact points seriously interferes with their operation. It is evident, therefore, that if the cause of the trouble is prevented the trouble itself will not exist.

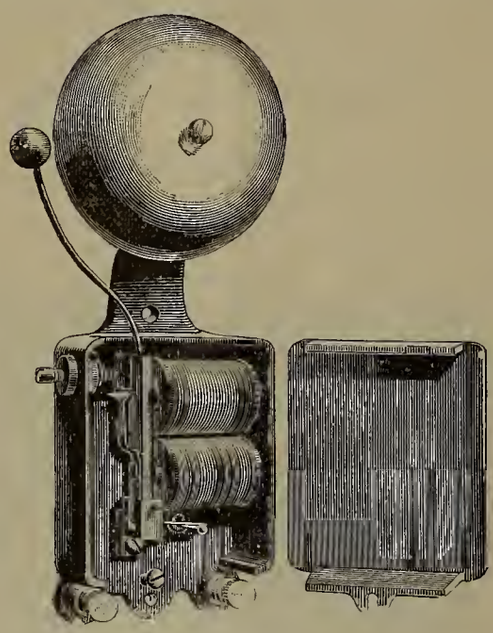


FIG. 2.

J. Jones & Son, 602 W. 22d street, New York, are the manufacturers of these devices, and apply them to the bells they make.

NOTES FROM JAPAN.

FROM OUR OWN CORRESPONDENT.

The fire which occurred in Tokio on April 10 last, and which destroyed over 4,000 houses, did a great deal of damage to electrical interests.

The fire occurred in that district of Tokio known as Kanda, which is a pretty busy quarter of the city.

In this district the fourth station of the Tokio Electric Light Company was situated, and the fire completely destroyed it. It was a one-story brick building, and the plant consisted of three engines, which supplied the power to drive 2 Hopkinson alternate current dynamos and 5 Edison No. 10 dynamos. The damage to this station was about $150,000.

The fire destroyed 28 telephone poles, cutting off the means of communication with 66 subscribers. The poles carried No. 17 copper wire. Telegraph and fire alarm lines also suffered to a considerable extent.

There are now about 1,000 subscribers in the Tokio telephone exchange. The telephone business in Japan is on the increase, and the government intends to open new exchanges at Kobe and Osaka.

Long distance telephony has been tried in Japan with much success. Tokio and Osaka were connected and the results were entirely satisfactory. The distance between the two cities is about 350 miles.

From the report of the Tokio Electric Light Company up to the end of last year the following figures will

be of interest : The number of Edison dynamos installed was 30. Besides these there were 5 Hopkinson 1,000-volt alternating current machines, 2 2,000-volt alternating current Brush machines and 3 Brush arc dynamos. There were at the end of the year 9,222 incandescent and 114 arc lamps in use. The capital stock of the company is 668,520 yen ($467,964).

There are three other companies in Tokio city, but they are comparatively small, each operating about 1,000 incandescent lamps.

The electric light business is quite rapidly expanding, and the Japanese people are very enthusiastic over it. The outlook for the companies is good. The alternating system of lighting is much favored in Tokio.

The Thomson-Houston system is now being introduced, and taking it altogether, we think we have good reason to be proud of our progress and enterprise in the use of electricity. K.

Tokio, April, 13, 1892.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Electromotive Force.

THE most terrifying term in the electrical vocabulary to the uninitiated and beginner is the word "potential.' This word has been discussed by scientists and electricians to such an extent that many students regard it as possessing a meaning inexplicable by ordinary language and utterly undefinable, and that it can only be comprehended by the development of a sort of special sense, which enables us to understand things without being able to explain them.

There is no reason, however, why any more mystery should attach to the word "potential" than to the word "motion," and, to be more general, there is no reason why any of the technical terms used in the electrical science should be enshrouded with mystery ; they are all easily understood if a little thought is bestowed upon their meaning. The mere verbal *expression* of a technical term, whether it be volt or megohm, does not necessarily convey its meaning. Thought is required, as well as an expression, and in this respect the study of electricity is no different to the study of the multiplication table.

The definition of "potential" is, briefly, *possessing latent power;* that is, stored power which may be utilized to perform work under proper conditions. If we take a weight *w* (Fig. 1) weighing, say 10 lbs., and haul it up from the ground a distance of 10 feet, it will be endowed with a certain amount of power to do work, which it can be made to perform by its descent to the ground. This work can be applied in a great many ways. For instance, the end of the rope *a* might be attached to a train of clockwork which would be set into motion by the descent of the weight ; or it might run a fan, a sewing-machine, or do any other kind of work, providing the weight was sufficient to overcome the friction of the mechanism. The weight then at a height of 10 feet from the ground has a *potential energy* of a given amount—potential energy, meaning latent energy, which is transformed into work when the weight descends. Should the friction of the train of clockwork *c*, and the pulley *p*, be so great as to prevent the weight *w* from descending, no work will be performed ; but if the total friction is slight, then the energy of the weight can be utilized to perform work in some form or another.

Now if we make the weight *w* 20 lbs (twice its original weight), it will have twice the potential energy at the height of ten feet that it did before, and consequently, all things being equal, will perform twice the amount of work ; it has twice the power to overcome resistance that it formerly had.

It is evident from these considerations that the greater the friction the less will be the amount of useful work available, and, on the contrary, the less the friction the greater the work. The same idea as to potential, or potential energy, is applicable to electric currents to express the power of a current to do work.

It is a difficult thing sometimes for beginners to get a clear conception of work done by electricity, but when it is remembered that work is required of the electric

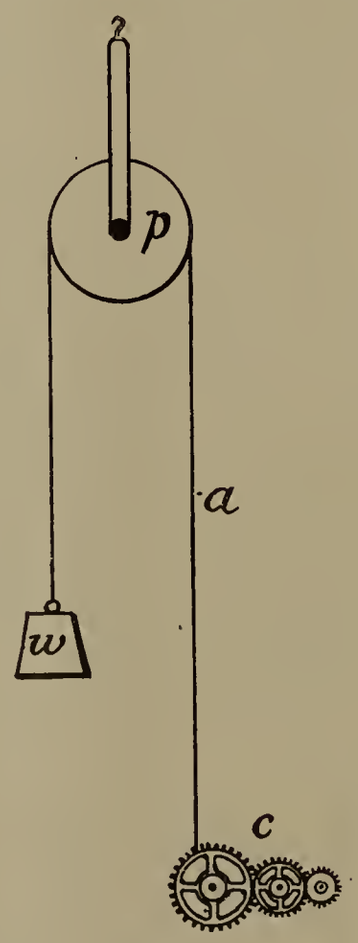

FIG. I.

current to overcome the resistance of the conducting wire, to produce light in the electric lamp, to deposit metals in the plating bath and to propel street cars and operate machinery, just as work is required of the weight in the example, to overcome the friction of the pulley and clockwork, a better idea of it will be possible. In an electric circuit of great resistance and with little potential energy at the source of current little or no useful work will be performed, because all or most of the power of the current is wasted in overcoming the resistance of the wire, which is analogous to the friction of the pulley and the wheels of the clockwork in Fig. 1. It is evident, therefore, that in order to get the greatest amount of power or work from a given electric current, the resistance to the current must be made small, so as to enable us to deliver as much of the current as possible at the point where the work is to be performed.

Electric potential, or electromotive force, is the power an electric current possesses to do work. All its energy

may be spent in overcoming the resistance of the conducting wire, in which case none will be available to operate a telegraph instrument, give us light or drive an electric fan motor to keep us cool in hot weather, and it is the business of the electrical engineer to so regulate the conditions that everything else is subordinated to the one central object, namely, to get as much current as possible from a given source to the point where it is to be used.

The phenomena of electrical potential can be represented graphically in a way that will give us some conception of its nature.

Electricity, however, is something that cannot be seen or felt; therefore it cannot be represented by visible characters, so that we can get some idea of its nature through the eye. For this reason we are compelled to resort to analogy when we desire to illustrate the phenomena of electrical action.

It has been found that water, to a great extent, obeys laws which are very similar to those governing electric currents, and for this reason it is customary to illustrate the action of electric currents by analogy with the action of water under similar conditions.

Fig. 2 shows a tank of water *t*, to which is connected a pipe *p*, having at the opposite end a stop-cock *s*. Along the horizontal limb of the pipe are erected other pipes, *a*, *b* and *c*, in which the water can rise. Now when the stop-cock is closed and the tank is full of water, the water in the pipes and in the tank will be at the same height; under these conditions the same potential exists in the water in the tank and the pipes, but the moment we open the stop-cock and allow the water to escape the conditions are greatly changed, as will be seen in Fig. 3. The potential of the water in the tank will remain the same as it was before, provided that the supply is equal to the waste, to keep it at the same height, but the potential in the pipes decreases to the extent represented by the diagonal line *d*. When the water reaches its lowest level *g*, its potential is said to be zero, and if we tap the pipe *p* at any point along its horizontal length and insert other pipes perpendicularly, the water will rise in each of these to exactly the point where the diagonal line crosses (Fig. 3).

By actual measurement it will be shown that the water in pipe *b*, is exactly one-half the perpendicular height

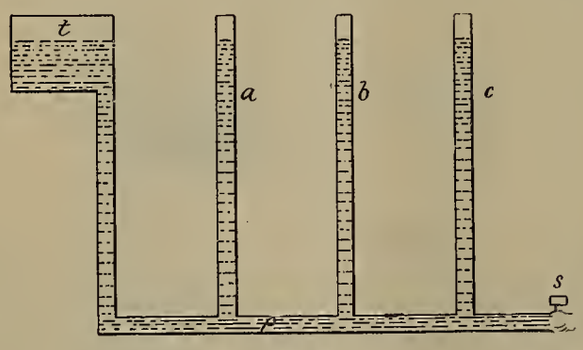

FIG. 2.

of that in the tank, therefore the potential of the water in that pipe is one-half of that in the tank; the potential in pipe *c* is only one-fourth that of the original, and the potential at *a* is three-fourths.

To the beginner this water illustration may seem irrelevant to the subject of this article, but such is not the case, because what is true of the action of the water in these examples is equally true of electricity under analogous conditions. If we now substitute the word "electricity" for "water," and go over the same ground, we have the exact facts before us as to an electric current. In the place of the tank *t* we put the dynamo or battery, or whatever the source of current may be, and connect thereto one end of a wire which will take the place of the pipe *p*, and insulate the further end of the wire; that is, not connect it with anything, but leave it free, hanging in the air for instance, the electric potential at the free end, or at any point along the wire between that end and the source of the current will be the same as that of the source itself, as in the case of the water illustration (Fig. 2). If, however, we connect the free end with the ground or earth at *g*, the potential or electromotive force will drop at the rate indicated by the diagonal line in Fig. 3 until it reaches the earth, where it will be zero—the potential of the earth being zero.

By taking measurements at any point along the wire the potential will be found to be exactly that shown by

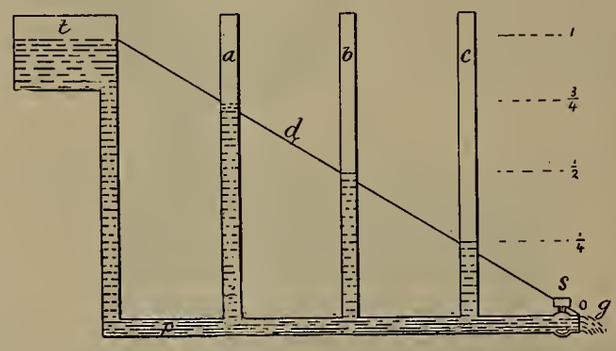

FIG. 3.

the intersection of the diagonal line (drawn from the point of highest to the lowest potential) with a perpendicular drawn from the point of measurement.

We have endeavored in this article to give as clear an idea as possible of the meaning of the term "electric potential" or "electromotive force," and having thus started from the very beginning of an electric circuit, we will in our next article consider a subject which naturally follows the one discussed here, namely, *resistance*.

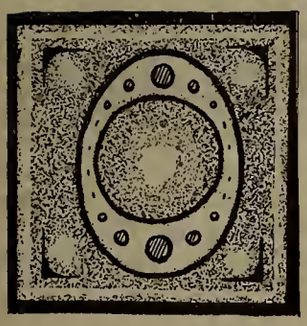
FIRE.

The Northern Car Company's plant at Robbinsdale, Minn., was recently destroyed by fire. The loss is estimated at $125,000, with a total insurance of $80,000; but as $18,000 of this amount represents insurance on the paint-shop and paint-room, the insurance on the burned buildings is reduced to $62,000, less than three-fourths of the loss. Between 150 and 200 men were employed by the company, and the plant, which had a capacity of one car per day, had been running steadily for some time past, and had orders booked that would have kept it going in full blast until the middle of next July. The company was reorganized last fall with a capital of $150,000 and was doing a very prosperous business. It is expected that the directors will decide to rebuild.

THE ECHO TELEPHONE.

This telephone, which is the property of the Echo Telephone Company, 15 Cortlandt street, is a magneto telephone consisting of five magnets and is operated without the aid of a battery, carbon contacts or induction coils. The voice acting upon the five magnets, the vibrations are brought to a control magnet, which in turn acts upon the transmitter and is greatly multiplied. The telephone is a success in every respect, the voice being very readily and clearly transmitted long distances. We understand that the company is now prepared to confer with reliable parties for exclusive rights, after the expiration of the Bell patents in March, 1893.

GOVERNING DYNAMOS.



ONE of the earliest discoveries in the evolution of the dynamo was that the position of the brushes upon the collector or commutator might be made to determine the output of electricity therefrom. When the brushes were set exactly upon the neutral line, the current was found to be at its strongest. When they were moved to one side or the other the current fell off in stren.gth But although this plan was often resorted to in the early machines, it was not always satisfactory. Such a method may probably be left to control the current, but it is not sufficient to maintain a fairly constant electromotive force.

Hence, regulation by means of shifting brushes was soon found better adapted to the case of running arc lamps in series than to that of incandescent lamps in parallel. In the former case, a fairly constant current is very desirable and the E. M. F. may be allowed to vary somewhat. In the latter case, unvarying potential is of the greatest importance, and this cannot be secured by merely shifting the brushes.

Many attempts have been made to utilize the brush shifting method for lighting purposes. A great difficulty had, however, to be overcome. The real effect of shifting the brushes is to upset the electrical balance of the armature. Since its two halves are connected in multiple (in most armatures), each half yields an equal share in the potential and current. This occurs when the brushes occupy the neutral, or "line of best collection." When, however, they are moved away, the current in certain of the coils upon one side begin to oppose the current in equal coils upon the other side, the result being neutralization of the output of those coils. But those coils are still active. The result of moving the brushes is to rupture their circuit before the proper time, and a great increase in the sparking is the result. Normally, with the brushes upon the neutral line, one at least of these coils on each side will be short circuited by the brush; to shift the latter is to give these "dead" coils life, which is discharged in a shower of sparks.

This destructive sparking soon deterred inventors from introducing the method of shifting brushes, even for arc lighting. But the designers of the Thomson-Houston machine saw a way out of the difficulty which was at least applicable to their dynamo. The chief objection to the sparking was its destructive effect upon both brushes and collector segments. This could, however, be obviated by blowing out the sparks by means of an air-blast, and to this automatic device alone is due the success of the Thomson-Houston dynamo in its feature of self-regulation. It is probably the only form of machine in which brush shifting has proved a success. In this dynamo the automatic moving of the brushes is performed by means of a regulating magnet.

The output of a dynamo may be controlled to some extent by changing or varying the speed. This fact has led several inventors to devise gear the function of which is to control the speed by governing the steam-engine. This method has not, however, come into general use, and it has many defects.

Scarcely less satisfactory is the old method of maintaining a certain resistance in the circuit, and varying this to meet the exigencies of the work. This method involves waste of energy in proportion to the otherwise useless resistance included in the circuit, and is generally so crude that it is seldom resorted to.

It may be said generally that the most successful method of regulating the output of a dynamo consists in varying the density of the lines of magnetism in the field. This has a direct result upon the electromotive force evolved by the armature. It may be done in several ways. The most obvious method is, of course, to vary the "strength" of the field-magnet by controlling its excitation. This opens up a wide field of inquiry, as it is possible to effect the required object by different methods, as separate excitation, shunt winding, compound winding and the later composite windings. All of these we shall briefly describe, although some of them have already been spoken of.

Mr. O. Firth devised a method of regulation by varying the width of the air-gap, which consists, briefly, in so arranging the two halves of the field-magnet upon suitable slides, that they may be separated or brought together, so varying the distance between the pole faces and the armature. The separation is effected by means of a screw gear composed of a single shaft, upon the two halves of which are cut right and left-handed threads. These work in nuts attached to the magnet cores. The arrangement is extremely simple. From experiments made with a dynamo of this kind it is shown that when the field magnet is closed up, and the machine is yielding its full output, as shown upon the voltmeter, a considerable separation of the two halves can be made before an appreciable effect is shown upon the E. M. F.

Governing by hand consists in varying a resistance placed in the field-magnet circuit by that means. It usually refers to separately excited dynamos. Since the exciting current is never very great, the loss involved in controlling it by wasting the surplus in the resistance coils in the form of heat is more than counterbalanced by the advantages gained. This may be effected automatically, although it does not appear that automatic regulation carried out in this way has met with general approval. Governing by hand may be applied to shunt-wound machines. This is Edison's device. The magnets being shunt-wound have a certain power of self-regulation. But in order to meet extreme demands for E. M. F., a set of resistance coils are kept in the shunt circuit. These are switched out as the potential of the dynamo begins to fall (by reason of the switching in of lamps). This method, like every other depending upon resistance, is to a certain extent wasteful. Edison has also operated this device by means of an automatic governor.

In cases of separate excitation the usual practice is to vary the resistance of the exciting machine's magnet windings. Separate excitation is becoming very common in the running of large dynamos. A small continuous-current dynamo is reserved for the purpose. The method of governing the output of the main dynamo by controlling the exciting current of the exciter is considered one of the best. Resistance coils are employed for this purpose. Since the current exciting the small dynamo is but a fraction of the whole to be controlled, the loss in resistance is sufficiently small to be of little moment. This control is generally exercised by hand. But it is a very common practice to arrange matters so that one continuous-current dynamo shall furnish the current required for exciting the field-magnets of several dynamos. It will be obvious, therefore, that the above method will not always be applicable to such a case as this, for any variation in the current given by the exciter will react impartially upon all the dynamos fed by it. This may be desirable or not, according to the nature of the case. It may answer if all the dynamos are feeding into a common circuit, and call for an augmentation or decrease of magnetism simultaneously. But if they are feeding into independent circuits such a method cannot be other than confusing. In the latter case, therefore, the control must obviously apply to each working dynamo separately. Hence variable resistances are placed in their field-magnet circuits for this purpose.

Resistance regulators consist in most cases of coils of iron wire. The wire is sufficiently thick to prevent overheating. (Nos. 8 to 16 of the standard wire gauge are generally used.) It is coiled upon some incombustible substance, with the turns well separated. One of the most usual methods is to coil the wire upon iron gas tubing, a layer of asbestos millboard being interposed between them to prevent short-circuiting. The coils may vary from a fourth of an ohm up to several ohms, rising by fourths. A series of studs with a contact-lever working from a centre are then arranged so that any resistance from zero to the full effect may be switched into the circuit. The coils will heat. Care is therefore to be taken that (1) they are arranged upon an incombustible base, preferably slate ; and (2) that they are so wound and separated that the heat may pass off into the surrounding air. Soldered joints are to be avoided in such apparatus. It should be so constructed that danger from fire is impossible, even if the coils should by accident be fused. Such arrangements are known as rheostats or resistance frames, according to the forms they assume. In many cases ribbon iron is used instead of round wire. This form of conductor presents more surface to the cooling effects of the air than round wire. The ribbon is generally arranged in a zigzag or corrugated form, so that a considerable length of it may be included between the sides of the "frame," the conductors being arranged in a number of parallel lengths across a square or oblong framework. In such forms of rheostat, contact plugs are generally used to throw in and out of the circuit the lengths of ribbon. This form of rheostat is now not so generally used as formerly. In some special cases German-silver is employed instead of iron to form the conductors.

Series dynamos may be said to be regulated by one of two methods. The first of these, that of shifting the brushes, has already been spoken of. The second is the more generally practicable. It consists in establishing a shunt wire across the magnets—that is, a variable resistance is connected across from the terminal where the main current flows into, to the terminal from which the main current leaves the magnet's circuit. This constitutes a short circuit, but it must present sufficient resistance to obviate the cutting off of too large a proportion of the current. When the dynamo is required to work at its full capacity, the resistance of the shunt would be equal to infinity, or no current would pass through it. When the dynamo is required to work at a small proportion of its capacity, resistance of the shunt would be very much less, and a considerable proportion of the main current would flow through it. This method of governing a series dynamo is preferable to the old plan of varying the resistance of the main circuit, but is distinctly inferior to the device of winding the magnets themselves with wire so fine that it may in itself constitute a shunt. This is, in fact, shunt winding, and it is intended to act as a self-regulator of the potential. The magnets of the machine are wound with coils of wire so fine that the resistance of this circuit is frequently 1,000 times that of the armature. The result is that very little current flows in the shunt when the work portion of the circuit presents comparatively little resistance. Hence, if the dynamo is feeding one arc lamp, the resistance of this compared to that of the shunt being small, leads away the greater portion of the current generated, and very little flows around the magnets. If another lamp be switched into the work circuit, the resistance of that portion will be increased ; less current will flow in it, but more current will flow across the shunt and so strengthen the magnet. The dynamo will thus begin to evolve a stronger current. If another lamp be switched in a still greater proportion of the current will flow in the shunt and the dynamo will evolve a still greater current. In this way a shunt dynamo may be said to regulate perfectly with regard to current (although, for other reasons, a constant-current dynamo has not yet been invented). Similarly, if the dynamo be feeding incandescent lamps connected in multiple across the mains, its electromotive force will be fairly maintained, even within wide limits of load. But it is impossible in such a machine to prevent the electromotive force from falling slightly. As more and more lamps are switched across the mains, the resistance external continues to fall, and the current to increase. Now increased current in the mains implies diminished current in the magnet's circuit, and the result is, of course, a slight drop in the electromotive force evolved. This is shown by the "characteristic" of such a dynamo having a falling tendency. But this slight falling off in the power of the machine may be very easily regulated by inserting a variable resistance in the shunt circuit. This is operated, as before, by hand. When a small load is on the dynamo the whole of this resistance is in circuit. As the load increases the lamps will begin to dim. It may here be mentioned that a drop of five per cent. in the potential will show greatly upon the lamps. The variable resistance is then diminished, allowing a greater proportion of the current to flow in the magnet's circuit, and so restoring the balance. A very little variation of the shunt resistance will suffice to regulate a shunt dynamo. This is especially the case if the armature's resistance is small. If the latter presented no resistance there would be, theoretically, no drop in the potential.

Although a shunt dynamo regulates so well under varying conditions of load, it is found to perform badly under variable conditions of driving. If the steam-engine be unsteady a shunt machine will be less satisfactory than a series machine in feeding arc lamps. This is due to the great self-induction of the shunt coils, wound as they are upon iron cores. It takes time to effect a change in such a circuit. While an increase or diminution of speed will instantly disturb the lamps, it will not so quickly affect the current in the shunt. Hence the lamp circuit is much more sensitive to the variations of the speed than the magnet's circuit. If the changes were slow, the shunt would presently recover its balance and meet the exigencies of the moment; but, as it performs but sluggishly, it fails to meet momentary variations. Shunt dynamos are, therefore, unsuited generally for feeding arc lamps, especially when the driving speed is apt to vary. On the other hand, a shunt machine performs excellently when the only changes involved are those of current and electromotive force.

It has been said that the slight drooping tendency of the characteristic by a shunt machine may be obviated by employing a variable resistance in the shunt circuit. Many attempts have been made to render this part automatic, and with the greatest success. But a still better method of regulation has been obtained by combining the attributes of the series dynamo with those of the shunt.

The series dynamo has the merit that it is almost free from the evils due to self-induction mentioned above. The storing-up tendency of the long shunt coil is absent, or nearly so, in the short, thick series windings. The effect is that the self-induction of lamp circuit and magnets are more nearly equal. This allows of considerable variations in the driving or speed, without their being apparent in the lights. In other words, the magnet part of the circuit responds to a change of speed as quickly as the lamp part of the circuit, and both feel it equally.

When a dynamo is "compounded" by furnishing its magnets with a few turns of series winding in addition to the shunt coils, it immediately partakes of the character of the series dynamo in respect of non-sensitiveness to inequalities in driving. The real effect and function of the series turns is to compensate for the slight tendency to lose electromotive force when there is an increased demand for current in the lamp circuit.

If a shunt dynamo could be provided with an armature having no resistance, it would yield a constant electromotive force, whether the exterior resistance was small or great. This condition is, however, impossible, although dynamos have been constructed having conductors so thick in the armature that the resistance of this part is merely nominal. Nevertheless, these machines will lose some of their electromotive force when the external current becomes a maximum, because the volts in the working portion of the circuit are but a proportion of the whole, and not the whole.

This fault can, however, be overcome by sending the main current round the magnet so as to reinforce the field as soon as the current in the working part of the circuit becomes large enough to cause a drop in the electromotive force. It has been said that the falling off is due to the increased current. This increase of current, if it be sent round the magnet, however, reinforces the magnetization, and in this way it is possible to make a compound wound dynamo increase in power faster than the load can be switched on, provided we are dealing with incandescent lamp lighting in parallel, and that the load is gradually increased. The "characteristic" of a compound machine would show a perfectly straight line—that is, the volts would be maintained the same while the ampères of current varied from light to full load. It is, indeed, comparatively easy to give the characteristic any desired shape. But most makers prefer to give the electromotive force a slight rise at full load. A well-designed compound machine will, therefore, show a slightly upward-sloping characteristic.

The composite field dynamo consists in taking an ordinary series-wound machine and adding thereto additional exciting coils fed by an independent source. It is, indeed, a combination of series and separate excitation.

One of the most interesting examples of the composite field method, applied as it has been to an alternating-current dynamo, occurs in the new "composite" field machine of the Thomson-Houston system. The armature of the dynamo is wound for alternating currents, and it revolves in a multipolar field for that purpose. These currents pass direct to the lamp circuit. But below the alternating-current windings (sometimes, however, side by side with them), and directly placed upon the core of the armature, occur a few turns of conductor forming an independent winding. The (necessarily alternating) current from these turns are passed to a commutator upon the shaft. The function of this is to commute them to a continuous direction. They then pass into the exciting coils of the field, and constitute a self-excitation. The field-magnets are, however, provided with two sets of coils. The second set is reserved for the current from a separate exciting machine. The self-exciting current may be regarded as a shunted portion of the main current. The machine may be regarded as a "compounded" alternating-current dynamo. In another form of the machine the self-exciting coils are wound upon all the armature cores except two. These are situated directly opposite to each other. They are excited by the current from the separate-exciting dynamo. The main object in all such combinations is to secure an initial and independent field, which, being independent of the variations in the main current, affords every facility to render the dynamo self-regulating.

It will be observed that most of the methods of governing here described have for their object the maintenance of a constant potential, and are therefore adapted more especially for incandescent lighting. But many attempts have been made to regulate for constant current. So far these endeavors have not been attended with success. Electromotive force is the attribute of the dynamo, and can be predetermined. Current, on the other hand, depends entirely upon the total resistance in the circuit. The nearest method we have to constant-current governing consists in the combination of a shunt machine with a separate source of excitation, acting in independent coils.

AMPERE'S THEORY OF MAGNETIZATION.

From observation of various electromagnetic phenomena, Ampère deduced the theory that electric currents are in constant circulation around the molecules of all bodies capable of acquiring magnetism, so that every such molecule is the centre of a field of electric force; and that when the body is unmagnetized these currents circulate in different directions, and hence no external effect is produced; but that under the magnetizing influence they are all made to circulate in the same relative direction, and hence between the adjacent sides of any two molecules they are in opposition and neutralize each other; and as this must be true of every interior molecule on all its sides, all interior circulation must cease; while the currents from the interior sides of the surface molecules, having no opposition, and all now circulating in the same direction round the mass at right angles to its length, produce the effect called magnetism.

In tempered steel the currents retain their harmony of movement after the magnetizing influence is withdrawn, but in soft iron they resume their irregular movement and the magnetism disappears.

This theory, so far as it relates to the external or field currents, is in harmony with the theory of molecular motion, while the latter accounts more satisfactorily for the origin of the currents, their permanency in tempered steel and want of permanency in soft iron, by ascribing them to the motion of the molecules themselves, and their change of position under the magnetizing influence. Ampère's theory gives an effect without an adequate cause, while, if molecular motion is regarded as a natural condition of all bodies, which seems to be well established, we have, in its various forms, ample cause not only for those manifestations of energy which we term magnetism and electricity, but also for other kindred physical phenomena.

In 1831 Faraday made the important discovery that an electric current can be induced in a conductor, forming a closed circuit by the movement of a magnet in proximity to it, and also that the same effect can be produced by the similar movement of a current-bearing conductor; both results furnishing additional proof of the close affinity of electric and magnetic induction and of the correctness of Ampère's theory of the circulation of electric currents round the magnet.

ITS SECOND YEAR.

The American Association of Inventors and Manufacturers, which was organized during the celebration of the Patent Centennial in 1891, has entered upon its second year with large opportunities of usefulness and encouraging prospects.

The objects of the association are the diffusion of information regarding inventions, the improvement of the patent laws, and enlarging the facilities for the prompt and thorough examination of applications for patents, and generally for *the promotion of harmonious relations and just dealings between inventors and the users of inventions.*

The officers of the association are: President, Dr. R. J. Gatling, Hartford, Conn.; first vice-president, Gardiner G. Hubbard, Washington, D. C.; second vice-president, Thomas Shaw, Philadelphia, Pa.; third vice-president, Prof. W. A. Anthony, Manchester, Conn.; fourth vice-president, Benjamin Butterworth, Cincinnati, O.; secretary and treasurer, Geo. C. Maynard, Washington, D. C.

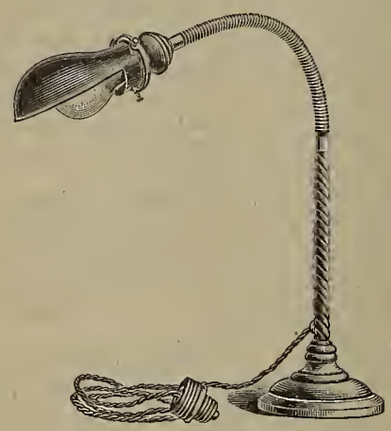
Arrangements have been made for holding an international congress of inventors, under the auspices of this association, at Chicago during the World's Columbian Exposition.

The headquarters of the association are at the corner of Eighth and H streets, N. W., Washington, D. C., in the Inventive Age Building.

NEW PORTABLE LAMP.

The McCreary Electrical Specialty Co., 136 Liberty street, New York, has just brought out a new specialty which will be appreciated by users of stand electric lights. It consists of a portable electric lamp-stand with flexible arm, and is shown in the accompanying illustration.

The base is made of either polished brass or nickel-plated, as desired, and the stand is fitted with the company's "almond" flexible arm, enabling the user to place



NEW PORTABLE LAMP.

the light in any desired position. Over the lamp is placed one of the aluminum half-shades made by the company, which can be moved around the lamp at will, throwing the light in any direction. These aluminum shades have the advantage of being non-breakable and non-tarnishable, and are powerful reflectors.

The portables are fitted with key socket, attachment plug, 12 feet of silk cord, shade holder and aluminum half-shade, all ready for use. This specialty is known as No. 20, and will be found very desirable and convenient. It is artistic in design and durable in service.

MOTORS.

If the terminals of a dynamo in motion be connected with the terminals of a dynamo standing idle, the current from the active dynamo will traverse the circuit of the idle machine and cause its armature to revolve. The first machine acts as a generator; the second machine becomes a motor. The conductors employed to convey the current from the generator to the motor exemplify the principle of the electrical transference of energy. Since the efficiency of such a system is very high, the transmission and distribution of motive-power by means of electricity is being rapidly utilized for various purposes, among which the electric railway occupies the first place.

If a straight wire be placed in a magnetic field with its length perpendicular to the lines of the magnetic force, and a current passed through it, it will experience a force tending to move it perpendicularly to itself and to the lines of the field. Provided the wire be free to act under the influence of this moving force, it will tend to cut the magnetic field, and a counter, or opposite current is induced in it. Hence, while the wire (or armature) is impelled to move across the magnetic lines, it acts to a certain extent also as a generator. The counter electromotive force induced in it greatly diminishes, or dams back, the moving current. The more rapid the motion of the armature the greater does this counter current become. Its strength is also dependent upon the strength of the magnetic field.

This magnetic reaction of the armature of a motor is a matter of the greatest importance in the electrical transference of power. The current in the coils of an iron-cored generator armature tends to make that core become a magnet, having poles opposed to those creating the magnetic field. This is well known as the reaction of the armature. In cases where the field magnet is weak it becomes a serious source of loss and other drawbacks. In dynamos, however, it is the builder's aim to set up so powerful a field relative to the possible counter action of the armature core that the latter is entirely overpowered.

Let us now consider the case of a dynamo becoming a motor.

Let a current be passed into it so that the polarity of the field is the same as when the machine acts as a dynamo. It will be found that the current in the armature is in a direction the reverse of that induced in it as a generator. The polarity of the armature will also be reversed—that is, it will exhibit poles the reverse of those of the field. These poles will mutually *attract* or *strengthen* one another. Hence the reaction of the armature's magnetism in a motor is contrary to what it is in a generator. But, as in the case of a generator, this is not an advantage, but on the whole the reverse, and it is the aim of the motor builder to employ so powerful a field magnet that the armature's magnetic reaction may be left almost out of account. As in the case of a generator the reaction tends to distort the direction of the lines of force in the field, and this distortion is the main cause of the necessity for "lead" in the brushes as employed in the case of generators.

Hence it is important to remember that in a perfect motor the twist (torque) communicated to the armature shaft is due not to the magnetism of the iron core but to the currents in the coils enveloping it. Mechanically considered, therefore, the means of attaching the latter through the core to the shaft demand considerable attention, otherwise the coils are not apt to be pulled backwards from their proper position upon the core. Such faults were of constant occurrence in both the earlier dynamos and motors.

The electrical transference of motive power has been found to be more efficient than transmission by ropes, water, or compressed air. This fact alone has sufficed to bring electric motors into use, in many cases to the displacement of every other workable system.

The whole of the power supplied electrically to the motor is not, however, converted into mechanical effect. There are various unavoidable sources of loss. There is first, the resistance of the connecting wires. This may be regarded as the loss due to transmission. There is, in the second place, a certain loss due to resistance, which appears as heat in the motor. Thirdly, there is the loss due to friction, mechanically considered, of the motor. There is also the invariable magnetic friction giving rise to eddy currents in the motor, but this is frequently so small in the best types that it may be left out of account.

The electrical power put into the motor is most conveniently expressed in watts. If C be the current, expressed in ampères, which actually flows in the circuit of the motor, and E be the electromotive force, expressed in volts, at the terminals of the motor, then the electrical power (per second) in watts, P, is found by multiplying together the ampères and volts, and dividing by 746 to obtain the electrical horse-power.

$$\text{Electrical horse-power} = \frac{EC.}{746}$$

Since only a proportion of the electric power supplied to the motor is returned as mechanical effect at its pulley, it is convenient to express the efficiency of the motor as follows: If C is the current (in ampères) that flows through the motor, and E the electromotive force (in volts), the watts, P, of mechanical effect is

$$P = EC.$$

The counter electromotive force of the armature varies with different motors. In the best types it is from five to ten per cent. less than the E. M. F. measured at the terminals of the motor.

The simplest case is that in which the dynamo at one place is connected in circuit with a dynamo (motor) at another place. The conductors between the machines must be insulated in the usual way. That is, if they are of naked copper they must be suspended above the ground and attached to insulators. If they are of the nature of heavily protected cables they may either be laid along the ground or buried beneath it. In many cases they are laid in water, as across streams. In the case of simply running a dynamo and a motor in this way, the machine should be adapted to the work to be done. In most cases the generating dynamo is moved at a constant speed. In that case both the generator and the motor should be series-wound machines. When the generator is run at a constant speed the motor will also maintain an approximately constant speed under all conditions of load. The speed in this case depends entirely upon the E. M. F. The torque depends, on the other hand, entirely upon the current. This is known as simply series transmission.

But in case of motors being run off circuits used also for lighting, where, instead of constant current, constant potential is required, as on an incandescent light circuit, series motors are found to be unsuitable; they will not maintain a constant speed under varying loads. But any shunt-wound or compound motor will do this under the above conditions, because the current through the shunt does not vary, and there is less variation of the strength of the field. Shunt-wound motors, if they are to maintain a constant speed upon a constant potential circuit must be furnished with armatures of low resistance. The field magnet must be relatively very powerful. If a shunt motor, on the other hand, be put upon a constant current circuit (such as the running of arc lamps) its speed will increase with its load, and will always fall off as the load is diminished.

There is this distinction to be remembered in the cases of setting dynamos to work as motors, or motors as dynamos. Taking the case of an ordinary series machine with brushes set (and having forward "lead") it will, when worked as a motor, run in the wrong direction, or against its brushes. It is usual in this case to reverse the direction of the current in the field magnet by changing the connections, or leaving the field magnet to reverse the connections of the armature. The machine will then run with its brushes. If these connections be left standing the brushes must be reversed and set with the lead in the other direction.

Shunt dynamos, however, are not subject to the same rule, for it is evident that while the current in the armature is in the same direction as before, that in the shunt will necessarily be in the reverse direction, and the machine will run as a motor without further change.

The case of a compound machine is somewhat different. It depends upon the relative magnetizing effects of the shunt and series coils whether it will behave as a series or as a shunt dynamo in the direction of its motion. If the shunt, as is usually the case, have a greater magnetizing effect than the series turns, the machine will act as a shunt dynamo, inasmuch as it will run as a motor in the same direction as it does as a generator. If, however, as is sometimes the case, the series coils preponderate in determining the magnetic polarity of the field, the machine will run against its brushes, and it must be reversed by altering the connections, as in the case of a series motor. Since the compound dynamo has the polarity of its field determined by the *combined* effects of both shunt and series coils, it is evident that when used as a motor the current in the shunt will oppose that in the series coils. Hence the *difference* between the magnetizing powers of the two coils will determine the polarity and strength of the magnetic field. Such a machine is known as a *differentially-wound* motor.

The self induction due to the armature of a generator chiefly determines the lead of the brushes. If it is great, and the field is weak, the lead will be considerable. If it is small, and the field be powerful, the lead will be small also. But in the case of a motor exactly the reverse is the case. Here the self induction, being in the reverse sense, tends to diminish the lead. When a motor is desired to run in a particular direction the lead must be determined to give, in that direction, the strongest mechanical effect. If the brushes be set with no lead the armature will be apt to run in either direction, as it may happen to be started, but without exerting its maximum effect. In cases where the motor is required to reverse its direction of running, by reversing the current (as is frequently done) the brushes must not be given any lead. There is, however, an element of uncertainty, in many cases, that the motor shall reverse its direction of turning upon a reversal of the current. It is immaterial whether (in the case of a series motor) the current is reversed in the armature or in the field magnet.

Although almost any type of continuous current dynamo may be used as a motor, yet makers usually produce specially built machines for this purpose. As a rule, motors, especially if used for propelling vehicles, must be more heavily built than dynamos. They are subject to greater strains, and the mechanical arrangement of the induction coils, the core and the shaft of the armature must be as solidly constructed as possible. This is especially true of the connections between the coils and the core. The wires are preferably sunk permanently, with hard insulation, in channels in the core, as in the Weston and the Westinghouse armatures. The core, if built of plates, must be properly keyed or "feathered" upon the shaft.

Government of regulation by differential winding appears to be the most suitable method adapted to the case of motors. It has the great advantage that no breaks in the circuit are required. A great number of ingenious regulators have been invented in which the current is admitted to the circuit of the motor during a proportion only of the time of each revolution. The chief drawback of this system lies in the fact that break and make of circuit are necessary, involving a great deal of destructive sparking at the points of rupture.

The proportions between the shunt and the series windings of the field magnets vary in different motors, but those expressed in Ayrton and Perry's formula have produced motors almost perfectly self-regulating. Let S stand for the number of turns of the series coils, Z for those of the shunt coil, R_z for the resistance of the shunt, R_a for the resistance of the armature, and R_s for that of the series turns (expressed in ohms). Then:

$$\frac{Z}{S} = \frac{R_z}{R_a + R_s}.$$

A method of governing applicable to the case of a motor with more than one pair of poles has been proposed by Professor S. P. Thompson. He uses as field magnets a double set of poles set at different angles with respect to the brushes of the motor. One pair of magnet poles, having a certain lead, is actuated by series coils; the other pair, having different lead, by shunt coils. When both shunt and series are working there will be a resultant pole having some intermediate lead. If the load of the motor is diminished, it will tend to run faster, increasing the current in the shunt part, decreasing it in the series part, and therefore altering the effective lead and preventing the increase of speed.

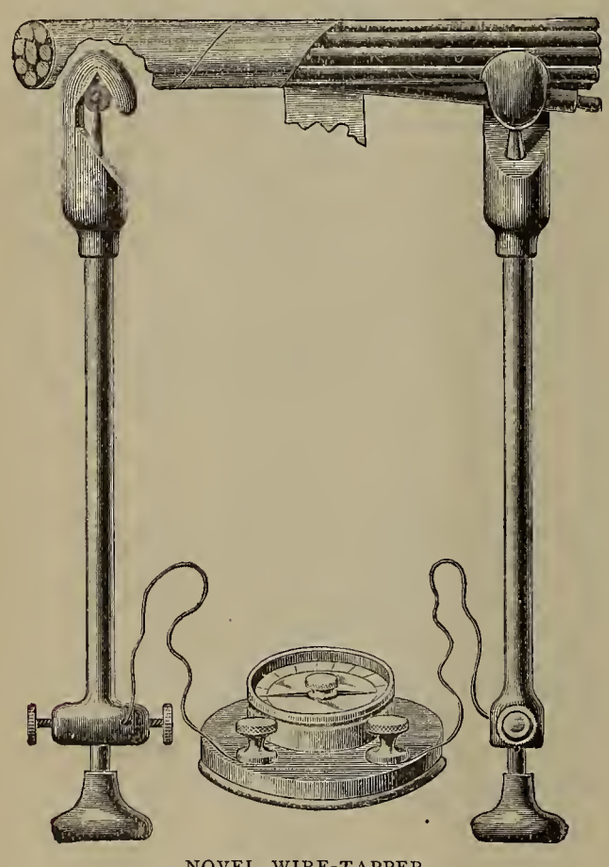
It can easily be shown, however, that in point of efficiency a differentially-wound motor must be inferior to a

motor either plain series or shunt wound. This shortcoming is due to the fact that the energy required to magnetize the field magnet is greater in the case of employing two opposing coils, as when the series and shunt machines are combined in one. The great advantages, however, of the differential method of winding in motors, combined with the fact that the loss due to the opposing coils is always relatively small, will probably lead to the almost universal adoption of compound motors for regular running. The energy consumed in magnetizing the field is always a small proportion of that supplied at the terminals, series or shunt, of the motor, and even if the opposing coils in a compound motor consume fifty per cent. more, it is still advantageous to employ this method of regulation.

LIGHTNING WIRE-TAPPER.

A very handy device for testing and locating trouble on insulated electric wires is shown in the accompanying illustration. It is specially adapted to finding trouble on annunciator, burglar-alarm, telephone or telegraph wires and for testing out cables of every description.

It is customary in testing and in locating faults to remove the insulation from the wire to be tested, and frequently this is attended with considerable inconvenience, besides impairing the insulation itself. The Menu Lightning Wire-Tapper, however, removes all these objectionable features and accomplishes the same result without detriment to insulation.



NOVEL WIRE-TAPPER.

The illustration is clear enough to tell its own story. By simply placing the wire to be tested in the V-slot and pressing the pin through the insulation, contact is made with the wire, and on the removal of the pin the perforation closes again, leaving the insulation in practically the same condition as it was before.

This tapper can be used on any size wire from $\frac{5}{16}$ diameter to the smallest magnet wire.

Wires otherwise inaccessible can be readily tested by the use of this device. The rapidity with which work can be carried on with this tapper is one of the main features of the instrument, which will be appreciated by all who are engaged in work of this class.

The Lightning Wire Tapper is manufactured by the John Simmons Co., 110 Centre street, New York City, and as it is of low cost it should find a very large sale.

NEW INCORPORATIONS.

The Mountain Bank Coal Co., New Whatcom, Wash., incorporated April 29, with a capital stock of $300,000. Among other things it will operate electric-light plants. Incorporators: Jerry Neterer, C. L. Snell, S. A. Calvert, J. L. Heron, A. W. Dresser, J. M. Hitt, New Whatcom, Wash.

The Cumberland Development and Improvement Co., Castle, Mont., incorporated April 26, with a capital stock of $60,000. Among other things it will manufacture and use electricity for light, heat and power. Incorporators: Charles E. Severance, Charles B. Carr, Oka, Mont.; A. J. Huncke, Castle, Mont.

The Jefferson Electrical Co., Steubensville, O., incorporated April 29, with a capital stock of $50,000. Incorporators: George A. Maxwell, George P. Dravo, Wilson McKee, George N. Henry, William S. McCauslen.

The Arnold Novelty Co. (this company succeeds Arnold Novelty Company of same place), Tacoma, Wash., incorporated April 25, with a capital stock of $12,500. Incorporators: A. F. Esperson, W. S. Arnold, J. E. Small, S. L. Rau, Ruch W. Kimball, F. W. Hicks, Tacoma, Wash.

Venture & Ojai Railway Co., San Buenaventura, Cal., incorporated April 25, with a capital stock of $250,000. Among other things it will deal in water, develop power, electricity, etc. Incorporators: W. S. Chaffe, Richard Robinson, E. P. Foster, E. S. Hall, G. W. Chrisman, W. H. Wilde, A. D. Barnard, A. Bernheim, all of San Buenaventura, Cal.; Joseph Hobart, K. P. Grant, J. K. Greis, Ojai Valley, Cal.

The Standard Electric Co., Castle, Mont., incorporated April 13, with a capital stock of $100,000. Incorporators: Elmer J. Anderson, Hanson H. Barnes, John L. Fraser, William A. Roots, Nahum T. Dinsmore, Charles E. Miller, all of Castle, Mont.

Seth B. Smith Electric Co., Butte, Mont., incorporated April 13, with a capital stock of $50,000. Incorporators: John O'Rourke, George T. Schmetzel, Seth B. Smith, Butte, Mont.

Pennsylvania Mining and Improvement Co., Everett, Wash., incorporated April 23, with a capital stock of $80,000. Among other things it will operate telephone and telegraph lines. Incorporators: Edward Mills, Everett, Wash.; Lincoln F. Gault, Tacoma, Wash.; B. W. Brintnall, Olympia.

Buffalo and East Aurora Electric Railroad Co., East Aurora, N. Y., incorporated April 20, with a capital stock of $150,000. Incorporators: Cicero J. Hamlin, Sandrock, Buffalo, N. Y.; Henry H. Persons, East Aurora, N. Y.

The Cardarelli Electric Light Crane Co., Sumter, S. C., incorporated May 7, with a capital stock of $6,000. Incorporators: H. J. Harby, R. M. Wallace, E. Cardarelli, Charles T. Mason, Jr., Horace Harby, all of Sumter, S. C.

The Kersmeyer Plumbing and Heating Co., Lincoln, Neb., incorporated May 6, with a capital stock of $27,000. Among other things it will deal in electric-light fixtures. Incorporators: F. A. Kersmeyer, G. H. Wentz, N. H. Howard, Lincoln, Neb.

The Commercial Electric Light Company, Columbus, Ind., incorporated May 7, with a capital stock of $20,000. Incorporators: Levi J. Lehman, A. Strauss, S. A. Essix.

The Hammond Electric Railway Co., Hammond, Ind., incorporated May 7, with a capital stock of $100,000. Incorporators: Miner Wamsley, Charles M. Story, Harry Wurzgurger, Joseph M. Finn.

Okiah Electric Company, San Francisco, Cal., incorporated May 5, with a capital stock of $30,000. Incorporators: George Johnson, C. B. Johnson, John Cosgrove, John W. Smith, Frank Boyd, all of San Francisco, Cal.

The Haverhill and Amesbury Street Railway Company, Haverhill, Mass., incorporated April 28, with a capital stock of $250,000. Incorporators: Charles Goss, Dudley J. Marston, William G. Ellis, Albert W. Goss, Adam Scott, N. Emory Collins.

The Jordan Electric Train Signal Co., Portland, Me., incorporated May 7, with a capital stock of $150,000. Incorporators: Henry B. Burnett, Frank D. Rogers, Herbert A. Clay, Portland, Me.

The Railway Equipment Co., Chicago, Ill., was incorporated May 3, with a capital stock of $100,000. Among other things it will equip electric, steam and horse railways. Incorporators: C. Metterhausen, A. E. Woodward, Ralph Bottemus.

National Construction Co. (incorporated in W. Va.), New York City, N. Y., incorporated May 5, with a capital stock of $1,500,000. Among other things it will build and maintain electric, steam, cable and horse railways. Incorporators: W. J. Foster, M. C. Steinrich, New York, N. Y.; H. W. Summex, Brooklyn, N. Y.

The Columbus and Magnetic Springs Electric Railway Co., Magnetic Springs, O., incorporated May 5, with a capital stock of $25,000. Incorporators: Edwin R. Hotsenpiller, Dunbar C. Kilbury, John W. Newhouse, William M. Warren, Solomon Hill.

The Dewey Electric Heating Co. (incorporated in W. Va.), Syracuse, N. Y., incorporated May 4, with a capital stock of $200,000 Incorporators: Emil Laass, Charles H. Duell, M. W. Dewey.

The Western Electric-Therapeutic and Alarm Co. (incorporated in W. Va.), Washington, D. C., incorporated May 3, with a capital stock of $500,000. Incorporators: A. J. Curtis, A. T. Smith, Washington, D. C.; J. T. Williams, St. Paul, Minn.

MULCTED IN DAMAGES.

Hannah T. Jackson secured a verdict for $5,000 damages against the Wissahickon Electric Light Company, Philadelphia, Pa., in the Court of Common Pleas. While out driving with her husband in Fairmount Park, the horse became entangled in wires of the company which were dangling along the drive and became unmanageable. Mrs. Jackson was thrown out, receiving severe injuries, and brought suit against the company for damages with the result as above stated.

ELECTRIC LIGHT IN QUEBEC.

The road committee held a meeting on May 6 to consider the tenders for the contract of lighting the city streets by electricity. Two proposals were submitted, one from the Quebec and Levis Electric Light Company, at $80 per light per annum, and the other from the Edison Electric Light Company, at $100 per light, for a contract of twenty years, the plant to become the property of the city at the end of that time. The merits of each company were presented through its counsel.

Mr. Lavery, representing the Edison Company, set forth the merits of the tender of his company, dwelling at length on the fact that with the expiration of the twenty-year contract the plant would become the property of the city, and that it would then be able to furnish light to private residences for $4.80 per light, instead of $6.00, as charged by the present contractors. The company asked the city to give its debentures to the amount of $80,000.

Mr. Gustave Stuart then spoke for the Quebec and Levis Electric Light Company. He said that the tender of the Edison Company was not the same as called for, and no doubt if such a thing was thought of, other companies would have sent in similar tenders. So far as the Edison Company's claim was concerned, that at the end of twenty years the plant would lapse to the city, he had it from practical and experienced electricians that at the end of that time it would not be worth $20,000, or even $10,000, and yet that company wanted to be given water-power free from taxation, and virtually asked the city for capital with which to erect its plant.

The committee then went into secret session, and finally decided to recommend that the tender of the Quebec and Levis Electric Light Company be accepted as the most advantageous in the interest of the city.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

Secretary Pope, of the Institute, announces that on account of the death of the mother of Mr. Nikola Tesla, that gentleman will not be able to attend the Chicago meeting of the Institute on June 6, 7 and 8 next.

CATALOGUE.

The Eickemeyer-Field Company, Yonkers, N. Y., has just issued a second edition of its illustrated catalogue, the object of which is to direct the attention of that portion of the public interested in street car-electric traction, to its system of apparatus. The catalogue is profusely illustrated and contains an exhaustive description of the company's various manufactures.

WARD ARC LAMPS.

"Ward" street-railway arc lamps, made by the Electric Construction and Supply Company, 18 Cortlandt st., New York, are performing excellent service, and sales of the same are good. Electric street-railway companies are beginning to appreciate the great advantages of these lamps, as is shown by the increasing demand for them.

The new ornamental "Ward" arc lamp is also meeting with excellent success, and it takes well in the trade. Large orders invariably follow when buyers see these lamps.

The Electric Construction and Supply Company has just brought out a new ceiling lamp about three feet high, which burns for seven hours. This lamp will no doubt meet with excellent success and demand.

The new double-carbon lamp, recently put upon the market, is made and sold under license by this company to the Brush Elec. Co. They are designed for constant potential circuits, and large numbers of them have been put out.

The company reports an active demand for "Ward" arc lamps, 300 being sold on Tuesday and Wednesday of last week alone. There are now over 1,000 in use in Brooklyn, and the number is constantly increasing. Several hundred have lately been installed for general commercial use. Seventy-five of these lamps were installed by the company in the large establishment of C. B. Rouss, on Broadway, New York, and are giving excellent satisfaction.

All the principal theatres and many large dry goods houses and other mercantile establishments in New York City and Brooklyn are using large numbers of these lamps with entire satisfaction.

PORTER & LEAVITT ELECTRIC MOTOR CO.

A visit to the works of the Porter & Leavitt Electric Motor Company, Providence, R. I., was made by a representative of the ELECTRICAL AGE last week, which proved to be very pleasant as well as interesting. At the head of this concern is Mr. Leavitt, who showed the writer through the new works, situated at 124 Mitchell street, where the company recently removed. The works are fitted up with the most improved modern and special machinery for the manufacture of electric fan motors, of which this company makes a specialty. The motors are made in four regular sizes, from 2 to 10 volts, and finished in first-class style with enamel finish, brass trimmings, with $\frac{3}{8}$ inch grooved brass pulley, and mounted on a nicely finished moulded-edge cherry base, having brass binding-post for connections. These motors are also suitable for running sewing machines, dental drills, jewellers' lathes and all kinds of light machinery. Mr. Leavitt has just perfected a new fan motor to be operated by gravity-cells. These motors will be cheaper and require less attention than any other motor in the market, and are especially adapted to warm climates where the continual use of fans are necessary. These motors will shortly be placed on the market. Mr. Leavitt is also getting out patterns for a new 110-volt fan motor, which is a new construction of perfectly ventilated armature designed by himself. Notwithstanding the fact that this company has been in business but one year, it has built up a trade and reputation that any one might envy. In consequence of the great demand for its motors, the company was compelled to run over-time until very recently.

"WITH EDISON AT SCHENECTADY, 1892."

Mr. W. H. Butler, of the General Electric Company, Schenectady, N. Y., has just got out a collection of photographs in book form of the Schenectady works of the General Electric Company, which is one of the most elegant and complete pieces of work of this class that we have ever seen. There are 125 photographs in all, giving as many different views of the works, and they are arranged in a most artistic manner. The book is elegantly bound, and will no doubt be of great value and interest to every one connected with the company. The title of the book is that at the head of this article, and this work is an elegant example of the photographer's and bookmaker's arts.

The idea of the book is to give a panoramic view of the Schenectady works, and the photographs, which were taken and arranged by Mr. Butler himself, are exceedingly clear and artistic. The price of the book is reasonable, considering the labor and workmanship involved in its production.

THE "HARRISBURG" IDEAL ENGINE.

W. R. Fleming & Co., formerly at 174 Fulton street and now removed to the new Mail and Express Building, corner Fulton street and Broadway, this city, are installing two of their now celebrated "Ideal" self-oiling high-speed engines in the new Naval Observatory at Georgetown Heights, Washington, D. C. As is well known, there is no more exacting customer than the government, and these engines were selected by Lieutenant A. V. Zane, of the Naval Department at Washington. After bids were received, he visited this city to investigate the merits of the different engines, and personally visited the engine rooms to see them run. He also visited other cities for the same purpose, and on his return to Washington the "Ideal" engines were ordered. His reason for ordering these engines were, as he expressed it, for their perfectly noiseless running, as the officers in the observatory, in order to use their instruments with accuracy, can have no vibration of any kind in the building, and on investigation Mr. Zane concluded these engines exactly suited to his purpose. The service required is very exacting, but the "Ideal" engine is fully equal to any demands of this kind that may be made upon it, as can be proved by the many fine electric plants now being noiselessly run by the "Ideal" engine in this and other cities.

INVESTIGATION.

A resolution was recently offered in the House of Representatives, Washington, D. C., by Mr. Crain, of Texas, requesting the Attorney-General to furnish information as to whether the Edison General Electric Company, the Thomson-Houston Electric Company or the General Electric Company have violated the provisions of the Anti-Trust Act in submitting proposals for furnishing lighting for the World's Fair at Chicago.

NEW YORK NOTES.

OFFICES OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, May 14, 1892.

THE *Electrical Engineer* has moved into the new Mail and Express Building, 203 Broadway.

THE offices of the Excelsior Electric Company have been removed to 42–44 Broad street.

THE FORT WAYNE ELECTRIC COMPANY, H. C. Adams, eastern manager, has moved its offices to 42–44 Broad street.

THE Eastern office of the Brush Electric Company, Mr. Hamill, manager, has been moved to 42–44 Broad street.

THE offices of the Norwich Insulated Wire Company have been removed from 58 Cedar street to 62 Greene street.

THE INTERNATIONAL THOMSON–HOUSTON ELECTRIC COMPANY has removed from 115 Broadway to 42–44 Broad street.

MR. C. C. SIBLEY is now connected with the Edison Electric Illuminating Company, of New York, Pearl and Elm streets.

W. R. FLEMING & COMPANY have moved from 174 Fulton street to the new Mail and Express Building, Fulton street and Broadway.

MR. J. H. SHAY, of the Munson Belting Co., Chicago, is in town. When last seen by your representative he was in good company and after business.

S. L. BARRIETT has opened a shop at 161 Washington street, having bought out the old Barriett Electrical Company, and is prepared to promptly fill orders for motors, etc.

THE D. FRISBIE COMPANY, manufacturer of elevators and hoists with C. & C. motors, is now occupying handsome and commodious quarters in the new Mail and Express Building.

THE New York office of the Thomson–Houston Electric Company, which is under the management of Messrs. Curtis and Dean, has been moved from 115 Broadway to 42-44 Broad street.

THE headquarters of Day's Kerite wire have been moved to Room 310 new Mail and Express Building, Broadway and Fulton streets. On the door will be a design of a section of Kerite cable executed in beautiful colors, which will be very artistic and attractive.

To show how near the West we are, Chas. E. Chapin, of 136 Liberty street, telegraphed to Warren, Ohio, for a barrel of Packard high grade lamps at noon, May 10, and at noon on the following day an expressman wanted $1 for a barrel that had arrived from Warren, O.

VAN WAGONER & LINN, electrical contractors, 74 Cortlandt street, furnish estimates for electric light works, electric gas lighting, burglar alarms, electric annunciators and all kinds of electric and speaking tube work. They have good facilities for carrying on their trade.

AT a meeting of the Brooklyn Institute a committee of two was appointed to confer with the management of the Claremont Avenue Rink, with a view to securing that building some time during November next for an electrical exhibition to be given under the auspices of the Institute, which has been promised the support of several large electrical companies.

THE COMPLETE ELECTRIC CONSTRUCTION COMPANY, 10 Cortlandt street, of which Mr. John A. Seely is general manager, has secured the contract for putting in the underground cables in Buffalo, N. Y., for the Buffalo Brush Electric Light Company. These cables are being supplied by the Safety Insulated Wire and Cable Co., 234 West 29th street, New York. About twenty-five miles will be used.

THE FORT WAYNE ELECTRIC COMPANY last week sold two 80-H. P. new Wood generators to the Hornellsville Electric Railway Company, Hornellsville, N. Y. The Wood arc system still continues to hold its own. Another 80-light dynamo, making 6 in all, was lately sold to the Manhattan Electric Light Company, New York. An order for a 630-light alternating dynamo for Cartagena, U. S. Colombia, South America, has also been received. All of these sales were made through the New York office of the company.

THE SAFETY INSULATED WIRE AND CABLE COMPANY, 234 West 29th street, has purchased the adjoining building, 50 x 100, 4 stories high, now occupied by the Cary and Moen Spring Company. The company has perfected arrangements to extend its manufactures, so as to include submarine and all other lines of wires and cables. Mr. L. R. Requa, the general manager, is the inventor of the safety system of insulation, and one of the most prominent chemists in this section. He thoroughly understands the requirements of the electric light, telegraph, telephone and cable companies, his knowledge extending over a long period.

STANLEY & PATTERSON, 32 Frankfort street, handle magnet wires, of all sizes, manufactured by the Atlantic Covering Company, and have just laid in a full and complete stock. They are the exclusive agents for Cutter's specialties in aluminum cone reflector shades, flexible fixtures, flush switches, etc. They have just brought out a new double annunciator drop, the magnets being of the same resistance as the bell magnet. The bell is mounted on the top of the back board with the drops, and in this way avoiding the necessity of an extra bell for testing. The annunciator magnets are set one before the other, not side by side, as is usual in other drops. The drop is made of handsomely-stamped finished brass, highly finished, with an ingenious catch, which holds the drop securely and at the same time being readily released. Messrs. Stanley & Patterson have on exhibition a fine Holtzer-Cabot automatic motor, made with resistances in the bottom of the base, for three different speeds.

W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE

NAMES OF COMPANIES.	CAPITAL.	PAR.	PRICE.
American Dist. Tel., N. Y.	3,825,000	100 00	62 00

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

The annual election for officers under whose management the New York Stock Exchange will continue was held on the 9th inst. and created considerable excitement among the members. To us Americans, perhaps, under all circumstances an election is looked forward to with a greater degree of pleasurable feeling than any other people. It is always uncertain; a black horse may turn up at any moment previous to the conceded and accepted nominations; after that war begins, and the Stock Exchange is no exception to the rule. There were two tickets in the field; that which was called the opposition contained the names of John H. Jacquelin and John Hone in place of W. B. Laurence and H. G. S. Noble for governors, and Chas. Stokes and Geo. H. Watson for members of the nominating committee, in lieu of A. G. Hodges and Edward L. Rogers. A healthy interest was taken, as shown by the fact that 652 votes were cast. The regular ticket was successful, and here is the list of those elected, with the offices they will fill: President, F. K. Sturgis; treasurer, D. C. Hays; secretary, George W. Ely; chairman, James Mitchell; members of the governing committee, W. B. Dickerman, A. M. Cahoone, John H. Jacquelin, James Seligman, C. W. Maury, John Hone, F. M. Thieriot, E. C. Homans, R. B. Whittemore, R. P. Doremus; trustee of the gratuity fund, W. E. Strong; members of the nominating committee, H. H. Hollister, George R. Sheldon, Charles Stokes, George W. Watson, H. Duncan Wood.

President F. K. Sturgis was cheered, as only brokers can cheer, when he took his seat just vacated by W. B. Dickerman, and responded in a neat little speech, thanking the members, invoking their aid and promising integrity and impartiality. The other officers were congratulated, and business proceeded as usual. The ELECTRICAL AGE, in tendering its congratulations, calls attention to the activity in industrial securities, and especially the electrics. We predict that on more than one occasion during the year the money articles will contain records announcing that the market was led by one or more electric stocks. At the moment Edison General takes the lead; next month will probably see the General Electric take its place in the business of the Exchange.

The development of successful combination of capital proceeds rapidly, regardless of the opposition of small dealers and others who find it impossible to get an interest or who oppose it on principle. Money is the great moving spirit, and leaving electrical propositions to one side for the moment, glancing at the concentration of capital represented by bonds and shares, we find over $10,000,000 of foreign capital being centred in Cincinnati for the purpose of controlling the distilleries of Kentucky, with a present output of 25,000,000 gallons of Bourbon. The contracts go into effect on June 1. Like nearly all foreign syndicates the control alone is desired, and in this case 40 % will be retained with the local management by the present owners. Liverpool and London furnish the capital, and investors are offered an opportunity to take a reasonable portion. Next comes the safe combination, to be known as the Herring-Hall-Marvin Co., a New Jersey corporation with a capital of $3,300,000. They include the Herring and Marvin Co.'s, of New York; Farrel and Meyers & Smith, of Philadelphia, and the Hall, of Cincinnati. Others will soon be added. Electricity will be benefited by all these combinations of capital in the shape of time-locks, burglar alarms, smelting, refining, telephoning, power transmission, lighting and many other methods.

The electric stock market has been very active this week, and should continue so until the conclusion of the negotiation between the parent companies is settled. On this occasion the shares have changed hands in quantity, over 10,000 Edison being handled in one day; usually these dealings are for a few hundred only. A great many fortunes will be made by investors in the electrics between this and the dull summer season, when the minds of capitalists are turned more on pleasure than business. Now is the time to get in.

THEY ARE APPRECIATED.

We give below a copy of a note received from Mr. J. M. Batchelor, which expresses the general sentiment in regard to the articles he refers to. Mr. Batchelor is a well-known writer himself and has recently contributed some very valuable articles to the ELECTRICAL AGE and STREET RAILWAY NEWS.

RED BANK, N. J.

EDITOR ELECTRICAL AGE: Sir, your articles on "Easy Lessons for Students" (in electricity), which are appearing serially in the ELECTRICAL AGE, are exceedingly interesting and instructive. They should obtain a wide notice. Respectfully,

J. M. BATCHELOR.

PHILADELPHIA NOTES.

THE LA ROCHE ELECTRIC WORKS report business booming, with plenty of orders ahead.

VALLEE BROS. & Co. are the agents for this city and vicinity for the celebrated Paiste Switches and "K. W." cut-outs, the manufacture of which has been taken over by the Bryant Electric Company, of Bridgeport, Conn.

MR. GEORGE WESTON, of W. H. Weston & Co., manufacturers of switches, etc., is laid up from the effects of an accident met with recently while operating a milling machine. He has the sympathy of his friends.

WESTERN NOTES.

LUKE LILLEY, city electrician of Cincinnatti, O., has got the g—b—, having been caught working several little snaps on the outside in connection with his official position.

MR. J. H. COOKE has severed his relations with the Sunbeam Incandescent Lamp Company, Chicago, and taken charge of the Chicago office of the Buckeye Electric Company, of Cleveland, Ohio.

THE GREAT WESTERN ELECTRIC SUPPLY CO., Chicago, has found it necessary to secure larger quarters, in order to satisfactorily comply with the requirements of its rapidly increasing business.

THE Chicago office of the Short Electric Railway Company has been removed from 225 Dearborn street to the new Monadnock Building, corner Dearborn and Jackson streets.

KOHLER BROTHERS, Chicago, representing the Western branch of the Eddy Electric Manufacturing Company, have removed to an elegant suite of offices in the Monadnock Building.

THE office and store-room of the Railway Equipment Company, Chicago, Ill., pending the fitting up of its new and permanent quarters, will be at 11 Adams street, which location is well known as the former headquarters of the Electric Merchandise Company.

TRADE NOTES.

THE engines manufactured by the Ball and Wood Co., New York City, still continue to grow in favor; so much so, indeed, that the Company finds it necessary to consider augmenting its works.

THROUGH the energetic efforts of Mr. Wm. P. Hall, its president, the business of the Hall Signal Company, 50 Broadway, New York, has been wonderfully increased since the first of the year. Orders keep piling in, to the great satisfaction of all concerned.

E. A. WILLIAMS & SON, the proprietors of the Jersey City Smelting Works, 105–111 Plymouth street, Jersey City, are ready to sell standardized fuse wires of all kinds, and are out with a circular giving points as to the carrying capacity, etc., of all their wires.

IN the quarters of the Interior Wiring and Fixture Company, 14 Clinton Place, New York, will always be found a full and complete supply of the various electric light and gas fixtures, of the latest designs, dealt in by it.

THE J. H. MCEWEN MANUFACTURING COMPANY, of Ridgeway, Pa., has completed the installation of two 100-H. P. engines for the Punxsutawney Electric Light Company, of Punxsutawney, Pa.

474,623. Circuit-Controller for Electric Motors. William S. Andrews, New York, N. Y., assignor to the Edison General Electric Company, same place. Filed May 27, 1891.

THE

"CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, under date of March 29, 1886, he says:

"A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weather-proof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use we make all sizes of stranded and flexible cables with Clark Insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

EASTERN ELECTRIC CABLE CO.,

THE TROLLEY IN BROOKLYN.

A trial trip was made on Friday, May 20, over that portion of the Brooklyn City Railroad so far completely equipped with the trolley system. This section of the line extends from Third avenue and 25th street to Fort Hamilton. President Lewis and a party of guests boarded the first electric car over the line, and the run was made without a hitch. Everything worked in a very satisfactory manner. Rapid progress is being made in changing to the trolley system, and the work is being done in the best manner possible.

IN DARKNESS.

On the night of May 17 Detroit was in total darkness through an accident to the steam-plant at the electric-light station, and on the same evening a portion of Brooklyn was threatened with the same fate. A fire in the station of the Citizens' Electric Light Company, Brooklyn, caused the lights supplied therefrom to be extinguished for about 15 minutes. The fire was brought under subjection and the lights again turned on.

FIRST ANNUAL DINNER.

The American Institute of Electrical Engineers is to be congratulated on the unqualified success attending the introduction of a new feature at its annual meetings, namely, a dinner. At the first annual dinner of the institute, which was held on the evening of May 17, there was a large attendance of distinguished persons engaged in the electrical field, and the affair passed off in an exceedingly pleasant manner. The after-dinner speeches were extremely interesting and full of suggestions, and the compliments paid to the enterprise of his American co-workers by Prof. George Forbes, of London, were received with great satisfaction and applause. The professor always sees much to admire every time he comes to America, particularly in electrical development, and he is afraid that his English brethren will question his loyalty to the British crown when he relates to them the wonderful advances made in America. It was, indeed, pleasant to listen to the sincere utterances of the professor regarding the position America occupies in reference to electrical progress, particularly in the electric railway line; and he was forced to admit that England would be far better off if her people had a part of the spirit of enterprise possessed by Americans. We think the professor would do better if he should transfer his allegiance to the great country over which the Stars and Stripes float. He has too progressive a mind to be held in subjection by the slow, methodical English way of doing things. Yet, perhaps, he can do more good in his present position. He can make an occasional visit to America to see how things are getting on, then go back home and shake things up for a while.

A social dinner will be one of the features of the annual meetings hereafter, and there is no question that it will accomplish a vast amount of good for the institute. It will bring members together and get them better acquainted with each other, and in this way promote interest and fellow-feeling in the association.

The election of Mr. Frank J. Sprague as president of the institute for the ensuing year was a happy one. Mr. Sprague is a man of great energy, enterprise and experience, and he will exert himself in every way to make this year the most successful one in the history of the institute.

We congratulate Mr. Sprague on his election, and the institute in having secured so worthy a gentleman to preside over its affairs.

POWER GENERATOR.

The generator shown in the accompanying illustration is of recent production by Mr. James J. Wood, the well-known inventor of the arc-light system operated by the Fort Wayne Electric Company, and electrician of the same concern.

This generator is well designed and constructed and possesses features that are not found in other generators for electric-railway purposes. One of these features is the light weight for output; a 60 H. P. machine weighing but 3,600 lbs., and the 120 H. P. machine about 13,000 lbs. In the matter of economy of space these generators are extraordinary, the 120 H. P. machine occupying a floor space of only 91 x 97 inches.

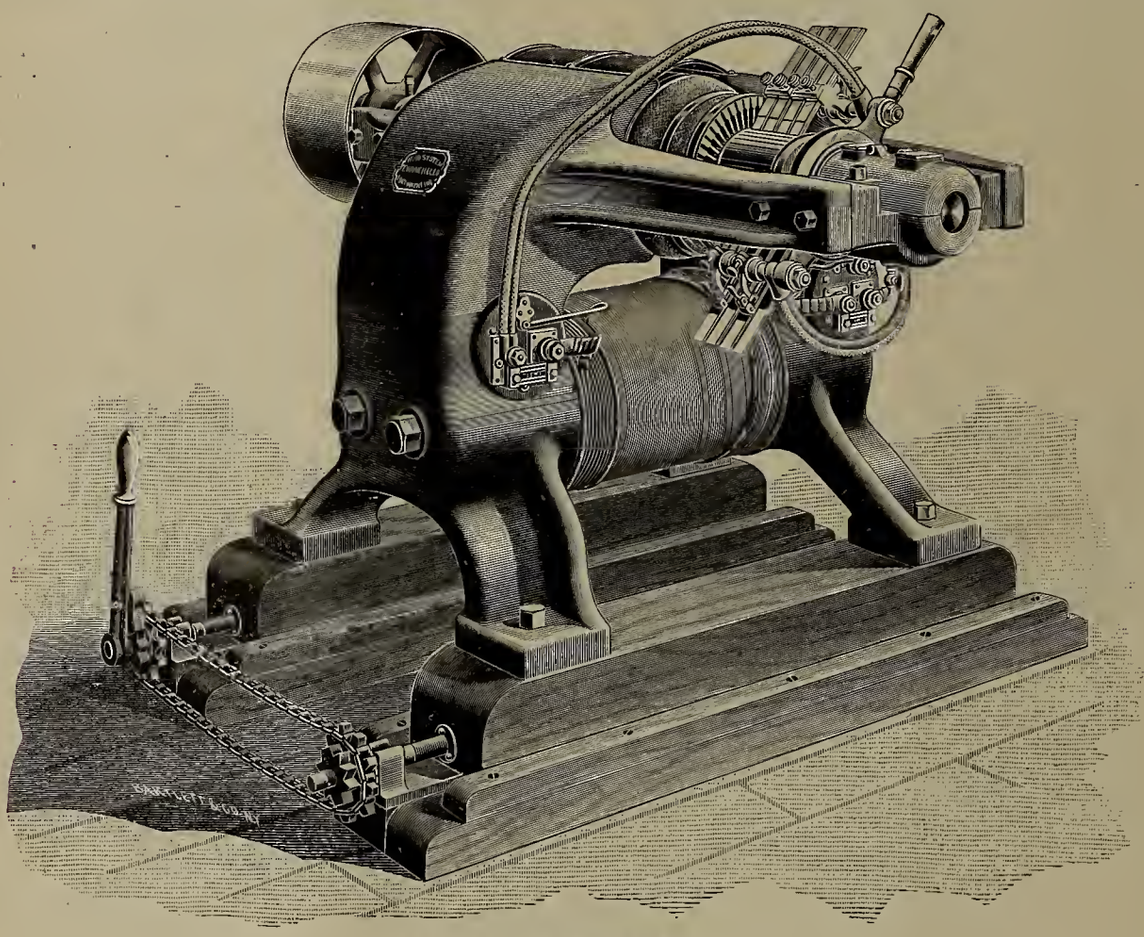
The capacity of the 120 H. P. generator is 120,000 watts.

The Fort Wayne Electric Company manufactures these generators from 10 H. P. up to 120 H. P.

ELECTRICAL EXECUTION.

Joseph L. Tice was executed by electricity in the prison at Auburn, N. Y., at 8:39 o'clock on the morning of May 18. The execution is said to have been a success in every particular, lasting but two and one-half minutes from beginning to end. There was a largely increased voltage over that used at the previous executions, and some changes were made in the method of applying the electrode.

Tice walked to the chair without assistance, and after he had seated himself the straps were hastily adjusted. The head electrode consisted of a metal cap filled with



RAILWAY POWER-GENERATOR.

The generator has self-contained multiple fuses for each end of the circuit and also an equalizing connection, the object of which is to connect several machines in multiple, and it is so arranged that all the machines can be kept working at the same potential irrespective of the load.

For the purpose of facilitating its operation the machine is set on a patent anti-friction and insulating sliding base, which keeps the motion positive irrespective of slackening or tightening the belt.

In the construction of these generators only the best of material and workmanship are employed, and in electrical efficiency they are about all that could be desired. They are perfectly self-regulating on all changes of load with an entire absence of sparking at the brushes.

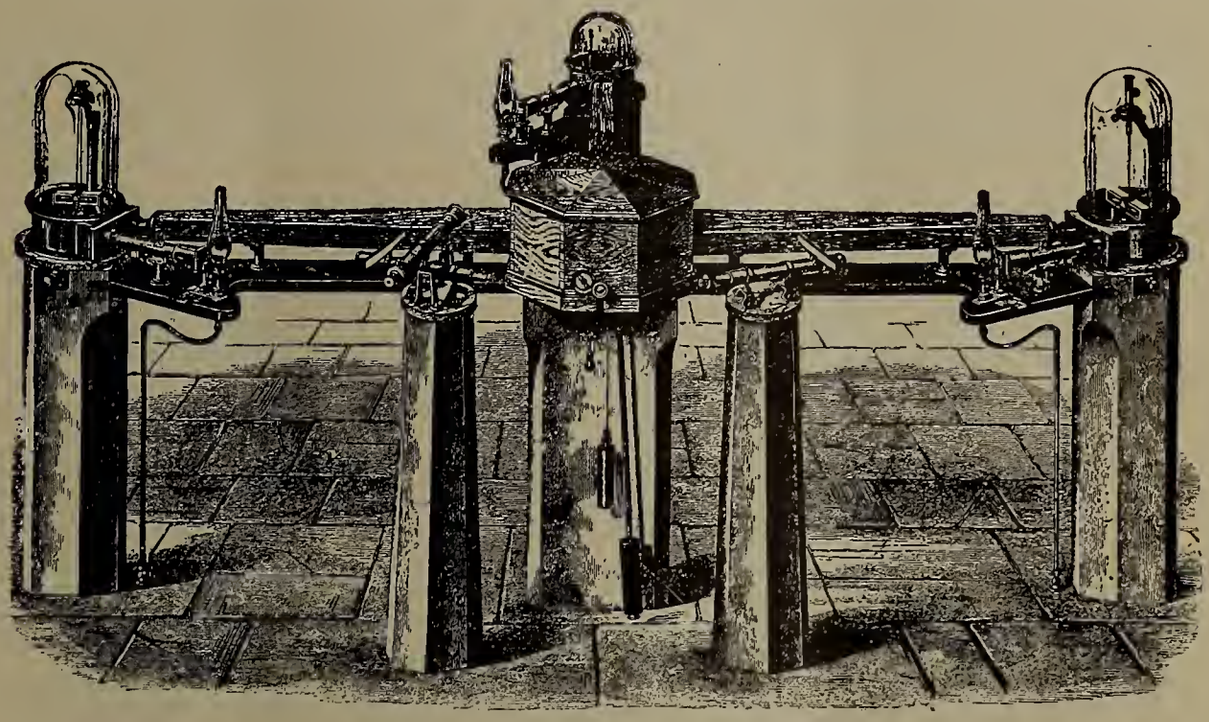
These machines are fitted with self-oiling expansion-boxes, and in every respect represent the highest degree of perfection, both mechanically and electrically.

sponges which brought the current to both temples. The other electrode was fastened to the calf of the left leg. At a signal from Dr. Daniels, Warden Brown turned on the salt water to the electrode sponges, and electrician Davis moved the switch, 1,720 volts being driven through Tice's body. The current was kept on for fifteen seconds. After an intermission of three seconds the current was again turned on for another period of fifteen seconds. There was a cessation for five seconds, and then a contact for ten seconds, with another interval of five seconds, and finally ten more of contact. The execution had occupied exactly one minute and three seconds. The appearance of the victim was perfectly natural, the face retaining the same appearance as when he had sat down.

The crime for which Tice was executed was the killing of his second wife on July 11, 1891. Tice was the ninth man executed under the new law.

SELF-RECORDING MAGNETIC APPARATUS.

At Kew and other magnetic observatories the daily and hourly variations of the magnet are recorded on a continuous register. The means employed consist in throwing a beam of light from a lamp on to a light mirror attached to the magnet whose motion is to be observed. A spot of light is thus reflected upon a ribbon of photographic paper prepared so as to be sensitive to light. The paper is moved continuously forward by a clock-work train, and if the magnet be at rest the dark trace on the paper will be simply a straight line. If, however, the magnet moves aside, the spot of light reflected from the mirror will be displaced, and the photographed line will be curved or crooked. Comparison of such records, or "magnetographs," from stations widely apart on the earth's surface promises to afford much light upon the *cause* of the earth's magnetism and of its changes, of which hitherto no reliable origin has been with certainty assigned.

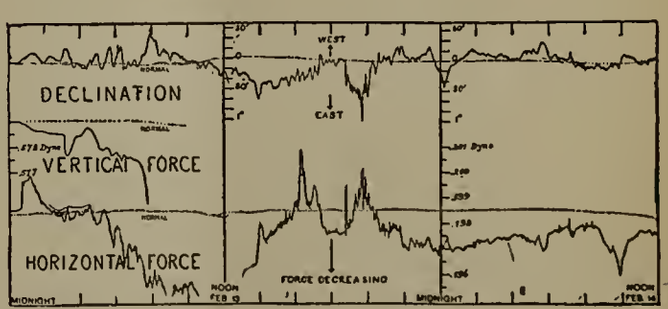


NEW MAGNETOGRAPH AT THE NAVAL OBSERVATORY, WASHINGTON.

The phenomenon of earth-currents appears to be connected with that of the changes in the earth's magnetism, and can be observed whenever there is a display of aurora and during a magnetic storm; but it is not yet determined whether these currents are due to the variations in the magnetism of the earth, or whether these variations are due to the currents. It is known that the evaporation always going on in the tropics causes the ascending currents of heated air to be positively electrified relatively to the earth. These air-currents travel northward and southward toward the colder polar regions where they descend. These streams of electrified air will act like true electric currents, and as the earth rotates within them it will be acted upon magnetically. Whether this will account for the gradual growth of the earth's magnetism is an open question. The action of the sun and moon in raising tides in the atmosphere might also account for the delicate magnetic variations which occur daily. It is important to note that in all magnetic storms the intensity of the perturbations is greatest in the regions nearest the poles; also, that the magnetic poles coincide very nearly with the regions of greatest cold; that the region where auroræ are seen in greatest abundance is a region lying nearly symmetrically round the magnetic pole. It may be added that the general direction of the feeble daily earth-currents is from the poles toward the equator.

STARTING SHUNT MOTORS.

A shunt motor, without any auxiliary starting arrangement, may refuse to begin to rotate of itself if standing idle when the current is switched on. This defect is due to the fact that the current, finding a path of comparatively low resistance through the armature as compared with the shunt windings, flows almost entirely in that path. Only a small proportion of the current flows in the shunt. The lower the armature's resistance the less current will flow in the shunt, and there will be little or no magnetism in the field. When, however, the motor is started, the revolution of the armature immediately sets up in its coils an opposing or counter-electromotive force, as before explained. This being, in the case in point, equivalent to increasing the resistance of the armature,



RECORD OF MAGNETIC STORM, MADE BY MAGNETOGRAPH.

a proportionately larger current will at once flow in the shunt and the field-magnet will become energized. As the speed increases, more and more current will be diverted round the shunt, because the counter-current of the armature is nearly proportional to the speed. The greatest effect will therefore be exerted by the motor when the magnets are magnetized to saturation.

ELECTRO-MAGNETS.

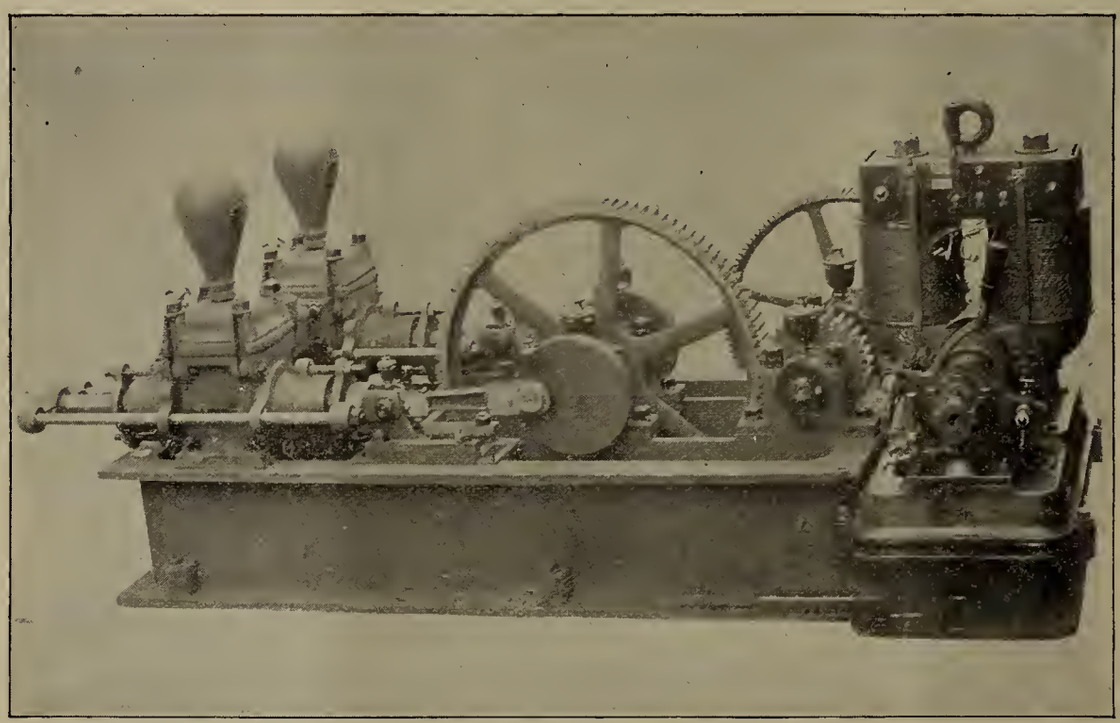
A very important factor to be considered in the construction of an electro-magnet is the length of the coil and of the core, as compared with the diameter. It is generally conceded that the maximum or outside diameter of coil should not exceed three times the diameter of the core, and while it has been said that the best results will be obtained by having the length of the core six times its diameter, there does not appear to be any universal reason for such a proportion. In a bar-magnet, however, where there is a desire to employ but one pole only, and get rid of the effects of the other, a decided advantage is to be gained by using a core of much greater proportional length, and should there be any restrictions as to the amount of wire to be used, fewer layers can be wound over a long piece of iron than would be over a shorter one. In this way the distance between the iron and the wire would be reduced, and having the same resistance the number of lines of force would consequently be correspondingly increased. If the same proportion were to be maintained between the respective diameters of the lengthened core and its coils, and the gauge of the wire so increased as to maintain a constant resistance and constant number of turns, the polar strength developed close to one end of the core will vary as the square of the length of the core—that is, if the core is not lengthened so extensively as to permit a leakage of the lines of force at the sides of the coil. This limit will vary with different qualities of iron in accordance with the relative permeability, or in other words, capability of conducting lines of force.

The above description treats only of electro-magnets in which the wire has been evenly wound its entire length; but for some purposes it is preferable to vary the method of winding.

We will suppose, for example, that it is desired to construct a bar-magnet which shall develop close to its extremities a very powerful field, and yet at the same time not exert any force at a comparatively greater distance. In such a case it should have the wire coned up near the ends; that is to say, it should have a larger layer of wires over the ends, the number gradually decreasing towards the middle and with few or none being wound over the central position of the core. As a rule, the wire should not at any point be wound more than three times the diameter of the core. In such a magnet the lines of force will be powerfully developed near the ends and have but little tendency to leak out. On the other hand, much smaller curves will be made than would result from an equal length of wire wound evenly along the entire length of the core.

ELECTRIC PUMP.

A good combination of a pump operated by an electric motor is the equipment which the Edison General Electric Company is about to put on the market. This consists of an Edison standard motor of the type '85, with a Deane duplex double-acting pressure-pump upon one and the same special bed-plate. These pumps have outside packed plungers, with the valves arranged above the cylinder in such a manner that they can be uncovered for examination or repair without removal of any pipes. The covers of the valve chests are held down by swing bolts. To remove these covers it is only necessary to loosen the nuts and swing the bolts away without removing them. The pump is operated by the motor by means of a double gear. The details and arrangement are shown in the cut.



PUMP OPERATED BY EDISON MOTOR.

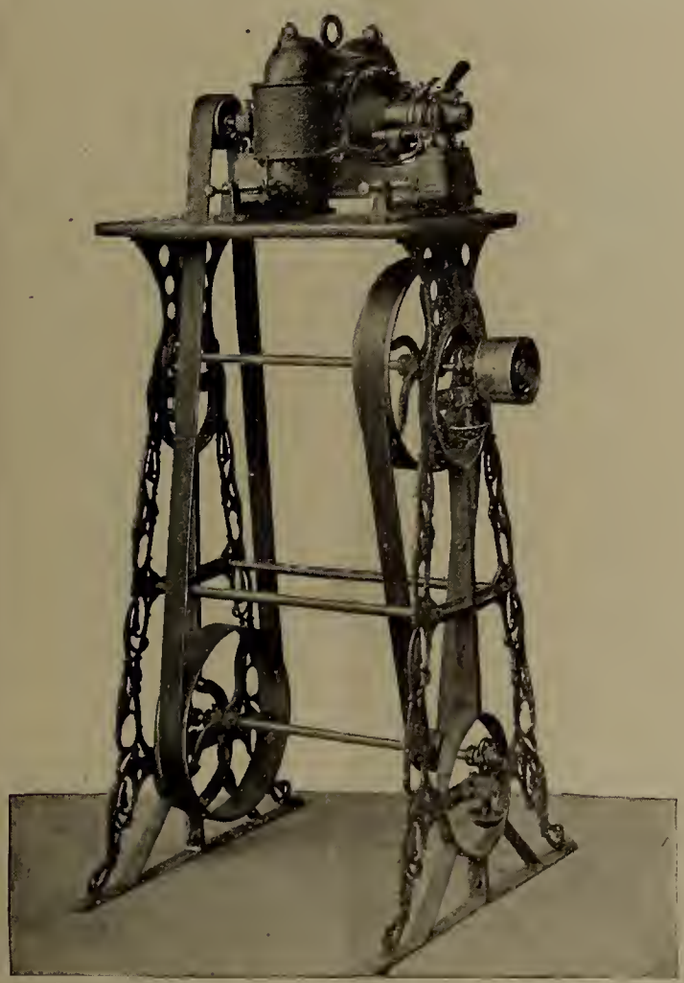
CONVERSION OF MECHANICAL INTO ELECTRICAL ENERGY.

It has been found that to produce a given electromotive force and current a certain expenditure of power is indispensable, since electricity itself is but another form of motion, which requires power to produce it. It is also found that whether we seek to produce 1 volt and a current of 1,000 ampères or 1,000 volts with a current of only 1 ampère the power expended will be the same; so for the convenience of calculation the term *watt* has been introduced to indicate the amount of electrical energy contained in 1 volt x 1 ampère. One horse-power of mechanical energy, which is equal to the work done per minute by 1 lb. falling through 33,000 feet, or by 33,000 lbs. falling 1 foot, is equivalent to 746 watts. This means that if we could convert directly, without any loss through

friction or any other imperfection, 1 horse-power of mechanical energy into electrical energy, we should obtain 746 watts. As we can subdivide the watts into ampères and volts at our discretion, so we could at will obtain either 746 ampères at 1 volt pressure or 1 ampère at 746 volts pressure, in exchange for our horse-power, or any two factors of volts and ampères which multiplied together produce 746. In practice the best modern dynamos waste in conversion from 2½ to 5 per cent. of the energy put into them as motive-power; in other words, it is possible to obtain from 95 to 97½ per cent. of electrical energy from a dynamo absorbing 100 per cent. of mechanical energy to drive it.

FAN-MOTOR STAND.

Messrs. McLeod, Ward & Co., 91 Liberty street, New York, have just brought out a novel fan-motor stand of iron about five feet high. The motor is set on top of the stand and belted down to the counter-shafting for the purpose of reducing the speed of ceiling fans. This stand was designed to do away with the use of unsightly counter-shafting and belts, etc., on ceilings. It is made



SPEED-REDUCING STAND FOR FAN-MOTORS.

of ornamental iron, and can be finished in bronze, brass, etc., as may be desired. This firm has lately completed an installation of 1,500 lamps in the building of the New York Biscuit Company, 16th street and 10th avenue. The plant consists of one Billberg dynamo, made by Thomas H. Dallett & Co., Philadelphia, and a 100 H. P. Billberg motor, said to be the largest now running in New York city. Six "Ward" arc lamps were also installed to run on this circuit. The firm is kept busy installing its ceiling fan, which was recently illustrated in the ELECTRICAL AGE. Messrs. McLeod, Ward & Co, besides being manufacturers of fans, blowers and exhaust systems, are also manufacturing electricians and contractors for the installation of electric light and power plants.

ANNUAL MEETING OF THE AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.

The annual meeting of the American Institute of Electrical Engineers for the election of officers was held at the institute headquarters, 12 West 31st street, New York. at 4 P.M., May 17. There was a good attendance of members and considerable interest manifested. The result of the election was as follows:

President, Frank J. Sprague.

Viee-Presidents, A. E. Kennelly, Nikola Tesla and O. T. Crosby, who succeed F. B. Crocker, Frank J. Sprague and Joseph Wetzler.

Managers, Charles Wirt, A. S. Hibbard, M. I. Pupin and C. P. Steinmetz, in place of Dr. F. Benedict Herzog, Dr. William E. Geyer, H. C. Townsend and Francis R. Upton.

Secretary, Ralph W. Pope.

Treasurer, George M. Phelps.

The following-named gentlemen were elected honorary members: Lord Kelvin (Sir William Thomson), Dr. Werner Siemens and Cyrus W. Field.

The report of council showed the membership to be 615, a net increase of 74 over last year.

The officers holding over from last year are as follows: Vice-presidents, Thos. D. Lockwood, Carl Hering, Wm. J. Hammer; managers, J. C. Chamberlain, P. B. Delany, H. A. Foster, H. Ward Leonard, Dr. Louis Bell, Herbert Laws Webb, Prof. A. G. Compton and James Hamblet.

The general meeting of the institute will be held at Chicago June 6, 7 and 8.

After the elections were over Mr. Sprague assumed the chair and made a few remarks thanking the members for the honor bestowed upon him, and at once settled down to business.

The business of the meeting was concluded at 5:30, and at half-past six the members assembled at "The Arena," across the street, where a subscription dinner was served. This certainly was one of the most delightful affairs the institute ever participated in, and at the close of the post-prandial exercises it was decided that the annual-dinner feature of the institute should be continued, and that this one would be known as the "First Annual Dinner."

There were between 60 and 75 members present at the dinner, and the greatest enthusiasm and cordiality prevailed. Among those present were: Prof. George Forbes, of London, England, who sat at the left of President Sprague; E. E. Higgins, general manager of the Short Electric Railway Company, Cleveland, Ohio; O. T. Crosby, H. Ward Leonard, Franklin L. Pope, C. A. Benton, A. S. Hibbard and Dr. Louis Duncan.

After the dinner had been disposed of and cigars lighted, President Sprague arose and made a few appropriate remarks, invoking the co-operation of all the members in his effort to carry on the work of the institute this year, which was to be an important one.

He then called upon Mr. T. D. Lockwood for some remarks, and that gentlemen kept the party in extremely good humor for a few minutes with his witticisms. After getting down to the serious part of his remarks he called attention to the significant and interesting fact that auroras had occurred exactly every 27 days since the first of the year. He spoke of the several theories proposed concerning the nature of electricity, but thought we should be cautious about the acceptance as an ultimatum what any man says electricity is.

Mr. O. T. Crosby was next called upon. He spoke of the electric railway, and predicted that radical changes in the industrial and social conditions in our cities would be brought about by electricity. He believed rapid transit would have a wholesome effect on communities by eradicating many of the existing evils in city government. This he thought would be brought about by spreading

the population and relieving congestion. Those engaged in the electrical art, he thought, were going to be the forces which would produce these changes. He spoke very enthusiastically of the important part the electric railway would play in bringing about these great social and industrial changes, and his sentiments were generously endorsed by the hearty applause they evoked.

After Mr. Crosby, appropriate remarks were made by Mr. C. E. Emery and Mr. Oberlin Smith, who were followed by Prof. Forbes. The professor spoke in a complimentary manner about the great progress made in America in matters pertaining to electricity, yet in England in some things we were surpassed. Electric lighting, for instance, he said, was conducted there in a more substantial and satisfactory manner than in America. All the stations in London are of a high class and put up to stay. In electric traction, however, they were lamentably behind-hand in England. This the professor said was due to the great opposition there to the overhead trolley system, but the time would soon come when they would take hold of electric traction the way they did electric lighting, and make a good job of it. During his recent travels throughout the country he had paid particular attention to electric traction in American cities, and had studied the various systems on all sides. He thought the progress made in this country in this industry was simply phenomenal, and when he returned to England and made his report they would accuse him of disloyalty, as they had done before when he had made reports of American enterprise after former visits here.

The slowness in England of introducing new electrical enterprises, he said, was due to the fact that they were waiting for substantial conditions. All the experimenting was being done in America, and when Americans had settled down to a solid basis, England would take hold, and with all the benefit of American experience, come to the front. He admired American enterprise, and thought that England would be greatly benefited if the people there had some of America's go-ahead spirit.

He referred to the Niagara Falls tunnel enterprise and was surprised at its magnitude, and closed his remarks by complimenting the electrical fraternity of America on the cordial manner in which they entertain their foreign brethren. He assured his hearers that the fraternity in England were always glad to reciprocate these kind attentions.

Interesting remarks were made by Franklin L. Pope, T. C. Martin and Dr. Louis Duncan, and at 10:45 the exercises were brought to a close.

ELECTRICAL SOCIETIES.

THE CANADIAN ELECTRICAL SOCIETY.

At a meeting of the executive board of the Canadian Electrical Society, held at Hamilton, Ont., May 11, it was decided to hold the annual convention of the association at Hamilton on June 14, 15 and 16. The programme for the three days is as follows :

Tuesday, 14th, at 11 A.M., meeting of the executive board. In the afternoon the election of officers will take place, and a session will be held in the evening for the transaction of regular business. Wednesday, 15th, afternoon session for the reading of papers by different members of the society on diverse subjects ; in the evening an excursion will be made to Burlington Beach by boat. Thursday, 16th, a general discussion of the papers will be held and the business of the meeting concluded. Afterwards a drive around the city and a dinner will close the convention.

The membership in the association is now over 120, and the attendance at this convention promises to be very large.

THE NEW ENGLAND ELECTRIC CLUB.

We are pleased to note the organization of an electric club in the city of Boston. It will be known as the New England Electric Club, and is to be opened on May 25. The club starts out under favorable auspices, over 200 members having been already enrolled. Large donations have been received from all the large electric companies and allied interests. The ELECTRICAL AGE extends to the club its heartiest good wishes for all success and prosperity.

NEW YORK ELECTRIC CLUB.

At a meeting of the board of managers of the Electric Club of New York, held on May 20, twenty-one new members were elected. The club will give a concert on May 27, and an enjoyable entertainment is promised. The affairs of the club are in an excellent condition, and its future prospects very satisfactory.

A LIVE ISSUE.

BY J. M. BATCHELOR.

IN view of the existing tendency among electrical organizations and street railway companies to unite in the shape of enlarged combinations, it is interesting to note some comments on the subject by General E. P. Alexander, who, in a Southern newspaper, dwelt upon the subject of railway consolidation at considerable length, and in a most striking and forcible manner. He said that centuries ago it was discovered that there might possibly be too much of even a good thing, and that too much of some remedies, even of competition, might sometimes constitute another disease. From this conviction arose gradually innumerable forms of what are called protective unions, brotherhoods, alliances and associations in every trade, profession and occupation on earth, until to-day every man sees in his own business, which is the only one he understands fully, that after competition has run to a reasonable extent there must be some form of protection devised against competition gone mad. The correctness of this general view is just now being notoriously emphasized by the calamitous effects of an over-production of cotton.

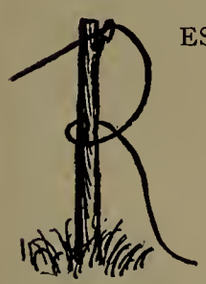
There is sound reason in Gen. Alexander's attitude, particularly as he applies it in the case of railways, be they for local or any purposes, because railways are the objects of more or less legislative discrimination in all the States of the Union, and some form of protection, as he well says, is a positive necessity, not for the purpose of increasing the burdens of the patrons of such roads, but to establish a combination of interests which will enable all concerned to protect themselves from the unjust encroachments of legislatures or any other agencies. Right or wrong, however, the principle, or rather the advantages, of combination are so numerous to the participators that the conclusion is natural in saying we now are on the eve of a much wider movement in the direction of combination than any which has preceded, simply because of the strict economy there is in it, a feature almost lost sight of in the numerous newspaper criticisms against trusts, or whatever name the combination passes under. These critics fail to comprehend

the problem, and devote their energies to crying down everything which a corporation, as such, is permitted to do, merely because the cut-throat policy of competition is removed, or rather, supposed to be removed; for, as a matter of fact, should the combine increase prices in consequence of a supposed monopoly, such advance would be a practical premium for the establishment of rivals. But the true merits of such combinations is a matter entirely apart from the issue of competition, for they permit an economy that is variously estimated all the way from 15 to 30 per cent. of what it is possible to do by any member of such combinations acting alone. While we will not attempt to describe in detail what those economies are, they being almost countless in variety and differ in each case, they can be easily appreciated by explaining that they are the difference between doing business on a wholesale scale and doing it in a retail way. If a new method of doing business is devised which will permit a reduction in the cost of service to the extent described, it is absurd to antagonize it solely from fear that the operator will abuse what is erroneously supposed to be, by the adverse critics referred to, his power. These critics argue that firms should do business at a loss of from 15 and above per cent. rather than take a course which will enable them to prevent it, merely because they, the critics, cannot understand the true advantages derivable to all consumers from combination. Consumers or patrons, as the case may be, are directly benefited in the reduction of prices so long as it is not done at the expense of labor, that is, wages. Consequently such patrons are primarily benefited when the manufacturer or the corporation simplifies his business methods in a manner which will permit a reduction in cost to the consumer; for if no such economy is made no reductions to consumers are possible. For these reasons it becomes a self-evident proposition in saying that combinations, or so-called trusts, are here to stay.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Resistance.



RESISTANCE is the term used in the science of electricity to indicate the property possessed by all substances of offering opposition to the flow of electric currents.

As in the case of electrical potential, which was the subject of consideration in our last article, electrical resistance has an analogue in the water-pipe, and what is true of water passing through a pipe is equally true of an electric current passing through a wire.

When a stream of water passes through a pipe there is a friction between the pipe and the water which retards the flow of the latter, and this friction is greater as the pipe grows smaller in diameter. So it is with conductors of electric currents. The smaller the wire the greater will be the friction or resistance to the passage of the current, and the larger the wire the less will be the resistance. To overcome resistance greater potential or electromotive force is required, as was explained in our last article ; it is advantageous, therefore, always to keep the resistance down as low as possible.

All substances do not possess the same degree of resistance ; some offer exceedingly small and others interpose a very great resistance to an electric current. Those substances which offer the least resistance are called conductors, and those which offer the greatest are known as insulators. All substances are conductors to a greater or less degree. All the metals are conductors and offer the least resistance to the passage of currents, though the resistance varies greatly, some metals offering more than others.

Silver offers the least resistance to a current, and is for this reason adopted as the standard of comparison. Representing a silver wire of given diameter and length as 1, the resistance of a hard-drawn copper wire of the same diameter and length would be 1.086, and an iron wire of similar dimensions would have a resistance of 6.460, more than 6 times that of copper and silver. Copper wire is used for electric lighting because it offers the least resistance and at the same time is within the limit of commercial economy, although it is a very important factor in electric-light calculations on account of its high cost compared with that of iron. Iron is generally used for telegraph wires, although it offers greater resistance to the current. The general use of copper wire for telegraph purposes is to a great extent prohibitive on account of the greater comparative cost, and it is more economical to increase the current strength to overcome the resistance of the iron wire than it would be to use copper. In late years, however, copper wires have come into extensive use for important telegraph circuits.

Resistance is a necessary evil in telegraphy. Consider a telegraph instrument for a moment. The magnets are wound with a very long, fine copper wire, which, on account of its fineness, offers great resistance to the current. Fine wire must be used in order to get a great number of turns around the core of the magnet to produce the necessary electro-magnetism to operate the instrument. It would not do to use large wire, because the magnets would necessarily get beyond all proportions in the matter of size. The currents required to operate telegraph instruments are very feeble as compared with those used in electric lighting, being reckoned in milliampères, (a milliampère meaning one thousandth of an ampère). In electric lighting very large currents are used, consequently wire offering the least resistance possible is required for their transmission.

The resistance in an electric circuit, whether it be telegraph or electric light, has great effect on the resultant current; the current being the quotient of the electromotive force of the generator divided by the total resistance of the circuit.

This law was discovered by Ohm, a German physicist, and is universally known as Ohm's Law. It is usually expressed by this formula :

$$C = \frac{E}{R};$$

C standing for current; E, electromotive force, and R, resistance. Suppose, for example, we have a dynamo or a battery with an electromotive force of 100 volts, and the resistance of the circuit is 50 ohms, the current C, in ampères, would be 2, because, in substituting these values for the symbols of the formula expressing Ohm's law, we would have $\frac{100}{50} = 2$.

The unit of resistance is the ohm, which is named after the discoverer of the law governing electric currents above referred to. It represents the resistance of a column of mercury 106 centimetres in height and 1 square millimetre in cross-section, at the temperature of 0° Centigrade.

In practice very small and very large resistances are met with and measured. In order to facilitate the expression of exceedingly small or large values, which frequently run into the millions, the prefixes *micro* and *meg* are used in conjunction with the word ohm. The prefix *micro* means one-millionth part, and *meg* means one million. Thus if we say five *microhms*, it is equivalent to saying " 5 one-millionth parts of an ohm," or $\frac{5}{1.000.000}$. One *megohm* means one million ohms, and in insulation tests, where the resistance to the passage of the current through the insulating substance is very great, the term

megohm is constantly used. Good insulation runs up into the millions of ohms in its resistance.

Temperature has great influence on the resistance of substances. In the case of metals the resistance increases with the temperature—that is to say, the higher the temperature the greater is the resistance. This is very noticeable on long telegraph lines. On cold days such a line has the least resistance, while on hot days its resistance is greatest; and these variations occur during very short periods of time. Thus, for instance, a wire will have less resistance early in the morning, before sunrise, than it has when the sun is up high in the heavens. These variations in resistance are noticeable in the working of multiplex systems, and have to be compensated for. In electric-light circuits the question of variation of resistance in the lines is not of sufficient importance to require any special consideration in calculations, because the lines are comparatively short, and the variation is not perceptible in practical work.

The longer a conductor is the greater will be its resistance, of course, the resistance being proportional to its length. Thus, if a wire 1 mile long has a resistance of, say, 10 ohms, one hundred miles of similar wire will have one hundred times that resistance, or 100 (miles) × 10 (ohms) = 1,000 (ohms).

The resistance of a wire varies inversely as the square of the diameter. Thus if one wire has a diameter of, say, one-tenth of an inch, and the other two-tenths, the area of the cross-section of the latter will be four times that of the former, because the areas of circles are to one another as the squares of their diameter. Therefore the larger of the two wires will have one-fourth the resistance of the smaller one. The same rule applies in all calculations affecting resistance and diameters of wires.

While the resistance of substances of a metallic nature increases with the temperature, that of non-metallic substances behaves in the opposite manner—that is to say, the resistance of such substances decreases as the temperature increases, and *vice versa*. Hard rubber, for instance, has very great resistance, but if we apply heat to it its resistance decreases as the heat increases; and so it is with all substances that are classed as insulators.

A STUPENDOUS COLUMN OF WATER.

Altogether the most extraordinary water-power installation—so far as head is concerned—ever known has recently been made by the Pelton Water Wheel Co. in one of the famous Comstock Mines at Virginia City, Nevada. The wheel is 36 in. diameter, made of a solid steel disc, with the buckets riveted on to the periphery in a way to afford absolute security, weighing complete 180 lbs.

It is running under a vertical head of 2,100 feet, equal to 911 lbs. pressure. 460 feet of this head is obtained from the pipe line of the Gold Hill Water Co., and the remaining 1,640 feet from the California and Con. Virginia shaft, down which the pipe line is run to the Sutro Tunnel level, where the power station is located and through which the water discharges after passing over the wheel. The wheel runs at 1,150 revolutions, with a peripheral speed of 10,804 feet per minute, or about 120 miles per hour.

The construction of the wheel amply provides for the centrifugal strain the velocity of the water gives it, running without load, when it would attain the enormous speed of 21,608 feet per minute, equal to about 240 miles per hour. A nozzle tip ½ in. diameter gives under above conditions 100 H. P. Every miner's inch of water, equal to a flow of 1.6 cubic feet per minute, gives 5 H. P., while 1 H. P. is given for every 2 lbs. of metal in the wheel. It is only by comparison that an idea can be obtained of the height of a column of water due to such pressure. It is more than four times as high as the Washington Monument, and considerably more than twice the height of the Eiffel Tower. It is safe to say that no water-wheel has ever before been operated under any such head, nor any such demonstration afforded of the velocity and power of water under such an extreme pressure.

The installation made by the Pelton Company some two years ago in the Chollar shaft on the Comstock lode is in some respects no less extraordinary. This consisted of six 40-in. Pelton wheels, which run under a vertical head of 1,680 feet, driving that number of electrical generators, the power from which is conveyed up the shaft to the Nevada Mill, some 2,000 feet distant. These wheels weigh only 220 lbs. each, and with nozzle tips ⅝ of an inch diameter develop 125 H. P. each.

The water is first run over a Pelton wheel on the surface under 460 ft. head, and is then carried down the shaft by a pipe to the Sutro Tunnel level, where the underground station is located, the power from the electrical generators being conveyed to the counter-shaft of the mill with which the surface wheel is connected, the two distinct forces working together in perfect harmony.

A most interesting illustration of the double use of water is here given, some 400 H. P. being produced in this way from what may be termed waste water. This station has now been running more than three years without interruption and practically without expense in the way of repairs, as well as without any appreciable loss in efficiency, affording a most striking example of the advantages of water-power, both by direct application and electric transmission, as well as the reliability of such a plant under such extraordinary conditions.

ANNUAL MEETING OF THE WESTINGHOUSE COMPANY.

The Westinghouse Electric Company held its annual meeting in Pittsburg on May 18.

According to reports submitted, during the fifteen months of reorganization ending March 31, the indebtedness was reduced from $5,298,632 to $1,783,297. The company now owns the Consolidated Electric Company, of New York, and the United States Electric Lighting Company, of Newark, N. J. It has three factories and employs 1,600 men.

The business for March and April of this year amounted to $1,576,323. The cash and available assets are approximately $3,150,000. The company has in its treasury 7,355 shares of preferred stock, 19,242 shares of active stock and $332,751.97 in first mortgage bonds. Now that the company's motor or street-railway system, is perfected, it is no longer entirely dependent upon the electric light business.

The following directors were elected: Charles Francis Adams, of Boston; Lemuel Bannister, of Pittsburg; August Belmont, of New York; A. M. Beyers, of Pittsburg; N. W. Bumsted, of Boston; Marcellus Hartley, of Boston; George W. Hebard, of New York; Henry B. Hyde, of New York; Brayton Ives, of New York, and George Westinghouse, Jr., of Pittsburg.

ANIMAL ELECTRICITY.

Several species of creatures inhabiting the water have the power of producing electric discharges by certain portions of their organism. The best known of these are the *Torpedo*, the *Gymnotus* and the *Silurus*, found in the Nile and the Niger. The *Raia Torpedo*, or electric ray, of which there are three species inhabiting the Mediterranean and Atlantic, is provided with an electric organ on the back of its head. This organ consists of laminæ composed of polygonal cells to the number of 800 to 1,000 or more, supplied with four large bundles of nerve-fibres; the under surface of the fish is —, the upper +. In the *Gymnotus electricus*, or Surinam eel, the

electric organ goes with the whole length of the body along both sides. It is able to give a most terrible shock, and it is a formidable antagonist when it has attained its full length of 5 or 6 feet. Humboldt gives a lively account of the combats between the electric eels and the wild horses, driven by the natives into the swamps inhabited by the *Gymnotus*.

Nobili, Matteucci and others have shown that nerve excitations and muscular contractions of human beings also give rise to feeble discharges of electricity.

ANSWERS TO INQUIRIES.

EDITOR ELECTRICAL AGE: Will you kindly advise me what is the velocity of electricity and light?

FREEDOM, PA. C. J. R.

Answer.—Wheatstone states that the velocity of electricity is 288,000 miles a second, but the fact is there is no definite assignable velocity. The flow of a current through a wire is affected by so many different conditions that it is impossible to state in a general way what the velocity is. Light is said to have about the same velocity as electricity.

Is there any way of preventing the sparking at the contact points of telegraph instruments; if so, will you kindly point to the way out of my troubles? T. A. C.

OLEAN, N. Y.

Answer.—Sparking may be partially prevented by connecting a condenser in shunt around the points. Another good plan is to connect in the same manner a choking magnet of high self-induction. Such a magnet may be made by winding fine wire on an iron core. The coil should be very long compared with its diameter.

Please explain the cause of the production of electric current in a battery cell. J. T. E.

FRANKLIN, PA.

Answer.—It is not known definitely any more than that the electricity is generated by chemical action, which consists in a transferring of the atoms from one compound or element to other elements or compounds. When this change occurs an electric current is the result.

I have a plating dynamo which gives me trouble sometimes by losing its residual magnetism. Can you tell what may be the cause of it? and oblige, P. O.

VICKSBURG, MISS.

Answer.—You give no data on which we can base a reply to your question. The trouble you complain of, however, may be caused by some opposing current circulating in the magnet coils of the dynamo while the machine is idle, such currents coming from the depositing vats.

In the quadruplex apparatus the No. 2 relay as it is called has very short magnets. Why are they made so short? O. C.

PORTLAND, ME.

Answer.—These magnets are made short so that the cores will charge and discharge quicker. The reason that they do charge and discharge quicker is because the magnetic inertia, or lag, is decreased by shortening the core. Magnetic inertia means the inability of the magnet-core to instantly loose or acquire magnetism.

I would like to know what is the value of the legal ohm, and if it is the same as the British Association unit? S. M. M.

ALTOONA, PA.

Answer.—The legal ohm is the resistance of a column of mercury one square millimetre in cross-section and 106 centimetres in length, at the temperature of 32° F. The legal ohm is not the same as the B. A. unit. The legal ohm = 1.00112 B. A. unit, which value was adopted by the International Electric Congress in 1884, and is now accepted internationally as the true value of the ohm.

Is the passage of an electric current through a conductor of very low resistance accompanied by any heat? Why is it that a small wire heats more than a large one? Please give formulæ for the determination of heat generated in a conductor. H. E.

DUNKIRK, N. Y.

Answer. — Heat is developed in any conductor by the passage of a current, however low the resistance may be. Heat H is equal to the square of the current, C^2, multiplied by the resistance of the wire, or, $H = C^2R$. It will be seen from this that the greater the resistance the greater will be the heat. In a comparatively large conductor the heat is spread over a considerable surface, and is rapidly lost by radiation.

SUBWAY COMMISSIONER.

George R. Gray has been appointed an electrical subway commissioner by Gov. Abbett, of New Jersey, in the place of James Smith, Jr., who resigned.

ELECTRICAL ENERGY.

Whenever a current of electricity flows a certain amount of energy is expended, and it is necessary to be able to measure exactly the amount of energy so expended in any circuit or in any part thereof. The quantity of work performed in raising a mass of one pound through a difference of level of one foot against the force of gravity is generally taken as the unit of mechanical energy, and is known as the foot-pound. The work done in raising any mass through any height is found by simply multiplying together the number of pounds in that mass by the number of feet through which it is lifted. Somewhat similarly we can take, as the practical unit of electrical energy, the amount expended in transferring a unit quantity of electricity (one coulomb) through a difference of potential of one volt. And by multiplying the number of coulombs, which have flowed from one point to another by the difference of potential in volts between those points, we obtain the number of units of electrical energy expended during the passage of the current. The unit of electrical energy, or one coulomb multiplied by one volt, is called the joule. As a simple numerical example, we may suppose a current of 10 ampères to flow for 5 seconds, then the quantity of electricity passing through the circuit would be 50 coulombs, and if this current were maintained by a potential difference of 8 volts, the amount of energy expended in that time would be $8 \times 50 = 400$ joules.

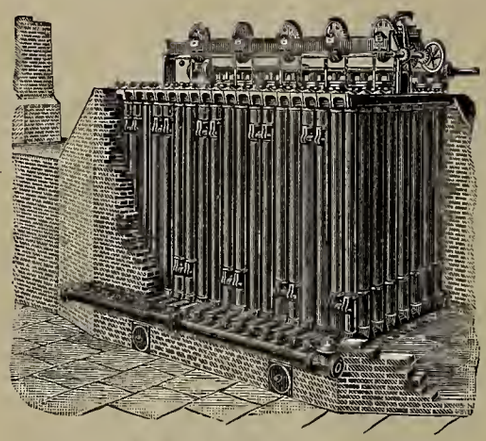
As a rule, we wish to know the *rate* at which work is being done in any circuit rather than the amount which is done in a given time. It is evident that this rate can always be found by dividing the amount of work by the number of seconds taken for its performance; but the same result can be arrived at by multiplying together the potential difference and the rate of transference or flow of electricity instead of the quantity actually transferred in a given time. Now the rate of flow of electricity is what we know as the current strength, which is measured in ampères. Therefore, if the difference of potential in volts between any two given points is multiplied by the resulting current in ampères the product gives the rate at which energy is being expended, or the rate of working between those two points. The unit rate of working or the unit of *power* is called the *watt*—that is to say, 1 ampère × 1 volt = 1 watt. Therefore, if a difference of potential of 20 volts between the ends of a wire maintains a current of 3 ampères the rate of working is $3 \times 20 = 60$ watts.

FUEL ECONOMIZERS.

The use of fuel economizers as an important and very necessary adjunct to a steam-plant is so well known as to call for but little or no comment. Every one having any knowledge of steam boilers knows that they are used for the purpose of utilizing the vast amount of surplus heat which would otherwise be wasted and escape up the chimney in heating the feed-water for the boiler.

An economizer which has met with much success and become very popular is one known as the Green Economizer. The apparatus consists of a set of cast-iron pipes about four inches in diameter and nine feet in length, made in sections (of various widths), and are connected together by "top" and "bottom boxes;" these again being connected by "top" and "bottom branch pipes" running lengthwise, one at the top and the other at the bottom, on opposite sides, both outside the brick flue which encloses the economizer. The waste gases are led to the economizer by the ordinary flue from the boilers to the chimney.

The feed-water is forced into the economizer by the



FUEL ECONOMIZER.

boiler pump or injector at the lower branch-pipe nearest the point of exit of the gases, and emerges from the economizer at the upper branch-pipe nearest the point where the gases enter. Each pipe is provided with a scraper, which is made to travel continuously up and down the pipe at a slow rate of speed, the object being to keep the external surface clean, soot being a non-conductor of heat.

The mechanism for working the scrapers is placed on the top of the economizer, outside the chamber, and the scrapers are moved up and down by rods and chains which pass through small openings in the top of the machine. The motive-power is supplied by a belt or from some convenient shaft; the power required is so small as to be immaterial. The apparatus is fitted with blow-off and safety valves. A space is provided at the bottom of the chamber for the collection of soot which is thrown off by the scrapers.

Great care is exercised and only the best of material employed throughout in the construction of these economizers, a very noticeable feature being their extreme simplicity and freedom from complications.

While, as we have said before, these economizers have become very popular, they will now become more so from the fact that Mr. P. M. McLaren, who has been for the past ten years connected with the Babcock & Wilcox Boiler Company as general agent, and through whose efforts and energy these boilers were so generally introduced into electric light and power stations, mills, etc., has lately become associated with E. Green & Son, the patentees and manufacturers. Large works have been built at Matteawan, N. Y., where the economizers will be manufactured, it having been found cheaper to erect a plant and manufacture them in this country than to import them from abroad, owing to the prohibitive duties imposed by the tariff.

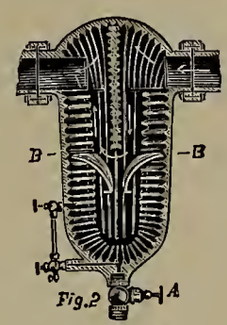
The same old-time zeal will be displayed by Mr. McLaren in his new sphere, and it will add greatly to his credit and the satisfaction of those with whom he is associated. The main offices are at 91 Liberty street, New York.

STEAM SEPARATORS.

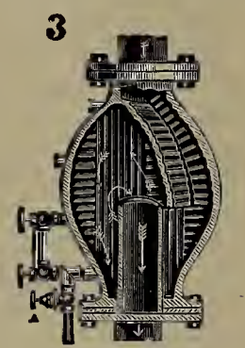
A subject which should receive the careful attention and consideration of every one interested in the use and application of steam power is the separation of water from live steam, and the keeping of exhaust steam in as pure a state as possible by the extraction of oil, grease and dirty water.

The question then becomes the selection and adoption of a device which will best fill the requirements. We take pleasure in presenting to our readers a description of the Hine "Eliminator," which has been eminently successful in this direction, and the fact of its being universally used throughout all sections of the country is a sufficient guarantee of its superiority.

The Eliminator is the only steam separator constructed in such a manner that the steam is thoroughly broken up in its passage through it, and the particles eliminated



HORIZONTAL



VERTICAL.

immediately carried entirely out of and away from the action of the steam current.

The principles of construction and operation which apply to an apparatus for the separation of water from live steam are identical with those required for the extraction of oil, grease and dirty water from exhaust steam.

The Hine Eliminator possesses all these requirements in a marked degree, and is acknowledged to be superior to all other grease extractors.

In connection with this eliminator, it is interesting to note that in a competitive test of steam separators made at Sibley College, Cornell University, in January, 1891, it came out at the head of the list.

The details of the test have been published in a neat little pamphlet by the Hine Eliminator Company, 106 Liberty street, New York, and can be had upon application, as also circulars containing complete information relating to the Eliminator and testimonials from acknowledged authorities all over the country.

HARRISBURG IDE AND IDEAL ENGINES.

The following is a list of a few of the later modern buildings in which the Harrisburg perfected Ide and Ideal engines are now noiselessly running:

Hotel Marlborough, 250 H. P.; Hotel Endicott, 210 H. P.; Hotel St. Lorenze, 110 H. P.; Hotel Del Mont, 110 H. P.; Grand Central Depot, 150 H. P.; H. C. F. Koch & Co., 125 H. P.; Brooklyn Navy Yard, 175 H. P.; Pennsylvania R. R. ferries, 125 H. P.; Browning, King & Co., 100 H. P.; "The Haberman," 100 H. P.; U. S. Naval Observatory, 90 H. P.

The favor with which these engines are regarded may

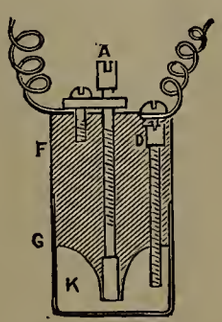
be estimated from the fact that over 600 are now in use in the United States, Chicago alone having 100.

W. R. Fleming & Co., the New York representatives of the Harrisburg Foundry and Machine Works, the makers of these engines, are doing a large trade.

OVERHEATED BEARINGS.*

The overheating of bearings in machinery has very often been the cause of serious troubles, many a conflagration having had its origin from this source, due in more cases than one to the fact of one man having been called upon to do more work than he could properly attend to. This subject, which had been long and carefully studied by Messrs. Pierce, Desisles and Oliver, led to their joint invention of the apparatus called the Electric Heat Alarm, described and illustrated herewith.

The system consists of an automatic device which is situated on the bearing, and which closes a local battery circuit when the bearing reaches a certain temperature. The battery circuit is connected to a drop annunciator with an alarm bell, which may be situated in the engineer's office or in any convenient place, the annunciator having a number on it for every bearing equipped with the device. As soon, therefore, as the alarm bell rings, the engineer has but to look at the annunciator to learn



HEAT ALARM.

at a glance which bearing is running hot, and by quick attention can either cool off the bearing or at least prevent any damage from occurring.

In using the apparatus the centre plug is removed, and the hollow screw *A* is inserted. The screw is then turned down until the bell rings; then it is adjusted for any desired temperature. The screw *D* is always connected with the battery, and the bell or annunciator to *A*. The use of two colored wires is advised.

NEW PUBLICATIONS.

We have received a copy of a handy little classified and descriptive guide to electrical books, edited and published in English, French and German by F. von Szczepanski, St. Petersburg and Leipzig. The book contains 75 pages and can be had from the International News Company, New York. Price 50 cents.

CATALOGUES.

John S. Halls, 40 Cortlandt street, New York, has issued an illustrated catalogue and price-list for 1892, of the engineers' and machinists' specialties manufactured by him. Mr. Halls' many friends will be pleased to hear he is rapidly convalescing from his recent severe illness.

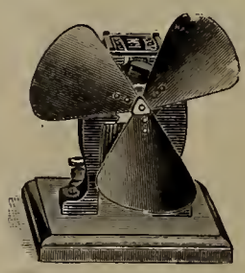
Catalogue No. 23, just issued by the Electrical Supply Company, Chicago, descriptive of the light and power supplies carried by it, contains 496 pages, and is profusely illustrated. It is gotten up in the shape of a pocket edition and is exhaustive in its details.

* Electric Heat Alarm Co., 113 Devonshire street, Boston.

A HANDY MOTOR.*

An exceedingly efficient battery motor for ventilating purposes, operating light or model machinery, turn-tables, etc., is the one shown in the accompanying cut, and is known as the Premier No. 3. It is made of the best soft iron, enamelled, carefully insulated and wound with best double-covered wire, has oil-cups on bearings, brass driving-pulley, binding-posts, etc., and is mounted on a hard-wood base. Being made exact to gauge, all parts are interchangeable, and the brushes are easily adjusted. The manufacturer claims that for its size it is the strongest motor in the market. It is made to take a current of from 2 to 6 volts, and has a 6-inch fan. Special motors with two fans, for the dining-table, desk, etc., and wound for special voltages, are also made at a slight advance above regular prices.

In addition to the three sizes, the company is at present manufacturing a ½ H. P. motor which will shortly be placed upon the market that will run on any continuous-



FAN MOTOR.

current lamp-circuit. It is designed to meet the demand for a low-priced motor that may be attached to a lamp-circuit to run ventilating fans, sewing-machines, dental drills, etc.

These battery motors are made under letters patent which fully cover the armature of three radial cores, also the connections to make the motor self-starting.

The company reports a good demand for its Premier battery, 5 × 7 in size. This battery will run a motor 18 to 25 hours.

CONTINENTAL DYNAMO IN NEW HANDS.

P. Claus & Co., electrical engineers and contractors, 52 Broad street and 50 New street, this city, have recently completed arrangements for the manufacture of the well-known Continental dynamos, motors and generators. The firm has already on hand several orders for dynamos for lighting and electro-deposition purposes. Among the orders recently secured is one for a complete plant for the New Manhattan Opera-House, on 34th street, New York city. This plant will consist of one 200 H. P. Weston automatic engine, one 1,200-light and and one 600-light Claus & Co. dynamo. There will be in all 3,300 lamps. It said that this will be one of the finest plants in New York city. The firm will also install a 400-light plant complete for Fred. Hollender & Co., 149 West 125th street, New York city. This plant will include one 400-light dynamo and one Ball & Wood engine. Two 600-light dynamos have been sold in Boston and one with a capacity of 1,200 ampères at 10 volts in Philadelphia. The firm will receive bids for estimates on electric-light plants and give estimates for complete electric-light installations, including engines, boilers, dynamos, wiring, feed-water heaters, etc.

Mr. Claus is well known in the trade as a first-class electrician, and his ability to make a first-class electric machine is unquestioned.

* The Premier Electric Company, Brooklyn, N. Y.

THE DETROIT ELECTRICAL WORKS.

At the annual meeting of the stockholders of the Detroit Electrical Works, held at the company's office April 26, the following gentlemen were elected directors to serve for the ensuing year: Hugh McMillan, W. H. Wells, T. H. Newberry, Gilbert N. McMillan, Jas. H. McMillan, Stratheairn Hendrie and Louis Warfield, all of Detroit, and Messrs. Albert A. Pope and Geo. B. Strong, of Boston, Mass.

The following officers of the company were elected by the board of directors at the meeting held May 17th: Hugh McMillan, President; Louis Warfield, vice-president and general manager; Joseph E. Lockwood, secretary; Thomas Muir, treasurer and H. C. Van Husa, assistant secretary.

NEW INCORPORATIONS.

Galesburg Electric Motor and Power Co., Galesburg, Ill., incorporated May 13, with a capital stock of $210,000. Incorporators: P. M. Johnson, E. A. Bancroft, William Kellogg, Henry F. Arnold.

The Nicaragua Water, Irrigation and Electric Co., San Francisco, Cal., incorporated May 10, with a capital stock of $250,000. Incorporators: J. I. Jewell, C. C. Jewell, Petaluma, Cal.; W. C. Quinby, A. P. Bacon, San Francisco; W. F. Russell, Santa Rosa.

The Standard Electric Heat, Light and Power Co., Portland, Me., incorporated May 11, with a capital stock of $500,000. Incorporators: Robert J. Edwards, Frank Q. Brown, Boston, Mass.; Charles A. Campbell, Chelsea, Mass.

The West India and Columbia Electric Co., Chicago, Ill., incorporated May 12, with a capital stock of $500,000, to carry on a general telegraph and telephone business and furnish electricity for light, heat and power purposes, street railways, etc. Incorporators: John P. Dieter, William G. Adams, John H. Miller.

The Boulder Electric Power Co., Creighton, Neb., incorporated May 10, with a capital stock of $500,000, to operate mines in Park Co., Mont. Incorporators: A. N. Hawley, L. P. Ash, Charles W. Hamilton.

The Negaunee and Ishpeming Street Railway and Electric Co. (consolidation of the Negaunee and Ishpeming Street Railway Company and the Negaunee and Ishpeming Electric Light Co.), Negaunee, Mich., incorporated May 5, with a capital stock of $120,000. Incorporators: Alexander Maitland, John B. Maas, Peter White.

The Tamaqua and Pottsville Electric Railroad Company, Tamaqua, Pa., incorporated May 5, with a capital stock of $120,000. Incorporators: J. O. Ulrich, John H. Stidfole, William J. Oliver, Tamaqua, Pa.

The Lewistown and Bellefonte Electric Railway Company, Lewistown, Pa., incorporated May 6, with a capital stock of $400,000. Incorporators: Johnson Muthersbaugh, A. P. Martin, W. W. Trout, all of Lewistown, Pa.

The Canton Electric Light, Heat and Power Company, Canton, Pa., incorporated May 2, with a capital stock of $10,000. Incorporators: J. W. Parsons, W. C. Crippen, H. B. Parsons, Canton, Pa.; C. W. Carrier, Troy, Pa.

The Liberty Avenue Street Railway Company, Pittsburg, Pa., incorporated April 23, with a capital stock of $50,000, to operate an electric street railway. Incorporators: S. J. Wainwright, Jr., M. F. Leslie, P. C. Bryne, Pittsburg, Pa.

The Susquehanna Railway Company, Susquehanna, Pa., incorporated May 5, with a capital stock of $75,000, to construct and operate an electric railway. Incorporators: C. Eberle, Girardville, Pa.; M. Walsh, Beaver Falls, Pa.; George R. Graham, Allegheny, Pa.

The Moscow Electric Light and Power Co., Moscow, Idaho, incorporated May 7, with a capital stock of $50,000. Incorporators: M. J. Shield, P. Tillinghast, J. H. Shields.

The Lynden Electric Motor Railway Co., Lynden, Wash., incorporated May 6, with a capital stock of $250,000. Incorporators: W. N. Lawrence, Jr., Dr. Walter Wilbur, H. A. Judson, E. J. Robinson, S. Kildall, E. Edson, P. C. Williams, S. H. Bradley, Alfred Keohan, B. W. Loring, all of Lynden, Wash.

The Enamel Insulator Co., Chicago, Ill., incorporated May 11, with a capital stock of $500,000. Among other things it will manufacture, buy and sell electric heating devices. Incorporators: Thomas E. Morford, Robert W. Vasey, Henry B. Ford.

Neftel & Marsh Co., Jersey City, N. J., incorporated May 9, with a capital stock of $50,000, to purchase, sell, furnish and equip electrical and other machinery, apparatus, etc. Incorporators: K. Neftel, Jersey City, N. J.; C. W. Marsh, H. M. Hawkesworth, New York, N. Y.; F. B. Marsh, Brooklyn, N. Y.

Electric Cutter Co., East Orange, N. J., incorporated May 9, with a capital stock of $25,000, to manufacture, sell and deal in electric cloth cutters, etc. Incorporators: J. Smith, A. K. Thyll, L. A. Smith, New York, N. Y.

The Atlantic and Western Telephone Company, Chicago, Ill., incorporated May 16, with a capital stock of $5,000,000, to manufacture, use and license others to use electric speaking telephones throughout the United States. Incorporators: H. P. Caldwell, H. C. Strong, D. A. Strong, E. B. Springer, G. J. M. Porter, G. M. Brinkerhoff.

PRINTING BY ELECTRIC POWER.

The Sedalia daily and weekly *Democrat*, of Sedalia, Mo., will henceforth run its printing-press by electricity. The Edison Company has installed a 3 H. P. Standard Edison Motor in the Equitable Building, Sedalia, Mo., for this purpose. Current will be taken from the mains of the Electric Railway, Light and Power Company of that town.

ELECTRICITY AND THE PRESS.

The proprietors of the *Daily Palladium*, New Haven, Conn., have, among other improvements made in their plant, discarded their steam-engine and adopted electricity as the motive power for their presses. The Edison General Electric Company has installed one of its 12 H. P. motors in the Palladium Building, and the paper observes: "The motor occupies very small space, is noiseless, easy to manage, and does its work quite as effectively as the cumbersome and more expensive steam-engine, and at far less expense."

WELL-EQUIPPED POLYTECHNIC SCHOOL.

The Rose Polytechnic Institute, an advertisement of which appears in this issue of the ELECTRICAL AGE, is one of the few well-endowed and well-equipped schools of a college grade in the United States devoted exclusively to the professional education of mechanical, electrical and civil engineers and chemists. Very special attention is devoted to electricity.

It is the strongest possible evidence in favor of this school that for several years the number applying for admission has exceeded the limited number that can be admitted.

Those intending to study engineering should address Rose Polytechnic Institute, Terre Haute, Indiana, for catalogue.

MARRIED.

Mr. Louis Warfield, general manager of the Detroit Electrical Works, Detroit, Mich., was on May 2 last, united in marriage to Miss Alice McMillan, of Detroit, Mich. The home of the bride's parents, where the ceremony took place, was brilliantly illuminated and decorated profusely with flowers, and the affair was one of the most elegant seen in Detroit for a long time Mr. Warfield's large circle of friends in the electrical fraternity wish him joy and prosperity in his new venture.

NEW BOOKS.

An advance copy of the second edition of the "Dictionary of Electrical Words, Terms and Phrases," by Prof. Edwin J. Houston, has just been received from the publishers, The W. J. Johnston Company, Limited, Times Building, New York City. The first edition of this book was published in 1889, and was somewhat smaller than the new one. The second edition has been entirely rewritten and revised, and is practically a new book. It is octavo and contains 562 double-column pages. There are 570 illustrations which cover a very wide range of electrical apparatus. Definitions are given under about 5,000 distinct titles, and nearly as many more titles are entered for the sake of giving cross-references to other titles under which their definition may be found. The type is clear and the paper of excellent quantity. Price of book, $5.00.

LIGHTING BY ACCUMULATORS.

The Union Electric Company, of New York, is installing an accumulator plant to be used for lighting at Aldrich court, 45 Broadway. The plant will consist of 150 cells, each having a capacity of 500 watt hours. These cells will be used for supplying the lights in the building after 6 o'clock P.M., the maximum number of lights being 250. The cells will be charged each day while the regular dynamo plant is in operation, and drawn from after 6 o'clock. Heretofore one engine has supplied the lights after 6 P.M., for both Aldrich court and the Columbia Building, but under the new arrangement the two buildings will be operated independently as far as the lights are concerned, the accumulator plant supplying the current for the lights in Aldrich court alone.

The accumulators of the Union Electric Co. are made under the patents of Prof. Wm. Main. The positive plates are made of a number of thin sheets of lead, enclosed between two stout outer sheets. These are all perforated at once in a press and secured together by numerous leaden rivets. During the process of "forming," the inside lead sheets are completely converted into peroxide of lead, leaving the thick ones on the outside, which are but superficially affected. As retaining-walls and supports, the transverse holes afford free access of current and fluid to the interior of the plate. The working surface thus obtained is much greater than the outer flat sides would afford. No peroxide can drop out, and the plate, however thick it may be, is discharged uniformly throughout.

FIRE.

Fire broke out in an extension to the Navy street wing of the Citizens' Electric Light Company, Brooklyn, on the evening of May 17. Damage, about $5,000.

With the breaking out of the fire the electric lights supplied to a large portion of the western district were extinguished. The fire was under control in fifteen minutes, and five minutes later the lights were going all right again.

ELECTRIC LIGHTS EXTINGUISHED.

Owing to the bursting of a steam-pipe connected with the engine in the works of the Detroit Electric Light and Power Company, Detroit, Mich., at 8:30 P.M., May 17, every street light in the city as well as those in private houses and other buildings was extinguished. So far as the streets were concerned Detroit spent a night in darkness.

EASTERN NOTES.

The Economic Electric Manufacturing Company, of Boston, Mass., reports business very good.

H. L. Slade & Co., Boston, Mass., successors to Kendall & Slade, are very busy in their line of electric lighting, etc.

Mr. Geo. F. Talcott, the popular travelling salesman of the Simplex Electric Co., Boston, Mass., is looking after the affairs of the company during the brief absence of Mr. J. R. Mason, who is in Chicago, combining business with pleasure.

H. N. Bates & Co., Boston, Mass., dealers in shafting, pulleys, hangers, gears, friction pulleys and general machinery for the transmission of power, report an excellent business. They keep a large stock constantly on hand, and any one requiring such goods should write for a catalogue.

Mr. Henry S. Kaliske, the popular member of the Beacon Vacuum Pump and Electric Co., Boston, Mass., entertained a representative of the Electrical Age last week. The company is in a flourishing condition, and as is usual, has as many orders as it can fill.

The Samson Cordage Works, Boston, Mass., are six weeks behind in their orders, and in consequence a line of machinery of the most modern design has been placed in their factory, which will aid them in keeping apace with the continual increase of business, and filling orders promptly.

Arthur A. Brigham, manufacturers of textile machinery and mill supplies, of Boston, Mass., is supplying the ropes for transmitting the power from the engine to the ground for the Third avenue and Broadway railway lines of New York city. There will be 32 ropes for each station, 2 inches in diameter. These ropes are made of cotton and very peculiar in construction, being considered the best for the above kind of service. Mr. Brigham is supplying the rope for the cable road in Baltimore, Md. N. D. W.

NEW YORK NOTES.

Office of the Electrical Age,
First Floor, World Building,
New York, May 21, 1892.

Mr. P. C. Burns, manager of the Peru Glass and Carbon Company, Peru, Ind., was in town last week.

J. Jones & Son have moved their establishment to 39 Vesey street, where they will keep a good stock of general electric supplies in addition to carrying on their manufacturing business as heretofore.

Mr. Emil Gabel, of Emil Gabel & Co., 44 Dey street, former representative of the Munson Belting Co., Chicago, now sole Eastern agents for the celebrated Monarch rivetless and Bradford dynamo leather belting, reports great demand and excellent sales for these goods.

In the warerooms of the Apparatus Supply Company,

6 Barclay street, will be found a complete line of the fine chemical and physical apparatus for colleges, schools and laboratories, consisting of balances and weights of precision, assay materials, etc., manufactured by it. Mr. G. H. Davidson is manager.

THE NASSAU ELECTRICAL CO., 112 White street, is manufacturing what they call the Electro-faradic Hair-Brush. The brush is furnished with a faradic battery placed under the cover on the back. Quite a number have been sold, and the latest fad is an electric shampoo at some of the first-class barber shops. The company has just issued a small pamphlet descriptive of its specialties.

THE DETROIT ELECTRICAL WORKS, Detroit, Mich., have opened an Eastern office at No. 18 Cortlandt street, room 311. Mr. T. W. Warfield has been appointed district manager. Another room in the same building has also been secured to display samples of their goods. Mr. Warfield is an energetic man and no doubt will build up a lucrative business for his company in a very short time.

THE BISHOP GUTTA PERCHA COMPANY, of 426–430 East 25th street, is quite busy, just now, finishing a two-inch submarine cable that will be used to illuminate a buoy on Southwest Spit in Lower New York bay, about two miles northwest of Sandy Hook. The cable when completed will be 10,500 feet long. Mr. Henry Reed takes great pleasure in showing visitors this indeed finely constructed cable.

MR. WILLIAM M. FRISBIE, president of the D. Frisbie Company, Mail and Express Building, Broadway and Fulton street, manufacturers of passenger and freight elevators, friction clutches and pulleys, and electric hoisting machinery, is personally looking after the installing of a number of direct electric elevators with C. and C. motors in Detroit, Mich., for several large concerns, among whom are D. M. Ferry & Co., Oliver Goldsmith, and others.

SOME enterprise was shown at the time of the destruction by fire of the electric-light plant at the depot of the Long Island Railroad, Long Island city, a few weeks ago. The same day of the fire the Ball Electric Light Company placed a 100 arc-light machine and a Payne engine on a box car which was side-tracked alongside of a stationary boiler, and with this plant the station was supplied with light the night after the fire. The work was done so quickly that the patrons of the road never suspected that the regular plant had been destroyed.

C. E. CHAPIN, manufacturers' agent and resident buyer, 136 Liberty street, closed orders last week for 300 30, 35 and 40 feet chestnut poles for electric light use and 1,750 Packard lamps. The advantages offered by Mr. Chapin for out-of-town electric people are becoming rapidly appreciated, as is evidenced by the large number of commissions he is constantly receiving. Among the recent orders received was one from Colorado for a marbleized slate-switch board 18x7½ feet; another from Virginia for 36,000 feet of sash cord for arc-lamp use. Other orders received were for a Remington typewriter, sheet copper, spring brass, screws, tool steel, twist drills, Babbitt metal, glue, varnish, 25,000 push button centres, 20,000 pendant bushings, magnolia metal, wire of all kinds, and many orders for the several specialties he handles as manufacturers' agent.

BUSINESS is booming with the A. B. C. Co., 18–20 Cortlandt street. An order was lately received for the equipment of ten miles of electric railway, including wires, hangers, clips, etc. The company has four salesmen out with full lines of electric light, railway, household and office supplies, and the results of their labors are very gratifying, orders having been received which keep the company going at its full capacity. A visit to the salesrooms of the company is the same as visiting an electrical exhibition. The show windows are stocked with all styles of fan motors, gongs and bells, ranging from 12 inches in diameter to the baby call-bell; test instruments of the finest quality for all kinds of electrical testing and laboratory work; electric trumpets for the use of yachts and other purposes. The company exhibits the largest Ajax switches ever made, having a capacity of 1,500 ampères at 500 volts.

THE ELEKTRON MANUFACTURING COMPANY, New York office, 89 Liberty street, Mr. Robert Watson, manager, has lately installed two of its dynamos specially designed for use in connection with gas-engines in the country residence of G. P. Morrisini, the noted banker. These dynamos, which have a capacity of 150 lights each, are provided with three bearings and a fly-wheel for the purpose of steadying the motion of the gas-engines. Mr. D. Rousseau, of the Rousseau Electrical Works, has ordered one of these dynamos for use in his shop. A. C. Manning & Co., 18 Vesey street, agents for the Otto gas engines, have installed a 50-light dynamo to be operated by one of their engines on Ninth street. The Elektron Company is also installing a plant for the Merritt Wrecking Company on one of its wrecking vessels, consisting of one 125-light dynamo, and a Huntington search-light. The dynamo is to be run by one of the new Wells Balance Engines, made by the Wells Engine Company, 91 Liberty street. Arc lamps connected with flexible cables are used for wrecking purposes.

THE ZUCKER-LEAVITT CHEMICAL COMPANY is now settled in its new building 10–14 Grand street. The offices and salesrooms occupy the main floor. The electrical departments, which occupy the upper floors, are busily engaged in turning out a large number of new Hercules dynamos and motors for light and power purposes. The company's improved American "Giant" dynamos for electroplating, electrotyping and deposition are having a big sale. The "Giant" dynamo contains all the latest improvements up to date, and is, without doubt, a very superior machine, and of the highest efficiency. It is said to be absolutely free from sparking, and there is practically no wear on the commutator or brushes, if properly cared for. Possessing these advantages, the "Giant" dynamo should certainly meet with a large sale for electroplating purposes. Owing to the great demand for these machines, it has been found necessary to treble the working force. Mr. M. Mayer, the inventor of these dynamos, has charge of the electrical department, and as every machine is inspected by him before shipment, it may be depended upon that nothing but perfect ones leave the place. W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

On the 17th inst. the New York Stock Exchange had been in existence one hundred years. The many changes which have occurred in that time, afford a subject on which no doubt some financial author will publish a volume; and from the many changes that have taken place, both in men and securities, a lesson may by learned which, if acted upon by the youth of the present institution, will surely lead to honor and wealth. The natural merging of eastern securities will be repeated in the West and South, and on practically the same lines, as the population becomes settled and more dense. While New York and its banks are the centre of American finance, the New York Stock Exchange is the particular point at which it is concentrated, and where will be found the real wealth of the nation represented and the men who in their fiduciary capacity control it. The only new innovation introduced on the occasion is the Clearing-House, which should have been adopted from twenty-five to fifty years ago. The first days clearing includes the leading active securities only, Reading, St. Paul, Northern Pacific (preferred), and Louisville & Nashville. Had the clearing by this method been delayed another month I feel sure one or two of the electrics would have been included. The Clearing-House has come to stay, and before Christmas the brokers will wonder how they managed to get along without it. The next thing wanted is a few leaders in whom the public have confidence and who will work on conservative lines. The business of the Exchange has had quite a rest for the past few years, and there is no doubt but that half a dozen solid houses, represented by known and respected men on the floor, each with his line of securities, ready with explanations of the special conditions, and dealing on the merits, not the rumored speculative qualities, would in a very short time give a tone to and wonderfully increase the business. We wish the Exchange a happy and prosperous new century.

The first grand financial battle between the two electric corporations is now on at Chicago for the lighting of the Exhibition, and the final closing of the contract will practically decide which one is to live. The first bid called for was to furnish 92,000 incandescent lamps. The Edison General Electric Company offered them at $13 per lamp, and the South Side Machine Company, a Chicago corporation, for $5.45; then diplomacy began. The Westinghouse Company came on the field expecting to carry out the contract at the lowest bid, and the result was that all were declared off and new bids asked for. This naturally brought the fight down to the Westinghouse and Edison companies alone, these companies owning or controlling all the other capable competitors. The bid at the present writing is as follows: Westinghouse, $399,000; Edison, for the alternating system, $480,694; direct system, $577,485; combination of both, $525,384. There is a great deal of bluffing going on on both sides, and it is nobody's contract yet. It is asserted that both systems will be absolutely required, and that the Westinghouse Company can only furnish the alternating system, which may lead to a fight over the patents. Every electric-light security holder in the country is interested in this contract, as it may decide the ownership of many patents, and innumerable restrainers and injunctions follow. A division of the contract is hardly possible; the fight is on and a result demanded by both.

ENLARGES ITS PLANT.

It is reported that the Wilmot & Hobbs Manufacturing Company, of Bridgeport, Conn., has purchased the property of the Bridgeport Rolling Mill Company. The original cost of these works is said to have been nearly one hundred thousand dollars, and they have been operated for a year past under lease by the Stanley Works, Alfred N. Stanton having the direct management. The plant is situated on the harbor at Cedar Creek in Bridgeport, and on a branch of the N. Y., N. H. & H. R. R., and within one block of its already extensive Cold Rolled Steel Works, thus giving the best of water and rail transportation facilities.

It is understood that the company has in view the erection of a hot-rolling mill, as the cold-rolled sheet and strip steel which it produces has to be first hot-rolled from their special billets into long strips before the cold rolling takes place, and as heretofore this has had to be done outside, the advantage in having its own rolling-mill is manifest.

It will enable the company to reduce the enormous stock of steel which it was previously compelled to carry, and in future it will keep its stock largely in the shape of billets which can be hot-rolled at a day's notice into any width and thickness which may be desired. This company has a secret and patented process for producing steel which is of such a fine quality that its business is

increasing with wonderful rapidity. It is said to be the largest producer of this kind of steel in the world, and has now an annual capacity of about twenty thousand tons of steel of all kinds.

NEW ANTI-FRICTION BABBITT METAL.

Mr. A. C. Stiles, for six years the superintendent of the brass foundry of the N. Y., N. H. & H. R. R. Co., is the inventor of a formula for the manufacture of an Anti Friction Babbitt Metal, the success of which has been phenomenal. Tried as it was for a long time on the locomotives and cars of the above-mentioned road and in competition with many other metals, it soon proved itself far superior in its ability to withstand the severest tests, and its durability in the long runs of the through Boston express trains, eliminating the long-dreaded hot-boxes which cause so many vexatious and expensive delays; for one of the best features of this metal is its ability to run *long* and *cool* without wearing out.

It has also had many tests on electric motors and rapid-running machinery of all kinds with great success.

Mr. Stiles is also the originator of a formula for bronze for heavy bearings that sustains a record on locomotive driving-wheel bearings now in use of 7,000 miles per month for 27 months, and cannot be equalled for heavy work.

All mixtures of both of these metals are made by the originator of the formula, and insure a uniform quality—always the best

The real merit of these bearings becoming more widely known, a company has been recently formed called the Stiles Smelting Co., with A. C. Stiles, pres.; Newton H. Cox, sec.; James R. Lyon, treas. New York office, 136 Liberty street. F. H. Alling, manager.

The already numerous orders would indicate the large and ever-increasing business in store for it.

P. & B. COMPOUNDS.

The merits of the celebrated P. & B. compounds manufactured by the Standard Paint Company, 2 Liberty street, New York, N. Y., are so well known as to call for but little or no comment. We will content ourselves then with a brief description of the various uses to which these compounds can be applied, particularly as regards telephone, telegraph, electric light and railway companies. The salient features of the compound are that it is a very quick dryer and a good body coating; is a complete preservative for wood, iron, brick or fabrics of all descriptions; makes surfaces thoroughly waterproof and resists the strongest alkalies and strong acids. Above all, it possesses high insulating properties. These qualities bespeak its extreme value as an important aid in all branches of electrical work. Other specialties handled by the Standard Paint Company which also enjoy an enviable reputation are P. & B. armature and field-coil varnish; P. & B. waterproof insulating tape; P. & B. giant insulating paper, and P. & B. little giant insulating paper. To Mr. Frank De Ronde, the company's representative, must be attributed the credit for the phenomenal success of the P. & B. specialties, especially the compounds. A recent order received was for 20,000 pounds of P. & B. compound, the average sale of which is 100,000 pounds per month. As an evidence of the great satisfaction which the specialties of the Standard Paint Company have given to those who have used them, we give a few of the names of several prominent firms out of the great number of testimonials received by the company. Pettingell Andrews Co., Boston, Mass.; Trustees of the New York and Brooklyn Bridge, Brooklyn, N. Y.; American Telephone and Telegraph Company, New York, N. Y.; Standard Underground Cable Company, Pittsburg, Pa.; Westinghouse Electric Manufacturing Company, Pittsburg, Pa.; The Standard Gas Light Company, New York, N. Y., and a host of others.

TRADE NOTES.

Recent shipments made by the Ball Engine Company, Erie, Pa., include the following: Maryland Steel Co., Sparrows Point, Md., one 50 H. P. simple engine; Wilmington Street Railway Co., Wilmington, N. C., two 130 H. P. simple engines and complete steam-plant; J. C. Hubinger Co., Keokuk, Iowa, one 300 H. P. cross-compound engine and condenser; J. W. Parker & Co., Philadelphia, Pa., one 50 H. P. simple engine; Chesapeake Light and Power Co., Hampton, Va., two 150 H. P. tandem-compound engines and transmitting machinery; Moundsville Electrical Co., Moundsville, W. Va., one 130 H. P. simple engine; Niagara Falls Street Railway Co., Niagara Falls, N. Y, two 130 H. P. simple engines and steam-plant complete; Electric Light Co., Elizabeth, N. C., one 100 H. P. simple engine; Philadelphia House of Refuge, Philadelphia, Pa., two 50 H. P. and one 100 H. P. simple engines; Edison General Electric Co., State House, Trenton, N. J., one 35 H. P. simple engine; Schuylkill Electric Railway Co., Pottsville, Pa., one 250 H. P. simple engine; Electric Light Co., Doylestown, Pa., one 130 H. P. simple engine; Somerville Hotel, St. Clair, Mich., one 35 H. P. simple engine and steam-plant; Freeport Gas and Electric Light Co., Freeport, Ill., one 130 H. P. simple engine; Warrenton Electric Light Co., Warrenton, Mo., one 50 H. P. simple engine; Pittsburg Iron and Steel Engr. Co., New Castle, Pa., one 50 H. P. and one 80 H. P. simple engine.

Cicerco Light, Heat and Power Company, Cicero, Ill., was incorporated May 17, with a capital stock of $150,000. Incorporators: E. L. Jeffrey, H. P. Lucas, H. P. Brauns.

The Electrical Age's Illustrated Patent Record.

ELECTRIC POWER IN FARM WORK.

Enterprising proprietors of large farms would do well to look into the subject of electric power to perform their farm work. Some interesting experiments have been made in this direction by the State Agricultural and Mechanical College of Alabama, at Auburn, Ala., and the electric plant is now running successfully. The power is put to various uses, such as ginning, pressing cotton, cutting up feed-stuff, thrashing grain, etc. An account of this plant, which is the first of its kind ever established, will be found on another page.

Who dares to say that even the horse on the farm will not be displaced by its more powerful and efficient rival, the electric motor?

THOUGHT-WAVES.

In a lecture delivered by Prof. E. J. Houston on March 1 last before the electrical section of the Franklin Institute, Philadelphia, that gentleman in an extremely interesting manner attempted to correlate to some extent the phenomena of thought with grosser physical phenomena. On the assumption that thought is accompanied by molecular or atomic vibrations of that part of the brain called the cerebrum, he proposes a hypothesis to account for mesmerism, hypnotism and other cognate phenomena.

In support of this hypothesis he cites his own experience, which can be corroborated by many others, that in taking charge of a class as a teacher where a number of bright students are undergoing examination, he experiences great mental exhaustion. He suggests that it is possibly caused by the rapid dissipation of energy by the cerebral radiations being absorbed by the receptive brains of the students, in a manner analogous to the well-known fact that when sympathetic vibrations are being excited by a sounding tuning-fork in a body near it there is greater rapidity of expenditure of energy of the fork's motion than when it was not exciting such waves.

For the benefit of those of our readers who are interested in such matters we publish Prof. Houston's lecture in full elsewhere in this issue.

HEROIC TREATMENT NEEDED.

The success of the electrical execution on May 16 last had the effect of causing a very noticeable change in sentiment among the daily papers regarding that mode of executing criminals. Those papers which had previously violently attacked the system were remarkably mild in their comments this last time, which fact can have but one significance, and that is that electrical executions having been rendered successful of accomplishment, may now as well be regarded as having come to stay.

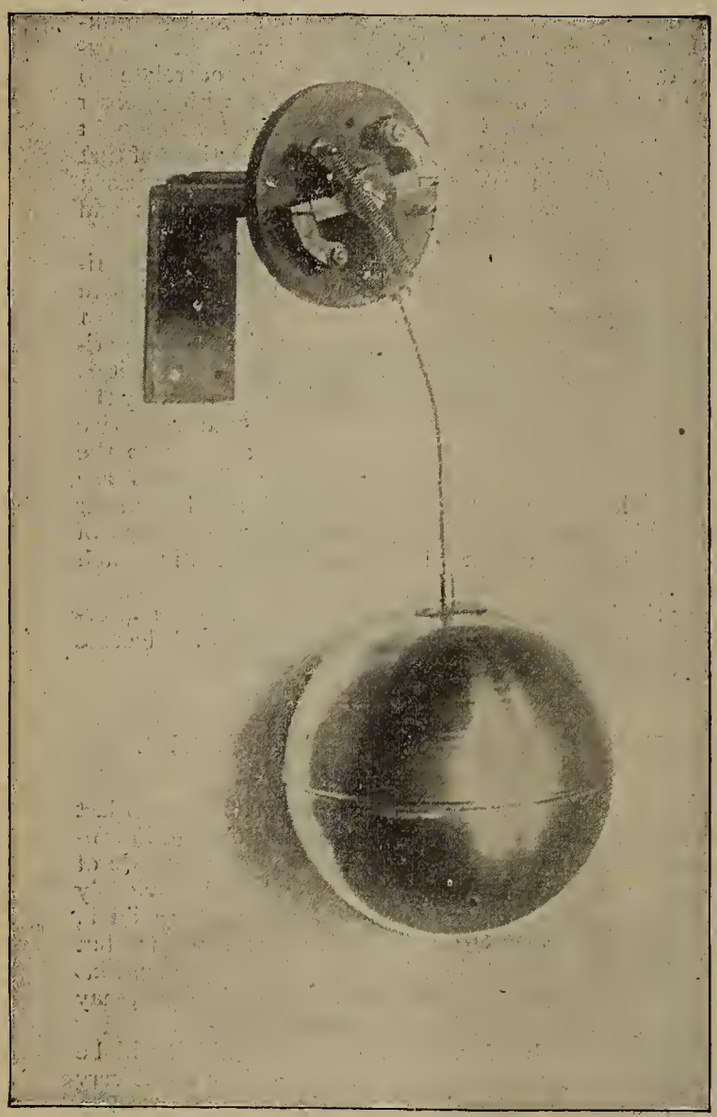
In an article by Mr. J. M. Batchelor, which will be found on another page, that gentleman gives some very good reasons why electricians should unite in an effort to discourage such use of electricity. Everything connected with executions, he argues, is repugnant, and "can electricians afford to encourage such a state of mind with reference to electricity?" he asks. Millions of dollars have been invested in electrical enterprises of various sorts, and in order to protect these vast interests, electricians, he thinks, should combine and discourage the use of electricity for the purposes of executing criminals. They should foster a public appreciation of the great benefits derived from the use of this wonderful force instead of remaining indifferent to the fact that the public is learning by these electrical executions to look upon electricity as some horrible thing, to be shunned.

The suggestions Mr. Batchelor makes should receive the careful attention of all electrical people. Now is the time to act, if any action is to be taken in the matter.

ELECTRIC PUMP SWITCH.

The Edison General Electric Company has just designed and put on the market an automatic switch for use with electrically operated pumps employed in filling water tanks.

This is a simple single-pole switch with ebonite base, mounted upon an angle piece and operated by a ball-float. As the water rises in the tank, the ball-float rises with it until it reaches a point where the switch is opened by the operation of a spring. The motor consequently stops and no more water is pumped into the tank. As the water is drawn off, the ball falls with the water level, the switch is closed, the pump starts and continues



AUTOMATIC PUMP SWITCH.

working until the tank is again filled to the desired point. The ball and all parts coming in contact with the water are insulated from the switch connections and line terminals, so that no part of the circuit can be grounded through the tank. The switch may be screwed to a wall or partition by the side of the tank, or, if convenient, may be placed within and screwed directly to one side of the tank.

The particular switch shown in the illustration is fitted with an arm 7 in. long and a ball 7½ in. in diameter, and will operate with a variation of 6 in. in the water level. It requires a cubic space of 11½ x 18½ x 20 in., and can be used in any ordinary tank capable of holding more than thirty gallons.

Switches of this type can be used in connection with motors up to 2 K. W. capacity, and can be changed to operate upon any reasonable change in water level.

A GRAVE SUBJECT FOR SERIOUS CONSIDERATION.

BY JOHN M. BATCHELOR.

PUBLIC hangmen are shunned by the community; the profession they are engaged in is not generally deemed sufficiently respectable to permit intimate social relations with them. The scaffold and the guillotine are likewise objects of horror and repugnance to all well-balanced people; as is the case with the public executioner's axe and block and all other similar paraphernalia exclusively devoted to carrying out the mandates of the law in the shape of public executions. Now, in consequence of this universal feeling, the question seriously arises: can electricians as a body afford to encourage or in any way abet the use of electricity which this State has made lawful for the execution of criminals? If such encouragement is given, and other States imitate New York, would not the natural tendency be to create a popular feeling of horror or, at best, disgust at a means which is associated with one of the most painful so-called necessities of the times?

This issue is now in its infancy, and the number of electrical executions are comparatively few, therefore any possible prejudice has not yet had an opportunity for serious development; at the same time let any one to-day ask a lady what she thinks of electricity being used for executing criminals, and she will undoubtedly reply that it gives her a nervous horror to thinkof it, and she strongly desires to avoid the subject. Now, as it affects these ladies, it will in all likelihood sooner or later affect gentlemen and all honestly-disposed people, whether they endorse capital punishment or not. Now again we ask, can electricians afford to encourage any such state of mind? Is the electrical business not dependent upon the pleasure one receives from the use of the incandescent light, the arc light, or the manifold uses to which electricity is being put in the household? Likewise, is not the success and prosperity of electrical development for power purposes—such as its use to propel street cars and obtain passengers therefor, as well as for the thousand and one purposes to which the street supply is devoted in the public's behalf—solely, or at least largely, dependent upon its popularity, as well as its money-saving attributes?

These questions might have had less point previous to the execution on May 16; becau e, before that execution took place the press was all but universal in the condemnation of the use of electricity for such a purpose, in consequence of a supposed torture associated with it, and the indications were that sooner or later the law would be repealed and electrical executions be abolished. But now a change in the sentiment of the daily press is noticeable; they all, if they make any comments on the subject, class this last execution in the light of a physiological success, using such an expression from the physician's standpoint. Herein, in this new attitude, is the danger threatening future electrical development. Let this notion of "success" become prevalent in other States, and the law of this State may receive general imitation. The effect of so united an action may be easily conceived; for ladies would be likely, in looking at the incandescent lights put into their homes, to consider them as being objects suggesting fearful suffering; as objects to be shunned, like the executioner's apparatus; and in time the remainder of the community would more or less be affected in a like manner.

It must not be forgotten that the popular use of electricity is yet in its infancy, and that the struggle to intro-

duce its manifold uses is hard enough at best, in consequence of the newness of the idea. That particular remembered, and the enormous amount of money already invested in allied industries, as well as the sums in contemplation which capitalists will be called upon to meet, should be a sufficient incentive to all electricians to "sit down" upon and in every way discourage the use of electricity in any such injurious manner. The feeling induced by rare accidents is already sufficient to cause insurmountable obstacles against the general use of electricity; as is well known in the case of legislative consent to the extension of business in needed departments. Then shall this legislative obstruction be made worse through any additional incitation on the part of the public, because in the minds of those unable to make proper distinctions it is looked upon as an object of public torture? It is not to the point that experts concede that there can be no torture; for, so long as the class referred to think there is, that thought is what will, in all likelihood, modify future legislation in conformity with it.

It is to be taken for granted that many electrical mechanicians may look upon this argument as too sentimental for their consideration; as their attention is so wrapped up in the details of their work, the state of mind customers may get into over public executions becomes to them a matter of indifference. But all electrical workers must remember that the consumer of electrical products reasons from another standpoint. He is more interested in the utility of electricity in its application to the circumstances where it is to be used; and he well knows that in numerous instances any existing prejudice, whether ill or well founded, is calculated to injure or lessen consumption. Few householders would put electricity in their houses if the women part of the family were afraid of it, or manifested repugnance to its use. Therefore, conceding the necessity of stopping any further executions of the described kind, the next point is, how to remedy the matter. A good answer to this query at this moment is not at hand, except that it might be advisable to unite on the subject and determine to bring about the desired end. That determination will sooner or later develop its own fruit; as the saying is, "where there is a will there is a way."

AUTOMATIC CUT-OFF ENGINES.

The Ball Engine Company, of Erie, Pa., was fortunate in recently securing the services of Mr. Frank R. Chinnock, well known in the electrical trade as a wide-awake and successful young business man, as its selling agent for Long Island, New York and New Jersey, and for the export trade; and it is reasonable to assume that the company will experience a boom in business in consequence of having its interests confided to the hands of so qualified a person as Mr. Chinnock.

Mr. Chinnock is quite a young man, being born in Harlem, N. Y., September 21, 1860. His first business venture was as a telegraph operator on the Intercolonial Railway, Canada. This was in 1881–83, and in the latter year Mr. Chinnock became chief inspector for the Metropolitan Telegraph and Telephone Company of New York. He remained in the telephone service in various capacities until 1887, when he was appointed state agent for the United Edison Manufacturing Company, with which concern (known afterwards as the Edison General Electric Company) he remained until his appointment to his present position.

Mr. Chinnock has taken hold of his new duties in a manner that indicates success both for himself and the company he represents.

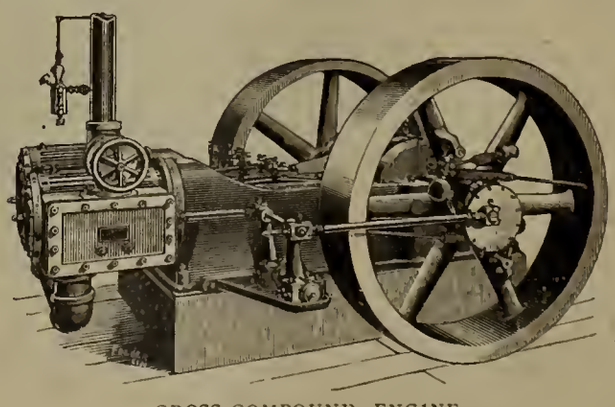
He has engaged Mr. J. S. Du Vall, formerly with the Edison Electric Illuminating Co., as assistant, to have charge of his office, etc.

The engines handled by Mr. Chinnock are well known in the electric light and railway service for their high efficiency. While they meet the exacting duties required of them in these services the company is not content, but is anxious to make them still more perfect, and is constantly making important improvements with this end in view.

The Ball Engine Company, of Erie, Pa., makes four classes of engines, namely: simple, tandem-compound, cross-compound and triple-expansion. Some of the feat-

FRANK R. CHINNOCK.

ures of great importance possessed by these celebrated engines are simplicity of construction and compactness. They are very solid and strong, and their bearings and wearing surfaces are unusually large. For smooth and quiet running they are unsurpassed; and they are economical in operation, durable, and have good regulation. Every engine is thoroughly inspected before it leaves the works, and no expense or efforts are spared to improve the engines wherever it is seen that improvements can be made. Such is the record of the Ball engine, of Erie, Pa. The simple engine is designed for heavy duty and long, continuous runs. One of the wheels contains the automatic cut-off regulator or governor, the sensitiveness of



CROSS-COMPOUND ENGINE.

which insures great regularity in speed. The frame is rigid, and the varying strains and direct thrust of the moving parts are so balanced that there is no vibration or deflection when the engine is in operation. On long runs it shows no signs of distress when subjected to heavy, continuous loading, and has staying qualities that few engines possess.

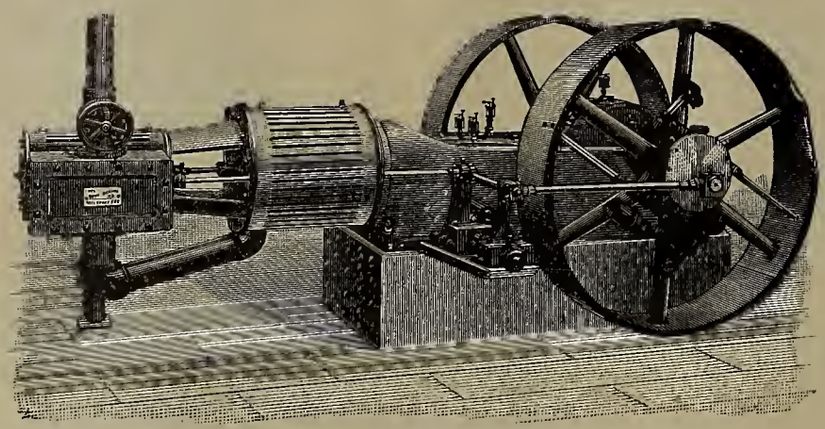
The advantages of the compound condensing engine are well known to all engineers. It saves fuel and soon pays for its additional cost in this manner; even if condensing water is not available, the saving is very consider-

able and well worth the consideration of steam users who desire high efficiency.

In the tandem-compound engine the valve operating the mechanism allows each valve to be driven in the most simple and direct manner, and the many parts are readily accessible. Among recent improvements in the engine is the placing of a hand-hole in one side of the low-pressure cylinder, rendering it an easy matter to examine the interior of the cylinder, the condition of the packing-rings, and to fasten the piston-head to its rod. This improvement meets the objection sometimes raised against this class of engines, that the examination of the low-pressure cylinder cannot be easily made.

Three years' experience with these engines has proved that they excel in these points: economy of fuel, close regulation of speed under all changes of load and boiler pressure, ample strength, superior quality of material and workmanship, extreme simplicity, and reliability under all conditions. All the engines of this type built and put into operation by this company are giving excellent service.

Two years ago this company brought out its first cross-compound engine, which was designed for and put into the new station of the Edison Electric Illuminating Co., Brooklyn, N. Y. It was designed for heavy work, and all the parts were made unusually large and massive.



TANDEM COMPOUND ENGINE.

The crank-shafts of these engines, which are made of the best open-hearth steel forgings, are set opposite each other, one counteracting the effect of the other, and in this way obtaining a perfectly balanced engine, capable of being run at a rapid speed with quietness and ease and without heating. The valves provide for quick admission of steam and insure against all possible leakages.

The engine as a whole is a most perfect machine, and is claimed to excel all other engines of this type in the matter of simplicity, durability, strength and economy. The company builds a special cross-compound engine for electric railway work, and has a number of them in successful operation in this service. Among the large electric railroad companies using this class of engine are the Rochester Street Railway Company, Rochester, N. Y., and the Buffalo Street Railway Company, Buffalo, N. Y. The results attained both in economy and the performance of these engines under very trying conditions have, it is said, been entirely satisfactory.

It is claimed for this cross-compound engine that it will give more satisfactory results and produce power at less cost under the conditions of variable load generally encountered in service than any other type of slow-speed engine. The engine can be operated at its most economical point of cut-off and the governor gives closer regulation under changes of speed and boiler pressure than is possible with a slow-speed engine.

In addition to these engines the company makes a double-condensing, triple-expansion, high-speed engine, which is believed to be the first engine of this class ever built and adapted to street-railway work. The performance of these engines has been highly satisfactory, and they give the greatest economy. Their construction is strong and massive, and at the present time are made of 300, 400 and 500 H. P.

The favor with which Ball engines, of Erie, Pa., are regarded may be judged from the fact that at the present time over 850 electric plants are equipped with these engines, besides those used in street-railway work. Some of the largest stations in the country use them, and the utmost satisfaction is given in every instance.

We give below a list of the cities where Ball engines of Erie, Pa., are used for the generation of street-railway currents:

Buffalo, Rochester, Amsterdam (two roads) and Binghamton, N. Y.; Pottsville, Reading, Allentown, Lebanon, Erie, Johnstown, Pittsburg (two roads), Du Bois, Braddock, Pa.; Cincinnati (two roads), Cleveland (two roads), Akron, Canal Dover, Ohio; Detroit, Mich.; Lynchburg, Richmond, Va.; Salem, Milford, Brockton, Mass.; Newark, N. J.; Portland, Oregon (two roads); Port Townsend, Seattle and Corvallis, Wash.; Rockford, Elgin, Ill.; St. Louis, Kansas City, Mo.; Beatrice, Norfolk, Neb.; Louisville, Paducah, Ky.; Baltimore, Md.; Great Falls, Mont.; Melbourne, Aus.; Denver, Col.; Washington, D. C. (two roads); Austin, New Birmingham, Texas; Athens, Macon, Ga.; Vancouver, B. C.; Windsor, Ont.

CONTRACT FOR THE WESTINGHOUSE COMPANY.

A despatch from Chicago, Ill., states that the contract for the incandescent lighting of the World's Fair has been awarded to the Westinghouse Electric Manufacturing Company, Pittsburg, Pa., by the committee on grounds and buildings; but that, however, a bond of $1,000,000 was required as an evidence that the Westinghouse Company would fulfil its contract. The company has until June 10 to accept the terms. President Westinghouse will consider the matter before accepting, as he thinks the demand for a $1,000,000 guarantee very unjust and entirely uncalled for.

SUBWAY COMMISSIONERS APPOINTED.

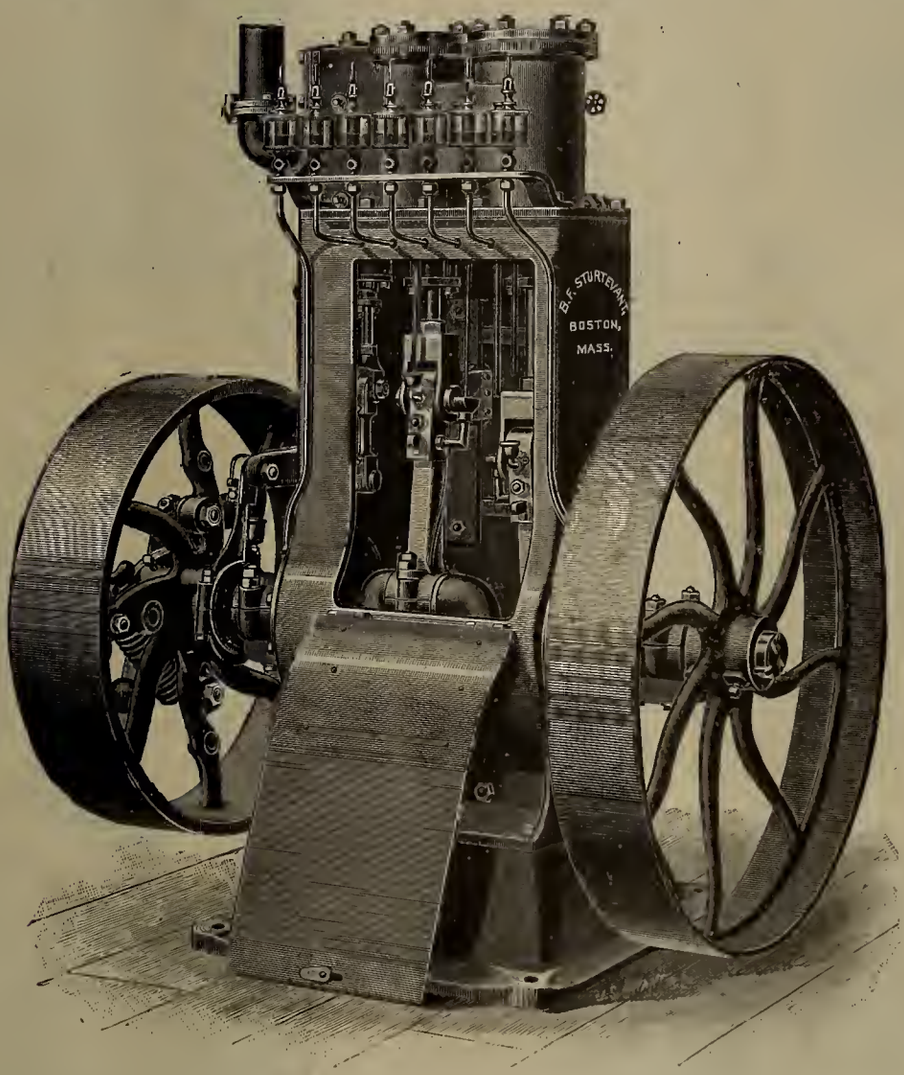
Mr. Frederick R. Lee and George W. Plympton were appointed subway commissioners by Mayor Boody, of Brooklyn, at an annual salary of $3,000. Their terms will expire on Nov. 1, 1896. The custody of the subways will devolve upon the mayor and city works commissioner.

THE STURTEVANT AUTOMATIC DOUBLE ENCLOSED ENGINE.*

We present in the accompanying illustration a unique design in the way of upright engines suitable for general work, but specially designed for fan propulsion and electric-light work. The bed upon which the engine rests is well spread, very heavy, and is so designed as to give the engine a substantial foundation. The body of the engine is built in two parts, the upper part consisting of the cylinder alone, which may be readily removed for re-oiling. It will be seen that this makes a very convenient arrangement in case it is necessary to repair either cylinders or valve-seat.

The valve is of the piston type and supplies both cylinders by a special arrangement of ports. The design assures continuous running in dusty atmospheres, where any other engine would rapidly become worn by the dust which would unavoidably enter all bearings.

As the cylinders are placed side by side in the same casting, the cranks set opposite at an angle of 180 degrees, and steam admitted simultaneously at the top of one cylinder and the bottom of the other, the reciprocating parts are balanced in their movements, and high speed is made possible. The cylinders are of large diameter as compared with the stroke, so that a large amount of power may be developed at high rotative, but moderate piston speed. By the omission of the band-wheel and the bed beneath the engine, it may readily be placed upon entire engine can be easily and tightly closed, preventing a frame casting and connected direct to the shaft of a moderate-speed dynamo. In fact, although it has been



STURTEVANT ENCLOSED AUTOMATIC ENGINE.

of the cross-head is readily seen, it being of the slipper-guide type, running upon a steel slide-bar attached to the back of the frame. The connecting-rod is very substantial, being of the marine type with large crank-pin bearings. The crank itself is carefully counterbalanced and all moving parts are made as light as is consistent with the heavy duty which is placed upon the engine.

The regulation of the engine is secured by means of a shaft governor acting through a single eccentric to change cut-off from zero to ⅞ stroke.

The oiling has had special attention, and the oilers are all collected together and connected with the various bearings by tubes. By means of the doors shown, the the admission of dust, or the objectionable throwing of oil upon the running parts.

This is a very prominent feature of the engine, as it but recently introduced, it is being very generally employed for this particular purpose, and its record as a continuous running, high-speed engine is warranting its introduction.

* B. F. Sturtevant, 34 Oliver st., Boston.

IMMENSE CAR-SHOPS.

The Brooklyn City Railroad Co., Brooklyn, N. Y., is now at work on plans for a new car-shop, which will be a gigantic one. It will occupy one entire square, and will be bounded by 58th and 59th streets and Second and Third avenues. The size of the shop will be 200 by 700 feet, three stories high and built of brick. It will accommodate nearly 1,000 cars each 24 feet long. It is expected that the shop will be ready for occupancy about October 1 next. Its cost will be $250,000, exclusive of the land, which cost $80,000.

MAGNETO-ELECTRIC MANUFACTURING COMPANY.

Mr. C. J. Francis was born in Owen Sound, Ontario, Canada, on January 12, 1860, where he attended the common and high schools until 18 years of age, at the same time taking a special course in mathematics and physics under Prof. De La Matter. While still attending the high school in 1877, he constructed and put in operation between the post-office and the Dominion Telegraph office the first pair of telephones in that section of Canada.

C. J. FRANCIS.

Mr. Francis received his first practical experience in mechanics with Farrar & Trefts, engine builders, in Buffalo, N.Y., in whose shops he served about two years, after which he had a varied experience, working in different electrical factories and experimental shops in Philadelphia and New York until 1884, when, in connection with Mr. Geo. B. Wilkes, he started the firm of Wilkes & Francis, for the purpose of manufacturing electro-surgical and dental apparatus. In 1887 Mr. Francis sold out his interest in the firm to Mr. Wilkes, and then engaged in experiments in fac-simile telegraphy for the Auto-Telegraph Company, a subject in which he has been greatly interested for 13 or 14 years, and on which he is still working. Mr. Francis says that he already has it in a very advanced state, but will not put it out until it has been brought to such a degree of perfection that it can be operated by an office boy, or person without any special training. In September, 1888, Mr. Francis entered the employ of the Echo Telephone Company as electrician, and perfected the telephones, magnetos and most of the apparatus now controlled by that company. About a year after the company had started in the manufacturing business Mr. Francis was made superintendent, and when the Magneto-Electric Manufacturing Company succeeded to the manufacturing business of the Echo Company he was retained in the same position by the new company. The company is now doing a general manufacturing business, electrical and otherwise. Its factory is equipped with the latest improved machinery and tools, including automatic gear-cutters, boring-machines, screw-machines, heating and tempering furnaces, etc., etc. The company has contracts on hand embracing quite a variety of work, including ampèremeters, combination locks, fire-alarm boxes and apparatus, and all descriptions of magneto-bells, the manufacture of which is the company's principal business.

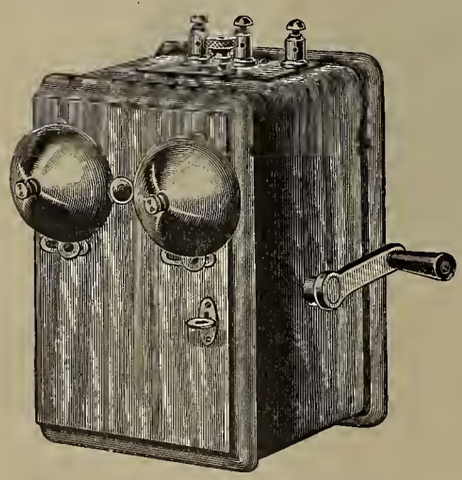


FIG. 1.

Figs. 1 and 2 represent the ordinary magneto-bell closed and open. It will be noticed that the permanent magnets in the generator are made of circular form, the poles being set in steps on the pole-pieces, thus concentrating the lines of force almost entirely through the armature, and making a very neat and compact arrangement. There is a shunt around the generator which is operated automatically by the action of turning the crank. All parts of the machine are made from accurate tools and jigs, and are interchangeable; they are made in six grades, to ring through from 1,000 to 35,000 ohms.

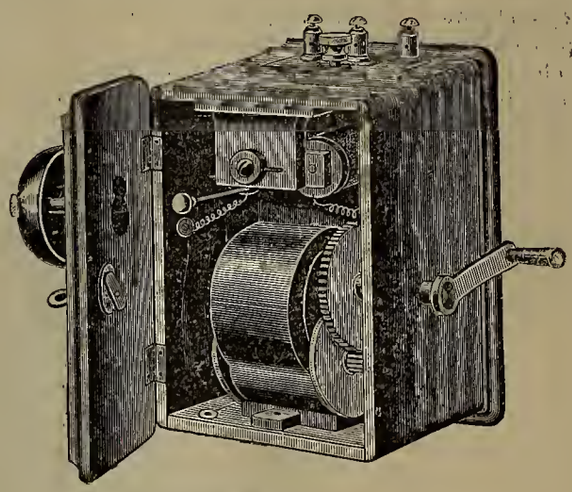

FIG. 2.

Figs. 3 and 4 show the testing-bell closed and open. It is practically the same as the ordinary bell, with the exception that the gongs are inside of the box, which is provided with a strap for carrying, and has two large binding-posts which take from the smallest wire up to quarter-of-an-inch, also two smaller ones for looping in a telephone when required, so that a lineman or inspector may talk with the central station; they are made to ring through from 15,000 to 50,000 ohms or more on special order.

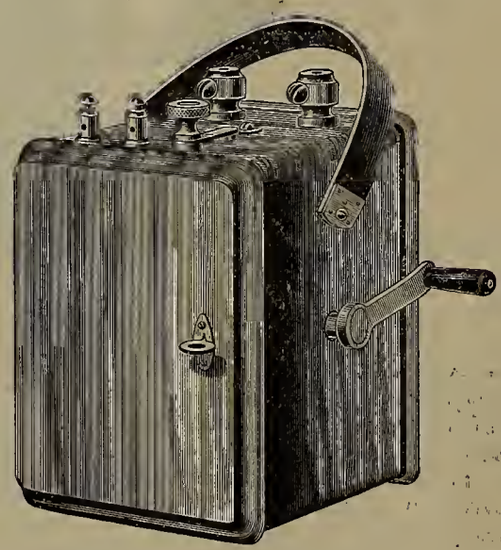

FIG. 3

Fig. 5 shows the extension bell which is suitable to use

in connection with a 1,000 or 3,000 ohm bell, and "standard" for use with the high grades of magnets.

One or more of these bells can be connected with a telephone and placed in different parts of a building so as to ring simultaneously with the telephone, or they may

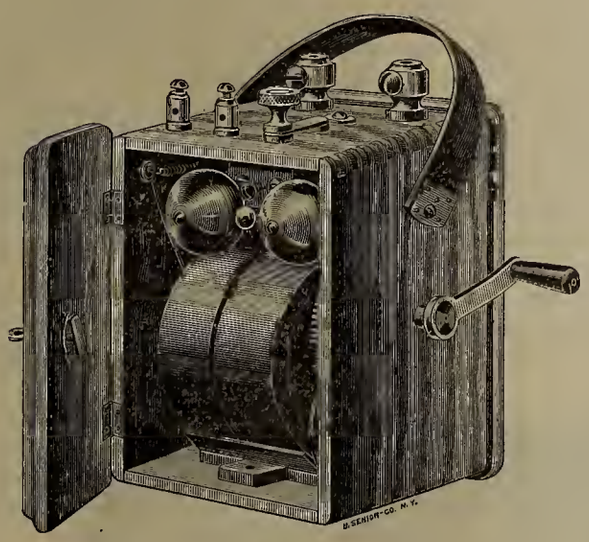

FIG. 4.

be placed in different parts of a factory and connected with a magneto-bell in the office.

The office and factory of the company are located at No. 520 W. 35th street, New York City; downtown office 15 Cortlandt street.

THE "INSULATING SADDLE STAPLE."

Since the introduction of electric lighting the wire staple has become an object of great consideration and solicitude. Prior to this time it was an insignificant but quite indispensable article, and probably would never have played an important part in the electrical field had electric lighting not appeared upon the scene.

The ordinary metal staple has been the cause of so much trouble on wires that inventors have given their attention to the matter, with a view to devising some way to overcome these difficulties.

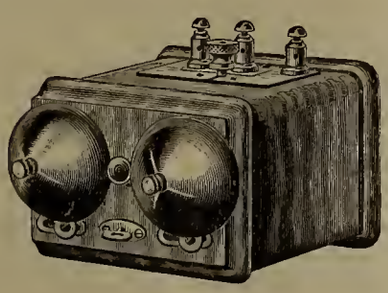

FIG. 5.

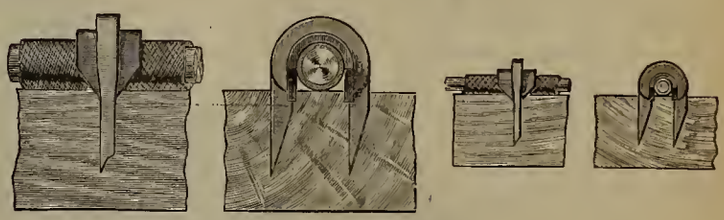
Metal staples are objectionable because they cut the insulation of wires in the operation of driving them; this, of course, results in leakage of current, either from one wire to the other or to the ground. Besides this leakage a weak spot is developed on the wires where the insulation is damaged. Moisture is enabled to penetrate, and eventually causes a corrosion of the copper wire. Frequently the conductor itself is broken by the pressure of the staple upon it, in the operation of driving the staple, and trouble of this sort causes considerable annoyance and delay because it frequently escapes detection at the time.

The board of underwriters does not permit the use of metal staples for electric lighting and power work on account of the objections named.

The "Insulating Saddle Staple," a description and illustration of which are given herewith, was designed to overcome the objections met with in the use of the ordinary metal staple, and from the fact that the board of underwriters approves of it and requires its use in wiring buildings for electric light and power, is evidence that it meets all of the requirements of a perfect, safe and reliable staple.

By reference to the illustration it will be seen that the staple has a "saddle," which is made of vulcanized fibre and firmly attached to the staple. The "saddle" is treated with a moisture-repelling compound which also coats the metal in such a way as to prevent corrosion and the leakage which would ordinarily take place where the old form of metal staple is used. These staples do not abrade the insulation on the wires, drive equally well in hard and soft woods, and they are neater and stronger than cleats. They are valuable for electric light and power conductors, telephone, district messenger, burglar-alarm, annunciator or telegraph wires, especially where wires run in moist places.



INSULATING SADDLE STAPLE.

The Vulcanized Fibre Company, 14 Dey street, New York City, has the exclusive agency for the sale of "Insulating Saddle Staples" throughout the world, and has perfected machinery whereby large quantities of these staples can be produced at greatly reduced cost. The company is now prepared to supply the trade with these goods in any quantities to suit.

POWERFUL TURBINES FOR NIAGARA.

The immense new pulp and paper plant of the Cliff Paper Co., at Niagara Falls, is to be supplied with late new designs of the horizontal shaft Double Discharge James Leffel Wheels, built by James Leffel & Co., Springfield, O. The contract for this work was signed by the Cliff Paper Co. and James Leffel & Co. on May 13, after the Cliff Co. had made a full and careful investigation of the merits of various wheels presented during the past year for its consideration. Each of these turbines is to be eleven hundred horse-power capacity, and built essentially upon the plan of style No. 23, illustrated in the pamphlet of James Leffel & Co. These wheels will connect directly to the pulp-grinder shafts at each end of the wheel shafts, without belts or gearing.

This water-wheel company has celebrated its thirtieth year of continuous business in this line of work. It has added many improvements to its James Leffel Wheel in the past two years, and has designed a large number of new styles, incorporating in them the best ideas of its large experience. The manufacturing plant of this company has also been recently greatly extended, and various pieces of new, improved and heavy machinery added; all adapted to the heavy water-wheel work it is now manufacturing. The company shipped some time since one James Leffel wheel and casing weighing forty-five tons; also filled one order for nineteen large wheels for one pulp and paper company.

THE COMPLETE COMBUSTION BOILER.

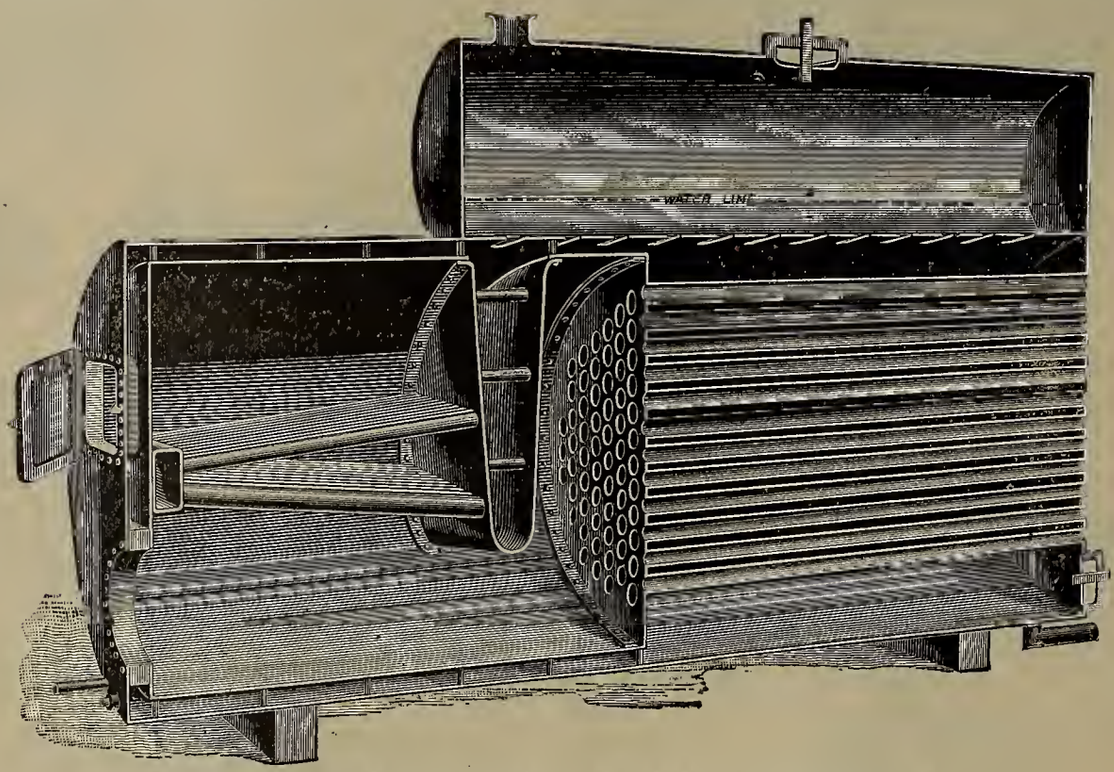
The Central Complete Combustion Manufacturing Company—Calab R. Ayer, president; Melville Eggleston, vice-president; and H. Durant Cheever, secretary and treasurer—with headquarters at 13 Park row, New York city, has put upon the market a new style steam-boiler, which, from its radical departure from old and accepted forms and methods of constructing and operating steam generators, will be studied with interest by steam users generally.

It is known as the complete combustion boiler, and is of the down-draught pattern, and everything points to a brilliant success for it.

This boiler is of the horizontal cylinder, multitubular type, differing principally in the furnace. At the back of the grate is a hanging water-leg of steel plates, riveted to the crown sheet and side wall of the fire-box. The grate is formed of water-tubes entering the front side of this water-leg at a moderate inclination from the horizontal, tan, shavings or any other kind of fuel which may be burned in any steam-boiler, and is absolutely smokeless, thus insuring a great saving in fuel by its use.

At a test of a twenty-five H. P. complete combustion boiler at Bishop Bros., East Somerville, Mass., the evaporation from and at 212 degrees was found to be equivalent to 11.53 lbs. of water for one pound of combustible. Another test of a seventy-five H. P. boiler at Smith & Carleton's Iron Works, South Boston, showed equivalent evaporation of 12.21 lbs. to one pound of combustible, the water evaporated from and at 212 degrees per square foot of heating surface per hour, 2.85 lbs. Other tests showed like results, and in all the horse-power developed was considerably in excess of that at which the boiler was rated.

A recent test of this boiler under ordinary working conditions, made by Peter Backus & Sons, engineers, at the factory of Messrs. McGuire & Clark, 68 Madison street,



LONGITUDINAL SECTIONAL VIEW, COMPLETE COMBUSTION BOILER.

and at the front of the furnace entering a gun-metal box just below the furnace doors. Return tubes, also inclined, extend from this box back to the water-leg and insure circulation of water through the shell and water-leg through the grate tubes. The grate is one of the most important features of the boiler. It is constructed of the best lap-welded, seamless tubing, made to order. The tubes are arranged in zigzag or alternating form, the wide spaces between the upper series of pipes being divided by a lower series, so that a fine mesh is secured without loss of air-space or impediment to draught. Ample and practical provision is made for expansion, and this grate has never been known to leak. As an auxiliary in generating steam the grate takes first rank. The space below the grate, ordinarily the ash-pit, is the combustion chamber; the air for combustion being admitted through the fire-box above the grate and drawn down through the grate-bars by the chimney draught, where it becomes highly heated during its combination with the hot gases of the coal. As the combustion chamber is completely surrounded by the water-heating surfaces of the boiler, and as the heat after leaving the combustion chamber passes through the tubes, which form a large absorbing area, directly to the uptake chimney, it will be seen that the boiler should have a high efficiency. No brickwork is required in setting, which is another good feature.

This boiler can burn either hard or soft coal, wood, dry

New York, gave even better results than those we have already mentioned.

NEW BOOKS.

ELECTRIC RAILWAY ENGINEERING. By Edward Trevert. 186 pages, profusely illustrated. Bubier Publishing Company, Lynn, Mass. Price, $2.

In this work it has been the author's aim to describe in as simple a manner as possible the application of electricity to street-railway service as a means of motive-power, and the mechanism employed in connection therewith. He has admirably succeeded in his endeavor, and the book will be found of great value not only by the electrical student, but also by the public generally. It contains fifteen chapters in the following order: The power-house and its apparatus; Railway generators; Line construction; Electric railway motors; Rheostats; Electric heaters; Trolleys; Locomotives for heavy traction; Trucks; Car wiring; The storage-battery system; Some illustrative roads; Some general remarks for motormen; Some general remarks for stationmen, and Conclusion. There are five appendices, which treat of: The chronological history of the electric railway; Fenders; Methods of controlling street-car motors; Rapid transit, and Electric street railways as investments.

CEREBRAL RADIATION.*

BY PROF. EDWIN J. HOUSTON.

I HAVE thought it possible that it might interest you to consider some rather wild speculations in which I have indulged for a number of years past, but which I have heretofore refrained from publishing. In these speculations, to which I was first led by a suggestion from a friend, I have endeavored to correlate, to some extent, the phenomena of thought with grosser physical phenomena. Although the suggestions I have to offer as a basis for a hypothesis of the mechanism of cerebration are confessedly incomplete, and perhaps improbable, yet I have concluded to place them on record as of possible interest to the scientific world.

I am, of course, aware of the fact that the psychical operations of the brain are by no means understood. It is generally believed, however, that the seat of psychical activity is the cerebrum. The manner in which the brain acts to produce, record and reproduce thought is unknown, and will probably remain unknown.

On the single assumption, however, that cerebration or thought, whatever may be its exact mechanism, is accompanied by molecular or atomic vibrations of the gray or other matter of that part of the brain called the cerebrum, I would propose the following hypothesis to account for telepathy, mesmerism, thought transference, hypnotism and other cognate phenomena.

Postulating the existence of the universal or luminiferous ether, which is now generally accepted in scientific circles, and bearing in mind the fact that this ether passes through even the densest matter as easily as water through a sieve, it follows that the brain atoms or molecules that are here assumed as the cause of cerebration are completely surrounded by the ether. Now since the ether is a highly elastic, easily movable medium, it would follow that thought or cerebration, if attended by vibrations, must necessarily develop in the ether wave-motions, which have the brain atoms or molecules for their centres. In other words, the act of thought or cerebration necessitates an expenditure of energy, because it necessitates the setting in motion of these assumed atomic or molecular brain particles.

The exact nature of the motions that are assumed to attend an active condition of the brain must necessarily remain unknown as long as we are ignorant of the exact nature of the mechanism that is moved. But if an active brain evolves thought because something is set in motion, it of course follows that a brain absolutely free from producing thought must be at rest so far as that kind of motion is concerned. An absolute freedom from thought in a healthy brain is most probably a condition that seldom exists; relative rest, however, must be quite common.

That the brain cells of the gray or other matter involved in the production of thought can be caused to assume certain groupings or relations towards one another would appear to follow from the ease with which that curious function of the brain called memory permits it to readily recall past peculiarities in the to-and-fro motions. By continually repeating certain trains of thought, as in study or repeated observations, the peculiar motions required to produce such thought are probably given a set or tendency to form more or less permanent groupings. When, therefore, the brain is moved or played upon, so to speak, these motions recur and certain memories are awakened.

How may these motions be produced? The answer would certainly appear to be both from within and without. It is, perhaps, possible that the flow of blood to an active brain, which as is well known attends all active cerebration, is not only for the purpose of nourishing and rebuilding the organ, but also for affording the purely mechanical force, that needs but to touch this marvellously attuned organ to awaken the thoughts already impressed thereon, or to sit in judgment on new combinations never before presented to it.

I will suggest an explanation later on as to how these impressions may possibly be excited from without.

Whatever be the origin of these vibrations, or however excited, energy is required to be expended in producing them, and, as the brain-worker will readily acknowledge, the expenditure of such energy often calls for an enormous expenditure of nervous force.

Cerebral energy, or energy thus expended in producing thought, is dissipated by imparting wave-motions to the surrounding ether, and such waves are sent out in all directions from the brain, possibly in greater amount or of greater amplitude from some of the brain openings, as, for example, those of the eyes.

Although there are no absolute proofs of the existence of the molecular or atomic vibrations of the brain particles which I have assumed, such a movement, however, is far from being improbable, and, indeed, some facts known to the medical profession are far from being at variance with such an assumption. A certain amount of pressure on the brain arising from the pressure of the blood is necessary for its proper action. If this pressure increases beyond a certain value, as, for example, in cases of fractures of the skull, where a portion of the bone is depressed by the fracture, thereby producing a compression of the brain material, all thought or cerebration instantly ceases; but when this pressure is relieved by the act of trephining, cerebration not only begins but, curiously enough, generally goes on from the point where the patient left off when the injury occurred.

Let us assume, then, that cerebral radiations or waves are given off from every sentient or active brain, and that these waves pass into the space around the brain something like the waves that are imparted to the air around a sounding tuning-fork.

The cerebral radiations are not so gross as those of sound. Their wave-lengths are almost certainly much shorter. They are imparted to the universal ether.

If such waves, which I would call thought-waves or cerebral-waves, be present in ether that fills all space, it will be interesting to inquire what phenomena they might be expected to produce.

It being assumed that these vibrations take place in the ether itself, there need be no doubt or speculation as to the general nature of the waves themselves. They would presumably partake either of the nature of transverse or torsional vibrations.

The commonest character of the vibrations which occur in the universal ether are the vibrations which are now generally recognized as transmitting the phenomena of heat, light, electric or magnetic radiations, viz., of transverse or torsional vibrations.

An active brain may therefore be regarded as moulding the ether around it into thought-waves that are spreading outwards from it in all directions. In this respect it is not unlike a conductor through which an oscillatory discharge is passing, producing those waves which Hertz has so beautifully demonstrated as resembling the vibrations that produce light.

Assume, then, that the cerebral radiations partake of the nature of thermal, luminous, electric or magnetic radiations, and the following explanation of telepathy, or thought transference, is, to say the least, not improbable.

I would explain the possibility of the transference of specific cerebral vibrations from an active brain to a

* Read before the Electrical Section, Franklin Institute, Philadelphia, March 1, 1892.

passive or receptive brain by the simple action of what is known in science as sympathetic vibrations.

Take the case, for example, of a vibrating tuning-fork that is sending off its waves across the space which separates it from a second tuning-fork, not as yet in motion, but tuned so as to be able to vibrate in exact unison with it. As is well known, the exact correspondence between the period of the active, or the transmitting-fork, and the passive- or the receptive-fork, is such that the vibrations of one fork are gradually taken up by the other fork, so that the energy of the motion of the one is transferred or carried across the space existing between them, by means of pulses or waves set up in the air which surround them.

As is well known, such sympathetically excited vibrations can be produced in a fork situated at a considerable distance from the exciting-fork.

Or, similarly, take the case of the sympathetic vibrations excited by waves of light. Solar energy is radiated or transferred across the space existing between the sun and the earth by waves or oscillations in the luminiferous ether. These waves, falling on the delicate structure of a leaf, suffer a species of selective absorption, certain wave-lengths being absorbed and others thrown off. The absorbed waves excite or produce sympathetic vibrations in the molecules of carbon dioxide present in the leaf, and cause the atoms of carbon and oxygen in such molecules to move towards and from one another in interatomic vibrations, which increase in amplitude or violence until their chemical affinity or atomic attraction is overcome and dissociation occurs. The oxygen is then thrown from the leaf into the air, and the carbon is retained in the structure of the plant.

Or, take the still more interesting case of what Hertz calls electric resonance. As already mentioned, it is now generally recognized by electricians that a conductor which is the seat of an oscillatory electric discharge is sending into the space around it electric-waves or oscillations which travel with the velocity of light, and which are in fact of exactly the same nature as light itself. If these electric-waves meet a circuit so tuned as regards the period of oscillation of the circuit in which they originally occurred as to be in consonance with them, electric oscillations will be set up in this circuit of exactly the same nature as those exciting it.

In view of these facts it does not seem improbable to me that a brain engaged in intense thought should act as a centre of cerebral radiations, nor that these radiations proceeding outwards in all directions from such brain should affect other brains on which they fall, provided, of course, that such brains are tuned to vibrate in unison with them. In such cases the absorption of energy by the recipient brain may be either a species of selective absorption in which its train of thought is only modified, or it may be absolute; in which case the recipient brain has excited in it an exact reproduction of the thoughts of the exciting brain.

Such a hypothesis is far from improbable; on the contrary, it would appear to be carried out by a variety of curious circumstances, which have only wanted some general hypothesis to properly correlate them.

If such a hypothesis be true, then these cerebral vibrations or radiations must travel through space with exactly the velocity of light. This is of course on the assumption that the vibrating or oscillating brain molecules or atoms set up vibrations similar to those of light. Of course, this equality between the velocity of cerebral wave propagation and that of light is true only for free ether. In the ether which fills the interatomic or intermolecular spaces of gross matter, or, as it is technically called, combined ether, the velocity of wave propagation varies according to the particular character of the matter with which it is associated. A retardation or decrease in the velocity of the assumed cerebral waves would doubtless be experienced while passing through the materials of the skull and head.

If thought travels along waves in the ether similar to waves of light, it would be able to travel along any path by which rays of lights can pass. It can therefore travel along rays of light, *i.e.*, along paths in the ether through which rays of light are moving.

There is a well-known experiment in hypnotism, in which the patient, placed in a state of semi- or complete unconsciousness, has his brain called into a more or less active condition by the suggestions of the hypnotizer, which might seem to somewhat favor the hypothesis of cerebral radiation.

It might be interesting, in view of the above suggestions, to see whether a hypnotizer, placed in such a position as regards the hypnotized that flashes of light falling on his eyes shall afterwards fall on the eyes of the patient, to observe whether or not acts of suggestion are more readily perceived by the brain of the hypnotized along such rays of light than without the aid of such rays.

If the preceding speculations be regarded as wild, and that this is true I have already granted, what may not be said as to the following?

If thought radiations partake of the nature of ether-waves, then there should presumably exist in the thought radiations or waves phenomena corresponding to the various phenomena of thermal, luminous, electric or magnetic radiation; even the phenomena of reflection, refraction and possibly even of dispersion of such waves would appear to be a possibility. In this connection it is of interest to imagine the analysis or separation of a complex wave of thought into its component or elementary waves, corresponding to the separation of a beam of light by means of a prism.

In this connection there would be a new significance in the phrases, "radiant with thought," or, "to concentrate one's thoughts on a subject."

If thought radiations or waves partake of the nature of light, then it would seem among the remote possibilities of science to obtain—say by means of a lens—a photographic impression of such thought-waves on a suitably sensitized plate, somewhat after the manner of the ordinary photographic picture. Such a thought-record, suitably employed, might be able to awaken at any subsequent time in the brain of a person submitting himself to its influences thoughts identical to those recorded.

Of course I am aware of the improbability of such a record being obtained in the near future, and of the exceeding difficulties that would seem to stand in the way of ever obtaining it.

Until we know something more definite concerning the nature of these assumed cerebral vibrations and of their lengths, we must necessarily be seriously handicapped as how best to permanently fix them on a suitable record-surface, and how afterwards to cause such record-surface to interpret its peculiarities to the brain. I merely throw it out as a possibility of what science may have in store for those who come after us. I would suggest, in this connection, that 100 years ago it would probably have been regarded as quite impossible that the telephone or the phonograph could have been produced.

Such a thought-record, however, if obtained, would not be an image of the thought itself, or of the particular groupings of the particles, whose to-and-fro movements attend or produce thought, any more than the tracings of the phonograph record form an image of the spoken words. They would merely represent the to-and-fro motions of the ether set in motion by the thought or cerebrations.

An eye looking at such an image would not be influenced thereby. If, however, ether-waves similar to those recorded could be reproduced by causing light to pass through such photographic images of the to-and-fro

motions of thought-waves, such waves might be caused to influence the brain and thereby awaken thoughts similar or identical to those recorded.

I have often amused myself with picturing a possible thought-recording machine, whereby the thoughts of an active brain might be continuously and permanently recorded on a moving sensitized film, the exposed surface of which was placed at the focus of a large lens placed in front of any one engaged in intense thought.

If, like the cylinder or plate of a phonograph or gramophone, such a record were afterward rotated at the same speed as that at which it received its impressions, under circumstances in which light passing through it is moulded into waves similar to those recorded on it, such waves when caused to act on a receptive brain should, it would certainly seem, excite therein thoughts identical to those recorded as its record-surface.

Of course, it is needless for me to say that such a machine has never been actually constructed, and is still as unsubstantial as are the speculations which I have offered you. Indeed, the probabilities against its being produced are so great that I have hesitated even to mention it.

Some experiments might be tried in a similar manner in thought transference, by holding large lenses in front of the eyes of a hypnotizer at such a distance as to converge the assumed cerebral radiations on the eyes of the hypnotized. These experiments might be tried either along with light, or independent of it.

I know that many points of the hypothesis which I have suggested are quite improbable, and that I may and probably will be misunderstood by some as putting forward facts rather than a bare hypothesis.

Probably one of the most serious objections to the hypothesis is to be found in the fact that the phenomena of telepathy and thought transference are not of more frequent occurrence. This I must frankly acknowledge to be a most serious objection. I would suggest, however, that the comparative infrequency of the phenomena may possibly be explained by the presence in the human body of a shield which protects the brain or the nerve centres from the effects of cerebral radiations. It is not impossible the sheaths of the nerves act as screens to prevent the reception by the brain of these thought radiations.

Prof. Tyndall, in his work on sound, alludes to the well-known fact that when sympathetic vibrations are being excited by a sounding tuning-fork in any body near it, that there is a greater rapidity of expenditure of energy of the fork's motion than when it was not exciting such waves. The analogue of this phenomena exists, perhaps, in the case of the assumed thought transference. Mental energy is presumably expended at a greater rate when it is exciting thought-waves in this manner than when such are not being excited.

There has often been experienced by me as a teacher a feeling of great exhaustion in taking charge of or watching a room in which a number of bright students were undergoing an examination. It is possible that the cause of this exhaustion is the rapid dissipation of energy by the cerebral radiations being absorbed by the receptive brains of the examinees. I am informed by certain physicians that a feeling of great exhaustion is experienced by them in the treatment of some cases.

If there be any truth in the hypothesis I have briefly outlined, there should be what I would term a kind of vital radiation going on and passing outwards from the body of a healthy person, which may not improbably excite by sympathetic vibrations in the bodies of weaker persons around them, vibrations of a normal or more healthy type than those present in the sick person.

If this be true, the old belief of the efficacy of the laying on of hands, or of magnetic healing, may find some foundation, in fact, apart from what is most probably the general explanation of such causes, viz., hysteria.

I have thrown out the above hypothesis of cerebral radiations with considerable doubt and hesitation as a suggestion only to those working in the field of telepathy or thought transference, in the hope that I may thereby call the attention of such investigators to some phenomena in this very obscure field of research.

ELECTRICITY ON THE FARM.

BY A. F. McKISSICK.

THE recent application of the electric motor to ginning and pressing cotton, cutting up feed stuff, thrashing grain and other farming operations where mechanical power is called into play is another of the many instances where power transmitted by electricity furnished from a central station has proven more convenient, more economical and safer than power furnished by a steam-engine.

The location of the first plant of this kind is on the farm of the experiment station of the State Agricultural and Mechanical College of Alabama at Auburn, Ala. The station is situated about three-quarters of a mile from the college, and is in every respect a typical Southern farm. One of the necessities on a large farm like this is some source of mechanical power for performing the various operations such as ginning and pressing cotton, cutting up feed-stuff, thrashing grain, etc. This power has heretofore been supplied by a 15 horse-power engine and boiler, but it was decided some weeks ago to supplant this by the electric motor, which is furnished with current from a generator in the dynamo-room of the college. This generator is a 12 kilo-watt compound-wound Edison, 125 volts, and is run by a 35 horse-power Westinghouse Junior engine, furnished with steam from the steam plant which supplies the mechanical and electrical laboratories. The motor is a Thomson-Houston shunt-wound 110-volt 10 horse-power and contains the device for variation of speed. Owing to circumstances, the dynamo that furnishes the college buildings with lights had to be used as a generator, and the low voltage necessitated a greater loss than would otherwise have occurred. This defect it is proposed to remedy this summer by the installation of a 500-volt system. The generator and motor plants were installed, the poles put up and the wires strung by the students in electrical engineering. A number 0000 B. & S. wire is used for the outgoing; a number 6 grounded at each end and at intervals completes the return.

The motor is belted to a counter-shaft, and from this belts run to the feed-cutter, gin, screw press, cotton-seed crusher and thresher. A Brush arc dynamo is used for lighting up the campus. The feed-cutter is used for grinding up oats, ears of corn, shelled corn, peas and all kinds of grain.

In the same room is located the cotton-seed crusher. The gin and thresher are run also from the same counter-shaft. The silo-cutter is used for preparing silo, and there is a corn sheller and separator.

The steam plant is in operation the greater part of the day, so there is no delay in starting the motor at any time.

The advantages of this plant over the superseded one are its safety from danger to life and property, its safety from damage by fires, its convenience, its economy, its neatness, and the advantages necessarily accompanying the centralization of small units into one large plant.

The plant is running successfully and has proven its claims.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Current.

AN ELECTRIC current, whether it be for telegraphic, telephonic or electric lighting purposes, may be said to have two natures—visible and invisible—the visible consisting of the batteries or dynamos, poles, wires, etc.; the invisible, which comprises electromotive force, resistance and current. The visible part is simply a medium for the application of the invisible part to useful purposes.

If an electric current flows through a wire, a fountain head of electric power or electromotive force somewhere is implied; and the quantity of current (current being measurable) depends upon the resistance the current has to overcome.

In our last two articles we considered "Electromotive Force" and "Resistance," and in this "Current" will be given our attention, the amount of current being determined by dividing the electromotive force by the resistance.

As has already been stated, if we have a source of electromotive force and a wire connecting the two poles (positive and negative) of that source, the result will be a current of electricity in the wire. If the electromotive force of a dynamo, for instance, be 100 volts, the electromotive force at any point along the wire would not be 100 volts, but less, because in passing through the wire the current strength is exhausted by being required to do work in overcoming the resistance of the wire. The less resistance the wire has the greater will be the power of the current to do work at any point along the wire, as was explained in the article on "Resistance," in last issue. If the current is required to pass through a wire of great resistance, its strength might all be frittered away uselessly before it reached the point where we want it to perform work. It is evident from what has already been said that the less resistance we have in the conductor the greater will be the current. This is proved by Ohm's well-known law, that the current is equal to the electromotive force divided by the resistance. $\left\{ C = \frac{E}{R} \right\}$

To make this clear we will give a couple of examples to show the practical application of this law, which is one that every electrician is constantly required to deal with in his calculations.

Suppose we have a dynamo with an electromotive force of 100 volts at its terminals, and a wire with a resistance of 50 ohms is connected to the terminals; then, according to Ohm's law, the current in that wire will be 2 ampères, because the electromotive force (100 volts) divided by the resistance (50 ohms) gives the current, which is equal to 2 ampères.

Take another case, the dynamo having an electromotive force of 50 volts and the resistance in the circuit being 100 ohms. By the application of Ohm's law we would get a current of .5 of an ampère.

We can increase the current in a circuit by decreasing the resistance. By decreasing the resistance we do not affect the electromotive force at all, because that remains constant in a given machine; the increase of current is due solely to the decrease of resistance in the circuit. Decreasing the resistance of a wire can only be accomplished by increasing its thickness; therefore, by increasing its thickness we increase its current carrying capacity.

Electric currents behave very much as currents of water do. If we have a pipe of a certain diameter connected with a water-tank of a given capacity, the pipe will deliver the water at a certain rate; but if we put in a larger pipe we increase its carrying capacity, and get, in consequence, a larger stream of water. As in the case of an electric wire, friction or resistance to the flow is what limits the quantity discharged in a given time. If the water-tank is of a certain capacity, and no provision is made to supply the loss caused by the discharge through the pipe, the current would soon cease, and the water would be discharged the quicker if the diameter of the discharge pipe were increased. This is exactly what occurs when the source of electric current is limited in its ability to produce current; a battery for instance, or an accumulator. In a battery by adding fresh chemicals and liquids we extend its ability to generate a current, and by making such renewals at proper intervals we practically make the battery a constant source of current. In a dynamo the current is maintained so long as we maintain the proper motion of the armature.

Currents are measured in ampères. To the lay mind an ampère is a meaningless term; it has no understandable value; some conception of its value, however, may be formed by comparing it with a quart measure, which is the unit measure of liquids.

The current can always be determined by the application of Ohm's law if we know what the electromotive force and the resistance are. In the generation of currents for electric lighting and electric railways an instrument called the ampèremeter is used, which shows by direct readings what the current value is at any moment. These instruments do away with the necessity of calculations.

The quality of *intensity* is inherent to a more or less degree in every electric current, but must not be confounded with the quantity of current. The intensity represents the power a current has of overcoming resistance, while the quantity of current depends altogether upon the resistance, and is variable inversely as the resistance.

ELECTRICAL SOCIETIES.

THE NEW ENGLAND ELECTRIC CLUB.

The New England Electric Club was launched into existence very successfully on the evening of May 25, in the presence of a large number of members and invited guests.

The club-house is at No. 14 Bosworth street, Boston, and since the organization of a club was first mentioned it has received generous support. It is the outgrowth of an idea formulated some months ago by a few prominent electricians and others engaged in the electrical trade in Boston, that such a club would be beneficial to the trade in that city as well as visiting members of the fraternity from all parts of the country.

There were over one hundred gentlemen present at the opening ceremonies.

Hon. Ferdinand K. Wyman, on account of ill-health, resigned the office of president of the club two months ago, and Mr. C. S. Knowles was unanimously elected to fill the position. Mr. Knowles has exerted a great deal of influence for the good of the club, having brought no less than fifty new members into the organization.

The ground floor of the club-house is taken up by a reception and dining room, the reception-room being handsomely furnished with plush and leather furniture. The second floor contains a billiard-room, kitchen and wine-room. The entire third floor is devoted to sleeping-rooms, and the fourth floor is used by employés.

Every floor in the house is fitted up with electric lights and bells and every modern convenience. It is the object of the club to provide a place for social gatherings and discuss topics of general interest to the electrical fraternity.

During the winter months a course of lectures will be established, and discussions will be had among the members at least once a month.

Among those present were Mr. Morris W. Mead, of Pittsburg, Pa.; Charles T. Luther, of Pawtucket, R. I.; George M. Phelps, of New York; Frank Ridlon, J. K. Robinson, D. A. Andrews, C. C. Pierce and others.

Refreshments were served and music was furnished for the entertainment of the members and guests. Mr. Morris W. Mead made a few impromtu remarks, wishing the club great prosperity, and many congratulations were received by wire from different electric clubs throughout the country conveying the best wishes for the club's success.

The officers of the club are: President, C. S. Knowles; vice-president, E. A. Record; treasurer, A. O. Smith; secretary, Lynn M. Hays. Directors: Maybin W. Brown, Elmer P. Morris, Charles C. Pierce, E. R. Tilton, Edward W. Sawyer.

The present membership comprises over one hundred names.

THE NEW YORK ELECTRIC CLUB.

The board of managers of the Electric Club of New York has issued a circular letter to the members of which the following is a copy:

"The efforts of the board of managers to raise funds to pay the floating debt of the club have been so far successful that the sum of $4,460 has been contributed to date. This has enabled the club to pay off about three-fourths of its obligations (excluding bonds).

"It has been determined to continue the occupancy of the present commodious club-house.

"Many members have contributed largely in excess of the assessment asked for March 21, and it is the desire of the managers to resume the restaurant on a self-sustaining basis as early as possible.

"It is earnestly hoped that all members who have not yet responded to the request of the managers for contributions will do so at once, whether the amounts donated be less or greater than the assessment of March 21."

AT THE WORLD'S FAIR.

Prof. John P. Barrett, chief of the Department of Electricity of the World's Fair; has sent us a copy of a circular he is sending out to intending and possible electrical exhibitors concerning electrical installations, space, etc. The following is the circular in full:

"It is the purpose of the Exposition management to allow exhibitors to completely equip the electrical building for lighting and power. With a view to determine just what may be done in this direction, the Department of Electricity chooses to place its plans before those who are interested in its success, and advise with them as nearly as may be, with a view to give them an opportunity to participate in this equipment.

"Under the rules of the Exposition it will be necessary as to plant all operating machinery in what is to be known the general power plant. All generators will be established at that point immediately adjacent to steam power of competent capacity. Between this power plant and the electrical building there is a subway six feet deep and six feet wide for the accommodation of conductors Fireproof vaults will be built at the point of entrance to the electrical building, in which to install transformers, to comply with the National Underwriters' requirements. Headway averaging seven feet under the flooring, and foundation posts at intervals of twelve feet will give ample wiring facilities.

"It is the purpose to divide the building into equitable sections, and to assign these sections to the various exhibiting interests. Those to whom assignments are made will be expected to install their own generators, furnish cables between the plant and the building, and do all wiring—including the furnishing of wire. Those who are given arc lighting to do will be expected to furnish carbons and attend to renewing same. Those undertaking to operate incandescent lamps will be expected to furnish all renewals and attendance. In addition to these items of expenditure, all exhibitors whose generators are operated from steam in the power-station will be asked to pay, *pro rata*, the costs incident to the erection of the machinery. Belting from shafting to generators must also be furnished by exhibitors, and exhibitors of alternating systems will be asked to contribute to the expense of constructing the transformer vault.

"The building will be equipped for 500 horse power for the operation of motors; 500 horse power for arc lights; 500 horse power for incandescents, and a reserve of 500 horse power for extra incandescents, applications for most of which are already in.

"In order that the plant for this building may not be a source of expense to the Exposition management a charge will be made for any special arc lighting desired by exhibitors who *do not* participate in the equipment and electrical supply of the building, also against the same class of exhibitors who desire power for motors or who require incandescent lamps. These charges do not concern any who contribute to the expenses cited above.

"In order that the above proposed system may be reduced to a definable quantity, I beg leave to submit the enclosed blank, which please fill out *completely* and return to me at once:

"TO EXHIBITORS IN THE ELECTRICAL DEPARTMENT OF THE WORLD'S COLUMBIAN EXPOSITION.

"Do you desire to participate in the electrical equipment of the electrical building on terms in accord with the accompanying circular?

"Is your exhibit designed to include generators operated under load?

"If so, how many, what capacity, what minimum steam power required, nature of current and character of work intended to be done (motor, incandescent or arc lighting)?

"What floor space will generators and adjuncts occupy? (Send scale drawing and confine as much as possible.)

"How many arc lamps will you exhibit?

"How many incandescent lamps will you exhibit?

"How many motors will you operate, of what sizes, and how much *power* for motors?

"Do you desire to equip your own space for arc lighting? space for incandescent lighting? space for motor power?

"Do you desire to equip additional space in the general scheme, and if so, how much, and for what purposes?

"NOTE.—Those exhibitors of special electrical apparatus which may enter into the equipment of the building, lamps, carbons, ornamental or other posts, brackets, wires, etc., and who desire to exhibit same in operation, will state kind and quantity of apparatus and specify as to its use. The department will endeavor to place such apparatus in service, and exhibitors will realize full credit conspicuously announced.

"Exhibitors will, of course, remove all their apparatus at the close of the Exposition.

"Those exhibitors who do not contemplate participation in this lighting and power scheme, but who will require electric current for motors or who will require arc lights as a part of their exhibit, in addition to the general illumination, or who will require incandescent lamps, will please state as directly and explicitly as possible the details of their requirement."

ELECTRIC RAILWAY EQUIPMENT.

Data furnished by the Field Engineering Company, 143 Liberty street, engineers and contractors for electric railways and power stations, show that the cost of equipment of electric street railways per mile of double track for cities, assuming four-minute service and 25 H. P. per car in capacity of power, is $55,000, or $27,500 per mile of road in single track length, based on road being all double tracked, and may be briefly summarized as follows:

Power station, $1,500; steam plant, $5,000; electrical plant, $3,000; car equipment, $13,000; track construction, $22,000; line construction, $7,500; general sundries, $3,000.

DIE-SLOTTER.*

To manufacturers and others making numbers of punches and dies, the machine shown will be of special interest, for there is an undoubted advantage in using a slotter.

This machine, Fig. 1, appears to combine in an eminent degree the special features desired in a tool of this kind. The two cross-motions and the rotary table provide for

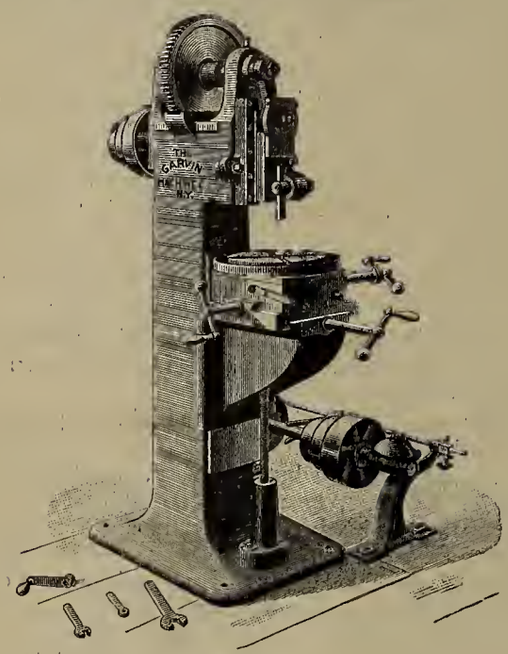


FIG. 1.

following any outline, and the arrangement of handles is convenient and avoids mistaking one for the other. The handle for the rotary table has provision for using dials for dividing purposes, which is convenient for such work as that shown in Fig. 4. For small numbers of divisions and for rapid work the worm shaft can be pulled right out and a lock-pin arrangement used for indexing the table, the handle for which is shown at the left-hand side. The handle for raising and lowering the knee is con-

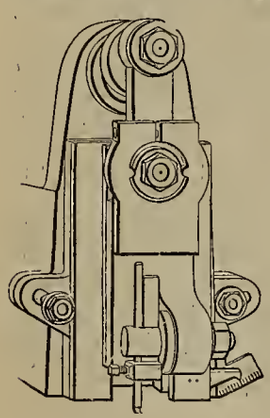

FIG. 2.

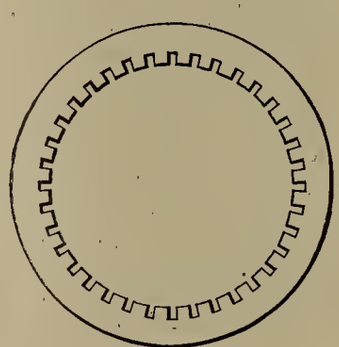

FIG. 4.

veniently placed on the side of the knee (not shown in the cut). The stroke of the machine, after due consideration, has been fixed at 2½, which is more than sufficient for the class of work intended, and affords a more solid arrangement than the usual adjustable pin. The work can be brought into proper relation to the stroke by raising the knee; and for thin work, since the cutting is done at the last or slowest part of the stroke, the number of strokes can be increased by means of the cone pulley, which thus fully compensates for any surplus stroke. To give the required draught to the die, the slides for the cam can be swivelled either way and set by the graduated index shown. With this arrangement the draught is the same in every part of the die. The tool-block is well adapted to hold special tools, such as the one shown in Fig. 2, made of Stubb's steel, clamped in a holder. The tool is cleared on the return stroke by an ingenious cam arrangement, shown more clearly in Fig. 2. The tool-block swivels on a centre near the lower edge; and at the upper end, carried in a yoke, are two hardened plugs which bear on a cam, which is bushed in to the lower end of the connecting rod, and derives a partial rotary movement from the action of the rod, and by this motion locks the tool-block. As an instance of what can be done on the machine, a typewriter key of form shown in Fig. 3, 10″ long and $\frac{3}{16}$″ wide at narrowest part, was machine finished in six hours. A die for armature rings 5″ diameter, with 36 notches $\frac{1}{8}$″ wide, $\frac{1}{4}$″ deep, such as shown in Fig. 4, was done in two hours.

* Garvin Machine Company, New York.

NEW INCORPORATIONS.

The Hoke Electric Belt Company, Camden, N. J., incorporated May 13, with a capital stock of $100,000, to manufacture, sell and dispose of Prof. C. U. Hoke's electric appliances, etc. Incorporators: C. U. Hoke, M. C. J. Stupp, Reading, Pa.; H. Becker, Philadelphia; E. S. Warren, Pensaukin, N. J.

Thomas Day & Company, San Francisco, Cal., incorporated May 12, with a capital stock of $300,000, to manufacture and deal in gas and electric fixtures, etc. Incorporators: Frank J. Symmes, Vanderlyn Stow, Samuel C. Bigelow, H. T. Clay, E. J. Duffey, all of San Francisco, Cal.

The Delaware County and Philadelphia Electric Railway, Chester, Pa., incorporated May 11, with a capital stock of $120,000. Incorporators: William H. Sayer, Wayne, Pa.; James S. Austin, Lansdowne, Pa.; Edward V. Kane, Lansdowne, Pa.

The Brookwood Traction Company, Harrisburg, Pa., incorporated May 13, with a capital stock of $10,000, to construct and operate motors and cables and other machinery for supplying motive power to passenger railways. Incorporators: N. Hamilton, Christian W. Lynch, John E. Fox, Harrisburg, Pa.

The Bloomfield Street-Railway Company, Pittsburg, Pa., incorporated May 9, with a capital stock of $12,000. Incorporators: Joshua Rhodes, John W. Fraggardh, George M. Von Bonnhorst, Pittsburg, Pa.

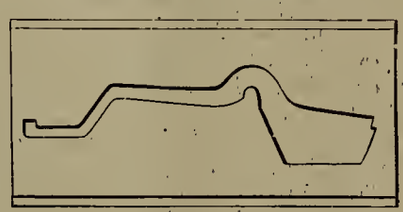

FIG. 3.

Physicians' Electrical Supply Company, Lafayette, Ind., incorporated May 13, with a capital stock of $50,000. Incorporators: Charles G. Longyear, William D. Hyslop, William G. Churcher.

Gate City Electric Street-Railway Company, Keokuk, Ia., incorporated May 12, with a capital stock of $130,000. Incorporators: William Logan, S. P. Townsend, G. S. Dana, William J. Roberts, H. H. Richardson, H. C. Reimer, all of Keokuk, Ia.

The North Manufacturing Company, Denver, Col., incorporated May 21, with a capital stock of $100,000, to

manufacture, buy and sell batteries and motors of all kinds and descriptions operated by electricity, etc. Incorporators: John D. North, W. L. Beardsley, B. A. Ambler, of Denver, Col.

The Glendale Electrical Company, Glendale, W. Va., incorporated May 23, with a capital stock of $50,000, to furnish light, heat and power by means of electricity. Incorporators: William Erskine, D. L. Hukill, Wheeling, W. Va.; J. M. Booth, Moundsville, W. Va.

The Falls City Electric Company, Louisville, Ky., has been incorporated, with a capital stock of $10,000, to manufacture and sell Hanson primary batteries, etc. Incorporators: Nicholas Finger, George A. Foree, E. D. Foree, J. B. Quinn, W. J. Wilson, H. F. Smithers, Louisville, Ky.

The Union Electric Company, Louisville, Ky., has been incorporated, with a capital stock of $50,000, to manufacture and deal in electrical instruments and supplies. Incorporators: James Marret, J. M. Biggs, John Welch, J. M. Williams, Louisville, Ky.

Home Electric Light and Power Company, Muscatine, Ia., incorporated May 23, with a capital stock of $150,000. Incorporators: S. G. Stein, F. P. Sawyer, Muscatine, Ia.

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, May 28, 1892.

MR. A. B. LAURENCE, New York manager of the Shultz Belting Co. of St. Louis, has just taken an order for three 8" dynamo belts for the Citizens' Electric Lighting Co., of Far Rockaway, L..I.

MR. ABEL HUOT, electrical engineer of Quebec, is in New York. Mr. Huot holds a number of options on waterfalls in the vicinity of Quebec, and is trying to form a company to utilize them for the generation of electric power.

MESSRS. B. W. PAYNE & SON are nicely situated in their new office and salesrooms, 41 Dey street. They recently installed a 30 H. P. automatic engine in the Seabury building, Maiden lane, to operate a 250 incandescent light plant on the Loomis system.

THE SAFETY INSULATED WIRE AND CABLE COMPANY, 234 West Twenty-ninth street, of which Mr. L. F. Requa is general manager, has secured the order for the insulated wires to be used in installing the arc-light system at the World's Fair, Chicago.

E. J. VON SAUN, formerly with Schneider, Campbell & Co., is carrying on a practical sanitary plumbing, gas-fitting and electrical business at 86 Fifth avenue. Mr. Von Saun has had a thorough experience in these branches, and is qualified in every respect to handle the finest kind of work. He makes a specialty of jobbing and repair work.

MR. J. W. GODFREY, general manager of the New York Insulated Wire Company, 15 Cortlandt street, has secured an order from the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa., for insulated wire for 100,000 16 c. p. lamps, which will be used in lighting the World's Fair. The order calls for the celebrated Grimshaw wire.

MR. ISSERTEL, of the A. B. C. Company, 20 Cortlandt street, has just returned from a successful trip west. The A. B. C. Company's incandescent railway lamp with carbon support is meeting with excellent success. While on his trip Mr. Issertel secured a large order for railway lamps from the Pittsburg Traction Company. He also received a number of orders in Ohio for railway and electric light supplies.

MR. A. G. GREENBURG, formerly in the office of the Fort Wayne Electric Company, New York, is now with the New York office of the Washburn & Moen Manufacturing Company. This company has secured the contract for the trolley, feeder and supplementary wires to be used on the electric system of the Brooklyn City Railroad Company, Brooklyn, N. Y.

MESSRS. BAKER, SEELY & PORTER, 12 Cortlandt street, are rapidly completing the construction of the Newtown electric light plant. The Fort Wayne arc and incandescent systems are employed ; 60 arc and 8,000 incandescent lamps. The dynamos as now arranged will be worked to their full capacity, and it is more than likely that others will have to be added. Buckeye engines are used in this station.

MR. W. R. BRIXEY, having undertaken the general management of the long established business of S. A. Day (successor to A. G. Day), manufacturer of the celebrated Kerite insulated wires and cables, with offices in the new Mail and Express building, 166 Fulton street, is prepared, after an experience of thirteeen years in superintending and improving their manufacture, to supply materials of the highest standard attainable. His personal close study and contact with the practical part of the business will enable him to meet the wants of customers in every detail.

A. T. SMITH, 6 West 15th street, is selling agent for Holtzer-Cabot motors and fans. He makes a specialty of fan motors and carries all sizes up to 1 H. P. for power purposes. Mr. Smith is getting a number of storage batteries ready that will be used to operate a small search-light on the steam yacht *Mamie*. He lately installed a 1 H. P. motor to run five grindstones and four diamond drills for Mundorff, the optician on Broadway, between 26th and 27th streets; also a dynamo for gold, silver and nickel plating. Mr. Smith contracts for and installs all kinds of household electrical goods, particularly gas-lighting appliances. All those who are in need of anything in his line should write him for figures.

A SALESMAN of the Manhattan Electric Supply Company, 38 Cortlandt street, travelling in the interest of the Mesco dry batteries, manufactured by the company, while on his rounds met a competitor, and in a comparative test of the merits of their respective batteries the Mesco battery came out on top of the heap. The Mesco showed 38 and the other only 25 points after a half-hour's test. The result was that the Manhattan Electric Supply Company secured an order for nearly 1,000 of its batteries. This company is gradually getting its salesrooms into ship-shape, and from the great number of packing-cases which can be constantly seen being filled up with supplies, it is easy to guess that business is booming.

MR. C. A. BENTON has disposed of all of his interests in the Detroit Electrical Works, and will hereafter devote his entire time and attention to the management of the Sprague Electric Elevator Company, 15 Wall street. Mr. Benton is thoroughly at home in New York, having before his connection with the Detroit company been associated with the Edison Company in this city. He was one of the most successful of the many representatives that this company ever had, it being conceded that the degree of perfection of the company's system existing under his efficient management has never since been surpassed. The Sprague Company may well be congratulated in having secured his valuable services. The Sprague system of propelling elevators is very ingenious, and under Mr. Benton's vigorous management we have no doubt but that a great demand will be created for it.

MESSRS. DOUBLEDAY, MITCHELL & COMPANY, 136 Liberty street, report large orders for their flexible conduits and canvas-jacket insulated wires. A big quan-

tity of the conduit is being installed in several large buildings in this city. As the conduit can be bought in any length desired, the cost of installation is reduced to a minimum. It is composed of a spiral tube of fibre, covered with tape and canvas jacket, and then saturated with a weatherproof and waterproof compound. The manufacturers claim that it cannot become abraded through contact with rough surfaces, as the spiral tube is so flexible that any amount of hard usage will not damage it. In the language of Mr. Doubleday, a cart can run over and not injure it. Messrs. Doubleday, Mitchell & Company are agents for the motors of the Holtzer-Cabot Company, Boston, Mass. They are doing a big business with Columbia lamps, and handle a full line of the Consolidated Electric Company's specialties ; in fact, anything in the electrical line can be obtained from this firm.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

PERSONAL.

Mr. M. D. Law, of the Edison General Electric Company, Schenectady, New York, has resigned to engage in other business.

EASTERN NOTES.

MR. ALFRED CLARK, vice-president of the Eastern Electric Light and Storage Battery Company, Lowell, Mass., reports business improving.

THE COLBURN ELECTRIC MANUFACTURING COMPANY, Fitchburg, Mass., has found it necessary to increase its facilities in order to supply the demand for its motors.

THE ELECTRIC GAS LIGHTING COMPANY, Boston, reports business very good. Col. Burnham, the senior member of the company, is visiting friends in California.

MR. HENRY HINE, general manager of the Stanley Electric Manufacturing Company, Pittsfield, Mass., has been confined to his home for the past two months with a severe attack of rheumatism.

MR. GEO. H. POOR, manager of the Hill Electric Company, Boston, is very popular, as is also the incandescent motor manufactured by his company. These motors are sold as fast as they can be manufactured. N. D. W.

The Electrical Age's Illustrated Patent Record.

Issued May 24, 1892.

475,289. Electric-Arc Lamp. Lucien Brianne, Paris, France. Filed July 28, 1891. Patented in France, in Germany, in Austria-Hungary, in Belgium, in England, in Italy and in Spain.

475,300. Extension-Transmitter for Telephones. Victor A. Cook, New York, N. Y. Filed Jan. 8, 1892.

475,334. Electric Signalling Apparatus. William C. Moore, Kansas City, Mo., assignor to the Electric Secret Service Company, New York, N. Y. Filed June 19, 1891.

475,335. Manufacture of Electrodes for Secondary Batteries. James F. McLaughlin, Philadelphia, Pa. Filed Jan. 31, 1890.

475,340. Automatic Electric Heat Alarm. Fred S. Palmer, Boston, Mass., and Leonard H. Desisle, Lamoine, Me., assignors to the Electric Heat Alarm Company, Bangor, Me. Filed Jan. 9, 1892.

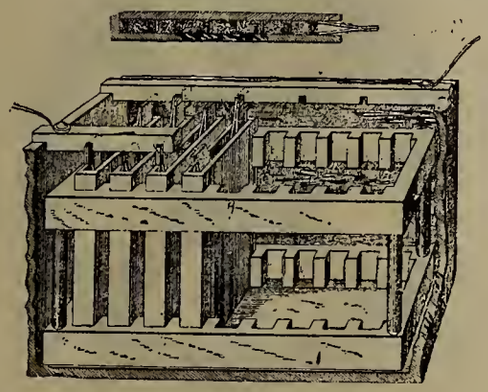
475,345. Incandescent-Lamp Socket. Frederick C. Rockwell, Hartford, Conn. Filed Feb. 24, 1892.

475,394. Incandescent Electric Lamp. Henry Green,

Hartford, Conn., assignor of one-half to Geo. S. Miller, same place. Filed Aug. 22, 1891.

475,399. Electric Actuator for Registering Mechanisms. Charles F. Holt, New London, Conn., assignor of one-half to William S. Starr, same place. Filed June 22, 1891.

475,410. Electric Mechanism for Reciprocating Motion. Henry S. McKay, Boston, Mass. Filed Aug. 20, 1891.



475,335.—MANUFACTURE OF ELECTRODES FOR SECONDARY BATTERIES.

475,411. Electric Meter. Alexander G. McKenna, Allegheny, Pa., and Henry T. Weed, Brooklyn, N. Y., Filed July 14, 1891.

475,441. Telegraphic Relay. Charles Cuttriss, New York, N. Y. Filed Dec. 1, 1891.

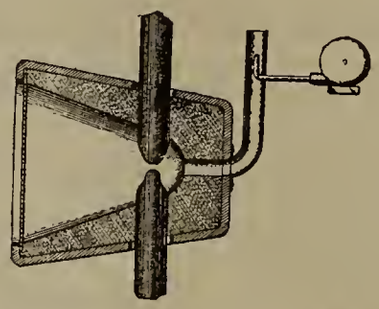
475,467. Trolley for Electric Railways. John W. Newhouse, Indianapolis, Ind. Filed Nov. 14, 1891.

475,468. Electrical Transmitting System. Frederick E. Now, Cleveland, Ohio. Filed Dec. 4. 1891.

475,482. Lightning-Arrester. James E. Browne and Frederick H. Tidnam, Elizabeth, N. J., assignors to James E. Browne, same place. Filed July 10, 1889.

475,491. Electric Locomotive. Thomas A. Edison, Llewellyn Park. N. J., assignor to the Edison Electric Light Company, New York, N. Y. Original application filed June 3, 1880. Divided and application, filed May 20, 1882. Again divided and this application filed June 9, 1891. Patented in England, in Canada, in Victoria, in France, in New South Wales, in Queensland and in New Zealand.

475,492. Electric Locomotive. Thomas A. Edison, Llewellyn Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Original application filed June 3, 1880. Divided and application filed May 20, 1882. Again divided and this application filed June 9, 1891. Patented in England, in Canada, in India, in Victoria, in France, in New South Wales, in Queensland and in New Zealand.



475,544.—ELECTRIC-ARC LAMP.

475,493. Electric Locomotive. Thomas A. Edison, Llewellyn Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Original application filed June 3, 1880. Divided and application filed May 20, 1882. Again divided and this application filed June 9, 1891. Patented in England, in Canada, in India, in Victoria, in France, in New South Wales, in Queensland and in New Zealand.

475,494. Electric Railway. Thomas A. Edison, Llewellyn Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Original application filed June 3, 1880. Divided and application filed May 20, 1882. Again divided and this application filed June 9, 1891. Patented in England, in Canada, in India, in Victoria, in France, in New South Wales, in Queensland and in New Zealand.

475,514. Electric Car-Lighting System. James F. McElroy, Albany, N. Y., assignor to the Consolidated Car Heating Company, Wheeling, W. Va. Filed Dec. 19, 1891.

475,527. Coin-Controlled Electrical Apparatus. Horace Wickham, Milwaukee, Wis., assignor to Hugh Ryan and Henry D. Goodwin, same place. Filed Dec. 11, 1891.

THE

"CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, under date of March 29, 1886, he says:

"A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weather-proof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use we make all sizes of stranded and flexible cables with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

EASTERN ELECTRIC CABLE CO.,

61 to 65 Hampshire Street, Boston, Mass.

HENRY A. CLARK, Treasurer and General Manager.
HERBERT H. EUSTIS, President and Electrician.

475,528. Rheostat. Charles Willms, Baltimore, Md. Filed Jan. 14, 1892.

475,529. Rheostat. Charles Willms, Baltimore, Md. Filed Jan. 14, 1892.

475,544. Electric-Arc Lamp. RobertS. Dobbie, Brooklyn, assignor to the Edison General Electric Company, New York, N. Y. Filed June 11, 1891.

475,555. Incandescent-Lamp Socket. Cromwell A. B. Halvorson, Saugus, Mass. Filed Aug. 5, 1891.

475,566. Automatic Electric Time-Check. Charles K. Jardine, Georgetown, British Guiana. Filed Dec. 10, 1891.

475,587. Diffusion-Battery. George A. Messick, Wilmington, Del. Filed March 22, 1889.

475,600. Cable-Hanger. John J. Nate, Chicago, Ill. Filed March 24, 1892.

475,645. Lightning-Arrester. Addison G. Waterhouse, Hartford, Conn. Filed Dec. 17, 1891.

475,648. Anti-Inductive Conductor. Bror H. Wesslau, Charlottenburg, assignor to Siemens & Halske, Berlin, Germany. Filed Jan. 21, 1892.

475,668. Commutator-Brush. Charles L. Coffin, Detroit, Mich. Filed Sept. 5, 1891.

475,727. Electric-Arc Lamp. James E. Gaston, Sparta, Ill., assignor to the Gaston Electric Head Light Company, same place. Filed Sept. 4, 1891.

ELECTRIC LAUNCHES AT THE WORLD'S FAIR.

Last Friday a trip was made on the Passaic river at Newark, N. J., of an electric launch which may be one of the many that will transport visitors at the World's Fair about the lagoons next year. The trip was a complete success as far as appearances would indicate. The boat is a sample to be sent to Chicago, so the Fair authorities can see for themselves what an electric launch is, and capable of doing, and if they are satisfied they will probably give the contract to the company which makes these boats, and travelling around the lagoons in these handy little craft will be one of the pleasant features of the World's Fair. There will be no offensive odors, nor any of the disagreeable features of steam or naphtha launches, and it will be a pleasure to ride about the waters in a clean and elegantly appointed boat.

A REMARKABLE STORM IN TEXAS.

A story comes from Texas that an "electrical storm" killed several acres of grass and cotton near Greenville. "The cotton is dead," says the despatch, "and has the appearance of being burned." It is further stated that the grass was burned dry by the action of the electricity. This is an unusual occurrence, and so extensive damage by an "electrical storm" has no parallel in history. The lightning, if "electrical storm" means lightning, must have been extremely active to get around several acres and kill vegetation.

ELECTRICITY ON THE ELEVATED ROADS.

There is a report that the Third avenue elevated road in this city will soon be operated by electricity. The residents along this line no doubt would welcome such a change; the electric motor would not keep them awake at night by puffing and blowing off steam, and filling their rooms with coal gas, and in every way the change would be a desirable one. It does not seem reasonable to doubt that all the elevated roads will some day be operated by electricity. "It's got to come," as an enthusiast said the other day.

ELECTRIC LIGHT STATION CONSTRUCTION.

Among the papers read at the general meeting of the American Institute of Electrical Engineers at Chicago this week was one by Mr. H. A. Foster, which should interest electric-light people. The title of the paper is "Some Points for the Electrical Engineer," and in it Mr. Foster calls attention to the careless manner in which electric-light stations are, in many cases, erected. He suggests that the Institute might, through a committee which should examine into proper station design, and report on some few general plans and suggestions as to lines to be followed, do a great deal of good by establishing a better backing for those of the members who are engaged in the electric-light business.

It is a wonder that some electric-light stations can be practically operated at all when the disadvantages to be offset are considered. Poor locations, poor construction and poor apparatus are the weak points in many stations, and there probably cannot be found any other mechanical industry where so little expert knowledge has been applied in laying the foundations for the business than in electric lighting.

Mr. Foster calls attention to the disregard of common-sense principles in many instances where electric-light stations have been established, and there can be no doubt that if the Institute should lay down some general lines to be followed in the construction of stations it would be of great benefit to the operating companies.

Some stations are models of engineering skill. This is true of large cities, but in smaller places the idea seems to prevail that any place is good enough for an electric-light station. It is gratifying to note, however, that station managers are gradually being made to realize the fact that the best is not too good for an electric-light station, which is a paying investment if run on business and scientific principles.

THE EDISON-LALANDE BATTERY AT THE CRYSTAL PALACE.

Among the numerous exhibits at the electrical exhibition now running at the Crystal Palace, near London, Eng., perhaps none has excited more general interest than that of the Edison Manufacturing Company, of New York, which shows a full line of the various types of Edison-Lalande cells, of which it is the sole manufacturer. The accompanying illustration is taken from a photograph of the company's stall, and gives an excellent idea of its general appearance. The stall occupies a corner space 10 ft. by 14 ft. in the south nave of the Crystal Palace, and thus stands in a very prominent position. The arches and balustrading are of ebonized wood, relieved with gold, and the panelled roof is covered with semi-transparent duraline, which gives a very soft light in the interior. The walls are draped with art serge and finished with an ebonized moulding round the top and sides, being also divided vertically into long panels by flat gilt strips. The upper shelf attached to the wall of stall seen on the left and supported by turned pillars contains a complete sample outfit of all the various types of cells that the

EXHIBIT OF THE EDISON MANUFACTURING CO., CRYSTAL PALACE, LONDON.

Edison Manufacturing Co. makes, while upon the shelf underneath it exhibits its Family and Physician's Faradic Batteries, and further back its Combination Cabinet outfit, which is a most complete equipment for physicians, combining both Faradic and galvanic currents, and provided with pole-changer, slow and rapid vibrators, and a circular selecting switch for throwing into circuit any particular number of cells required. In the corner another single set of cells is arranged in pyramidal form. On the shelf seen on the right the company's various cautery outfit and accessories are displayed.

The batteries are exhibited in actual operation, doing the special work for which they are severally designed. The sewing-machine in the front part of stall is driven by 6 M-type Edison-Lalande cells (motor model), while the fan-motor on the right-hand shelf at back is driven by 4 cells of the same type.

The Cautery batteries are shown heating the various cautery electrodes (all of which are manufactured by this enterprising company), and also lighting miniature incandescent lamps. The Edison-Lalande cells are also exhibited in another part of the Crystal Palace running electrical steam pressure-indicators attached to the boilers of the central power station, it having been found that this cell was best adapted to this class of work on account of its great constancy and minimum of attention required.

The stall is crowded with visitors every day, and judging from the very considerable attention that these cells are receiving from the foremost scientists in the electrical profession in England, we may safely conclude that they are destined to achieve as signal a success in that country as they have already gained in the United States. In other words, that they have come to stay.

Mr. J. W. Gladstone, superintendent, had full charge of this exhibit, and was its designer.

MOTORS AND BATTERIES.

The demand for a cheap and efficient battery-current motor to operate sewing-machines, electric fans, etc., has led to the production of numberless machines of this class, but none seems to have met all the requirements so well and completely as the one described below.

These motors are series wound and of high efficiency. They are wound for a 30-volt current and will do good work with a current as low as 4 volts. The field-magnet and pole-pieces are composed of only three castings, and are more massive than usual. The armature is of the three-coil type, with the cores of the coils arranged radially on the shaft at angles of 120 degrees. The armature core casting is all in one piece and is of the best soft iron. The base of the motor shown in Fig. 1 is

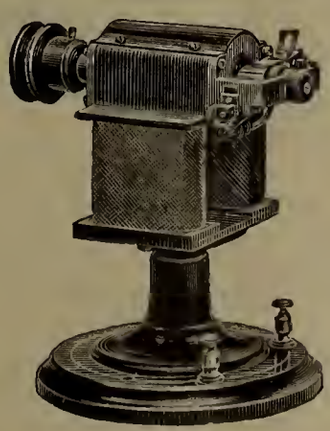

FIG. 1.

solid iron, which, on account of its weight, acts as an anchor to the motor when in operation. This avoids the necessity of screwing the motor base down to keep the machine from "walking off" or "blowing itself away," as it is liable to do when the fan is running at its full speed.

The sewing-machine motor (Fig. 2) is provided with a clamp for the purpose of attaching it to the machine stand.

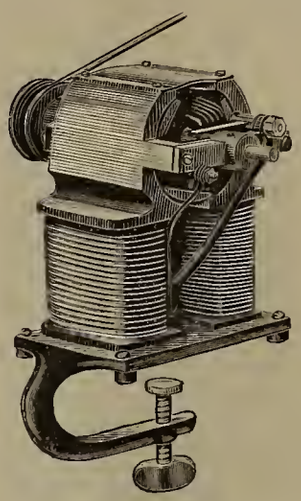

FIG. 2.—SEWING-MACHINE MOTOR.

These motors are well finished in black enamel with polished brass trimmings, and develop $\frac{1}{16}$ H. P. at 16 volts.

The "Conqueror" battery, which is designed to operate this motor, has some meritorious features, the main one and most important of which is long life. It is guaranteed to run a motor for 90 consecutive hours. It

FIG. 3.—CONQUEROR BATTERY.

is of the two-solution type, the porous cup containing the "Conqueror" solution, and the outer jar the acidulated water. The zinc is amalgamated by a special process, and it tapers so as to present the greatest quantity at the water-line, where the consumption is greatest. The carbons are especially made and are the largest on the market. They are cylindrical in shape, with two slots in the sides for the free motion of the liquids. The battery has a glass cover which is a desirable feature. (See Fig. 3).

The company has also brought out an open circuit battery which is a new departure. It is named the "Hero."

The outer cell contains the granulated carbon and the porous cup the sal-ammoniac solution. On top of the granulated carbon a hard carbon ring is set and forced

down on the grains of carbon by a screw cap, thus insuring a reliable contact. (See Fig. 4).

The granulated substance is always accessible in this battery, which is a valuable feature. The zinc is amalgamated by the same special process above referred to, which adds longer life to it, equal to a gain of about half the life of an ordinary Leclanche zinc. The E. M. F. of

FIG. 4.—"HERO" BATTERY.

this battery is said to be about $\frac{1}{3}$ volt greater than that of any other open-circuit battery in the market.

The disagreeable features of the creeping of salts are practically overcome in this battery.

These motors and batteries are manufactured by the Hero Electric Company, 80 Cortlandt street, New York city.

ELECTRICAL SOCIETIES.

CANADIAN ELECTRICAL ASSOCIATION.

During the first annual convention of the Canadian Electrical Association, which will be held in the Board of Trade Rooms, Hamilton, Ont., on Tuesday, Wednesday and Thursday, June 14, 15 and 16, 1892, the following papers will be read: "Long-Distance Telephoning," with illustrations, by Mr. Hugh Neilson; "Central Stations," by Mr. D. Thomson; "Carbons," by Mr. H. O. Fisk; "Financial Aspects of Electric Lighting," by Mr. S. J. Parker; "Steam and Electric Power," by Mr. J. J. Wright; "Multiple Switchboards," by Mr. Baylis; "Possibilities of Electric Railroading," by Mr. W. A. Johnston; "Line Construction," by Mr. T. H. Wadland, and "Safe Wiring," by Mr. A. B. Smith.

ELECTRICITY ONE HUNDRED YEARS AGO AND TO-DAY.

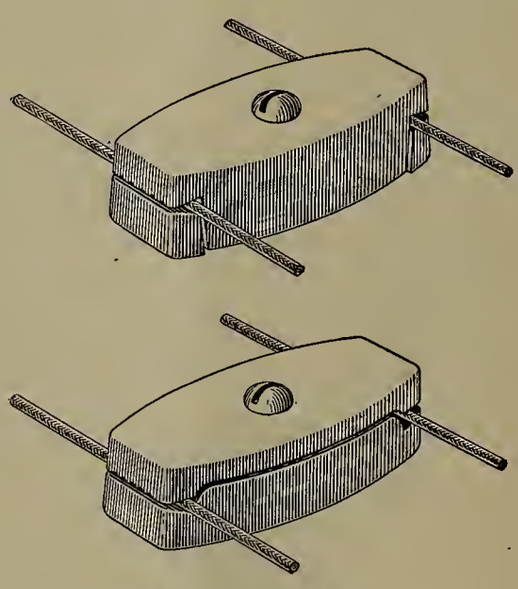
A highly interesting, entertaining and instructive lecture on "Electricity One Hundred Years Ago and To-day" was delivered by Professor Edwin J. Houston, of Philadelphia, at the Brooklyn Institute of Arts and Sciences, 502 Fulton street, Brooklyn, on the evening of June 1. There was a large attendance, and every word of the lecturer was listened to with profound attention. The professor commenced his discourse with a quotation from King Solomon, "that there was nothing new under the sun," and then in a masterly manner proceeded to demonstrate that, wise as Solomon was, yet still there was something new under the sun, and that it was to be found in the discovery and development of the electrical science. The professor divided his subject into three classifications, viz.: The immature or incomplete; the mature, but unripe, and the ripe, each one of which was specially dilated upon. He briefly reviewed the first practical discovery of electricity, which was made about 2,000 years B.C., and then running rapidly over successive periods, confined himself to the development of the science from about one hundred years or so ago up to the present time. For two hours he held his audience in rapt attention.

In concluding his remarks, the professor made some forecasts into the future, and wound up by telling the story of Alladin and his lamp, and asking if in the possession of the arc and incandescent electric lighting the world might not be considered as being in possession of a veritable Alladin's lamp.

The professor finished his remarks amid great applause, and a unanimous vote of thanks was tendered him, accompanied by expressions of regret that he had not time to continue longer. It was sincerely hoped that at some future date he would be again able to address the Institute.

THE SECURITY CLEAT.

This new departure in the way of a two-wire porcelain cleat is one of the specialties of the Security Insulator Co., of 136 Liberty street, New York. The accompanying cuts (which are about one-half actual size), showing both front and back views of the cleat, give a very fair idea of the way it is used. It is intended for incandescent wiring, and will hold securely wires of any of the usual diameters. The principal features of this cleat are its strength, neat appearance, absolute freedom from injury to the wire, and low cost in comparison to other porcelain cleats. The cleats can be had either glazed or unglazed.



SECURITY CLEAT.

EASY LESSONS FOR STUDENTS.

Owing to the press of other matter we have been compelled to omit from this issue the regular weekly contribution under this general heading.

SOME POINTS FOR THE ELECTRICAL ENGINEER.*

BY HORATIO A. FOSTER.

Although it is the province of this Institute to consider largely the more theoretical side of electrical engineering, and rightly so, it is perhaps well that it should occasionally have brought to its attention that outside practical part, only for which theory would have no backing and therefore could not reach its proper development.

It has been the fortune of the writer during the last ten months to visit and inspect, both technically and financially, considerably more than a hundred central lighting stations.

Taken as a whole, it really seems as if much of the ordinary commercial common sense and the usual keen judgment of self-interest had been on a vacation when these plants were erected. In many cases this traces back—first, to the wiles of that sleekest of all individuals the agent, who is always willing to assure the buyers that his system of lighting will virtually run itself, and then to the fact that people were formerly so doubtful of the prospective profits that on going into the business they invested the smallest amount that would start the work. The consequence was, bad construction, bad machinery, bad lines, and, of course, an entirely unreliable service. Oftentimes the man put in charge was a novice, and that worst of all novices for the business, the local amateur electrician; and is it any wonder that the business was a failure for the first few years ?

In some localities this condition still obtains, nothing having been done but to patch up the bad work of the past.

In a few cases the administration has been changed by putting at the head some substantial and tried business man, very much to the benefit of the concern. While, in many instances, even the large city plants suffer from the above causes, they also suffer from other conditions inherent in the size of their field.

The pioneers were so timid about the outcome, that the city station was invariably very much too small, and inside of two years had become so patched up and crowded, that rebuilding became necessary, and this in many cases was repeated two or three times.

There is probably no business extant which has been built over so many times and that has had the same quality and quantity of brains applied to it that is in such chaos as to the proper design of building and arrangement of machinery. In cotton or any other weaving industry, machine shops, foundries and similar establishments, it has long been determined which is the best form of building to erect, and those put up in the last ten years or so of a similar industry are planned in the same lines, differing only in size to suit the special case. Now, this not only fails to be the case in electric lighting, but outside of the two prominent systems of connecting the dynamo to its power—that is, by direct belting to fast-running engines, or by counter shaft to larger slow-running engines, there are scarcely a half dozen stations in the State built on the same or similar lines.

So much diversity of opinion is shown in designing these stations, and oftentimes by those whose opinion should have no weight, but unfortunately does, that it has the effect to convince some of the investing public that the electrical engineer does not know his business and they might as well go it alone.

If some action could be taken by this Institute through a committee which should examine into proper station design and report on some few general plans and suggestions as to lines to be followed, it might go far toward establishing a better backing for our members who are in that branch. As it is I think it will be acknowledged that far more electrical engineering skill is applied to the larger isolated plants, and that the central stations are enlarged or rebuilt under the management of the local superintendent or board of directors, who frequently lack technical knowledge or even familiarity with recent improvements elsewhere. Quite often this is owing to the fact that the only experience they have had with an electrician has been the generally young inexperienced expert who was sent out to install the first plant, and they think they can make better use of their money by controlling it themselves.

The method of distribution should also have consideration, especially in reference to the amount and style of underground work which certain sizes of city will be able to stand.

This may seem a large question, but you can be assured it is one of the most vital to the future welfare of the industry. It may be said that it is not well to interfere in private business, and that electrical engineers can be trusted to remedy the evil. I assure you the electrical engineer "is not in it," to use a vulgar phrase, and sad to say, has never been in it to any extent. Quite often officials of the electric lighting companies take a jaunt through the country visiting different stations for models for a new one for themselves. This often results in a worse muddle than ever, as they seldom find two stations at all similar, and they return resolved to use their own judgment.

This leaves the real electrical engineer out in the cold, at a point where if known he could by consultation do much good; but many of these company officials never heard of the American Institute of Electrical Engineers and need to have it brought to their notice in some way.

Some may think that in time the electrical engineer will be called in and consulted, as are engineers of other works, but at the present rate I am afraid many will be angels or worse before the majority of electrical central station companies come to that point.

Perhaps if instances be mentioned under the following heads a better understanding can be arrived at, viz.: Location; foundations; construction of station; motive-power; arrangement of machinery, and location and construction of lines.

LOCATION.

The location of plants is not now so generally bad as in the past, although we occasionally find a station in a location for which no excuse is apparent, as, for instance, one located in the basement of a carpenter shop at a long distance from fuel supplies, and only plenty of condensing water to recommend it; insurance rate, three per cent. or more. Another located nine miles away from a village of two thousand people to take advantage of water-power never surely available all the year, and since destroyed entirely for the greater part of the year. Another placed so low down in reference to its water power as to be flooded in freshets. Another located more than a mile from fuel supplies, and the centre of distribution at the top of a long, steep hill, with not even free water to recommend it. Another so located in relation to a very intermittent water-power as to be unable to take advantage of the water for condensing purposes and now running the poorest kind of a side-valve engine. Another located in a rickety, old, uncared-for part of a gas-house, where coke is scarce, and apparently plenty of water-power available within a half mile.

Another located a long distance from centre of distribution and coal supplies, to take advantage of cheap land and cheap fuel, the last of which has since proved very unreliable, when seemingly land could have been

* A paper read at the General Meeting of the American Institute of Electrical Engineers, Chicago, Ill., June 6, 7 and 8, 1892.

had much more central, with a much surer supply of cheap fuel, and to cap all, the value of that land has since increased enough to have paid the entire cost of the station at any moment it be desirable to sell.

One advantage of some of the older centrally located stations has since been learned in the increase in value of such real estate. One such station visited will enlarge and rebuild soon, and will sell its present real estate for enough advance to go far toward paying for the new station, and there are others which can, I think, tell the same story. In fact, in the present problematical growth of the future, a well-selected piece of ground may prove a very valuable part of the investment.

FOUNDATIONS.

Foundations are now much better than in the past, and some of those now placed under dynamos would sustain almost anything that could be put on them. Poor foundations are occasionally seen though, as for instance those under a large bank of boilers in a station which was erected and started in six weeks. The boilers have since lurched forward until the fronts are some two or three inches out of plumb. In fact too little attention seems to have been paid to boiler foundations as a general thing.

Engines have fared better, and when the ground has been good the foundations are to be little criticised.

One station has very large Corliss engines, and owing to water-soaked ground and limited time in which to build the brick foundations, they were placed wholly above the floor level of the dynamo-room, and belts run both ways from the fly-wheels to the shafting on either side of the room.

Very few bad dynamo foundations are now met, but many unbalanced armatures are found which no amount of foundation would hold steady.

STATION CONSTRUCTION.

In station construction there has been no settled design, therefore the promoters have generally built as they saw fit, occasionally following suggestions of the agent. Of course many plants are located in buildings already up, in which case the machinery had to be made to fit.

In many of those built especially for the work, no attention has been paid to designing for a low insurance rate, and brick stations are found sheathed all over the inside with pine, the one thing that insurance inspectors always criticise. A couple of coatings of whitewash or paint would have been much cheaper, safer, and looked quite as well.

When stations have been remodelled, very little improvement has been made in the smaller ones, but those in large cities have generally taken advantage of all the improvements to date, if not too strongly attached to some one parent company.

MOTIVE-POWER.

The selection of motive-power has of course been governed by local conditions; in the northern and northwestern part of New York State water-power is abundant and is largely used as motive-power for stations, but almost invaribly with steam reserve.

Water-power alone has been found very difficult to govern for uniform speed, and some of the devices used for that purpose are to say the least ingenious.

When the load is large enough to use part steam there is no trouble whatever, as the wheel takes a steady load and the engine does the governing.

Plants are sometimes placed a long way from the work in order to take advantage of water-power, and in some cases it seems as if all else had been sacrificed to that one point.

Of engines there is no end to the different designs, style and size used. Some use high speed, belted direct to dynamos, others slow speed belted to counter, some simple non-condensing where compound-condensing would be decidedly best.

I know of at least three plants located in waterworks pumping stations, using high-speed simple non-condensing engines on a practically steady load, all of which have been erected during the past three or four years.

Two stations I remember having an all-night and every-night load of arc lights, and situated on a lake shore, which run high-speed simple non-condensing engines.

To offset this there is one station that deserves mention, as it embodies many points of value. The building is substantial, of brick, two stories high and on a river-bank. The boilers are very efficient and well set, the engine is a moderate speed compound-condensing, with shaft extended for three dynamo pulleys and one for the power condenser. There is a heater between the exhaust and condenser and a power-pump attached to one side of the condenser. The flow to the boilers is governed by a bye-pass valve, as the pump is of course in motion all the time the engine is running. This station has only an arc load and runs all night. It was built entirely under the supervision of a local mechanical engineer, with the exception of connecting the lines and dynamo terminals to the switchboard, and would, I think, be hard to beat for results.

ARRANGEMENT OF MACHINERY.

The arrangement of machinery is as diverse as the style of motive-power; when direct belting is used the arrangement is generally simple and plain, but oftentimes so crowded as to be very inconvenient.

There seems no end to the arrangement of shafting; some have a line shaft through the middle of the dynamo-room and belt both ways to dynamos; others a shaft on either side of the room belting to dynamos in the centre; others the shaft under the floor belting up to dynamos and occasionally to engines also; others have the shafting overhead—in fact, there is no end to the styles, some good and some bad. In most cases friction-clutches are used with shafting for stopping individual dynamos, and some few may use loose pulleys on independent sleeve for the same purpose.

The length of belt centres varies greatly, some apparently thinking if long belts are better than short, very long ones must be much the best.

The improvement in switchboards seems to me more marked than in any other one department, which is probably owing to the pressure of insurance men who look at the switchboard as the most dangerous risk of all.

LINE CONSTRUCTION.

In line construction I cannot see that any very marked improvement has been made excepting, in some cases, the substitution of larger and better poles for the older ones.

The use of black covered wire in place of white has perhaps made the lines a trifle less conspicuous, but that is about all. The lines still have the apparent aimlessness of direction mentioned by Prof. Thomson at Buffalo.

People in the larger interior cities are already agitating the question of underground wires, and it seems probable that unless something is done soon by the companies themselves to rid the streets of the more conspicuous of these wires, there will be very costly trouble for them to contend with.

It can no longer be denied that wires are working well every day in subways, and the only valid argument against them is extreme cost. Nevertheless when the general public learns this fact, cost will have little to do with the argument.

In many places wires can be removed from the main

streets to alleys back of the shops, and the extra cost will be decidedly cheaper than underground work. In such few places as have already done this, wires are inconspicuous and the underground question is never raised.

In street lighting the favorite method is the cable suspension across the street. Where the work is neatly done this serves very well, but it would be difficult to find a more unsightly thing than some of the lamps so suspended.

Considerable trouble is occasioned in the above method by breakage of the wires at the joint with the line and at the cross-bar over the hood. There is no apparent reason why twin or duplex wire should not be more used for this purpose instead of the kinked and straggly single wires.

There are many other methods, some of them good in principle but bad in the application, and so it goes.

It seems to me that if some action was taken by a non-partisan association like this Institute an advance toward better engineering might be made, if a few general laws could be suggested to be followed in laying out the different parts of a lighting station. Perhaps it may be said that much of the above work should more properly come before the National Electric Light Association, but as many of that society are members of this Institute, I feel sure they would individually appreciate its backing in the future when the time comes for enlargement, and they have need of combined expert opinion.

RAILWAY TRAIN LIGHTING.*

BY A. H. BAUER.

The first successful system of railway train lighting is that invented by Houghton, and adopted by the London, Brighton and South Coast Railway of England, in 1881–82. Since then the many improvements suggested by other inventors have made it almost automatic. . . .

Numerous propositions have been made to use primary batteries for car lighting, but I am not informed of a successful installation of that character.

Secondary or storage batteries have been more or less employed for that purpose, with varying success. The first attempt in this direction was made in 1887–8 on two Pullman limited trains, of six cars each.

Each car was equipped with thirty cells of battery, having a capacity of 150 ampére hours, and weighing 50 lbs. per cell, or 1,500 lbs. per car. Duplicate sets were kept charged at each end of the line, and on arrival of the train exchanged for those that had been exhausted while on the road. The average number of lamps per car was 26, of 16 candle-power, at 60 volts, or a total of 156 in the train. After sixty days' trial, it was clearly demonstrated that, under existing conditions, the system could not be made successful, and it was abandoned. . . .

This was five years ago. Since then improved methods of manufacture as well as more intelligent care in handling has to a great extent overcome their objections and thereby increased the life of the battery. It may be asked—why not increase the size and therefore the capacity of the cell? The reply is—that to properly light a train of six Pullman cars, for instance, between Chicago and Jersey City, with the number and kind of lamps above stated, would require 30 cells, each weighing not less than 100 pounds—a total of 3,000 pounds per car, or 18,000 pounds for a six car train. The expense of handling and changing such a weight would make its use almost prohibitory, for each cell would have to be handled singly. The weight on the car would also be objectionable. Since these experiments were made, car lighting for short distance only, from storage batteries, has been made successful. For the past two years four cars, each equipped with 32 cells of 150 ampère-hours capacity and 26 16 c.p. 60-volt lamps have been running between Chicago and Cincinnati, and Chicago and Indianapolis. Two of these cars are charged every day at Chicago for about nine hours with sufficient current for a round trip. The batteries, however, are not changed; the cars are always placed on the same side track to which wires from the dynamo are led, and the charging is done without removing them. The average length of time the light is required during a round trip is six hours; the cars leave each end of the line at 8 and 9 P.M. respectively. Repairs are made by removing the defective cell and substituting another if necessary.

The cost of repairs and renewals of all kinds since September, 1891, to January, 1892, inclusive, per month, was as follows:

September, 1891	$ 36 44
October, "	108 82
November, "	51 24
December, "	79 21
January, 1892,	38 31
Total	$314 02

which, divided by four, is $78.50 per car per month, or $2.61 per car per day, and this divided by 26 gives 10 cents as the cost per lamp per day. As the engine and boiler are used for furnishing power for other purposes while running the charging dynamo, it is difficult to get the cost of the power for charging these batteries, that factor, therefore, is not included in the above statement.

In January, 1888, a solution of the problem of lighting six car trains for long distances was sought for in another direction. Two trains running between Jersey City and Jacksonville, Florida, a distance of 1,100 miles, were selected for the experiment. At first an attempt was made to utilize the power of the axle, but for reasons already stated did not prove successful.

The next step was the substitution of a vertical single-stroke engine, located in the baggage car, for the axle connection. This engine was belted to the dynamo, and was supplied with steam from the locomotive boiler.

While this plan seemed to be a step in the right direction, it still had its objections, due to the fact that the upward and downward movement of the driving-rod acted in the same manner as would a heavy blow on the car body, so that the latter would vibrate in unison with the stroke of the engine.

After a few trials, the vertical engine was removed and a three-cylinder reciprocating engine, with three-inch cylinders and four-inch stroke, was substituted. It was connected direct by a flexible coupling to a 75 volt 60 ampère dynamo of the ordinary open-frame type, and both run at 1,000 revolutions per minute.

The working of this combination clearly demonstrated that a solution of the problem was attainable, and it was now possible to guarantee a fairly successful lighting of the two trains. A fault soon developed which could not be anticipated. It is well known that all railway trains while running gather more or less dust and dirt, but it was not known until train lighting was attempted that this dust and dirt contains certain quantities of carbon and metal which adhere to armature and field wires, and being conductive form short-circuits. So frequently did this occur, that it became necessary to carry an extra armature with each plant, and make changes while the train was in motion. Later in the year these dynamos were removed, and the Eickemeyer installed. The Eickemeyer dynamo seems to be perfectly adapted for train lighting. As both the armature and field coils are protected by the iron of the machine, the dust and dirt does not reach the wire, except in small quantities, and by removing it every six months, when the car is shopped

*Abstract of a paper read at the General Meeting of the American Institute of Electrical Engineers, Chicago, Ill., June 6, 7 and 8, 1892.

for repairs, short-circuits have been prevented. Its strong construction is such that it will successfully withstand the general rough usage to which machinery of this character is subjected to on railway trains.

The system which has been used for the past five years on all Pullman trains consists of a Brotherhood three-cylinder engine and Eickemeyer dynamo, bolted to a cast-iron bed-plate, and located in the forward end of the baggage car, occupying an enclosed space of 6 feet 6 inches by 3 feet 3 inches. The engine and dynamo are connected by a flexible coupling which allows for the irregularity should they not be in perfect line. A two-gallon sight-feed pressure lubricator bolted to the end of the car furnishes oil to all wearing parts of the engine. The average consumption of oil is about one gallon every 20 hours of actual running of the engine.

Steam is taken from the locomotive boiler, a tap being made at the dome, the pipe passing under the tender and car, between which a flexible rubber hose makes connection. It has been found that with 1½-inch pipe between the boiler-head and car, there is a loss of 15 pounds pressure due to friction and condensation ; therefore, to run the engine with 50 pounds requires 65 pounds at the supply-pipe on the locomotive. With 50 pounds pressure, the dynamo will, at 900 revolutions, generate 80 ampères, at 72 volts, when all the lamps and batteries in a six car train are in circuit, and 50 to 75 ampères, at 80 to 85 volts, at the same speed when the batteries alone are connected, depending on the counter E. M. F. of the batteries.

On the side of the car is placed an automatic switch, which will break the circuit when the E. M. F. of the dynamo equals that of the batteries. A voltmeter and ammeter are kept constantly in circuit while the plant is in operation. A tachometer, belted to the armature shaft, is also provided for noting the speed of the engine and dynamo. This plant is enclosed by a tongue-and-groove partition surmounted by a wire screen.

The system of wiring adopted is the equi-potential, in which the pressure is practically equal at each lamp and battery. One wire leads from the positive pole of the dynamo to the rear end of the rear car, where it is coupled to a second that returns to the baggage car—but not to the dynamo—being tapped, however, by the positive pole of each battery and one side of each lamp. A third wire leans from the negative pole of the dynamo to the rear end of the rear car. where it ends. This third wire is tapped to the negative pole of each battery and the remaining side of each lamp.

All the batteries and lamps are therefore in multiple arc. Double-pole, fusible cut-outs are placed in each circuit, and with the switches are located in the closets of each car. The wires are always placed on the roof of a car. For this purpose white-wood moulding, thickly coated with asphalt paint, is nailed from end to end as near the centre as possible, usually one and three-quarter inches from the edge of the smoke-jack if the car is equipped with centre oil lamps, and from 6 to 24 inches when gas lamps are applied. Branch mouldings extend to all points on the roof through which it is desired to run wires to the lamps, switches, etc., inside the car. . . .

When the batteries alone are in circuit, the E. M. F. of the dynamo will be from 67 to 83 volts, which, minus the loss, will overcome the counter E. M. F. of the batteries, viz., 57.6 to 73.6 volts. When both lamps and batteries are in circuit the external resistance is of course reduced, and the E. M. F. of the dynamo falls in proportion, and that at the lamps will be from 60 to 66 volts.

It is unnecessary to use a resistance in the lamp circuit, as when the lamps are first turned on, the E. M. F. being, say, 66, a greater candle-power is had just at the time when most needed, which, however, gradually falls and ordinarily reaches 60 to 61 volts in from two to four hours, depending upon the amount of charge in the batteries. It is true that this is at the expense of the life of the lamp, but as the handling of the switches is done by the porters and conductors, the use of rheostats or regulators, no matter how simple, would complicate the system and probably cause the total extinction of the light. Each car is provided with 32 cells of storage batteries, placed 16 in each of two boxes, securely fastened under the centre, and directly over the truss-rod. The weight of batteries and boxes complete is about 2,000 pounds. As already stated, with the system of wiring adopted the batteries and lamps are permanently connected in multiple arc, so that shouldthe train be parted and connection with the dynamo become broken the batteries will supply current necessary to maintain the light ; or should the batteries under one car become disconnected, its lamps will be supplied from batteries under other cars in the train.

SELECTIVE OR INDIVIDUAL SIGNALS.*

BY THOMAS D. LOCKWOOD.

The business of the average user of the telephone keeps a line employed but for a very small part of the entire business day, and for the remainder of the time the line wire is idle and earning absolutely nothing. If by any means it could be made possible to place several sub-stations in connection with the same circuit, without materially affecting the efficiency of the service rendered, it is obvious that the earning power of the circuit would be largely increased. But a call-bell or other signal is clearly necessary in order that the attention of the station may be attracted when some other station desires to communicate, and as we add stations to a circuit we also necessarily add call-bells ; thus introducing two practical objections, viz. :

1. A most incessant and annoying ringing, because a call sent to any station is heard at all stations.

2. The necessity of distinctive signals, whereby when the bell at any station is rung the attendant may know whether the call is for his or for some other station.

At this juncture the selective signal steps in, and its special work or function may be thus stated : That two or more stations being electrically connected with the same circuit, the call-bell at any predetermined or desired one of such stations may be operated, and the call given there, to the exclusion of the call-bells at the other stations, which at the same time remain quiescent, or are silent. We therefore see that the thing to be done is not merely to ring a bell over an electrical circuit; but to select and ring from a distant point a *given* bell on a circuit with which more than one are connected; and at the same time to insure that the bells at the other stations which are not intended to be rung shall not be rung.

This statement of function justifies the term "*selective signal,*" which I have adopted, and which I conceive to be more appropriate than the old term "individual signal," because more descriptive.

The idea of producing a practical selective signal is not (as might from the introductory remarks of this paper have been supposed) one which made its first appearance subsequent to the advent of the telephone.

Appliances possessing the same characteristics appeared in England many years ago, and several forms have from time to time been patented in that country for use in connection with telegraphy, which closely resemble some of the forms which within the last ten or twelve years have been reinvented and patented here.

* Abstract of a paper read at the General Meeting of the American Institute of Electrical Engineers, Chicago, June 6, 7 and 8, 1892.

One of these[1] is based upon combinations of a plurality of line wires, two or more of which extend from a terminal to each two substations.

A second[2] involves two wires, together with the use of both directions and varying strengths of currents; and states itself to be "for sounding any particular alarm in a set of telegraph stations."

The third,[3] quoting from the published abstract, is for "transmitting secret intelligence to any one or more stations without the use of extra wires. At each station a metallic disc, suitably inlaid with non-conducting portions, is brought to the required position in order to complete the circuit or not, by any electro-magnetic step-by-step movement, thus excluding or including the telegraph instrument at any particular station or set of stations as required."

Three other British patents prior to 1876 are of this class, one of which[4] speaks of "an apparatus comprising a main line, a series of independent branch or station lines at each end, and clocks at both ends working synchronously, which, by means of revolving cams, place the main wire in consecutive connection with corresponding branches at the two ends for definite times."

Another[5] speaks of "apparatus placed in a continuous circuit; the bell at any particular station being caused to ring by the simultaneous advance in all the line-wire apparatus of a cam disposed in a way peculiar to each station, which is instrumental in closing a local circuit by which the bell is sounded."

The final instance[6] of this series is a mechanism in which a disc slotted or perforated at but one point, the location of such point differing for each station, opposes itself to the forward motion of an armature lever, at all times, except when the slot or hole is immediately opposite a pin on the end of the lever. This occurs at no two stations at the same moment, but when it does occur at any station the pin passes into the slot and the armature is thereby permitted to complete its advance and to close a local circuit and ring a bell.

Several of these suggestions will no doubt be recognized as being found also in some of the more modern selective signal appliances.

In France, too, in connection with railway telegraphy, this class of invention was formerly very popular; and as might be expected, is not neglected by that indefatigable chronicler, the late Count du Moncel, who devotes considerable space to the subject in the "Exposé des Applications de L'Electricité.[7]

It is unnecessary to recapitulate much of what he states, and it is perhaps sufficient to say that the plans of no less than thirteen different inventors are described in which the achievement of selective signalling is at least aimed at, and that some of them evince as thorough an appreciation of the merits of the question as do many of the appliances patented for the same purpose in America since 1876; while one or two actually are based upon ideas which are found in comparatively recent patents also.

In the plan of Lamothe, for example, which is discussed by M. Du Moncel, the gong which is to be struck is by one electro-magnet brought within range of a bell hammer, which then by a second electro-magnet is caused to strike the bell.

Another inventor, Bizot, has a plan for selectively ringing bells by means of pendulum hammers placed at the different stations, and adjusted at each station to a different length.

An electro-magnet at each station in the main circuit controls the swing of the pendulums by its alternate magnetizations and demagnetizations brought about by the makes and breaks of the main line current; these being effected by a vibratory circuit breaker at the transmitting station, operated by a similar electro-magnetic pendulum there, which can be adjusted when desired to the same length as the pendulum at any one of the other stations which it is desired to operate. Only that one to which it is adjusted will be operated, the others remaining inert. By so arranging *all* of the station pendulums that they can be adjusted, any station is enabled to selectively signal any other.

This apparatus I have described at considerable length, because it is founded on the harmonic principle which later was introduced into telegraphy, and because it contemplates the use in selective signalling of that principle, subsequently more elaborately worked out by German and American inventors and described in their several patents.[1]

Martorey's system, which likewise is described by M. du Moncel, also contains the elements of many subsequent forms. In it, by an electro-magnetic step-by-step motion, an escapement wheel having a number of teeth at least equal to the number of stations on the circuit, to give the signal is brought to a given position by a given number of pulsations, differing for each station. All the teeth are metallic, and all except one are insulated. That one connects with the axis and mechanism, and is part of the alarm circuit. When brought into position, the ringing circuit, which it appears is open normally at two points, is closed at one of these points, and at this juncture a single impulse sent over a second wire closes the second break in the local circuit, causing the bell to ring.

In addition to the foregoing examples of the condition of the art, it is not, I conceive, out of order to point out that the principles which govern printing telegraphy are closely related also to selective signalling. Consider for example, the House, Hughes and Phelps telegraphs, and the form of stock quotation recorders now so universally employed; in all of these a given letter or figure is brought to a suitable point and is then pressed by a final operation against the paper to make the impression.

Now a little careful thought will show that the two problems:

A. To bring a number of typewheels at different stations all to the same predetermined point, and then press the paper against them so that the same letter will be printed at all stations, and

B. To bring a number of wheels at different stations carrying local circuit-closing devices (placed at a different point for each wheel) all to the same predetermined point, where any particular one of them will be in position to close its local and ring its bell when the press movement is made; are not in principle by any means far distant from each other.

They are further related, in that both must have a unison, zero, or starting-point, to which they can be brought periodically for a fresh start, to forestall a lack of harmony between the different stations, or to provide means for bringing back an errant wheel which has strayed away from the path of electro-mechanical rectitude.

A good stock of knowledge thus was at the disposal of those interested, even at as early a date as 1876, when the career of the telephone was only beginning. We had the electro-magnetic ratchet and pawl, step-by-step, movement. We had electrically controlled clocktrains.

It was old to trip clockwork electrically, and also to use wheel circuit changers. The unison device in connection with step-by-step devices was old, and its use well known; the relay and its function of closing local alarm circuits was already a classic; wire combinations of various sorts were customarily employed, and the har-

1. Br. Patent 12039, January 25, 1848, H. and E. Highton.
2. Br. Patent 12959, February 7, 1850, E. Highton.
3. Br. Patent 13427, December 27, 1850, Dering.
4. Br. Patent No. 3006, December 1, 1863, Wilde.
5. Br. Patent No. 910, March 31, 1865, De Bonneville.
6. Br. Patent No. 1801, June 11, 1869, Lyttle.
7. Exposé des Applications de L'Electricité, Vol. iii, 1874, pp. 510–528.

1. German Patent, No. 1044, Maron, December 5, 1877.
Br. Patent, No. 5078, Blake, December 11, 1879.
U. S. Patent, No. 251,097, Currier, Dec. 20, 1881, and others.

monic field had already been well threshed by Helmholtz, Bizot, La Cour, Varley, Gray, Bell and others.

Why then was it not easy to make at once a thoroughly satisfactory and efficient selective call?

One reason is, that the average inventor or would-be inventor generally refuses, tacitly it is true, to recognize that there is any material of which he may make use. He does not know the state of the art; does not want to know the prior art; does not care anything about the prior art, and often feels affronted when he is necessarily brought face to face with it; and then he gives utterance to the pathetic plaint that "the people of former times were a dishonest race, they have stolen all my new inventions."

It is, however, clear from what has been stated, that the principles which underlie the problem in its many phases had to a great extent been elucidated, and that much had been done in working out scores of electro-mechanical contrivances, capable of being utilized in apparatus embodying such principles; and for these reasons there has in this branch of electro-mechanics been little scope for the exercise of original broad invention, and consequently little reasonable expectation of substantial pecuniary reward, even for him who might produce a thorough practical success in selective signalling.

These considerations have without doubt had effect in preventing many inventors and mechanicians of the first rank, or of great experience, from vigorously grappling with what was left of the problem. Yet from January 1879 to December 1891, 161 U. S. patents were granted for forms of telephonic selective signalling appliances, all of which I have examined.

A careful analysis shows that quite a large number of general plans have been proposed, and that each of these has been developed in several ways, with greater or less care, and to many degrees of perfection. Several sub-methods can be utilized in many of the general plans, and in a number of cases attempt has been made to provide for several additional functions.

Though at one or two points selective signals embodying a few of these different plans are even yet employed, every telephone man knows that it cannot truly be asserted that success has attended such appliances.

To reach practical success, by which is meant to devise a really trustworthy selective signal, economical, simple and easily kept in order, invention is not so much needed—keeping the prior art in mind—as is electro-mechanical skill to mould a homogeneous and perfect apparatus from the immense amount of material we have to choose from; an apparatus in fact which will operate perfectly, not only when the several circuit signals are ranged up alongside each other on the testing-room wall, where a screw may be adjusted here, a spring tightened there, and a bell-hammer rod bent in another place; but equally well when they are distributed over the circuit, and all at a distance from the operator.

HIGH-SPEED ELECTRIC RAILROAD.

The announcement that Dr. Wellington Adams was to lecture before the New York Electric Club on June 2, on the subject of the proposed high-speed electric railroad between Chicago and St. Louis, brought out a large attendance, and although the weather was extremely warm, all those present were deeply interested in the details of the unparalleled project as given by Dr. Adams.

The speaker introduced his subject by referring to the difficulties and obstacles met with in the introduction of the early railroads, and how these projects were ridiculed. So it was with his.

It was while he was in Europe last summer that he first got the idea of building a long high-speed electric road. At first he thought of laying the road out between New York and Philadelphia, or New York and Boston—where the traffic is great—but after further consideration he came to the conclusion that the hilliness of the country intervening between these cities, and the many streams which would have to be crossed would form great obstacles, so he finally selected St. Louis and Chicago as the termini of his proposed road. Between these two cities —a distance of 248 miles in a straight line—the country is for 200 miles as level as a floor, and on the other 48 miles the maximum grade is but 2 per cent.

It is proposed to erect two generating stations along the line of the road, one at Wilmington or Fairbury, 60 miles from Chicago, and the other at Edinburg, 18 miles southeast of Springfield. At Wilmington there is an abundance of water-power which can be had free, and at Edinburg the company owns a coal-mine, the coal from which can be sold, and the coal dust which is ordinarily waste will be used in the production of steam for the generation of the electric power; in this way it will cost the company nothing for fuel, which is the most important item of expense in a power-generating plant.

It is proposed to divide the road into four sections, as far as the electrical distribution is concerned, and each power plant will supply current to two of the quarter sections—one on each side of the station.

On a screen was projected a cross-sectional view of the road-bed, which showed that great care would be given to this important particular.

The company proposes to build at first two tracks, and each will be put upon an independent bed with a drain between the two beds and a ditch at either outside. The road-bed will be of unusually solid construction and the rails will be California rails, which overlap and are practically continuous, without fish-plates or any devices of that sort. The road will thus be secure against many of the accidents which ordinary road-beds cause. Between the two roadbeds will rise a series of poles supporting cross-arms, to either end of which will be strung the wire along which the trolley will work. The trolley will be of different design to that ordinarily used on street lines. It will be a combination of the sliding contact and wheel, and constructed with a view to meeting the conditions of high speed. The trolley wire itself will be suspended in such a way that it will be a perfectly straight line. This will be accomplished by the use of suspension supporting wires, on the principle of the suspension bridge. It is necessary to have a straight trolley wire to prevent the trolley jumping off, as it would if there were any inequalities of level, in going at such high speeds

The cars will be low, heavily weighted, and the front end of each car will be a sort of inclined plane, so that the least atmospheric resistance will be got. There will be two trucks, with a pair of six-foot wheels and a pair of 31-inch wheels to each truck. The part of the car in which the passengers will be put will be partly down between the two trucks. The top of the cars will be only 9 feet from the rail. This low car permits of the cheap construction of bridges over highways. All the highways crossed by the road will be carried over the tracks by bridges, which will be built in a substantial and proper manner, at a cost of $10,000 each.

The electrical generating and translating apparatus was meagrely described, Dr. Adams, stating afterwards that there were some details that he was compelled to withhold at present. In general, however, a three-phase 500-volt current is to be generated at the power-house, and this is to be transformed into one of 25,000 volts, which will be again transformed by step-down apparatus to 3,000 volts at transforming stations located 10 miles apart, and fed to the trolley wire at this pressure at these stations.

As to the motors to be used on the cars, Dr. Adams said practically nothing.

In the practical operation of the road all cars will go through without stop. It is intended to build spurs from the main tracks to the larger towns that have been cut off because of taking the air-line route. The car from each town will run straight from that town to Chicago or St. Louis, as the case may be, without stop or let-up. In the course of time the company expects to build two more tracks and run accommodation trains on them, stopping at stations erected a mile apart.

Mr. O. T. Crosby and Prof. George Forbes, of London, both made a few remarks at the conclusion of Dr. Adams' address.

Mr. Crosby hoped that the Doctor's enthusiasm was well founded, but he feared there were still many difficulties in the way.

Prof. Forbes said he regretted that Dr. Adams had not been more explicit as to the way the electricity was to be applied, as without knowing that no one could discuss the scheme. He has listened to the Doctor with enthusiasm but not without some misgivings.

NEW COMPANY.

The Pierce & Miller Engineering Company, 42 Cortlandt street, which succeeds the firm of Pierce & Thomas in the general engineering and contracting business carried on by that firm, was organized under the laws of the State of New York, on June 2, 1892, with a paid-up capital of $100,000. The officers are: President, F. M. Pierce; vice-president, J. D. Miller; secretary and treasurer, W. H. Stalnaker. Mr. F. Schmerber continues as chief-engineer and Mr. W. B. Hadley as electrical engineer.

Under the reorganization Mr. R. H. Thomas has withdrawn. The gentlemen composing the new company were all actively connected with the old firm, and will pursue the same vigorous policy under which Messrs. Pierce & Thomas became so well known. The company will still continue to represent the McIntosh & Seymour engines, and will make a specialty of installing electric light and railway plants. It will also go more extensively into the business of engineering and contracting for complete steam plants for electric railway, lighting and manufacturing purposes, also for mining machinery and the construction of plants for the equipping of mines and for the concentration of milling of ores, and in all work the new company will adhere closely to the policy adopted by Pierce & Thomas, of furnishing first-class machinery specially adapted to the work it has to perform, and first-class engineering and construction work, where contracts are to be executed, having in view, first, the economical and convenient operation of the plant, in line with the best engineering practice.

The first McIntosh & Seymour engine used for street-railway purposes in Brooklyn was installed by Messrs. Pierce & Thomas for the Brooklyn City Railroad Company, Brooklyn, N. Y., and it was through their efforts that engines having a total capacity of over 100,000 H. P. have been installed throughout the East. We extend our best wishes to the new enterprise and predict a successful future.

LIFTING POWER OF MAGNETS.

The lifting power of a magnet (also called its "*portative force*") depends both upon the form of the magnet and on its magnetic strength. A horseshoe magnet will lift a load three or four times as great as a bar magnet of the same weight will lift. The lifting power is greater if the area of contact between the poles and the armature is increased. Also the lifting power of a magnet grows in a very curious and unexplained way by gradually increasing the load of itsarmature day by day until it bears a load which at the outset it could not have done. Nevertheless, if the load is so increased that the armature is torn off, the power of the magnet falls at once to its original value. The attraction between a powerful electro-magnet and its armature may amount to 200 lbs. per square inch, or 14,000 grammes per square centimetre. Small magnets lift a greater load in proportion to their own weight than large ones. A good steel horseshoe magnet weighing itself one pound ought to lift twenty pounds weight. Sir Isaac Newton is said to have possessed a little loadstone mounted in a signet ring which would lift a piece of iron 200 times its own weight.

ELECTRIC LAUNCH FOR THE WORLD'S FAIR.

On the afternoon of June 3, on the invitation of the Electric Launch and Navigation Co., 120 Broadway, New York, several representatives of the electrical press and a few other gentlemen took a short ride on the Passaic river, at Newark, N. J., on an electric launch made by this company, to witness the performance of the craft.

This company hopes to get the contract for the water transportation service on the lagoons at the World's Fair, and this launch will be sent to Chicago in a few days for test and approval of the Exposition management, and as a specimen of what the company will supply in case the contract is awarded to it.

The boat is exceedingly attractive in appearance, has fine lines and is elegantly finished, and above all there are none of the disagreeable features that are inseparable from steam or naphtha launches, such as hissing of steam, smell of oil or naphtha, coal smoke, soot, etc., etc. In the electric launch no part of the motive-power is visible, and there is not the faintest suggestion of any thing of a disagreeable nature anywhere about the boat.

The boat is built of white cedar, with oak and brass trimmings, and the cabin, or rather, cockpit, which runs almost the whole length of the craft, is finished in mahogany. The seats are covered with leather cushions, and the floor with a carpet of a color harmonizing with the surrounding trimmings.

The name of the boat is *Electra*, and as she slipped through the water at her normal speed—7 miles per hour—she was exceedingly attractive, and looked capable of attaining a much higher speed with ease.

The *Electra* is 34 feet long over all, 30 feet on the water line and 6 feet beam. She draws 28 inches of water, and her propeller is 18 inches in diameter, with a pitch of 12 inches.

The current is supplied by storage cells which are arranged under the seats on each side, and on each side of the motor in the bottom of the boat. There are 78 cells in all, each with a capacity of 125 ampère-hours, and weight of 38 lbs. The total energy of the cells is 2,250 watt-hours, and the current delivered under normal speed is from 30 to 35 ampères. They carry a charge sufficient to run the boat at normal speed for 10 hours, or 70 miles; for maximum speed the cells are all connected in series, while for normal they are connected in two sets of 39 in parallel. The cells are filled with a jelly electrolyte to prevent spilling by the motion of the boat. They were made by the Consolidated Electric Storage Company, of 120 Broadway, New York.

The motor, which was designed by Mr. Anthony Reckenzaun, of London, lies under the floor of the cabin, and is entirely out of sight. It weighs 420 lbs. and gives four speeds, viz.: 3, 7, 9 and 11 miles an hour, the normal being produced with the armature running at 650 revolutions a minute. The motor is built in an extremely compact form and requires little space, and its

nominal power is 4 H. P. It is series wound, and the armature is of the Gramme ring type.

The electrical fittings and supplies are furnished by The E. S. Greeley & Co., the New York Electrical Works, Alexander Barney & Chapin, The C. McIntire Co. and others, and the wire by The Okonite Co.

The propeller shaft, which is connected directly to the armature shaft, is 1⅛ inches in diameter, and is made of Tobin bronze. Ball bearings are used throughout. The power is controlled by a switch-wheel placed concentrically with the steering-wheel. The shaft of the electric switch revolves within that of the steering-wheel but is entirely independent from it ; the handling of the boat is therefore a matter of great facility, as both the switch controlling the power and the steering apparatus form practically one wheel. This arrangement was designed by Mr. Fred Reckenzaun, electrician of the Consolidated Electric Storage Company, and works perfectly.

In practical operation the machinery worked with remarkable smoothness and freedom from vibration, and in every respect the boat seemed to be a perfect success.

Gen. C. H. Barney, general manager of the Electric Launch and Navigation Co., managed the boat on the trip with skill, and showed just what could be done in the matter of easy handling. Mr. E. J. Moore, vice-president of the company, accompanied the party, as also did Mr. Fred Reckenzaun, Mr. Gardner and others.

SUIT DISCONTINUED.

The suit for $12,000,000 brought by the Western Union Telegraph Company against the American Bell Telephone Company in the United States Circuit Court, Boston, Mass., has been discontinued, but in such a manner that it can be resumed at any time. The object of the suit was to compel the defendant to transfer to the plaintiff one-fifth of the shares of the capital stock of numerous corporations operating telephone and exchanges throughout the United States, and also one-fifth of the dividends of the companies and one-fifth of the sum paid the defendants for license to connect telephone exchanges, and one-fifth of the bonds and securities received for the license of telephones. The contract which forms the basis of the suit was made Nov. 10, 1879, between the American Speaking Telephone Company, the Gold and Stock Telegraph Company, the Harmonic Telegraph Company, the Western Union Telegraph Company, who are the plaintiffs, and the National Bell Telephone Company, which was the predecessor of the present defendant. The stock of all the companies named as defendants, with the exception of the Harmonic, is controlled by the Western Union Telegraph Company. By the terms of the contract the defendant was given the right to use the Gray and Edison patents, which were owned by the plaintiffs, in return for which they were to receive 20 % of all sums received for royalties. The point in dispute was whether the 20 % was to be returned upon all sums received or only on profit made.

NEW BOOKS.

DICTIONARY OF ELECTRICAL WORDS, TERMS AND PHRASES. By Edwin J. Houston, A.M. 562 pages ; 570 illustrations and diagrams. The W. J. Johnston Co., Limited, New York. Price, $5.00.

The first edition of this work was brought out in 1889, at a time when there was a great need for a book of this character, and since then so many new words and phrases have been coined and put into currency that a complete revision and enlargement of the original work was necessary in the second edition, which is just out.

The book is entirely rewritten, and is much larger than the first. It is a veritable electrical encyclopædia, and will be as valuable to the electrician and electrical student as the unabridged dictionary is to the student of the English language. It includes all of the words and terms in current use, and gives much valuable information in each definition.

Definitions are given under about 5,000 titles, and there are nearly as many more for the purpose of cross-references. Every subject treated of is brought up to date, and taking the work entire, it stands alone in its completeness and scope. No electrical library can be complete without a copy of this valuable book.

AMERICAN TELEGRAPHY : SYSTEMS, APPARATUS, OPERATION. By Wm. Maver, Jr. 563 pages ; 450 illustrations. J. H. Bunnell & Co., New York. Price, $5.00.

The object of this book is to present to its readers a comprehensive account of the systems of telegraphy now in use in America, from a practical standpoint, and it is written in a manner intended to be clear to novices in electrical matters, more especially to those who are directly engaged in the practical working of electrical systems of telegraphy. The laws and facts of electricity and magnetism involved in the operation of the systems and methods described are clearly set forth. The illustrations in the book are nearly all original, having been prepared expressly for this work. They are exceedingly clear, and, in conjunction with the relative text, it requires little mental effort to understand the practical details of the subjects discussed.

There are 34 chapters in the book, which cover such a wide range of subjects that it would take more space than we have at our disposal to enumerate them. They not only embrace telegraph systems, but many other subjects, such as fire-alarm telegraphy, police-signal systems, railway electric block-signal systems, underground conduits, etc., and construction and maintenance of telegraph lines.

The author of this book is a well-known electrician, and has a reputation of being careful and exact in the preparation and statement of facts, and backed by such forces the work seems destined to meet with great success. It will "fill a long-felt want," for it is many years since a work of this character has made its appearance. Since the last book of this kind great changes and improvements have been made in all systems of telegraphy, and the object of this work is to bring the descriptions of all these together under one cover for handy reference. There is no doubt that it will meet with great demand. It brings everything up to date.

NEW INCORPORATIONS.

John L. Gisk Ideal Rheostat Company, Jackson, Mich., incorporated May 13, with a capital stock of $10,000, to manufacture and sell John L. Gisk rheostat and electrical appliances. Incorporators: Clarence H. Bennett, John L. Gisk, H. Smith, Jackson, Mich.

The Yonkers Machine Company, Yonkers, N. Y., has been incorporated with a capital stock of $5,000 to manufacture and sell machines, and construct power plants, electric-light plants and other apparatus. Incorporators: Rudolph Eickemeyer, Norton P. Otis, William Delavan Baldwin, all of Yonkers, N. Y.

The Pernaux Electric Company, New York, N. Y., has been incorporated with a capital stock of $2,000, to manufacture electrical instruments. Incorporators: C. Louis Yorston, James D. Croll, New York, N. Y.; James Levre, Brooklyn, N. Y.

Rockbridge Hotel Power and Electric Company, Glasgow, Va., has been incorporated with a capital stock of $150,000. Incorporators: D. Axtile, H. W. Fuller, F. Huges, W. B. Berill, Fitzhugh Lee.

Enterprise Electric Company, Chicago, Ill., incorporated May 20, with a capital stock of $25,000, to buy, sell and deal in electrical supplies. Incorporators: William F. Richardson, F. P. Hill, W. C. McKinlock.

Harrisburg and Mechanicsburg Electric Railway Com-

pany, Harrisburg, Pa., incorporated May 17, with a capital stock of $75,000. Incorporators: E. Z. Wallower, Frank R. Leib, S. W. Fleming.

The South Side Railway Company, Denver, Col., incorporated May 16, with a capital stock of $150,000, to build and operate a system of electric railway lines in the county of Arapahoe, etc. Incorporators: John C. Montgomery, James Leonard, Stanbery Sherwood, Frank B. Gibson, Calvin P. Butler, all of Denver, Col.

The Pine Grove Water, Light and Power Company, Pine Grove, Col., incorporated May 13, with a capital stock of $15,000, to furnish water-works and electricity to the inhabitants of Pine Grove, Col. Incorporators: Charles W. Dake, Theo. W. Herr, Willis B. Herr, all of Denver, Col.

Aluminum Insulated Wire Company, New York, N. Y., incorporated May 12, with a capital stock of $2,000, to manufacture and sell insulated cables and wire and electrical machinery, instruments and supply. Incorporators: William J. Mullan, Charles C. Buddington, Thomas T. Goodenough, all of New York, N. Y.

General Fixture Company, New York, N. Y., incorporated May 12, with a capital stock of $600,000, to manufacture, buy, sell, lease and use all kinds of gas and electric fixtures. Incorporators: Samuel Insull, Joseph Hutchinson, Edward A. Stevenson, all of New York, N. Y.

Elk Ridge Coal and Coke Company, Elkhorn, W. Va., incorporated May 18, with a capital stock of $50,000; among other things it will generate electricity and sell same. Incorporators: J. H. Bramwell, C. W. Seaman, I. P. Mann, Elkhorn, W. Va.

The Electricon Metal Company, Newark, N. J., incorporated May 18, with a capital stock of $15,000. Incorporators: W. M. Whiting, East Orange, N. J.; F. M. Larchar, New York, N. Y.; L. Parker, Newark, N. J.

The Fiberite Company, Ballston Spa, N. Y., incorporated May 17, with a capital stock of $20,000, to manufacture, buy and sell fiberite conduits and battery cells and other electrical specialties. Incorporators: Horace J. Medbery, Stephen C. Medbery, Ballston Spa, N. Y.; Franklin Acker, New York, N. Y.

Edison Electric Light and Power Company of Trenton, N. J., incorporated May 17, with a capital stock of $200,000. Incorporators: F. A. Magowan, W. P. Hayes, Trenton, N. J.; F. Z. Maguire, Washington, D. C.

Universal Electric Company of the City of New York (incorporated in W. Va.), New York, N. Y., incorporated May 19, with a capital stock of $2,000,000, to buy and sell Letters Patent relating to the application of electricity to various commercial objects. Incorporators: C. W. Keep, R. L. Keen, G. P. Platt, New York, N. Y.

Indianapolis Light and Power Company, Indianapolis, Ind., incorporated May 20, with a capital stock of $600,000; among other things it will produce electric current and distribute and sell it for light, power or other purposes. Incorporators: Daniel W. Marmon, Charles Perry, William R. Evans.

City Electric Railway Company, Port Huron, Mich., incorporated May 26, with a capital stock of $100,000. Incorporators: Albert Dixon, S. L. Ballentine, William Canham, all of Port Huron, Mich.

Washington Park and Spring Grove Railway Company, Sioux City, Ia., incorporated May 27, with a capital stock of $150,000, to maintain and operate a street railway by electricity. Incorporators: Ed. Haakinson, Daniel T. Hedges, William V. Hedges, Carl E. Haakinson, E. H. Haakinson, Sioux City, Ia.

Lowell Electric Light Company, Lowell, Mich., incorporated May 25, with a capital stock of $60,000. Incorporators: C. J. Church, Greenville; Otto C. McDonnell, Alice E. McDonnell, both of Lowell, Mich.

The Magnetic Electric Company (incorporated in W. Va.), Boston, Mass., incorporated May 24, with a capital stock of $5,000,000, to manufacture and deal in electrical apparatus. Incorporators: W. D. Northenn, W. F. M. Collins, A. J. Lowd, Salem, Mass.

The McConnellsville Malta Electric Company, McConnellsville, O., incorporated May 21, with a capital stock of $10,000. Incorporators: H. B. C. Vincent, John A. Adair, F. M. Beckett, Irven Traves, Elmer A. Taylor.

Katahdin Mining Company, Spokane, Wash., incorporated May 23, with a capital stock of $100,000. Among other things it will build and operate railways, electric light and water-works. Incorporators: A. M. Mason, H. T. Mallon, B. Norman, Ralph C. Clark, C. Happy.

Norway Water Power and Electric Light Company, Norway, Me., incorporated May 24, with a capital stock of $50,000. Incorporators: H. L. Horne, C. N. Tubbs, F. H. Noyes, Norway, Me.

National Gas and Water Company, Chicago, Ill., incorporated May 25, with a capital stock of $500,000, to build, lease and operate gas, water and electrical works. Incorporators: C. D. Hauk, E. E. Morrell, N. A. McClary.

Chicago Electric Light Enlarging Company, Chicago, Ill., incorporated May 25, with a capital stock of $5,000. Incorporators: Adolph Graeff, Alfred Graeff, Jesse Cox.

Pierce & Miller Engineering Company, New York, N. Y., incorporated May 23, with a capital stock of $100,000. Among other things it will contract for electric and manufacturing plants. Incorporators: Francis M. Pierce, Ferdinand Schmerber, New York, N. Y.; John D. Miller, Brooklyn, N. Y.

The Nutley Electric Light, Heat and Power Company, Franklin, N. J., incorporated May 26, with a capital stock of $100,000. Incorporators: C. H. McIntyre, Newark, N. J.; E. Teeter, H. Edgar, Franklin, N. J.; F. W. Ward, East Orange, N. J.

Johnston Motor and Electric Company, Portland, Me., incorporated May 26, with a capital stock of $250,000, to manufacture and deal in all kinds of electrical appliances. Incorporators: W. C. Johnston, C. W. Higgins, Melrose, Mass.; Charles A. True, Portland, Me.

Chadron Electric Light and Power Company, Chadron, Neb., incorporated May 27, with a capital stock of $20,000. Incorporators: James W. Boyd, Thomas A. Coffey, Chadron, Neb.

Gordon Electric Company, Chicago, Ill., incorporated May 28, with a capital stock of $10,000, to manufacture and deal in all kinds of electrical machines, equipments, materials, instruments, etc. Incorporators: Walter T. Gunthorp, Jean Elliott, Marion E. Moore.

The Electrical Supply and Construction Company, Pittsburg, Pa., incorporated May 25, with a capital stock of $100,000. Incorporators: M. D. Card, H. M. Doubleday, Pittsburg, Pa.; William M. Galbraith, Chartiers, Pa.

Belle Vernon Electric Light Company, Belle Vernon, Pa., incorporated May 27, with a capital stock of $1,000. Incorporators: J. S. Van Voorhis, A. C. Brown, J. C. Cunningham, Belle Vernon, Pa.

The Lewisburg Light, Heat and Power Company, Lewisburg, Pa., incorporated May 23, with a capital stock of $12,000. Incorporators: Charles S. Pardee, Frank S. Marr, John F. Duncan, Lewisburg, Pa.

People's Electric Light and Power Company of Silver Creek, Silver Creek, N. Y., incorporated May 26, with a capital stock of $20,000. Incorporators: Theo. Gresho

Albert H. Stebbins, H. W. Alson, Frank P. Stewart, Charles Hamond, all of Silver Creek, N. Y.

Citizens' Electric Company, Battle Creek, Mich., incorporated May 27, with a capital stock of $50,000, to furnish electricity for lighting Battle Creek. Incorporators: William Andrus, M. M. Lewis, William H. Mason, Battle Creek, Mich.

The Carroll Electric Company, Portland Me., incorporated May 27, with a capital stock of $75,000, to manufacture and deal in electrical apparatus of all kinds. Incorporators: Frederick V. Chase, John B. Kehoe, George H. Allen, Portland, Me.

The Portland Consolidated Street Railway Company, Portland, Ore., incorporated May 26, with a capital stock of $1,000,000, to operate street railways, either by horse, mule, or electric, cable, steam or other mechanical power. Incorporators: George B. Markle, James Steel, R. L. Durham, D. F. Sherman, E. McNeil, Portland, Ore.

The Standard American Electrical Company (incorporated in W. Va.), New York, N. Y., incorporated May 21, with a capital stock of $3,000,000, to manufacture and deal in electrical machinery, contract for electrical plants, for heat, etc. Incorporators: John H. Storm, W. H. Wood, Charles N. Codding, New York, N. Y.

Newton Electric Light and Power Company, Newark, N. J., incorporated May 20, with a capital stock of $150,000. Incorporators: J. A. Seely, Brooklyn, N. Y.; C. O. Baker, Jr., Newark, N. J.; C. F. Porter, New York, N. Y.

The Western Temperature Regulation Company, Chicago, Ill., incorporated May 21, with a capital stock of $60,000, to sell, erect, operate and handle the Johnson Electric Service Company's patents for temperature regulation, and control mechanical fixtures. Incorporators: Charles A. Barker, Pulhemus S. Hudson, Arthur A. Simmons.

Brownville Electric Light Company, Brownville, Pa., incorporated May 20, with a capital stock of $7,000. Incorporators: Frank P. Kifer, Joseph S. Elliot, Bridgeport, Pa.; William E. Ledger, Lucyville, Pa.

The Hope Electric Light and Power Company, Cartersville, Ill., incorporated May 17, with a capital stock of $20,000. Incorporators: A. C. Hope, J. V. Walker, R. H. H. Hampton, W. H. Zimmerman, F. C. Zimmerman.

The Pullman Electric Light and Power Company, Pullman, Wash., incorporated May 13, with a capital stock of $25,000. Incorporators: H. H. Cheatham, S. A. Midge, Alexander McKenzie, all of Pullman, Wash.

The Prospect Street Railway Company, Ashtabula, O., incorporated May 14, with a capital stock of $10,000, to build and maintain a street railroad to be operated by electricity, steam or other power. Incorporators: James Reed, S. F. Conant, C. H. Blakeslee, F. C. Moore, Frank Luce.

BRADBURY STORAGE BATTERIES.

Judging from the continuous increase in its business, and the numerous testimonials received, the Bradbury Storage Battery Company, Lowell, Mass., is manufacturing one of the best storage batteries yet put upon the market. This company has increased its facilities twice within the last three months, and in order to supply the increasing demand for these batteries, has found it necessary to again enlarge its capacity. The following claims are made by the company for the superiority of its storage battery over all others: It is strong and durable. The electrodes are constructed of a hollow gird, braced in all its parts, to insure against buckling. Is made in one piece with two open faces. The braces not only strengthen them, but act as a support for the active material, as well as afford a conductor for the current to act rapidly upon the active material in charging and discharging. This accounts for the remarkably low internal resistance of the battery. It will stand heavy discharges where others would succumb. It will deliver a larger percentage of current than any other. It is lighter and takes up less floor-space than any other. There are no solder joints to burn off. It does not require a current regulator to govern the current, to prevent the lamps from burning out. To fully appreciate the many various uses to which these batteries can be applied, a copy of the company's catalogue, which treats of the subject exhaustively, should be secured.

A PLEASANT AFFAIR.

We are indebted to Mr. A. B. Laurence, New York manager of the Shultz Belting Company, for an account of the reunion of the Shultz family at Shipman, Ill., on May 20 last.

This reunion brought together about one hundred of the members of this family, who reside in four or five States. The occasion of the meeting was the ninetieth birthday of the mother, Mrs. Nancy Shultz, who is still in possession of her faculties. Nine of her children are yet alive, including Mr. John A. J. Shultz, president of the Shultz Belting Company, of St. Louis, Mo.

There were present at the gathering, besides sons and daughters, eighty grandchildren, great-grandchildren and great-great-grandchildren, and other guests from different cities.

The entire number of living descendants of Mrs. Shultz comprises five generations and two hundred and twenty-three living persons.

A reception was held in honor of Mrs. Shultz at the residence of her son Mesback, in Shipman, and an elegant dinner was served, at which addresses were made by her son, Mr. John A. J. Shultz, and others.

Mrs. Shultz is the daughter of a Revolutionary soldier who served all through the war. On the occasion of her ninetieth birthday the members of her family memorialized the event by presenting a new church in Shipman with a bell, to be known as the "Nancy Shultz Memorial Bell."

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, June 4, 1892.

MR. G. M. LEE, well known in electric light circles, was in town this week.

MR. SAMUEL INSULL, who was recently elected second vice-president of the General Electric Company, has resigned that position to accept the presidency of the Chicago Edison Illuminating Company.

THE INTERIOR CONDUIT AND INSULATION COMPANY, 42–44 Broad street, has issued a very useful telegraphic code-book to be used in connection with its illustrated general catalogue No. 7.

DR. J. B. DE LERY, 5–7 Dey street, who enjoys great popularity among the electrical fraternity, offers to advance the money necessary for the development of electrical patents and inventions of merit. He also purchases patents outright.

THE KNAPP ELECTRIC MOTOR COMPANY, of Warren street, has increased its manufacturing facilities, which now enables it to turn out over 500 motors a week. The Knapp motor, although new upon the market, is meeting with wonderful success.

THE TYPEWRITER EXCHANGE, 10 Barclay street, New York, of which Mr. George A. Hill is the manager, continues to increase in its enormous volume of business.

Here can be found all the standard makes of typewriters, and the surprise is how Mr. Hill manages to sell machines at one-half the prices asked by the manufacturers ; but this he does, as is evidenced by the fact that hundreds of business houses throughout the country have purchased their typewriters from Mr. Hill.

The Manufacturers' Advertising Bureau, owing to the large increase in its business, has found it necessary to add two more rooms to its present quarters. An entire floor is now occupied at 117 Liberty street. B. R Western and J. H. Williamson, proprietor and busines. manager respectively, are well known in the trade fos their enterprise.

Mr. W. F. D. Crane who has been widely and favorably known as manager of the railway department of the Engineering Equipment Co., New York, has become connected with the Electrical Department of the H. W. Johns Mfg. Co., 87 Maiden Lane. This department deals with the company's specialties, moulded mica, vulcabeston and monarch insulating materials, extensively known through their numerous applications in the insulation of electric railway trolley lines, and in the manufacture of insulating device for electrical machinery lamp-sockets, and other purposes.

Mr. J. E. Costilo, for many years foreman of the Garvin Machine Works, New York City, has recently established a general tool and machine shop, on the corner of Hudson avenue and Concord Street, Brooklyn, N. Y. A visit to Mr. Costilo's works elicited the fact that it is one of the finest fitted up shops of its kind in Brooklyn, equipped with the most modern machinery for the manufacture of all kinds of tools, milling machinery, sharpers, planers, screw machines, etc. Mr. Costilo makes a specialty of screw and milling machines the former of which has a great run, as is evidenced by the fact, that the supply is not equal to the demand. His milling machine is also in great favor. Mr. Costilo is an expert machinst, and employs only first-class workmen, hence, intending purchasers may be assured of the quality of the goods obtained from his works.

Messrs. Bateman & Pollard, 143 East 23d street, contractors for electric light wiring of buildings, isolated plants, complete installations, electric railroads, marine works, electric bells, burglar alarms and speaking tubes, have lately completed the isolated plant for the Hebrew Institute, East Broadway and Jefferson street. The installation consists of one 650 light Eickemeyer dynamo, Ball engine, etc. They also wired the building for 750 16 candle-power lamps. The Temple Bethel, 5th avenue and 76th street, was wired by this firm for 1,250 16 candle-power lamps on the Edison system. Messrs. Bateman & Pollard make a specialty of marine wiring. They are at present overhauling and rewiring Wm. H. Starbuck's steam-yacht *Tillie*, putting in 55 storage batteries, and are making an electric band 300 feet long to hold 150 16 candle-power lamps for illuminating the outside of the yacht on special occasions. This band is carried from the stern over the top of the masts to the bowsprit. Other steam-yachts being overhauled and rewired by this firm are John A. Morris' *Cora* and A. B. Claflin's *Seneca*.

Messrs. Hatzel & Buehler, 29 West 26th street, exhibit a line of pictures of mansions, commercial buildings, hospitals and depots where they have installed complete electric-light plants, rewired or newly wired for the installation of electric light and of general electrical appliances, including call systems, watchmen's time-detectors, etc. They lately installed in the New York Hospital one of the finest isolated incandescent electric-light plants in this city. This plant consists of Detroit Motor Company's dynamos, for which they are agents, with a capacity of 760 lamps each. The switch-board is a novelty in itself. The building is wired for nearly 1,500 lamps. The call system for the ambulance surgeons, an exceedingly ingenious device, is the invention of the firm. When a call for an ambulance is received at the main office the clerk on watch pushes a button and establishes connection with the surgeon's quarters, where a bell is rung, and at the same time closing a circuit through a relay, cutting in a 16 C. P. lamp. Before leaving the surgeon pulls a pendant switch and cuts out the lamp. Messrs. Hatzel & Buehler have also invented and built a static electro-medical apparatus with resistance, which can be connected with the lamp circuit in any part of the building for treatment of patients. The apparatus is mounted on wheels, and can be conveniently moved from floor to floor and to all parts of the building. The residence of Henry O. Havemeyer, 5th avenue and 66th street, was also wired by this firm for electric light and all kinds of household apparatus. They also wired the immense building of Austin, Nichols & Co., the large wholesale grocers, and have just completed the wiring of the new quarters of the American Express Company, 63 Broadway. The firm has a large number of contracts on hand, among which is one for another 20 H. P. motor from Austin, Nichols & Co.

W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor Electrical Age.

Names of Companies.	Capital.	Par.	Price
American Dist. Tel., N. Y.	3,825,000	100 00	61 00
American Telegraph and Cable	14,000,000	100 00	85 00

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

The comparison between British and American public companies is prodigiously in favor of the former. The methods of keeping the public posted on the business of the corporation, with the single exception of that current business which if made public would evidently be taken advantage of by competitors, is accepted as correct; and further, the general or annual meetings are held in public halls, and if the shareholders are not too numerous, all who desire are welcome to enter and listen to the proceedings. No corporation with over one hundred shareholders would be deemed to have acted honorably by holding its meeting without representatives of the press being present, and the report of the proceedings as handed in by the reporter (whose notes he is liable at all times to be called on to swear to) is taken by the secretary, and a copy sent to each shareholder, beside the publicity given by the regular circulation of the paper itself. No particular paper is selected, but the one having the fullest report is generally given the order for copies. This from a company like the Civil Service Supply Assocation, which has nearly 100,000 members or shareholders, is an order worth having. In most cases no charge is made, except for the actual copies sent out at regular prices, but when the company is small and the shareholders scattered, one or two pounds is paid the reporter for his work. The real cause of this is that the directors of companies in Great Britain are educated men, competent to manage the financial affairs of the proprietors, and almost without an exception, strictly honest. A nobleman with a long list of historical ancestry may take a guinea for attending a meeting as a director, but money would not induce him to knowingly, or even if he suspected it, permit the interest of the shareholders to suffer, whether they were present or absent. There are over six hundred members of Parliament who are directors of public companies, and in case of one's conduct as a director being successfully questioned, one of his first acts must be to resign his seat in the House, or unquestionably the hour would very soon arise when he would not be allowed the privilege of resigning. There is at times a humorous side (but who shall say it is not honest?), as is shown by the following from the *Financial World*:

"The following advertisement lately appeared in an English newspaper:

"'Directors wanted of good social standing for a new company now in course of formation; qualification will be found for selected applicants, and remuneration will be on a liberal scale.'

"To this there were 141 replies received: one earl, one viscount, four barons, seven baronets, one knight, thirteen honorables, six members of Parliament, four generals, one admiral, nine colonels, four majors, fourteen army captains, three minor naval officers and seventy-three without rank or title. There were some very amusing letters accompanying the applications. The earl said: 'I need not point out that, should you entertain my proposal, an important leverage in securing a good subscription of public capital will be gained by my title, which is an old one and likely to prove an attraction to investors. I may also state that, if appointed, I should always make it a point of driving to the general meetings in my brougham and pair, with servants in full livery. This, I am told by friends sitting on company boards, is a great factor in inspiring shareholders with confidence.'

"One of the barons wanted to know 'if the fees were paid in advance, irrespective of any profits made by the company.' One of the members of Parliament wrote that he had no doubt that, if he were appointed, it would result in heavy purchases of shares in his constituency, where he was very popular. 'And,' he added, 'it would be well if the bona fides of your scheme were assured, at any rate, on the surface.' The last part of the sentence would seem rather to give the virtuous legislator away, as he evidently did not care whether the scheme was good or not."

It will be a great advance for American investments when five or six hundred of our representatives in Congress assume these responsibilities. There are a few already in the traces, but not enough to give solidity to the mass of directors.

The dividend list increases satisfactorily, and has increased $1,679,042 over the month of June, last year. The amount this month is $28,339,882, and as usual I suggest that a considerable proportion of this, in being reinvested, finds its way into electric securities. The field is growing very fast, and the returns are not only increasing monthly, but the intrinsic value advances at a rate unequalled even by a real estate boom in New York. The market is well supplied with new securities, the latest being the "Leetonia Electric Light and Power Co.," of Ohio, who wish to issue $30,000 ten-year 6 % gold bonds; they have a 30-year franchise and 5-year contract with two cities, and expect a third of the same nature, all to be operated from the same central station. The company now earns $4,500 over all expenses. There is one point in reference to this class of securities worthy of note to the investors; they are situated in the old settled states, free from excitements or opponents, and as electricity becomes more popular, the local company reaps all the benefit. There are a great many of these corporations from one to four or even five years old, who have themselves established a plant, and having constructed and equipped it for their own use and purpose, feel justified in either realizing on part of their interest or borrowing, in the shape of bond and mortgage, money to use for other purposes. There are also a few municipal bonds in the market, the bonds being issued to the construction company for the expenses of installing the plant; one of these is Portland, Conn. (a city I never heard of before, but it is there), surely the bona fides of a $20,000 municipal bond so near by can be ascertained by investors in a few days, and these are offered at an attractive figure.

WESTERN NOTES.

The Railway Equipment Company, 11 Adams street, Chicago, of which Mr. W. R. Mason is general manager, has issued a circular descriptive of the "Chicago Clamp," to be used in connection with its complete standard insulator, and which is the only reliable device made for such purposes. This company always carries in stock a complete line of electric railway supplies.

THE E. P. ALLIS COMPANY, Milwaukee, Wis., will furnish free the chief motive-power for the machinery at the World's Fair. The engine will be furnished as part of the company's exhibit, and will be of gigantic proportions—capable of developing between 3,000 and 4,000 horse-power. It will be of the quadruple-expansion type. The Allis Company's exhibit will cost about $175,000.

EASTERN NOTES.

THE GERMANIA ELECTRIC COMPANY, Boston, Mass., has moved its offices to rooms 46 and 47, 620 Atlantic avenue. It also announces that Dr. F. A. C. Perrine, formerly of the John A. Roebling's Sons Company, has become identified with the company as its treasurer.

MR. GEO. H. SOUTHWICK, superintendent of the Wheelock Engine Company, Worcester, Mass., reports business very good. The company has recently received orders for twelve engines, ten of which are for electrical service. Engines of all sizes from 50 to 2,000 H. P. are built by the company. The entire system of the Chicago City Railway Company is operated by Wheelock engines, and these are giving entire satisfaction.

THE JOHN BECKER MANUFACTURING COMPANY, Fitchburg, Mass., makes a machine which seems almost indispensable in the manufacture of electrical goods, etc. This machine is known as the Becker Vertical Miller, and is made in three styles: Nos. 1, 2 and 3, each of which possesses special merits. No. 1 is designed to perform the most delicate kind of milling operations upon brass, steel, iron, copper, zinc and wood. To meet the requirements to this end, the following very necessary features have been embodied in this tool, viz.: high spindle speed, long bronze bearings, constant and perfect lubrication of same, combined with perfect control of spidule-head and sensitiveness of the table-slides. This machine will be sound of great value in electrical instrument manufactories. No. 3 is designed for various operations for milling with face mills, and has no equal among its class for range of general usefulness. In construction nothing but the best of material and workmanship is employed. These machines are having a great sale; several were recently shipped to Chicago, New York, Newark, N. J., and elsewhere.

THE ELEKTRON MANUFACTURING COMPANY, Springfield, Mass., has found it necessary to keep its men working until midnight for some time past, in order to keep up with the great number of orders which it is daily receiving.

THE HART & HEGEMAN MANUFACTURING COMPANY, Hartford, Conn., reports business exceedingly good. The Company is making some changes and bringing out new novelties in the switch line that will soon be put on the market. N. D. W.

TIME-BALL SERVICE RESUMED.

The old Western Union time-ball was as familiar an object as anything in this city prior to July 18, 1890. On that date a fire in the Western Union Company's building did great damage, and the time-ball service was necessarily suspended. It has just been resumed after a lapse of two years, and the new apparatus is an improvement on the old.

Thousands of people depended upon the daily dropping of the old ball for the regulation of their timepieces, and it was especially valuable to mariners, with whom accuracy of time is a matter of great moment.

The new ball will be visible on a clear day from Sandy Hook with the aid of a glass, and no doubt the sailors who depended upon the old ball for their time regulation will be glad to know that the service has been resumed and that it will be more accurate than the old, if such is possible.

VALUABLE PAPERS.

We publish in this issue abstracts of some of the papers read at the general meeting of the American Institute of Electrical Engineers, which was held in Chicago last week. Each paper is sufficiently interesting to be published entire, but when the question of space is taken into account it would require a volume as large as a book to do justice to all.

We have endeavored to extract from each paper what is of most practical value to our readers, and in this condensed form we think the matter will be better appreciated and surely read by busy men.

The papers read this year were on a great variety of subjects and add a great deal to our knowledge on electrical development in general.

CONVENTION OF RAILWAY TELEGRAPH SUPERINTENDENTS.

During the present week the Association of Railway Telegraph Superintendents will hold its annual convention in Denver, Col. This society is composed of intelligent and practical men who meet every year and read papers and discuss subjects pertaining to their important duties. After the business of the convention is over the party will visit various places of interest in Colorado.

Among the papers to be read at this convention will be one by Mr. Charles Selden, superintendent of telegraph of the Baltimore and Ohio Railroad Company, on the subject of "Electricity and its Relation to Transportion." As Mr. Selden is always practical and instructive in his papers, no doubt this one will be full of general interest, especially to those connected with electric street railways, as his theme is largely in this line.

DEATH OF MR. CAVELL.

Mr. E. V. Cavell, late general manager of STREET RAILWAY NEWS, and well known among street-railway people throughout the country, died in Nassau, N. P., June 7.

He went to Nassau last March in the hope of receiving some benefit from the climate in that latitude, but it did him no good.

Mr. Cavell was born in England about 34 years ago, and he had a large circle of friends who will be pained to learn that he is dead, although his death was not unexpected.

VALUABLE SUGGESTION.

A very valuable suggestion, and one that should receive the careful consideration of electrical students, is offered in a paper recently read before the American Institute of Electrical Engineers at Chicago. It is suggested that as students cannot very well afford to take a year from the midst of the college course for outside work, they should during the summer vacation between the third and fourth term seek and accept such employment as would give them an opportunity to put to a practical test the theoretical knowledge acquired during their studies.

THE WESTERN UNION TIME-BALL.

THE Western Union Telegraph Company has resumed its time-ball service at its headquarters in this city, and thousands of people will now be able to keep better time than they have since the service was suspended by the fire, July 18, 1890.

The new service will be an improvement over the old in many respects. It will be remembered that under the old arrangement the mast on which the ball dropped was located on the tower at the Broadway end of the old building. The reconstructed building has a flat roof, and the new time-ball will be dropped on a mast 23 feet high, which surmounts a skeleton tower 82 feet high, erected on the roof at the rear end of the building. The new ball when elevated to its highest point will be 265 feet above the sidewalk, and can be seen, on a clear day, for many miles in every direction. Mariners, who used to depend so much upon the old ball for the regulation of their time-pieces, will be able to see the new one from Sandy Hook on a clear day, with the aid of a glass.

The four corner frames of the tower, as they set on the roof, form a square, and the tower tapers towards the top, so that it is smaller at the top than at the base.

FIG. 1.

It is substantially constructed of iron and especially designed for the service that it is put to.

The mast is a hollow metal tube, at the top of which are placed two pulleys, set diametrically opposite each other, on which the ball halyards run. This construction will be understood by reference to Fig. 1. It will be seen that the two ropes on the outside of the mast sustain the ball, and after they pass over the pulleys they combine into one which passes down through the interior of the mast. This rope, after it emerges from the mast, is attached to the drum of the drop mechanism.

FIG. 2.

Fig. 2 gives a general view of the mast and ball, and shows, at *H*, where the rope passes out of the interior of the mast to the winding and dropping apparatus.

The ball is constructed on a different plan to the old one. It is formed with steel ribs and covered with can-

vas. In its descent from the top of the staff it drops into an air-tank, the air in which acts as a cushion and breaks the force of the falling ball. The air gradually escapes from the tank through valves located at the bottom. The diameter of the ball is 3 feet 6 inches.

Fig. 3 shows the method of releasing the ball so as to cause its descent. The rope to which the ball is attached is shown passing through the opening at the right-hand top corner. When the ball is drawn up to the top of the mast, which is done by winding the rope in the drum by means of a handle, the drum is prevented from unwinding before the proper time by the pawl *f*. The construction of the pawl-lever and the lever *G* is such, and they are so placed with reference to each other, that when the sounder armature is drawn down it releases the lower end of the lever *G*, the upper end of which, under the tension of the spring *n*, flies back, and in so doing disengages the pawl from the teeth on the drum. All restraint being thus removed from the drum, the ball drops by gravity into the air-tank before referred to.

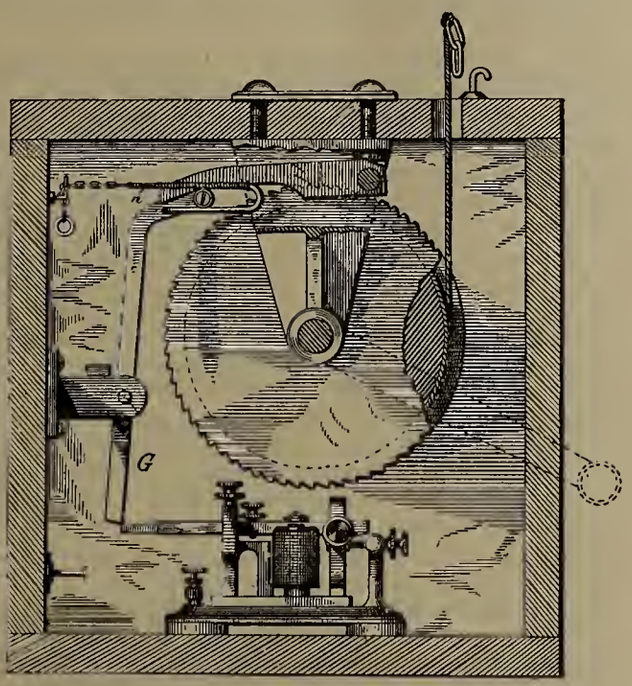

FIG. 3.

The sounder used for this purpose is of the ordinary pattern, and is operated by a relay on which the noon signal is received from the Washington Observatory. Two wires are connected with the Observatory and the time-beats are received on both, but the time-ball mechanism is operated by only one of the wires. The additional wire is a reserve, so in case trouble should appear on one wire just before the noon signal is received the other one is used to receive the signal on. The switching is done quickly by an attendant who has a three-point switch at hand, so he can switch off the defective wire and switch on the good one in an instant. Trouble on both wires at the critical moment is of extremely rare occurrence.

Just a few moments before noon the time-circuit is opened by the clock at Washington, and exactly at noon it is closed again. In this interval the time-ball apparatus is placed in connection with the sounder, as above referred to, and when the current is closed at noon the ball is released and drops.

STEERING BY ELECTRICITY.

During the voyage of the double-turreted monitor *Miantonomoh* to Norfolk, Va., she was steered by electricity. This is the first instance of an American vessel having been steered in this manner. This is looked upon as quite a feat, in view of the fact that it is said to be more difficult to steer a monitor than any other vessel.

A NEW SYSTEM OF ELECTRIC PROPULSION.*

BY H. WARD LEONARD.

PART I.

In the distribution of electricity from a power station for the operation of electric railways the only commercial method to-day is by the use of a system of constant E. M. F. operating the motors in multiple arc with each other, and at the present time every consideration of economy and automatic regulation seems to indicate that the constant E. M. F. multiple arc system will always be the best for such distributions.

In the use of electric energy by motors operating under conditions of varying speed and torque, the best results as regards economy and regulation are obtained when the electric energy utilized has a voltage varying directly as the speed and a current varying directly as the torque, for it is evident that under these conditions the electric energy required will be always proportional to the power developed.

If we could operate from the constant-potential system a shunt-wound motor running at a constant speed, and could interpose between this motor and the axle some device equivalent in its effect to an infinite number of different sets of mechanical gears, so that we could make use of any reduction desired, it would enable us while using a constant power to increase the torque as we decreased the speed, and *vice versa*, which is just what is desired in railway practice, where the least torque is required when at full speed on the level, and the greatest torque is required at the slow speed in starting and in operating on a grade. Numerous and very ingenious devices have been invented for accomplishing this variable mechanical reduction, but on account of the complication, noise and unreliability they have never proved successful.

The writer has recently devised an electrical method of securing all the results which could be obtained from such a set of gears described, with a freedom from the noise, wear, complication and rigidity which such a set of gears would necessarily involve.

Following is a general description of the arrangement proposed, as indicated by Fig. 1:

T, trolley.
M, motor portion of power converter.
G, generator portion of power converter.
P, the propelling motor for the car.
R, the regulating and reversing rheostat in field of G.
E, the connection to ground.
W, the car-wheel.

Each axle is driven by a gearless motor, either directly or by means of a connecting-rod. The fields of these motors are excited directly from the constant E. M. F. of the line and independently of the armature circuit. Beneath the car and between the axles there is suspended a motor-generator, each armature winding being in a separate field. The motor portion of the motor-generator — which will for convenience be called the power converter — is shunt wound and connected just as a shunt-motor is for use upon ordinary constant-potential circuits. The field of the generator portion of the power converter has its field connected across the line, and has inserted in it a regulating and reversing field rheostat. This field circuit is independent of the armature circuit. The generating armature of the power converter is in metallic connection with the armatures of the gearless propelling motors. It will be noticed that this circuit including the armature is a distinct and separate metallic circuit having no connection with the line in any way.

Suppose now that our shunt-motor is running at full speed, and that our controlling rheostat in the generator

* Paper read at the general meeting of the American Institute of Electrical Engineers, Chicago, June 6, 7 and 8, 1892.

field circuit is at its central position, so that the generator field circuit is broken. Although the generator armature is being driven at full speed, it is revolving in a field having no magnetism except the residual magnetism, and hence produces practically no volts. Let us now move our controlling-switch so as to place the generator field across the line, but with a resistance in series with the field of ten times the resistance of the field-coils. We now get a slight excitation of the field and a development of volts at the brushes of perhaps 40 volts. This voltage will produce a current through the armatures of the driving motors dependent upon the ohmic resistance of this circuit only; and hence, even at this low voltage, a large current will be produced which, being in a field of full strength, will cause a torque sufficient to start the armature. The speed of the armature will, of course, be governed by the counter E. M. F. which its revolution produces in its strong field; and hence, just as in the case of a shunt-wound motor, its speed will be practically constant so long as the E. M. F. supplied is constant.

If we now gradually increase the magnetic field of the generator by cutting out resistance by moving the controlling-switch, we will gradually raise the E. M. F. of the

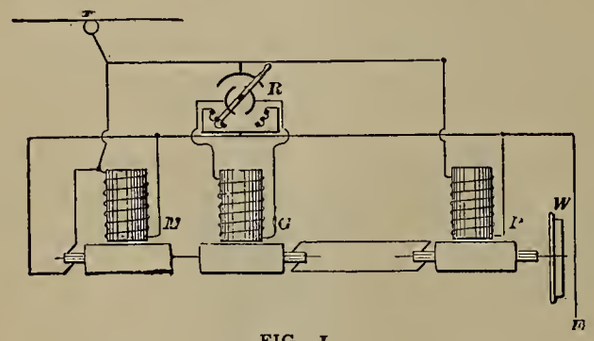

FIG. I.

armature circuit, and with it the speed of the driving-motors. Since these armatures are revolving in a constant field, the torque they produce will be exactly proportional to the current in them, and the current will automatically flow exactly as is required to produce the necessary torque to maintain a speed such that the counter E. M. F. will approximately equal the E. M. F. supplied by the power converter. Thus it will be seen that the speed of the car will be dependent upon and proportional to the E. M. F. supplied by the power converter, and the torque or tractive effort will be dependent upon and proportional to the current supplied by the power converter.

Let us suppose that 60 ampères flowing through the armatures in fully excited fields will produce a torque sufficient to move the load when upon a grade. It is evident from what we have seen that 40 volts from the power converted will produce this current. Hence, by an expenditure of 2,400 watts in the secondary circuit, or a total power, including field excitation, etc., of about 8 H. P., we can start a fully loaded car upon a grade.

Under the existing systems we would need the same 60 ampères in the same fully excited field, but would necessarily use the full voltage of 500 volts, and therefore consume energy represented by 30,000 watts, as against possibly 6,000 in this system. The current from the line in starting the car under ordinary conditions by this system would be about 12 ampères at 500 volts, instead of from 60 to 100 amperes at 500 volts.

In practice, the controlling switch-lever can be instantly thrown from its central position to its extreme position for full speed. The field magnetism of the generator is rapidly increased, and consequently also its E. M. F., which in turn causes a gradual acceleration of the car.

The current in the armature circuit, and consequently the torque, is quite large in the beginning; but the E. M. F. at this time is quite low, so that the total watts are low; as the inertia is overcome and the counter E. M. F. begins to approximate to the impressed E. M. F., the current falls off and finally becomes constant at an amount necessary to produce the torque required to maintain the speed. The current from the line, and hence the power, gradually increases from zero to the amount required at full speed, but at no time, either at the start or during the acceleration, is the energy from the line greater than that required when we are operating at full speed. It will be noticed that the effect is the same as though we first operated through a set of gear-wheels, giving an extremely great reduction of speed and then rapidly changed the ratio of gearing, until finally we operated at full speed, with no reduction.

With our hypothetical gears we could, when running at speed, rapidly increase the ratio of gearing so that the movement of the car would tend to drive the shunt-motor faster and faster. This would convert it into a generator forcing current back into the system; which production of electrical energy would act as a brake and gradually bring the car to rest.

Just so, if, while running at full speed we suddenly place our switch-lever at its central position, the field of the generator will gradually reduce the strength, and the counter E. M. F. of the propelling motors will soon exceed that of the generator. The momentum of the car will now be driving our gearless motors as generators, which will supply current to the former generator, operating it as a motor, causing it to drive the shunt-motor coupled to it as a generator, which in supplying energy to the line will act as a brake, and smoothly but rapidly bring the car to rest by converting the energy stored up and represented in the movement of the car into electrical energy, which will tend to relieve the work at the central station. Similarly, a car descending a grade and tending to accelerate in speed can be made to move at any desired speed without the aid of any mechanical brakes, and the energy represented by its falling weight will be converted into electric energy, and the car will become a moving feeder supplying energy to assist the generators at the central station in the operation of other cars.

It will be evident from what has preceded that with this power-converter system we can propel a car upon any practicable grade with a consumption of power no greater than is required to operate the car at full speed upon a level, by merely reducing the speed to the required extent.

In street railways of from five to ten cars this is of great importance, for it means that we can equip a road with about six H. P. per car, as regards the engines and dynamos, and that our conductors can be reduced to about one-third of the amount at present necesary, for we will never require more than 20 ampères at the distant point, where to-day we have to provide for 60 ampères with the same loss and same initial E. M. F.

Under the rheostat system the plant is severely taxed when an unusual crowd must be moved from a certain point, and it is then, when it is of the greatest importance that no break-down should occur, that it usually does occur. With this power-converter system we could, upon a five-car road, start up and move with perfect safety 10 or even 20 cars from the most distant point on the road, though of course at a reduced speed, but the crowd would be handled with perfect success and without subjecting any portion of the plant to any unusual strain.

In the large cities it is no unusual sight to see an electric car moving at the slowest possible speed for perhaps several blocks. Perhaps 12 amperes are required to obtain the necessary torque. This at 500 volts is 6,000 watts. The power required for this slow motion by the proposed system would not exeed one-fifth of this amount.

Following is a tabulated statement (Table I.) showing the results we may expect to obtain by this system in operating with fully loaded car under three different conditions: First, at 12 miles per hour on level; second, at three miles per hour on five per cent. grade; and third, at one mile per hour on level.

Total watts wasted...	.....	2295	.....	.....	5260	.....	.....	985	.....
Watts of work done	.....	4000	.....	.....	6000	.....	.....	400	.....
Total watts absorbed.	.....	6295	.....	.....	11260	.....	.....	1385	.....
Ampères at 500 v.....	.....	12.6	.....	.....	22.5	.....	.....	2.8	.....

In arriving at the losses, as indicated, the motor part of the power converter has been assumed as having the following features:

E. M. F., 500 V.; current capacity for ten hours' continuous duty, 15 ampères; resistance of shunt field winding, 1,000 ohms; armature resistance, 1.1 ohms.

The generator portion of the power converter and the driving-motor are assumed as having the following features:

E. M. F., 500 V.; current capacity for ten hours' continuous duty, 40 ampères; resistance of field, 900 ohms; armature resistance, 0.55 ohms.

The rolling friction with gearless motors on good level track is assumed as 20 lbs. per ton. Car is assumed to be eight tons in weight full loaded, and five tons for moderate load.

We find that with 12 tons moving at 12 miles per hour on a level we will require 12.6 ampères, which is practically the same as by present series-motor systems. With eight tons moving at three miles per hour upon a five per cent grade 22.5 ampères will be required, which is about one-third of the power required by present systems. With eight tons at one mile per hour on level, 2.8 ampères will be required, which is about one-fifth of that required by present systems. With five tons moving at five miles per hour on five per cent. grade, 18.5 amperes will be required, which is about 40 per cent. of the power required by present systems.

THE TECHNICAL EDUCATION OF THE ELECTRICAL ENGINEER.*

It is impossible for many, and doubtless undesirable for the majority, to take a year from the midst of their college course for outside work. The summer vacation between the third and fourth year should, therefore, be occupied in some such employment as wireman on electric light or telephone construction, or better, in the station and repair-room of an electric railway, under the eye of an appreciative superintendent. Three months spent in this work may seem very little, but it will do a deal of good in giving an apt student a fair idea of how far exact formulas will carry him. It is only by the generous co-operation of employers that students can obtain this summer's work. At first thought it appears that the employer gains no advantage from it, but upon careful consideration an advantage is evident. To begin with, the properly trained student will not prove useless during the summer, and the satisfactory one will usually find employment after graduation, with the interests of those who afforded him summer work, and who thus gain the benefit of his greater advancement during his last year at college. In a similar manner, the manufacturer gains an advantage from placing his apparatus in the technical school laboratories for *proper* use in instruction.

Suppose a student has completed the prescribed college course, and has done a proper portion of repairing armatures, stringing wires, or similar work, at some interval between his terms at college, what shall we call him? A few of the technical colleges of the front rank call their graduates engineers, but we have already seen that they must pass through a transition period during which the claim to the title can be proved. To call an untried graduate an engineer does not seem proper respect for himself or the successful workers in his profession. The transition period may never end for some graduates, while its length must always depend upon the man. Until the graduate has been in practical life a sufficient time to show his capacity, and has reached a position of responsibility, he has no right to claim from his college an engineer's degree. Upon this ground the University of Wisconsin, as do many others, confers degrees in engineering upon graduates of its engineering school of not less than three years' standing, who have held engineering positions of trust for at least one year. The minimum transition period is thus tacitly recognized as three years. Upon completing his college course, the student is given a graduating degree of Bachelor of Science by the engineering school, which is simply an endorsement by the university that he has received a good technical college education and is in a fair way to profit by it.

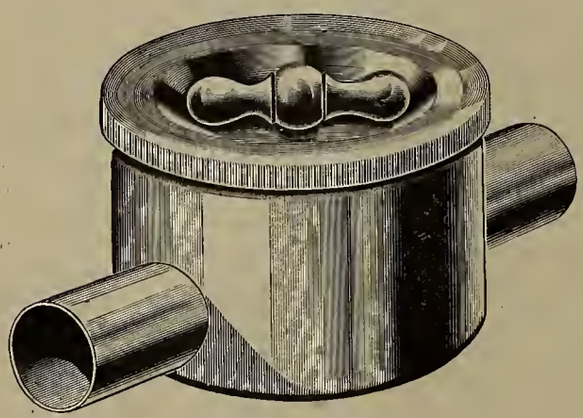
That the rigid specialization required in the technical school may not diminish the graduate's field of vision and thus his usefulness to society, is a matter of much concern. With the college left behind there is little opportunity to gain a broadening culture, except that received by contact with broad men, while we have seen how little opportunity for this can be afforded in the technical course. With this in view we recommend at the University of Wisconsin, that all who can afford the time and money complete a four-years' undergraduate course in the University School of Arts and Sciences before entering the School of Engineering. By proper elections during the general course, the studies of an engineering course can be completed in two additional years. By this plan a solid educational foundation is laid for the specialized studies of the engineering student, and the best conditions are developed for his ultimate success in professional work. The plan offers two other

* Abstract of paper read at the general meeting of the American Institute of Electrical Engineers, Chicago, Ill., June 6, 7 and 8, 1892.

points of advantage: First, the student comes to his professional studies in the engineering courses with a more matured mind, which is of much importance; second, students without the taste for hard engineering work, which is required for their future success in technical industries, will not often attempt a technical course after having completed a general course.

We can now usefully inquire into the specialized work that should be prescribed for the average electrical engineering student during his last two years at college. Up to this point students in mechanical and electrical engineering courses have received virtually the same instruction. Here, we hold, with several others, their paths should diverge. The student of mechanical engineering goes into careful study of shop practice, designing and utilizing various types of machinery, and similar subjects. The electrical engineering student must receive a good working knowledge of the problems of the mechanical engineer, but he must, above all, be trained in the practical problems of electrical engineering. He therefore goes into a study of that which will aid most in making him truly an electrical engineer. His knowledge must all be based on mechanical laws, but he must be much more than one-tenth electrical.

Before reaching his truly professional studies, the student should gain, during his course in physics, a common-sense grasp of the elementary notions of electricity and magnetism, and of the "all-pervading law of Ohm." The latter can be properly enforced in the laboratory by placing in the student's hands ordinary electrical instruments, such as bridges, galvanometers, ampèremeters, voltmeters, etc. Before beginning his specialized work the student's knowledge of Ohm's law and its common results should have become almost instinctive.



FLUSH SWITCH.

With due regard for his preparation, it seems best to arrange the professional studies for the average electrical engineering student in four divisions, thus:

1st. Electro-magnetism and its application to practical uses, with special reference to dynamos and motors.

2d. Electro-chemistry (including primary and secondary batteries) and electro-metallurgy.

3d. Alternating currents and alternating-current machinery, including dynamos, converters, condensers, etc.

4th. The special application of the preceding divisions in electric light, power, railway, mining and other types of plants.

The last division is allotted about twice the amount of time given to each of the others. . . .

The student who satisfactorily completes a *proper* professional course at college, whether laid down in the college catalogue or carefully selected from that prescribed, is not likely to become one who "turns out results like a cornsheller, and never grows wiser or better tho' it grinds a thousand bushels of them." In order that he may have a fair opportunity of growing "wiser and better" in the practice of his art, he should be given reasonable encouragement. As Mr. Holley one time said, an understanding should obtain—"among the owners, directors, and commercial managers of engineering enterprises that it is not a matter of favor, but a matter of as much interest to themselves as to any class, that young men of suitable ability, and of suitable preliminary culture, however acquired, should have an opportunity and encouragement to master the practical features of technical education *in works*, not as mere apprentices, but under reasonable facilities for economy of time and completeness of research."

A legend on the cover of a circular lately issued by the Engineering School of the University of Wisconsin, gives the true object of the technical college, when it says, "We do not aim to produce engineers, but to produce men with great capacity for becoming engineers." If our product is accorded the treatment advised by Mr. Holley (himself an experienced manufacturer), we feel sure the work of our school and of similar technical schools will not be useless.

FLUSH SWITCH.

The new ten-ampère Flush Switch illustrated herewith is manufactured by the Interior Conduit and Insulation Company of New York, at the suggestion of a prominent architect, and is a production which has received high indorsement and commendation from the electrical trade. The illustration shows the many desirable features of the article. A notched cover is indented so as to allow the handle of the switch to be "flush" with the wall on which it is placed, and a brass rim extends around the edge so as to protect the wall from soiled hands when unscrewing the cover, and at the same time serving to impart a finish to the switch when placed in position.

The advantages of this switch are at once apparent, and the article instantly commends itself to the attention of architects and others interested in rendering the various appliances used in conjunction with incandescent electric lighting ornamental and unobtrusive, as well as useful.

AMMETERS AND VOLTMETERS.

Queen & Co., of Philadelphia, are just issuing a revised price-list of their "Magnetic Vane" Ammeters and Volmeters, in which two forms are given—one with brass and the other with iron cases. The difference in price is occasioned only by a corresponding difference in material used, and external finish, for both types are calibrated to the same degree of accuracy. These instruments are extensively employed for switchboard purposes, and enjoy an excellent reputation. As decided changes in appearance and prices have been made, it will be well for interested parties to obtain a copy of the special descriptive circular No. 330.

UNIVERSAL ELECTRICAL DIRECTORY

J. A. Berly's Universal Electrical Directory for 1892, just out, is more complete than any of the preceding issues. It contains nearly 75,000 entries and covers the entire civilized world in its scope. The rapid increase of all electrical industries and kindred trades is shown, and the book contains 200 pages of new matter. A complete list of electric light stations in America is given, as well as the addresses of those engaged in the electrical industries. It is published by H. Alabaster, Gatehouse & Co., 22 Paternoster row, London, E. C.

RAILWAY CONTROLLING-SWITCH.

In the operation of electric railroads not the least point for consideration is that of facility and rapidity of control of the electric power generators. Until recently the large switchboard has been employed, necessitating extreme agility on the part of the electrician in charge to bring the output of his generators to the desired point, and this plan has been found not only cumbersome but expensive. Improvements were therefore looked for.

In order to secure a thorough, effective and rapid control of the generators in an electric railway station, a new device has been gotten up known as the Railway Controlling Table. On this are mounted all the regulating and indicating apparatus in the most compact and convenient space possible. The framework is of strong bar-iron. In front are the dynamo field regulators operated by wheel handles and duly numbered in reference to the machines they control. On the table are mounted the cross-bar snap-switches—new style switches recently designed—the dynamo fuse-blocks and the equallizing bar-switches, one of each for each dynamo ; a voltmeter of the Weston type and a voltmeter switch of the regulation pattern.

On the upright back piece are the ampéremeters and the galvanometer. These instruments merit particular mention. The ampéremeters are of the standard Edison type, the solenoid of bar-copper, highly polished, being mounted directly on to the marble.

The galvanometer shows when the voltage of the current of one of the generators about to be switched into circuit is the same as that from the other machines already supplying the circuit. If the voltage of the current from the generator ready to switch into the circuit is too high or too low the deflection of the needle indicates the fact, so that the field regulator can be adjusted until the voltage is correct, when the needle presents no deflection. This instrument is mounted directly on to the marble.

With this controlling table in the station, the electrician has no difficulty in swiftly regulating his output of current to meet the varying conditions under which the road may be working. With one hand on the snap-switch handle and the other on the wheel of the field regulator an almost simultaneous movement is possible, and control is thus immediate.

The table shown was designed for four generators, and was invented and constructed by the Edison General Electric Company.

EDISON RAILWAY CONTROLLING-SWITCH.

A LIFE AND EFFICIENCY TEST OF INCANDESCENT LAMPS.*

BY PROFESSOR B. F. THOMAS AND MESSRS. P. MARTIN AND R. H. HASSLER.

There is a great divergence between the published claims of lamp makers and the statements of the experience of station managers. Makers generally say that they will guarantee 600 hours life for their lamps, and from 10 to 14 or more lamps per horse-power, but some station managers insist that they do not get an average of 400 hours life.

Lamp makers have, from necessity, made a study of their own lamps, and of those of other makers also, as to efficiency and life, and they know, better than any one else, the character of the incandescent lamp of to-day. But naturally they, if they say anything on the subject, tell about the good points of their own goods and the bad points of others, and, as naturally, the buying public

*Abstract of paper read at the general meeting of the American Institute of Electrical Engineers, Chicago, Ill., June 6, 7 and 8, 1892.

say that all their statements are questionable. Much good work has been and is being done in college laboratories on lamp efficiencies, and the results are published and accepted, but on the equally important question of life the laboratories are silent. The tests of the Franklin Institute stand as a model piece of work, but that work is now eight years old. Farther, the lamps tested at that time were furnished by the makers themselves for the purpose of test. Believing that the public would be interested in the results of a test of commercial lamps, as to both efficiency and life, the writers have carried out such a test and give the results in this paper. The test was made at the Electrical Laboratory of the Ohio State University, Columbus, O., and all expenses incurred were paid by the trustees.

Considering it of prime importance for our object that the lamps tested should be of the same character as those usually sold to consumers, we bought some lamps of regular dealers, as in the usual course of business, and obtained others from lots supplied for central station use. Lamps of the following makes were obtained, no attempt being made to get lamps of any given efficiency of any make: A. B. C., Beacon, Columbia, Economic, Packard, Pennsylvania, Standard, Thomson-Houston, Edison, Perkins, Sawyer-Man, and Steuben. In ordering (through persons purchasing for us in Chicago and New York) we called for ten 110-volt lamps of 16 c. p. in each case, but on receiving the lamps we found three lamps out of ten of one make labelled 111 volts. The three were excluded and seven put in, but another lot of ten of the same make, correctly labelled, was obtained. Ten of another make were received with the original marking, 111 volts in ink, changed by pencil to 110 volts. They were also excluded, and a new lot of ten of that make, correctly labelled, obtained. Ten Sunbeam lamps were divided into two lots of five each, evidently supplied as a sample lot, and were excluded. We could not get others of that make in time to enter the test. There were, therefore, in all 127 lamps, labelled 110 volts and 16 c. p., of 12 well-known makes, 17 lamps, in two separate lots of one make, and ten each of 11 different makes.

For convenience in making the photometric measurements, the lamps were mounted vertically in horizontal rows of 20 on a light, vertical rack 6 feet high and 20 feet long. The rack was made in the form of ordinary shelving, having five vertical pieces of pine 4 inches wide and 1 inch thick, and four horizontal strips of the same width, the 4-inch face being horizontal. The whole was rigidly braced diagonally, suspended by strong cords passing over pulleys in the ceiling and counterpoised by weights. This arrangement enabled us to bring each row of lamps to the level of the photometer described below by raising or lowering the rack, and definiteness of position was secured by spiking to the brick wall of the photometer room two two-by-four-inch vertical guides, against which the rack was pressed, and fastened each time by stout inclined pins, passed through the diagonal braces into holes bored in the guides.

A system of positive mains was arranged by fastening a No. 2 wire along the face of each horizontal strip in the rack, and joining them at the middle of the rack by a vertical No. 0 wire. A set of negative mains similarly made was placed on the opposite side of the rack. Flexible Okonite cable of equivalent section joined the No. 0 vertical wires to the ends of the dynamo mains fastened to the wall, which point is called the centre of distribution. Porcelain keyless wall sockets were screwed in place on the horizontal rack strips, and joined to the mains on each side by No. 16 wire. All connections were well soldered.

A Thomson centiampère balance provided also with a resistance for obtaining standard potential readings was used as a standard for current and potentials. Its constants had been repeatedly checked by a voltmeter and by Clark cells, and found correct and constant to within one part in one thousand. Two Weston milliampèremeters and two Weston voltmeters were used in the current and potential readings on the lamps. The ammeters were graduated to 10 milliampères, readable to one milliampère, and the voltmeters in volts, readable to tenths. The Weston instruments were compared with the Thomson balance at intervals, and found correct, or affected by a small constant error, which was applied as a correction. One voltmeter showed a slight change in zero, due to a sub-permanent set of its controlling springs, when it was allowed to remain in connection with the mains for a half hour. This, of course, was not done in the course of measurements.

Current was supplied to the lamps by a 200-light Thomson-Houston dynamo, of the spherical armature type, which proved to be an excellent machine for the purpose. Owing to the variable speed of the engine, due to varying load and steam pressure, a special automatic regulator was devised and applied to the dynamo, to keep the potential at the centre of distribution constant. This was effected by causing a small motor to slide a contact-piece along two vertical German silver wires joined to an extension of the field coil of the dynamo, a current being sent through the motor in one direction or the other, as needed, by relay points, the relays being controlled by an indicator attached to wires leading to the centre of distribution. As used, the combination proved very satisfactory, keeping the potential difference at the centre at 110 volts, within a limit of three fourths of a volt either way. It could readily have been set to a smaller margin, but that was not considered necessary.

For the candle-power measurements a two candle-power Methven screen was used, the gas being passed through a Methven carburetter containing pentane. Its constant was checked by standard candles. Three 32-candle-power Edison lamps were used as working standards. Each was checked at intervals by comparison with the Methven screen on a 100-inch photometer-bar, a slide-wire resistance enabling us to adjust the current through the lamp to a definite strength, which was always the same for a given lamp. The currents used were such as to develop about 18 candle power in the standard lamp. Instead of the usual Bunsen or Leesen disc we used a Summer-Brodhun prism, made by Schmidt & Haensch. It gave us much better satisfaction than the best Leesen discs we have been able to obtain.

In front of the test rack and parallel with it was placed a bench with a guiding-rail, along which a Weber portable photometer was arranged to slide, so as to be placed successively in front of each lamp in a row on the test rack. Instead of the little benzine standard lamp which was removed, a 16-candle incandescent, called the reference lamp was placed at a distance of about 800 centimetres from the end of the tube to which the benzine standard is attached. In taking the candle-power of the lamps under test, the photometer was first placed in front of one of the working standards. By means of a conveniently arranged slide-wire resistance the current through the standard lamp was accurately adjusted to the strength used with it, when its candle-power was measured on the standard photometer against the Methven screen. Care was taken that the adjustment of current was right when the measured potential at the terminals of the reference-lamp was just 110 volts. Readings of the standard lamp against the reference-lamp being taken, the photometer was then moved in front of each lamp under test, and readings taken of each against the reference-lamp. The candle-power of each lamp was then found by comparing these readings with those obtained opposite the standard lamp. The reference-lamp being of the same character as those under tests, and connected to the same mains, the slight

changes in potential allowed by the regulator affected alike the candle-power of the reference-lamp and the test-lamp being read, allowing us to take readings more rapidly than we could have done had it been necessary to adjust and hold the potential at 110 volts.

Before the duration test began the mean horizontal candle-power of each lamp was determined in the usual way, and the ratio of this mean to the candle-power found when the plane of the ends of the filament was perpendicular to the photometer bar was found, and used as the distribution factor. The lamps were placed on the rack in the same position with respect to the Weber photometer, at a distance of about one meter from its plate, the exact distance of each lamp being measured and used in the calculations on it. All results are expressed in terms of mean horizontal candle-power. The unavoidable delays encountered in starting the test made it impossible to determine the sphercal distribution without cutting short the time of run which we had set as desirable, viz., 1,200 hours. The duration test was begun on March 17, and it was necessary to run night and day, Sundays excepted, until the night of May 14, to complete the 1,200 hours. The run began with 77 lamps on the rack. The remaining 50 lamps were received later, and placed on the rack with the others 187 hours after the start.

As the methods used involve nothing particularly new, and have been fully described in print many times, we have considered it unnecessary to do more than state the general outlines, as above.

The object we had in view in undertaking the test was to determine the character of the incandescent lamp as a commercial product, not as a scientific instrument. The number of lamps of each make taken was, of course, too small to base a fair judgment on as to the absolute or relative merit of the lamps generally sold by the makers. For that purpose some hundreds of lamps of each make, taken from different lots, would have to be tested, which it was of course impossible for us to do. For this reason we have considered it unfair to the several makers concerned to give their names in connection with the results on their lamps, but have instead designated each make by a letter, and each lamp by a number. We believe, however, that the average of the results of all makes may be taken to represent fairly well the character of the average commercial lamp.

The results of the test are given in the following tables, the values given being in each case the average for a given make of lamp. Table I. gives in the second column the average value of the distribution factors found for the 10 lamps of make "A," and the average value of the mean horizontal candle powers for those lamps at intervals after the beginning of the duration test, expressed in hours by numbers in the first column. The third column gives corresponding values for the lamps of make "B," and so on. Table I. includes the lamps started March 17. Table II. contains similar data for the lamps started 187 hour later.

STILES POWER PUNCHING PRESSES.

The illustration (Fig. 1) shows the entire series of the well-known Stiles Power Punching Presses, from the smallest No. 0 to the largest No. 5. These presses are now made from new patterns and embody several new features, in addition to a greater strength of parts and increased length of bearings.

The eccentric adjustment used in these presses will be understood by reference to Fig. 2. It not only permits of rapid and very accurate adjustment, but transmits the pressure entirely through solid metal instead of throwing it upon screw threads, a decided advantage for heavy work. The graduation of this adjustment enables the operator to keep an exact record of the setting of the dies.

Nearly all the best manufacturing establishments in

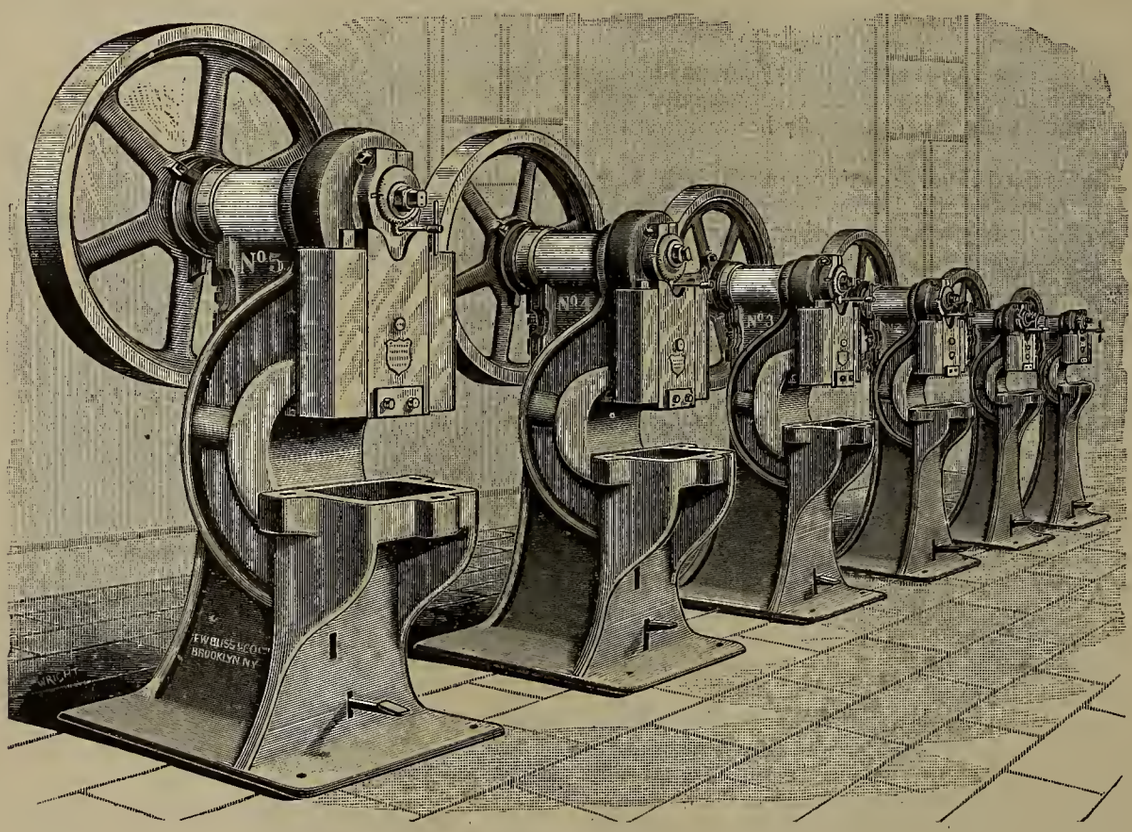

FIG. 1.

this line in America, and many in Europe, employ one or several of these presses. The range of work for which they are adapted covers nearly every kind of blank cutting, punching, perforating, forming and bending. These presses are made by the E. W. Bliss Co., Limited, No. 7A Adams street, Brooklyn, N. Y.

PRACTICAL NOTES ON THE ELECTROLYTIC REFINING OF COPPER.*

BY F. B. BADT.

Stalmann's patent drawings show the vats arranged in either series or multiple. The inventors of the series processes, like the Smith, Hayden, Stalmann and others, claim for their processes very much cheaper first cost of plant, very much less copper carried as idle capital in the vats, much less floor-space and higher efficiency in operation—that is, a larger recovery per horse-power hour. Whether or not these claims can be demonstrated in practice is yet an open question. One pound of copper will be deposited in one hour, theoretically, by a little less than 386 ampères out of a solution of sulphate of copper. If we, therefore, pass 386 ampères through one vat, we will deposit one pound every hour, and if we pass the same current through a series of 100 vats, we will deposit 100 pounds each hour. The amount of power expended in each vat, however, is $C^2 \times R$, but as it is always possible to reduce the resistance of a vat by increasing the surface of the plates, we can greatly reduce the amount of power required for the same output in copper per horse-power hour. We may also reduce the ampère-age for a given production by joining more vats in series, or we may combine both methods.

It is therefore always possible to largely reduce the expenditure of electrical energy, and consequently that of the motive-power. As a matter of fact, theoretically, any amount of copper may be refined with any given horse-power, but as soon as we attempt to largely increase the production of copper with a given power, we find it necessary to largely increase the size and number of vats and the quantity of copper under treatment. These conditions have been thoroughly examined, and the laws governing them have been explained in the several handbooks extant.

As a résumé it may be stated that if power is cheap we may make the internal resistance of the vats greater, employ small vats and less copper under treatment, requiring less floor-space, thus decreasing the first cost of the establishment materially. If, on the other hand, power is expensive, we must make the internal resistance of the

* Abstract of paper read at the general meeting of the American Institute of Electrical Engineers, Chicago, June 6, 7 and 8, 1892.

vats as small as possible, have a large amount of copper under treatment, requiring a larger floor-space, and materially increase the first cost of the plant. It can easily be seen that in each special case these conditions must be carefully determined in accordance with principles very similar to those laid down in Sir William Thomson's law.

From these statements, however, we may infer that the claims of the promoters of the so-called series processes are not well founded; because no matter how the plates in the vats may be arranged, we can always arrange the plant for conditions of minimum first cost or minimum operating expenses. It is true that both Smith and Hayden do away with cathodes of refined copper, and thus save quite an item for copper under treatment. On the other hand, there is the advantage that particles of the original anodes will stick to the final cathodes of refined copper, and that it will be found difficult to separate them.

As a matter of fact, it is claimed by some assayers and selling agents that electrolytic copper obtained by these two processes is not so pure as copper obtained by a process employing anodes and cathodes arranged in multiple. Mr. Stalmann in his arrangement obviates the latter advantage by attaching removable plates of refined material to his anodes.

Another important item in order to obtain a pure deposit is the density of the current. American copper refiners usually adopt 10 ampères per square foot of active cathode surface as a maximum. I am told, however, that some of the refineries operating on the "series" processes go even beyond 15 ampères per square foot, which may account for certain impurities found in the electrolytic copper and for a geater efficiency of the plant—that is, a larger output of copper for a given number of vats and amount of copper under treatment.

High voltage in an electrolytic plant of course means considerable saving or less drop in conductors, less trouble from poor contacts, etc., and it is probable that for these reasons the so-called series processes show a greater efficiency per given horse-power than the processes employing electrodes in multiple. For refineries using this latter process low-tension machines and comparatively few vats in series are employed. By adopting as high voltages in the multiple process as in the series process, of course, the same advantages may be obtained.

One advantage of the series proceess is the fact that each electrode will get its proper ampèrage per square foot, as all the plates are in series, and are of uniform size. In the parallel process some trouble is always experienced in properly subdividing the current in each vat, so that each plate will get its share; or in other words, that the curent density will be the same for each square foot of active cathode surface. By proper precautions, however, trouble in this direction may be easily avoided.

Another important item for the obtaining of pure deposits is a good circulation of the electrolyte. This insures a uniform specific resistance in the solution between the parts of the plates. Inasmuch as a solution of sulphate of copper is of greater specific gravity than the acid, which is liberated by the decomposition of the copper upon the surface of the cathode, such acid rises to the surface of the liquid while the solution of sulphate of copper settles toward the bottom. Where plates are arranged vertically, therefore, there is an ascending current before the surface of the cathode, and a descending current before the surface of the anode. If there is not a sufficient circulation of the electrolyte the free acid attacks the other portion of the plates more rapidly than the lower portion, and the deposition goes on most rapidly on the lower portion of the cathode.

In American practice the eleotrolyte is sometimes kept in circulation by arranging the tanks on the cascade plan, and have each higher vat siphon through a pipe whose orifice is near the bottom of the next lower vat.

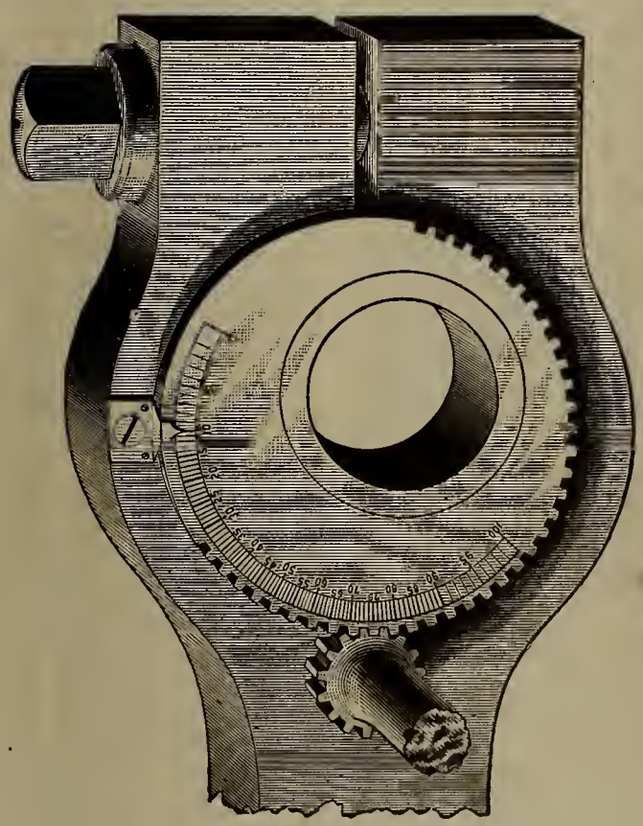

FIG. 2.

A better plan now usually adopted is to have a trough run through the whole refinery, and have each vat fed independently by means of a rubber hose. The electrolyte is raised from the collecting tank into the troughs by means of lead pumps or steam injectors. Both, however, are objectionable. The pumps are always getting out of order, and the steam injector means waste of steam, besides having the disadvantage of putting too much moisture into the electrolyte, which again necessitates the adding of free acid continually. A better plan is to have two collecting tanks, which are to be used alternately. Just as soon as one is full it is made air-tight, and a small air compressor driven by an electric motor compresses the air above the solution and drives the solution under a pressure of, say 25 pounds, through a pipe up into the troughs. Smith claims that in this arrangement no artificial circulation of the electrolyte is required. He claims that the free acid liberated over the whole horizontal surface of the cathode in each cell rises directly through the solution and the screen to the surface of the anode above and acts uniformly over its whole surface. As the deposition also takes place uniformly over the whole surface of the cathode, uniform electrical and chemical conditions are secured over the whole surface of each plate and uniform liquid resistance between the parts of the plates and the action of the cells is entirely automatic. Smith also claims that less heat is wasted by this arrangement than in installations which require the circulation of the liquid.

We might mention another incidental advantage of the multiple process over the series processes. Some of the patentees claim one-fourth of a cent per pound of refined copper as a royalty. In one instance one plant gives the patentee, under this arrangement, an income of over $100 per day. Taking this in combination with the very doubtful advantages claimed for the series process, we need not wonder that there exists prejudice against erecting electrolytic refineries employing these patented operations.

As to the value of the patents, from a legal point of view, I do not care to express an opinion. Some legal authorities state that anybody may arrange the electrodes in series within a vat without infringing if he omits some of the minor details of the combination patents whose claims have already been quoted.

The power installations of some of the electrolytic refineries which the author had an opportunity to visit reminded him very much of electric-light stations put up about ten years ago. The old motto, "Cleanliness is next to godliness," he found missing, and the plants usually excelled by a total absence of voltmeters or ammeters or other electrical testing instruments showing the conditions under which the plant was operating. Such statements, therefore, as "working current of a thousand ampères," or "density of current of 10 ampères per square foot," which we get from electrolytic refiners, must be taken with several grains of allowance.

I could enumerate a long list of defects that exist today in almost all of the electrolytic refineries, and which may all be traced to one cause, and that is the imperfect knowledge of the refiners of matters electrical. Large amounts of money may be saved in the erection and operation of such plants by considering all the conditions carefully before making the final plans. One case came to my knowledge where the lead lining was put in the tanks, and plumbers were commissioned to wipe the seams in the ordinary way instead of having the edges of the lead melted together by means of the hydrogen blowpipe. The latter plan should always be followed, as wiped joints will be destroyed by the electrolytic action of the solution in a very short time.

This is not by any means a small matter, as repairing of the lead lining involves large expenses and great loss of time. In one installation the conductors leading from the dynamos to the tanks are underground, but run in such a careless manner that they are permanently grounded, often get short-circuited, and in a few instances the wood conduit was set on fire. As a matter of fact, all the experiences which we have gone through for the last ten years in constructing electric light and power plants have been of no benefit, it seems, to most electrolytic refiners. Even in the few installations where a voltmeter is used to indicate the proper working condition of the vats, this voltmeter is carried by two men from vat to vat, and the voltage of each vat is taken in this cumbersome manner.

In a plant just being erected, the writer proposes the erection of a potential board in the office of the superintendent. Both terminals of each vat are to be connected with two contact points of the potential board, and a voltmeter is to be so arranged that by simply turning a switch handle the potential of each vat can be taken almost instantaneously. As a matter of fact, the working condition of each vat may be thus ascertained in a few minutes, while it would take hours for two men to do the same by carrying the voltmeter from vat to vat. One of the occurrences which has to be guarded against is the short-circuiting of an anode and a cathode, which in the multiple plan means the short-circuiting of a whole vat. Such an occurrence should be detected immediately, as otherwise the contents of the vat may be spoiled. The author proposed for a plant just being erected an electric tell-tale in connection with the potential board. This tell-tale might be constructed somewhat after the fashion of a hotel annunciator. Each magnet might be permanently in circuit with its corresponding vat, and the tension of the armature spring so adjusted that at the proper potential the armature would be held up, but just as soon as the vat is short-circuited no current, or but very little current, will flow through the magnet and the armature will drop, ringing an alarm-bell and indicating the number of the vat in which the trouble occurred.

All such appliances are labor-saving devices, and their installation would pay well in a plant where many thousand dollars worth of copper and solution is under treatment and liable to be spoiled. In a number of refineries there are T-rails suspended over the vats in such a manner that a pulley carrying a block and tackle can be used for lifting the plates out of the vats and moving them in the gangways for either washing off the slime or for substituting new anodes for the old ones. Some of the electrolytic refineries in the United States buy copper matte of from 45 to 54 per cent. of copper from the mining companies. In these cases they own their own smelters, resmelt the copper matte, producing black copper of from 97 to 98 per cent. of copper. This black copper is then cast into anodes and subject to the electrolytic process. Other refineries buy the black copper direct from the smelters owned by the mining companies. For instance, the Bridgeport Copper Company, of Bridgeport, Conn., buys the entire product of the Parrott Silver and Copper Company, of Butte, Mont., as black copper.

There is another matter which should be mentioned, as it is very often misunderstood by the public and the electric companies. If copper matte contains, according to the assay, 30 ounces of silver or less per ton of matte, no extra charge is made for the silver, but the copper matte is sold at the reigning market price. If it contains, however, over 30 ounces, the silver is to be paid in accordance with the assay. Thirty ounces of silver per ton of matte, of course, means almost double that amount per ton of electrolytic copper. It can easily be seen that electrolytic refineries prefer to buy copper matte containing just a trifle less than 30 ounces of silver per ton.

There are quite a number of points which need the attention of electrolytic copper refiners. There are, for instance, only a few of the refineries which manufacture

their own sulphate of copper, but buy it at high rates in the market. Sometimes the cost of freight and haulage doubles its cost. Each copper refinery should have a little installation of its own for the manufacturing of the necessary sulphate of copper, which it can do at a small fraction of what it has to pay for it. The same holds good in relation to the refining of the slime or mud which collects at the bottom of the vats, and which contains the precious metals. Each copper refinery should have its own little plant for the refining of the mud. These little installations can be run at a small expense in connection with copper refineries, and it is almost nonsensical to have other concerns make large sums of money which could be saved by the refiner himself.

A few words as to electric generators may not be out of place. The author prefers separately excited machines for the reason that they cannot be reversed, and other incidental advantages. When water-power is used as prime mover a good deal of trouble has been experienced in the regulation of the wheels. As a matter of fact there is no water governor in existence which will regulate so perfectly as the governor of a modern automatic engine under varying loads. By running all the exciters from an independent prime mover (either water or steam) the strength of the fields of the generators will be uniform at all times whether there are fluctuations in the external circuit or not; the strength of the field of the generators which, with self-exciting machines, is subject to the fluctuations in the external circuit, and is a variable, becomes a constant. The author proposed this arrangement over three years ago for railway and power stations with the very best results.

Before closing, we might mention some processes which have not been introduced in the United States yet, but about which a good deal has been said during the last few years. There are in Europe processes by which electrolytic copper is produced direct from the "matte" containing from 35 to 55 per cent. of copper. From the reports that have appeared from time to time it seems that these processes have not been a great success. There are other processes which contemplate the extraction of copper direct from the ores by means of electrolysis. The best known are the "Siemens" and "Hoepfner." If we are correctly informed, the Siemens process is now being used in one experimental plant only, which is owned by the Siemens firm. This is at Martinicken fields, near Berlin. Another one, which they have in the Caucasus at their own copper works, is said to have been abandoned because it did not give satisfaction. Dr. Hoepfner's process, it is claimed, is now in operation in three plants: one at Schwarzenberg, which began operations in September, 1890, and two others about which very little has been published. Dr. Hoepfner uses in his process a cuprous chloride solution, out of which a current of one ampère will deposit 2.35 grammes per hour, while out of a solution of sulphate of copper, only one-half of this amount of copper can be deposited per unit of current per hour.

As it was the object of the writer to give practical points on the refining of copper, and as he does not know anything about these two processes from personal observation or from practical experience, he does not wish to comment any further, but prefers to wait until he can see one of these plants in operation in the United States. While these processes do away with the smelting and resmelting of the ores, and while they would make unnecessary the large, expensive plants now used for this process, they seem to be very complicated; their commercial value certainly should be investigated much more closely by American mining companies before they should be willing to invest large amounts of money.

We finally give below the approximate cost of a refinery with a capacity of 1,000,000 pounds of electrolytic copper per month.

Building	$30,000
Pavement (asphalt)	2,000
Pipes for steam heating	4,000
Vats	6,000
Lead for lining vats, collecting tanks and troughs	28,000
Lead burning	1,500
Copper conductors	11,000
Rails for overhead blocks for handling plates	2,000
Sulphate of copper	3,500
Sulphuric acid	1,000
Steam injectors or pumps or air compressors	1,000
Electric generators, switchboard, instruments	30,000
Shafting and belting	3,000
Total	$123,000

To this sum must be added the copper under treatment, which in this case will amount to at least $80,000, and if a steam plant should be required, another $20,000 must be added, bringing the total of this plant up to $223,000. The above items include labor of erection, but do not include freights. These figures, although approximate and true only under certain conditions, will demonstrate that electrolytic copper refineries are expensive plants, and should be erected on carefully prepared plans and under the supervision of responsible and competent engineers.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Magnetism—What Is It?

AGNETISM is supposed to be closely related to the molecular constitution of a body capable of being magnetized.

It is well known that heat, cold, concussion and torsion affect the molecular constitution of a magnetizable body, and it is as well known that the same conditions likewise affect the magnetism of a magnetized body, and have the effect of destroying it.

The effect on the magnetism of a body of a disturbance of the molecules of that body is well illustrated by filling a glass tube with iron filings, closely packed. The filings represent the molecules of a solid bar of iron, and if we magnetize the contents of the tube by any of the well-known methods, it is noticed that the iron particles will arrange themselves lengthwise in the tube, but if disturbed or shaken the molecules are displaced and the magnetism disappears. The arrangement of the molecules—end to end—as exemplified by the iron filings, is supposed to account for the fact that a bar of iron is slightly longer after being magnetized than it was before, and at the same time its other proportions are correspondingly reduced.

It is supposed that in an unmagnetized bar of iron the molecules are arranged without any order, but under the influence of an electric current or magnetism they arrange themselves end to end, with like poles in the same direction, as did the filings in the tube, the result being a change of form as mentioned above.

Another fact which supports this theory is the slowness with which steel acquires and loses magnetism as compared with soft iron. Soft iron, as is well known, acquires and loses magnetism very rapidly, and this difference in the behavior of the two metals is attributed to the difference of rigidity. Steel resists the change of position of the molecules, while soft iron has very much less degree of resistance to this action.

That there is molecular motion in the magnetization of iron or steel is apparently further proved by the fact that

when a bar is suddenly magnetized by an electric current a faint metallic clink may be heard in the bar, both at the beginning and end of the magnetization, as though the molecules were wrenched into place and released after the influence of the current ceases.

These and other phenomena indicate that magnetization produces a change of position in the molecules, and on these facts the theory that magnetism is a mode of molecular motion is based.

It is not known, of course, what the character of this motion is; but this theory of magnetism is sanctioned by Clerk Maxwell, Hughes and other investigators, and agrees with like theories in regard to heat and electricity.

Ampère proposed a theory to account for magnetization by the presence of electric currents in the molecules themselves. The theory assumes that the molecules of all magnetizable bodies have closed electric circuits in which electric currents are constantly flowing ; that in an unmagnetized body these currents neutralize one another because of their difference in direction, and that the act of magnetization polarizes the particles, so as to cause the currents to flow in the same direction.

Hughes propounded a theory which is somewhat similar to that of Ampère. He assumed that the molecules of matter possess naturally opposite magnetic polarities ; that these molecules when arranged in chains or closed circuits neutralize one another, which is indicated by the non-magnetic condition of the body, and that the act of magnetization polarizes the molecules, or arranges their axes so that one set of poles tend to point in one direction while the other set point in the opposite direction, exhibiting the power known as magnetism.

Hughes' theory seems to be strengthened by the facts that a bar of iron or steel becomes elongated when magnetized, and that no matter how many magnets we may divide the original one into, each part exhibits opposite polarities. This, it is supposed, would hold good if we could subdivide the bar into its constituent molecules—each molecule would become a magnet itself.

NEW INCORPORATIONS.

The Delaware Electric Street Railway Company, Delaware, O., incorporated May 31, with a capital stock of $60,000, to build and operate an electric street railway and furnish light and power, etc. Incorporators: James K. Newcomer, Velerios T. Hills, John D. Van Demon, Beverly W. Brown, William A. Hall, Christian Riddle, Francis M. Marriott, Robert G. Lybrand, Harvey J. McCullough, Henry A. Welch, James Crawford.

Santa Anna Electric Power and Development Company, San Bernardino, Cal., incorporated May 31, with a capital stock of $1,000,000. Incorporators : Andrew E. Paris, F. C. Finkle, W. S. Hooper, San Bernardino, Cal.; William H. Coucher, F. M. Frazee, Los Angeles, Cal.

Suffolk Electric Company, Portland, Me., incorporated June 3, with a capital stock of $300,000, to manufacture and deal in electrical appliances of all kinds. Incorporators : Albert N. Reynolds, Albert W. Rounds, Boston, Mass.; Henry W. Boyd, Wareham, Mass.

Alleghany Hotel Company, Goshen, Va., incorporated May 31, with a capital stock of $100,000. Among other things it will construct and operate electric and horse railways and electric plants. Incorporators: C. W. Meyer, W. A. Anderson, J. R. A. Hobson, S. M. Taylor.

El Paso Electric Company, El Paso, Tex., incorporated May 31, with a capital stock of $100,000, to operate street railways and supply light and motive-power. Incorporators : George Davis, J. N. Carnes, Charlestown, W. Va.; E. B. Bronson, Peyton F. Edwards, El Paso, Tex.

The Forest City Electric Light, Heat and Power Company, Forest City, Pa., incorporated June 2, with a capital stock of $1,000. Incorporators : John McLaughlin, W. H. Leek, H. O. Purple, Forest City, Pa.

Delaware Railway Company, Philadelphia, Pa., incorporated June 4, with a capital stock of $51,000, to construct and operate an electric railway. Incorporators : Edward W. Patton, J. Lee Patton, Samuel Crothers, Philadelphia, Pa.

The Bloomsburg Electric Street Railway Company, Bloomsburg, Pa., incorporated June 1, with a capital stock of $12,000. Incorporators : J. L. Dillon, C. W. Miller, C. W. McKelvey, Jr., Bloomsburg, Pa.

Shickshinny and Huntington Valley Railway Company, Huntington Mills, Pa., incorporated May 31, with a capital stock of $60,000, to construct and operate an electric railway. Incorporators : F. A. B. Koons, Huntington Mills, Pa.; R. M. Tubbs, Shickshinny, Pa.; C. R. Eberle, Philadelphia, Pa.

New Kensington Street Railway Company, Pittsburg, Pa., incorporated June 2, with a capital stock of $15,000, to construct and operate an electric railway. Incorporators : S. E. Moore, James P. Anderson, Howard Childs, Pittsburg, Pa.

The Columbia and Marietta Electric Railway Company, Columbia, Pa., incorporated May 31, with a capital stock of $50,000. Incorporators : J. K. Sigfried, Pottsville, Pa.; Robert T. Ryon, James A. Ryon, Columbia, Pa.

Citizens' Passenger Railway Company, of Williamsport, Pa., incorporated May 28, with a capital stock of $13,500, to construct and operate an electric railway. Incorporators : James B. Krause, W. W. Champion, A. M. Champion, Williamsport, Pa.

The Electric Railway Supply Company, Chicago, Ill., incorporated June 1, with a capital stock of $200,000. Incorporators : George H. Graham, Francis L. Graham, Thomas Clarke.

O'Neil Electric Company, Chicago, Ill., incorporated June 3, with a capital stock of $5,000 ; among other things it will manufacture and sell electrical apparatus. Incorporators : John D. O'Neil, William Edelstein, M. R. Fletcher.

Lacon Electric Company, Lacon, Ill., incorporated June 3, with a capital stock of $16,000, to construct and maintain an electric light and power plant. Incorporators : I. S. Baldridge, C. C. Travis, Annie J. Travis.

People's Electric Light and Power Company, Benton Harbor, Mich., incorporated June 7, with a capital stock of $100,000, to purchase and sell electricity for light and power. Incorporators : Peter English, John Bell, Benton Harbor, Mich.; Willard W. McDonald, Chicago, Ill.

Hopedale Electric Company (incorporated in W. Va.), Boston, Mass., incorporated June 6, with a capital stock of $5,000,000, to manufacture and sell electrical batteries, dynamos, motors, etc. Incorporators : E. H. Abbott, Cambridge, Mass.; W. F. Draper, Hopedale, Mass.; Moses Williams, Brookline, Mass.

New England Electric Heating Company, Portland, Me., incorporated June 4, with a capital stock of $250,000, to manufacture and deal in electric heating apparatus. Incorporators : Edward Jewell, Boston, Mass.; Arthur B. Smith, Levi L. Parsons, Saugus, Mass.

American Electric Heating Company, Portland, Me., incorporated June 4, with a capital stock of $1,000,000, to manufacture and deal in all kinds of electrical heating apparatus. Incorporators : Edward Jewell, Fred A. Cook, Samuel B. Jenkins, Boston, Mass.

CATALOGUES.

THE "C & C" ELECTRIC MOTOR COMPANY, 402–404 Greenwich street, New York, has just issued its general catalogue for 1892. It is the most elaborate catalogue yet issued by this company, and contains not only a full list of its motors and dynamos, but also a careful description of all supplies necessary for the equipment of electric light and power plants. The specialties manufactured by this company, and to which attention is directed, are the switches on pages 18 and 19, the automatic motor starting-box on page 84, the organ rheostat and organ attachments on page 89, and the fans, blowers and other ventilating machines described in the last ten pages. The catalogue is printed on fine paper and profusely illustrated.

THE catalogue and price-list for June, 1892, issued by J. Elliott Shaw & Company, 632 Arch street, Philadelphia, manufacturers and dealers in electrical supplies, air compressors and Burgess atomizers, contains full descriptions and prices of the large number of specialties handled by them. The catalogue contains 100 pages and is freely illustrated.

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, June 11, 1892.

MR. JAMES H. MASON has resumed the managership of the business of A. M. Mason, manufacturer of Mason batteries, motors, etc., 366 Myrtle ave., Brooklyn, N. Y.

THE new motor recently produced by the Interior Conduit and Insulation Company, 42–44 Broad street, is being generally praised around town. This motor is of high efficiency and regulated for three speeds. All the parts are enclosed, and freedom from dust and dirt thus assured. It is so arranged that the air is drawn down through the armature in such a manner as to always keep it cool.

MR. LEMUEL BANNISTER and Mr. H. McL. Harding, the enterprising and energetic representative of the Westinghouse Electric and Manufacturing Company, of Pittsburg, Pa., are doing good work in the interest of their company. We hear that they have secured the contract for the equipment of the Newark and Orange horse railroad company with the Westinghouse system at a cost of over $100,000.

MR. S. L. PHILLIPS, president of the Seneca Falls Electric Railway Company, of Seneca Falls, N. Y., is in town for the purpose of organizing a general electric motor and supply business. Mr. N. M. Garland will be the New York representative. The new concern has accepted the New York agency for the Emerson Company, of St. Louis, manufacturers of the Emerson motors, which are very compact and efficient.

MESSRS. MORRIS & HARRISON, of the railroad supply department of the Thomson-Houston Electric Company, Boston, Mass., have, we understand, secured large storerooms on West street, this city, and are placing nearly $200,000 worth of street-railway supplies, motors, etc., for immediate delivery to convenient points to New York city.

THE BLAKENEY ELECTRIC COMPANY, of Brooklyn, report business very good.

PORTER BROS. & COMPANY, 78 Worth street, are sole agents for an insulating material employed in the manufacture of key-socket handles, bushing lamp socket bases, lightning arresters, arc-light insulators, etc., and claim it to be the best yet put on the market. Some of the firms using their material are the Edison General Electric, Thomson-Houston, Electric Construction and Supply Company, and others. They also supply it to firms in Germany. Messrs. Porter Bros. state they are finding a ready market for all they can supply.

THE BRADY MFG. CO., 83 Washington street, Brooklyn, has the best of facilities for the manufacture of electrical apparatus of all kinds. The most delicate instruments and the largest dynamos and motors are made by this concern, showing the great range of work it is able to carry on. Besides this the company designs and perfects labor-saving machinery of all kinds, and gets up drawings, patterns, tools, gauges, dies and models. With its large experience back of it, this company does things well and with dispatch.

MR. BENJAMIN F. LEAVITT, of the Porter Leavitt Motor Company, Providence, R. I., gave the ELECTRICAL AGE a call this week. Mr. Leavitt reports the motor business very good. The demand for his motors is constantly increasing.

MR. R. S. Vivian, of Kansas City, Mo., broker in first mortgage bonds, street-railway bonds and investment securities, gave us a call during the week.

THE "C & C" ELECTRIC MOTOR COMPANY, 402–404 Greenwich street, reports large sales of its standard generators during the past few months, and states that this department of its business is rapidly attaining equal importance with that of its regular line of motors.

THE WADDELL ENTZ COMPANY has removed its offices from 302 Produce Exchange to 203 Broadway.

W. T. H.

WESTERN NOTE.

A REPRESENTATIVE of the ELECTRICAL AGE, while in Buffalo last week, called at the show-rooms of the Edison General Electric Company, on Niagara street, and found the place well stocked with an elegant line of fixtures, motors, etc. Mr. H. B. Oakman, the company's resident agent, reports trade good.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor ELECTRICAL AGE.

NAMES OF COMPANIES.	CAPITAL.	PAR.	PRICE
American Dist. Tel., N. Y.	$3,825,000	100 00	61 00

*Per cent. †Registered stock.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

FINANCIAL.

To those pecuniarily interested in the advance of the electric art, it is most satisfactory to know that scarcely a turn in or on the great wheel of the world we inhabit can be or is being made without disbursing a generous amount of wealth to some one or other of the electric interests. The whole mind of the people at the present time centres on the various nominations for candidates for the principal offices for the ensuing four years, and all are informed of the current action simultaneously with its changing condition at Minneapolis and Chicago—by electricity, of course, with profit to the shareholders. To be sure the Western Union and Postal Telegraph Companies are reaping the greatest benefit, but the money itself, to the extent of at least seventy five per cent., is distributed among electricians of one kind or another, and the supply and construction houses, which only for the technicality of language must be numbered among the electrical family. The local electric light and car companies should, if the convention lasts a week, make enough to pay a half years' interest on their fixed charges, at all events. Further than this, while a presidential year is considered an off one for all general business, the electric industries will be called on to the utmost of their capacity. Electricity this year will no doubt stand next to wet refreshments in the amount of net profits contingent on the elections, and this fall be the most active we have experienced in many years in both the securities and extension of the industry. The embryo telephone companies which are mysteriously rumored to be very active should assume tangible and aggressive shape before the end of the year. There are several complete systems in the market lacking but two things—capital and right of way; only one of these is fairly offered, a clean sale for the American, Canadian, English and French patents for $500,000, half cash and half stock in the new company, or one fourth of all for $5,000 cash, which will enable the present owners to exploit successfully a company on lines they have laid out. It is claimed to be a vast improvement on the present system. Investors would also be safe in putting a few thousand dollars into a corporation in full working in this city, manufacturing and selling electrical machines for transmitting messages from one typewriter to another any distance under 1,000 miles; the money is needed to fill orders for equipment all over the country, the north Atlantic seaboard only being served at present. The safety of the system lies in the fact that, while the telephone by induction is quite sure to leak and the click of the Morse alphabet is known to thousands, this is a single click for each letter from keyboard to keyboard. The system also includes train messages, danger signals, police news, fire alarms, quotations and all matter of a private nature; only $30,000 of the 8 % pref. stock can be had, and if taken soon in one block a bonus of common stock goes with it, otherwise it is held at par flat. Another new matter is an electric hinge, control of which can be had for $15,000, self contained; it quietly closes a door automatically, has the appearance of any first-class hinge, and is strong enough to support the door. The field for this is equalled only by the number of respectable houses and doors. The profits are large, and the business will increase for years to come. The time has come when investors must look to such enterprises as those named, to have a voice in the disposition of their money. What show has a $50,000 holder, for instance, in the Western Union or a corporation of similar magnitude; but in the other case, while not requiring his absolute personal attention, he is acquainted with the condition of the business, and can suggest with effect. Let the institutions and estates invest in the large corporations; they can through their employed counsel get more information, while individuals desire to have their funds better in hand.

The Electrical Age's Illustrated Patent Record.

Issued June 7, 1892.

476,236. Electro-Magnet. Andrus D. Ayres, Kalamazoo, Mich. Filed Sept. 15, 1891.

476,292. Apparatus for Trimming Carbon Points. Philo Moses, Fremont, Ohio. Filed June 25, 1891.

476,296. Electric Battery. Richard P. Osgood, Methuen, Mass. Filed Jan. 18, 1892.

476,311. Electrical Governor. Mark A. Replogle, Mattawana, Pa. Filed Dec. 12, 1890.

476,317. System of Testing Electric Circuits. Charles H. Rudd, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Nov. 4, 1889.

476,330. Safety Device for Electric Motors. Elihu Thomson, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Oct. 16, 1889.

476,331. Dynamo-Electric Machine. Elihu Thomson, Lynn, Mass, assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Oct. 14, 1889.

476,346. Alternating-Current Motor. Merle J. Wightman, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. Filed Nov. 14, 1888.

476,368. Brush-Holder for Dynamo-Electric Machines and Motors. Frank B. Daggett, St. Joseph, Mo. Filed Sept. 8, 1891.

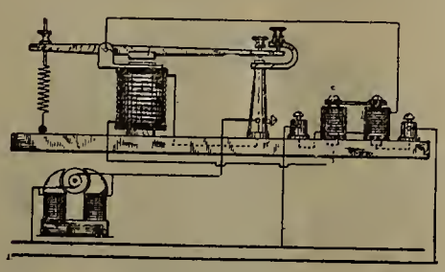
476,376. Electrically-Controlled Valve. William B. Fleming, Philadelphia, Pa. Filed Nov. 3, 1888.

476,422. Electric-Lighting System. Albert Sechrist, Denver, Col. Filed Dec. 1, 1891.

476,425. Electric-Arc Lamp. Edward F. Smith, Cincinnati, Ohio. Filed Oct. 5, 1891.

476,426. Electric Generator or Motor. Elmer A. Sperry, Chicago, Ill. Filed April 3, 1886.

476,437. Electric Locomotive. Thomas E. Adams, Cleveland, Ohio, assignor to the Brush Electric Company. Filed May 28, 1890.



476,330—SAFETY DEVICE FOR ELECTRIC MOTORS.

476,463. Electric Chime or Bell. Joseph H. Hunter, Pittsburg, Pa. Filed Feb. 29, 1892.

476,464. Metallic-Circuit Cable. Charles E. Jackson, Boston, Mass. Filed Nov. 12, 1891.

476,483. Secondary-Battery Plate. Edward C. Paramore, Philadelphia, Pa., assignor, by mesne assignments, to the Paramore Electric Company, of West Virginia. Filed Sept. 2, 1890. Renewed Oct. 31, 1891.

476,484. Electric Cable. William R. Patterson, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Oct. 29, 1891.

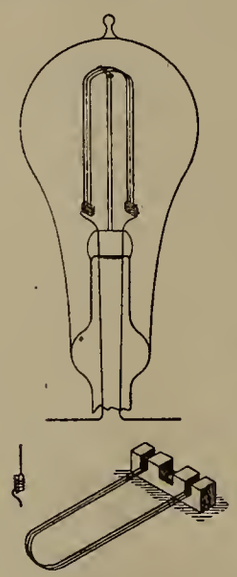
476,490. System of Testing for Electric Circuits. Chas. H. Rudd, Evanston, assignor to the Western Electric Company, Chicago, Ill. Original application filed Jan. 19, 1888. Divided and this application filed Oct. 25, 1888.

476,492. Circuit for Test-Batteries and Cords of Multiple Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 1, 1885.

476,493. Electric-Arc Lamp. Charles E. Scribner, Chicago, Ill., assignors to the Western Electric Company, same place. Filed Oct. 13, 1891.

476,494. Keyboard System for Metallic Circuits. John A. Seely, New York, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 15, 1886.

476,501. Incandescent Electric Lamp. Ephraim E. Weaver and Gustavus B. Manypenny, Philadelphia, assignors of one-fourth to John Woolman Comfort and William Steele Ambler, Jenkinton, and John Cunningham, Jr., Philadelphia, Pa. Filed Dec. 5, 1891.



476,528—INCANDESCENT ELECTRIC LAMP.

476,509. Keyboard-Circuit for Multiple Switchboards. Oro A. Bell, New York, N. Y., assignor to the Western Electric Company, of Illinois. Filed Sept. 30, 1891.

476,527. System of Electric Lighting. Thomas A. Edison, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed August 7, 1882. Patented in England, in Belgium, in Italy and in France.

476,528. Incandescent Electric Lamp. Thomas A. Edison, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed March 16, 1883.

THE

"CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

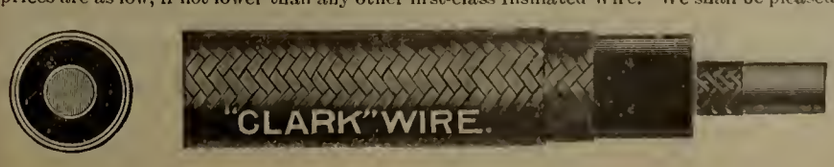
In a letter from the Inspector of the Boston Fire Underwriters' Union, under date of March 29, 1886, he says:

"A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weather-proof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use we make all sizes of stranded and flexible cables with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.



EASTERN ELECTRIC CABLE CO.,

61 to 65 Hampshire Street, Boston, Mass.

HENRY A. CLARK, Treasurer and General Manager.
HERBERT H. EUSTIS, President and Electrician.

476,529. System of Electrical Distribution. Thomas A. Edison, Menlo Park, N. J. Filed Oct. 10, 1883.

476,530. Incandescent Electric Lamp. Thomas A. Edison, Llewellyn Park, N. J. Filed June 4, 1887.

476,531. Electric-Lighting System. Thomas A. Edison, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed April 26, 1881. Patented in England, in Germany, in France, in Belgium, in Italy, in Portugal, in Victoria, in India, in Spain, in New South Wales, in Austria-Hungary, in Queensland and in New Zealand.

476,544. System of Electrical Distribution. Harry W. Leonard, New York, N. Y. Filed Dec. 28, 1891. Patented in England.

476,570. Fuse-Block for Electric Circuits. Elmer A. Sperry, Chicago, Ill. Filed March 19, 1891.

476,573. Electrical Valve-Controller. John V. Stout, Easton, Pa. Filed Dec. 22, 1891.

476,582. Microphone, Cæsar Vogt, Posen, Germany. Filed May. 27, 1891.

476,583. Magnetic Telephone. Cæsar Vogt, Posen, Germany. Filed Sept. 14, 1891.

476,603. Conduit for Electric Railways. William Bradley, Fort Wayne, Ind. Filed June 22, 1891.

476,604. Insulator-Bracket. Thomas H. Brady, New Britain, Conn. Filed April 9, 1892.

476,607. Electric-Light Mast-Arm. John H. Caldwell, Philadelphia, Pa. Filed June 19, 1891.

476,613. Electric Switch. Charles E. Davis, Chicago, Ill. Filed Feb. 20, 1891.

476,618. Apparatus and System for Compound Telegraphy and Telephony. Francis W. Dunbar, Newark, N. J., assignor to the American Telephone and Telegraph Company, of New York. Filed Jan. 25, 1892.

476,653. Electroplate Attachment. Christian Keck, Cincinnati, Ohio. Filed Dec. 22, 1891.

476,700. Electric-Arc Lamp. Robert H. Thurston, Ithica, N. Y. Filed Feb. 27, 1892.

476,730. Telegraph-Instrument. Charles B. Carr, St. Johnsbury, Vt. Filed Jan. 7, 1892.

476,733. Galvanic Battery. Martin M. Clark, Chicago, Ill. Filed Dec. 26, 1888.

476,739. Electric Street-Lamp Post. Thomas Flaherty, Pittsburg, Pa. Filed March 23, 1891.

AN INTERESTING PAPER.

Mr. Nelson W. Perry in a very interesting paper recently read before the general meeting of the American Institute of Electrical Engineers at Chicago, asks in view of the fact that in the application of electricity in telegraphy where long distances are concerned, and in telephony where more than two instruments are on the same circuit, and again where large amounts of energy are to be transmitted great distances, as is illustrated by the arc light, the series system is the only one equal to the demands; why should it not also be applicable for the operation of electric railroads which are run long distances?

The practical application of such a system would, as Mr. Perry says, possess many valuable features, especially in the case of extensions of roads which must necessarily occur. The necessity for erecting extra generating stations with the accompanying expenses for real estate, building material, machinery, additional labor, etc., would be obviated. This would mean the saving of thousands of dollars, as a comparatively small expense would be incurred for the additional copper required. Every dollar saved means just so much more for dividends and where it is gained without detriment to the equipment investors are sure to be pleased.

Mr. Perry explains in an exhaustive manner how this may be possibly accomplished, and illustrates his remarks with diagrams by reference to which his suggestions may be the more readily understood. For the benefit of our readers we will produce the paper in full.

A UNIQUE SUGGESTION.

A decidedly unique, interesting and novel suggestion, thoroughly original in its conception, is made by Mr. A. A. Knudson in another column in this paper. Mr. Knudson's suggestion, if carried into effect, cannot fail to excite the greatest interest throughout the length and breadth of the land. His idea is that the formal opening of the World's Fair should be announced in all the large cities from the Atlantic to the Pacific and from the Dominion to the Gulf, by the simultaneous discharge of cannon, the thundrous tones of which would proclaim that the greatest Exposition the world has ever seen, or probably will see for many years to come, had been opened to all nations. In a very clear and succinct manner Mr. Knudson demonstrates the complete feasibility of his plan, which will be the more readily understood by reference to the diagram. He proposes through the cooperation of the telegraph company or companies to have cannon connected in electrical circuit in as many of the cities as may be determined upon—the more the merrier. Then, when everything is in readiness, the President, or whoever may be delegated to perform the ceremony, by simply pressing the key and closing the circuit, will cause the cannon to be discharged in each city, announcing to the multitude of expectant citizens that all nations had commenced the celebration offered in honor of the great Columbus.

The suggestion offered by Mr. Knudson is probably the most interesting that has yet been made in connection with the Exposition, and deserves the careful, and we would say favorable, consideration of the Fair authorities. As but a period of two minutes would be occupied for the purpose of signalling, firing and restoring the circuits to their normal working condition, we feel quite sure that the telegraph company or companies would be only too glad to lend assistance.

A SUGGESTION FOR THE COLUMBIAN EXPOSITION.

BY A. A. KNUDSON.

THE World's Columbian Exposition at Chicago next year will afford greater opportunities than any other event in the history of the development of the arts and sciences for the display of genius of every kind.

It is well known that the ingenuity of scores of minds throughout this country is being actively exercised with a view to evolving something for the great Fair that will be entirely original and attractive, and it is the desire of all Americans to have as many original features as possible in connection with the great Exposition.

The attractions and novelties at the Chicago Fair no doubt will be innumerable, and it is reasonable to presume that the hundreds of thousands of visitors who will come to America next year from foreign lands will get a good idea of what a great and energetic people the Americans are.

Although there have been many attractions proposed for this great occasion, I wish to offer a suggestion in the line of a novelty in connection with the opening exercises of the Fair that I think might prove of extreme interest throughout the country.

Three years ago a very successful electrical exhibition was held in the city of St. John, New Brunswick, and as part of the programme of the opening exercises cannons were fired in St. John by electricity, the current being transmitted from Montreal, and also from Vancouver, on the Pacific coast, some 3,500 miles away. The use of the lines of the Canadian Pacific Telegraph Company were freely tendered for the purpose, and its president, Mr. Van Horne, personally touched the key in Montreal which caused the current to speed with lightning rapidity to the gun in St. John, and fire it off, Mayor Openheimer, of Vancouver, doing the same there. Telegrams of congratulation were afterwards sent by both of these gentlemen to the lieutenant-governor, who presided at the opening exercises, and who declared the exhibition open, after his speech, by discharging three guns himself from the platform, the cannon being in a fort conveniently near the building.

This feature of the exhibition attracted probably more notice and interest than any other. It was entirely successful in its operation, and was easy of accomplishment. I had the honor of being the general superintendent of the exhibition, and devised this attraction which, with the liberal help of the telegraph company in affording the use of its line across the continent for the purpose, brought forth such successful results.

Some time ago it occurred to me that a similar feature of this character would be eminently appropriate and interesting in connection with the opening exercises of the World's Fair, and having given the matter considerable thought I have evolved a scheme which I hereby submit for the consideration of the proper authorities of the Fair.

My idea, briefly, is to provide means by which a cannon stationed in the capital city of every State in the Union can be discharged by the touch of a key on the platform at Chicago—one touch of the key discharging all the cannons simultaneously—or, should circumstances require it, cannons in a greater or less number of cities; the object of course being to give general and audible notice that the great Fair has been formally opened.

In the development of my plans I have kept in mind the necessity of disturbing existing arrangements in telegraph offices as little as possible, and it will be noticed by reference to the accompanying diagram of connections that there is no interference with the main telegraph lines at the cities where the guns are to be fired. The "gun circuit" in every case is entirely local, and is controlled by a switch *m* (Fig. 2).

The diagram shows the proposed connections at Chicago and, for example, Boston, the connections in the latter city being, of course, identical with those in each place where a gun is to be fired.

Fig. 1.

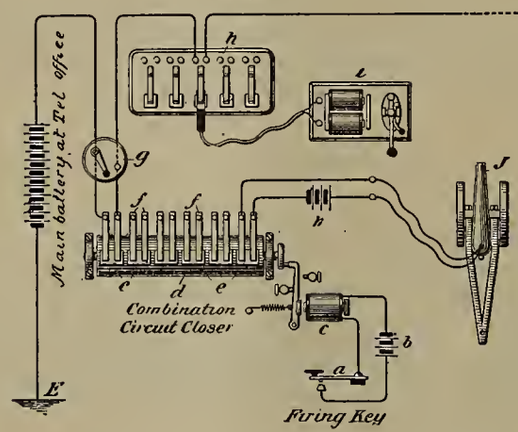

Fig. 2.

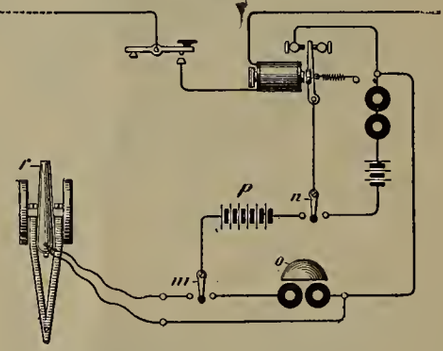


The firing-key *a* (Fig. 1) is an ordinary open-circuit strap key. It is connected, as shown, with a battery *b* and an electro-magnetic device *c*, which releases a catch, causing the combination circuit-closer *d* to operate. This circuit-closer consists essentially of a cylinder of some insulating substance—hard rubber, say—on the outer surface of which is attached, longitudinally, a series of metal plates *e*.

The cylinder is revolvable by suitable mechanism, which is put into operation when the catch is released by the electromagnet *c*, when the latter is charged by the closing of the key.

Before the circuits are closed the strips of metal on the surface of the cylinder are not directly under the finger-bars *f*; but when the cylinder is made to turn by the operation of the electromagnet, the metal plates form a contact between every pair of the finger-bars (which are also made of metal and represent the terminals of an open wire), thus closing the circuit connected therewith and firing the gun on that circuit, in the manner to be explained further on.

A switch *g* is placed in the main telegraph circuit for the purpose of cutting in and out of circuit the combination circuit-closer; and on the same circuit in the telegraph office is a test switch *h*, for the purpose of test-

ing the gun circuits just previous to the operation of firing.

By previous arrangement all such circuits can be tested a short time before the firing current is to be transmitted, in order to insure a clear wire, free from trouble, and to give time for the substitution of a good wire in case of derangement of any one of them. The test instrument *i* enables the chief operator to test each of the gun wires by simply inserting the plug in the switch, which may be of the ordinary jack-pin pattern.

The gun *j*, at Chicago, is so connected that when the circuit-closer revolves and the two finger-bars are connected by the metal plate on the cylinder surface, the circuit is closed and the gun fired by the heating to incandescence of the fine wire in the fuse. The current for heating this wire is generated by the battery *k*, which is of sufficient size to heat the wire to incandescence as soon as the circuit is closed.

This explains the operation of transmitting the firing currents.

The arrangement of the circuits at the receiving ends (all being similar to the one shown in the diagram) is shown in Fig. 2. The regular main-line connections in the telegraph office are not disturbed at all, the only change consisting of the insertion of a three-point switch *n* in the local circuit which controls the sounder. Connected with one of the wire terminals of the sounder is an extra wire which runs to a bell *o*, the circuit continuing through the bell to one point of another three-point switch *m*, thence to the battery and the left-hand point of the switch *n*. The gun *r* is connected in the manner shown, and the operation of the arrangement is as follows : When the time arrives to make preparations for the firing of the gun, the switch *n* (at the telegraph office) is turned to the left, and the testing operator at Chicago, at the proper time beforehand, sends a signal over each of the gun circuits by cutting in on the switch *h* (Fig. 1). This signal rings the bell *o* (Fig. 2), which is located at a point convenient to the gun operator, the switch *m* being turned to the right. When the gun operator hears the bell ring he turns the switch *m* to the left, which cuts the gun into the circuit, and it is all ready to be fired by the closing of the circuit at Chicago, by the President of the United States or whoever may be the person delegated to perform this extremely interesting ceremony.

In an instant all the guns in electrical connection with the Chicago platform, scattered as they would be all over the country, separated by thousands of miles, would simultaneously with the gun at Chicago speak in a voice of thunder, and announce to the thousands of expectant citizens gathered around each that the greatest World's Fair in history had been declared open to all nations.

It may be noted here that by this plan, after the guns have been discharged the telegraph lines can be instantly restored to their normal working condition, a period of two minutes, at the longest, being sufficient for the purposes of signalling, firing and restoring the circuits.

This arrangement, I believe, would create much additional interest in every part of the country in the exhibition, and would tend to make the affair memorable.

A NEW SYSTEM OF ELECTRIC PROPULSION.*

BY H. WARD LEONARD.

PART II.

Let us examine some of the advantages that this method seems to offer over the existing methods, starting at the car and considering the entire equipment back to the boiler.

*Paper read at the general meeting of the American Institute of Electrical Engineers, Chicago, June 6, 7 and 8, 1892.

In order to place before you the opinions of some of the best authorities on the questions involved, I shall quote freely from "The Electric Railway" (Crosby & Bell); Parshall's "Methods of Electrically Controlling Street Car Motors," "Comparative Test of High and Low Speed Engines in Electric Railway Work," by Charles W. Wason (*Electrical Engineer*, April 27, 1892); "The Practical Operation of the Gearless Motor," by S. H. Short (*Electrical World*, April 16, 1892); "Load Diagrams of Electric Tramways and the Cost of Electric Traction," by A. Reckenzaum (*Electrical Review*, London, March 25, 1892).

The cost of car equipment will be increased by the cost of the motor-generator, but as a partial offset to this we have saved the rheostats, two expensive controlling switches and a complex system of wiring.

Our motors, having constant and fully-excited fields, will operate absolutely without spark under all conditions. The control of the car will be entirely accomplished by a small switch and rheostat, handling never more than one-half of an ampère and occupying a space of one foot square and one inch deep over all.

As regards efficiency, we will have the advantages of the present system under all conditions. For long runs upon the level we will, by a suitable switch, connect the driving-motors directly to the line and secure an efficiency of 90 per cent. for our motor.

As regards depreciation, we will have the advantage of no rheostats or controlling switches to burn out and with no sparking and no connection with the field circuit we will have the minimum liability of burning out armatures.

Our fields will have no tendency to burn out, since they are not subject to the excessive currents which the present series fields are. The current in our field will be independent of the load.

As to field windings and rheostats in existing methods, Parshall says:

"With 25 H. P. motors, an external resistance of 10 to 12 ohms is required.

"Lessening the duty of the rheostat is a very important point, since as yet it has been found exceedingly difficult to construct a cheap rheostat that could be placed under the car in the small space available and dissipate so large an amount of energy as is required when the car is to be run for a considerable time at a speed so low as two or three miles an hour. Any method of control that has lessened the energy to be dissipated in the rheostat has in general been considered with favor, since there has been a corresponding diminution of trouble in each case that the energy to be dissipated has been lessened.

"The range of speed without the use of a rheostat is determined by the limit to which it is safe to heat the magnets."

Crosby and Bell say :

"In using this method (commutated fields) the principal difficulty has been met with in disposing of the excessive heat necessarily generated in the compact mass of field windings.'

"The practical problem has been to secure a convenient rheostat.

"The principal sources of loss in our present street railway motors are the regulating devices and the gearing.

"With the motors and the gearing generally employed, the average commercial efficiency of the combination is probably not often in excess of 65 per cent., giving a total commercial efficiency for the system, from engine to car-wheel, of 39 per cent.; this of course is but an estimate. But taking all the factors into consideration it is probable that the average of the roads now in operation would fall quite nearly to the point indicated. In very few cases would it fall below 30 per cent.; in still fewer would rise above 40 per cent."

Regarding the power required to start a car on exist-

ing methods and to operate it upon levels and grades Crosby and Bell say:

"With the ordinary car equipment of two 15 H. P. motors and the usual speeds, from eight to 12 miles per hour, experience has shown that five to six electrical H. P. is necessary on nearly level tracks.

"The amount of current ordinarily taken in starting a car is momentarily more than 50 ampères, which at the ordinary voltage corresponds to about 25,000 watts."

Reckenzaum says:

"If we calculate from the accepted coefficients of resistance to traction on common tram-rails, we find that an ordinary tram-car will require but three to four H. P. for its propulsion when once in motion."

He says of the Thomson-Houston car:

"The maximum current at any time was 75 ampères."

Of Sprague motors:

"Here again we observe a maximum current of 75 ampères.

"Westinghouse motors, maximum current 95 ampères."

Short finds that 80 to 100 ampères are required to start a car, and says:

"On this road the traffic is very heavy, although grades are light."

Leaving the car, let us now consider the line. It will be evident from what we have seen that we can reduce the amount of copper to one-half the present requirements, as we never will require the enormous currents at present called for in starting and upon heavy grades. Or, to put it in another way, with the existing conductors we could run twice as many cars as at present, with the same loss in the conductors.

Now let us look at the generators and the prime movers, whether steam-engines or water-wheels.

Under existing systems for roads of from five to 10 cars, it is necessary to install about 20 indicated H. P. (rated at $\frac{1}{4}$ cut-off) per car and about 16 kilowatts per car in generators. Also about 20 H. P. per car in boiler capacity. This large equipment is necessitated by the occasionally very large demands for power and the inefficiency consequent upon this.

Under the proposed system it is not necessary to provide power in excess of 15 H. P. for any car under any conditions, and since in practice most of the cars will be operating at less power than this, we need only install engine, dynamo and boiler capacity of 8 H. P. per car, instead of 20. Or, to express it another way, we can operate with existing boilers, engines and dynamos at least double the number of cars they can at present supply.

Crosby & Bell recommend, for a five-car road:

"An equipment consisting of two 40,000 watt dynamos, one 80 H. P., high-speed, simple engine belted directly to them, and two boilers of about 50 nominal H. P. each."

Now let us look at the economy of the operation of the station. With the extremely fluctuating loads of existing systems, the economy of the entire generating plant is very low. The stations of three roads which have been tested give for the combined efficiency of engine and dynamo 40 per cent., 54.6 per cent. and 62.8 per cent. respectively. If the load can be kept approximately constant, the combined efficiency of engine and generator should be about 75 per cent., and in the proposed system the load will be sufficiently uniform for us to expect an efficiency equal to this, and because of the nearly constant load we can produce a horse-power on about 25 lbs. of water, while in present practice for small roads about 50 lbs. of water per horse-power is a fair figure, and the best published result thus far obtained, even when the average horse-power rose to 750 H. P., is 28 lbs. per H. P., as found by Wason, at Cleveland, in operating a total of 71 motor cars.

With the present systems the average indicated horse-power per car is about 12 horse-power, which on account of fluctuating load, requires at least 36 lbs. of water per horse-power, or about 420 lbs. of water per car per hour.

With the proposed system we will operate with an average of about eight indicated horse-power per car, which, on account of the steady load, will be produced with about 25 lbs. of water per horse-power, or 200 lbs. of water per car per hour. That is, we require about 50 lbs. of coal per car per hour by present systems, and about 25 lbs. of coal per car per hour by proposed system, or a saving of 50 per cent. in the coal and water required in favor of the proposed system.

On this subject of fluctuating loads and their effect, Crosby and Bell say:

"A record of ten minutes on a recording ammeter may give some faint idea of the condition of things. It will be seen that at one point the output jumped from zero to 150 H. P. and back inside of a single minute, and during the latter five minutes shown in the diagram there were no less than 25 sudden *variations* of 50 to 100 H. P., each taking place within a few seconds. The road from which this record was obtained is four miles in length, and was operating seven cars at the time of the test."

Reckenzaum says:

"These abrupt changes have the effect of reducing the efficiency of the whole system to a comparatively low figure."

Church says (*Electrical Engineer*, April 27, 1892) that the best compound engines will show an economy of only 28 lbs., and the usual compound engine "an average duty not better than 35 to 40 lbs. The same is true of every form of non-compounded engine, whether high-speed or low-speed, both of which show a tremendous falling back of fuel duty under variable load."

Let us now examine the comparative first cost of a railway of moderate size, say from five to ten cars, equipped by present systems and by the proposed system.

The detailed figures per car are given in Table 2.

TABLE 2.

SHOWING PROBABLE COMPARATIVE FIRST COST PER CAR BY PRESENT AND PROPOSED SYSTEM.

	Present System.	Proposed System.
Steam plant, generators and conductors per car (steam plant 1,000, generators 700, conductors 500)	$2,200	$1,700
Motors (2 H. P. equipments)	1,800	1,400
Power converter	0	900
Controlling switches, cables, rheostats, etc	200	30
Total first cost per car	$4,200	$3,430
Saving in favor of proposed system per car		770

Table 3 gives a summary showing the features of the proposed system as compared with the corresponding features of the present system.

TABLE 3.

	Present System.	Proposed System.
First cost of steam plant, generators, conductors and car equipment per car	$4,200	$3,430
Ampères at 500 volts required to start full load on level	75	2.8
Ampères at 500 volts for full load at full speed on level	12.5	12.5
Ampères at 500 volts to start full load on 5 per cent. grade	125	10
Ampères at 500 volts for working speed on 5 per cent. grade	60	22.5
Ampères fed back to system in coming down 5 per cent. grade	0	10
Pounds of coal per car per hour	50	25

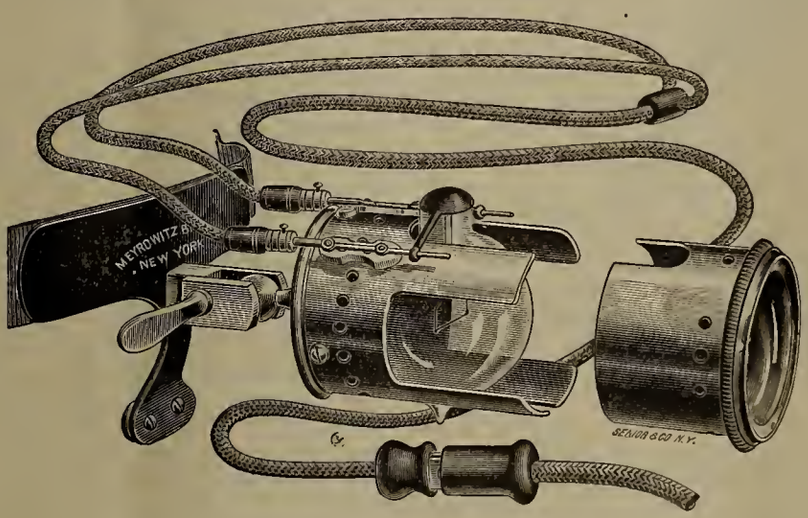
The features of the proposed system which seem, at first sight, to be very objectionable are: The increased cost of the car equipment and the fact that we are adding an additional machine, having two fields, two

armatures and three bearings; but, as we have seen, there is only an apparent increase in the first cost, for the saving in the generators and distributing plant far exceeds the additional cost of the car equipment; and the use of the motor-generator for elevators, travelling cranes, etc., has demonstrated that, as regards the attention it requires and the depreciation it suffers, it has a marked advantage over the rheostat or commutated field used in the present methods of operation.

ALUMINUM ELECTRIC PHOTOPHORE.

In the old style electric photophores the metal parts were so heavy as to be supported on the forehead with great fatigue. It was in order to obviate this decidedly objectionable feature that E. B. Meyrowitz, 104 East 23d street, New York, a practical manufacturer of optical, ophthalmological and surgical instruments, etc., designed and perfected the photophore illustrated herewith.

The metal parts are constructed of aluminum, and in this way the desired result has been accomplished, as that



ALUMINUM ELECTRIC PHOTOPHORE.

metal is of extremely light weight. Many new features and improvements have been introduced, and no pains spared to make it a first-class article. The lamp used in connection with this photophore is of 4 C. P., the light being projected in parallel rays by a strong plano-convex lens. It can be operated by the Meyrowitz two-cell storage battery, or direct with the Edison current by employing the Gish ideal rheostat. In filling a long-needed want, this photophore should meet with large sales among the medical fraternity.

ELECTRICITY AND ITS RELATION TO TRANSPORTATION.*

BY CHARLES SELDEN.

Eminent motive-power people have told me that experience shows that under the best conditions the locomotive can only be utilized to the extent of 25 per cent. of its power, and 15 per cent. under unfavorable conditions which are met daily. There are several factors that brings this about—partial consumption of fuel under high speed is one, loss of fuel through exhaust is another, lack of traction is another, and so on. You build an enormous machine in order to secure certain traction effects, and you mine and handle and rehandle and haul and rehaul millions of tons of coal, every movement of which means money, and added to that you get only a low per cent. efficiency of what you finally at great cost deliver to your fire-box. Assuming (and I have reason for the assumption being well grounded) that you can take the power out of your coal at the mine, and after conversion you transport, not the coal, but the resultant power and energy by means that are, so far as record shows, practically everlasting, and deliver to your motive device a high per cent. of your power, are you not operating at an immense saving? And will it not enable you to meet the requirements of low rates, large tonnage and high wages?

Again, where your road is so located as to enable you to utilize water-power, there is still more inuring to your benefit. I know that owing to the sluggish response of the turbine to a sudden call for increased power, that in operating a number of speed trains it is not all that could be desired, but that will be remedied, and for slow freight movement I believe that it will fill the bill even now; if it does, so much the better; practical trial alone will demonstrate it, and can be made upon many roads that are located beside streams and following their courses, where thousands of horse-power energy is wasting in its passage to the sea.

Owing to the brief time the electric motor has been employed as a practical tonnage mover, an attempt to show its economies as against the locomotive is an arduous task, and it is hard to believe how difficult it is to get figures in such shape as to admit of proper comparisons being made. One reason is that the street-railway companies figure on the number of passengers carried, regardless of distance, as all pay the same fare for either long or short haul, while the steam railroads figure on the number of miles each passenger is carried.

The electric motor has practically dealt exclusively, up to this writing, with the carrying of passengers. There are a few isolated cases in which a freight car or two have been utilized, and records show that in one instance a single car in one year carried 10,460 tons, but unfortunately the records do not show the mileage made by the car, nor its earnings ; and hence we cannot reduce the figures to tons carried per mile and earnings. Another difference in the method of accounting is that the figures are based upon the earning and expense per car-mile, instead of the ordinary method employed by steam railroads. I selected as a fair comparison a steam road that pays a dividend, and upon which the earnings from passenger service exceeded the expenses about 25 per cent., taking the passenger car mileage and reducing it to miles per car, likewise showing earnings per car-mile and expenses per car-mile.

The expenses were $4,552,992.84, or per car, $7,367.30 ; or per car-mile 12.41 cents, a net earning per car-mile of

*Abstract of paper read at the Convention of the Association of Railway Telegraph Superintendents, held at Denver, Col., June 15 and 16, 1892.

6.89 cents. The mail and express included in the above earned over $1,100,000, or in the neighborhood of one-seventh of the whole.

From an average of a number of electric roads, good, bad and indifferent, I have found the earnings per car-mile to be 30.31 cents per mile, and expenses, 11.10 cents per car-mile, leaving a net of 19.21 cents per mile, or a net gain over the steam road of 12.32 cents per mile.

These figures seem to show that the average of electric roads earned much more per car mile than the steam roads, and at an expense of only 1.31 per cent. per car mile less than the steam road. This slight difference in expense looks somewhat discouraging, but it must be borne in mind that the electric road figures are an average of a number of roads compared against a dividend earner and a net passenger traffic. There are electric roads operating for 7.8 cents per car mile and earning 24 cents per car-mile, a difference in their favor in both earnings and expenses that catches the eye at once. Again, the steam road enjoys cheap fuel as against the electric road's high-priced fuel and water. A crew of five men to five-car trains steam, as against ten men to five electric cars, and a proportion of taxation is charged against electric and not against steam in the figures given, and there are other matters entering into the expenses of operation that do not enter into the maintenance of steam roads, such as street paving, per centage of gross receipts, park tax, etc. Hence, when we analyze we have no reason to complain, and I think we can safely assert the economy of electric motive-power over steam, at least in certain localities and under certain conditions, and I believe in nearly, if not all.

The electric roads of recent date are not cheaply-constructed affairs either. You will find girder-rails running from 60 to 85 pounds per yard, giving a track that would enable them to use it for rapid travel as well as heavy tonnage.

In contrasting the two methods of transportation one should also remember that the electric roads, generally speaking, traverse thickly-populated districts and carry a great number of people over a short mileage, while the steam railroad is scattered over a large extent of territory. Just whether this is in favor of one or the other (rate per mile being taken into consideration) I leave for some abler hand to determine, but I feel sure if you will take up some steam roads and analyze them, division by division, you will find where comparatively short mileage is covered by a large number of people, and hence the near approach to parallel comparison with the operation of electric power can be made with this view of, upon some portions of a road, largely increasing the net results from passenger traffic.

There is, apparently, good reason for the layman to suppose that the electric motor is very limited in its power, because he naturally views it from what he has seen it perform, and hence argues that the best foot has been put forward, but he was never more mistaken in his life. The electric motor introduction is a revolution, and like all revolutions, it meets with many obstacles. The first thing capitalists interested in street-railway traffic met it with was, "We shall have to throw away millions of dollars in car equipment we now own." What then was to be done? *Build a motor to fit the existing equipment;* and it was done. Restricted, therefore, to certain dimensions, certain space and certain weight, the electric motor must necessarily be restricted to certain power; but how is it in other instances? An electric motor of, say, fifty horse-power may be arranged to actuate one set of drivers, and then duplicates of the same until the one combined motor may have 300 or 500 horse-power; and hence we find ample power to draw trains, just as has heretofore been done with the locomotive, and, it is claimed, more economically.

We know it is now practicable, at slight increase in cost of motor, to so construct it as to carry a train of several cars at an even less cost per car than by small motors; and the progress in the distribution of high electric pressure, which can be translated, makes possible the acquiring of greater power at less relative cost than was heretofore deemed probable, and it will go right on in that line.

Electricity, in a commercial sense, has never retraced a single step, and it will not do so now.

Let me ask the general managers whether there is not some piece of road that is now operated at a loss, that could be operated at a profit by electricity? You have track, you have coal, you have power-houses. Is there not some such territory on your own road?

Take suburban roads, or suburban points upon a through line—do you not strive and spend money to build up the locations? Do you not, sometimes for years, maintain a non-paying territory clearly on hope and speculation as to the future? Do you ever satisfy the commuter? Does not a percentage want the 11 o'clock train made 12 o'clock, and *vice versa*, and perhaps both? You meet this by saying you are doing the best you can and losing money at that. Now, then, how much quicker could you build up such a territory by more frequent and less expensive trains, and carry freight-cars too, one by one, or two or three, and thus supply your local traffic; or, if needs be, steam must haul freight, let it be done on the same track; they will work right along together. But, say you, "the question of speed comes in." So it does, yet I think you will find that the suburban public would rather have twenty-four trains a day at twenty miles an hour than twelve trains at forty miles an hour, and I do not intend here to beg the question of speed. When it comes to speed, *per se*, rotary motion is undeniably capable of it with less strain and wear and tear than the reciprocating.

We feel that you do not want to make any expensive useless experiments. Now to avoid that, suppose you have some such territory as named; without the expenditure of a dollar, you can get estimates as to the cost of construction and maintenance and operation. This association is talking to you because we are all proud of the roads we represent; we are proud of the fact that electricity as a motive-power is now so rapidly advancing, and to the extent that we can aid the roads in saving money and bettering the service we shall be proud also. We are your loyal subordinates; your success is ours; electricity in its relation to transportation has never failed you yet. We and our loyal coworkers constitute your electric safeguard, with its train orders, its signals, block and otherwise; and you will doubtless recognize that being in the confidential arm of your service, we feel as if we should call your attention to the great question of the day.

With singular appropriateness and, perchance, strange coincidence, it falls to the lot of the same corporation that first bore the imprint of electricity in its relation to transportation, to be the one upon which the great task is now thrown of demonstrating the power of the electric motor as a tonnage mover.

In the Baltimore and Ohio tunnel at Baltimore, arrangements are now making for a demonstration which cannot fail to be of great moment to the transportation world. The question of expediency and comfort, rather than economy, prompted the trial of a motor, and so sanguine is such a corporation as the Thomson-Houston Company, that it has contracted to equip the tunnel in such manner that the electric motor shall be capable of a speed with passenger trains of 30 miles an hour, and freight trains at 15 miles an hour.

It is expected that three motors will be more than sufficient to move 200 trains per day, each freight train's maximum weight to be 1,200 tons; and the motors will

encounter grades varying from 45 to 90 feet per mile. There is specified a draw-bar pull or pressure of 32,000 pounds.

The motors will be simplicity itself, the armatures being fastened directly to the axles and without gearing. Each driver can be operated singly, or they can be multiplied indefinitely and act in concert. The motors will be used in two capacities. Going down grade they will act as a brake, and going up as a motive-power.

Upon entering the tunnel the locomotive furnace-door will be thrown open, and no steam used, the motor drawing or pushing the engine and train.

Trains will be protected by electric block signals, and the tunnel will be ventilated by electric fans; thus the great experiment will be surrounded by everything conducive to comfort, speed and safety that electricity affords, and I feel sure will be an undoubted success.

Awaiting the result of this experiment in Baltimore stands the Baltimore and Lehigh Railroad. Rather than expend money at the moment for further steam-power, for use in its suburban work, it proposes to await the outcome, and if the experiment be successful, then the Baltimore and Lehigh Railroad Company will employ electricity as the motive-power for all its suburban trains.

Objections are raised to trolley systems generally, and the high cost of storage batteries has precluded the extensive use of that system, but brave brain of mankind will assault again and again, and, tireless in its perseverance, will finally find the way. In this connection, and simply to show you the channels through which mentality is at work, I present in a rough way the idea of Mr. Elias Reis, of Baltimore, whereby he proposes to move cars by electricity without a storage battery, a trolley wire, a slotted conduit, or a rail connection. Whether or not he will succeed the future will show. I have been informed that arrangements have been made to try the idea practically upon a section of road.

The method is the use of an alternating motor upon the car operated by induction. I have here an iron double trough casting having a central core. Traversing up one channel, lying against the core, and down the other channel is a coil of wire. These castings are presumed to be 50 feet or of any desirable length, having a depth of, say, four inches, and a width of, say, six or eight inches, and the trough, as I term it for want of a better name, is flanged on each side for a width of, say, three or four inches. After the coil of wire is placed, you can fill around the coil with gum, paraffine, asphalt or cement. The terminals of the coil are to be connected to an underground subfeeder carrying a current which has been transformed from a high to a low voltage. The high-voltage wire is in a properly protected cable and carried underground. The troughs are placed in the centre of the track, and then paving, such as asphalt, is laid in contact with and over them from rail to rail, thus affording a smooth, unbroken roadway. The motor car has an exact counterpart trough suspended underneath the car and as close to the surface of the street as is practicable; the terminals of its coil are connected to an alternating-current motor, which in turn is so geared as to propel, by its motion, the car. It will thus be clearly seen that the two troughs and their component parts practically form a converter, one side of which is stationary and the other side moves with the car.

I have a small model car here with which to demonstrate the results obtained, and if I succeed in getting the current, I will perform some experiments for you, lighting glow lamps through asbestos, wood or glass, and then under the same conditions you will see the car propelled, although there is no physical electric connection between the car and the wires carrying the current from the power-house. Paving, such as wood, asphalt or stone, will be permeated as easily as the glass, and one may walk on the surface without feeling the slightest electrical effect. The same principle is involved here as is used daily in electric lighting by converters, and with this Mr. Reis expects to propel cars at a first cost, as to plant, but little, if any, above the trolley system, and with an economy of operation that cannot now be obtained; thus offering to electricity still another channel in its relation to transportation.

ELECTRIC HAIR-BRUSH.

A genuine electric hair-brush that actually supplies and delivers an electrical current is the one shown in the accompanying illustration.

This brush is furnished with a Faradic cell, placed under the cover on the back, the current being applied in an agreeable and efficient manner to the scalp.

As the action of this brush does not depend upon the

ELECTRIC HAIR-BRUSH.

imagination, its value to sufferers from over-fatigue, congestion, nervous headache, neuralgia and kindred affections where the application of electricity is known to produce good effects must be apparent.

The brush is very little larger and not much heavier than an ordinary hair-brush.

SERIES ELECTRIC TRACTION.*

BY NELSON W. PERRY, E.M.

Part I.

In telegraphy, that application of electricity where pre-eminently long distances are concerned, the series system is alone adequate to the demands. In telephony, where more than two instruments are concerned, as in the case of several subscribers on the same circuit, or where, as in small towns, several of them are connected on a single wire, they are all connected up in series; and again, where larger amounts of energy are to be transmitted to considerable distances, as in the case of the arc light, the series arrangement is the only practical one now at hand. Why then should not this system commend itself for long lines of electric railroads? Mr. T. Carpenter Smith, in a series of valuable articles on "Some Views of Central Station Management," now running in one of the weekly electrical journals, lays down as one of his canons in the establishment of a plant, that it should be so planned as to permit of its ready extension as the demands increase; or, in other words, that in laying our plans we should provide for the future rather than for the present. If this be good advice in the case of electric lighting stations, how much more force must it have if it be applied to electric railway systems, which, as we all know, are being rapidly extended, in many instances to double and treble the distance originally contemplated, only to be increased again as soon as these further limits are reached.

In railway practice it is the distance rather than the quantity of current that forms the most important factor

* A paper read at the general meeting of the American Institute of Electrical Engineers, Chicago, Ill., June 6, 7 and 8, 1892.

of increase, though the latter cannot be neglected in planning for the future.

In street-railway construction, assuming the distance to remain the same but the traffic to double, the amount of copper required to maintain the same relative economy must also be doubled. This is a minor matter as compared with the case where both distance and traffic are doubled. In this latter case, to maintain the same economy, the weight of copper must not only be doubled but squared. The limit of extention even on these lines is, however, soon reached, and the only recourse, by existing methods, is to erect at or near the further point another generating station, with all that implies in the way of additional investment in real estate, machinery, etc., and a duplicate set of employés.

In long lines, the bugbear of the multiple arc system of distribution is the drop in potential at the further end. The potential may be amply sufficient near the generating station, but it becomes less and less so as this proximity is departed from, until at the further end the lights which burned brightly near the station dim down to scarce more than a dull red, and the cars are operated under heavy loads with difficulty or not at all. There are two remedies for this drop in potential

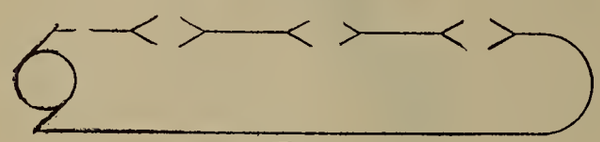


Fig 1

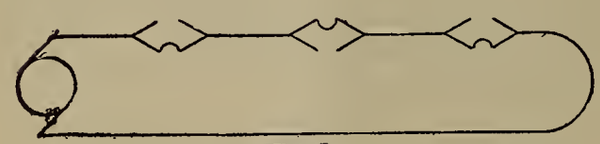

Fig 2

at hand—either to increase the amount of copper in the feeders, which within commercial limits is but a partial remedy, or to increase the pressure, using the same amount of copper which, when the multiple arc method of distribution is employed, introduces as many difficulties as it obviates. There is still a third remedy, and that is to employ the constant-current method, in which, under all circumstances, the current remains the same and the pressure varies as the work performed.

In the one case the copper must vary as the demands and distances—the pressure remaining the same, and in the other the pressure varies, the copper and current remaining the same.

In an arc light (series) circuit the wire will be of the same size whether it be erected to supply one lamp or sixty—whether the distance be one mile or five, and it, at any future time, it be desirable to extend the line of double or treble the distance, the wire already erected is amply sufficient for the part of the line it covers, and merely requires extension to the desired point to meet all the demands. There are in this country numerous arc light circuits in successful operation, twenty miles and more in length, yet I doubt if there is anywhere in the world a direct current constant potential circuit in operation to-day of anywhere near this length.

If energy can be so much more advantageously distributed to long distances by the constant-current method for arc lamps, why should this method not commend itself to the ever-increasing distances to which our electric street railroads are reaching? If the steam locomotive is ever to be supplanted by the electric motor, why should not this method of distribution be the one to be adopted?

The answer is that the constant-current method, as heretofore developed, has not been sufficiently elastic to meet the requirements, and although the generation of a constant current involved much less complex machinery, and the cost of distribution to distant points necessitated a much smaller initial outlay, still the difficulties introduced by this method largely outweighed all its advantages.

With the arc lamp or other stationary translating device, arrangements were readily devised for automatically shunting the current around in case of disability of the translating device, or the desire to throw it out of service. Not so with a moving object, such as a street car. No means had been found to shunt the current around the latter, or in case it got out of circuit by means of the trolley getting off the wire, or automatically closing up the gap thus made, and the disability of one car became the disability of the whole line and of every car on the line.

Could this and some other difficulties be surmounted, the constant current possesses many advantages over the constant potential that seem to me would bring it into almost universal use for traction purposes, especially on interurban lines and in other cases where long distances are concerned.

It is my purpose to show how all this has been accomplished, and how the constant-current system may be made as elastic in every way, at least on paper, as the constant potential, without sacrificing in any way any of the advantages peculiar to the system, and how it is possible to make each unit in such a system nearly if not quite as independent of every other unit as is the case in the system now in vogue.

The most ambitious and painstaking, and withal successful attempt up to the present time, to adopt the series or constant-current method to electrical traction, was that made by Prof. S. H. Short, now of Cleveland, Ohio, and he actually constructed and operated for a considerable length of time, and with some success, two roads, one a single track road at Huntington, W. Va., connecting that city with Guyandotte, about three and a half miles distant, and the other a belt and double-track road on South Broadway, St. Louis, which was, I think, about

Fig 3

three miles in circuit. Prof. Short employed two wires, divided up into sections of any desired length, but necessarily not less in number than the number of cars to be operated. These sections were connected together by switches operated by a peg on the trolley mast, the peg on one car throwing the switch in one direction, and that on the succeeding car throwing it in the opposite direction. The current coming up one line of wires crossed over through the motor to the other line, by which it was carried to the next car motor, through which it passed back again to the original line of wires. Each car as it passed a switch set it so that the current in the section it was entering would come up on the same wire as it had in the section just left, and the succeeding car would set the switches so that the current would come up to it on the opposite wire, and so they alternated.

Since the continuity of the circuit depended upon the presence of the motor between the two lines, if either of the trolleys got off its wire the circuit was broken and all cars had to stop for lack of current, just as if we had an arc lamp without an automatic cut-out, and the carbons should become broken or the arc blown out, the en-

tire circuit would be disabled, and any irregularities in the resistance of the arc of one lamp would affect all the other lamps on the circuit.

Since the switch must be thrown to opposite wires by each succeding car, if one car failed to do this, as would be the case if an odd number of cars were added to or removed from the line, it would again become broken by reason of the failure to throw the switch in the proper direction. Cars had, therefore, to be added to or removed from the route in even numbers. This precluded the intercommunication of two or more systems, for the reason that if a car was run off from one line onto another, it would be a case of the removal of an odd number to the other line, and both lines would become broken. So, too, it was impossible to operate a branched road on which part of the cars took one branch and a part the other, for the succeeding car, after it passed the forks, whichever route it took, would either break the circuit itself, by reason of failure to properly turn the switch, or would leave the switches in such a position that they could not be operated by the next car.

Fig. 4.

On a single-track road where the cars passed each other on sidings, it was necessary to wire the whole route, as though it were a double-track road, the cars going up one pair of wires and returning on the other which followed the siding. This was the case at Huntington, where, although there was but a single siding perhaps fifty feet long, where the two cars passed each other, the whole three and a half miles had to be double-wired to enable them to pass, else the two cars would be thrown into multiple with each other and neither could run. I succeeded in devising a means by which if there were but two cars and one siding on the road, the only double-wiring required was at the siding, but the plan failed where more cars and sidings were involved.

In Short's system the switches were purely mechanical, exposed to the vibration of the trolley wires and to the elements, and had to fit tightly else they would burn out. If they fit sufficiently tightly to obviate this, they were liable through corrosion or ice or some other cause to fit too tightly and fail to operate, in which case the line again became broken.

I speak more freely of the defects of the Short series system from the fact that it has been abandoned by the Short Company, and because its failure has been officially announced by its projectors. My object in dwelling upon it at such length being to point out more clearly some of the defects that must be remedied before the series can become a practical working system.

The system which I am about to explain may properly be described as consisting of a circuit interrupted by a series of breaks in multiples of two; or one consisting of a circuit interrupted by breaks in multiples series with each other—the breaks being in multiples of two. The conception then would be like Fig. 1.

But in order that a current shall pass around this circuit, it is necessary that *one* of the breaks in each multiple shall be normally closed. It matters not which one is closed, so our plan would now look like Fig. 2.

If a translating device should successively occupy each of these breaks, it would receive current during the time that its terminals connected the ends of the two broken wires, in proportion to the relative conductivity of the two paths open to the current. But we are not satisfied to have a portion only of the current pass through our motor—it is necessary that *all* the current must so pass. We must, therefore, make the resistance of the other branch infinite during the time in which the motor is bridging, through its terminals, the break; or, in other words, the normally closed branch must be broken.

If, therefore, we place an electro magnet in *series* with the normally broken branch, so that when vitalized it will open the switch in the normally closed branch, and allow it to close again by gravity or otherwise, when the magnet is devitalized, we have provided in a crude way for operating travelling translating devices in series. Our conception now would be represented somewhat by Fig. 3.

By this arrangement, the moving device only receives a momentary impulse as its terminals touch the ends of the break, and would have to rely upon its acquired momentum to carry it to the ends of the next break. It will be apparent, however, that it is immaterial whether the device receives its next impulse by closing the next break in the circuit or whether it skips that one and gets it from any other break, either on that circuit or from one connected with an entirely different dynamo. It is this feature that permits the use in my system of sidings on single-track roads, and of forks (the skipping of one or more breaks), and the intercommunication between separate circuits (the jumping from a break on one circuit to a break on another).

It is desirable, however, that the moving device be impelled by as nearly a continuous force as possible, instead of by a succession of momentary impulses. Instead, therefore, of having the ends of the normally open break face each other as represented heretofore, we may extend these wires for some distance parallel with each other, and our plan assumes the form shown in Fig. 4.

And it is desirable that the interval of time during which the device is without current, viz., that occupied in passing from one break to the next, shall be as small as possible. This naturally suggests having the normally open breaks all on the same side of the normally closed breaks, and if these parallel wires be continued, so as to overlap those constituting preceding and succeeding

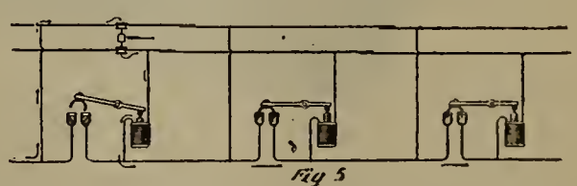

Fig 5

breaks, a car or other moving translating device may pass from one break to another without even momentary interruption of current. In Fig. 5, the lower line, which I call the "feeder," contains all of the normally-closed breaks, represented by mercury cups normally connected electrically by a fork taking into them, which constitutes a double-pole switch actuated by an electro magnet in the manner to be described.

GOOD RESULTS.

NEW YORK, June 17, 1892.

TO THE ELECTRICAL AGE PUBLISHING CO.

Gentlemen: The results obtained from our small four (4) issue "adv." in your journal have been very satisfactory.

It has undoubtedly brought in good orders that will keep our factory busy for some time.

We feel gratified in saying that we have received good and prompt returns for our money.

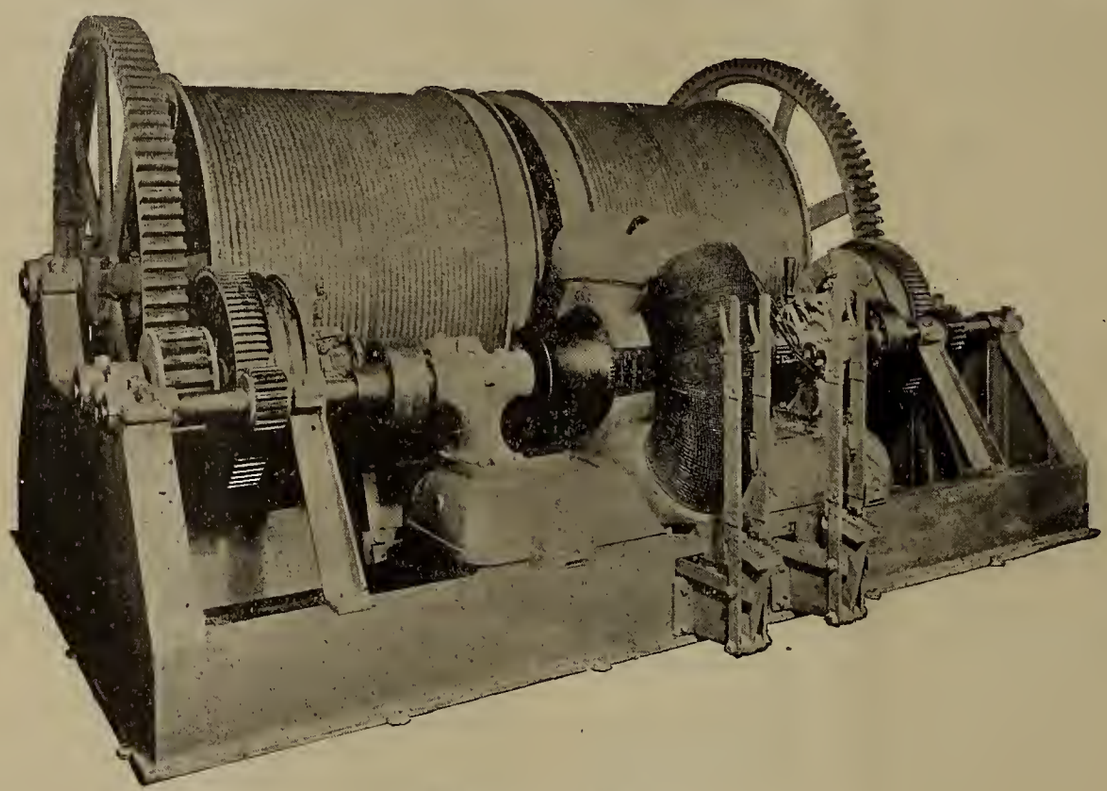
Very respectfully yours, HERO ELECTRIC CO.

ELECTRIC MINE HOIST.

The accompanying illustration shows an electric mine hoist recently installed by the C. & C. Electric Motor Co., of New York, in a mine at Corbin, Montana. At a rope speed of 400 feet it lifts a weight of 5,000 pounds. There are two drums, each five feet in diameter by forty inches long, intended to run either separately or together, independently geared by two reductions to each end of the motor shaft.

The motor pinions are rawhide. Their motion is transferred to the intermediate shafts by means of two Frisbie friction clutches.

The motor is 65 horse-power, and is reversible. The reversing and speed-regulating switch (not shown) is placed conveniently near the operator of the four levers shown. Two levers are for throwing the clutches in and out, and two for applying the brakeband on the inner peripheries of the drums. The bearings have ample length, and the whole machine is substantially and well made. It occupies a floor-space of about ten by thirteen feet, and has a total weight estimated at sixteen tons.



ELECTRIC MINE HOIST.

AMPÈREMETERS AND VOLTMETERS, AND THEIR USES.*

BY FRANK KITTON.

The ampèremeter and the voltmeter have been designed more particularly to meet the wants of the practical man rather than for laboratory use, although such instruments have been so far perfected as to give results which are remarkable for their degree of accuracy. To measure the strength of a current flowing through a circuit with a direct-reading ampèremeter, or to determine its E. M. F. with a direct-reading voltmeter is perhaps a simple matter, and may be accomplished by one having but slight knowledge of electrical laws, under ordinary directions. The application of these instruments, however, for other than simple current and voltage measurements requires a somewhat more extended knowledge of the science of electricity.

To consider this application more particularly is our purpose at this time. As a rule, these instruments contain permanent magnets for producing a strong magnetic field in which the coil conveying the current is placed, and on the constancy of these permanent magnets depends the continued accuracy of the readings, as any change in the intensity of the magnetic field would cause the instrument to give a different reading from that previously obtained under the same conditions of current or E. M. F., and therefore necessitate a recalibration of the instrument.

To calibrate a galvanometer is to determine by comparison with some standard the value of the different deflections, which are then marked off on a scale in practical units of current strength, or E. M. F. (ampères and volts). It is apparent, therefore, that it is of first importance that the permanent magnets shall retain their magnetic strength unchanged indefinitely. To insure this they are treated by a process called "aging," which is accomplished by subjecting them to rough treatment, such as pounding, etc.

Between the poles of the magnet in the magnetic field is pivoted a small coil of wire free to rotate around its vertical axis, to which the pointer is affixed. This coil is so arranged that a current flowing through it causes it to rotate against a spiral spring tending to retard or restrain its movement, and the degree to which it is deflected is nearly proportional to the strength of the current flowing through the coil. There is practically no difference in the construction of the ampèremeter and the voltmeter; their difference lies more particularly in their application. In one the divisions on the scale represent ampères, signifying the strength of the current passing through its coils, and in the other the divisions indicate in volts the difference of potential of the current at its two terminals. In the former the scale might as readily show the voltage, and in the latter the current strength.

In order to measure the voltage of a current—that is, the difference in potential at any two points in the circuit

* Abstract of paper read before the Buffalo Electrical Society, May 16, 1892.

—the two terminals of the voltmeter are connected at those points. For instance, to measure the difference of potential at the terminals of an incandescent lamp, the instrument is attached on each side of the lamp. In order to do this and not disturb or alter the potential difference at those points, the voltmeter must offer a very high resistance as compared with that of the lamp.

The fall of potential in a circuit is uniform with the resistance; that is to say, if a generator developing 110 volts is connected in a circuit of 220 ohms resistance, the potential of the current falls 1 volt in passing through each 2 ohms resistance.

Instead of stating the difference of potential to be between zero and 110, + or —, the zero or neutral line is drawn through the centre of the generator and the centre of the lamp (Fig. 1), and it may then be stated that the difference of potential is 55 volts + (or above zero), and 55 volts — (or below zero). The object of this arrangement is to enable us to show the fall of potential through each of the wires leading from the generator to the lamp; or, in other words, to show on one side a fall from 55 + towards zero, and a fall on the other side from 55 — towards zero, as will appear presently. In Fig. 1 the E. M. F. is 110 volts; resistance of circuit, 220 ohms; and fall of potential, 1 volt in each 2 ohms resistance. Twenty ohms of this resistance, as shown, is in the wires leading to the lamp (10 ohms in each wire) and 200 ohms lamp resistance; then if the potential of the current falls 1 volt in passing through each 2 ohms resistance, it follows

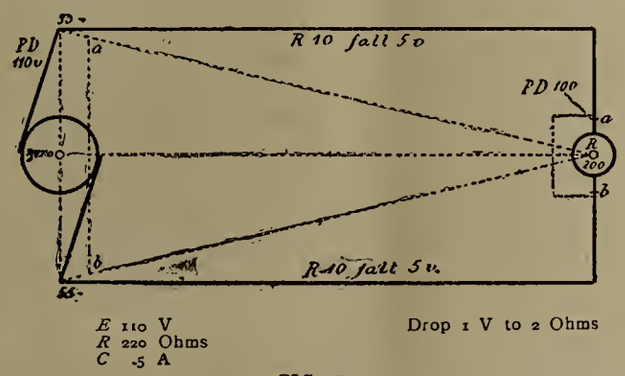


FIG. 1.

that 5 volts are lost in each wire before reaching the lamp; therefore the difference of potential (or voltage, as it is commonly called) at the lamp terminals is 110—10, or 100 volts. Now then a voltmeter of low resistance (200 ohms) is connected as shown in Fig. 2. The total resistance of the circuit is reduced and the current increased proportionately. (Ohm's law: decreasing the resistance increases the current.) The resistance of the circuit is now 120 ohms, therefore the ratio of fall of potential is changed, and is now nearly 1 volt through each ohm resistance (more precisely, 1 volt through each 1.09 ohms). The loss in the leads is then about 20 volts, instead of 10 volts, as was the case in the previous illustration; and the difference of potential at the terminals of the lamp is only 90 volts—10 volts less than it was before the voltmeter was connected. Under such conditions then, the reading of the voltmeter does not indicate the true E. M. F. at the lamp terminals under normal conditions. With a voltmeter of high resistance, say 20,000 ohms, which is about the resistance they actually contain for that range, the conditions of circuit with the voltmeter connected are: total resistance of circuit, 218 ohms (2 ohms less than when voltmeter is not in circuit); the fall of potential is in this case 1 volt to each 1.99 ohms; a fall through the 20 ohms resistance of the leading wires of a fraction over 10 volts (5.05 volts in each), leaving a difference of potential at the lamp terminals of 99.9 volts, or only one-tenth of a volt less than was the case without a voltmeter in circuit—a very much smaller error than was found with a voltmeter of lower resistance. As a matter of fact, in actual practice it is rare, if ever, that such exaggerated conditions exist, and the error is so small that it may be overlooked entirely, because ordinarily more than one lamp is being operated on the circuit, which reduces the lamp resistance, as they are connected in parallel or multiple arc, and the resistance of the lamps is the resistance of one lamp divided by the number of lamps; consequently there is a much greater difference between the

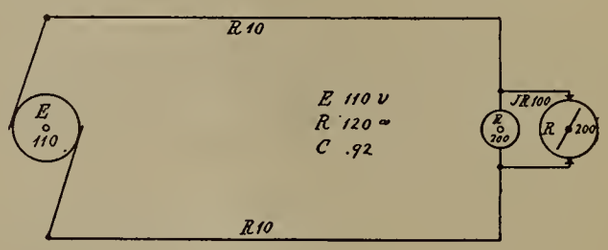

FIG. 2.

resistance of the circuit and that of the voltmeter, and, as has been shown, the greater this difference the less the error.

In order to measure the strength of a current flowing in a circuit with the aid of the ammeter, it is connected in series with the other apparatus, that all of the current may pass through it. Then, as will be shown, the conditions are such as to make it desirable to use an instrument which offers a very small resistance; just the opposite of the conditions previously considered in connection with the voltmeter.

In practice, ordinarily a large number of lights are operated on a circuit requiring a much greater current, and ammeters capable of measuring currents ranging from 1 to 150 ampères introduce only about 2 or 3 ten thousandths (.0002) of an ohm resistance, instead of .05, the resistance shown in this case.

Yet the statement that ammeters and voltmeters differ essentially only in application is true; as a matter of fact, the coils in this ammeter and this voltmeter may be identical as far as the amount of wire and the number of turns in the movable coil is concerned. Their real difference is the manner in which the movable coil carrying the pointer is connected with the extraneous resistance contained in the instrument. Here the term "extraneous" is used to distinguish this resistance from the resistance of the movable coil. The extraneous resistance is so placed as to have no inductive influence on the magnets or coil. In the voltmeter it is connected in series with the movable coil, and the resistance of the instrument is the sum of the two resistances. In the am-

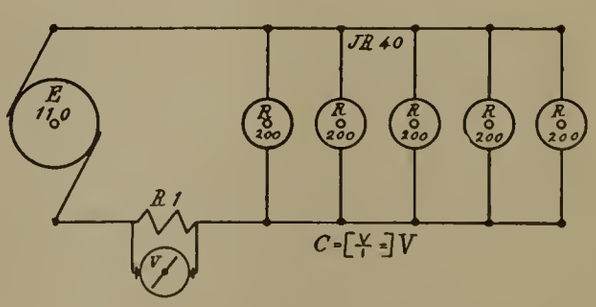

FIG. 3.

meter the coil and extraneous resistance are connected in parallel or multiple arc. Then the resistance of the instrument becomes the joint resistance of the two. As the resistance of the movable coil is large compared with that offered by the extraneous resistance as arranged in ammeters, only a small portion of the current passing

through the instrument finds its way through the movable coil. The path for the greater portion of the current is provided by the extraneous resistance, which shunts the movable coil. For this reason it is possible to construct ammeters that offer so little resistance; in practice it may be neglected and the instrument may be placed in circuit without causing any approachable change in the current, or left there without waste of energy.

How the total current may be calculated when only a portion passes through the movable coil will appear in connection with Fig. 3. It is now apparent why the voltmeter is arranged to offer a very high resistance to the passage of the current that comparatively little passes through it, while the ammeter offers but little resistance that all of the current may traverse it. In both cases the chief object is to admit of placing either instrument in a circuit without materially changing the pre-existing conditions of the circuit.

Ammeters and voltmeters may be employed for measurements beyond their normal range by utilizing suitable known resistances.

To increase the range of an ammeter a resistance is placed to act as a shunt to the instrument, carrying a certain portion of the current around it. If the shunt is equal to one-half the resistance of the ammeter, then two-thirds of the current passes around the instrument, and one-third through it, and its reading would then be multiplied by three.

To increase the range of a voltmeter the extra resistance is connected in series with the instrument, and the readings are then multiplied by the ratio of the fall of potential through the extra resistance and through the resistance of the voltmeter. If the extra resistance is twice that of the voltmeter, then two-thirds of the fall of potential is through it, and one-third through the voltmeter; therefore its reading must be multiplied by three.

ELECTRICAL SOCIETIES.

CANADIAN ELECTRICAL ASSOCIATION.

The first annual convention of the Canadian Electrical Association was opened at Hamilton, Ont., on Tuesday, June 14, and ended on Thursday, June 16.

The first day's session was opened by an address from the president of the association, Mr. J. J. Wright, at the conclusion of which Mayor Blaicher welcomed the delegates to the city.

The annual report was then read by the secretary, Mr. C. H. Mortimer, after which the election of officers took place. The result was as follows: President, Mr. J. J. Wright, Toronto (re-elected); first vice-president, Mr. K. J. Dunstan, Toronto (re-elected); second vice-president, Mr. John Carroll, Montreal (re-elected); secretary-treasurer, Mr. C. H. Mortimer, Toronto (re-elected). Executive committee: Messrs. D. A. Starr, Montreal; H. O. Fisk, Peterboro; W. A. Johnson, Toronto; S. J. Parker, Owen Sound; A. B. Smith, Toronto; D. Thomson, Hamilton; Thomas H. Wadland, Hamilton; L. B. McFarlane, Montreal, and John Yule, Guelph.

This finished the first day's proceedings.

The second day's session was opened with the reading of a paper on "Long Distance Telephoning," by Mr. Hugh Neilson, of Toronto. Mr. D. Thomson, manager of the Hamilton Electric Light and Power Company, followed with a paper on "Central stations." Mr. Lask, who is in charge of the machinery department of the Dominion of Canada's exhibition at the World's Fair, addressed the convention in reference to electrical exhibits. Mr. H. O. Fisk read a paper on "Carbons." A visit was then made to the Telephone Exchange.

The afternoon session was devoted to reading of papers on "Multiple Switchboards," by Mr. James A. Baylis, and "Steam and Electric Power," by Mr. J. J. Wright, and discussing the date and place of holding the next meeting, Toronto being the place, and January the month selected. In the evening the delegates were entertained at the Beach, where an elegant repast was served. Speeches were made, songs were sung, and all thoroughly enjoyed themselves.

The last day's session was opened with the reading of a paper on "Safe wiring," by Mr. A. B. Smith, of Toronto. In the absence of Mr. S. J. Parker, of Owen Sound, who was prevented from being present, Mr. J. J. Wright read his paper on "The Financial Aspect of Electric Lighting." A motion offered by Mr. K. J. Dunstan, pledging the association to do everything possible to make the Canadian exhibition at the World's Fair thoroughly satisfactory was unanimously adopted. A vote of thanks was then tendered the board of trade, Mr. C. R. Smith and the local press. *The Canadian Electrical News* was chosen as the official organ of the association.

The proceedings were then terminated, and the convention adjourned.

INTERESTING DECISION.

A point of interest to stockholders in business corporations was decided June 17 by the Court of Appeals in the case of Thomas Commerford Martin vs. the W. J. Johnston Company, Limited.

Mr. Martin, who was and is a stockholder of the W. J. Johnston Company, believing that its affairs were being improperly managed by its president, obtained from Judge Lawrence, of the Supreme Court, through Masten & Nichols, his attorneys, a peremptory writ of mandamus, requiring the company to exhibit its books to him and to allow him to make extracts or memoranda therefrom. The company resisted the application, claiming that Mr. Martin was not a stockholder; that he had no right in any event to make extracts from the books, but only to inspect them; that his demand was irregular, having been made upon the treasurer instead of the secretary; and that his motives for the examination were improper, as he was interested in a rival corporation.

The case was very strenously litigated by the company, which not only endeavored to obtain a stay of the writ, but also carried it twice to the Court of Appeals. This court has now finally held, affirming the decision of the General Term, that the writ was properly issued, and that Mr. Martin was entitled to the granting of the application as fully as it was allowed.

NEW BOOKS.

EXPERIMENTS WITH ALTERNATE CURRENTS OF HIGH POTENTIAL AND HIGH FREQUENCY. By Nikola Tesla. 146 pages, illustrated. The W. J. Johnston Company, Limited, Publishers, New York. Price, $1.00.

Under the above title the publishers have reproduced in book form the celebrated lecture delivered by Mr. Nikola Tesla before the Institution of Electrical Engineers, London, England. The work is prefaced with an interesting biographical sketch of the author.

ANNUAL REPORT.

We have received a copy of the verbatim report of the tenth annual meeting of the American Street Railway Association, held at Pittsburg, Pa., Oct. 21 and 22, 1891. Containing as it does papers and remarks from some of the best-informed street-railway men in the country, it will be found very interesting reading.

J. C. HUBINGER Co., Electric Light Co., of Keokuk, Iowa, has just installed a 300 H. P. Cross Compound Condensing engine, built by the Ball Engine Co., Erie, Pa. The engine is giving good satisfaction.

A CURIOUS WAY OF ADVERTISING.

In the show window of a store in Wilmington there is a glass case in which is a pivoted Crocker-Wheeler motor with a fan and about two pounds of feathers. When the motor is in operation it revolves completely around in a circle, throwing a strong current of air and causing the feathers to fly around in all directions. The crowd about the window is so great that it requires two policemen to keep them away, and as a natural result the dealer is growing rich from his sales of motors. We learn incidentally that the Crocker-Wheeler people are receiving more orders for these pivoted motors than they can fill, and they will undoubtedly have an immense sale. The Crocker-Wheeler Electric Company owns the fundamental patent upon this principle as well as the patents on the special devices, and will hold the field against all comers.

NEW INCORPORATIONS.

Kansas City Gas and Electric Company, Kansas City, Mo., incorporated June 7, with a capital stock of $10,000. Incorporators: George H. Nettleton, J. S. Chick, George Kumpf, Kansas City, Mo.

The Hamilton Electric Light and Power Company, Hamilton, Wash., incorporated May 31, with a capital stock of $30,000. Incorporators: J. L. Warner, H. R. Berndt, C. B. McDowall, Hamilton, Wash.

The Amethyst Electric Light and Power Company, Creede, Col., incorporated June 13, with a capital stock of $200,000. Incorporators: E. N. Magner, B. F. Kelly, J. P. Wallace, A. W. Brownell, Creede Amethyst P. O., Col.

Electric Construction Company of St. Joseph, Mo., incorporated June 7, with a capital stock of $5,000, to deal in wholesale and retail electrical machinery, etc. Incorporators: F. M. Atkinson, C. C. Hyatt, M. M. Crandall, St. Joseph, Mo.

The Platte Valley Electric Railroad Company, Denver, Col., incorporated June 7, with a capital stock of $500,000. Incorporators: D. F. Carmichael, Brighton; Jerry N. Hill, Edward A. Reser, David J. McCanne, John A. Thompson, Denver, Col.

The K. and W. Electric Company, Bridgeport, Conn., incorporated June 13, with a capital stock of $10,000, to buy, sell and manufacture all kinds of electrical appliances. Incorporators: James L. Kimball, Herbert C. Wirt, W. C. Bryant, Boston, Mass.

New York Electric Equipment Company, New York, N. Y., incorporated June 9, with a capital stock of $200,000, to manufacture and sell every kind of electric apparatus. Incorporators: Sigmond Bergmann, Edward H. Johnson, Philip H. Kelin, jr., all of New York, N. Y.

Northwestern Electric Fixture Manufacturing Company, Chicago, Ill., incorporated June 9, with a capital stock of $2,000 dollars, to manufacture electric, gas and combination fixtures and parts thereof. Incorporators: Charles Laubmayer, James P. Holmes, Lessing Rosenthal.

Kester Arc Lamp and Manufacturing Company, Chicago, Ill., incorporated June 9, with a capital stock of $50,000, to manufacture arc lamps, elcctrical appliances and specialties. Incorporators: J. F. Kester, C. J. Langhren, Thomas E. Mays, C. W. McMahon, Samuel I. Jacques.

Electric Power Company, of Staten Island, New Brighton, N. Y. Incorporated June 8, with a capital stock of $250,000, to produce electricity for light, heat and power. Incorporators: William Dwight Wiman, Norman S. Walker, Jr., Samuel H. Libby, Erastus Wiman, all of New Brighton, N. Y.

The Cuyahoga Falls and Akron Railway Power Company, Cuyahoga Falls, O., incorporated June 6, with a capital stock of $100,000, to construct and maintain a street railway to be operated by electricity or other motive-power. Incorporators: W. J. Price, C. F. Parmelee, G. F. Harris, Jas. Anthony, S. S. Leonard, R. H. Carlisle, Z. M. Hubbell.

Manhattan Electrical Supply Company, Jersey City, N. J., incorporated June 8, with a capital stock of $20,000, to manufacture and sell electric and acoustic apparatus, appliances, machinery and supplies. Incorporators: H. T. Johnson, John J. Gorman, James Pembrooke, New York, N. Y.; Richard Fodan Greenville, N. J.; Edgar Whitmore, Brooklyn, N. Y.

Denison Normal School Association, Denison, Ia., incorporated June 9, with a capital stock of $60,000. Among other things it will construct and operate an electric-light plant. Incorporators: C. Sievers, J. H. Carstens, R. Heffelfinger, M. Goldheim, W. J. Scriver, T. J. Garrison, Joseph Brogden, P. E. C. Lally, Henry Kelly, C. Green, G. Gronan, L. M. Shaw, J. B. Romans, A. C. Balle, C. F. Kuehnle, F. W. Mueller, Denison, Ia.

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, June 18, 1892.

MR. H. WHEELER, the Pittsburg, Pa., representative of the Thomson-Houston Company, is in town. Mr. Wheeler is an old-timer in street-railway specialties, and holds his own.

MR. C. E. AINSWORTH, New York agent of the Jewel Belting Company, with offices at 136 Liberty street, is reported to have secured some very large orders lately.

H. G. MADDEN, 136 Liberty street, 1st floor, is doing all the buying for some of the largest light and power companies, and also handles an excellent line of electric light specialties.

MR. C. D. MARSH, who is introducing the Enholm primary battery, has one on exhibition in the show window of the A. B. C. Co., 20 Cortlandt street. It is operating a small Porter fan motor.

MR. GEO. F. SWAIN, 136 Liberty street, New York representative for the Syracuse automatic sprinklers, reports an excellent business. These sprinklers are of ingenious construction, thoroughly reliable and non-corrosive.

MR. FRED C. ROSS, manager of the Eddy Electric Manufacturing Company, 136 Liberty Street, makers of the well known Eddy motors, dynamos and electric hoists, is meeting with great success. He is securing many new customers.

A REPRESENTATIVE of the ELECTRICAL AGE met Mr. H. W. Leonard on his return from the meeting of the electrical engineers in Chicago. He looked smiling and happy, and it is pretty safe to assume that his trip was thoroughly agreeable and satisfactory.

MR. CHARLES H. DAVIS, C. E., consulting and supervising electrical and mechanical engineer, 120 Broadway, has issued a circular entitled "Facts and figures interest-

ing to electric railroad men." It is replete with statistics and contains much valuable information.

Mr. Morris W. Mead, the well-known superintendent, Bureau of Electricity, Pittsburg, Pa., also president of the Pittsburg Electric Club, was in town this week and gave the Electrical Age a call. Mr. Mead is as jolly as ever and still tips the beam in the two hundreds.

The Rheumatic Electric Ring Company, 45 Broadway, is selling a great number of its rheumatic rings. Sufferers from neuralgia, sciatica, etc., who have given it a trial cannot speak too well of it. We personally know a number of people to whom it has afforded great relief.

Mr. S. L. Phillips, general agent, 120 Liberty street, New York, has accepted the agency for the Meston alternating current motor fan. This fan is a perfectly built, strong, durable and handsome machine, finished in polished bronze and black enamel, or nickel-plated if desired.

Mr. Wallace, of the Eastern Electric Supply Company, of Boston, was in town lately and reported active business, and large orders received. Mr. Wallace's company is supplying one of the big manufacturer's of street railway motors, etc., with all of their railway specialties.

Huebel & Manger, manufacturers of electrical and brass goods, 286 Graham street, Brooklyn, are working on their new patent contact bell-post, and will soon be able to place it on the market. This firm makes a specialty of bells and push-buttons. They report business exceedingly good.

Mr. C. E. Chapin, 136 Liberty street, is doing a good business. He is resident buyer for quite a number of out-of-town houses. His specialty is Packard lamps, which are being sold as fast as they can be made. Porcelain goods are holding their own in competition and large orders taken.

The Baehr Electric Company, formerly 110 Livingston street, Brooklyn, has removed to 290–292 Graham street, same city, where it has more commodious quarters for the manufacture of electrical specialties, switches, fan motors, etc., the demand for which has increased to such an extent that the company is four weeks behind with its orders.

Mr. Randolph Brandt, 38 Cortlandt street, manufacturer of the Selden packings, has largely increased his facilities and just refitted his office and warerooms, where he is prepared to extend every welcome to his friends. The "square" Selden which has been on the market for a short time, is meeting with much success for both the Corliss and high-speed type of engine.

Mr. J. E. Wyman, manager of the Bush Revolving Store Fixture Company, 4 Benson street, has a few of their popular motors and turntables left, that he will dispose of at low figures. The turntables are made in the very best manner and will carry from 50 to 100 pounds. The motors are wound to be operated by batteries, and there are several good primary batteries that will run them satisfactorily for months without renewal. The Edison-Lalande battery is specially recommended.

Mr. C. H. Copeland, manager of the Rice Automatic Engine Company, 136 Liberty street, reports having received an order for a 25 H. P. horizontal engine from the Hunt Engineering Company one morning, and the next day the Hunt Company was installing it in the temporary arc-light plant at Green Isle, N. Y. This engine will be replaced later on by a larger one, it having been made use of by the Hunt Company to enable them to have the plant in operation within the time specified in their contract.

Our representative called upon the McLean Engineering Company, 136 Liberty street, this week. Mr. McLean is exceedingly proud of an $\frac{1}{8}$ H. P. fan-motor of the Edison type which he has buzzing away in these hot days; it is equipped with a 3-point speed-switch and rests upon rubber feet, causing the motor to run almost without any noise. These people are very busy just now, but notwithstanding are always pleased to welcome their friends.

Mr. S. J. Lenher has been connected for a long time with Edward P. Hampson & Company, engineers and contractors, 36 Cortlandt street, which has every facility for furnishing estimates, plans and specifications for the installation of complete steam plants for electric light and railway service. This firm has been the New York representative for the popular Armington & Sims engines ever since their introduction years ago, and have placed thousands of horse-power. They also represent the Eclipse Corliss engines. To enumerate the number of electric light and power plants installed by this firm would occupy too much space. Mr. Lenher recently secured an order for a complete steam plant from the Rahway, N. J., Electric Light Company; it will consist of two 90 H. P. Armington & Sims engines and 2 boilers. They will also remodel the old plant and move it into the new building that was recently erected.

"Ward" arc lamps are selling just as largely as ever. The new ornamental "Ward" arc lamp is the talk of the trade, and is in great demand. A number of them were recently installed in Koster & Bial's big concert hall on 23d street, near 6th avenue, and many more of them are being placed in halls, etc. This lamp was specially designed for use in theatre lobbies, hotel corridors, etc., wherever an elegant effect is desired. The Electrical Construction and Supply Company, 18 Cortlandt street, are the makers of a popular search lamp. They recently sold a large number of them for use on steamers. They are constantly installing some of the focussing lamps for theatrical effects, photo-engraving, etc. The company make "Ward" arc lamps to suit any electric-light circuit. W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, as quoted by Geo. B. Ellery, financial editor Electrical Age.

Names of Companies.	Capital.	Par.	Price.

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made: correspondence solicited.

FINANCIAL.

The annual meeting of the North American Company passed off very smoothly in Newark, N. J., on the 15th of June, and the balance sheet which so many wished to see was presented, as given below. This corporation is so largely interested in electric matters, that it is substantially an electric company. The last official report was submitted as long ago as July 1, 1890, at which time the stock was estimated to have an intrinsic as well as a market value of about $50 per share; now the report, made up to May 31, shows total assets of $10,718,513, including $2,987 in stocks, $4,368,390 in bonds and $912,080 in cash. The liabilities are $2,846,822, leaving net assets of $7,371,691, which makes the $40,000,000 of stock equal to 19¼. In the year ending May 31 the receipts were $418,119, and the net cash income $146,873.

But here is the report, for those of our readers who are or who intend to become interested, so that they can figure out at their leisure the point at which they will invest:

ASSETS.

$7,450,200 Northern Pacific common at 19¾.....	$1,471,414
533,000 Chicago and Northern Pacific at 16.....	85,280
32,500 Wisconsin Central preferred at 30.....	9,750
216,200 Edison General Electric at 111.....	239,982
90,100 St. Paul Edison Electric Co. at 140.....	126,140
2,887,000 Milwaukee Street Railway Co. at 25.....	721,750
333,300 Cincinnati Edison Electric Co. and Queen City Electric Co. at 100.....	333,300
604,000 Northern Pacific consols at 77	465,080
276,000 Chicago and Nor. Pac. 1sts at 78½.....	216,660
45,333 Wisconsin Central incomes at 30.....	13,600
3,276,000 Milwaukee St. Railway 5s at 90.....	2,948,400
699,000 Minneapolis, Lyndale & Minnetonka Street Railway 5s at 85.....	594,150
145,000 Cicero and Proviso Railway 6s at 90.....	130,500
West Side Street Railway, Milwaukee, cash paid on purchase contract	301,350
Milwaukee Street Railway Co., current advances on construction account.....	626,358
Secured accounts ($316,724 since paid off).....	753,186
Bills receivable ($36,000 since paid off).....	175,151
Miscellaneous securities.....	357,472
Advances under contract with T. A. Edison and Edison General Electric Co. for electric railway inventions, patents and appliances.....	52,701
Interest and dividend account, balance.....	184,207
Cash in banks and trust companies.....	912,080
Total value of assets.....	$10,718,513

LIABILITIES.

Bills payable, time loans secured and since reduced by payments of $136,529.....	$2,808,162
Accounts payable.....	38,660
Total of liabilities.....	$2,846,822

In Cincinnati the company is establishing a very large electric plant which will be completed before Dec. 1. The company has recently acquired the capital stock of the Queen City Electric Company, of Cincinnati. The general purpose of the company will be to push the substitution of electricity as a motive-power, and the North American Company will have exclusive right to the devices of the consolidated electric companies here and the General Electricity Company, of Berlin.

President Henry Villard says that the company was intended to operate in railroad financiering, electric lighting, power, etc. The company did purchase the capital stock of the Milwaukee street railroads, and also made contracts to furnish electric light and power for Milwaukee. It controls the entire street-railroad system, with over 100 miles of operated track. The company has 1,554 arc lights and 15,000 incandescent lamps in service. A large amount of electric power is also being furnished. The Milwaukee enterprises are expected to yield a net annual return of $500,000.

If the company continues active purchase, construction and equipment of electric light, heat and power, I predict that the stock in the fall booms—or if the presidential campaign interferes, then in the very early spring—will reach the 40's.

The annual meeting of the Brush-Swan Electric Light Company of New England was held at the company's office in this city on the 15th of June, for the election of directors for the ensuing year, and resulted as follows: William L. Strong, D. L. Einstein, Edwin Einstein, Chas. W. Spear, G. McFall, Joseph Sawyer, W. L. Pomroy, W. G. Wilson and J. W. Houston, Messrs. Geo. W. Stockley and Mr. Rowley retiring.

The financial history of this, practically the original electric light company of New York or the United States, has been what is called in Wall street steady and firm; steady, because so very few changes have occurred among the shareholders, and firm, because there have been no shares offered for sale, consequently no fluctuation in price. There are but fifty shares for sale to-day at less than the price for the whole corporation. Had the late General C. P. Stone and the late E. H. Goff never met, the Brush-Swan Company would have had a 50,000 candle-power plant on the Statue of Liberty, and an illumination worthy of the torch, and which would have reflected from the clouds an unmistakable glimmer to the incoming sailor, with favorable conditions, 200 miles at sea. The contract price was only $11,600. Well done, as this would have been, it must have proved a grand and lasting advertisement. Poorly done, as it was, neither glory, honor or profit redounded to the credit of any one connected with the illumination. As the company owns the territory east of Buffalo and north of Washington, with all the Brush systems, it will now take a more active position.

SPECIAL NOTICE.

The New York office of the Consolidated Electric Storage Company, 120 Broadway, is the sole agency for the sale of storage batteries for New York and vicinity. Purchasers desiring to secure the best terms should apply at that office to E. J. Moore, manager.

WESTERN NOTES.

Mr. Gilbert M. Smith, manufacturers' agent, 925–927 Unity Building, Chicago, who has recently opened an office at the above address, will represent a few leading manufacturers of brass and copper, bare and insulated copper wire, hardware specialties, etc. As Mr. Smith has had eleven years' experience with the Ansonia Brass and Copper Company, and was for the past four years manager of their Chicago office, he is thoroughly competent to successfully attend to the requirements of the business. The trade generally will do well to correspond with him before closing contracts.

THE SIOUX CITY ENGINE WORKS, owing to the great demand for their engines, have found it necessary to open a branch office at Room 513, Security Building, St. Louis, Mo., which has been placed under the managership of Mr. W. J. Brock, a well-known electrical and mechanical engineer.

TRADE NOTES.

For some time the managers of the Smith Premier Typewriter Co. have felt the necessity of considerably enlarging its factory to accommodate its rapidly increasing business. The company has now been in existence for twenty-seven months, having been organized in February, 1890, and up to the present time has sold nearly 16,000 machines. When the present large five-story building was erected, Mr. Lyman C. Smith, the general manager, believed that he was making ample provisions for many years to come, but the business has already far outgrown their present quarters, and ground has been broken for a new building adjoining their existing factory. Mr. E. W. Baxter, of Syracuse, is the architect, and work is being pushed on as rapidly as possible. The new building will be ready for occupancy by September 1 at the latest. The building will be 130 x 60 ft., and eight stories high. The company is now fully 2,000 machines behind its orders, and this fact, together with the constantly increasing business, makes additional room necessary. It is estimated that the increase of the last year over the business of 1890 was more than 100 per cent. There are employed at present between 350 and 400 men, and when the new building is completed, the number will be increased to between 800 and 900.

The company has fifteen branch offices, employing more than 150 people. Between 70 and 80 salesmen are sent out from the factory and branch offices, and they contemplate opening five or six more offices as soon as the output from the factory is increased. The Smith Premier Typewriter Co. recently secured an order from the government for 150 of their machines, to be used in the War Department, after an expert examination. This is the largest order that has ever been given at one time for typewriters. The present monthly output is between 1,000 and 1,500 machines, and this number will be doubled when the new building is completed. Some idea of the success of the company can be formed from the fact that all of the machines sold by them have been disposed of in the United States. Up to the present time they have not been able to fill the orders from the home market, and therefore have sought no foreign business.

THE enamelled signs manufactured by F. E. Marsland, 84 West Broadway, New York, are made of a material that will withstand the effects of the weather in all climates, thus making them the only durable sign in use. They are made of any color that can be fired up to 4,000 degrees of heat. The base is of iron, and is coated with the required color, which is amalgamated with the iron in furnaces at a white heat; only a greater heat than this can destroy them.

These signs are particularly adapted for advertising street names, railway signs and for all kinds of business signs. Having a glazed surface they require no cleaning. They can be made in any size up to ten feet long by three feet wide, and even larger, by making them in two or more pieces.

The New York Central and Hudson River R. R. Co., the Manhattan Railway Co., the Long Island Railroad Co. and others, have adopted these signs as a standard for station names, notices, etc. The cost is surprisingly small, even for signs that would only last a year or two, whereas these will last for fifty years. They can be removed and replaced if desired, and will be found at all times just as good as the day they left the kilns.

In writing for estimates, the quantity, size and colors required should be mentioned.

W. R. FLEMING & Co., new Mail and Express Building, New York city, agents for the Harrisburg Foundry Machine Works, have handed us a list of recent contracts for furnishing Ide and Ideal engines. When it is remembered that the sales mentioned below represent only a comparatively small proportion of the United States, and that we happen to know that other agents as well as the factory themselves have each been shipping almost as large a number as is handled through New York city, it is safe to infer that not only is the sale for the Ide and Ideal engines rapidly increasing, but they are doing as large a business as any other engineering concern in this country.

The following list covers the last few weeks' business done by W. R. Fleming & Co. alone, and equals over twenty-five hundred horse-power:

1 70 H. P. standard ideal engine; 1 150 H. P. steel horizontal tubular boiler. Edison Electric Light Co., North Plainfield, N. J.

1 60 H. P. standard ideal engine; 1 60 H. P. vertical boiler. Bar Harbor, Me.

1 30 H. P. standard Ide engine; 1 30 H. P. vertical boiler. McMahon & Wren, Bridgeport, Conn.

4 100 H. P. special direct connected ideal engines, Mail and Express Building, New York city, N. Y.

3 100 H. P. standard Ide engines. Pope Manufacturing Co., Hartford, Conn.

1 25 H. P. ideal engine for steamship service. Harlan & Hollensworth Co., Wilmington, Del.

1 16 H. P. standard ideal engine. Steam yacht *Clarion*, Newport.

1 45 H. P. standard ideal engine. Central Stores, New York city, N. Y.

1 55 H. P. standard ideal engine. Wild & Williams, New York city, N. Y.

2 225 H. P. standard ideal engines. Clarion Mills, Pa.

1 25 H. P. ideal engine. Weehawken Ferry Co.

1 30 H. P. standard ideal engine; 1 50 H. P. standard ideal engine. Naval Observatory, Washington, D. C.

1 55 H. P. standard ideal engine; 1 steel horizontal tubular boiler; complete steam plant. Brazil.

1 12 H. P. standard Ide engine. Whitlock Coil Pipe Co., Elmwood, Conn.

1 55 H. P. standard ideal engine; 1 60 H. P. standard ideal engine. Century Club, New York city, N. Y.

1 150 H. P. special railway ideal engine; 1 80 H. P. special railway ideal engine; 1 55 H. P. standard ideal

engine. Chillicothe Street R. R. and Lighting Co., Chillicothe, O.

1 55 H. P. standard ideal engine. Hyland Paper Co., Johnsonburg, Pa.

2 60 H. P. standard ideal engines. Hotel St. Lorenz, New York, N. Y.

5 25 H. P. standard ideal engines. Pacific Mail Steamship Co., New York city, N. Y.

The Electrical Age's Illustrated Patent Record.

Issued June 14, 1892.

476,781. Electric Switch. Francis Broadnax, New York, N. Y. Filed Nov. 3, 1890.

476,792. Electric Switch. William M. Goodridge, Highland Park, assignor to the Western Electric Company, Chicago, Ill. Filed Oct. 19, 1888.

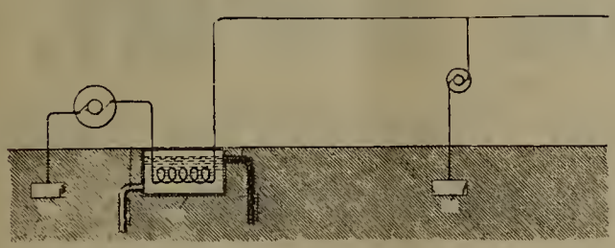
476,793. Metallic-Circuit House-Telephone System. William M. Goodridge, Highland Park, Ill., assignor to the Western Electric Company, Chicago, Ill. Filed Sept. 30, 1889.

476,816. Electric Converter. Gustav Pfannkuche, Exeter, N. H., and Alfred Pfannkuche, Cleveland, Ohio, assignors to the Brush Electric Company, Cleveland, Ohio. Filed May 14, 1887.

476,818. Magnetic Inductor for Dynamo-Electric Machines. Lazarus S. M. Pyke and Edward S. Harris, London, England. Filed Feb. 5, 1892.

476,819. Field-Magnet for Dynamo-Electric Machines. Lazarus S. M. Pyke and Edward S. Harris, London, England. Filed Feb. 5, 1892.

476,826. Telephone-Exchange Apparatus. John A. Seely, Brooklyn, N. Y., assignor to the Western Electric Company, Chicago, Ill. Filed Nov. 25, 1889.



476,855.—LIGHTNING-ARRESTER.

476,828. Circuit-Breaking Insulator. Albert P. Seymour, Syracuse, N. Y. Filed March 21, 1892.

476,829. Electric Switch. Albert P. Seymour, Syracuse, N. Y. Filed March 21, 1892.

476,830. Compensating Alternating-Current Dynamo. Oliver B. Shallenberger, Rochester, assignor, by mesne assignments, to the Westinghouse Electric and Manufacturing Company, Pittsburg, Pa. Filed Feb. 13, 1889.

476,843. Current-Alternator. Harry L. Tyler, Corning, N. Y., assignor of two-thirds to George W. Drake and Charles E. Drake, same place. Filed Oct. 6, 1891.

476,845. Limiting-Stop for Armatures. Richard Varley, Jr., Englewood, N. J. Filed July 27, 1891.

476,855. Lightning-Arrester. Alexander Wurts, Pittsburg, Pa., assignor to the Westinghouse Electric and Manufacturing Company, same place. Filed Jan. 21, 1892.

476,873. Electric Train-Signal. Nathaniel B. Cregier, Chicago, Ill., assignor of one-half to De Witt C. Cregier, same place. Filed Oct. 27, 1890.

476,887. Telephone System. Bélizaire Marinovitch and Géza Szarvady, Paris, France. Filed Sept. 5, 1889. Patented in France and in England.

476,889. Pole for Electric Wires. Julius Meyer, New York, N. Y., and Carl Binder, Chicago, Ill., assignors to the Edison General Electric Company, New York, N. Y. Filed March 17, 1892.

476,914. Process of and Apparatus for the Extraction of Aluminium. Myrthil Bernard and Ernest Bernard, Paris, France. Filed Jan. 20, 1888. Patented in France, in Belgium, in Luxemburg and in England.

476,933. Spark-Arrester for Electric Lamps. Walter M. Spencer, Chicago, Ill. Filed Feb. 5, 1892.

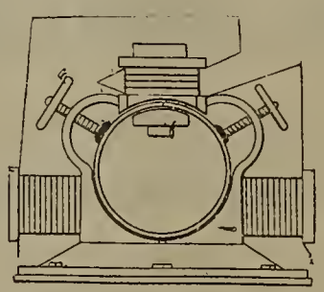
476,964. Insulating-Tube for Electric Conductors. Albert P. Seymour, Syracuse, N. Y. Filed March 5, 1892.

476,983. Pyromagnetic Generator. Thomas A. Edison, Llewellyn Park, N. J. Filed June 13, 1887.

476,984. Expansible Pulley. Thomas A. Edison, Llewellyn Park, N. J. Original application filed June 10, 1890. Divided and this application filed Aug. 28, 1890.

476,985. Trolley for Electric Railways. Thomas A. Edison, Llewellyn Park, N. J. Filed Nov. 20, 1890.

476,986. Means for Propelling Electric Cars. Thomas A. Edison, Llewellyn Park, N. J. Filed March 2, 1891.



477,101.—ELECTRIC WELDING.

476,988. Lightning-Arrester. Thomas A. Edison, Llewellyn Park, N. J. Filed Aug. 14, 1891.

476,989. Conductor for Electric Railways. Thomas A. Edison, Llewellyn Park, N. J. Filed Aug. 14, 1891.

476,990. Electric Meter. Thomas A. Edison, Llewellyn Park, N. J. Filed Aug 25, 1891.

476,991. Method of and Apparatus for Separating Ores. Thomas A. Edison, Llewellyn Park, N. J. Filed May 21, 1888.

476,992. Incandescent Electric Lamp. Thomas A. Edison, Llewellyn Park, N. J. Filed Jan. 24, 1891.

476,993. Electric-Arc Lamp. Thomas A. Edison, Llewellyn Park, N. J. Filed Oct. 1, 1891.

477,049. Electric Clock-Synchronizer. James W. Du Laney and Charles F. Du Laney, Canton, Ohio. Filed Sept. 4, 1891.

477,058. Spark-Arrester. Carl G. Luthman, Altoona, Pa. Filed Feb. 23, 1892. Patented in Sweden and in Finland.

477,068. Fire-Alarm System. Lewis G. Rowand, Camden, N. J., assignor to Henry C. Terry, Philadelphia, Pa. Filed Dec. 14, 1891.

477,069. Fire-Alarm System. Lewis G. Rowand, Camden, N. J., assignor to Henry C. Terry, Philadelphia, Pa. Filed Dec. 14, 1891.

477,070. Fire-Alarm System. Lewis G. Rowand, Cam-

den, N. J., assignor to Henry C. Terry, Philadelphia, Pa. Filed Dec. 14, 1891.

477,071. Annunciator. Lewis G. Rowand, Camden, N. J., assignor to Henry C. Terry, Philadelphia, Pa. Filed Dec. 14, 1891.

477,100. Electric Elevator. John H. Clark, Boston, Mass., assignor to the Whittier Machine Company, same place. Filed June 5, 1891.

477,101. Electric Welding. Charles L. Coffin, Detroit, Mich. Filed Nov. 6, 1889.

477,146. Electric-Lamp-Socket Switch. Gwynne E. Painter, Baltimore, Md., assignor of one-half to James F. Morrison, same place. Original application filed March 17, 1891. Divided and this application filed July 24, 1891.

477,175. Detachable Commutator. Charles H. Gaylord, Cleveland, Ohio. Filed Dec. 17, 1891.

477,182. Secondary Battery. Henry H. Lloyd, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Gloucester City, N. J. Filed Feb. 27, 1892.

Valuable Suggestion, A		371

A VALUABLE SUGGESTION.

It is well known that many railroad companies are compelled to operate portions of their lines at a loss, particularly in cases where suburban districts are newly opened up for settlement. Mr. Charles Selden, in his paper read before the Convention of the Railway Telegraph Superintendents at Denver, last month, suggests that such unprofitable lines might be operated at a profit by the substitution of electric for steam power.

There is considerable food for reflection in this suggestion, and it would be well for railroad managers to give it some consideration. There is no doubt that electricity can do the work.

TWICE VISITED BY FIRE.

The headquarters of the General Electric Company in this city were twice visited by fire last week, and the damage, while not very extensive in dollars and cents, was irreparable in that many valuable papers and documents were destroyed. The fire will cause some of the officials considerable inconvenience, as it destroyed their office furniture. Fortunately no damage was done beyond the floors on which the fires originated, and this fact proves that a fire-proof structure is essential for the headquarters of a vast concern like the General Electric Company. It is not yet known what caused the fires.

THE DENVER CONVENTION.

We publish in this issue a record of the proceedings of the convention of Railway Telegraph Superintendents, which was held in Denver, Col., June 15 and 16.

This convention was the most successful one ever held by the association, both as regards the character of the papers read and attendance. It is growing in importance more and more every year, and its influence for the good of the service represented by its members is being felt. The knowledge that the members acquire at these meetings is of extreme value and practically applicable to the needs of their respective roads, and it is evident that nothing but good can result in favor of the railroads with which the members are connected. The association is a worthy one and deserves the hearty support of every railroad company in the country. All railroad managers recognize the fact that they cannot get along without the telegraph in the operation of their roads; for this reason they should lend all the aid possible to their telegraph superintendents in their laudable efforts to improve the telegraph service, on the efficiency of which so much depends.

The association now possesses the distinguished honor of being the first organization before which a scientific paper from Mr. Thomas A. Edison was ever read. Mr. Edison's paper was of a high character, and a most valuable contribution to our knowledge on "insulation." Every sentence of it contains a fact of very great value, and furnishes a subject for investigation and experimentation.

The other papers read were of great practical value and of exceeding interest to the members, who, when they get settled down to work again, will carefully digest the contents of the various papers, with the object of picking out and applying practically what may be of value to their companies.

HIGH INSULATION.

The insulation of oil of wood tar, according to Mr. Edison's tests, is no less than 1,670,000,000 megohms. This is well-nigh infinity.

A NEW FAN-MOTOR.

Now that the warm weather is upon us and the advertisements of the various manufacturers of fan-motors are beginning to be displayed in our columns, it is a fitting time to make note of the various improvements that have been recently made in these valuable appliances, which add so much to our comfort during the warm summer months. The Interior Conduit and Insulation Company of New York are bringing out an

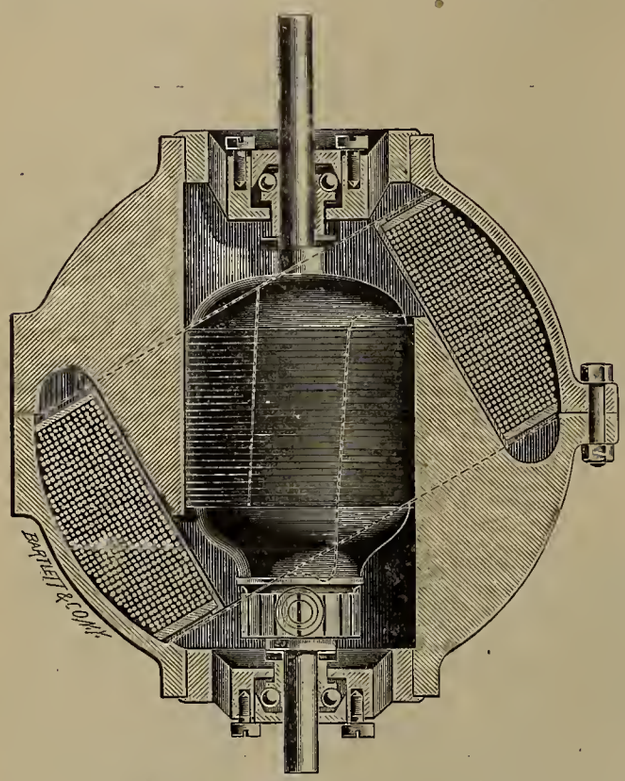

FIG. 1.—VERTICAL SECTION LUNDELL FAN-MOTOR.

entirely new form of fan motor, the invention of Mr. Robert Lundell, who is connected with the company.

Many attempts have been made to design dynamos and motors in which there should be practically no magnetic leakage; but until the appearance of the new Lundell Motor, which they now offer, these attempts have not met with any marked degree of success. In an ordinary well-designed motor the leakage amounts to from 40 to 50 per cent., thus requiring an extra heavy magnetic circuit and producing a field-magnet of low efficiency. The practical elimination of all magnetic leakage constitutes the chief factor of superiority in the

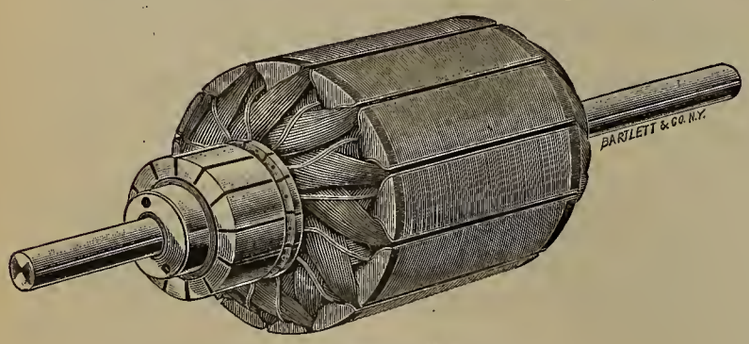

FIG. 2.—ARMATURE.

new Lundell Motor, although it is not the only one. This great desideratum is attained in the following manner, as shown in Fig. 1.

The armature and pole-pieces are surrounded by a single magnetizing coil, which in turn is itself totally surrounded by the keeper or yoke, thus leaving no chance for stray magnetism. It is a true ironclad field-magnet, having at the same time the shortest possible magnetic circuit. The keeper would form a perfect sphere were it not for the slight projections constituting the bearings.

The motor assumes wonderfully small dimensions for any given capacity, due to the fact that every cubic inch of space inside the spherical keeper is effectively utilized. It is also very light, on account of a short magnetic circuit having smallest cross-section, with comparatively few turns of wire in the magnetizing coil.

The type of armature adopted is the very best, being a modern Pacinoti drum, proportioned with a view to maximum efficiency. In the design of the motor particular attention has been paid to the shape of pole-pieces in relation to the reaction between armature and field-magnet. Thus the motor has been rendered sparkless, and the point of commutation remains fixed between the limits of load and at reversal of rotation. The need

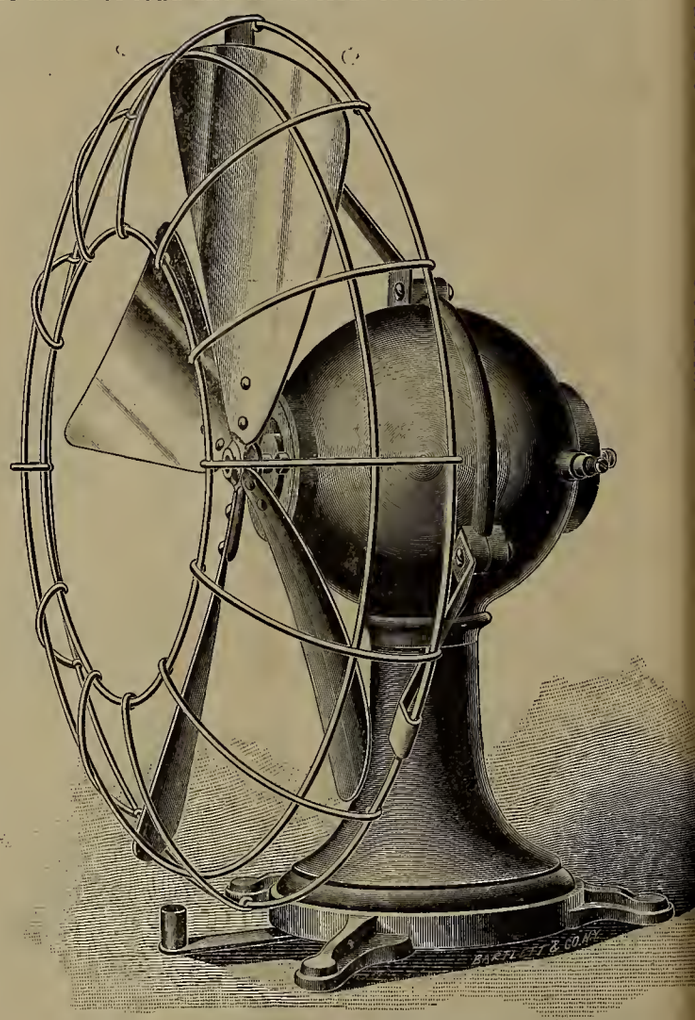

FIG. 3.—$\frac{1}{6}$ H. P. LUNDELL FAN-MOTOR.

for a special rocker-arm for supporting and adjusting the brushes is consequently obviated.

The brushes themselves are small carbon pencils, fitted in bayonet-jointed holders, and held upon the commutator by a small spiral spring.

The new motors are furnished in five different styles. They are superbly finished in rich black japanning, with red and gold striping.

The $\frac{1}{12}$ H. P. motors are all fitted with ball-bearings which require no oil, a most valuable consideration.

The $\frac{1}{12}$ H. P. motors run at a maximum speed of 1,800 revolutions per minute, a minimum speed of 900, and a mean speed of 1,150 at 110 volts E. M. F., while the $\frac{1}{8}$ H. P. motors have a maximum speed of 1,800 revolutions, a minimum speed of 900, and a mean speed of 1,000 revolutions per minute.

The novelty of the design alone commends the motor at once, not only to electricians but to laymen as well.

SERIES ELECTRIC TRACTION.*

BY NELSON W. PERRY, E.M.

PART II.

(*Continued from page* 361.)

The upper pair of wires, which it will be seen are merely the parallel extensions of the other possible path for the current, are in multiple with the path through the mercury cups. One of each of these pairs of wires, which will hereafter be denominated sections, is connected to the feeder wire on one side of the mercury cups, and the other has a similar connection on the other side. The two wires of each section normally without electrical connection with each other, constitute what has been termed the "series of breaks normally open." If, however, these two wires be connected electrically through the terminals of a motor, the latter will be in multiple with the mercury cups and momentarily receive only the

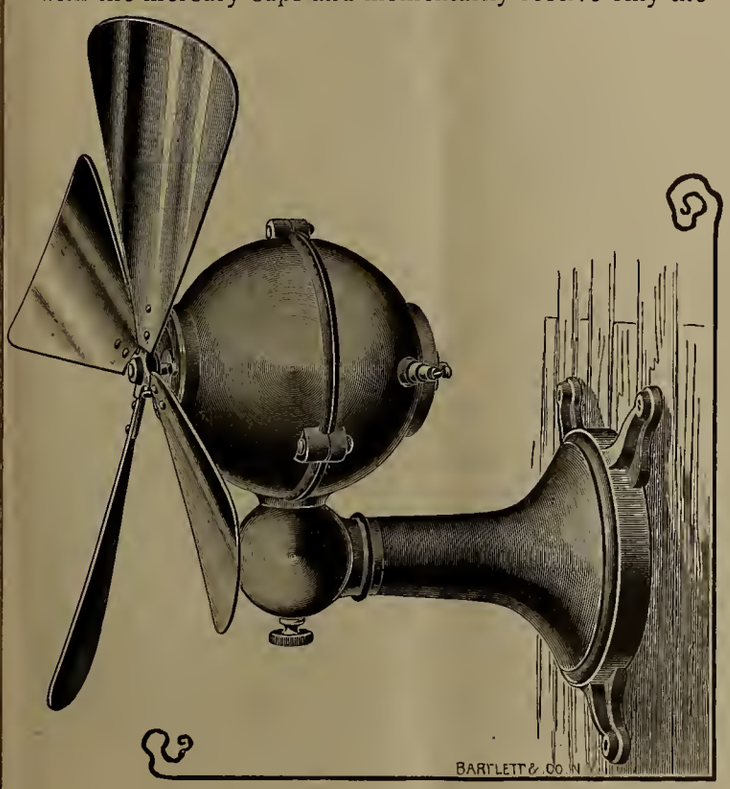

FIG. 4.—⅛ H. P. LUNDELL BRACKET FAN-MOTOR.

current due to the relative conductivity of the path thus offered. By the arrangement shown in Fig. 5 the electro-magnet which opens the mercury-cup switch is in series with the motor circuit, and the latter no sooner receives current than the former is actuated, the switch is opened, and the whole of the current, which was momentarily divided between the two branches, is diverted to the motor.

If the corresponding wires of the succeeding sections be caused to overlap without making electrical connection with each other, and these laps be staggered as shown, a means is provided whereby the motor prepares the succeeding section for occupancy before wholly passing out of the one it is about to leave, and accomplishes this without interruption to the current. Figs. 6 and 7 show how this is done, and the arrows show the paths taken by the current as the transition takes place. When the motor is in the position represented in Fig. 5, there is but one path for the current, viz., around the open switch in the feeder and through the electro magnet by which it is kept open, back again to the feeder.

As the motor proceeds to the right, one of the terminals first embraces the lower lap, thus offering two paths for the current, one passing through the switching arrangement that controls the section the car is about to leave, and the other through that controlling the section it is about to enter. (See Fig. 6.) As it progresses still further this terminal passes beyond this lap at about the same time that the other terminal embraces the other lap. This leaves the first switch without current, and the succeeding switch is automatically opened. There is no break in the circuit, however, even during the short interval occupied by the two switches in acting, for while the further terminal embraces the further lap, both of the switches concerned are short-circuited, as shown in Fig 7. Before the further terminal has passed beyond the lapping portion of the two succeeding wires, the first switch will have closed and the succeeding switch will have been opened, thus diverting all of the current to the section upon which the motor has now entered.

FIG. 5.—CEILING FAN-MOTOR.

Fig 8 shows another arrangement by which a motor is enabled to pass from one section to another without interrupting the circuit. In this arrangement the ends of the sections, while mechanically continuous, are electrically disconnected, but do not lap as before. The break in the wires connected with the switch-actuating device is longer than that between the other two wires. The larger gap, however, is lapped by a subsidiary conductor, which short-circuits the switch actuating the section the motor is about to enter, as shown. As the car proceeds from left to right, before both its trolleys have passed off the section, one of its trolleys has embraced the subsidiary conductor, and the electro magnet controlling that section is cut out of circuit and the switch drops. While the switch is dropping, however, the current continues to flow through the companion wire, through the motor to the subsidiary wire and *around* the switch actuating the section it is entering. Fig. 8 represents a branched or forked road operated by a single dynamo. In the arrange-

* A paper read at the general meeting of the American Institute of Electrical Engineers, Chicago, Ill., June 6, 7 and 8, 1892.

ment shown in Fig. 8, where the branch road is operated by the return circuit, a car turning to the left would really skip from the first section of the road to the very last, if we count them in the order in which they receive current; whereas in going straight ahead it would pass from section 1 to section 2, etc., counting them in the same order. In Fig. 9, however, which represents a similar road operated by the loop system, a car taking the left-hand branch would pass from section 1 to sections 2 and 3, whereas if it went straight ahead it would pass from section 1 to sections 4 and 5. It will be apparent from what has preceded that in neither of these cases does the skipping of one or many sections involve an opening of the circuit.

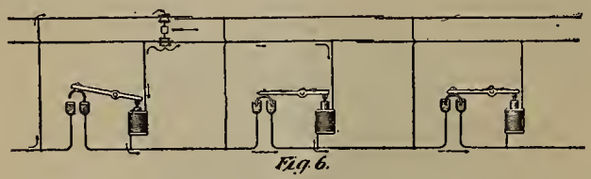

Fig. 6.

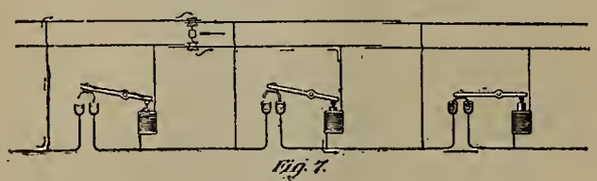

Fig. 7.

But, returning to Fig. 8, and following the car still further in its progress from left to right. We left it standing with one trolley on the further wire and the other on the subsidiary or short-circuiting conductor. In this position the current will continue to pass through the motor only so long as the switch actuating that section requires to fall into the mercury cups. Immediately that has occurred, which will be accomplished before the further trolley has passed from its wire, the motor will have been short-circuited and the car will, by its acquired momentum, pass from the system without sparking or other disturbance of the circuit. If the acquired momentum should carry the car to another section of the same system, or to a section connected with an entirely separate system, all that is necessary to enable it to proceed would be some arrangement by which the switch controlling the section upon which it was entering, could be opened by the entrance of the car itself. It will be evident from Fig. 10,

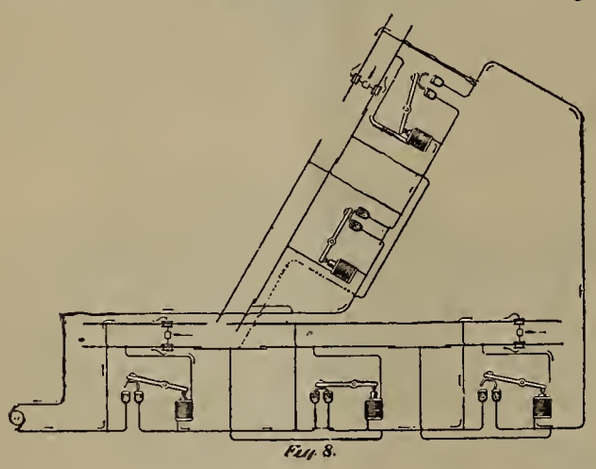

Fig. 8.

which represents two connecting roads operated by separate dynamos, that it matters not as far as the integrity of either circuit is concerned, whether the car goes to the left or to the right; in either case the circuit is closed before it leaves a section, and as it enters the succeeding section it does so before opening the switch which actuates that section, and it is entirely immaterial whether that section belongs to the same system as the one just left or to one entirely foreign to it. If only the proper switch can be opened the car may proceed on its way on either system of roads. In order to accomplish this automatically, each car may be provided with some such an arrangement as is shown in Figs. 11 and 12. *M* is a solenoid magnet in series with the motor *D*; *L* is a lever pivoted at *P* and playing between two stops, but when not actuated by the plungers of *M*, kept in contact with the lower stop by the spring *S*; *B* is a local battery; *W*, *W'* are the trolley wires; and *C* is the mercury switch connecting adjacent sections of the feeder wire. As long as the motor is receiving current from the feeder, as is the case in Fig. 11, the current must pass through *M*, which, by its pull on the plungers, maintains the lever *L*

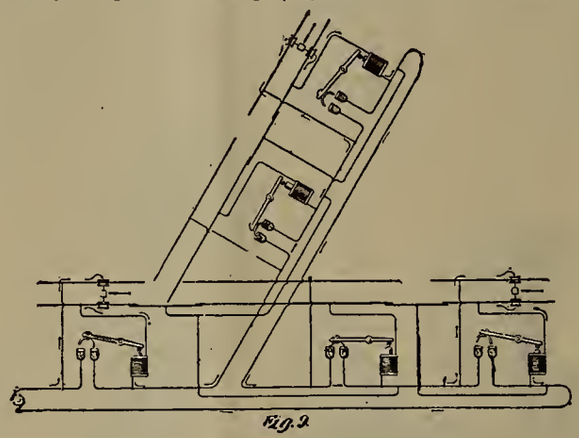

Fig. 9.

against the upper contact. As the trolleys pass off from a given section and the motor loses its current as before described, the spring *S* causes the lever to make the lower contact (Fig. 12), thus throwing the battery *B* into the circuit *W*, *F*, *C*, *F'*, *W'*. The moment the trolleys enter upon a new section this circuit is closed, the local current passes through the feeder-switch magnet and opens the switch *C*, and diverts the current from the feeder to the section just entered. This stronger current actuates the lever *L*, again bringing it against the upper contact and cutting the battery *B* again out of circuit. Since the battery *B* is only momentarily in circuit, the cost of maintenance will be insignificant.

On single-track roads where turnouts are required, the turnout constitutes merely an additional section to one side of the main line, which is skipped by the car keeping the main track, and taken by the other car in passing. It, like every other section, has its own individual con-

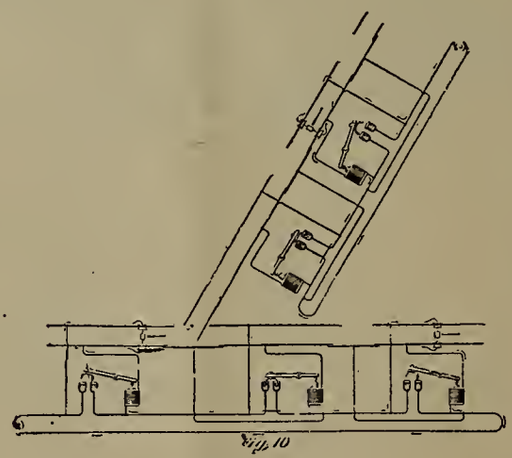

Fig. 10

trolling switch, and when both the main track and siding are occupied by cars, their motors are arranged in series with each other as represented in Fig. 13. By following the arrows the course of the current can readily be understood.

But both of the plans thus far discussed possess serious faults. In both we have provided a means by which a car may leave one section on a given road and enter an-

other one on the same or another road without breaking the main circuit, *provided the car is always going in the same direction.* In all of the cuts thus far, the car is supposed to be going from left to right, and the switches are arranged accordingly; but if we examine the drawings again it will be found that in the plan suggested in Figs. 5, 6 and 7, if the car were going in the opposite direction, the circuit would be momentarily broken as it left one section and would fail to divert the current to the

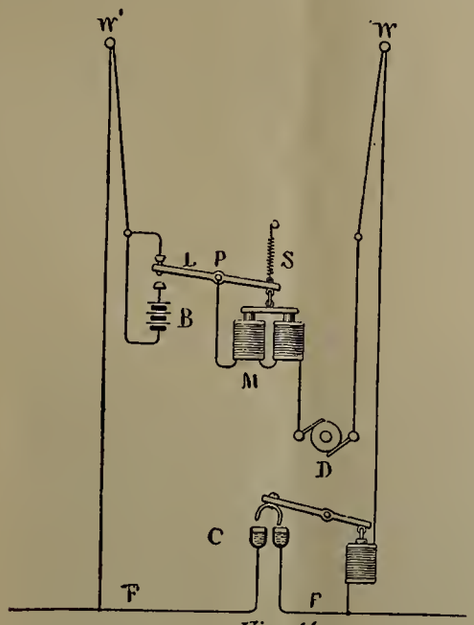

Fig. 11

section it was entering. In the second plan, outlined in Figs. 8, 9, 10 and 13, the car is momentarily without current whenever it passes from one section to another.

By combining the two plans, however, all of the difficulties seem to be removed. Figs. 14 and 15 show how this combination is effected, and the courses of the current when the motor terminals are in different positions on the wire. It will be noticed that, as in the first plan

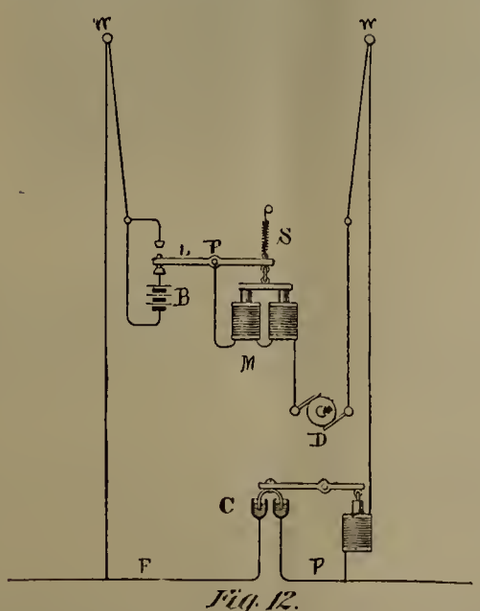

Fig. 12.

described, the trolley wires of adjacent sections are lapped, and that these laps are staggered; that parallel to but insulated from the nearer laps is placed the subsidiary wire which short-circuits the switch to the right. The switch-controlling magnet, as is shown, has two coils wound cumulatively, and may be operated either by the current passing through the subsidiary wire, by that passing through the nearer trolley wire, or by both when it takes both paths.

The supplemental conductors and the laps in the trolley wires are so arranged relatively to each other that when a car is travelling in the direction of the main current, as the trolleys approach a lap, the trolley travelling upon the wire connected with the switch will contact with the supplemental conductor before reaching the lapping portion of the trolley wires, and the companion trolley will reach its lap after the first trolley has reached its lap and before it has passed beyond the supplemental conductor; while with a car travelling in the opposite direction the order will be reversed, the trolley upon the wire *not* connected with the switch first reaching its lap, after

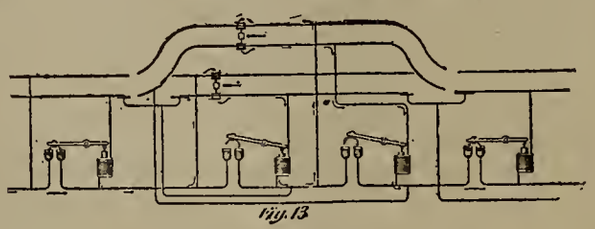

Fig. 13

which its companion trolley reaches first its lap and afterward the supplemental conductor. By this arrangement, in whichever direction the car may be going, in passing from one section to another, it first short-circuits the switch controlling the section it is about to enter, next diverts a portion of that current to that switch, and finally all of it, cutting the switch controlling the section it has just left entirely out of circuit. In this manner the transition is accomplished in either direction from one section to another, either of the same or another connecting road without spark or interruption of circuit.

Should either one or both trolleys leave the wires, or the circuit through the motor in any other way become broken, the magnet controlling the switch to that section would be left without current and the forks would

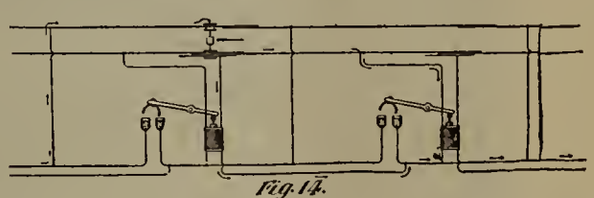

Fig. 14.

immediately drop into the mercury cups, renewing the circuit through the feeder wire almost instantaneously. There would, however, be an interruption of the current while the fork was dropping. Even this slight interruption may readily be avoided by connecting with the switch any of the devices so sucessfully employed to obviate the same difficulty in arc-light circuits.

Should a second car run upon a section already occupied, the two would be thrown in parallel and both would stop. This arrangement therefore constitutes a most perfect automatic block system, not dependent upon frail human nature, but sure and positive in its action. On interurban electric roads, where it is even now pro-

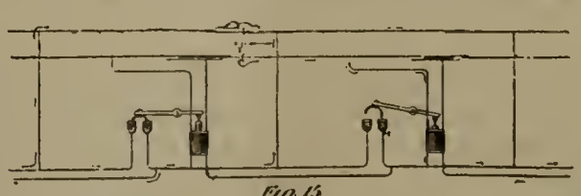

Fig. 15

posed to reach greater speeds than are customary or attainable with steam locomotives, the importance of this feature cannot be overestimated. Not only will collisions be rendered practically impossible, but by putting semaphores or other signalling devices in the wires connecting the main feeder with the two trolley wires, each car as it enters a section will automatically set a signal at each end of that section showing that the section is occupied, and when it has left the section, set another,

indicating that the way is clear. These signals cannot fail to act, for being in series with the motor, they *must* receive current when the motor does, and lose it when the latter has passed out of the block. This seems to be the solution of the block system, as it eliminates all the uncertainties inseparable from a dependence upon human intelligence and watchfulness.

This system will no doubt be criticised first, on the score that it is a double trolley system which many are opposed to on general principles, and second, on the score of the high potentials necessarily involved in series distribution to long distances. Anticipating these, I will say in regard to the first, that however valid the objections may be to the double trolley on multiple-arc roads, they have but little force as applied to series circuits. In the latter, since both the wires on all sections not occupied by cars are of the same potential, the difficulties of insulation of the one from the other disappear entirely. Then, again, I am satisfied, with an intimate knowledge of the electric roads in Cincinnati, where with one exception they are double-trolley multiple-arc roads, that most of the objections raised against them are greatly magnified. They certainly have the decided advantage over the single trolley—of being independent, in their operation, of the condition of the track. Their chief objection being the difficulty of insulating the positive and negative wires from each other (which we have seen does not hold in series roads) and the multiplication of wires, crossings and switches where many lines converge and cross. In suburban districts where these complications do not occur (and this system is particularly adapted to such) the double-trolley multiple-arc system is in many respects superior to the single trolley. Mr. John Kilgour, president of the Cincinnati Street Railway Company, is justly proud of the Avondale double-trolley road (a suburban line), and I doubt if there is a more successful road in the country than this.

In regard to the other objection to the series method, viz.: the high potentials, the method outlined in this paper permits the use of any number of feeders, each of which may be used to supply a different portion of the road, thus reducing the potential, which in series distribution is the variable quantity, in the same manner exactly that the "drop" is obviated in parallel systems.

It is perfectly clear to the members of the Institute that this question of potential on series circuits is very much misunderstood by the laity. In the parallel system of distribution the high potential impressed upon the circuit at the dynamo is carried to every translating device on the circuit, even to that at the extreme end of the line, whereas in a series circuit the high potential spoken of exists only at the dynamo terminals, and is the sum of the electro-motive forces consumed by all the resistances on the line.

As an illustration in point, supposing we have two circuits—one parallel and the other series, the differences of potential between the terminals of the two generators being exactly the same—let us say 2,000 volts. On the multiple-arc circuit, no matter how insignificant the translating device may be or where it is located, one cannot handle its terminals without subjecting himself to a shock due to 2,000 volts. If the motor be generating one H. P. or 100, the danger is exactly the same. On the other hand, in the series system, if we are using a current of say 40 ampères, which is a convenient one for street-car purposes, if the motor be generating one H. P., the difference of potential between its terminals will be a little less than 19 volts. If it be generating 100 H. P. it would be but 1,865 volts, and before it would be as dangerous to handle as a motor on the multiple-arc circuit, it would have to be doing work equivalent to 107 H. P.

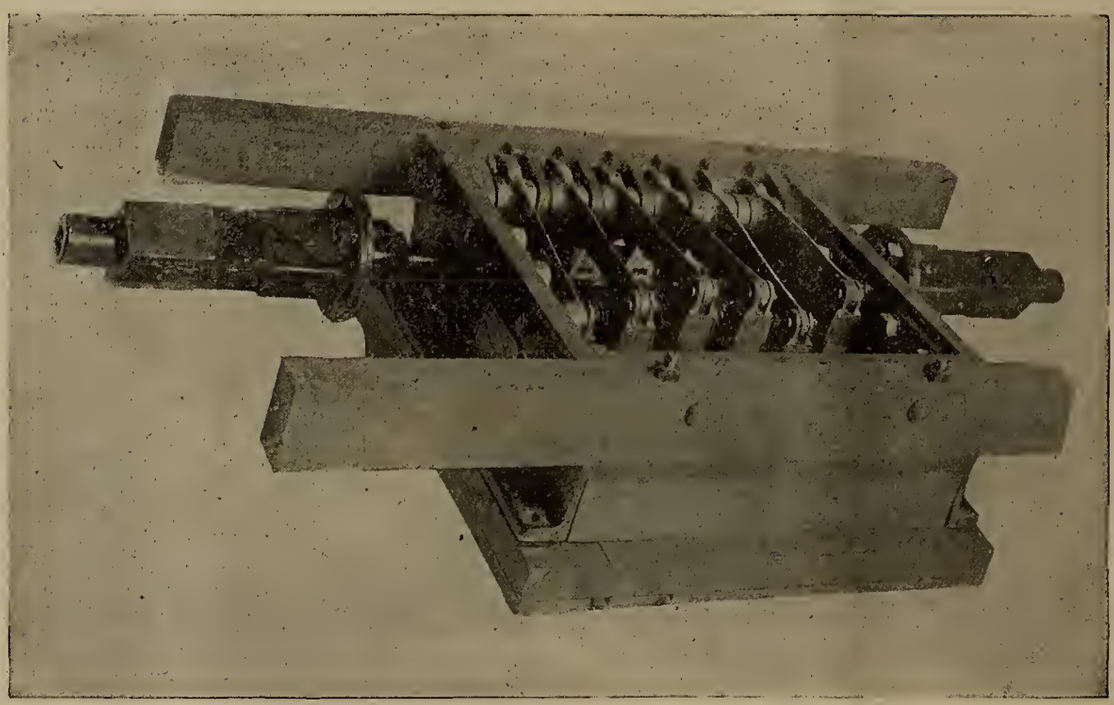

FIG. 1.—TOP VIEW OF CONTROLLER.

CONTROLLER FOR STREET-RAILWAY MOTORS.

The Thomson-Houston Electric Company has for a long time been engaged in experiments, having in view the development of a controller for railway motors that would be an improvement on those now generally used. It is well known that the regulation of motors by means of a resistance only is decidedly wasteful as well as troublesome. It in fact involves the consumption of nearly as much energy when the motor is running at slow speed as when running at high speed, although the work given out by the motor in the two cases is very

different. It simply means that the energy which, in the one case, drives the motor at a high speed, is, in the other, partly expended upon the resistance, and the remainder only is used to drive the motor. It has been customary to modify this method of regulation in well-designed plants by providing, in addition, a device for changing the field-magnets of the motor so that the counter electromotive force for a given speed will be greater, and permit, in consequence, the use of a smaller amount of resistance. In some cases these two methods of regulation—by means of resistance and alteration in field-magnet strength—have been combined in a system of commuting sections of the field magnet coils, by which the coils themselves offer a greater or less resistance to the passage of the current, and at the same time have a variable effect on the field-magnet strength. In other cases the combination of the two methods has been effected by having a separate resistance external to the motor, and then, in addition, providing a switch to cut out a section of the field-magnet coils or "loops," as it is often called, or to shunt a portion of the current around them for highest speed.

These methods have served a most excellent purpose, but it has long been the belief of Thomson-Houston engineers that a new method of motor control would be eventually developed which would secure as nearly absolute economy as possible, and at the same time be free from the troubles inherent in the use of resistances and commutated field circuits, with the sparking at the commutator which ensues where such commutation is carried to an excessive degree. After a long series of experiments the Thomson-Houston Company is now placing on the market a controller which, it has satisfied itself, is thoroughly practical, and which at the same time realizes almost a perfect theoretical economy in regulation. In a number of instances where this regulator has been used for some time, a saving of 30 per cent. in consumption of current has been effected, and when it is realized that this means a saving at the central station of over three hundred horse-power out of a thousand, the great importance of this new device cannot be doubted.

The principle upon which the new controller is based is the shifting of the connections of two motors from series to multiple, so that for slow speed the two motors will be in series, giving in consequence a high counter electromotive force (that of each motor being in series with that of the other) at a low rate of speed, while for higher speed they are connected in multiple, in which condition highest speed and power are obtainable with equal economy.

In the accompanying illustrations the general form of the apparatus which the company has adopted for effecting these changes is disclosed. Figure 1 shows a top and Figure 2 a bottom view of the new controller. As will be readily understood from an inspection of the illustrations, the apparatus consists of a longitudinal shaft acting upon a series of switch-levers to produce the various connections necessary to place the motors in series or parallel. This controller is to be placed at any point beneath the car and operated by a mechanical connection from either end of the vehicle. In this apparatus the mechanical and electrical details have been worked out with the greatest care, and it was permitted to go on the market only after satisfactory tests had been made, proving the efficiency and reliability of the device. The Thomson-Houston Company has for some time owned controlling patents of this type of controller, the most important being No. 385,055, dated June 26, 1888, and No. 393,322, dated November 20, 1888.

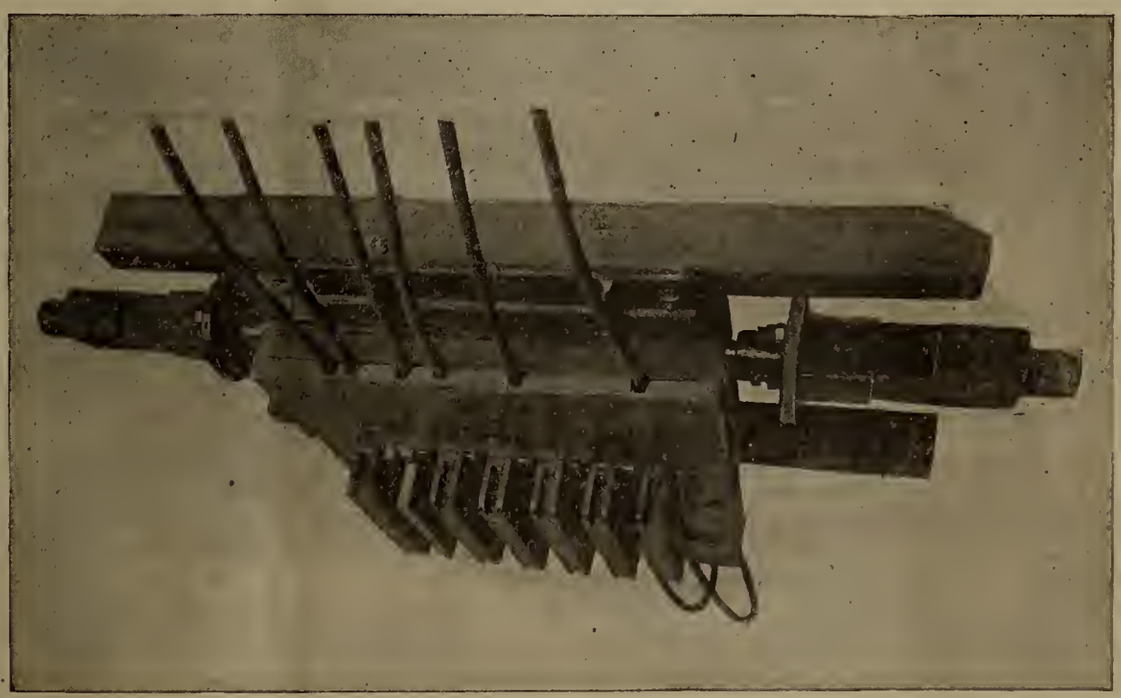

FIG. 2.—BOTTOM VIEW OF CONTROLLER.

QUICKEST TIME ON RECORD.

The quickest time for making the largest belt on record was recently accomplished by the Bodifield Belting Company, of Cleveland, Ohio. At 10.30 A.M., June 2, the company received an order from the American Wire Company, Cleveland, Ohio, for a 143 feet 60-inch three-ply belt. At 5 A.M., June 6, the belt was on the pulleys running. This is certainly marvellous, especially as every inch of it had to be made. The belt contained 2,145 square feet of leather, 300 steer-hides being used to make it; the belt when completed weighed 2,263 pounds. This speaks well for the company's ability to accept and promptly fill all orders entrusted to it.

CONVENTION OF RAILWAY TELEGRAPH SUPERINTENDENTS.

The annual convention of the Association of Railway Telegraph Superintendents of America was called to order at 10 A.M., Wednesday, June 15, by President C. S. Jones, at "The Albany," Denver, Col. There was a large number of delegates present from all parts of the United States. Ten new members were elected and the following-named gentlemen were elected honorary members: Thomas A. Edison, Orange, N. J.; J. J. Dickey, Supt. W. U. Telegraph Company, Omaha, Neb.; Thomas D. Lockwood, of the Bell Telephone Company, Boston; Ralph W. Pope, Editor *Electric Power*, New York; Prof. Wm. F. Gardner, U. S. Naval Observatory, Washington, D. C., and Thomas R. Taltavall, Editor ELECTRICAL AGE, New York.

Announcement was made by the secretary that the Western Union Telegraph Company, through Superintendent Dickey, and the Colorado Telephone Co. extended to the members the free use of their wires during the convention, and that the Remington typewriter people had placed a typewriter and a stenographer in the meeting-room for the convenience of the members of the association free of charge.

The election of officers for the ensuing year was next taken up, and the following-named gentlemen were chosen: President, L. H. Korty; vice-president, U. J. Fry; secretary and treasurer, P. W. Drew.

Milwaukee was chosen as the place for the next annual meeting and June 20, 1893, the date.

After the election of officers Mr. J. W. Lattig read a paper by S. S. Bogart, entitled, "A Few Words About Batteries."

Mr. Bogart referred to the virtues and weak points of some of the batteries now in use, and continued as follows:

"I was forcibly reminded while reading the very able remarks of Mr. G. L. Lang, from the cultured New England, the pioneer of the railroad signals [at last year's meeting], that a leading cause of the difficulties encountered was the sulphating of zincs, causing a high internal resistance and consequent change in the output of current, and it occurred to me that I might give you a few personal observations without being accused of having wearied you thus far only to spring on you an old form of advertisement in a new guise. Some of you doubtless know that I am above guile. I know a battery I do not believe it will be possible to sulphate, giving an average internal resistance of about one-tenth of an ohm, whose constancy is maintained from the point of starting until the end. I have used the type 'G' of the Edison-Lalande for different purposes during the year past. While at our Cincinnati meeting from the cells used on the phonoplex, four relays, transmitters, locks, sounders, bells, signals and answers back were tapped from the same cells, twenty-four circuits in all. Whenever the locks had completed their phase and vitalized the answer backs the cell on that particular set had no resistance interposed, yet there was no interference. I saw a battery of this type in April that had worked daily on a phonoplex circuit over 200 miles, and had not been renewed nor had any attention in twenty-six weeks. I am now using the same type of battery in preference to others for a block-signal system, four cells in series, closed circuit, in which there is an average resistance interposed of ten ohms. It has been working since April 4. There is tapped from it a sounder alarm bell and annunciator, the last two on the same cell, which shows conclusively that the 300 ampères, by interposing a proper resistance, can be called upon to give out their E. M. F. as required. I know of no other type of battery capable of such a showing. Another feature which contributes to the value of this battery for use in connection with railway signals and all work requiring the installation of cells at points where heat is unavailable, is found in the exceedingly low temperatures which the solution will stand without solidifying. It has been tested to 50° (Fahr.) below zero, with no sign of freezing. The solution in a Callaud or gravity cell will solidify at a temperature a few degrees below the freezing-point of water.

"There are gentlemen here who have experienced the same trouble in their quadruplex batteries as that described by Mr. Lang in his paper to which I have already referred, and in which he states that nine-tenths of the trouble on block signals is attributable to the battery. In this I fully agree with him. Why not abandon the old reformed Daniells and use one of a higher efficiency, good from start to finish, whose strength, like this convention's, is continuous? Eminent chemists say there is nothing injurious in *potasse fusa*; certainly no more than sulphuric and other acids. It burns no quicker. One cannot help according a tribute to the foresight of Edison.

"I regret my inability to write an interesting paper filled with historical facts and profusely illustrated, and feel confident that you will never call on me again."

At the conclusion of the reading of the paper letters of regret were read from several members at not being able to be present at the meeting, including one from Mr. E. T. Jeffrey, President of the Denver and Rio Grande R. R., who had expected to address the convention, but was unavoidably absent from the city.

Invitations were read from the Pueblo Board of Trade to the members to visit that city, and from the Denver and Rio Grande, the Union Pacific and the Colorado Midland railroads, extending the courtesies of free transportation over these lines.

Governor Routt, of Colorado, was then introduced and made a few well-chosen remarks. His many official duties, he said, prevented his preparing a speech. He referred to the responsibilities of railroad telegraphers, and stated that many lives constantly depended upon them. He paid them a high compliment, and when he concluded his remarks three rousing cheers were given him.

A recess was then taken till afternoon, and in the meantime the members in a body visited the room in which the exhibits of the various electrical and railway devices were shown, all of which were fully described by attendants. An account of these exhibits will be found elsewhere in this issue.

At the afternoon session the first business was the reading by Mr. M. B. Leonard of an extremely interesting and valuable paper on "Insulation," written by Mr. Thomas A. Edison. This paper in full is given elsewhere in this issue.

Some remarks on the subject of the paper were made by Mr. T. D. Lockwood and T. J. Smith.

Mr. Lockwood thought the paper was one of great value, and he agreed with what Mr. Edison had said.

Mr. Smith spoke of oil insulators, stating that as yet they were made and used to but little extent in this country.

Mr. C. A. Darlton then read a paper by Prof. Wm. F. Gardner, entitled "The Government Time System in Its Relations, Practically, to Railroad Matters."

Prof. Gardner referred to the advantages incident to a single central standard of time; gave a history of the government time service, and pointed out the advantages incident to the government system which qualify it to be a standard of authority.

In conclusion, he recommended that as far as possible hand work should be avoided in the transmission of time signals on railroad wires, and that automatic receiving and distributing should be employed even at the most distant points. He further recommended that the ob-

servatory signals be received direct throughout the whole system of each railroad at least once daily, instead of receiving the observatory signals only at some central station, and at another hour retransmitting them from there. The simplest instruments should always be used, and the use of duplex and quadruplex instruments avoided. Simple instruments are more sure of operation and easier of adjustment.

At the conclusion of the reading of the paper Mr. T. D. Lockwood, on invitation, made some extremely interesting remarks on galvanometers and their uses.

In introducing his subject he spoke of the high regard he entertained for associations of the character of this one. "We obtain advantage," he said, "by association with our fellow-craftsmen." He thought that it would have been better if the railroads and the telegraph had always been associated as they are now; there would have been fewer collisions.

Coming to his subject he said it was the fashion among telegraph men—for it was a fashion—to believe that the galvanometer was a mysterious instrument, but there was really nothing mysterious about it. In the study of electricity no higher mathematics were necessary; arithmetic, he said, sufficed for all needs.

He then briefly described ammeters, voltmeters and ohmmeters, used in measuring electric light currents, and said that the galvanometer if rightly handled could be used as all three instruments. By it we can measure current, voltage and resistance, although it takes a little more time.

He next referred to the early discoveries as to the relations between electricity and magnetism, and explained how, by increasing the number of turns of wire around a magnetic needle the effect of the current upon the needle was augmented. This fact, he said, was taken advantage of by Crooke & Wheatstone in their telegraph system, which was invented three years prior to that invented by Morse.

The tangent galvanometer was next fully and clearly described, and with the aid of a blackboard, he explained a tangent and how it was used in connection with the measurement of electric currents by the deflections of the needle. Tangent galvanometers, he continued, were used in measuring resistances of instruments, batteries, ground wires, etc.

Rheostats and the substitution method of measurement were next explained, and he then told how the galvanometer could be used to determine how much battery is needed for a given amount of work.

Mr. Lockwood then, in a very clear and able manner, described the Wheatstone bridge it all its details, and with diagrams on the blackboard made the subject easy of comprehension.

In conclusion, he stated that all electrical appliances which a railroad uses should be placed in the charge of the telegraph superintendent.

Votes of thanks were tendered to Mr. Lockwood and also to Prof. Gardner for his able paper, after which the meeting adjourned until Thursday morning.

SECOND DAY, THURSDAY.

The meeting was called to order at 9:45 A.M., and the first thing done was the reading of a telegram from the Train Despatchers' Association, in convention at New Orleans, in which greetings were conveyed, with the wish that the superintendent's convention would be a prosperous one.

The secretary was authorized to return an appropriate answer to the telegram.

Mr. Charles Selden then read a very interesting paper on "Electricity and its Relation to Transportation," a full abstract of which was printed in our last issue. Well-deserved applause followed the reading of the paper, after which a paper was read by Mr. J. B. Stewart, on "The Block Signals of the Present and What Is Required for the Future."

Mr. Stewart described the English, or Sykes system, the one now in general use, and asked if it met the requirements and gave the necessary security.

It is claimed for the Sykes system, he said, two persons must make a mistake before a wrong signal can be given, but he gave a supposititious case where a collision was possible under the ordinary conditions. Such a condition would be present if a train from some cause stopped after entering a block 1,000 feet. To meet such a contingency, the Hall Signal Company, of New York, had, he said, made an improvement on the Sykes system. It consisted of a track instrument which was depressed by a train in passing out of the block. The instrument is connected electrically with the unlocking device, so that it is necessary for at least a part of the train to pass out before the lever can be unlocked.

Another great chance for an error in the Sykes system, as well as in all other non-automatic systems, he said, was the possibility of the operator failing to notice the absence of "markers" (in case a train should break in two) and report "train clear." The following train would, under such circumstances, be admitted into the block under a clear signal, to find the detached portion of the preceding train unprotected by a flag.

These points seemed to be covered by the pneumatic system, he thought, but he believed the same protection is afforded by another system which is operated by a track circuit and with much less mechanism.

He thought that the electro-pneumatic would be the system of the future. With such a system the operator controls the line of signals for a certain distance in the blocks each side of his station. He believed that, in any event, electricity would play an important part in the block signal of the future. His own experience and observations had led him to believe that a combination automatic and manual system would meet the requirements, and he suggested that blocks be not less than three-quarters of a mile ; the home signal operated by a lever, and signals operated by electricity and gravity, placed 1,000 or 1,500 feet apart throughout the block, the circuit connecting these signals to be also connected with the lever at the home station, so that in moving the lever to place the home signal at danger, the circuit would be opened and the signals go to danger by gravity, or weight. These signals, he said, will give ample notice of the position of the home signals and protect a train stopping just beyond a block station. It also admits of giving notice to the train, should the block ahead become clear, that schedule speed might be resumed before the train reaches the home station.

To eliminate the chance of an operator unlocking the lever while any part of the train is in the block, he would add to the above the connecting, and insulating of one line of rails throughout each block, running taps from this rail circuit to one side of the metallic line circuit which is used to unlock the lever. A train passing over the block will ground the side of the circuit connected by taps to rail and close the relay, and the local of this relay will lock the lever which operates the home signal and open the circuit of the block in the rear, remaining so until the last pair of wheels connected by a metal axle passes out of the block. With this arrangement it will not be essential that the operator shall see the markers.

In conclusion, Mr. Stewart referred to the trouble caused by improper attention to batteries. He claimed that with systematic attention to batteries and apparatus, there would be no failures of the electrical parts.

Mr. Stewart's paper was followed by one on "Individual Selection of Electrical Objects," prepared by Mr. S. S. Bogart and read by Mr. J. W. Lattig. A very full abstract of this paper will appear in our next issue.

At the conclusion of the reading of Mr. Bogart's paper

a short discussion took place, during which Mr. T. D. Lockwood referred to the use of electric motive-power in the Baltimore tunnels, which enterprise was spoken of by Mr. Selden in his paper. Mr. Lockwood stated that it was not an experiment, but a success already. He then, in a very clear manner, gave a sketch of the beginnings of the dynamo, stating that Moses G. Farmer was really the inventor of it; although he was twenty years ahead of his time. He thought that great developments would be made in the next five years in electric railways for surburban traffic.

In Mr. Selden's paper that gentleman referred to a new system of electric railway invented by Mr. E. E. Reis, of Baltimore. Mr. Selden, after Mr. Lockwood's remarks last noted, showed a working model of the railway.

Underneath the car, running its entire length, was the secondary coil of a transformer. The primary coil or coils consisted of a series of coils laid end to end under the surface, but parallel to and between the rails. The passage of an alternating current through these primary coils induced in the secondary coil (on the car) sufficient current to operate a small alternating-current motor placed on the car, and this motor imparted motion to the car-wheels in the usual way. The model worked well, and it attracted the very earnest attention of the members.

A recess till afternoon was then taken.

When the meeting was called to order in the afternoon, Mr. J. W. Lattig, of the Electric Secret Service Co., New York, in answer to a question from a member during the morning session, read a letter from Mr. George Payson, of the Western Railroad Association, in which the legal status of the company's system of individual calls, etc., was defined. It appeared from this communication that the only existing controversy between the Electric Secret Service Co. and the Gill-Alexander Co., of Kansas City, in no way affected the right of either company to install and sell its own instruments. Mr. Lattig said his company would guarantee to protect all purchasers of its apparatus against legal complications.

The following committees were then appointed by the president, to report at the next annual meeting:

To revise the constitution.—Messrs. Selden, Greene and Gemmell.

To devise a new form of service-card.—Messrs. Swift, Ford and Sholes.

On arrangements for the next annual meeting. — Messrs. Reed, Fry and Ford.

On topics for papers for the next meeting.—Messrs. J. B. Stewart, Gemmell and Adams.

All business having been concluded, President Jones, in a neat little speech, in which he expressed great satisfaction at the success of this convention, surrendered the chair and gavel to the president-elect, Mr. L. H. Korty. Mr. Korty assumed the chair and thanked the members for the honor conferred upon him. The meeting then adjourned.

The following is a list of those in attendance at the Convention:

C. S. Jones, Ill. Cent. R. R., Chicago; A. R. Swift, C. R. I. & P. R. R., Chicago; C. Selden, B. & O. R. R., Baltimore; O. C. Greene, N. Pac. R. R., St. Paul; G. M. Dugan, Ill. Cent. R. R., Jackson, Tenn.; P. W. Drew, Wis. Cent. R. R., Chicago; M. Magiff, Cent. Vt. R. R., St. Albans, Vt.; H. C. Hope, C. St. P. M. & O. R. R., St. Paul; G. L. Lang, N. Y. & N. E. R. R., Boston; M. B. Leonard, C. & O. R. R., Richmond, Va.; C. A. Darlton, R. & D. R. R., Atlanta, Ga.; J. L. Orbison, C. H. & D. R. R., Cincinnati, O.; J. C. Ford, C. St. P. & K. C. R. R., St. Paul; G. R. Kimball, B. & O. R. R., Newark, O.; G. T. Williams, N. Y. C. & St. L. R. R., Cleveland, O.; L. B. Foley, D. L. & W. R. R., New York; J. T. Gibbons, D. L. & W. R. R., New York; K. McKenzie, M. & O. R. R., Jackson, Tenn.; H. C. Reed, M. L. S. & W. R. R., Milwaukee; J. B. Stewart, West Shore R. R., New York; W. W. Jackson, N. Y. & N. E. R. R., Providence, R. I.; R. J. M. Danley, C. H. & S. R. R., Columbus, O.; W. B. Ward, B. C. R. & N. R. R., Cedar Rapids, Ia.; W. D. Vincent, B. & O. R. R., Pittsburg, Pa.; S. K. Bullard, M. K. & T. R. R., Sedalia, Mo.; U. J. Fry, C. M. & St. P. R. R., Milwaukee; W. J. Holton, C. & W. I. R. R., Chicago; D. H. Caldwell, N. Y. C. & St. L. R. R., Ft. Wayne. Ind.; G. C. Kinsman, Wabash R. R., Decatur, Ill.; H. C. Sprague, K. C. Ft. S. & M. R. R.. Kansas City, Mo.; L. H. Korty, U. P. R. R., Omaha, Neb.; C. G. Sholes, A. T. & S. F. R. R., Topeka, Kan.; A. R. Lingafelt, C. R. I. & P. R. R., Topeka, Kan.; W. P. McFarland, F. E. & M. V. R. R., Omaha, Neb.; C. S. Rhoads, C. C. C. & St. L. R. R., Indianapolis, Ind.; F. M. Duncan, D. & R. G. R. R., Denver; W. W. Ryder, C. B. & Q. R. R., Chicago; Geo. B. McCoy, Ill. Cent. R. R., Memphis, Tenn.; C. P. Mackie, Electric Secret Service Co., New York; J. W. Lattig, Electric Secret Service Co., New York; S. S. Bogart, Electric Secret Service Co., New York; W. S. Logue, Edison Mfg. Co., New York; H. F. Houghton, Wabash, R. R., Decatur, Ill.; J. B. Shaw, Jamestown, N. Y.; Ralph W. Pope, *Electric Power*, New York; T. D. Lockwood, Bell Telephone Co., Boston; T. J. Smith, The E. S. Greeley & Co., New York; H. R. Wilson, Chicago; D. C. Matheson, C. & G. T. R. R., Flint, Mich.; T. R. Taltavall, ELECTRICAL AGE, New York; C. M. Crook, Du Laney Clock Co., Chicago; R. B. Gemmell, A. T. & S. F. R. R., Topeka, Kan.; A. P. Willoughby, Standard Battery Co., Chicago; E. R. Adams, P. & R. R. R., Reading, Pa.; J. J. Burns, D. & R. G. R. R., Pueblo, Col.; C. W. Hammond, Mo. Pac. R. R., St. Louis, Mo.

LADIES.

Mrs. J. L Orbison, Mrs. W. F. Taylor, Mrs. A. R. Swift, Mrs. O. C. Greene, Mrs. G. M. Dugan, Mrs. C. Selden, Mrs. P. W. Drew, Mrs. M. Magiff, Mrs. G. L. Lang, Mrs. C. A. Darlton, Mrs. G. T. Williams, Mrs. T. D. Lockwood, Mrs. L. B. Foley, Mrs. K. McKenzie, Mrs. J. B. Stewart, Mrs. J. B. Shaw, Mrs. R. J. M. Danley, Mrs. W. P. Ward, Mrs. S. K. Bullard, Mrs. G. H. Scott, Mrs. U. J. Fry, Mrs. W. J. Holton, Mrs. H. F. Houghton, Mrs. T. J. Smith, Mrs. C. P. Mackie. Misses Greene, L. Selden, Bessie Stork, E. McCoy, Nellie A. Hope, Nellie B. Hope, M. Stewart, Frankie Magiff.

EXHIBITS.

Distance had no terrors for enterprising concerns who had something worth exhibiting on this occasion.

The Electric Secret Service Company, of 45 Broadway New York, had an extensive display of its various apparatus in practical operation. These included the Leonard Interlocking Block Signal system, the Leonard Automatic Train Order Signal, the Individual Continuous Telegraph Call with automatic answer back, and the Individual Arc Light and Motor Cut-Out. The company was represented by C. P. Mackie, general manager, S. S. Bogart, general agent, and J. W. Lattig, general superintendent.

Mr. M. B. Leonard showed a couple of samples of Miller's Excessive Current Protector, invented and patented by J. N. Miller, of Cincinnati, O. This instrument is designed to protect all classes of electrical apparatus from stray excessive currents.

The Edison Manufacturing Company, 42 Broad street New York, was ably represented by Mr. W. S. Logue, and had quite an extensive exhibition of Edison-Lalande batteries of all types, from 15 ampère-hours to 900 ampère-hours capacity; also two Faradic batteries in highly-finished wooden boxes. The phonoplex in practical operation was also shown. A circuit from Denver to Colorado Springs, a distance of 75 miles, was used,

and the apparatus worked with complete success. The condensers used in connection with the operation of the phonoplex were made by Mr. Wm. Marshall, University Building, New York, which instruments are justly celebrated for their high efficiency, excellence of construction, etc.

The Du Laney Clock Company, 79 Dearborn street, Chicago, was represented by Mr. C. M. Crook, who exhibited a sample of the self-winding and synchronizing clocks made by this company. These clocks are remarkable for simplicity of construction and ease and accuracy of operation. They are made for railroad time service. The clock is wound every two minutes by the operation of a pair of magnets instead of an electric motor. This frequent winding keeps the main spring wound at a nearly definite tension all the time. The synchronizing is accomplished by another pair of magnets which are energized by the electric time signal, and the operation is performed independently of the motion of the clock-work. Two cells of Samson battery will keep the clock wound for one year.

The Gill-Alexander Individual Telegraph Call-Bell system was shown in practical operation. This system is in use on many Western railroads, and the testimonials received by the company show that it gives satisfactory results. Mr. M. C. Gillham, the treasurer of the company, was present.

The Standard Battery Co., 324 Dearborn street, Chicago, was represented by Mr. A. P. Willoughby, the general manager. Mr. Willoughby showed some cells of the Iron Gravity Battery made by his company. In place of zinc an iron electrode is provided, and there is no corrosion whatever. The other electrode is copper. It is claimed that this battery has very excellent merits.

Mr. G. E. Lang showed some samples of the goods of the Laminar Fibre Goods Co., 180 Summer street, Boston. Laminar fibre is used for general insulating purposes and is similar to vulcanized fibre, but much cheaper. All the roads running out of Boston using electrical track signals use it for track insulation. It can be made in any form, and when it is dry it is one of the very best of insulators. It is made of cotton or linen pulp, and finds many uses in railway work.

An exhibit of historical interest was inclosed in a frame. It consisted of old train orders issued by the Camden and Amboy, and Philadelphia and Trenton Railroads, dated December 15, 1846; October 2, 1847, and February 8, 1849, and an old time-card issued December 21, 1858. These were loaned by Mr. Wm. Ettinger, of the Pennsylvania R. R., Jersey City. Mr. Magiff, of the Vermont Central road, showed in the same frame a time-card issued by that road bearing date October 10, 1853.

CONVENTION NOTES.

A party of delegates to the convention, to the number of 75, some accompanied by their wives, left Chicago for Denver at 6 P.M. Sunday, June 12, on two special Pullman cars provided by the Chicago, Rock Island and Pacific R. R. Co. Mr. A. R. Swift, superintendent of telegraph of that company, and his wife, had charge of the arrangements, and did all in their power to make all hands comfortable. The ride to Denver was a most enjoyable one and will be always remembered with pleasure by those who comprised the party. The train arrived at Denver at 8 A.M., Tuesday, June 14, and the day was spent in sight-seeing.

After the convention, which lasted two days, Wednesday and Thursday, several excursions were given to the delegates by the various railroad companies to many of the points of interest for which Colorado is celebrated.

On Friday the Union Pacific Railroad Co. ran a special train to Silver Flume over the celebrated "Loop." The train stopped at Silver Flume, where lunch was served on board. After lunch the party visited the silver mines which abound in that vicinity.

On Saturday morning the delegates went to Manitou on a special train provided by the Denver and Rio Grande R. R. Co., and in the afternoon ascended Pike's Peak in a special furnished by the Manitou and Pike's Peak Railroad Co., popularly known as the "Cog-Wheel Line."

A point about 3000 feet from the summit was reached, whence a magnificent view of the surrounding country was obtained; as the road-bed had not yet been entirely overhauled after the severe snows of winter, it was not considered advisable to proceed further than the point named. After returning from the Peak a special train on the Colorado Midland R. R. conveyed the party to Woodland Park, through the beautiful Ute pass.

The party stayed over night at Manitou, and on Sunday in a special train provided by the Denver and Rio Grande R. R. Co. took a trip to Pueblo and the Grand Cañon, visiting the world-famed Mineral Palace *en route.*

As a token of their appreciation of the many courtesies and the attention received at the hands of Mr. and Mrs. A. R. Swift during the trip from Chicago to Denver, the members presented to that gentleman and lady an elegant solid silver salad service appropriately inscribed. The presentation speech was made by Mr. Charles Selden.

The various railroads treated the members of the association and their wives and friends with the utmost liberality. Nothing was too good for the visitors, and everything possible was done to make their stay as enjoyable as possible.

A resolution of hearty thanks was tendered by the association to the Chicago, Rock Island and Pacific, Atchison, Topeka, and Santa Fe, Union Pacific, Denver and Rio Grande, Colorado Midland, and Manitou and Pike's Peak Railroad Companies, Superintendent J. J. Dickey, of the Western Union Telegraph Company, the Colorado Telephone Co. and the Remington Typewriter Co. for courtesies received. The railroad companies provided free transportation; the telegraph and telephone companies free use of their wires, and the Remington Typewriter Co. placed one of their indispensable machines, and a stenographer, at the disposal of the members during the convention. The committee of arrangements was also tendered the appreciative thanks of the association for the able manner in which it arranged and carried out the programme of the meeting.

Mr. T. D. Lockwood's talk on the Galvanometer was greatly enjoyed by the members, and they all agreed that the association was highly honored when that gentlemen was elected an honorary member.

On the other hand, Mr. Lockwood himself expressed great pleasure at being thus honored. The association no doubt will receive a great deal of benefit from the advice and help Mr. Lockwood will bestow at the meetings.

The members of the association feel proud of their organization, for the reason that it has the unique honor of being the first body before which a paper from Mr. Thomas A. Edison was read.

The programme of next year's meeting of the association, which will be held at Milwaukee, will include a visit, in a body, to the World's Fair.

CROOK, HORNER & Co., Baltimore representatives of the Ball Engine Co., Erie, Pa., have recently furnished two 150 H. P. engines of this manufacture to the North Avenue Street Railway Co., Baltimore, and two 150 H. P. Tandem Compound Condensing engines and complete steam plant to the Chesapeake Light and Power Co., Hampton, Va.

INSULATION.*

BY THOMAS A. EDISON.

To telegraphy the insulation of its circuits is so vital a matter that, at the risk of making history repeat itself and of recounting an oft-told tale, a short paper on the subject may be tolerated.

As a class, gases are the best insulators ; next liquids, and solids last of all. The insulation of gases is so good that no determination appears yet to have been made of any leakage through them. If it were possible to make an experiment at or near the centre of the earth, so as to be beyond the reach of gravitational force, an electrified body might be left for hours in a gas without any visible means of support, and observations then made to determine whether any loss of charge took place through surrounding gases. Under existing circumstances the loss of charge which always does take place on electrified bodies cannot readily be traced beyond that through the suspension or support that holds them. Even in moist air the loss of charge has not yet been brought home to the aqueous vapor. Professor Boys exhibited before the Physical Society of London, in April, 1889, a pair of electrified gold leaves, suspended in moist air by a short hook of quartz. The loss of charge appeared to be about 25% in five hours. A glass hook under the same conditions would have allowed the charge to disappear, it was said, within one minute.

If any perfectly insulating solid could be found, telegraphists would soon discover any surface leakage from their wires through the air, for the surface of a No. 8 B & S wire in 224 square feet or 20.8 square meters per mile.

The loss of charge which takes place convectively into the air over any sharp point in an electrified body is a phenomenon of a different nature. There the layer of atmosphere over the point is continually being torn by the magnitude of the forces brought locally to bear upon it, and the particles of moving air carry away the charge. Some liquids have also a very high insulation, notably most mineral oils. Animal and vegetable oils are by no means so good, or at least there is greater difficulty in obtaining them in a highly insulating condition. Water, contrary to prevailing notions, is quite an insulator. In the purest distilled water resistance as high as 7 megohms per c. c. has been recorded ; that is to say, a block one centimeter cube of water pressed between two opposite conducting planes as electrodes would offer a resistance of 7 megohms ; but the least trace of impurity brings the resistance down.

Ice at 12° C. has been measured at 2,240 megohms per cubic centimeter. There are two conditions of surface upon which bare wires, miles in length, laid on the ground have been worked telegraphically—one over the dry desert sands of Africa, the other over dry ice in the far north. Sea-water has a resistance of about 30 ohms per c. c. at 5° C.

It would appear probable that liquids cannot conduct without electrolytic decomposition. A microscope will show that one microampère decomposes the drop of water it traverses.

One of the most important and promising modern theories of chemistry is based upon the assumption, in accordance with a considerable array of facts, that solutions only conduct by the transfer of atoms or ions to the electrodes, each carrying an electric charge, and the conductivity of a liquid measures on this hypothesis the number of uncombined or dissociated ions permeating its mass. These free ions are the porters carrying the charge, and the conductivity of the liquid depends upon the number available and the speed with which they can migrate.

Liquids, too, have, as a class, the quality of elastic insulation to high tensions, which is an important feature to the electrical engineer. Air for the first few centimeters will break and allow a spark discharge to occur when the pressure reaches from 10,000 to 50,000 volts per centimeter (25,400 to 127,000 volts per inch) according to the shape and condition of the electrodes, but rosin oil is said to stand about 75 times the pressure of air per cm. without disrupting.

The following is a list of actually observed resistance in commercial samples of well-known insulating substances. The results are given in megohms per cubic centimeter at or near 18° C.:

Paraffine wax.....	110,000,000	megohms
Heavy paraffine oil...	8,000,000	"
Olive oil.....	1,000,000	"
Lard oil.....	350,000	"
Creosote.....	5.4	"
Stearic acid.....	350,000,000	"
Sperm oil.....	0.077	"
Benzine.....	14,400,000	"
Balsam copaiba.....	211,000	"
Benzole.....	1,320	"
Oil of wood tar.....	1,670,000,000	"
Crude ozokerite.....	450,000,000	"

All transparent solids are insulators, but, of course, the opposite statement is not true that all opaque solids are good conductors. There is now good evidence for believing that the process by which light is propagated, the mechanism by which it is transmitted through space, is purely electromagnetic, and the magnetic vibrations passing through a conductor would generate electrical currents and be absorbed in the substance as heat ; that is to say, it would be opaque to the light, failing to transmit the energy.

The difficulty with solids is not so much to find insulators, for the great majority of solid substances freed from moisture are poor conductors, but to find an insulation of suitable mechanical qualities. Glass, porcelain and mica seem to be almost the only practically available insulators that will support considerable stresses, and these for many structural purposes are far weaker than is desired. In American telegraphy, glass is almost the universal insulator, but in Europe, particularly in the south and west, the atmosphere is so much more humid, and glass so hygroscopic, that no circuit of any length could be operated with glass insulators except in dry weather. Porcelain or vitrified stoneware insulators are used instead, and in quite a variety of forms. Practically speaking, the insulation of a line is never that of the material forming the insulators, but always that of their surfaces, and the films of dust and moisture that may have become encrusted thereon. The most perfect insulators are those which have underneath the hood a cup filled with oil, in such a manner that the current leaking from the wire to the ground has to pass over the oil, or else through the substance of the insulator itself. These insulators are certainly more expensive, and require to be refilled with oil at intervals, but they will defy weather and keep the insulation nearly as high in fog as in sunshine.

When a long leaky wire is opened at the distant end, and tested for insulation, the insulation per mile always appears to be somewhat more than it is for any actual mile, since the more distant portions of the line are tested with a reduced pressure, owing to the leakage over the nearer portion. When the wire is grounded at the far end and its conductor resistance measured, the leakage will on the other hand make the apparent resistance per mile too low. But if the conductor resistance is reduced in a given ratio, say as 100 to 95, the insulation will be overindicated in the exact inverse ratio of 95 to 100, provided that the insulation of the line is uniform. So that if a wire's conductor resistance at its temperature of observation is known to be 10 ohms per mile, but appears

* Paper read at the Convention of Railway Telegraph Superintendents held at Denver, Col., June 15 and 16, 1892.

by leakage over the whole length to be 9 ohms, then if the insulation per mile apparently measures 400,000 ohms, it will be really 360,000, and each mile taken separately might be expected to measure 360,000. As is well known, telegraph lines work better up to a certain point if the insulation is rather low. A wire has to be emptied of its charge between the impulses of the key sufficiently far to keep the relays from sticking. If the insulation is perfect this quantity has to be cleared through the ends to ground, but if the line leaks it can escape more readily at all points.

The longer the line, the more essential good insulation necessarily becomes. The insulators are perhaps never more carefully tested than those intended for the long circuits on the Asiatic plains. It was at one time customary to test each insulator before it went out, by taste. The insulator was immersed nearly to the rim, head downwards in water, and a battery of 100 cells was connected with one pole to the water and the other to the insulator stalk through a particular kind of key. The operator first rested his moistened finger on this key and then applied his tongue to it. If he tasted no current, the insulator was passed out as satisfactory. The test was sensitive and expeditious, and saved the care and handling of a galvanometer.

The insulation of a wire is a definite term and stands for a definite property so long as it is not necessary to measure it very accurately. There is usually no difficulty in finding the insulation of any overhead wire within 5 % at any one time, and two observers measuring the line from the same end with different instruments would generally agree in their results to that limit, but as higher degrees of accuracy are attempted (a condition that fortunately does not practically occur), the difficulty of obtaining concordant results may increase rapidly. A resistance coil of wire at a uniform temperature can have its resistance measured to within one-fiftieth of one per cent., if necessary, but a leakage resistance is essentially liable to variation. The atmospheric conditions may be altering, or there may be polarization, or inductive disturbances from neighboring wires, or a combination of conditions that may set close measurement at defiance. It is generally advisable to employ galvanometers for this purpose, that even if sensitive are slow of movement and deadbeat. The only instances in which accurate measurements of insulation are possible and necessary are in connection with subterranean or subaqueous wires. Jute and paper, dry or saturated with compound, are rapidly coming into use for subterranean wires sheathed in lead, while for long cables under water, india-rubber and guttapercha are invariably employed. With conductors highly insulated by these methods, the insulation can be measured much more closely, and is definite for a given temperature of the core, but even in this case the current that will flow from a battery into the wire freed at the distant end is not all leakage. A considerable portion may be stored up in the insulating substance, and be returned from the wire to ground after the battery has been removed. This "polarization" is particularly noticeable with guttapercha and india-rubber covered wires, and their insulation may be apparently 50 % greater after three minutes of charging than at the end of the first minute. In specifications it is usual to call for a certain insulation per mile at 75° C., and after a definite interval of charge.

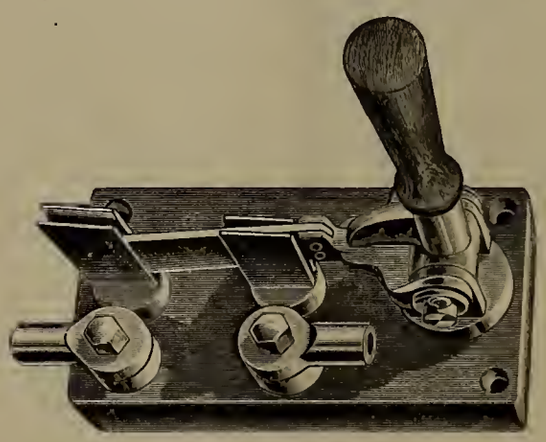
The insulation obtained from a given thickness of covering depends on the diameter of the wire as well as on the quality of the cover, for a large wire supplies a larger leaking surface. Also if an insulating coating of a certain thickness produces an insulation of 100 megohms per mile, doubling that thickness will not double the insulation, because the leakage will take place with greater relative facility through the greater surface of the second coat. The exact increase of insulation will depend upon the diameters of first coating and wire.

When a wire is well and homogeneously insulated, its insulation resistance at a given duration of charge or period of electrification will appear to be the same with different battery powers or voltages applied, but if, on the contrary, it contains any small faults or defects, it will generally show less insulation with increasing testing pressures. This often forms a criterion as to the reliable insulation of a long cable. The insulation in an ocean cable under the pressure of great depth and near the temperature of melting ice that deep oceans approach might be 15,000 megohms per nautical mile at the fifth minute. With a small incipient fault the insulation might still reach 3,000 megohms per mile and seem excellent, but it is probable that when tested with 5 cells and with 50 cells, the insulation resistance in the latter case would not appear so high. It would also probably be different with the zinc or copper pole to line.

The only value that can attach to a high measured insulation is the assurance it conveys that no flaws exist in its covering or supports, and will therefore remain in good signalling order unless disturbed. In fact, a very high insulation, as we have seen, actually tends to retard signalling. Mechanical security from the loss of insulation is the great desideratum rather than a very high degree of insulation itself.

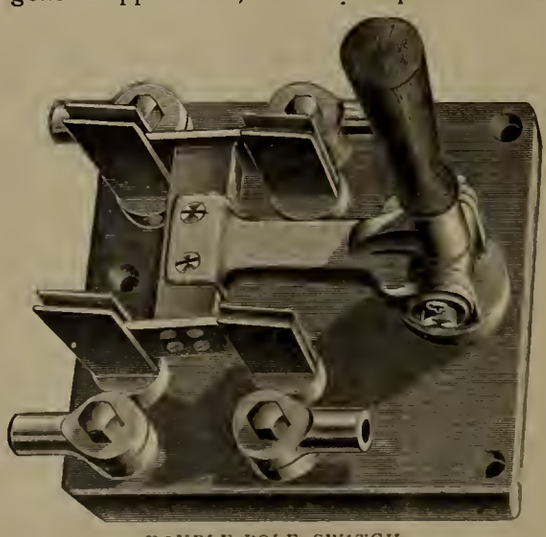
SNAP SWITCHES.

The accompanying cuts represent the single-pole and double-pole snap switches recently placed upon the market by the C. & C. Electric Motor Co., of New York.



SINGLE-POLE SWITCH.

The plain switches designed by this company have the same general appearance, the only important difference



DOUBLE-POLE SWITCH.

being the omission of the snap spring in the plain switch, while the handle-lever and knife-lever are replaced by a single casting.

Almost all specifications for electric-lighting plants now call for marble or slate switch-boards, instead of the wood board, which was formerly considered satisfactory. The switches that were designed for the wood boards have been made to do service on the marble, but owing to their construction they do not make a handsome appearance. The switches here illustrated were designed specially for this class of work, and have been provided with ample contact-surface and quick brake, and the metal parts are so solidly constructed as to obviate any possible danger of breaking.

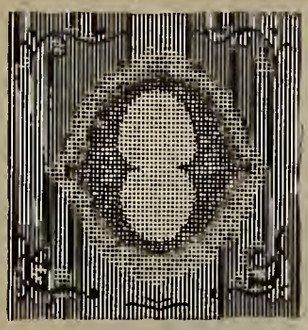
The connections are made from the back of the switch-board to these switches, but the contact binding-posts are made extra long, so that when wanted the switches may be supplied to be fitted to a switch-board of any thickness.

On switches provided with fuse blocks and mounted on slate bases the distance between the fuse terminals is made ample enough to render the fuses perfectly reliable and to prevent any danger of arcing across. This feature is specially desirable when the switches are used on 500 volt circuits.

EASY LESSONS FOR STUDENTS.

BY THE EDITOR.

Electroplating.



ONE of the most interesting applications of electricity is that of electroplating, and as a great deal of experimental work of this character is carried on, as well as in a commercial sense, a few words concerning the requirements for successful results will not be amiss.

Electroplating, defined, means the plating of one metal with another metal by means of the electric current passing through liquid solutions of the proper metals, in which the articles to be plated are suspended.

The power of an electric current to decompose liquid chemical compounds and effect other combinations is called *electrolysis*. Electrolysis was the subject of the article of this series in the ELECTRICAL AGE of May 14 last, to which the reader is referred for careful study in connection with this one.

As far as history teaches us, Wollaston conducted experiments in electroplating in 1801, but it was not introduced as an art until 1840. This was in England, by Richard Elkington.

The metals generally used in electroplating are gold, silver, nickel and copper, although others are deposited in this way—tin and platinum, for instance. It is interesting to note that it is estimated that over 125 tons of silver are used annually in electroplating.

In large establishments the plating solutions are held in vats made of pine lined with lead or gutta-percha. For small work and for experimental work vessels of glass, china or earthenware answer every purpose.

The electric current may be supplied by a dynamo or a battery, but for amateur or experimental work batteries are the usual sources of current. The direction of the current should under no circumstances ever be reversed with respect to the circuit.

The solutions used in plating consist of some salt of the metal to be deposited, the solvent usually being distilled rain water. The anode usually consists of plates of the same metal with which the articles are to be plated, while the articles themselves constitute the cathode. The anode of a plating cell is connected with the positive pole of the source of current, while the cathode is connected with the negative pole. The anode and cathode are both suspended in the solution from copper bars which rest on copper strips laid along the edge of the vessel containing the solution, but insulated therefrom.

The proper area of the anode is a matter of some importance; there is such a thing as getting it too large or too small. For nickel plating the area of the nickel anodes, or plates, should at least equal the cathode surface; that is, the surface of the articles to be plated, and each cathode surface should be exposed to an anode surface. The anodes should be submerged to about two-thirds the depth of the solution.

In gold plating a less surface of the anode is required, and the exposure of the cathode surfaces to the anode is a matter of less importance as compared with nickel plating. The reason for this is that the anode in the gold bath is more soluble than the nickel anode, and the gold solution itself is more readily decomposed by the current than the nickel solution, consequently it parts with its metal with greater facility.

What is true of gold plating is equally true of silver.

To do this subject complete justice, we will be compelled, on account of the press of other matter, to divide it into two parts, and will therefore continue it in our next article.

PORTABLE TESTING KEYS.

Every one who has occasion to make insulation tests away from a laboratory knows how essential it is to have apparatus that is reliable and at the same time adapted to surrounding circumstances; that is, accuracy must be combined with portability.

A short-circuit key or a contact key that can be thrust

PORTABLE TESTING KEY.

into one's pocket will commend itself for convenience to those engaged in outside work, and we are informed by Queen & Co., of Philadelphia, that they can "fill the bill" with their new key, illustrated herewith. The keys are made of hard rubber, polished, with brass connections and platinum contacts, and the desired effect is produced by simple pressure of the hand.

Three forms are now made, viz., single-contact, double-contact and short-circuit.

QUICK WORK.

The advantages which a purchaser derives by dealing with a bulk contractor are clearly illustrated by a remarkable installation recently made at White Plains.

A very handsome new church was presented to the parish by Mrs. M. C. Reynal, and the architect, Mr. T. H. Poole, of New York city, contracted with one of the large electrical manufacturing companies to put in wiring and fixtures for electric lights, and made arrangements with the local lighting company to install a special dynamo and supply current.

It was intended to use the lighting plant at the consecration exercises, but as that day drew near it was evident that neither company would be ready.

The day before the exercises the architect concluded that he must have electric lights if it were at all possible. Having had satisfactory experience with a well-known bulk electric contractor of New York city, the architect called upon the concern at 4:30 one afternoon and asked

if it would be possible to install the plant and have it running in time for the exercises which would come off at 10:30 the next morning.

It was necessary to secure, deliver at White Plains, and install the dynamo, complete the wiring of the church, run the line to the central-station plant, alter the speed of the engine, supply belting, foundation, etc.

The contract was promptly accepted by H. Ward Leonard & Co., whom Mr. Poole applied to at 4:30 in the afternoon, and at 10:15 the next morning the entire plant was operating perfectly.

Architects and the public generally are beginning to appreciate that electric plants can be installed by bulk electric contractors with a rapidity and satisfaction which can never be obtained by dealing with various large manufacturing concerns, no one of whom shoulders the entire responsibility.

PACKARD LAMPS.

The long experience of the Messrs. Packard in the incandescent lamp business led them to stamp the name

PACKARD RAILROAD LAMP.

"High Grade" on the lamps now being made by the New York and Ohio Co., Warren, Ohio.

The ordinary type is manufactured in 8, 10, 16, 25, 32 and 50 C. P. for all bases. The illustration represents the supported filament or railroad lamp, which allows the supporting of the filament during violent vibrations and the non-support of the filament when the conditions are normal.

The Packard High Grade lamps are receiving endorsement from some of the largest consumers, and they are especially satisfactory to meter customers where the "most light for the money" is wanted.

The record made by the Packard Lamp is a good one and is due to an appreciation of the necessary careful inspection of details of manufacture, coupled with a thorough understanding of the business by the makers.

The Eastern agent, Mr. Charles E. Chapin, 136 Liberty street, New York city, reports a good business being done in the East with entire satisfaction to the trade.

SPECIAL NOTICE.

The New York office of the Consolidated Electric Storage Company, 120 Broadway, is the sole agency for the sale of storage batteries for New York and vicinity. Purchasers desiring to secure the best terms should apply at that office to E. J. Moore, manager.

NEW YORK NOTES.

OFFICE OF THE ELECTRICAL AGE,
FIRST FLOOR, WORLD BUILDING,
NEW YORK, June 25, 1892.

THE ABENDROTH & ROOT MANUFACTURING COMPANY, 28 Cliff street, New York, has just sold a 300 H. P. Root's Improved Water Tube Safety Boiler to the New York Steam Company, foot of East 116th street, New York.

MR. H. C. RICHARDSON, of Curtis & Dean, reports the sale of Thomson-Houston equipment for two 20-ton electric cranes to the Wright Steam Engine Works, Newburg, N. Y. Three Standard T.-H. railway motors will be used on each crane. When fully equipped the new shops of the Wright Co. will have the finest facilities for rapid assembling of their engines.

PROF. F. B. CROCKER, vice-president of the Crocker-Wheeler Electric Company, New York, sailed on Saturday in the steamer *Etruria* for Europe. While abroad he will meet all the prominent English and Continental engineers, to get, if possible, the results of their latest experiences in central station and power transmission work, and to compare notes on electrical matters in general, making a special study of improvements in electric motors, with a view of introducing anything of value into the Crocker-Wheeler machines.

THE MANHATTAN ELECTRICAL SUPPLY COMPANY, incorporated under the laws of the state of New Jersey, with an authorized capital full-paid of $20,000, has purchased the good-will, business, patents, trade marks and stock of the Manhattan Electrical Supply Company, incorporated under the New York state laws, and will continue in the electrical supply business at 36 Cortlandt street, New York. With better facilities for manufacturing electrical goods, and the enlarging of its salesroom at 36 Cortlandt street, the company is prepared to fill orders promptly and at moderate prices. The officers are: J. J. Gorman, president; Edgar Whitmore, vice-president; James Pembroke, secretary, and H. T. Johnson, treasurer.

THE firm of F. Holman & Co. has been reorganized under the name of F. Holman Electric Company. The new concern will continue at the old address, 128 Pearl street, New York, Mr. Holman giving his personal attention to the manufacture and sale of the "Paradox" reflector shades for incandescent lights which have attained considerable popularity. These shades contain many valuable features, and are so constructed as to permit of a variety of designs and artistic effects. The

company guarantees these reflectors to retain their reflective power for three years, failing which they will be renewed. The reflector shade was first brought out by Mr. Holman, while connected with the Edison General Electric Company. He subsequently withdrew from that concern and organized the firm of F. Holman & Co., which has been reorganized, as above stated.

W. T. H.

ELECTRICAL STOCK QUOTATIONS.

The following are the latest prices for electrical securities in New York, asquoted by Geo. B. Ellery, financial editor ELECTRICAL AGE.

NAMES OF COMPANIES.	CAPITAL.	PAR.	PRICE
American Dist. Tel., N. Y.	3,825,000	100 00	62 00
American Telegraph and Cable	14,000,000	100 00	85 00
American Visual Telegraph Co.	500,000	100 00	475 00

As very few electrical securities are dealt in on the Stock Exchange, the above prices are approximate, but will be found very near the mark. Corrections cordially made; correspondence solicited.

SPECIAL CORRESPONDENCE.

The following letter speaks for itself:

NEW YORK, June 18, 1892.

To the Editor of ELECTRICAL AGE:

Several of the technical journals have recently published notices, emanating evidently from the Magnetic Separator Company, of New York, stating that a suit had been entered in the United States Court for the District of New Jersey against the International Ore Separating Company, of No. 1 Broadway, New York, for infringement of patents. We will be greatly favored if you will publish in your columns the following true statement of the matter:

We wish to say on behalf of the International Ore Separating Company that this statement, that suit has been brought against it by the Magnetic Separator Company, or by any other person, firm or corporation, is unqualifiedly false.

The International Ore Separating Company operates under patents assigned to it, which infringe no other patents whatsoever, while eminent counsel have repeatedly advised that the claims of the patents of the Magnetic Separator Company are invalid, and this the International Ore Separating Company stands ready to prove before any court of law or equity. By the actual practical results of separation, as well as by the opinion of those best qualified to judge, the separators built by the International Ore Separating Company are superior by reason of their simplicity, cheapness, durability and efficiency to all others now on the market.

The especial features of these separators are absolutely new—the spirally-wound drums of small diameter, the special forms of magnet with consequent poles, the method of transference from drum to magnets, the combination with these of a belt and rollers, together with the method of operation under the surface of water, are all completely protected by United States and foreign patents, and any infringement of these will be promptly prosecuted.

INTERNATIONAL ORE SEPARATING COMPANY,
by Harvey S. Chase, Treasurer.

A CARD TO THE STEAM-USING PUBLIC.

It having been brought to my attention within a day or two that printed matter is being circulated wherein my name appears as general manager of the "Hussey Re-Heater and Steam Plant Improvement Company," I would state that I have not been connected with that company for over two years.

For your further information I would advise you as follows: In 1883 Mr. Hussey patented two reheaters for reheating exhaust steam. These reheaters were manufactured and sold by Mr. Donaldson and Mr. Hussey conjointly, afterwards by Mr. Donaldson, and in 1884 by the Donaldson Heater Company, of which I was secretary. Within a few months I, individually, secured the exclusive right to manufacture and sell them.

In 1888, on the strength of certain promises, I organized, with others, the Hussey Re-Heater and Steam

Plant Improvement Company, of which I was general manager. But after two years with that company I resigned as its general manager, at the same time withdrawing such interests as I had, and since then I have had no further connection with it.

I intended at the time to open an office for the continuation of my business, but while making the necessary arrangements I concluded to spend a short time in the electrical business, since I knew very little about electricity, and realized that it was to play an important part in the steam business. I entered the Edison Company and only recently left it.

How long my name has been used in the manner mentioned I do not know, but I wish, even perhaps at this late day, to state that I am not interested, either directly or indirectly, in any business except my own.

Very truly yours,

S. D. BREWER,

Hussey Reheater System, 50 *Broadway, New York.*

THE

"CLARK" WIRE.

Insulation Guaranteed wherever used, Aerial, Underground or Submarine.

In a letter from the Inspector of the Boston Fire Underwriters' Union, under date of March 29, 1886, he says:

"A thoroughly reliable and desirable Wire in every respect."

The rubber used in insulating our wires and cables is especially chemically prepared, and is guaranteed to be waterproof, and will not deteriorate, oxidize or crack, and will remain flexible in extreme cold weather, and is not affected by heat. The insulation is protected from mechanical injury by one or more braids, and the whole slicked with Clark's Patent Compound, and special extra finish, which we have now adopted for all our solid wires as an extra weather-proof protection, and also preventing chafing and abrasion, which is water, acid, and to a very great extent fireproof. Our insulation will prove durable when all others fail. We are prepared to furnish Single Wires of all gauges and diameter of insulation for Telegraph and Electric Lights from stock. Cables made to order. We are now prepared to furnish our Clark Wire with a white outside finish for ceiling cleat work as well as our standard color.

Clark Joint Gum should be used for making waterproof joints. This is put up in half-pound boxes, in strips about one foot long and five-eighths inch wide, and when wrapped about a joint and pressed firmly it makes a solid mass. **FOR RAILWAY** and **MOTOR** use we make all sizes of stranded and flexible cables with Clark insulation.

WE GUARANTEE OUR INSULATION WHEREVER USED, AERIAL, UNDERGROUND OR SUBMARINE, and our net prices are as low, if not lower than any other first-class Insulated Wire. We shall be pleased to mail Catalogues with terms and discounts for quantities.

EASTERN ELECTRIC CABLE CO.

61 to 65 Hampshire Street, Boston, Mass.

HENRY A. CLARK, Treasurer and General Manager.

HERBERT H. EUSTIS, President and Electrician.

PATENTS.—Continued.

477,315. Thermotic Circuit Closer. Walter H. Tapley, Chicago, Ill., assignor to the Ware Automatic Heat Generator and Regulator Company, same place. Filed Aug. 14. 1889. Renewed Oct, 24, 1891.

477,374. Electrical Switch. Charles J. Klein, New York, N. Y., assignor to the Interior Conduit and Insulation Company, same place. Filed May 28, 1891.

477,383. Printing-Telegraph. Charles J. Reed, Orange, N. J. Filed May 27, 1891.

477,384. Printing-Telegraph. Charles J. Reed, Orange, N. J. Filed July 6, 1891.

477,407. Incandescent Electric-Lamp Socket. Jacob S. Gibbs, Hartford, Conn., assignor to the Perkins Electric Switch and Manufacturing Company, same place. Filed Feb. 27, 1892.

477,409. Electric Switch. Edwin T. Greenfield, New York, N. Y., assignor to the Interior Conduit and Insulation Company, same place. Filed Dec. 16, 1891.

477,427. Electric-Arc Lamp. Frederic V. Maquare, Paris, France. Filed Aug. 13, 1890. Patented in France, in Belgium, in England, in Germany, in Spain, in Italy and in Austria-Hungary.

477,483. Electric Motor. Frederick Yeiser, Tampa, Fla. Filed Sept. 22. 1891.

477,579. Test-Circuit for Multiple Switchboards. Charles E. Scribner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed May 12, 1885.

477,595. Electric Switch. Jesse L. Hinds, Syracuse, N. Y., assignor to the Electric Engineering and Supply Company, same place. Filed July 23, 1891.

477,612. Electric Switch. Eugene A. Snow, Syracuse, N. Y., assignor to the Electric Engineering and Supply Company, same place. Filed July 23, 1881.

477,613. Combined Weighing, Lifting, Measuring and Electric Machine. August Sundh, Yonkers, N. Y. Filed Nov. 4, 1890.

477,616. Electric-Annunciator Drop. James C. Warner, Chicago, Ill., assignor to the Western Electric Company, same place. Filed June 17, 1889.

477,627. Electric Embossing-Stamp. Charles E. Carpenter, Minneapolis, Minn., assignor to the Carpenter-Nevens Electric Heating Company, same place. Filed June 21, 1890.

477,628. Electric Heater. Charles E. Carpenter, Minneapolis, Minn. Filed Nov. 29, 1890.

LEONARD'S 3-WIRE SYSTEM.

Indentical in Cost and Efficiency

WITH EDISON SYSTEM.

SIMPLER TO OPERATE.

Copper required guaranteed to be not over 30% of that required for 2-wire system, under same conditions.

Royalty, 1 cent per lb. of Copper Installed.

PATENTED JUNE 7, 1892, No. 476,544.

CHARLESTOWN, W. VA., June 18, 1892.

MESSRS. H. WARD LEONARD & CO.,
136 LEONARD STREET, NEW YORK.

GENTLEMEN: The central station plant, which you installed for us here, under your new patented system, has given entire satisfaction ever since is started, which was about six months ago.

The operation of the plant is quite simple and economical, and as a result the plant is making very satisfactory earnings, although our town is rather small, having only about 3,000 inhabitants.

Yours very truly,
(Signed) CITY ELECTRIC LIGHT CO.,
WM. CAMPBELL, *Sec'y*.

VAST POSSIBILITIES.

No one can read electrical literature of the day without being forcibly impressed with the vast possibilities of electric power for railway-car propulsion. Gradually the steam-railway problem is being solved, and it may not be many years, or perhaps months, before we may see the dream of electric railway enthusiasts realized.

ALTERNATING CURRENTS.

In the paper on the physiological effects of alternating currents of high frequency read by Prof. E. J. Houston before the electrical section of the Franklin Institute, May 24 last, some interesting passages occur. He refers to the experiments of Mr. Nikola Tesla with alternating currents of very high frequency, and points out the reason why such currents are less dangerous to the human body than currents of less frequent alternations. Currents of enormously high frequencies traverse only the superficial portions of the body, while those of less frequency penetrate the surfaces to greater extent. From these considerations he infers that when the frequency of alternations becomes as great as that of the ether waves, which cause sunlight, the body would probably experience on the surface the same genial effects as are produced by the light and heat of the sun.

Prof. Houston is considerable of a philosopher, and has a power of penetrating the mysteries of nature that few men possess. On the 1st of March last he read a paper before the same institution on "Cerebral Radiation," which was full of scientific interest, and in which he ventured some explanations of the operations of the mind. Although such a subject is one extremely difficult to treat in a popular manner, Prof. Houston succeeded in expressing his views so clearly, that any one with intelligence, after reading his paper, could not help feeling that there was a near approach to fundamental truth in what he said.

THE TELEPHONE INDUSTRY.

The census bureau at Washington has just issued an interesting report on operating telephone companies for the year ended December 31, 1890, prepared by Mr. Allen R. Foote, expert special agent for the collection of statistics of the electrical industries.

The figures of 1890 are compared with corresponding ones of 1880, and show the marvellous development of the telephone industry.

At the beginning of 1879 the telephone was an insignificant affair, and the business was little or none, but at the end of that year it had developed into one of the most important industries in the country.

The report for 1890 is accompanied by several tables which show in detail the enormous strides the business has made during the decade 1880–1890, financially and physically.

There were 148 companies in the field in 1880, while in 1890 there were but 53, showing the results of combination.

The total amount invested in telephone property in 1890 was $72,341,736, against $14,605,787 in 1880, and the net earnings show an increase of $4,536,334. In 1880 there were in use 108,638 telephones and transmitters, and in 1890, 467,356, while the number of miles of wire at the same dates was 34,305 and 240,412.

Among other interesting figures we find an increase in the net earnings per mile of wire of 3.60 per cent., and an increase in net earnings per subscriber of 54.68 per cent. There was an increase of 5.30 per cent. in the interest-bearing and profit-showing investment per subscriber.

The report, which is published in full elsewhere in this issue, is exceedingly interesting, and may be studied with much profit. It tells a story that is unequalled in the history of the industrial world.

ELECTRIC LIGHT PLANT IN AN HOSPITAL.

In the installation of isolated electric-lighting plants it is frequently necessary and important to attain some special end other than that of the production of current for the lights. In hospitals, for instance, any jarring or vibration from machinery would be decidedly objectionable; in such a place a smoothly-running plant, free from such unwholesome features, is an absolute neccessity.

A plant of this character is that of the New York Hospital, on 16th street, between 5th and 6th avenues, New York City.

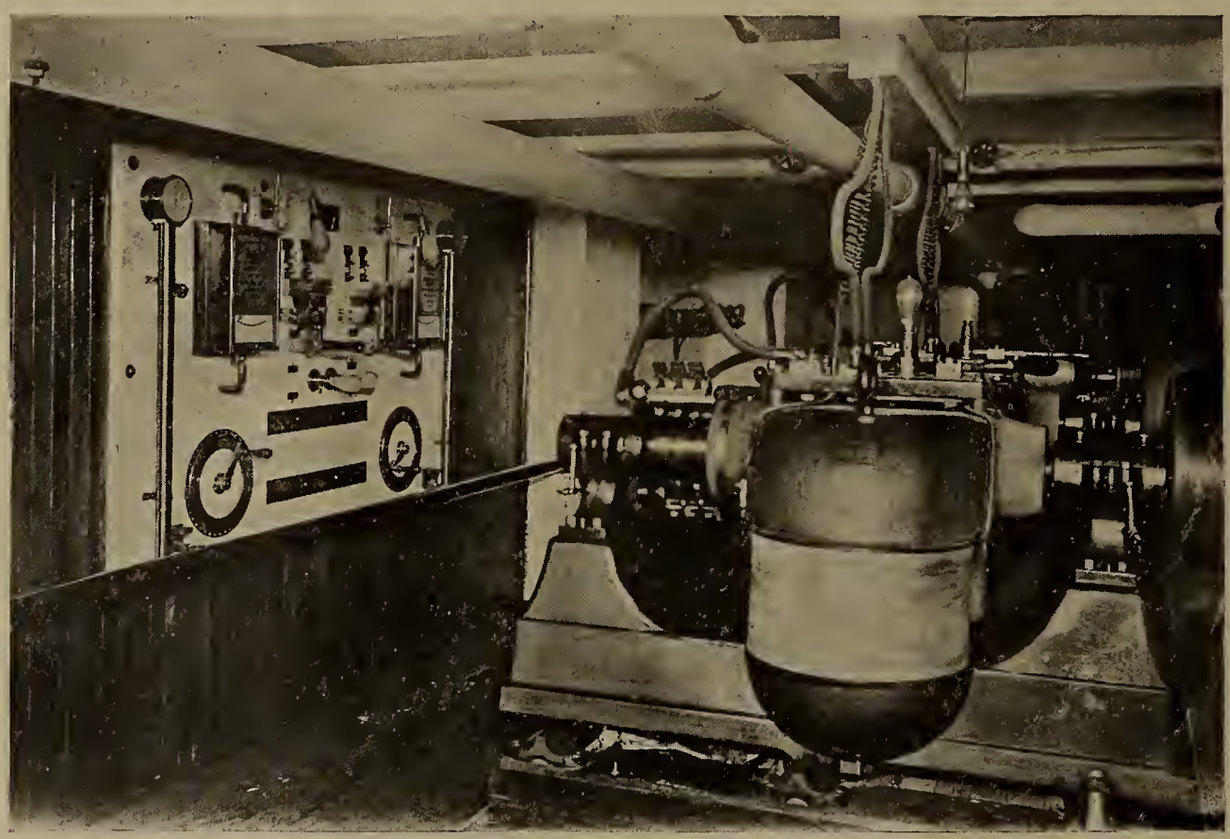
This plant which is described and illustrated herewith, is remarkable for its quiet running and efficiency. The electrical portion of it consists of two 40 kilowatt shunt-wound Detroit generators, manufactured by the Detroit Motor Co., of Detroit, Mich. They run with exceptional smoothness, and are free from sparking at all loads. No leaving ample capacity in the generating plant for future extensions of the buildings.

The buildings are wired on the three-wire system with Bishop "White Core" rubber-covered wire throughout, and all the wiring is on the surface encased in neat mouldings. The connections are so arranged that by simply throwing two-way switches one way or the other, the current supply may be obtained from the isolated plant or the street mains of the Edison Electric Illuminating Co.

Sawyer-Man 117 volt lamps are used, and answer equally well on either system.

The power for driving the dynamo is developed by two Straight-Line Engines of 75 H. P. each, running at 270 revolutions a minute.

The boiler-house is a spacious one, and contains a battery of 7 40 H. P. boilers, each built by Haywood & Bartlett, Baltimore, Md. They were installed by Baker, Smith & Co., of New York, who also did all the piping. The piping is all covered with patent air-space and magnesia covering.



ELECTRIC LIGHT PLANT IN NEW YORK HOSPITAL.

change is necessary in the adjustment of the brushes to meet the altered conditions of change of load. The machines have self-oiling bearings of large surface.

The switchboard is a very compactly built one, and is made of Italian marble. It is 6 feet 6 inches in length and 4 feet high. Mounted directly on the board are Cardew voltmeters, ammeters, a ground-detector, and Van Nuis Ajax switches for the various circuits. One feature of the board is that the switches and the switch-faces of the rheostats are mounted directly on the board, dispensing with the use of separate bases. At the back of the switch is a connection-closet where all necessary connections with the bus-bars and other parts are made with great facility. The switchboard was furnished by T. J. Murphy, the well-known switchboard maker, 136 Liberty street, New York city.

The present buildings are wired for 900 16 C. P. lamps,

Underwood cotton-leather belting is used, and it runs noiselessly.

The plant, taken as a whole, is a model one in every particular, and reflects great credit upon the gentlemen who installed it, Messrs. Hatzel & Buehler, of 114 Fifth avenue, New York city. This firm is the new agent in New York for the Detroit Motor Co., of Detroit, Mich.

The accompanying illustration was made from a photograph of this plant taken by our special artist.

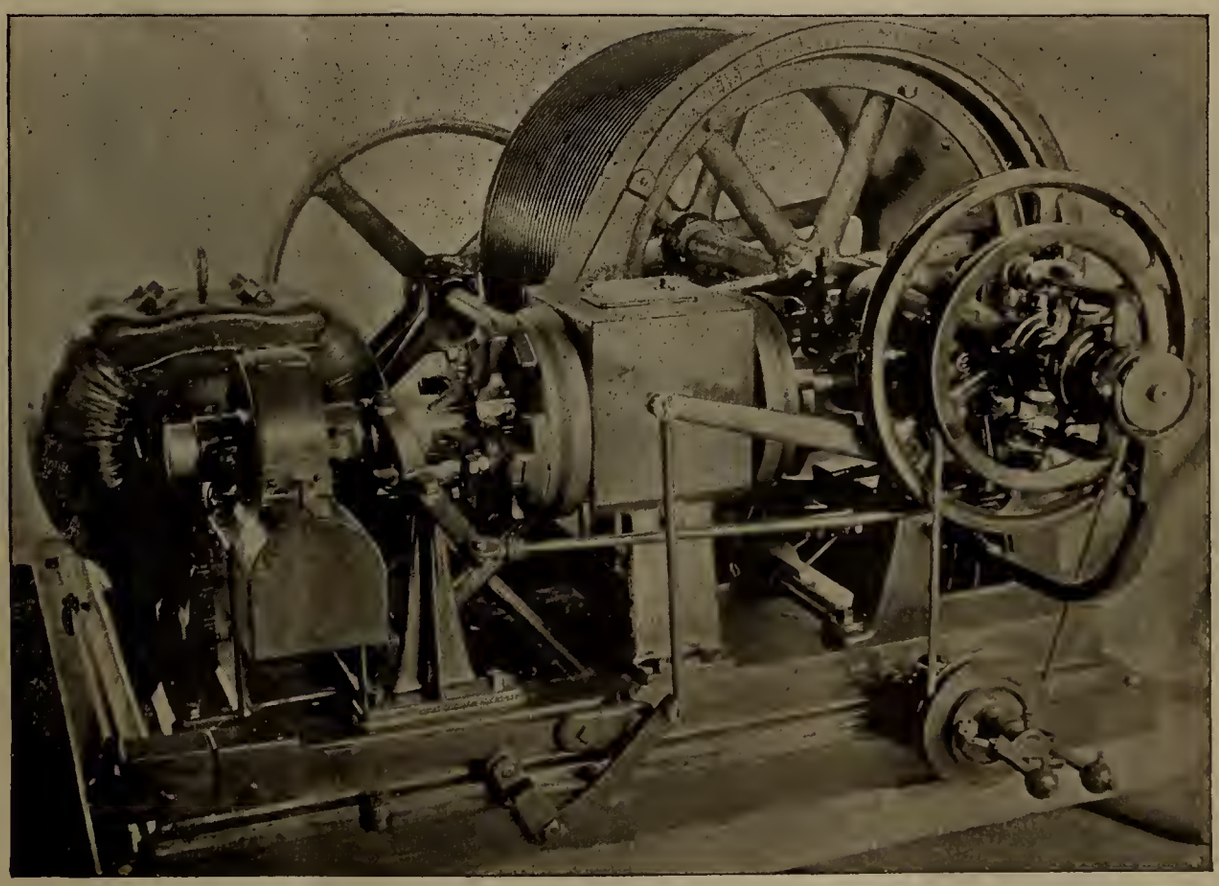
PERSONAL.

Mr. Carl Hering was married on June 30 to Miss Harriet B. Truesdell, of Philadelphia, the ceremony being performed in New York City. The couple will spend their honeymoon in Europe.

FRISBIE ELECTRIC ELEVATOR.

The accompanying cut represents one of the new Frisbie Direct Electric Elevators. The motor is run continuously during the hours of work, thus having its full power to start the load when thrown on by means of the friction clutches. The motor is connected to a screw shaft and runs into a worm gear that is keyed to the shaft that has the friction clutches, one being used to hoist and one to lower. The reverse motion is gained by a set of mitre gears, to which is connected the spur pinion that drives the drum gear. These gears are all cut by machinery and run smoothly and quietly.

The machine has an automatic stop motion that allows the car to be run at full speed and stopped at the extreme travel of the run independently of the operator. A slack cable-stop also stops the machine in the event of the descent of the car becoming impaired, and prevents the cables from leaving the drum. A speed governor also stops the machine if for any reason the speed of the car becomes greater than usual. The machine has, in fact, all the safety appliances that are required for all contingencies.



ELECTRIC ELEVATOR MADE BY THE D. FRISBIE COMPANY.

There are a large number of the machines running and all giving good satisfaction. The D. Frisbie Company has an office in the Mail and Express Building, New York city, and the main office and works are located in New Haven, Conn. This company has made many improvements in elevators within the last year, and will no doubt bring out many improvements in the near future.

SPECIAL NOTICE.

The New York office of the Consolidated Electric Storage Company, 120 Broadway, is the sole agency for the sale of storage batteries for New York and vicinity. Purchasers desiring to secure the best terms should apply at that office to E. J. Moore, manager.

ELECTRIC STORM VAGARIES.

BY WILLIAM FINN.

In a recent communication to the ELECTRICAL AGE on the subject of earth-currents the writer presented some details regarding the derangement of the telegraph service from the series of electric storms which began February 13 last, and continued with more or less frequency and intensity up to April 26.

Several recurrences of the phenomena have since been noted, and some curious and anomalous results observed.

On Monday, May 16, for instance, the entire quadruplex service between New York and Chicago over the Western Union lines was quite seriously interrupted all day by the prevalence of earth-currents, which, strange as it may appear, failed to sensibly disturb the more delicate apparatus of the automatic system until after 3 P.M., though that system is usually the first to indicate the fact of their existence in the wires.

The following day was a comparatively quiet one, only a few instances being recorded of interruptions from that cause; but early on Wednesday, May 18, an electric storm of considerable proportion put in an appearance, and continued to rage with varying degrees of violence all day and during a greater portion of the succeeding night.

At first the western wires alone felt the disquieting forces, but towards the afternoon the area of disturbance became greatly extended, and after 3 P.M. circuits in nearly every direction became influenced.

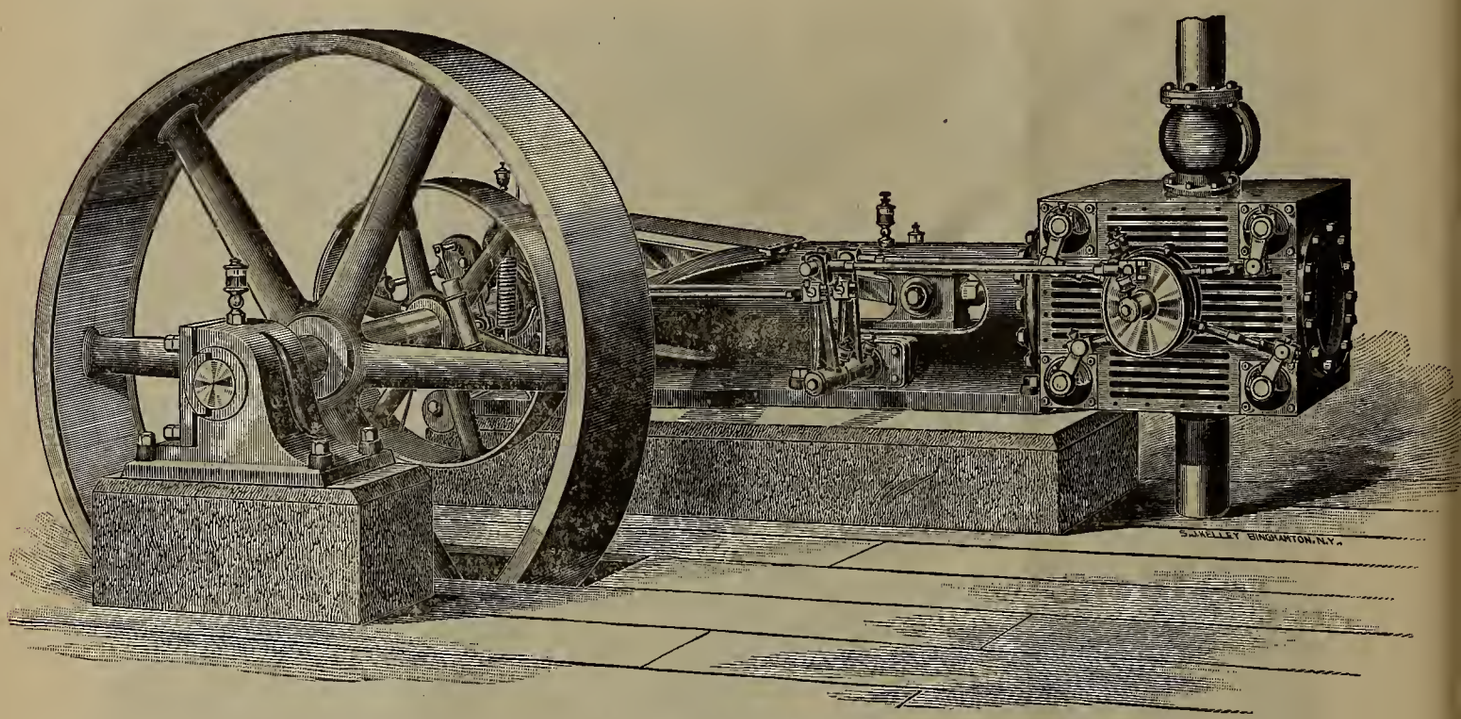
The maximum intensity was reached about 4 o'clock, at which time an earth-current in a wire between Buffalo and Chicago developed a strength of 35 milliampéres,

(Continued on page 395.)

THE PAYNE-CORLISS.

BY C. E. MANNING, M.E.

The age of iron, so rapidly merging into the age of electricity, is particularly marked by the rapid strides in machinery for the production of electrical power. In all practical electrical apparatus of any considerable size the real basis of production is the coal; so the next step is the water, thence the steam, thence the electricity. The first movement toward the mechanical production of electricity was to produce the machinery at any cost to produce required results. The next problem—the one which now confronts us—is to produce the machinery that will yield the same required results at a minimum cost. A step in this direction is the Payne-Corliss engine, which although on first investigation seems a compromise, is proving to be an advantageous one from an economical standpoint.



PAYNE-CORLISS ENGINE.

As will be seen from the engraving, the Payne-Corliss combines two universally-approved devices—the Corliss type of valves and the shaft-governor. Two wrist-plates have been substituted for the one in the Corliss engine proper; one wrist-plate actuates the steam valves, operating under control of the shaft-governor through a variable eccentric. The other wrist-plate actuates the exhaust valves only, and is operated by a fixed eccentric on the shaft, thus obtaining a constant free exhaust. The advantage thus gained gives a cut-off dependent directly upon the speed, and an exhaust unaffected by the variable point of cut-off. It also allows the close regulation of the standard shaft-governor.

It has been the aim of manufacturers of the modern high-speed engines to attain the economy of action of the long-stroke Corliss engine; and several approximations have resulted.

B. W. Payne & Sons, 41 Dey street, New York city, whose works are in Elmira, N. Y., have accomplished the desired result by using a double ported valve of the Corliss type, in which for any given angular motion of the wrist-plate the valve opening is twice that of the standard Corliss valve. This operates so satisfactorily that they are enabled to do away with the slow-working dash-pots and to obtain a positive valve motion that equals the best results of the Corliss disengaging valve-gear. The records of the indicator cards taken at several plants containing the Payne-Corliss, show a large gain in economy over the single-valve engine—results which compare very favorably with the longer stroke engines. These data, which were reported by the owners of the engines, show an economy of from 2.6 to 2.8 lbs of coal per H. P. per hour, on a basis of nine lbs. of boiler evaporation; engines non-condensing.

The Payne Company is installing a Payne-Corliss in the Haverstraw, N. Y. electric-light station, under written guarantee to save twenty per cent. in fuel over a single-valve engine which has been in operation for some time. If feasible, without interference with the working capacity of the engine, extensive tests will be made to determine how high a speed can be economically obtained.

As a step towards economy the Payne-Corliss is certainly in the right direction; it most assuredly merits the attention of electrical engineers as well as the owners of electrical or other plants who are not stockholders in coal property.

DIED FROM TASTING ELECTRICITY.

The death of Arthur James Yeo, a practical electrician, who recently died in New York, was said by his physician to have been due to too much electricity taken internally, and causing nervous apoplexy.

For some two years past, Yeo, who had been employed in the electrical works of Ostrander & Co., New York, had been in the habit of testing fine wire, such as is used for burglar alarms, etc., by touching them to his tongue. Then it began to affect him; his nervous system was undermined, and he grew weaker and weaker, and finally died. Previous to his employment in this city he had been working on the Panama canal, and caught the fever, from the effects of which he had never fully recovered; this may have aggravated his trouble. It is said that electricians throughout the city have been dismayed at Yeo's death, although many of them profess not to believe in the cause attributed by the attending physician.

OPERATING TELEPHONE COMPANIES.*

BY ALLEN R. FOOTE.

The report on telephones for the tenth census (1880) is presented in volume iv., commencing on page 787. Preceding the tables the following statement is made under the heading of " Remarks ":

It is of the first importance to remember that the census year 1879–1880 was the year in which the telephone business passed through the stages of an unprecedented development. At the beginning of that year this business amounted to little or nothing. At the end of the year it represented one of the greatest interests of the country. Neither the census nor any other statistical agency can deal in a wholly satisfactory manner with anything which is subject to rapid and violent changes.

The tables exhibit 148 companies and private concerns, which aggregate 34,305 miles of wire, 54,319 receiving telephones, and 3,338 employés.

The collection of these statistics has been with a view to exhibit the telephone business in 1880 as completely as circumstances allowed, and for the purpose of establishing a basis for the future taking of such statistics.

The inquiry into this subject for the eleventh census is assigned to the Division of Manufactures, to place it properly in the group of electrical industries in said division. The form of publication adopted for the tenth census disclosed the detailed statistics for each reporting company. The form of publication adopted for the eleventh census is particularly designed to avoid disclosing the individual statistics of any reporting company, firm or person. For this reason, in presenting the statistics of operating telephone companies, a consolidated report is given, in which is grouped the statistics of all reporting companies, and comparison made with corresponding statistics for the year 1880, so far as the same are exhibited in the tenth census report.

Examination of the report now presented will show that many items are reported for the eleventh census that do not occur in the report for 1880, thus broadening the basis of comparison for future reports.

The percentages of increase and decrease from 1880 to 1890, in those items of essential interest to the public, are shown in the following summary:

sation. While these data possess considerable statistical value, it is impossible by such methods to convey a proper representation of the actual changes that have occurred in the business of operating telephone companies during the decade from 1880 to 1890. Improvements in instruments and exchange switchboards, changing from grounded to metallic circuits, placing wires underground, extension of lines to extra-territoral districts, and, finally, the introduction of long-distance service, combined to make the service rendered in 1890 more valuable and satisfactory to subscribers than the service rendered in 1880.

The presence in the statistics for 1890 for the first time of the items "5,029,438 feet of cables" and "54,690 miles of wire underground," requires a few words of explanation and comment. The rapidly increasing number of subscribers rendered it imperative to employ a very large number of wires for the service. This led to bunching of wires in cables. The average number of wires so bunched in present practice is about fifty pairs. The increasing number of wires and cables for various electrical purposes led to an urgent demand that the wires be placed underground in the congested districts of large cities.

A comparison of the cost of the two systems will be found in the subjoined table:

Cost of Telephone Line Construction.	Per mile of wire.	Per mile of productive wire. (*a*.)
Aërial lines, individual wires	$35.00	$35 00
Aërial lines, cabled wires	*b*89.76	179.52
Underground lines, cabled wires	*c*121.44	242.88

a. The cost per mile of productive wire is calculated on the basis of existing conditions, as follows: In aërial lines of individual wires, all wires placed are productive. In aërial lines of cabled wires the productive wires average one-half of all wires placed. In underground construction the productive ducts and wires average one-half of all ducts and wires placed. In the cities of Washington, D. C., and Baltimore, Md., there are 6,061 miles of wire underground. Of these wires 2 980 miles are productive and 3,081 miles are nonproductive at the present time (1892).

b. At this rate per mile of wire, the 5,029.438 feet of cables reported in 1890, containing 50 wires to the cable, cost $4 275,022 placed.

SUMMARY SHOWING PERCENTAGES OF INCREASE OR DECREASE FROM 1880 TO 1890.

Items.	Increase. (Per cent.)	Decrease. (Per cent.)
Number of companies, firms and persons reporting	.....	64.19
Interest-bearing and profit-sharing investment	395.30	.....
Interest bearing and profit-sharing investment per mile of wire	.....	29.34
Interest-bearing and profit-sharing investment per subscriber	5.30	.....
Net earnings per mile of wire	3.60	.....
Net earnings per subscriber	54.68	.....
Number of exchanges	183.98	.....
Miles of wire per exchange	145.57	.....
Number of subscribers per exchange	64.86	.....
Number of employés per exchange	.....	12.50
Miles of wire	600.81	.....
Miles of wire per subscriber	49.30	.....
Number of subscribers	369.61	.....
Number of employés	158.99	.....

The above summary shows that the number of subscribers has increased during the decade 369.61 per cent.; the number of persons brought into communication per exchange has increased 64.86 per cent.; the mileage of wire per subscriber has increased 49.30 per cent.; while the interest-bearing and profit-sharing investment has increased but 5.30 per cent. per subscriber.

Unfortunately, the census report for 1880 affords no basis of comparison for cost to subscribers per conver-

c. At this rate the 54 690 miles of underground wires reported in 1890 cost $6,641.553 placed. The feet of cables and mileage of wire underground is a duplication to the extent in which cables are placed underground.

The report for 1880 included the statistics of the American Bell Telephone Company, as at that time this company operated one exchange. The report for 1890 excludes the statistics of the American Bell Telephone Company, since it is not now an operating company.

The following tables show the number of operating

* Census Bulletin, No 196.

telephone companies, the amount and character of investments, revenues and expenses, the facilities furnished for public and private use, as well as the use made by the general public of such facilities for 1890 in comparison with similar data for 1880, so far as the same is possible, considering the enlarged scope of the inquiry for 1890.

Table 1 shows for 1880 and 1890 the number of operating telephone companies, the amount and character of investments, revenues and expenses :

TABLE 1.—COMPARATIVE STATEMENT, 1880–1890, OF OPERATING TELEPHONE COMPANIES' INVESTMENTS, REVENUES AND EXPENSES.

ITEMS.	1880	1890	INCREASE.		DECREASE.	
			Amount.	Per cent.	Number or Amount.	Per cent.

Number of other employés	.....	3,876	.....	.....	.....	.....
Total number of employés	3,338	8,645	5,307	158.99	.....	.....

a. The report of 1880 gives "Number of receiving telephones in use, 54,319." To make comparison with 1890, a transmitter is added for each telephone.

Table 3 shows for 1890 the use made of the facilities furnished by operating telephone companies in comparison with the data obtained for 1880 :

TABLE 3.—COMPARATIVE STATEMENT, 1880–1890, OF USE MADE OF OPERATING TELEPHONE FACILITIES.

Use Made of Facilities.	1880	1890	Increase.		Decrease.	
			Number.	Per cent.	Number.	Per cent.
Exchange and toll stations		203,060				
Extra exchange toll stations		1,037				
Private lines and other stations		23,260				
Total number of subscribers	48,414	227,357	178,943	369.61		
Number of subscribers per exchange	111	183	72	64.86		
Number of exchange conversations		450,000,000				
Number of extra-territorial conversations		3,200,000				
Total number of conversations		453,200,000				
Average daily calls per subscriber :						
Exchanges with 100 or less subscribers		4.80				
Exchanges with 100 to 200 subscribers		6.25				
Exchanges with 200 to 500 subscribers		7.43				
Exchanges with 500 to 1,000 subscribers		8.00				
Exchanges with 1,000 to 1,500 subscribers		8.67				
Exchanges with 1,500 subscribers and over		8.86				
Average price paid per subscriber per call :						
Exchanges with 100 or less subscribers		3.25 cents.				
Exchanges with 100 to 200 subscribers		2.33 "				
Exchanges with 200 to 500 subscribers		2.40 "				
Exchanges with 500 to 1,000 subscribers		2.37 "				
Exchanges with 1,000 to 1,500 subscribers		2.14 "				
Exchanges with 1,500 subscribers and over		3.50 "				

ELECTRIC STORM VAGARIES.

(Continued from page 391.)

representing a potential difference between the two grounds of nearly 90 volts.

Conversation was subsequently carried on between New York and Buffalo, and signals exchanged over wires to Albany, Boston and Bangor by means of these natural currents.

It is a singular fact that at a time when circuits to Philadelphia, Washington and other comparatively short lines to southern points were almost entirely free from interruption, the longer southern circuits, such as those to Richmond, New Orleans, etc., could only manage to be operated with considerable difficulty and delay.

The most peculiar characteristics of the storm consisted in the variety of its vagaries and the suddenness of its changes.

At one moment the signals on the circuits affected would be rendered entirely unintelligible, while immediately afterwards the storm would so far subside as to admit of the ordinary signalling currents passing without any interference whatever.

These alternations of maxima and minima continued with more or less irregularity all day, the phase and period of one wave differing apparently from those of every other wave.

There have been electric storms in the past of much greater severity and longer duration, but none within the experience of the writer that presented so many anomalies, or exhibited such odd eccentricities as the one referred to.

The only effective remedy against earth-current disturbances on land lines appears to be in the use of the metallic circuit. It is possible to entirely exclude them by means of condensers interposed in the line, as is customary on long submarine circuits, but where neighboring wires are more numerous, and operated with currents of much greater intensity, the condenser introduces a fresh source of trouble from inductive action, which renders it practically useless in the ordinary transmission of the signalling currents.

ATMOSPHERIC ELECTRICITY.

In 1752 Lemonnier observed that the atmosphere usually was in an electrical condition. Cavallo, Beccaria, Ceca and others, added to our knowledge of the subject, and more recently Quetelet and Sir W. Thomson have generalized from more careful observations. The main result is that the air above the surface of the earth is usually, during fine weather, positively electrified, or at least that it is positive with respect to the earth's surface, the earth's surface being relatively negative. The so-called measurements of "atmospheric electricity" are really measurements of difference of potential between a point of the earth's surface and a point somewhere in the air above it. In the upper regions of the atmosphere the air is highly rarefied, and conducts electricity as do the rarefied gases in Geissler's tubes. The lower air is, when dry, a non-conductor. The upper stratum is believed to be charged with + electricity, while the earth's surface is itself negatively charged, the stratum of denser air between acting like the glass of a Leyden jar in keeping the opposite charges separate. If we could measure the electric potential at different points within the thickness of the glass of a Leyden jar, we should find that the values of the potential changed in regular order from a + value at one side to a — value at the other, there being a point of zero potential about half way between the two Now, the air in fine weather always gives + indications, and the potential of it is higher the higher we go to measure it. Cavallo found more electricity in the air just outside the cupola of St. Paul's Cathedral in London, than at a lower point of the building. Sir W. Thomson found the potential in the island of Arran to increase from 23 to 46 volts for a rise of one foot in level; but the difference of potential was sometimes eight or ten times as much for the same difference of level, and changed rapidly as the east wind blew masses of cloud charged with + or — electricity across the sky. Joule and Thomson, at Aberdeen, found the rise of potential to be equal to 40 volts per foot, or 1.3 volts per centimetre rise of level.

During fine weather a negative electrification of the air is extremely rare.

INDIVIDUAL SELECTION OF ELECTRICAL OBJECTS.*

BY S. S. BOGART.

Individual selection, as applied to electrical objects, has some interesting features. It is strikingly singular that it has not received more attention at the hands of the eminent persons here present. The application of a selector to any circuit to reach any of the objects desired and the necessity for such a device is doubtless as apparent to all as is the application of the current to telegraph, lighting and power. In the individual call-bell circuit we have a combination of electrical impulses on a transmitter (or sent by an ordinary Morse key) and selector-shaft that correspond with each other. Any other than the combination for that instrument throws in a false combination, upsets the pawls and restores the selector's sector to zero. This principle applied to all the other selectors on the circuit acts in a like manner. The call-bell set consists of a key, transmitter, relay, sounder, answer-back and bell. When the combination has properly completed its phase, the answer-back is vitalized, and it automatically transmits the assurance back over the wire that the object has been reached and the bell is ringing. The sounder is always in circuit, except when the bell is ringing, then all of the battery is transferred to the bell. But three cells of ordinary Callaud or gravity battery are necessary for the entire circuit. There are no short circuits ; always a magnet's resistance interposed, consequently the battery is in a normal condition. Does not waste under local action or wear out through short circuiting. The advantages of this system in saving time in calling offices has been carefully gone over, and as it is an undisputed fact that upwards of one-third of the time is spent in calling, the fact is apparent that the general managers will bless us all for not asking them to build additional expensive wires on which we are to spend one-third of the time calling the offices. The greater the number of wires the more difficult the problem of raising the one or two operators at some points. As we increase the number of wires on the poles, we increase the cross-fire or induction and escape. When the relay adjustments change to such an extent as to affect the sounder, the selector will work so long as the armature of the relay moves to its contacts. Other arguments too exhaustive to advance here could be offered in favor of the adoption of such a system. Fearing that they might smack too strongly of bias in favor of my own, I prefer to have my associates get the bias from another direction.

FOR ELECTRIC LIGHT AND POWER USES.

In connection with the use of arc lights, the selector system affords a simple and effectual means of starting and extinguishing lights at various hours upon the same circuit. Arc service, as is well known, is usually run on "day," "nine o'clock," "midnight," "all-night," and other circuits, and frequently all these may be found on one block or street. This multiplicity of circuits and variety of uses lead inevitably to greater expense, increased risk and difficulty of operation. The application of the "combination" device permits the several classes of lights to be operated on one circuit, and the central offices to control each separate class, or each group in that class, as desired. Incandescent circuits and those used for the transmission of power are equally subject to the control of the "combination selector," and in all branches of lighting and power work the system may be applied to advantage. The automatic attachment both ensures safety of operation and announces to the transmitting point the completion of the desired work, while the economy resulting from its use on circuits or wide extent of great activity will be an important consideration to every company employing electric lights or power.

FOR FIRE-ALARM AND POLICE SERVICE.

The use of these instruments on the police and fire circuits of cities enables an alarm to be confined only to such posts or stations as are at the moment required, instead of arousing the entire department, as is generally the case. The call may be limited to a single station, or to a group of them, or to a whole district, according to the "combinations" employed. The immense saving of time, money and fatigue to men and horses by the adoption of such an individual signal will be readily appreciated by all familiar with the present system in vogue in our departments of public safety. The chief of a department can direct his summons at pleasure to the stations he wishes to reach, and by using a number of combinations can employ as many different signals as necessity requires.

FOR TELEGRAPH AND TELEPHONE PURPOSES.
