No other city in this country is so effectually guarded, telegraphically, from the spread of fires as New York, and the value of such appliances have been very fully demonstrated within the last few months, and the losses by fire, compared with the aggregate amount of property exposed, have been very small indeed.

New York has also that without which even the best telegraphic and electrical arrangements are deprived of much of their value—a most excellent, efficient and well managed fire department. This department was never in such a complete and efficient condition as it is at the present time, and is an exception to the general mismanagement and inefficiency which usually characterize municipal arrangements.

Alliance between the Western Union and American District Telegraph Companies.

IN another column we give the principal provisions of the contract which has just been concluded between the Western Union and the American District Telegraph Companies for the receipt and delivery of business for the former company. This is a very important arrangement and one which will doubtless prove mutually advantageous and profitable, and at the same time bring telegraphic facilities for reaching any part of the country or the world to which telegraphic lines extend to the doors of the residences and places of business of the patrons of the American District Telegraph Company.

The Executive Committee of the Western Union Telegraph Co. have ordered the contract to be immediately carried out, and the W. U. Company will at once open offices in seven of the offices of the District Company, all of which, with the exception of the Central Park office, will be open all night for the reception and delivery of messages.

"The Plug."

THE tearful appeal of our Jersey correspondent for a paper to be started in the interest of "plugs" has met with a prompt response from the porcine metropolis of the West, from whence we have received the first number of a small sheet yecept *The Plug*, the publishers of which have endeavored to give it a charmingly appropriate air of verdancy by printing it on paper of emerald hue. It is conducted by Selden and Mattoon, whom we well know to be wags, but never having "forked a fire" with them, we can't say for certain whether, as plugs, they possess that vast and comprehensive ignorance of telegraphic practice necessary to place them in the front rank of that illustrious brotherhood. The paper is well filled with squibs of both local and general application which are unquestionably cheap at a dime to the victims, if no one else. The classic motto adopted by *The Plug*—"In Pockets put Nickelo"—expresses the object for which journals are usually published, but they are seldom sufficiently and confidently honest to avow it.

Suggestions for Securing the Safety of Passengers in Steamship Disasters.

WE print a communication from an esteemed correspondent suggesting means of securing the safety of passengers on ocean steamers in case of disaster. This is not exactly telegraphic or electrical in its character, but will doubtless be of interest to many telegraphers and persons connected with telegraphs who are not unfrequently represented in the passenger lists of such vessels.

The Telegraph.

Contract for an Alliance and Co-operation between the Western Union and American District Telegraph Company.

Negotiations which have been pending for a considerable time between the Western Union and American District Telegraph Companies for an alliance and co-operation between the two companies, have recently been concluded on terms which are believed to be mutually advantageous.

The contract provides for a general business alliance between the two companies, wherever their systems co-exist. Offices are to be established, operated and maintained upon the principle of mutual interest and good will, the object being to improve public telegraph facilities, and by a division of expenses, either to reduce them, or to furnish at the same cost better service and better facilities and accommodation. In this city the delivery of all messages for points above Chambers, or Worth, or Canal streets (as may be hereafter determined), is to be made by the American District Telegraph Co.

For the present the two contracting companies will unite in maintaining twenty-eight offices, where their joint facilities will be offered to the public. Of these offices five will be open day and night. Six others of the American District Offices will also be kept open and ready for business day and night, for the reception of messages for transmission over the Western Union lines; thus, eleven of the district offices will be open constantly for the reception of Western Union business.

By this alliance and co-operation telegraphic facilities in this city will be greater than are to be found anywhere else, as each of the 2,500 instruments connected with the District Telegraph system in this city practically constitutes a telegraph office, as the lessee can at any time summon to his premises a messenger by whom a despatch can be taken to be transmitted to any point in this country, or elsewhere, where telegraphic connection is made.

The large number of messengers employed by the American District Telegraph Co. will enable them to transmit messages without delay to their destination, while the small area covered by the several districts will insure more rapid delivery than has heretofore been practicable, as no person in the city South of Sixtieth street, will be more than ten minutes distant from a telegraph office, while from 80 to 90 per cent. of the population will be within three minutes of such an office.

The capacity for service of the American District Telegraph system has recently been very fully demonstrated—upon one evening of last week, in addition to its regular business, the company distributed within an hour 10,000 circulars at private houses. It has also during the same week obtained through its messengers and offices 17,382 signatures to a petition for rapid tran-

sit, besides distributing letters, cards, circulars, handbills and newspapers by scores of thousands. Within the twenty-three months during which the system has been in operation, it has proved a great convenience, and it has become an indispensable accommodation to the public.

The Shares of the Gold and Stock Telegraph Co. to be Dealt in at the Stock Exchange.

The shares of the Gold and Stock Telegraph Company have recently been admitted to what is termed the free list of the New York Stock Exchange, and will be quoted and dealt in at the board hereafter. The capital stock amounts to \$2,500,000, each share being \$25 fully paid. The floating debt of the company amounts to \$129,172.74. The gross earnings for the fiscal year ended August 31, 1873, were \$641,977.64; the gross expenses, \$397,084.17; leaving a balance to income account of \$244,893.17. The registry of the company is the Union Trust Company.

The Western Union Executive.

DURING the absence of Prest. Orton in Europe, Mr. A. B. Cornell is acting President of the Western Union Telegraph Company.

The Telegraph Line of the Great Southern Railway.

A NEW railroad is being constructed from Jacksonville, Florida, to Jesup, Georgia, which is called the Great Southern Railway.

Mr. Paul W. Bossart, formerly of this city, and more recently Superintendent of Telegraph of the Buffalo, New York and Philadelphia Railroad, is the Superintendent of Telegraph of the road, and is now engaged in building the line. This road runs through an entirely new country, a distance of 100 miles, which is 120 miles shorter than the present route between the two places.

The telegraph line will be used jointly by the railroad and the Southern and Atlantic Telegraph Co., and will give the latter company an extension into Florida.

The poles for the line are already up for nearly 40 miles, and only waiting for the wire and materials. It is expected that the entire line will be built and in working order by July next.

The Contract Between the Union Pacific R. R. and Western Union Telegraph Cos. to be Terminated.

THE New York Tribune states that on the 20th inst. the Western Union Telegraph Company received formal notice from the Union Pacific of the termination of the contract existing between them. The Union Pacific authorities say that this contract was an onerous one, compelling them to carry large quantities of freight, operatives, etc., to stop trains and the like, and that they reckon its abrogation as equivalent to a saving of at least \$50,000 per year. The result is a decided advantage to the Atlantic and Pacific Telegraph lines in competition for California business. They are expected to construct an independent line from Omaha to Chicago, and thus complete their system of lines between the two oceans. Sharp rivalry between the two companies is said to be impending.

A Proposed Government Telegraph Line on the Texan Frontier.

In the House of Representatives at Washington, D. C., on Monday last, Mr. Giddings, representative from Texas, moved to suspend the rules and pass a bill for the better protection of the frontier settlements of Texas against Indian and Mexican depredations by the construction and maintenance of a line of telegraph from the city of Dennison, Texas, to Fort Sill, Indian Territory, and thence along the northern frontier line of settlements and by the various military posts to Brownsville, and appropriating \$100,000 for that purpose. Agreed to and the bill was passed.

The bill authorizes the Secretary of War to construct and operate a telegraph line, beginning at or near Dennison, Texas; thence to Fort Sill, Indian Territory; thence along the northern frontier line of settlements to Forts Griffin and Concha; thence to Peco River, at or near the mouth of Toyah Creek; thence to Fort Clark, on Los Moras Creek; thence to Fort Duncan, on the Rio Grande; thence down the Rio Grande via Fort McIntosh and Kingdold Barracks to Brownsville, so as to connect with the military posts which are now or may hereafter be established. These posts are from 100 to 200 miles apart, and extend over a distance of 1,500 miles, and, by means of the telegraph line, troops can be concentrated and citizens can be given timely warning of the incursions of Indians and Mexicans. The bill now goes to the Senate.

Foreign Telegraphic Notes.

THE India rubber, Gutta Percha and Telegraph Works Company have received news of the completion of the direct submarine cable between Marseilles and Barcelona, laid from their steamship Dacia. This reopens communication between Spain and the rest of Europe, hitherto interrupted by the destruction of the land lines in the districts affected by the civil war. The line will be opened for traffic shortly.

On Friday, March 27, a new telegraph cable was laid in the Frith of Forth between Granton and Burnt-island, in place of the principal cable, which was destroyed some time ago by a ship riding at anchor running foul of it. The new cable, which is of great strength, was made by the Silvertown Cable Company. The cable was brought to the Frith of Forth by the screw steamer International, and was laid under the direction of Mr. Lunnsden, engineer, Mr. Tansley, chief telegraph engineer for Scotland, and Mr. Lessels, divisional engineer.

The Cuba Submarine Telegraph Company have notified that their cable between Batabano and Santiago de Cuba has been repaired. This reopens telegraphic communication with the whole of the West Indies, and places for the first time Panama in communication with Europe.

The Submarine Cable Trust Company announce that the coupon attached to their certificates for six months' interest at the rate of 6 per cent. per annum, due April 15th inst., will be payable to Messrs. Glyn, Mill & Co. on that day. After providing for the coupons and expenses of the trust, the surplus revenue for the current financial year ending April 15, 1874, would enable the trustees to redeem 88 certificates, of the nominal value of £8,800.

Telegraphic communication was established between Malva and Los Angeles, Chili, March 5th.

The Guayamas, Mexico, paper of February 25th says, the wire and all required instruments for a telegraph line from Mazatlan to Uris in Sonora, had arrived in the City of Mexico, and the construction of the line will hardly be delayed a great while. A connection ought soon to be made from Tucson, Arizona, to Uris.

The new Government or administration, in Queensland, among other important reforms in the colony, promise a reduction in telegraphic charges.

All telegraph operators engaging with the Grand Trunk Railway are required to sign a pledge of total abstinence from all intoxicating liquors. This pledge is required of all other operators of that road as well.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: APRIL, WESTERN UNION, ATL. AND PAC., AMER. DIST. and rows for dates 16, 17, 18, 20, 21, 22.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended March 10, 1874, and bearing that date.

148,447.—ELECTRIC INDICATOR FOR ELEVATORS.—Augustus Hahl, Washington, D. C. Application filed February 7, 1872.

Indicator on elevator is connected by a flexible conductor to a stationary battery and to circuit closers on each floor.

1. The circuit making and breaking apparatus d' d', &c., and the connecting conductor M or n, in combination with an indicating apparatus E, arranged upon the car so as to be movable therewith, substantially as and for the purpose as described.

2. The weight w and pulley p, in combination with the cable M of an electrical indicator for elevators, substantially as and for the purposes herein set forth.

148,459.—ELECTROPLATING APPARATUS.—William C. Holman, West Meriden, Conn., assignor to The Meriden Britannia Company, same place. Application filed December 27, 1873.

Upon a certain determinate weight of plate being deposited on the articles in the bath a weighted arm is pulled down, simultaneously breaking the circuit to the bath and articles, short-circuiting the battery, and operating an alarm.

1. The combination of the revolving frame N, the lever L K, the cup T, the magnet R, and bar a, constructed and arranged substantially as described, the said bar a being tripped to break the main circuit, when the circuit through the magnet is closed by the rising of the lever L.

2. In combination with the supporting frame N, lever L K, magnet R, and bar a, the mercury cup H, making the connection between one pole and the frame N, substantially as described.

3. In combination with the supporting frame N, lever L K, magnet R, and bar a, the hammer V and bell X, substantially as and for the purpose described.

148,469.—ELECTRIC CLOCK.—Johann B. Kerz, Mainz, Germany. Application filed January 9, 1874.

An elastic arm attached to one of the arbors of a clock train, at each revolution, strikes a stud, against which it is first strained, then suddenly passes and strikes a connecting key, which completes an electric circuit through an electro-magnet in a clock at a distance. The magnet operates the hand moving mechanism of the distant clock.

1. The combination of the revolving elastic arm B, operated by a clock movement, with a circuit-closing key, C, constructed and operating substantially as described.

2. The combination of mercury cups D D with the gravitating key C, elastic arm B, clock movement A, electro-magnet F, armature lever G, and ratchet wheel J, all constructed and operating substantially in the manner herein set forth.

148,517.—ORE SEPARATOR BY USE OF MAGNETS.—John Y. Smith, Pittsburg, Pa. Application filed February 18, 1871.

The magnets are arranged to form a cylinder, around which passes a belt.

1. In combination with a magnet-cylinder, drum or roller H, and belt G, an auxiliary belt, G', and pulleys for controlling the relative speed of the belt and cylinder, substantially in the manner and for the purpose set forth.

2. The mode of attaching the magnets to form the cylinder, by means of the disks B and rods D, substantially as set forth.

3. In combination with the magnets C, the annular and adjustable keeper E, substantially as set forth.

4. In combination with the hopper and magnets, the brush I, when arranged to feed the ore or other fine particles from the hopper.

5. In combination with the magnet-cylinder, the combs K, arranged to operate substantially as set forth.

6. In combination with the magnets, the non-magnetic surface extending at the end of the cylinder beyond the influence of the magnetic force, and means for sliding the magnetic particles on such surface.

For the week ending March 17, 1874, and bearing that date.

148,608.—AUTOMATIC FIRE ALARM AND CIRCUIT THEREFOR.—John H. Guest, Brooklyn, N. Y. Application filed February 7, 1874.

A number of thermostats, placed in main closed circuit of a district alarm or other telegraph line, close, when acted on by heat, a branch circuit through an alarm and signal mechanism without destroying continuity of main circuit.

Claim.—1. The combination of a fraggible hmb or tube with a spring, b, for making or breaking an electrical circuit, substantially as set forth.

2. The combination, with an electrical circuit, of one or more fraggible tubes or bulbs, controlling circuit closing or breaking devices, substantially as set forth.

3. The combination, with the normally closed circuit of a district, alarm or other telegraph line, of branch or local shunt circuit, a suitable alarm placed therein, and thermostats controlling such circuit, substantially as set forth.

4. The combination, with one alarm apparatus, of one or more thermostats, and an electrical circuit operating such alarm and controlled by the thermostats, substantially as set forth.

Obituary.

H. R. MYERS,

who committed suicide at the Central Hotel in Chicago, Ill., on the morning of April 10th, 1874, was originally from York, Penn., and first came under our notice in 1864-65. He was at that time operator for the Phila. and Erie R. R. Co. at Renova, Penn.; subsequently he accepted a like position at Kane, Penn. From there he went to Washington, D. C., to work for the W. U. Telegraph Co. Resigning his position there he again took up R. R. telegraphing—this time on the Meadville Division of the Atlantic and Great Western R. R. Here he gained such favor with his employers, that he was offered and accepted the responsible position of agent and operator at Glendale, Ohio, on the O. H. & D. Division of that road, having previously worked at Middletown, Ohio, where he became acquainted with and married a beautiful and accomplished young lady. He was thrown from a car on the side track at Glendale in endeavoring to set a brake on it, the chain of which broke, and injured him so as to incapacitate him from performing the laborious duties devolving upon him there, and he resigned to accept the responsible position of manager of the Pacific and Atlantic Telegraph Company's offices, at Baltimore, Md. Previous to his entering the telegraph ranks practically, at the early age of 15 years, we find him conductor of a local freight train on the Northern Central R. R., between Harrisburg and Baltimore, enjoying the confidence not only of the older conductors, but also of the officers of the road. About a year and a half previous to the great Chicago fire, he accepted the position of manager of the Pacific and Atlantic Co., in Chicago, being in the full enjoyment of the entire confidence of his employers. His close application again told upon his health, and after the disaster which entailed so much loss and so many unfortunate changes upon thousands, he resigned this position, and for a long time was out of permanent employment. He visited successively most of the Eastern cities in hopes of locating himself in a business to accord with his inclinations and abilities, but no opportunity for this offered itself. He was afterward in Dayton, Toledo, and various points in Canada, where, from time to time, he fell back upon his knowledge of telegraphy, and obtained transient employment as operator. About six months ago he returned to this city and obtained a position in the Western Union office, working alternately the second New York wire—Smith report and Omaha duplex. He was a skilful operator, and from this fact was held in high esteem by his employers, and, by his many social and genial qualities, made for himself many friends among his fellow operators. About three weeks ago his wife went to Middletown, O., to visit her mother, taking with her their two little girls, and leaving Myers to make the necessary arrangements for their going to housekeeping upon their return. Myers, in the meantime, took board at the Central Hotel. It appears that after the departure of his family, the loneliness that succeeded induced a morbid and unhappy condition of mind. He could not be brought to look upon the bright side of things for the future. He became dissatisfied, discontented and misanthropic. His position was not worthy of his business capacity, the prospects of providing for his family in a manner according with their tastes and desires appeared dubious, and he became morbid with the reflection that his life was unsuccessful, and that his future was destined to contain nothing but misfortunes. This unhappy frame of mind induced

a mental aberration from which he was unable to extricate himself.

On yesterday morning he entered the barber shop of the Central Hotel, at about 6 o'clock. After lingering there a few moments he disappeared. Late in the afternoon the door of his room was found to be secured, and upon an application being made for admittance no response was elicited. Fearing that all was not right within, the door was forced open and he was found lying on his back upon the outside of his bed, dead, dressed as usual, except that he had on his dressing gown and was in his stocking feet. A pistol lying by his side told the sad story of self-destruction. He was peculiarly involved, and this, added to his other train of misfortunes, no doubt induced the untoward deed. He was but 27 years old, and, in spite of the failures at the outset, might have lived to enjoy a life of prosperity and influence. He has a father and mother residing at Dayton, O., and a brother in Baltimore, also two brothers residing near Dayton, O., and several sisters married, residences unknown. However unfortunate and unhappy may have been his latter circumstances, his influence and position were ever at the service of the poor and needy. He was generous to a fault; an affectionate husband, loving father, and faithful friend. He had left the office by the permission of the manager the first two evenings of this month to make arrangements to go into other and more remunerative business, failing in which he became more and more discouraged. Catching a severe cold about this time, he was seized with his old complaint, inflammatory rheumatism, which confined him to his room. He had apparently contemplated destroying himself, as he made casual inquiries (during the first few days of his confinement to the hotel) of the Asst. Observer Sergeant as to the best place to shoot one's self about the head to produce instant death without marring the features, and acted upon the information received exactly.

It seems he had all things prepared, his trunk packed, accounts arranged as far as possible, and kind loving letters written to his wife and a friend, on the 7th instant, but some brother operators calling that afternoon and evening seemed to cheer him up and delay the perpetration of the deed. He also had written a letter to the Coroner and his jury and left in his pocket, as well as all the others, in care of a friend. The following is a copy of the letter to the Coroner:

"Room 101, CENTRAL HOTEL, CHICAGO, April 7, 1874.
"TO THE CORONER AND HIS JURY—*Gentlemen*: You may be called upon to serve me in an official capacity. You may render a verdict as follows: Tired of life; tired of the trials, troubles and inconsistencies of both public and private life, excepting my wife and children and a few chosen friends. To the former my heartfelt love and undivided affection, with kisses. To the latter, my sincere, and, I hope in life, as in death, my unadulterated friendship and love. To my wife and dearly beloved children, Mizpah. HARVEY R. MYERS."

He was a member of the Masonic fraternity, belonging to Union Lodge No. 60, Baltimore, Md. His anxious inquiries for several days previous to his death for a letter he was expecting from his wife, gave rise to the rumor that he had family difficulty also, but the rumor, we are happy to state, was without foundation. The letter he was so anxiously expecting was taken out of the letter box at the telegraph office by a repairman named "Myers," read, and, as not understood, destroyed, and no mention made of it until after the suicide. * * *

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs. The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
Instrument with Office Outfit..... 7 50
Two Instruments and Outfits..... 14 50

THE

TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"

"History of America," "Civil War in America;" Member

of many Scientific and Learned Societies of Europe

and America; Commander of the Order of Dan-

nebrog, Denmark; Order of St. Olaf,

Norway, and of the Sword Order,

Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guerike, Hawksbee, Gray, Wheeler, Du Fay, Muschenbrock, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and of his improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost. Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

A SOUNDER FOR 30 CENTS.

THE "SNAPPER,"

a Mechanical Sounder and Key combined—giving a remarkably sharp and clear sound—weighs but half an ounce, and can be carried in the vest pocket.

EVERY OPERATOR,

EVERY AMATEUR,

EVERY STUDENT

wants one. Sent post paid on receipt of THIRTY CENTS; Six for \$1.50.

R. W. POPE,

Box 5278, NEW YORK.

SMITH & HALL,

Mont. Telg. Co., Hamilton, Ontario,
Agents for Ontario.

THE AMATEUR TELEGRAPHIC INSTRUMENT.

This instrument is in some respects similar to the "SNAPPER SOUNDER," but differs from that device very materially in the matter of form, finish and consequent DURABILITY. The base is composed of the best metal, highly polished, the Spring being Nickel Plated, and capable of producing a clear and pleasant sound. All who have used this instrument pronounce it to be par excellence. Sent to any address, post paid, on receipt of 50 cents.

The "SNAPPER SOUNDER" will be sent for 25 cents.

Very liberal discount to Agents.

Address,

J. M. FOSTER,

397 Broadway.

BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.
Acknowledged to be a decided improvement.
Price, same as the ordinary key.
Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

 - VAUGHAN'S AUGURS and TOOLS in variety.

- SULPHATE OF COPPER, NITRIC ACID, SULPHURIC ACID; the finest in the Market.

- TELEGRAPH BOOKS, MESSAGE PAPER, REGISTER PAPER, and STATIONERY.

- SECOND HAND RELAYS, CUT-OUTS and REGISTERS very cheap.

Repairing and Model Work promptly attended to.

Bliss' Manual and Price List furnished free on application.

GEO. H. BLISS & CO.,

41 THIRD AVE.

W. HOCHHAUSEN,
Manufacturer of
ELECTRICAL INSTRUMENTS,
132 WILLIAM STREET (rear),
Between Fulton and John Streets, NEW YORK.

One half of actual size
ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50
The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.
In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.
The Platina Points are large and hard.
Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight. \$50 00
Sounders, from..... 4 50 to \$6 50
Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00
Relays, from..... 9 50 to 16 00
Improved Switch Keys, from..... 3 00 to 5 50
Send for Illustrated Circulars.
The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes.**

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAI TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.
 This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.
 This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.
 These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.
 Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS
 manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES
 constructed in the best and most substantial manner, and on reasonable terms.
 Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.
 For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.
S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.
 Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
 CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
 And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
 Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.
 Address—
American Compound Telegraph Wire Co.,
ALANSON GARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.
 MANUFACTURED BY

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS
 FOR
ELECTRIC MEASUREMENT,
 Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.
 Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
 Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his
CELEBRATED HELICES
 WHICH ARE OF
 Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.
 These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

SMITH'S
MANUAL OF TELEGRAPHY.
 PUBLISHED EXCLUSIVELY BY
L. G. TILLOTSON & CO.,
 Price 30c. **8 DEY STREET, NEW YORK.**

THE PERFECT BATTERY. CLEANLINESS. CONSTANCY. ECONOMY.

THE LOCKWOOD BATTERY, PATENTED APRIL 8, 1873, L. G. TILLOTSON & CO., Sole Agents, No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY AT THE CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is NO LOCAL ACTION, and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current. The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO. 8 DEY STREET, NEW YORK, SOLE AGENTS.

New York, Oct., 1873. We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery. LOCKWOOD BATTERY CO. W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.80.

L. G. TILLOTSON & CO.,
No. 8 DEY STREET, N. Y.

NO EXCUSE.
There is now no excuse for using a poor quality of TELEGRAPH WIRE, when JOHNSON'S FAMOUS GALVANIZED WIRE can be purchased at reduced prices. Orders solicited in large or small quantities.
References: Western Union, Atlantic and Pacific, Southern and Atlantic, Franklin, American, Gold and Stock, American District, and every other Telegraph Company in the United States.

L. G. TILLOTSON & CO.,
SOLE AGENTS,
8 DEY STREET, NEW YORK.

CALLAUD BATTERIES
KEPT ON HAND, AND ORDERS FILLED BY
W. MITCHELL McALLISTER,
728 Chestnut Street, Philadelphia,
CHARLES WILLIAMS, Jr.,
109 Court Street, Boston,
AND BY THE
WESTERN ELECTRIC MANUFACTURING CO.,
AGENTS FOR THE UNITED STATES.
220 East Kinzie Street, Chicago, Ill.

WALLACE & SONS,
MANUFACTURERS OF
BRASS, COPPER & GERMAN SILVER WIRE.
Also, BRASS, COPPER and GERMAN SILVER,
in the Roll and Sheet.
We make the manufacture of Electric Wire a specialty—especially the finer sizes of Copper for conduction, and German Silver for resistance purposes—guaranteeing the conductivity of the same in every instance to be superior to that of any other manufacturer in the market.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of
 Railroad Telegraphs who find an attractive combination, giving
 loud sound without materially increasing the resistance beyond
 the standard of their relays.

We have rewound some of the old Box Sounders, in which we
 found the helices to have a resistance equal to 400 and 450 ohms.
 None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.
 Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet
 lined, to order.

See our advertisement in other columns.
 WATTS & CO., Baltimore.

BUY THE BEST.

If you want EQUIPMENT for a TELEGRAPH LINE, order of
 L. G. TILLOTSON & CO.

They have the GREATEST VARIETY.
 They carry the LARGEST STOCK.
 Their PRICES are the LOWEST and QUALITY the BEST.
 They guarantee EVERYTHING TO BE AS REPRESENTED.
 They always RECTIFY MISTAKES at their OWN EXPENSE.
 Every ARTICLE required for the CONSTRUCTION and
 OPERATION of LINES ALWAYS ON HAND.

Their EXCELSIOR TELEGRAPH INSTRUMENT FOR STU-
 DENTS, comprising Sounder and Key, is the greatest success of
 the times.

THE BISHOP GUTTA PERCHA WORKS,
 422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
 ONLY MANUFACTURER
 OF
 PURE GUTTA PERCHA GOODS
 IN THE
 UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,

FOR
 TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
 MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,
 Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
 SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,
 AND FOR

BLASTING AND MINING PURPOSES.
 In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
 GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
 SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable, Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and de-
 livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
 any Telegraph Cable or Wire manufactured at the Works in New
 York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods man-
 ufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
 sale in New York by

Original Article.

"Pip, Poor Pip!"

BY PETE ROPEYARN.

THE interesting sketches of Jim Lawless, Tip McClosky and others, which have recently appeared in THE TELEGRAPHER, have brought up recollections of another prominent telegraphist, not unknown to fame and fortune, of whom, it is believed, some reminiscences will not prove devoid of interest.

"Pip, poor Pip!" and yet he is neither poverty stricken or dead. I take a long retrograde step in the above caption, and, if it should be recognized by some ancient telegrapher who knew him in his days of callow youthfulness, it may be said, "Well, he was poor, it is true, and there was not a boy that took his turn on the bench who drove for a 'thirteener' with more earnestness than Pip." Bright, intelligent, ambitious to excel was he, and the Morse Alphabet was but a slight obstacle in his path to future telegraphic glory. A happy day was it for our hero, though it did rain, and "N. Y." came slow and shaky over old No. 2, when his quick ears caught the letters "B. Buf—" How every boy on the peripatetic force loved that rotund form, whose office was so happily located just beyond the "free limit." It must have been on the following day that a "garrote" collar appeared on duty, enclosing within its radius the stubby neck of Pip. As he took the pile of overnight messages out of the rack and hastily glanced through them, a looker on would have supposed that the collar had encircled his neck when his eyes first saw the light, so indifferent was his air when the voice of envy from his conferees squealed out, "What a swell!"

Our hero was not of the kind who could be scoffed down, however; and, by that gift of pluck and indefatigable perseverance which, when possessed, is the basis of success, not many months elapsed before he was placed in charge of a "paper mill" in the rural districts, where his frantic efforts to copy by "sound" became a severe trial to the patience of Dwight Case, who was at that time sole proprietor and manager of the old "Shore Line" wire, notwithstanding the constant admonition to "let his paper run." Pip toiled early and late, and to such good purpose that but a few weeks elapsed before he again appeared in his old haunts, but no longer in the subordinate position of a messenger. As yet, however, he lacked confidence to cut entirely loose from his register, but doing so was only a question of time, and when eventually the old office, which had been the scene of his advancement from the lower round of telegraphic service, was abandoned, he felt a joyful relief in thinking that that old "quill wheel" would no longer encumber his desk. Fancy, then, the feelings of poor Pip, when, among the apparatus of the new office, he discovered a brightly burnished register of the latest mud-turtle pattern. The manager, not being an expert sound reader himself, had insisted upon providing for the possible contingency of an operator getting stuck with some obscure word, and had consequently fitted up a table ostensibly for the benefit of the whole force, but in reality as a resort for Pip, when wrestling frantically with a pile of business from "P. FR."

From this point in his telegraphic career his road to final success did not differ essentially from that of others who have traversed the same path. We all "know how it is ourselves" from sometimes painful experience, but to one who, like Pip, knows no such word as "fail," the result is assured. His only failing was a ragged copy. The length of a "set to" with New York could usually be accurately estimated by the number of skeletons which encumbered his desk when he gave his final O. K. Blessed with a retentive memory, however, these were usually padded and patched until they were barely approved of after a critical inspection by the lynx-eyed manager. None knew better than himself the weak point in his professional achievement. "Pete, my boy," said he, "if I could only turn out a copy like Jim Lawless I would die happy."

Doubtful of his ability to excel in quality, he determined to achieve a national reputation for exceeding in quantity. Fortune favored his plans, for only forty miles distant was located the "Hub," and within its

precincts was the champion sender of that period, extensively known professionally as the "Knight of the Golden Key." The preliminaries being arranged, the Public Library was ransacked, and from a dusty alcove was abstracted a volume containing no words of more than two syllables. The circuit being short, a rainy night was chosen that the cooling drops might contract the excess of caloric, generated by friction on the wire. In spite of almost superhuman efforts to keep the affair secret by advertising it in all the Provincial newspapers, the Governor of the State was obliged to order out the Ancient and Honorable Artillery, whose guns, the admiration and terror of the orderly and turbulent of the city's populace respectively, were planted on the bridge, commanding the canal, and thus the streets were kept clear of the crowd of enthusiastic citizens. At the expiration of one hour the chairman of the committee, under whose supervision the performance took place, appeared at the office door, grasping in his hand half a ream of tissue paper. The pages were divided among a dozen men, who immediately proceeded to count the words. Another hour elapsed before the chairman again appeared, and announced the result. A tremulous murmur ran through the crowd—ten thousand words in sixty minutes—and then the artillery on the bridge belched forth a salute of nineteen guns, one for each year of Pip's life, and his reputation was established.

Twenty-four hours had not elapsed before the record of this remarkable feat became the topic of conversation in every telegraph office in the country. There was one man, however, who discredited the whole thing. Tip McClosky said he might swallow 8,000, as he had done that himself, but 10,000 was too many. He would investigate. He was then at Salt Lake, but he threw up his job and started East, determined either to nail a lie or surpass the feat. His first step was to see the committee and inspect the copy. He went faithfully at work, and having assured himself that there were 10,004 words in the copy, he proceeded to read it. There was a striking similarity between some of the pages. He went carefully through them again, finding, first duplicate and then quadruplicate pages. The African in the fence was discovered. The committee, composed of elergymen, deacons and other truly good men, were innocent of all knowledge of the black art of manifolding, and had been beguiled into the belief that 10,000 words had been received, when in reality the number was 2,500 copied on four page manifold. Tip McClosky was elated. Hurriedly scratching off a few lines he rushed to the nearest news-paper office, and handed in his communication. A young man in the office glanced at the name, blandly said "All right," and Tip dug out. The card never appeared. That young man was Pip. His literary aspiration had brought him in close communion with the editorial sanctum, and he availed himself of this opportunity to prevent the overthrow of the pinnacle of glory on which he had then taken his stand.

Glory, however, is a vapory foundation, unless backed by stamps. To unite glory, reputation and literature with the golden band of financial prosperity was now the future aim of Pip. With this end in view, he pondered long and earnestly as to the most available road to wealth. Blessed with a hearty appetite, it was natural that his inclination should tend to the alleviation of the stomach's cravings. Among the most prosperous merchants in the locality was a lineal descendant of Sir Walter Scott. His success as a peripatetic caterer had often aroused the envy of the hash fiends on his route, who little realized that as much labor was expended in the manufacture of sewed and pegged pies as was requisite in the demolition thereof. Scottie's external appearance was not calculated to add to the relish of the viands he peddled, the solidity of which was such that the heavily laden basket had gradually skewed his form, and even twisted his eyes, and given to his whole figure a delapidated air not unlike the spring opening of a last year's scarecrow. The red flannel shirt in which he always bloomed out was carelessly adorned with daubs of printer's ink, a series of impressions from which were gradually transferred to his face by a rolling movement of the left arm, his physiognomy having been previously wet down with profuse perspiration. Whether any radical reforms were inaugurated upon Pip's accession to an interest in this nocturnal lunch route remains a secret, which will not be revealed until the trumpet of Gabriel shall have summoned the victims before the last tribunal.

Meanwhile the literary germ was expanding within the brain of our hero, and by judicious training he bade fair to become in the New England what Dickens was in the old. His close relations with the press, derived from frequent visitations to the editorial sanctum to offer suggestions as to the interpretation of night reports, soon paved the way for future contributions. These, again, were followed by a permanent connection as "local" with the *Plantation Harbinger*. It was while in this position that some remarkable literary feats were performed. A copy of the *Harbinger*, containing a local sketch, found its way into the hands of a New York operator. For the amusement of his col-

leagues the recipient volunteered to read it aloud. He opened glibly, and read fluently until he reached a sentence about the middle of the article. He had spun out about fifty words, when he began struggling violently to reach a punctuation mark; his voice grew fainter and fainter; he gasped; he grew black in the face; still he persevered until he lisped the seventieth word, when he gave one despairing glance down the column, and still that full stop was five lines ahead. The last effort was exhaustive. He fell heavily to the floor, and the reading was not yet finished. A man of greater lung capacity was required. The by-standers shouted "Morrison." Frank gaily responded to the call, and came up smiling. He commenced afresh, and read without faltering until he reached the eightieth word, when, warned by the fate of his predecessor, he threw up the sponge. It was evident that his voice was so heavy that it required all of his extra lung power to manipulate it. The occasion demanded a man of equal or greater wind capacity and a voice of less volume. All eyes turned instinctively to John Lenhart. Blushing with his usual extreme modesty, John came to the front. Profiting by his observations, he threw back his shoulders and sailed in.

The trial was a severe one, but the goal was reached at length, and the sentence completed. A feeling of envy was aroused, by the successful rendering of this sketch, which was the forerunner of a subsequent outbreak of hostilities between the principal contestants.

The *Plantation Harbinger* was not blessed with a robust constitution. It had, however, struggled through many years under different titles, and through changes of ownership, as one after another of its proprietors had sought the refuge provided for the impecunious by the munificence of a former wealthy citizen—had survived even the editorial inflictions of another telegrapher, whose journalistic connection has made his name a household word among the fraternity of the North American Continent, until shortly after Pip's withdrawal from its staff. Whether his literary efforts had planted the seeds of dissolution within it, or whether it languished because of his absence, is a question of more interest to the ereditors of the deceased than to the readers of this sketch.

It becoming evident that none of the provincial journals were endowed with sufficient vitality to withstand the pressure of his vocabulary, Pip made a sudden change of base to the metropolis. "Pete, my boy," said he, "there's a pile of money in Gotham, and I've made up my mind to come here and scoop some of it in. By the way, what pay are you getting now?"

"Two hundred dollars a month, Pip, that's about as far as I expect to get."

"Poor fellow, I don't see how you can live, and a family to support too. Why, my washing and cigars cost me more than that."

A feeling of envy rankled in my bosom as I pondered over my abject condition. Heretofore I had been contented with my lot.

Blessed with good health and spirits, surrounded by staunch friends, engaged in congenial employment, affording me all the necessaries with a fractional part of the luxuries of life, I went to my quiet home that night to indulge in the erection of air castles and the possibilities of bettering my condition. A few hours' rumination assured me that any purely artificial effort to expand my natural abilities beyond their legitimate orbit might reduce me to the questionable comfort of a sky parlor in a metropolitan hash house.

Life is rendered pleasant by the variety of characters which it presents. Out of these few will leave behind them a record of good deeds, actually performed, as deservedly as Pip. A faithful and industrious telegrapher, loved and respected by his associates, he has struggled manfully against the adverse currents of life. Stimulated by prosperity, and again bowed down with grief, he still labors with the same indomitable zeal; and whatever may be his future career, the wrecks of other adventurers in the same sea will never form the foundation to the success of Pip.

Later Telegraphic Experiences.

SINCE my "Early Experiences" appeared in THE TELEGRAPHER, more than two years ago, I have been obliged to wait awhile, if I desired to give you my later ones, in order to let them accumulate. Meanwhile I had nothing to write of in THE TELEGRAPHER, as it is essentially devoted to one idea; and as I am the proud owner of one and a half, I like to have an opportunity of giving the half a chance occasionally.

Sitting within the narrow limits of my office day after day is not conducive to the development of much brilliancy, and if it was not for a message now and then a little out of the ordinary character, to vary the monotony of business, we operators would rust out. Before I knew anything of the business I anticipated much pleasant variety, and some gratified curiosity, in being the recipient of so many confidences, but how woefully I have been mistaken! With what a dreary sameness every message of a business character is written, and these constitute the large majority of the

whole? From force of habit, we unsentimental ones are so surprised when some anxious friend or fond lover sends a sweet word, regardless of publicity, that we say "Ha!" after our O. K., or "Pity about him or her!" as the case may be. Of course, if it was to one of us we should look upon it in an altogether different light.

I have learned a few things during my three years of telegraph operating. One is, that, as a rule, our offices are confined to very small quarters (at least in the city), I suppose for the reason that we need very little room for anything besides a desk. Other kinds of work you can leave for a while, or change your place; but with ours you must keep within hearing of the sounder, or else there is some sharp talk for you when you do answer. For the reason that we are compelled to be always on hand, the little space we occupy ought to be every way comfortable, especially as there are so many women in the profession. And this brings to mind what I have long thought, that eventually the whole of the work will pass into the hands of women. They are adapted for it in every particular, except, may be, as regards night work, which they could endure probably just as well as men; who find it none too healthy, and keep out of it when they can. In all, or most all other businesses, there is expected promotion; in telegraphy there is none, or the places are so few that there is no demand. An expert operator thinks a salary of \$100 per month a good one, while if he gave the same time and ability to another work he would be much better compensated. This is the real reason why so many young persons of both sexes take it up. A moderate salary suffices for their present wants; as for the future, they will look out for something that pays better.

It is the same in this as all other employments in which women are engaged, the pay is disproportional between their's and men's labor. A woman who gives as many hours, does her work under the same restrictions and obligations as a man, receives for it half as much pay. "But she is not equal to working long wires," they say. She has not been fairly tried. In the few instances we know of they have been fully able for the work assigned them. What woman cares to work a heavy wire with no better wages than she receives for a light one? The men would not ask for a choice if they profited so little by it. Within a few years telegraph schools have multiplied rapidly. There is hardly a city without one, and the young people are attracted by the comparative ease with which it is acquired to make it a help to defray their incidental expenses or a partial means of providing for their wants. Young girls or boys who have homes need just this much money to add a little luxury or amusement to their life, and telegraphy, costing but a trifle, is taken up temporarily. The old complaint, want of thoroughness, holds good here for both sexes. The better speller, penman, grammarian you are—in fact the more general information you have—the better prepared you are for telegraphic work. If the business of an office is responsible, it requires judgment and ability to do it well, and the more mature and better the business qualities of a man or woman, just so sure will the company he or she works for be benefited by them. The delay (except in bad weather), the mistakes in checks or otherwise, which too often are not noticed until the message reaches its destination, far or near, and numberless other little things, are almost always the fault of incompetent operators. They seem to forget that a telegram is sent instead of a letter, to hasten some proceeding or prevent some catastrophe, and that speedy delivery is expected.

In saying what I have, I do not mean to discourage any one who is looking forward to earning a living by telegraphy, but rather to inspire her and him with a desire to do every branch of it well, and without loss to themselves or their employers. M. H.

That Little Bill.

If a passer-by should notice a melancholy look on the face of a Dutch tailor, standing at the door of a certain building in this city, his dejected appearance may be accounted for by the following circumstances: A young telegrapher residing in an adjoining town obtained a more lucrative position with a New York company. Previous to his change of base he had entered into a contract with a resident tailor for a new coat, deliverable one week from date. The time having expired the coat was not forthcoming. "I could pay no puttons good enough. I wait ein week. I go py New York, and get somedinks dat is much petter ash I get here." Another week passed by with a similar result. "All delinings as I could get in dis town was no goot. I was peen to New York all retty, and he be done on Saturday, so help me."

The coat being finished eventually, the young man changed his boarding place instantly, and thought it would be no more than fair to keep the Dutchman waiting for his pay as long as he waited for the coat. The tailor didn't see it in that light, so on the next pay day he planted himself in the doorway to await the

departure of his victim. Dick had caught a glimpse of the obstacle at the door, and placed himself in the hands of his friends. They were swarthy linemen and equal to any emergency. While the Dutchman watched at the upper door, a rope was quickly tied around Dick's diminutive form, and in an instant he was dangling in the air, and was immediately landed safely on the sidewalk in the midst of a gaping crowd, with a week's pay safely stowed in his pocket. At five o'clock the occupants of the third floor filed out of the building, the Dutchman scanning each countenance closely. The man bringing up the rear proceeded to lock the door. "Vere ish dat leedle man vat you call him Deek?" "I dunno," was the response, and the last man locked the room and went home. The tailor—having seen his man, was confident, and suspecting that his creditor was being temporarily incarcerated to evade meeting him, he determined to stick it out. No one felt sufficient interest in the case to watch him, but it is generally supposed that he did not reach home till midnight.

How the British Government Telegraphs Pay.—An Increasing Deficit.

WE have been so long accustomed to hear of the vast benefit which society is to reap when Government takes possession of the railways, that one becomes curious to know what has been the result of their administration of the telegraphs. Well, certainly, after all that has been said in the way of blowing the trumpet of Government management, it is a matter of surprise to find that recent investigations have shown that their management of the telegraphs—a matter far more simple than that of the railways—has been anything but one of an encouraging character. Some time since we called attention to the fact that, although three or four years have elapsed since the Post-office authorities took possession of the telegraph lines of the country, the Treasury has not as yet paid the railway companies for the surrender of those lines which belonged to them. We have heard chairman after chairman, at the recent half yearly meetings, state that all attempts to obtain a settlement of their claims have been futile.

We know that last year a good deal of scandal was created, owing to the officious zeal of a gentleman connected with the Telegraph Department in applying towards its development a sum of money belonging to the Post-office revenue, and not condescending to wait for the constitutional sanction which is considered essential to the good government of public offices. The Post-office is again this year the mile cow of the Telegraph Department, for we find in a report just presented to Parliament that, practically, it is the Post-office which defrays the salaries of the officers engaged in that department. It further appears that, notwithstanding this friendly aid, the telegraphic net receipts have fallen short by £1,000 per week of the amount required to pay the interest on the purchase money. The original cost of taking over those lines was £3,000,000; but, as we have on a previous occasion shown, it is not likely to be less than £12,000,000, so that unless a considerable increase takes place in the telegraphic business the deficiency each week is likely to be much larger than it is at present. A good deal has been said of the tendency of railway companies to cook their accounts, and charge to capital what ought to be borne by revenue; but it will be seen from what we have already stated about the salaries of the officials in the Telegraph Department, that the Government have rapidly become adepts in the system of making things pleasant. To show this a little more in detail, we quote the report of the Comptroller and Auditor-General. Mr. Scudamore, as manager of the department, receives a salary of £300. Hearing this, one is inclined to protest against the injustice of paying such an officer as the Manager of a great State department a salary of a second or third class clerk in an ordinary counting house; but then Mr. Scudamore draws from the Post-office a salary of £1,500 per annum really for doing telegraph business. The Telegraph Department ought, in this case, to pay £1,800 per annum instead of £300; but, then, that would interfere with the object which the authorities have in view of showing how cheaply they can manage things. Again, Mr. Chetwynd receives a salary of only £25 from the Telegraph Department; but the Post-office makes up his salary to an amount worthy of his position. It is just the same thing in respect to the salaries of the bookkeeper (£100 per annum) and of chief examiner and cashier (£75 per annum each). The Auditor-General says he cannot think, however, that the known valuable services of these gentlemen in connection with the Telegraph Department are fairly represented by such payments. It is just the same with respect to the new buildings as it is with respect to the salaries—the Post-office bears the brunt and the Telegraph Department escapes almost scot free. The Auditor-General says:

"Under the votes for 'Post-office and Inland Revenue Buildings' considerable expenditure has for some years past been charged in respect of the building of the new Post-office, St. Martin's-le-Grand. In this building accommodation is provided, not only for the officials

of the Post-office, but also for the very numerous staff of the Central Station of the Telegraph Department; but no charge in respect of this expenditure has been raised either against the telegraph votes or the telegraph capital account, in the accounts submitted to me for examination; neither am I aware whether it has been taken into consideration in the annual account presented to Parliament under the provisions of the Telegraph Act of 1869. It, perhaps, may be intended to hand over the premises in Telegraph street for postal purposes, and to treat the accommodation thus afforded as an equivalent to that provided for the Telegraph Department in St. Martin's-le-Grand; but even if this should be the case, some independent evidence as to the value of the equivalent would appear to be desirable. It seems to me that I should fail in my duty if I omitted to point out that the Parliamentary account above mentioned undergoes no independent verification by the Exchequer and Audit Department, although it is the only account by which Parliament and the country are enabled to ascertain how far the telegraph revenue is equal to or exceeds the expenses of the management, the cost of maintenance, and the interest on the debt which the acquisition of the telegraphs has created. To do this with accuracy it would appear to be essential that this account should embrace, not merely the expenditure incurred by the Post-office itself, but also the expenditure which such acquisition has occasioned in other public departments."

We quite concur in these opinions, for when we hear it seriously proposed that Government should take over the management of the railways, it is not to be wondered at if we, on the part of the public, are desirous of seeing what has been the success of commercial departments administered by Government, that we may be able to judge how far the policy of State management in such enterprises ought to be allowed to proceed.—*The Railway News.*

The Telegraphers' Mutual Benefit Association.

Assessment No. 61, issued April 24, 1874—Death of George H. Everett.

GEORGE H. EVERETT (certificate No. 1,719, issued Dec. 9th, 1872), died at Tremont, O., March 26, 1874, of consumption.

Members holding certificates numbered up to and including No. 2,194 will please remit for above assessment.

Attention has been called to the last line on page 12 of the By-Laws. Several members understand by it that they must remit direct to the Secretary. Members will please erase the line referred to. Its publication was a mistake.

W. HOLMES,
Secretary.

J. D. REID,
Treasurer.

The British Postal Telegraph Service.

THE estimate of the amount required for the Post-office Telegraph Service for the financial year 1874-75 is £938,339, exclusive of the year's interest on the purchase money for the telegraphs; and the revenue for the year is estimated at £1,270,000. The expenditure is £80,000 more than in the year 1873-74. It includes £10,000 for telegraph extension works; this sum is stated at £50,000 in one place in the estimate, but it is twice stated as £10,000, and if it were £50,000 the total would be £978,339, instead of £938,339, which is declared to be the amount required to be voted. The wires used for public messages alone (exclusive of those which belong to the railway companies, and are used principally for railway and secondarily for public purposes) form a system of 99,842 miles; and the wires leased by the department to private firms or individuals for the transmission of messages on their own special business between offices and factories, and so forth, make a system of 5,730 miles. The total, therefore, is 105,572 miles—79,485 in England and Wales, 12,284 in Scotland, 13,803 in Ireland. There are 3,791 postal telegraph offices—2,744 in England and Wales, 447 in Scotland, and 600 in Ireland. The number of renters of private wires is 993—831 in England and Wales, 131 in Scotland, and 31 in Ireland. The department works submarine cables 420 knots in length, and having a total length of wire amounting to 1,258 knots; and there are cables 459 knots in length, and having a total length of wire amounting to 1,837 knots, which are the property of the department, but leased to and worked by the Submarine Telegraph Company. The year's estimate provides for the payment of £22,500 to railway companies as remuneration for the transaction of telegraph business at their stations on behalf of the Postmaster-General, under the 7th section of the 9th clause of the Telegraphs Act of 1868; also for a payment of £33,000 for maintenance of telegraphs by railway companies; and also £26,500 for annual rents, nominally for way leave, which the Postmaster-General has contracted to pay to certain railway companies, etc., as compensation, in full or in part, for the loss of their reversionary interests of every

kind in telegraph business, way leaves, pole rents, etc. The estimate again this year was submitted to the Treasury too late to be subjected to examination by that department before presenting it to the House of Commons.

Compliment to a Retiring Western Union Superintendent.

THE Houston (Texas) newspapers of April 21st give very interesting accounts of the presentation to Mr. D. P. Shepherd, who was about to retire from the position of Superintendent of the Seventh District of the Western Union Telegraph Company, of a splendid gold watch from his subordinates. The following from the *Houston Daily Telegraph* gives a brief and interesting account of the affair:

Shortly before 10 A. M. on Sunday morning a number of gentlemen dropped into the office of the Western Union Telegraph, to get some "undelivered telegrams," as they expressed it. Capt. Shepherd was all smiles and met his friends cordially, while the employes seemed busy enough at their duties and instruments. Among the seekers for despatches we noticed C. W. Pescay, Esq., Col. A. B. Small, President Texas Express Co., Capt. E. R. Wells, G. W. Gregor, A. J. Shepherd, Charlie Martin of the *Age*, and several others. It seemed as though all the "masters of the mystic wire" were on duty, as we noted the presence of Capt. Bleakley, E. B. Vosburgh, D. W. H. Voorhees, Mr. More, and others whose names escape us now.

As soon as the telegrams were delivered, Sam W. Small of the *Telegraph* stepped toward Mr. D. P. Shepherd, the retiring Manager of this district, and in a few words presented him with a splendid gold watch as a testimonial of esteem from his subordinates.

Mr. Shepherd received the gift in a few feeling and expressive words, saying that he could not make a speech, but that he would keep sacred and cherish the token as long as he lived. He was so taken by surprise that he could scarcely control his feelings. He appreciated thoroughly the kindly sentiments which prompted the gift, and would never prove unworthy of them.

The watch is a magnificent gold stem winder of the latest pattern, made by Chas. E. Jacot, and worth at cost price \$275 in gold. Upon the inside of the case the following inscription is beautifully engraved:

"Presented to D. P. SHEPHERD as a Token of Esteem by his subordinates connected with the 7th District of the W. U. T. Co., Houston, Texas, April, 1874."

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

An American Society of Electric and Telegraphic Engineers Proposed.

CHILLICOTHE, OHIO, April 25th.

TO THE EDITOR OF THE TELEGRAPHER.

I WOULD like to ask a question, thorough the columns of THE TELEGRAPHER, for the careful consideration of our American telegraphers. Let all think it over and speak out.

Why can't we have a *Society of Electric Engineers* in this country as well as our neighbors across the Atlantic?

We have abundant material out of which one might be composed, and one, too, that would be creditable to ourselves and our country. No one can deny but that such a society would be highly beneficial in promoting the science of electricity. Only within the last few years has this science received much study or attention at the hands of our telegraphers. Rapid progress, however, is being made at present, and a Society of Engineers is just the thing most needed. Here are a few names to begin with:

- Moses G. Farmer, Newport.
- George A. Hamilton, Boston.
- Frank L. Pope, New York.
- A. S. Brown, "
- Geo. B. Scott, "
- George Little, Rutherford Park.
- Dr. L. Bradley, Jersey City.
- W. D. Sargent, Philadelphia.
- David Brooks, "
- D. Brooks, Jr., "
- W. W. Smith, Indianapolis.
- C. H. Summers, Chicago.
- C. H. Ha-kins, Milwaukee.
- S. D. Field, San Francisco, and a host of others.

They can be found in almost every part of the country, from the Atlantic to the Pacific. There is no

good reason why a society should not be formed at once. Let us hear from all interested.

I. N. MILLER.

Congress and the Telegraph.

WASHINGTON, D. C., April 29, 1874.

TO THE EDITOR OF THE TELEGRAPHER.

THERE have been some matters in connection with telegraph affairs occurring here in the last fortnight worthy of record in THE TELEGRAPHER.

You had last week a notice of the passage by the House of the bill introduced by Mr. Giddings, of Texas, for the better protection of the Texas frontier from Indian and Mexican depredations by connecting the military posts there by telegraph. Originally this bill appropriated \$200,000 for this purpose. Mr. Hawley and Mr. Garfield both moved to reduce the amount to \$60,000, but finally it was fixed at \$100,000, and passed in this shape. It is now pending in the Senate.

A bill was introduced in the House, on Monday of last week, by Mr. McCormick, to protect lines of telegraph constructed or used by the United States from malicious injury or obstruction, which was referred to the Committee on Military Affairs. It provides that any person or persons who shall wilfully or maliciously injure or destroy any of the works, or property, or material of any telegraphic line constructed or in progress of construction by the United States, or that may be hereafter constructed or owned, occupied or used by the United States, or who shall wilfully or maliciously interfere in any way with the working or use of any such telegraphic line, or who shall obstruct, hinder or delay the transmission of any communication over any such telegraphic line, shall, on conviction thereof, be deemed guilty of a misdemeanor, and be fined not less than one hundred nor more than one thousand dollars, or with imprisonment for a term not exceeding three years, or with both, in the discretion of the Court.

Mr. Edmunds, on Friday last, by unanimous consent, introduced a bill to provide for a commission on the subject of postal telegraphy, which was referred to the Committee on Post-offices and Post Roads, and ordered to be printed. The bill provides "That a commission, to make personal examination and inquiry into the workings and expediency of a system of postal telegraphy, is hereby created, and the same shall consist of three persons, to be appointed and selected as follows, namely: the President shall, within thirty days from the passage of this act, designate an officer of the army above the rank of major, an officer of the navy above the rank of lieutenant-commander, and some person who shall not have been in the employ or interested, directly or indirectly, in any telegraph company or association, but who shall be well informed and practiced in the science of telegraphy; and the said persons, having been designated by the President as aforesaid, shall proceed to make such examination as may be deemed proper, and shall report the facts ascertained by them to Congress."

The House Committee on Appropriations have had under consideration the subject of postal telegraphy, and, after hearing Mr. Gardner Hubbard repeat his stereotyped arguments in advocacy of his scheme for a partnership between his proposed Postal Telegraph Company and the Government, in the telegraph business of the country, postponed the further consideration of the subject to May 12, when Mr. Lowry, of New York, will appear on behalf of the Western Union Telegraph Company.

The *Chronicle* newspaper, of this city, which is an advocate of an exclusive government ownership and management of the telegraphs, is uncharitable enough to assert that Mr. Hubbard is a cat's paw for the Western Union Company, and that this pretended opposition is merely a sham. This may have been what called forth Mr. Edmund's bill, which is given above in this letter. However that may be, it is conceded that nothing practical will be done by this Congress in the matter.

Mr. Hubbard, in addition to his telegraphic projects, is employed by the Combination of Bank Note Engravers and Printers, which is endeavoring to take the work from the bureau here, and divide it between them. In this case private companies can do the work more cheaply and advantageously than the government, according to Mr. Hubbard; but the same oracle sings quite another tune in regard to telegraphy.

Cornell Jewett has had an opportunity, so dear to his heart, of making an appearance before the Senate Committee on Foreign Relations, and getting his name in the newspapers, in advocacy of his bill asking for charter rights for ocean cables between the continents of Europe, Asia and the United States. Jewett pretends to represent, indirectly, the United States Direct Cable Company, which will lay the cable to New Hampshire this summer, as well as certain mythical parties, who he asserts are ready to invest \$24,000,000 in the cable, if Congress will only pass his bill.

This Jewett is one of the perpetual annoyances of Congress, and the newspaper representatives here, and

always turns up with some enormous scheme which amounts to nothing eventually. Congress has once or twice passed bills which he has had presented, but in no instance have they been availed of. In 1867 an Act was passed giving an American company, with which Jewett claims to have been connected, the right to lay and use cables on the Atlantic coast, except the coast of Florida, but no cables have been laid under it. He desires now to obtain more extensive grants, under the plea of anti-monopoly, which, should be he successful, he will endeavor to dispose of to foreign capitalists. It is sufficient to damp any enterprise in the minds of practical men that he should be either really or ostensibly prominently connected with it.

I do not write these things in the interest of any monopoly, but have no patience with such fellows as Jewett, who make a business of seeking to obtain from Congress concessions to dispose of to the highest bidder.

In his so-called argument before the Committee, the animus of the proposed bill was shown by the statement that, as neither Congress nor the people would aid cables, foreign capitalists, *joining American* (Jewett's) interests, desired special charter rights before risking \$24,000,000, necessary for the proposed cables, subject to a cable policy to be agreed upon between foreign nations and our own Government.

In the Supreme Court of the United States a decision was given on Monday of last week in the case of J. P. Humaston, plaintiff in error, vs. The American Telegraph Company. This is the case in which the American Telegraph Company, subsequently consolidated into the Western Union Company (the real defendant in the case), was sued under a contract in regard to the purchase of an Automatic System from Humaston. It was originally tried in the Circuits Court for the Southern District of New York, which gave a decision in Humaston's favor, but awarded only a small amount of damages. From this the plaintiff appealed to the Supreme Court. Mr. Justice Davis delivered the opinion of the Court, affirming the judgment of the Circuit Court, with costs and interest.

Prof. Royal E. House, the inventor of the House Printing Telegraph Instrument, has been in the city for several weeks past. It is understood that he is here attending to some business with the Patent Office. The Professor is in excellent health and spirits, and wears his years and honors lightly. CAPITOL.

California Personals.

CALIFORNIA, April 16.

TO THE EDITOR OF THE TELEGRAPHER.

THE following particulars in regard to the *personnel* of Mr. F. L. Vandenberg's able staff of operators on the Atlantic and Pacific wires may not be without interest to some of your Eastern as well as Pacific coast readers. There is not a "plume" among them:

Mr. H. M. Bennett takes report at "S. F.," and has "Og" den hoop it up, for when Harry gets on a "B" "n" der he wants "30," and is not backward about asking "Og" every twenty words for it either.

Mr. Tom R. "K" nox turns button and copies report in "S" acramento. In the railroad office "H" we hear J. A. "R" obin working as division operator, and the attentive Mr. Tom R. Jones, who "O" verses the overland and 2 of the way wires over the Western and Vallejo divisions C. P. R. R.

We are all interested in the communications from your correspondents on the League Question, but we are beginning to think that it's a superabundance of smoke, with too little fire. P. LUME.

Personals.

MR. ARMON SOPER has resigned his position with the Western Union Telegraph Co. as operator at San Bernardino, Cal., and has returned to his home at Bowmanville, Ontario, Canada.

MR. W. A. BOWEN has accepted the position of operator at San Bernardino, Cal., with the Western Union Co., vacated through the resignation of Mr. Armon Soper.

MR. CHARLES MATTHIAS, of 173 Smithfield Street, Pittsburgh, Pa., desires the address of Mr. LEW FISHER, who worked in the Pacific and Atlantic office in that city in August or September, 1873.

MR. JAMES F. FARRELL, formerly of the Virginia, Nevada, Western Union office, has been appointed Manager of the Carson, Nevada, office of the same Company.

MR. DAVID COWEN has been transferred from the Steamboat, Nevada, to the Carson, Nevada, Western Union office.

MR. C. W. STOVER has resigned the position of Manager of the Western Union Telegraph at Rochelle, Illinois, to engage in other business.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, MAY 2, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Bound Copies of Volume IX for Sale.

WE have a few copies of Volume IX of THE TELEGRAPHER, handsomely bound, which may be obtained, if applied for soon, at Five Dollars per copy. The number of these is very small, and those who desire to get them must apply soon, or the opportunity will be lost, as, once disposed of, we cannot duplicate them—some numbers of that volume having been exhausted.

The Currency Inflation Question and Telegraphic Prospects.

UPON the passage of the Act providing for inflation of the currency by the U. S. Senate, and in view of its almost certain passage in the House of Representatives, and the probable approval of the President, we made some remarks and suggestions in reference to its effects upon telegraphic interests. The action of the House confirmed the general expectation; but, contrary to the almost universal anticipation, the President—as we think very wisely and very properly—interposed his veto, and the mischievous policy was defeated.

It cannot be denied that there has been a very general feeling of relief that the danger which was so imminent has been avoided, and the country to-day occupies a far better position than it would had the President yielded to the pressure brought to bear upon him, and either signed the bill or permitted it to become a law by neglecting to either sign or veto it, as he might have done. As we conceded in the article referred to it is not our province or desire to discuss in these columns national financial policies, except in so far as they concern telegraphic interests. That the telegraphic interests of the country could be permanently benefited by such a policy as that sought to be inaugurated by this Act, we do not believe; and, although for a comparatively brief season, they might have participated in an unhealthy and illusive exhibition of prosperity, they must have suffered severely in the end, and participated in the general depression and prostration which would have inevitably followed its adoption. The situation as it is is sufficiently difficult, but, with a wise national financial policy, it will gradually improve, and the returning prosperity will have a substantial basis, and if not so rapid as might be desired, will be more satisfactory and more likely to

be lasting, than if based upon an additional issue of irredeemable promises to pay.

It is now probably too late in the season to look for any very marked development of the spring trade, and we do not anticipate that there will be a very pressing amount of telegraphic business during the spring and summer months. Still there is even now an improvement noticeable in the patronage of telegraph lines, though the business offering is by no means equal to that of previous seasons. We may, however, look for a slack spring and summer business, but the indications are that the fall business will show a decided recovery. It being settled that there is no probability of any material disturbance of the currency for some time to come, our business men can act with more confidence, and make their arrangements with less danger of finding themselves unexpectedly involved in loss through fluctuations in the currency. This will in turn furnish patronage to telegraphs, and create an additional demand for telegraphic facilities and services. The fall business is likely to be moderately active, and the worst effects of the late panic will have then passed away, and we hope the country will have started on a new era of real prosperity, in which, of course, the telegraphs will share.

It is not probable that there will be any very extensive additions to telegraphic facilities during the present season, though some additions to the lines of existing companies will be made. Telegraph managers and investors as well as others are inclined to be conservative, and will, no doubt, judge it best to wait a while for developments before making any very important moves. It is not a favorable time for inaugurating new telegraphic enterprises, and we doubt whether any can reasonably be looked for this year. With reviving prosperity and renewed business activity new telegraphic ventures will be made, and all concerned must wait with such patience and resignation as they may for the good time coming. That it will come they may be assured, and delay now will doubtless in the end prove beneficial.

The New Atlantic Cables.

THE new telegraph cable of the Anglo-American Company will be laid during the summer, landing at Newfoundland, and the cable of the United States Direct Cable Company, which is now being shipped on board the SIEMENS BROTHERS' new cable steamship, the Faraday, will be laid, the western end of which is to be landed on the New Hampshire coast. These are likely to be the two most important telegraphic events of the season, so far as this country is concerned. When the new company gets its cable in operation there may be some competition between it and the Anglo-American Company, although, unless the Direct Cable Company can develop some more speedy method of transmission of signals than that now in practice, it would not seem to stand very much show in a competition with its single cable against the five of the former company. Doubtless there will be in time work enough for all the cables; whether it will be profitable or otherwise, of course, depends upon the rates of tariffs which may be adopted. If competition should reduce these to the amount which some of our over sanguine and unreasoning newspaper writers anticipate, the profits will necessarily be inappreciable. As the capital invested in these enterprises is furnished in Europe, and mainly in Great Britain, perhaps it is unnecessary for us to trouble ourselves about the profits of the stockholders, so long as we profit by low rates for telegraph service. It must be remembered, however, that losing tariffs can never be permanent, and that what the patrons of cable telegraphs may temporarily gain by such tariffs will have to be made up hereafter in increased charges. No provisions against consolidations or tariff combinations between the competing companies can prevent this, notwithstanding the assertions of that blatherskite CORNELL JEWETT, at Washington, to the contrary.

In this connection it may not be amiss to state that

representatives of the United States Direct Cable Company disavow any connection of JEWETT with that enterprise or company, notwithstanding his recent attempt by the introduction of a ridiculous bill authorizing him and some mythical associates to lay and operate an Atlantic and a Pacific cable, in which reference is made as though from some authority or connection with the Direct Cable Company. It is but justice to that company that this should be stated, for it certainly will neither advance its interests or credit to have it supposed that he represents them even incidentally and indirectly.

The Weather and the Telegraphs.

If the northern and eastern sections of the country are entitled to any spring, they are this year being defrauded of their dues. Rain, hail and snow, with not infrequent and protracted gales, have characterized April even to its close, and if the May flowers depend upon the traditional April showers to bring them, they certainly will not put in their appearance this year. The closing days of April witnessed the heaviest snow storm of the winter and spring in some parts of the north and east, and rain in unlimited quantities in all parts—north, south, east and west. The weather has delighted our friend Mr. DAVID BROOKS, and his "tests of insulators" have been sufficiently frequent and complete to give him a season of unalloyed happiness. He has favored us with another "test," which will be found in the appropriate column, and which will be valuable and interesting reading to telegraphers and electricians. The constant and protracted soaking the lines have had during the month just closed has severely tested the different styles of insulation in actual use, and some contributions on this subject from the telegraphic brethren are now in order.

The rivers in the south and west are up, and the streams in all directions are filled to the highest high water mark, and, in many cases, even beyond it; and the telegraphs, especially in the south, have suffered very severely from this cause. It is to be hoped that JUPITER PLUVIUS will soon "let up" on us, or we shall need NOAH'S old tub to save a remnant of the great American people.

One extreme follows another—"man never is but always to be blest"—and in a few weeks we shall all be complaining because it is so hot and—dry. Atmospheric electricity will then be playing mischief with the telegraph wires, instruments, offices and operators, and there need be no fear that we shall be deprived of opportunities for dissatisfaction and grumbling.

A Sad Affliction.

WE regret to learn that President ORTON, of the Western Union Telegraph Company, whose departure for Europe, in hopes of obtaining improved health and recovery from nervous and physical prostration, caused by the excessive labor and responsibility of his official position, we recently recorded, has met with a very severe affliction. His youngest son Samuel, about three and a half years old, was taken with scarlet fever, which terminated fatally.

It was understood that Mr. ORTON'S health had been somewhat benefited by the trip, although he was not in a condition to undertake much labor, either physical or mental. Mrs. ORTON suffered so severely on the outward trip that it was feared she would not survive it, had it continued even a short time longer.

They intended to have gone to London, and from thence to Paris, but the sad affliction which has befallen them will prevent carrying out the plan. It is understood that they will immediately return to the United States.

Mr. ORTON and his family will have the kindly sympathy of all telegraphers in this affliction, which is the more severe, coming as it does when he is so ill-able, physically, to endure it. We trust that he may return in better physical condition than the latest advices from him indicated.

Agents for The Telegrapher.

OWING to the pressure upon our columns we have been obliged, for some time past, to omit the publication of the list of Agents of THE TELEGRAPHER, but, in fact, no special announcement or authorization is required. As the subscription is paid in advance, any person can act as agent and solicit and forward subscriptions to the paper.

In addition to the friends of THE TELEGRAPHER in Canada, who have kindly aided in extending its circulation heretofore, Mr. C. W. HURLBERT, of the Montreal Telegraph Company at Collingwood, Ontario, will act as agent, and subscriptions may be made through him.

Mr. GEORGE L. SPARKS, of the Pennsylvania Telegraphic Agency at Waverley Heights, Pennsylvania, will also receive and forward subscriptions.

We commend these and all others who may interest themselves in obtaining subscriptions to the favor of the fraternity, and hope that we may receive a material addition to our list through their efforts.

We allow to those who may interest themselves in obtaining subscriptions, who desire it, a commission of 20 per cent. on the amount collected, to defray expenses, etc., for postage, and in lieu of club rates.

The dull season is at hand, and special effort will be required to continue the increase of subscribers, and we hope that every friend of an independent American telegraphic journal will bear this in mind, and give to THE TELEGRAPHER the benefit of their exertions in its behalf. The success of the paper has been very flattering and creditable to the telegraphers of this country. Let no effort to make this success more marked be spared. We are trying to make the paper a good one, and have reason to believe that in this we have not been entirely unsuccessful. It should be read and paid for by every person interested in telegraphic pursuits.

Specimen copies will be furnished to individuals or canvassers gratuitously upon application.

The Telegrapher.
By Cable.

THE UNITED STATES DIRECT CABLE BEING SHIPPED.

LONDON, April 25.—The new cable steamship Faraday has commenced to load the new Atlantic cable, of the United States Direct Cable Company, which is to be laid to Rye Beach, New Hampshire, via Nova Scotia.

Interruption of the Cuba Cable of 1873.

RECENTLY the Cable from Key West, Florida, to Havana, Cuba, of the I. O. C. Telegraph Company, which was laid in 1873, failed. The tests made show the location of the fault as about 12 miles from Havana.

Mr. George B. Prescott, the electrician to the company, and Mr. William Mackintosh, foreman of repairs, sailed for Key West two weeks since to under-run the cable and repair the difficulty, but, at the last advices, had been unable to accomplish anything owing to the unfavorable condition of the weather.

By direction of the Secretary of the Navy, Admiral Scott placed one of the vessels attached to the Gulf Squadron at the service of the company, and on the 25th ult. an attempt was made by Mr. Prescott to underrun the cable, but on account of a gale coming up the party were obliged to abandon the effort for the time and return to Key West. The old cable is still working, however, and the transmission of business is not interrupted.

The New Philadelphia Office of the Philadelphia, Reading and Pottsville Telegraph Co.

THE main office of the Philadelphia, Reading and Pottsville Telegraph Company, at Philadelphia, has been removed from the corner of Third and Chestnut streets to the National Fire Insurance building, No. 204 South Fourth street, a central and eligible situation.

The first floor of the building has been handsomely fitted up, at considerable expense for the occupation of the company. A fine walnut counter extends along the front of the room for the accommodation of the customers and clerks, which presents a neat and tasteful appearance. The partitions, desks, tables, etc., are all of heavy walnut, and the new office is one of the neatest and best arranged of its kind in the city. The

tables for the operators are of the well-known and favorite Western Union pattern, each table having four instruments.

The office connections and wires are run in a cable from the line wires at the window to the Switch board, and from the Switch board to the instruments making a really handsome appearance.

This company is doing an excellent business, its wires extending along the entire length of the Philadelphia and Reading Railroad, and through connections with the Franklin and other lines, business is transmitted to all parts of the country.

There is also a local telegraph having thirty-one stations in different parts of the city, including Germantown, Frankford and Manayunk.

Mr. C. T. Sellers is the Superintendent, and Mr. H. W. Spang Asst. Supt. of this company, their headquarters being at Reading, Pa. Mr. O. W. Stager, who has been in the employ of the company for several years, and who is an able and experienced telegrapher and manager, is its manager in Philadelphia. The company, the public, and the manager and his subordinates are to be congratulated at having at length secured adequate and comfortable accommodations for their large and increasing business.

GALVANOMETRICAL MEASUREMENT OF INSULATORS

At the BROOKS INSULATOR WORKS, Philadelphia, April 25th, 1874, in Rain.

Constant of Galvanometer 4,200 through a million of units, with 100 cells Calland.

Description and Number of Insulators.	Date of Exposure.	Deflection by Insulator.	Resistance in Siemens Units.	Date of First Measurement in Rain.	Resistance in Siemens Units.
10 Porcelain (French Administration Standard)	Mar. 1, 1868	21	100,000,000	Apr. 7, 1868	No deflection.
10 Western Union Glass, with painted brackets.	" "	350	12,000,000	" "	83,000,000
10 West. Union new style (the wire at top)....	" " 1872	300	14,000,000	Mar. 10, 1872	116,000,000
20 Kenosha on Brackets....	Nov. 1, 1872	350	12,000,000	Nov. 6, 1872	2,300,000,000
10 Brooks in cross arm....	Mar. 1, 1868	1	4,200,000,000	Apr. 7, 1868	No deflection.

The foregoing table gives the resistance of the insulators when first exposed, and also extent to which their insulating properties have been reduced by exposure.

Foreign Telegraphic Notes.

THE receipts of the Submarine Telegraph Company for the month of March, 1874, amount to £9,000 against £8,447 for the corresponding month of last year.

ADVICES from Panama of April 16, state that it was officially announced there that the Cuban Cable was repaired, and that direct communication had been established between the Isthmus and New York, a message requiring only a few hours for transmission, but up to that date there had been no actual proof of the truth of the assertion. Telegraphic dispatches which should have arrived on the 8th had not yet come to hand.

KINGSTON, Jamaica, advices state that cable communication is reopened between the West Indies and the United States, as also Central and South America, so that communication is direct and prompt.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended March 17, 1874, and bearing that date.

148,667.—ELECTROLYTIC APPARATUS.—Evans Casselberry, St. Louis, Mo., and Nathan H. Edgerton, Philadelphia, Pa. Application filed April 19, 1873.

The terminal points or electrodes within the liquid are increased until a path is furnished, the current to the point of action having a minimum of resistance, thus utilizing the greatest amount possible for electrolysis.

The apparatus for electrical decomposition, consisting of a decomposing tank or receptacle and the bifurcated or divided conductors within such receptacles, substantially as and for the purpose described.

148,768.—PRINTING TELEGRAPH.—John E. Smith, New York, N. Y. Application filed August 23, 1872.

Unison stop. Improvement on stop in patent 127,111. Unbalanced stop lever J, loose on shaft, moves by gravity to engage pin on type escapement wheel, and is released therefrom by blow from lever O, pawl n and ratchet preventing recoil. Index affixed to show proper adjustment of spring of escapement lever.

1. The combination of the gravitating or unbalanced unison lever J, the pawl n, the ratchet wheel I, of the train of gear connected with the type and escapement wheels, the pin m, the armature lever O and the magnet H', substantially as and for the purposes herein set forth.

2. The combination of the index V, the scale W, the pulley T and the belt U with the adjuster R and spring S of the escapement pallet G, essentially as and for the purpose specified.

For the week ended March 24, 1874, and bearing that date.

No. 148,833—FIRE ALARM TELEGRAPH APPARATUS.—John F. Kirby, Boston, assignor to himself and Frederick William Nichols, Lynn, Mass. Application filed December 31, 1873.

Adjoining signal box is a closet, into which a person desiring to give an alarm, and not having a key to open the box with, enters, closes, and throws a bolt which passes into the signal box, starting it, at the same time locking himself in for a time, so that he may be detained until the correctness of the alarm be ascertained.

In combination with a signal box, a door attached to a suitable closet, and provided with a mechanism for locking such door from the inside, and at the same time operating the signal box, and a mechanism for preventing the closet from being opened until the expiration of a predetermined time, substantially as and for the purpose set forth.

148,910—COMPOSITION FOR COATING TELEGRAPH WIRES.—Alexander Wilkinson, London, England. Application filed February 20, 1874.

A preserving compound for telegraph and other electric wires, composed of white lead, pitch (or rosin or tar), japan, shellac or its equivalent, tallow, naphtha and oil, in or about the quantities specified, and capable of being applied either directly to such wire or wires, or by application to any fibrous or textile material covering said wire or wires, or by saturating such fibrous or textile material previous to enveloping the wire or wires, substantially in the manner and for the purposes specified.

148,938—FAC-SIMILE TELEGRAPH.—Francis De Houdt, Chicago, Ill. Application filed July 15, 1873.

Clock work revolving, transmitting, and receiving cylinders controlled by a verge attached to a polarized armature. To shaft carrying escape-pin taking into verge is fixed a mechanical pole changer; gives an intermittent rotary motion to the cylinders, but secures their unison. Message written in insulating ink on foil. While stylus travels over foil, a short circuit is made, which is broken by insulating ink, sending current over line.

1. The combination of an electro-magnet having a vibrating polarized armature, fitted with a verge and a mechanical pole changer, operated by a train of wheel work, the verge vibrating clear of the wheel work when the circuit through the magnet is unbroken, but when the circuit is broken the wheel work is arrested at half a revolution of the shaft thereof, substantially as and for the purposes set forth.

2. The combination, with a single train of wheel work, of an electric circuit, which governs the escape of the train, and a transmitting or message writing mechanism, operated by the same single train, substantially as specified.

3. In an electric chemical copying telegraph, the two independent circuits, one to govern the motion of the mechanism, and the other to produce the chemical effect, in combination with the transmitting and receiving mechanisms, substantially as specified.

4. The cam-shaft A'a, actuated by the trains to vibrate the lever c, carrying the battery terminals e, the adjustable sleeve f, fitted with projections g, and the verge lever D, vibrated by the armature C of the magnet B, combined, arranged, and operated substantially as specified.

5. In combination with the arm or style lever G and screw m, the jointed nut h, substantially as and for the purpose specified.

148,946—PRINTING TELEGRAPH.—Merritt Gally, Rochester, N. Y. Application filed February 23, 1874.

Reciprocating sending key, transmitting both for code and printing receivers simultaneously. Balanced frictional escapement key ping motor uniform.

1. In a telegraphic manipulator or transmitter, the combination of an index and a reciprocating key, substantially as set forth.

2. The combination, with a reciprocating transmitter, of a reversible index, substantially as specified.

3. A transmitter having two keys or sets of keys, each key or set of keys representing the same characters as the other, and capable of being operated for alternate transmission, substantially as specified.

4. The combination, in a telegraphic transmitter, of varying groups of conductors, and a single key with a series of contact points, the depression of the key at any letter of a provided in-

dex producing the proper contacts for causing the representation of that letter.

5. The combination, with a single key in a telegraphic transmitter, of varying groups of conductors for signal or code transmission, and additional sets of conductors for transmitting to dial or printing instruments, substantially as specified.

6. The combination, with a type wheel, of rack and gear C⁴ and a reciprocating key, substantially as set forth.

7. A printing mechanism having a movement for placing the position of the lines at the end of each line printed, instead of moving the material to be printed upon, substantially as specified.

8. The combination, with key D², or equivalent, having conductors for dot and dash alphabet, of a printing copier which is operated directly or indirectly by the transmitting manipulation, or in connection therewith, substantially as set forth.

9. A type wheel with two parallel faces, either of which may be used by rocking the wheel from side to side upon its centre of revolution, substantially as specified.

10. The combination, with a circuit closer for transmitting or receiving through the main line, of the local circuit R L, which is thereby mechanically kept in unison with the transmitting pulsations, substantially as specified.

11. The combination of adjustable devices, whereby the stopping of any of the parts propelled by the motor secures a uniform tension upon the motor, and therefore a uniform velocity, substantially as specified.

12. The adjustable stop lever M, or equivalent, substantially as and for the purpose specified.

13. The winch T, with conducting and non-conducting bearings for safety circuit, substantially as specified.

148,956—MAGNETIC TELEGRAPH APPARATUS FOR STUDENTS' USE.—William Humans, Cambridge, Mass. Application filed February 7, 1874.

Permanent magnet pivoted and depressed by a key until its other end is brought sufficiently near the sounding part to attract the same.

In a magnetic sounder, the combination of spring key e, a lever, b, a lever, i, with its bar h and spring m, and lever stops n o, the bar h or lever b being a steel magnet (or both being steel magnets), and the construction and operation being substantially as described.

Born.

LYON.—At Newark, N. J. April 21st, to FRANK G. LYON, of the Gold and Stock Telegraph Co., New York, a son.

Married.

WHEELER—NEALLEY.—At Salem, Oregon, April 9, by the Rev. S. C. Adams, Mr. A. F. WHEELER, Manager of the Western Union Telegraph, in that city, to Miss LAURA NEALLEY of Dallas, Oregon.

The matrimonial epidemic seems to carry off the Oregon telegraphers very rapidly, and a fresh importation of telegraphic bachelors will be required to keep up the supply. The last happy man is a good fellow, and deserves his good fortune. His few remaining unmarried telegraphic associates offer him and his bride their sincere congratulations, and will imitate his example at an early day.

Died.

ORTON.—On Sunday evening, April 26, of scarlet fever, SAMUEL VANCE, youngest child of William and Agnes Orton, age 3 years and 6 months.

GEO. W. RICHARDS.

THE

TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"

"History of America," "Civil War in America;" Member

of many Scientific and Learned Societies of Europe

and America; Commander of the Order of Dan-

nebrog, Denmark; Order of St. Olaf,

Norway, and of the Sword Order,

Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Mnschonbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Crnikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Oersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, scaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinhell, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

IMPORTANT!

We want all desirous of purchasing LEARNERS' INSTRUMENTS to know that the Sounder and Key of our PEERLESS SETT can be detached from the base and worked separately. An advantage not enjoyed by any other instrument of its kind.

PENNA. TELEGRAPHIC AGENCY, WAVERLY HEIGHTS, PENN.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

WATTS & CO.,

Box 5278, NEW YORK.

SMITH & HALL,

Mont. Telg. Co., Hamilton, Ontario,

Agents for Canada.

SPECIAL NOTICE.

That

"THE BEST IS ALWAYS CHEAPEST"

is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50

BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.

Acknowledged to be a decided improvement.
Price, same as the ordinary key.

Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,

at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

TELEGRAPH INSTRUMENTS,

splendidly finished, and mounted on highly polished Rosewood Bases.

- RELAYS unequalled for beauty and strength.
- GIANT SOUNDERS, without a rival for clear, loud sound.
- STRAIGHT and CURVED LEVER KEYS, warranted not to stick.
- REGISTER SPRING and WEIGHT, of approved patterns.
- POCKET RELAYS, in Hard Rubber Cases; new style.
- BOX RELAYS, with or without Keys on base, a specialty; superior in all respects.
- IMPROVED COMBINATION INSTRUMENTS for main line.
- RELAY, SOUNDER and KEY on same base, making an elegant set.
- WILSON, HASKIN, WESTERN UNION and PLUG CUT-OUTS.
- HASKIN'S AUTOMATIC REPEATERS, LIGHTNING ARRESTERS, GROUND, BATTERY and REPEATING SWITCHES.
- WESTERN UNION (new style) SWITCH BOARDS.
- ELECTRIC BELLS, single or vibrating stroke.
- MEDICAL INSTRUMENTS, cheap and reliable.

- AGENTS FOR
- KIDDER'S MEDICAL APPARATUS,
 - JONES' LOCK SWITCH BOARDS,
 - HILL'S ANNUNCIATOR and FIRE ALARM,
 - PUTT'S MECHANICAL INSTRUMENTS,
 - UNITED STATES ELECTRIC GAS LIGHTING APPARATUS.
 - POPE'S RAILWAY SIGNALS,
 - SELDEN'S PRINTER,
 - ANDER'S MAGNETIC DIAL and PRINTER.
- GROVE, CARBON, BUNSEN, DANIELLS, LECLANCHE, LOCKWOOD, CALLAUD, SMEE and GRENET BATTERIES.

- AGENTS FOR
- HILL'S and the EAGLE BATTERY,
 - KERITE and GUTTA PERCHA WIRES and CABLES.

- AGENTS FOR
- MOJRE & SONS' and PHILLIPS' MAGNETIC and OFFICE WIRES.

- AGENTS FOR
- ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK, and AWL CLIP.

- AGENTS FOR
- WASHBURN & MOEN'S celebrated GALVANIZED WIRE; also, AMERICAN COMPOUND WIRE.

- AGENTS FOR
- BROOKS' INSULATORS,
 - KENOSHA INSULATORS,
 - SCREW GLASS INSULATORS,
 - TELEGRAPH POLES,
 - BRASS ECCENTRICS,
 - HAND VICES,
 - STEEL CLIMBERS,
 - STUBBS and PATENT PLIERS.
 - VAUGHAN'S AUGURS and TOOLS in variety.

- SULPHATE OF COPPER, NITRIC ACID, SULPHURIC ACID; the finest in the Market.

- TELEGRAPH BOOKS, MESSAGE PAPER, REGISTER PAPER, and STATIONERY.

- SECOND HAND RELAYS, CUT-OUTS and REGISTERS very cheap.

Repairing and Model Work promptly attended to.
Bliss' Manual and Price List furnished free on application.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.
This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.
This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.
These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.
Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved, and superior
PRINTING TELEGRAPH INSTRUMENTS
manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES
constructed in the best and most substantial manner, and on reasonable terms.
Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.
For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.
S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).

COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over 15 per cent. the number of poles and insulators required.
Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring
EFFICIENCY AND RELIABILITY.
Address—
American Compound Telegraph Wire Co.,
ALANSON GARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.
MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.
OFFICES:
114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.
MAGNETO-DIAL TELEGRAPH
in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up
THE ELECTRO-MAGNETIC WATCH CLOCK,
which is the best watchman's time recorder in the world. Also,
ELECTRIC AND CONTROLLED CLOCKS
of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
OF
EVERY DESCRIPTION,
38 VESEY STREET, New York.
NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

RELAYS,
SOUNDERS,
REGISTERS and KEYS.

In addition to these, we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,
For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.
Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.
BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for
HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.
Sole Agents for the
EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Descriptive Circulars and Price List forwarded upon application to

F. L. POPE & CO.,
(P. O. Box 5503.) 38 VESEY STREET.

TILLOTSON'S ELECTRIC BELLS AND ANNUNCIATORS.

OFFICE WIRES, MAGNET WIRES, of every variety.
SUBMARINE and SUBTERRANEAN TELEGRAPH CABLES, all sizes, on hand and made to order.

L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK.

REDUCTION OF PRICES.

POPULAR, EXCELLENT and ECONOMICAL.
THE NONPAREIL

TELEGRAPH APPARATUS,
For AMATEURS, STUDENTS and SHORT LINES.

Since the introduction of this *Pioneer Low Priced Telegraph Instrument*, a little over a year and a half since, nearly 2,000 have been sold, and they are constantly more and more sought after.

Hereafter we shall furnish them at the following popular rates: Single Instruments, including Three Cells Battery, Connecting Wire, Chemicals and Instruction Book..... \$6 50. Two sets of Instruments, etc..... 12 00

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat. As they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals, and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a hauled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instrument.

Price of apparatus complete, is \$200 to \$300, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his
CELEBRATED HELICES

WHICH ARE OF
Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

SMITH'S
MANUAL OF TELEGRAPHY.

PUBLISHED EXCLUSIVELY BY
L. G. TILLOTSON & CO.,
Price 30c. 8 DEY STREET, NEW YORK.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard. Brass or nickel plated always on hand.

No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

A SOUNDER FOR 30 CENTS.

THE "SNAPPER,"

a Mechanical Sounder and Key combined—giving a remarkably sharp and clear sound—weights but half an ounce, and can be carried in the vest pocket.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,

AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable. Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and de-
 livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, MAY 9, 1874.

VOL. X. WHOLE No. 408.

The Historical Department of the German Telegraph Exhibition at Vienna in 1873.*

(Concluded from page 55.)

HAVING thus noticed the various groups of telegraphs in the stricter sense of the term, there remain those apparatuses which belong (almost independently of the choice of a particular telegraph) to the completion and equipping of stations; and, after glancing at these, we may briefly refer to the sources of electricity and the telegraph lines. Before doing so, however, a few words about automatic quick writers.

So long as, in telegraphy, the sending of a current is in the hands of a clerk, the regularity and correctness of the signs, as also the rapidity of signalling, must depend on the expertness and practice of the operator; whereas, a machine adapted for sending of currents would work quite regularly and with a rapidity which would find its limit only in the capability of the line to receive currents. The pointer telegraphs are mostly furnished with automatic transmitters: in the Morse writing, on the other hand, manual work still preponderates, and the historical department contains a rich collection of Morse keys, from one of the year 1850 down to the key now commonly used since 1871; also Siemens' key for induction currents (1855), his submarine key (1857), and various keys with change of battery. Morse attempted an automatic transmission of current even in his first telegraph, causing the telegrams, represented by a succession of long and short metallic pieces (types) fixed in a plate, to pass under a contact lever, which, on being raised by the types, closed the circuit. But this arrangement cost too much time, and the electro-magnets did not follow with sufficient quickness and certainty. Thereafter Bain (1846) cut out the Morse points and lines with a sort of pincers in a strip of paper, which was then wound round a metallic cylinder connected with the battery, while a spring or roller connected with the circuit came into contact with the metal at the perforated parts, and by this means the Morse writing was reproduced, electro-chemically, at the receiving station. In 1852 this mode of telegraphy was in use some time between Liverpool and Manchester. More successful had Siemens been with his quick writer (already noticed), which was constructed at first for the Russian state telegraph lines; and which, like his relay apparatus, possesses oscillating magnets. Besides these two apparatuses, there is exhibited the perforator, with three keys, for piercing the strips, and the signalling instrument, in which a steel style passes through the holes of the strip. From 1856 Siemens and Halske endeavored to solve the problem more thoroughly, by means of magneto-electric induction currents, in a permanent polarized electro-magnet system, and they supplied (1857) the Sardinia-Malta-Corfu line with such apparatus. The most recent progress in the Siemens quick writers for perforated paper strips, as used on the India lines made in 1868, is shown in the equipment of one line. The perforating key pierces the strip, which is carried by a small roller furnished with a series of guiding holes, and at the other end of the line a polarized ink writer is attached as a receiving apparatus. If magneto-induction currents are used in place of battery currents, the signalling instrument arranged for the purpose allows only the currents required for the Morse signals to pass into the line. Meanwhile, Siemens had tried another way with the type quick writer patented in 1862; types which represented entire Morse letters (later only lines, points, and intervals) were set in a frame and passed under a contact lever, the alternating currents (at first magneto-induction, afterwards galvanic) being thus sent through the line to a polarized ink writer at the receiving station. The type setting and distributing machine constructed by Siemens is unfortunately not exhibited. It is still more to be regretted that the Wheatstone automatic apparatus, patented in 1858 (and employing also perforated strips) along with its ingenious transmitting instrument for alternating currents, and especially its most recent arrangement for compensating currents, has not been shown. The three newest quick writers appear in Siemens and Halske's collections; in all three the pre-

paring apparatus is connected with the writer proper; they are furnished with finger-boards, and require neither types nor a perforated strip. Siemens' quick writer gives Steinheil writing; that of Hefner-Alteneck (1872) Morse writing. The quick printer (of Siemens, 1873) prints the telegram in type, writing much more quickly than Hughes'; there is a type-wheel, which, through two escapements, is brought back to the nil point after each impression, while opposite currents of equal duration are used, which have proved so especially serviceable in submarine lines.

The historical exhibition has a rich collection of relays of various construction. Near the oldest of them (1849), with straight armature-lever, are shown the Hanoverian (1850) with bent lever, the Siemens' box relay (1851), and a whole series of the most various polarised relays; the relays of Notteholm and Borggreve (both of 1857, with horizontal electro-magnet); a relay with electro-magnetic core, which can be varied according to the strength of current; and Siemens' relay with two electro-magnets and two armatures for translation in lines, with alternating currents.

There is also no lack of alarums. To the oldest (Sömmerings') are added—Schilling's apparatuses, the Kramer alarm for intermediate stations (1849), Siemens' intermediate alarm (1850), and the post alarums of Borggreve (1857) for currents of determine direction.

It is to be regretted that the history of the origin of translators is not clearly shown in the exhibition, and especially that the oldest Siemens' translator for pointer telegraphs, and the oldest Morse translators are absent.

A large number of lightning discharges are exhibited; the oldest of these (that of Steinheil's, 1846, being absent) is a plate discharger of Siemens' employed in 1848 between Eisenach and Frankfurt, and consisting of three plates, the middle one connected with the earth. Then follow, in order of age, four of those used by Siemens in the years 1850 to 1853; the wire-roll lightning discharger; the wire discharger with metallic support; the point discharger, in which there are plates opposite the metallic points, and the ball and point discharger, whose plates end above in balls, while each point stands opposite another. After Siemens' vacuum discharges (1852) come the Notteholm separating dischargers in the forms used before and after 1857; while the point dischargers, similar to these, are not exhibited. Lastly, we have the recent plate dischargers of Elsasser (1866 and 1869). There is also a discharger especially meant for telegraph lines, consisting of two metallic cylinders, one inserted in the other; the bottom being separated by a piece of wood (which has been boiled in oil) three centimetres thick.

Among commutators one misses the old clamp-commutator. Along with the bar commutator used since 1854, are shown three peg commutators of Notteholm, as these were used till 1857, and a series of peg and bar commutators by Borggreve and others, still in use, for the various branches of telegraph service—among others the testing commutator of Elsasser (1866).

Of rheostats or resistances there are only exhibited a mile resistance, in box form, by Siemens, in 1854; a bar rheostat with resistances of one to fifty miles of iron wire 2.1 lines in diameter (1857), and the graphite resistances used since 1865, at intermediate stations, for regulation of the line resistances. The latter consists of powdered graphite pressed in glass tubes, and giving a resistance of 500 to 2,500 Siemens' units.

Galvanoscopes are exhibited only in their most recent forms, viz., those in use since 1869 and 1871 (after Varley, 1857), and the hair needle galvanoscope of Siemens (1869).

As sources of electricity in telegraphy either galvanic batteries or inductors may be used. Of batteries, the historical department shows only that of Siemens (1849), with zinc copper elements. Recent batteries have been exhibited by various German, Austrian and French makers in their respective departments. Of inductors may be noticed, besides the Steinheil and Stöhrer apparatuses, the magneto-inductor, with twenty-eight pairs of lamellæ, which Siemens constructed in 1850 for alarm apparatuses; the magneto-inductor of Siemens (1850) for blasting charges in mines through glowing steel wires; and two electric inductors of Siemens (1855), one of which, with few elements, produces induction currents of the second order, changes them into currents with the same direction, and utilizes them in Morse writing in long lines; while the other produces Morse writing with alternating currents and polarized relays.

Along the walls of the hall before the Annexé, there are inserted a number of wooden and iron posts, on which may be studied the various constructions of overland telegraph lines. Sometimes we have simple posts, sometimes double stands, double rods, and they bear various kinds of insulators. Several of these posts show the arrangements for tightening the lines. Other posts exhibit the passage of an overland line into an underground; and a tunnel box shows the connection of the cable passing through the tunnel with the overland lines. Lastly, there are shown connections of lines at the stations; both the older (to 1867); and the

more recent. This part is supplemented by some Bavarian rods and wire connections in the Annexé itself, and here also are the various tools and testing galvanometers, etc., used in examination of overland and underground lines. Iron telegraph posts of the newest kind are exhibited by France in the Gallery, 5B, and by Siemens and Halske, in Gallery 8A of the Palace of Industry. The historical department contains no underground or submarine lines; but quite in the neighborhood are to be seen the cable tests of Felten and Guillaume, in Cologne, and of Siemens and Halske from the factory at Woolwich. On the other hand, the department contains an exhibit with which we will here close our survey (merely glancing at the interesting maps which show the development of the German Telegraphic System in the years 1854, 1860, and 1866, 1872, and also a table which graphically represents the development of telegraph traffic and its means in Germany, from 1854 to 1872). This is the first gutta-percha press for furnishing lines with a sheath of gutta-percha without suture; it is constructed in model by Siemens, and was handed over by him to Fonrobert and Pruckner, in Berlin. With machines formed after this model were furnished the cables for the underground lines laid in Germany and Russia, from 1847 to 1851, and they are now used for the covering of all submarine lines.

Hooper's Telegraph Works.

A MEETING was held on the 15th of April on board the cable steamship Hooper, in Millwall Docks, prior to the departure of that vessel on her third voyage to the Brazils, for the purpose of laying the section of cable between Para and the West Indies, and, in connection with the West India and Panama Telegraph Company's system, to connect the Empire of Brazil with the United States. Mr. Dunlop, chairman of Hooper's Telegraph Works, presided on the occasion, and in proposing continued success to the Hooper on her present voyage, referred to the very satisfactory condition of the cables already laid for the Western and Brazilian Telegraph Company—a statement confirmed by Mr. Heugh, chairman of the company. Mr. Earle, managing director of the West India and Panama Company, referred to arrangements in course of completion between his company and the company for whom the cable now on board the Hooper has been made, and, although previously associated with rival companies, he was glad to be afforded the opportunity of testifying to the skill displayed in the present arrangements for the manufacture and laying of the cable by Hooper's Company. Mr. Weaver and Mr. Andrews, other directors of the West India and Panama Company; Mr. Orton, President of the Western Union Telegraph Company, of New York; Mr. Chaytor, director of the Brazilian Submarine Telegraph Company; Mr. Erichsen, representing the Great Northern Telegraph Company; Mr. Madsen, under whose inspection the cables for the Great Northern Telegraph Company were manufactured; Major Bateman Champain; Major Stiffe; Mr. Preece, of the Telegraph Department of the Post-office; Sir Samuel Canning, Mr. H. C. Forde, Mr. C. Seymour Grenfell, Mr. Bramley Moore, Mr. Bessemer, Captain Pender, Captain Hull, Mr. Blakeney, and Mr. Snelling, of the Hydrographic Department of the Admiralty, were also present. Major Bateman Champain, in reply to the toast proposing his health, had much pleasure in saying how excellently the cables supplied by Mr. Hooper, and submerged in the Persian Gulf and between Ceylon and India in 1865 and 1868, still continue to act. The healths of Mr. Dunlop and Mr. Hooper (the managing director) were severally proposed and responded to.

First Report of the British Association Committee on Dynamical and Electrical Units.

THE first report of this Committee was made at the recent meeting of the British Association for the Advancement of Science, and is confined principally to the selection and nomenclature of units of force and energy, under which head the Committee is itself prepared to offer certain definite recommendations, which are as follows: 1st. The gramme, centimetre, and second are recommended as the units of mass, length and time, respectively; a combination which has the advantage of making the unit of mass appear identical with the mass of the unit volume of water—in other words, of making the value of the density of water appear equal to unity. From these fundamental units the units of electrical and magnetic magnitudes, now in common use, may be derived; and it is recommended that, until special names shall be prepared for them, they be distinguished from absolute units, otherwise derived, by the three initial letters, C. G. S. As regards the name to be given to the C. G. S. unit of force, it is recommended that it be a derivative of the Greek word *dynamis*—the form *dynamy* appears to be the most satisfactory to etymologists. The work done by this force working through a centimetre is the C. G. S. unit of work, for which is proposed a name derived from

* Abstract of a paper by Dr. Zetzsche in the *Internationale Ausstellungszehnung*.

the Greek *erg.*; the C. G. S. unit of power is the power of doing work at the rate of one *erg.* per second, and the power of an engine can be specified in *ergs* per second. The common and extremely variable unit of one horse power is about three fourths of an *erg.* per second. For the expression of high decimal multiples and sub-multiples the system introduced by Mr. Stoney is recommended. It consists in denoting the exponent of the power of ten which serves as a multiplier, by an appended cardinal number if the exponent be positive, and by a prefixed ordinal number when the exponent is negative; thus ten to the ninth power, or one thousand million grammes, constitutes a "gramme-nine," and the one thousand millionth of a gramme constitutes a "ninth gramme."

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF ASSESSMENTS 58, 59 AND 60, UP TO AND INCLUDING APRIL 20, 1874.

4, 5, 6, 13, 23, 26, 28, 33, 55, 58, 65, 70, 72, 74, 75, 80, 89, 93, 97, 101, 103, 108, 114, 120, 122, 131, 140, 141, 142, 144, 146, 148, 153, 171, 175, 179, 183, 189, 190, 191, 193, 197, 198, 215, 227, 230, 235, 240, 247, 248, 274, 303, 342, 344, 351, 360, 372, 380, 391, 392, 393, 402, 405, 413, 430, 431, 441, 466, 468, 469, 470, 471, 475, 476, 484, 511, 512, 514, 516, 553, 554, 556, 560, 561, 573, 575, 584, 590, 604, 618, 622, 642, 646, 648, 649, 662, 663, 664, 665, 669, 685, 694, 701, 708, 714, 729, 735, 737, 741, 750, 751, 756, 764, 769, 790, 803, 808, 809, 812, 820, 830, 831, 848, 855, 871, 873, 883, 901, 905, 922, 927, 930, 931, 939, 941, 943, 952, 976, 978, 980, 991, 992, 998, 1000, 1002, 1005, 1028, 1040, 1047, 1058, 1074, 1075, 1076, 1080, 1093, 1100, 1101, 1102, 1127, 1147, 1149, 1152, 1154, 1155, 1156, 1157, 1159, 1160, 1162, 1167, 1185, 1191, 1196, 1210, 1217, 1224, 1232, 1233, 1241, 1255, 1266, 1274, 1276, 1277, 1282, 1288, 1304, 1107, 1308, 1309, 1311, 1312, 1313, 1314, 1315, 1317, 1318, 1319, 1320, 1321, 1322, 1339, 1340, 1342, 1344, 1345, 1346, 1348, 1349, 1350, 1351, 1352, 1358, 1366, 1372, 1375, 1385, 1387, 1389, 1390, 1391, 1415, 1417, 1418, 1421, 1427, 1431, 1437, 1438, 1449, 1457, 1458, 1470, 1481, 1483, 1484, 1485, 1497, 1500, 1501, 1503, 1508, 1511, 1513, 1515, 1524, 1527, 1537, 1546, 1552, 1554, 1555, 1563, 1564, 1569, 1573, 1576, 1580, 1582, 1586, 1591, 1593, 1594, 1596, 1620, 1623, 1625, 1630, 1632, 1644, 1650, 1652, 1666, 1672, 1707, 1714, 1718, 1719, 1720, 1721, 1729, 1730, 1732, 1737, 1785, 1791, 1794, 1795, 1796, 1797, 1799, 1802, 1804, 1815, 1818, 1823, 1824, 1847, 1852, 1863, 1864, 1881, 1900, 1901, 1903, 1921, 1922, 1924, 1926, 1943, 1951, 1957, 1994, 1996, 1997, 2004, 2015, 2022, 2024, 2025, 2026, 2033, 2040, 1057, 2065, 2074, 2075, 2077, 2083, 2084, 2089, 2094, 2101, 2106, 2112, 2113, 2114, 2116, 2119, 2123, 2125, 2134, 2136, 2137, 2138, 2141, 2142, 2143, 2144, 2147, 2148, 2152, 2154, 2162, 2165, 2170, 2179, 2181, 2180.

ASSESSMENT NO. 61.

4, 6, 16, 52, 53, 54, 55, 64, 74, 86, 88, 113, 131, 175, 188, 208, 211, 230, 277, 289, 303, 383, 385, 426, 434, 478, 509, 564, 626, 661, 721, 722, 812, 825, 917, 1088, 1090, 1148, 1178, 1199, 1266, 1300, 1306, 1357, 1489, 1555, 1568, 1569, 1590, 1742, 1862, 1894, 1951, 2101, 2138, 2162, 2174, 2181, 2190, 2196, 2197, 2201, 2222, 2223, 2224.

ASSESSMENTS NOS. 55, 56 AND 57.

An Exegesis.
BY OWTON A FLYE.

Oh, the waste of intellect in the world! Doesn't it almost make you skeptical on the point that all is wisely ordered? Great minds victimized by overpowering circumstances? Brains lavished where they can never get out into the broad, charitable sunlight of the world's favor! Look at it! Why, even the profession in which I have the honor to bear the burden of ever so light a part is not without its illustrations of the grand mistake that seems to have been made in the distribution of intellect. I am personally acquainted with at least three persons in our office, at —, who, by virtue of their superior attainments, should be, each in his turn, President of the United States; and I stand ready to take them by the hand when they leave this office. But we can't all be Presidents, and in order to find a place for others, I must drop a little in the scale and call them statesmen, financiers, etc. Of course, these are men who can never become Tip McCloskeys, Jim Lawlesses or Posie Van Dusens in telegraphic circles, but who, no doubt,

would make Daniel Websters and Henry Clays in the political field.

Now, I contend that there is something wrong in the principle that hampers the great minds of nine tenths of the operators of our day, and binds them down to swinging crosses, bad connections, etc. My heart flutters with a little of its old fire, even now, as I think of what I might have been years ago, had it not been that the world, always too slow to recognize true merit, has kept me from my true position, and I am compelled to confine my talent within this aching brow, that almost hursts to belch it to the world. I write this much about myself, because I know I'll find lots of sympathizers in the profession; in fact, to pervert history a little, if I were not an operator, I might be a—river pilot.

However, I did not intend to make this a complainer; I choose rather to look on the bright side of things. We may be happy yet. The Government may take us in hand and then, bless the mark, we will all be politicians. And yet, somehow or other, when I hear the boys dilating on their great capabilities in life and their weak opportunities, it makes me feel bad. Excuse these tears.—*The Switch.*

The New Western Union Telegraph Building.

THE new building in process of erection for the Western Union Telegraph Company, in this city, on the corner of Broadway and Dey street, has reached the seventh story. The front of the structure has been completed to the top of the sixth story, and the interior walls and rear are being put in by the workmen.

In its present state of forwardness an idea can be had of the appearance the building will present when completed. With a front of 75 feet on Broadway and 150 feet on Dey street, it will, when finished, tower above every other business house in the city, except, perhaps, the new *Tribune* building. The height of the structure to the main cornice is 118 feet, and to the top of the pavilion roofs 174 feet. A tower will surmount both the front and rear, the clock tower on the Broadway front reaching an elevation of 226 feet. At the base of the seventh story, the point now reached, a broad stone balcony, with an ornamental iron railing, will run entirely around the building. At the top of the building a tower is to be built, in which will be placed a clock with four faces, each of which will be 11½ feet in diameter, by which strictly accurate time will be kept. It is to be in direct electrical communication with the clock in the National Observatory at Washington, and will be electrically regulated, the proper addition being made for the difference in longitude.

The material of the basement is Quincy granite, and of the first story Richmond granite. Above the first story the materials used are Philadelphia brick, with Richmond granite trimmings. Broad granite bands pass across the base of each story and serve to unite the piers of stone and brick work. The main entrance on Broadway is through a grand portico 20 feet wide and 36 high, faced by two columns and two pilasters of polished, amber spotted Quincy granite. Above the portico is to be a stone balcony on which will stand a statue of Professor Morse. The cellar will contain the batteries; the basement, with an entrance at the corner of the two streets, will be occupied by the company for the receipt and delivery of messages. The first and second stories will be rented, while the third will be devoted to the offices and meeting rooms of the officers of the company. The fourth and fifth stories will be fitted up in offices for rent, accessible by two elevators. The sixth will be devoted to the culinary department, its being found advisable to supply the employés with lunch on the premises. All the stories above the sixth will be devoted to the operating rooms of the company. The main operating room will be 22 feet high, 150 feet long and 60 feet wide.

An American Telegraph Operator Killed by Australian Savages.

By a letter from Castlemaine, Victoria, Australia, of February 25th, information is received of the massacre of an American telegrapher and the serious injury of another operator and a linesman by the blacks. A despatch from Adelaide, to the Australian Associated Press, dated February 23, states—

"The blacks attacked the Barrow's Creek telegraph station at 8 o'clock last night, while all the hands were outside of the station. While trying to get in, the natives speared Mr. Stapleton, the station master; Mr. Flint, an operator; and Frank, one of the linesmen; all of whom were seriously injured, and a native boy, named Frank, was killed. At latest accounts the wounded men were recovering. A strict watch is being kept against fresh attacks at the station, and the men are well protected and armed."

A subsequent despatch, dated on the 24th, conveys the information of the death and burial of Mr. Stapleton, as follows:

"Mr. Stapleton, the station master at Barrow's Creek,

has died from the effects of the injuries he received during the attack on the station last Sunday evening. He was formerly in the Victorian service, under Mr. M'Gowan. He leaves a wife and family.

"Mr. Stapleton was buried to-day, the natives watching the proceedings. Influential committees are being formed to collect subscriptions for the widow and family of the deceased."

The Queensland, Australia, Blacks Attacking A Telegraph Station.

A DESPATCH from Rockhampton, Feb'y 6, to the Australian Associated Press, states that telegrams from the Gilbert River telegraph station report that the station is beleaguered by blacks in great numbers, and the station is barricaded against an assault. The station, which is built of sawn timber shingles, is garrisoned by the telegraph master, his wife, and one assistant. One musket is the only firearm they possess, and it was impossible to hold out long. Two volunteers, in charge of sergeant Griffin, were just leaving for the scene of action, and the police were begging everywhere for the loan of firearms without obtaining any of the right sort. Large crowds of blacks are reported within ten miles of Georgetown.

Demoralized Telegraphers.

Mr. A. MITCHELL, General Superintendent of the Illinois Central Railroad, Chicago, Ill., advertises J. K. Bear, *alias* A. J. Curtis, who, he states, was agent for that road at Waverly, Iowa, and ran away January 23, 1874, stealing \$1,560. His age is about 28 years; is about 5 feet 10½ inches in height; rather narrow between the eyes and across the cheek bones; chin recedes from his mouth; lips rather thick, and projecting; wore heavy moustache of darkest red, which he kept colored; hair dark brown, inclined to be straight; eyes bluish gray; complexion fair, neither dark nor light; medium heavy eyebrows, that run clear across the forehead like one eyebrow; legs rather long; has scar from bullet on left side of his neck just back of ear, looks blue as if it might have been a boil. There are marks of powder under the skin also. When he says "put" he gives it the sound of put in putty; is a good sound telegraph operator, and an expert card player—probably is gambling. Information of his whereabouts is requested by Mr. Mitchell.

Mr. John F. Dickson, General Superintendent of the Texas & Pacific Railway Company, Marshall, Texas, offers \$100 reward for the delivery at that place of H. A. Keeley, late of the M. P. R. R. and H. & St. Jo R. R., or E. T. Coffey, late from Kansas Pacific R. R., who are charged by him with being absconding defaulters. They were employed as agents and operators on the road.

Galvanometrical Measurement of the Resistance of Insulators

At the BROOKS INSULATOR WORKS, Philadelphia, May 5th, 1874, Moderate Rain.
Constant of Galvanometer 4,200 Degrees through 1,000,000 of units, with 100 cells Callaud.

Description and Number of Insulator.	Date of Exposure.	Deflection per Insulator.	Resistance in Siemens Units.	Date of First Arc-Over in Rain.	Resistance in Siemens Units.
10 Porcelain (French Administration Standard)	Mar. 1, 1868	7	600,000,000	Apr. 7, 1868	No deflection.
10 Western Union Glass, with painted brackets.	" "	200	21,000,000	" "	83,000,000
10 West. Union new style (the wire at top).....	" " 1872	200	21,000,000	Mar. 10, 1872	116,000,000
20 Kenosha on Brackets.	Nov. 1, 1872	250	16,800,000	Nov. 6, 1872	2,300,000,000
10 Brooks in cross arm...	Mar. 1, 1868	.5	8,400,000,000	Apr. 7, 1868	No deflection.

The foregoing table gives the resistance of the insulators when first exposed, and also extent to which their insulating properties have been reduced by exposure.

An Efficient and Popular Superintendent.

MR. D. P. SHEPHERD, who has been Superintendent of the Western Union Telegraph Company for the past twelve years, resigned this position a few days since. Mr. Shepherd, had by strict attention to business, uniform courtesy and urbanity of manners, made him a host of friends throughout the State, and by untiring energy built up for his company one of the most remunerative districts in the South. When this gentleman came to Texas there were less than two hundred miles of telegraph line in this State; under his skillful management and foresight no town of over a thousand inhabitants is without its telegraph office, and every hamlet to which a railroad extends is placed in telegraphic communication with the rest of the world. Perhaps no superintendent of the telegraph company more fully possessed the confidence and respect of his employes than did Mr. S., and it should be very gratifying to him to know that, in his retirement, he carries the best wishes and cordial esteem of his late subordinates, all of whom had united in the presentation of a handsome Geneva watch as a slight testimonial of their high regard of so efficient an executive and courteous a gentleman.—*The Dallas (Texas) Daily Herald.*

A Plan for Organizing a Telegraphers' Association.

CALIFORNIA, April 26.

TO THE EDITOR OF THE TELEGRAPHER.
I HAVE read with interest the numerous articles and communications which have appeared in THE TELEGRAPHER on the subject of a league or association of telegraphers, and especially a communication asking, "Who shall start it?" I have thought of a plan for establishing on a sure foundation such a league or association, which I would like to make public through the columns of THE TELEGRAPHER, and obtain the views of the fraternity in regard to its practicability and feasibility.

To illustrate my plan, let us suppose a case. We will suppose that the telegraphers in New York, Boston, or any large city, have organized such an association. It will be certain that some of the shysters who play second fiddle to the great Moguls of the companies will very politely inform the employes in his division that if they connect themselves with it they may consider that they are no longer in the employ of the company by whom they are employed. This, it is true, is but a supposition, but such a result is almost sure to follow the action indicated.

Now the plan which I have to suggest to avoid such action on the part of employers, is as follows: Let a time be appointed, and have it known all over the country, that upon a certain designated day every telegrapher in the country is to meet and organize a district of a league or association in his or her town. Let it be thoroughly understood that the telegraphers everywhere must meet some time during the twenty-four hours of the designated day. Then the organization will spring into existence at once.

If there should then be any black sheep (and such are found in every flock), who betray the proposed organization, do not give it up, but be men, and meet and organize anyhow. Then, if the officials should ask if the employes had joined the organization, they could answer, "Yes; and every operator in the country met on the same day, and participated in organizing a district or division in his or her section of the country." In such a case it is not probable that any precipitate antagonistic action would be taken against an organization thus suddenly but fully established; and, upon consideration of the situation, the conclusion would be inevitable that the employes had the best of it this time.

I should be glad to know what the fraternity generally think of this plan.

A Practical Basis for a Telegraphic Association.

TO THE EDITOR OF THE TELEGRAPHER.
I AM opposed to the formation of a Telegraphers' "Union" as they are usually formed. The very name of Union or League invites the suspicion if not actual hostility of proprietors and officers of corporations. Nine out of ten who go into Unions do so to receive benefits without contributing. A few hundred operators by banding together and demanding promotion cannot succeed. The business is too easily acquired to admit of it. First class operators who thoroughly understand their business rarely wait for good situations. Therefore, strength by reason of individual merit will obtain re-

cognition sooner than mere combination of numbers. In order that we may attain this individual merit, I suggest the formation of an order which shall have for its object the classification of operators. I would have it composed of several degrees, and would not give the lowest degree to an operator unless he could alone open a way office, and decently explain the working of the telegraph to a visitor. The next degrees to require advancement in the art. Each degree to have its separate certificate properly signed, and vouching that the possessor has successfully passed the necessary examination. I have no doubt that, in order to start such a society, such men as Brown, Pope, Haskins, Summers, Miller and many others, would cheerfully act as examining officers for twelve months or more. What we want is some incentive for advancement. This is the only way I can now think of having a prospect of good results. I believe the telegraph companies would soon, if not immediately, recognize such an order, and demand of each applicant his certificate.

Let us drop our complaints and whinnings, and resolve to go to the top of the ladder in our profession, *When there we can see and be seen.* If we do not make ourselves prominent in our own business, it is not likely we will be solicited to embark in any other.

Now, comrades, get out your Pope's Modern Practice, and make yourselves ready for your first examination.

PERKINS.

The Proposed Society of Electricians and Engineers.

TO THE EDITOR OF THE TELEGRAPHER.

THE suggestions of your correspondent, Mr. I. N. Miller, in the last number of THE TELEGRAPHER of the formation of an American Society of Electricians and Telegraph Engineers is a very good one. There exists no adequate reason, so far as I can see, why such a society may not be organized. There can be no doubt of the existence in this country of plenty of material for such a society—all that is necessary is that the requisite preliminary steps should be taken by some of our more prominent electricians to give the movement a start. No doubt every electrician and telegraph engineer would be glad to participate in such an organization, and that it would prove beneficial and valuable will be conceded. The interchange of views and discussions which would take place at its meetings would serve to advance more rapidly than could otherwise be done correct scientific ideas and principles, and would concentrate, as we may say, the information and knowledge, much of which is now but of limited application. Errors would be eliminated—and the wisest of us, it must be confessed, are liable to error—and truth, and real science, and practical experience would be more generally available.

I know that many telegraphers are inclined to scoff at science as of little interest and value to the great body of the profession, but those who do so have little appreciation of the importance to them and to the telegraphic art, of which they are heedless or ignorant professors, of scientific knowledge and information. Without the aid of science, and the application of studious scientific individuals, the electric telegraph would to-day have been undiscovered and undeveloped. Their labors are facilitated, and their task constantly made easier, and the results more certain and reliable through scientific research and investigation. However, I will not pursue the subject further lest some of your readers may renew their complaint—that THE TELEGRAPHER has *too much* about science in it. My object is merely to express hearty approval of Mr. Miller's suggestion, and to express the hope that prompt action will soon result in the establishment of the proposed society.

ELECTRIC.

Telegraphic Improvements in Oregon.—Another Happy Man.—An Operator Resigned.

ALBANY, OREGON, April 24.

TO THE EDITOR OF THE TELEGRAPHER.
SCARCITY of telegraphic news is our reason for remaining silent so long. Allow me to assure you we have all been fluently entertained by the various correspondence in THE TELEGRAPHER; which, by the way, we are greatly pleased to see is improving with each successive issue; and let us urge our brethren to come forward with substantial aid, thus enabling friend Ashley to always *keep up his lick.*

The W. U. Telg. Co. are preparing to build an entire new line, with cedar posts, glass Insulators, and, strange to say, new iron wire. This line is to replace their old through wire which has been up for ten or twelve years, and has got to be a good deal the worse for wear. The new line will extend from Roseburg, Oregon, to Yreka, Cal., a distance of one hundred and sixty-five miles. Last fall a new line was completed south from Yreka, so, when this new section is completed it will give them an entire new line from San Francisco to Portland. This is something the boys "Long have sought and mourned because they found

it not." The last steamer brought up some three thousand glasses and over one hundred and thirty miles of wire, and Sup't Plummer will commence operations in a few days.

A few months ago there was strong talk of a new line from Portland down the Columbia river to Astoria, at the mouth of this river. This is an improvement that is absolutely required, and would remunerate the company very well. Col. Gamble, General Sup't of the W. U. Telg., made the citizens of Portland and Astoria a proposition, the exact nature of which we are not conversant with, but we do know nothing has been done in regard to this line lately. The benefit this line would be to commercial interests can hardly be over estimated.

The W. U. Telg. Co. are also, I understand, going to repair their through line from Portland to Tacoma, W. T., and from this point build a new line to Victoria. This part of the country is the hardest in the United States in which to keep a line up, on account of the vast forests through which so much of the lines must necessarily run. Heretofore, in winter, it has been next to impossible to keep continuous communication open.

Still another Oregon telegrapher has made an "unconditional surrender" to Cupid. I refer to our old chum, Gus Wheeler, at Salem, Oregon. Gus, it was thought, would never yield to the blandishments of the fair sex, but I will give him credit for holding out very well, considering that he has always been a ladies' man, and has been besieged for the last ten or fifteen years, but at last, finding it impossible to hold out, has capitulated; and we are pleased to hear has *wheeled* into a rich thing, and know he will *wheel-her* around right.

Mr. C. C. Hogue, late agent and operator at Tenino, W. T., on the Northern Pacific R. R., resigned and went East on the last steamer. Charley is going to Iowa to turn granger and till the soil; thus going into some *honest* business, as he says. Bye, bye, Charley. "Go the whole Hog(ue) or noue."

The weather is beautiful; trees and flowers have been in bloom for four weeks past. Roads splendid for driving. "Don't you wish you lived in the country?" Then you would be as happy as WEBFOOT.

The Slaughter of an American Telegrapher By Australian Savages.

VICTORIA, AUSTRALIA, }
CASTLEMAINE, Feb 25. }

TO THE EDITOR OF THE TELEGRAPHER.

WILL you kindly make known through the columns of your widely circulated paper, the enclosed account of the death of James L. Stapleton, an operator of over twenty years' experience in the United States, Canada and Australia. There are many of your readers who remember poor "Stape" (as he was generally called) quite well, and this announcement of his death will be received by them with sorrow.

As far back as 1854, or thereabouts, he served many months on the Panama and Aspinwall line, where his health suffered severely, through yellow fever.

After leaving there he became one of the Bohemian fraternity, travelling from office to office, until, at last, he crossed the line and located himself at Belleville, on the Grand Trunk Railroad, doing duty as night operator.

He was afterwards stationed at Whitby, on the same line, and, in 1858, came out to Australia. Mr. Stapleton was connected with the Victorian Telegraphs for ten years, and on the completion of the overland line between Adelaide (South Australia,) and Port Darwin, on the north coast of Australia, he left the Victorian service and took charge of one of the Maintenance offices in the centre of Australia, far away from the noise and strife of civilized life, where he expected to spend the remaining years of his life in seclusion and peace. He was a great favorite with all who knew him; and, as an operator and telegraph manager, he had the fullest confidence and esteem of his employers.

THOMAS GREEN,
Man. Elec. Tel., Castlemaine.

An Unprofitable Customer.

SAID an Irishman to the telegraph operator, "Do you ever charge anybody for the address of a message?"

"No," replied the operator.

"And do ye charge for signing his name, sir?" said the customer.

"No, sir."

"Well, then, will ye please send this? I just want me brother to know I am here," handing the following:

"To John M'Flynn—at New York—(signed) Patrick M'Flynn."

THE more machinery a nation has in operation, the more fully and profitably is its labor employed, the more rapid its material progress, and the more developed its civilization.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, MAY 9, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Bound Copies of Volume IX for Sale.

WE have a few copies of Volume IX of THE TELEGRAPHER, handsomely bound, which may be obtained, if applied for soon, at Five Dollars per copy. The number of these is very small, and those who desire to get them must apply soon, or the opportunity will be lost, as, once disposed of, we cannot duplicate them—some numbers of that volume having been exhausted.

The Proposition for a Society of Electricians and Telegraph Engineers.

IN the last week's issue of THE TELEGRAPHER was printed a communication from Mr. I. N. MILLER, of Chillicothe, Ohio, suggesting the formation of a Society of Electricians and Telegraphic Engineers in this country. The suggestion is one worthy of consideration, and we hope that its importance will be a sufficient excuse for devoting some portion of our editorial space to it.

Mr. MILLER very truly says that we have abundant material out of which to organize such a society, and one that would be creditable to ourselves and the country. As the readers of THE TELEGRAPHER are aware, from his valuable scientific contributions to its columns, he is himself an electrician of no mean ability, and the names of others whom he mentions will be generally recognized as worthy to rank with the foreign electricians and engineers who compose the English society of a similar character. It would undoubtedly be a great advantage if the scientific and practical telegraphic engineers of the country, and of the Dominion of Canada, could be associated together, and by occasional meetings and the discussion of subjects of scientific and practical importance in telegraphy develop and concentrate the results of their individual studies, researches and experience. The English society, to which reference has been made, has proved very useful and advantageous, and mutually beneficial and instructive. The example should not be lost upon their American brethren, and we hope it may not be.

It is true that there are obstacles to the establishment and maintenance of such an association here which do not exist in England. In the first place there is not here so marked and distinct a professional

character of electrical engineering as there. While we undoubtedly have as accomplished and able electricians as any country, the profession, as a profession, has not been so generally recognized. Most of those who are known as electricians here are engaged also in the more practical telegraphic duties, and do not generally devote their time and attention exclusively to scientific studies and pursuits. A moment's consideration of the employments and pursuits of the persons mentioned by Mr. MILLER will show the truth of this statement.

Again, there are not so many of them in any one place or locality as is found in London. For this reason it is hardly probable that as frequent meetings could be held which would be attended by a considerable number of the members of such a society. This is not an insuperable obstacle, however, as there are enough in New York and its vicinity to enable one or two meetings to be held a month, and arrangements could be made for holding general meetings quarterly, at which a majority of the members could usually be convened. These quarterly assemblies could be continued in session for two or three days, and might be made very pleasant and profitable occasions for those attending them.

The advantage which would be derived to the practical operation of telegraph lines from the discussions and conclusions of such an association ought to secure to it the earnest coöperation and support of all telegraph managers and companies. A great deal of money is constantly wasted in telegraphic operations in trying experiments in batteries and insulation, and in faulty construction of lines, from the want of any authoritative and carefully considered determination of the scientific principles which underlie the telegraphic art. This, to a great extent, could be avoided by the organization and effective maintenance of such an association as has been proposed. Much that is valuable in the results of individual study, research and experience is now lost, and the same ground is constantly being gone over by different individuals which such an association would to a considerable extent obviate.

It would further add to the dignity and importance of our electricians and telegraphic engineers if there were such a method of making their ability known to the world. Membership in such an association would be *prima facie* evidence that the persons admitted had some claim to recognition, and would give them a standing at home and abroad which they could not otherwise obtain.

There is much to be said in favor of the proposed organization, but we will not further dilate upon the subject at present. We desire merely to call the attention of those more immediately interested to the subject, and hope to hear the views of others upon it. The columns of THE TELEGRAPHER are open to the discussion of this matter, and we trust that it may not all end in talk. The time seems to be propitious for action upon it, and we hope that before many weeks have passed we may be able to record the organization of the American Society of Electricians and Telegraphic Engineers.

Unprofitableness of Government Telegraphs.

OUR British friends have no doubt become convinced that, as a financial operation, Government management of the telegraphs does not pay. With all the possible manipulation of the accounts and charging to the general post-office expenses much that is properly chargeable to the telegraph service, there is a deficit stated by the *Railway News*, of London, at £1,000 per week, and which is constantly increasing. The private companies which were superseded by the Government in the business, most of them made the business profitable to the stockholders, and the public was as well accommodated as it is now, to say the least.

Government telegraphy, as a remunerative branch of the postal service, is a failure, but having assumed the ownership of the elephant, he must, of course, be retained and supported. If Government telegraphy in a

country like Great Britain, which is densely populated, and whose telegraph facilities are very generally used by the public, the circuits short and easily maintained, and the compensation of employes comparatively very small, cannot be made to pay, what is the prospect in this country? The experience of Great Britain has probably saved our own Government and people from the loss, damage and dissatisfaction inevitably attendant upon Government telegraphic administration, but it is well to keep the facts before the public and Congress. The Government telegraph schemes are merely scotched, not by any means killed, and will undoubtedly be revived from time to time by interested and ignorant parties. Until these schemes and projects are definitely abandoned we must be excused if we do occasionally refer to a subject of which we know our readers, as well as ourselves, must be heartily sick and tired.

The Telegraph Instrument Manufacturing Business.

A FEW years since there were but few establishments in which the manufacture of telegraph instruments and apparatus was carried on, but the number has increased very rapidly, and there is now in the aggregate a large amount of capital employed in it. How extensive this business has become the advertising columns of THE TELEGRAPHER shows. Of course it is necessary for each of them to avail itself of the facilities afforded for making known their existence through the columns of this paper, and almost weekly we chronicle some new applicant for patronage. As a consequence, the pressure upon our advertising columns is very great.

The competition has naturally reduced prices very materially, which is to the advantage of purchasers, if not of the manufacturers and dealers.

There is danger of the business being overdone, of course; but in this, as in every other department, the demand and supply will regulate it.

Some of the establishments devoted to this specialty are very extensive and employ many hands, while others are comparatively small. The character of the instruments manufactured is generally very good, and the work turned out satisfactory.

Nothing shows the enormous expansion of the telegraph business in this country more than this increase of facilities for supplying the increasing demand. New adaptations of electrical and telegraphic apparatus are constantly being made, which in turn develops new manufacturing business, and calls into existence new establishments for the purpose. The Fire Alarm Telegraph, the District Telegraph, the Electric Railroad Signals, the Automatic Signal Telegraph, the Quotation and Private Line Telegraphs, each use instruments specially adapted to and invented for these specialties, and many shops and hands are mainly employed in supplying them. We hope that all manufacturers will find profit in their business and be prosperous, and the columns of THE TELEGRAPHER will materially aid them in attaining this result.

New Uniform of the Atlantic and Pacific and Franklin Messengers.

THE example set by the American District Telegraph Company in uniforming its messengers has inaugurated a very useful reform in telegraphic arrangements in this city, and is gradually being followed by the several telegraph companies. We have already published a description of the uniforms adopted for the American District and Western Union Messengers.

On the first instant all the messengers of the Atlantic and Pacific and Franklin Telegraph Companies in this city were equipped with uniform suits, which are neat, serviceable, and, we think, the handsomest yet adopted. The value of such a distinguishing mark by which the messengers may be readily and easily located by those who may have occasion to receive despatches from them or send answers, etc., by them, will be readily appreciated. The business has become so large, and the number of messengers employed by the different com-

panies so great, that it had become absolutely essential that some method of identification should be adopted. Various efforts have been heretofore made to establish the system of badges or uniforms by which the messengers could be known, but until within the last two years these have not been pressed with sufficient energy to insure success. There has been considerable opposition to it manifested by many of the messengers employed. We recollect, many years ago, a small rebellion was created among the limited number of messengers then employed, by an attempt which was made to have them wear a uniform cap, and it was finally given up after a few days' use. All this is past now, however, and hereafter any person can tell a telegraph messenger when on duty at a glance, and also what company he serves, and can identify, if necessary, the individual, and ascertain in what particular office he is employed.

No doubt this system of uniforming the telegraph messengers will eventually be adopted in all large cities.

The uniform of the Atlantic and Pacific Messengers was designed by Mr. ALFRED NELSON, the Secretary and Treasurer of the Atlantic and Pacific Telegraph Company, and reflects much credit upon his taste.

It consists of a jacket and pants of cadet gray cloth, similar to that used at West Point, for the uniforms of the cadets at the United States Military Academy. These are handsomely trimmed with scarlet military cloth, which sets them off to advantage. The jacket is buttoned up to the throat with military buttons. The cap is of gray cloth with scarlet cloth band, and a leather front with the words "Atlantic and Pacific and Franklin Telegraph" on a red visor. On the left breast is worn a German silver badge, in the centre of which is the number by which the messenger is designated, and by which he can be at any time identified, and the word "Telegraph," the whole surrounded by a black border, outside of which, at the four points of the compass, are the letters "N. S. E. W." For wet weather each messenger is furnished with an India rubber cape and leggings, and an enameled cap cover, by which they are effectually protected from the rain, and their despatches and books are also secured by this means from any damage by unfavorable atmospheric conditions.

The messengers are not allowed to wear any part of the uniform when off duty except the pantaloons, being required to deposit them in places provided at the offices for that purpose for each messenger employed.

The New Atlantic Cable.

THE work of loading the cable steamer Faraday with the cable of the United States Direct Cable Co. is proceeding successfully and she will sail in a few days for the purpose of laying the cable, the eastern terminus of which is to be at Rye Beach, N. H.

The contracts for connection with the cable between the Cable Company and the Atlantic and Pacific, the Franklin, and the Southern and Atlantic Telegraph Companies has been completed and signed. This contract provides for an exclusive connection with these companies for a term of years on mutually advantageous terms. The wires of the Franklin Company will be extended from Boston to Rye Beach in time to meet the cable when the laying is completed. If nothing occurs to interfere with the carrying out of the plans of the companies a few weeks more will witness the inauguration of competition in the Atlantic telegraph business.

The Termination of the Contract between the Union Pacific R. R. Co. and the Western Union Telegraph Company.

IN THE TELEGRAPHER for April 25th we published a statement from the *New York Tribune*, that notice had been given by the Union Pacific R. R. Co. to the Western Union Telegraph Co. of the termination, under its terms, of the contract existing between them.

By the provisions of the contract six months' notice is required from either party of a desire to terminate it

and this notice was given as above stated on the 20th ult. Under this contract the Western Union Co. leased a wire from Chicago, Ill., to Omaha, Neb., to the Railroad Company, which wire has under the agreement between the Union Pacific Railroad Co. and the Atlantic and Pacific Telegraph Co. been operated by the latter, and its business for points west of Omaha transmitted over it.

The Atlantic and Pacific Co. have authorized the construction of an independent line between those points, and the arrangements for the materials for the line have, we understand, already been made. By the time the contract under which they are now working is terminated that company will have its own line in operation over this territory, and will, of course, be relieved from any restrictions in regard to business, etc., which may have existed under the present arrangement.

Telegraphy and the Rensselaer Polytechnic Institute.

WE are indebted to W. J. FABIAN, of the Rensselaer Polytechnic Institute, of Troy, N. Y., for a copy of a publication issued by the class of 1875, called *The Transit*. Whether to classify this as a catalogue, or a magazine, or what, is more than we are yet prepared to decide, as it appears to be composed of fact and fancy in about equal proportions. It abounds in sharp and witty "squibs" at the expense of the officers and faculty of the institution, which a strict regard for veracity compels us to say are not in all cases entirely undeserved. Among other matters *The Transit* contains a history of the organization and progress of the Students' Telegraph Company, which commenced in the latter part of 1872 with two operators and 20 feet of wire, and now embraces 67 operators, students of the Institute, having offices and instruments at their rooms in various parts of the city. Mr. FABIAN is General Superintendent of the company, which appears to be in a highly prosperous condition. We extend our best wishes to our enterprising young co-laborers, and we hope that their organization may live long and prosper.

Personals.

Mr. J. A. ROBLIN, formerly of the Truckee Division of the Central Pacific Railroad, has been appointed chief operator of the Sacramento Division, with headquarters at Sacramento, Cal., vice H. C. MARKS, resigned.

Mr. WALLACE COFFIN is working nights at Wadsworth, Nevada, on the C. P. R. R. lines.

Mr. J. H. VAN WINKLE has been appointed agent and operator C. P. R. R., at Hot Springs Station, Nevada, vice Mr. HARRY CHAPMAN, resigned.

Mr. D. WASHEIM is now agent and operator at Brown's Station, Nevada, C. P. R. R.

Mr. CHARLES SHEARER is ticket agent and operator at Reno, Nevada, for the C. P. R. R.

THE San Diego, Cal., *Daily Union*, of April 22d, says:

"Mr. W. E. SMITH, manager of the Western Union Telegraph Office, returned to the city last evening from a trip into the country to repair the line. He proceeded as far as San Luis Rey, fifty-one miles out, on horseback, returning by stage. He informs us that the country is looking really magnificent, grass being in luxuriant growth, while the whole face of the land is covered with wild flowers."

The Telegraph.

By Cable.

SAILING OF A CABLE STEAMER FOR SOUTH AMERICA.

LONDON, May 4.—The steamer with the section of the South American Cable to be laid from Para, Brazil, to Demerara, sailed from Gravesend yesterday.

THE NEW ATLANTIC TELEGRAPH CABLE.

LONDON, May 2.—There was a large gathering of people to-day to visit the steamer Faraday, lying off Woolwich, taking on board the new Atlantic cable.

Two thousand four hundred miles of the cable are

now ready. The steamer will sail in about ten days for the coast of New Hampshire.

The cable on this side of the ocean will be landed and submerged fifteen miles south of Valentia.

New City Offices of the Atlantic and Pacific and Franklin Telegraph Companies.

THE Atlantic and Pacific and Franklin Telegraph Cos. have opened new offices at the New York Hotel and St. Denis Hotel, of both of which Mr. F. Marsh is manager. They take the place of the Western Union Company in these hotels, the offices of which were formerly operated by the latter. New offices have also been opened at No. 118 Water street, corner of Wall street, Mr. E. E. Stewart manager; and at Thurber's new building, corner of West Broadway, Hudson and Reade streets, Mrs. Foote manager.

Removal of the Office of the Automatic Signal Telegraph Company.

THE principal office of the Automatic Signal Telegraph Company in this city has been removed from No. 82 Cedar street to No. 42 Pine street. This company is meeting with remarkable success, and its system of telegraphic protection against the spread of conflagrations is being introduced in the principal business and other buildings in this city, as rapidly as a large corps of expert linesmen, etc., can put them in.

The new office has been neatly and tastefully fitted up, and the surroundings are much pleasanter and more appropriate than at the former location.

A New Western Union Office in Baltimore.

THE Western Union Telegraph Company has removed its main office from the location which it has so long occupied on the southwest corner of South and Baltimore streets, in Baltimore. Offices have been elegantly fitted up by the company in the new building of Alexander Brown and Sons, on the southwest corner of Baltimore and Calvert streets. The whole of the spacious new building, with the exception of the first floor, which will be occupied by Brown and Sons as a banking house, has been leased to the telegraph company.

The old office which has been occupied by the American and Western Union Companies for sixteen years, was vacated at two o'clock in the morning of Saturday last, May 2.

The Superintendence of the Arizona Military Telegraph.

THE *Arizona Miner* of April 8th says, in reference to the superintendence of the Military Telegraph: "We have it from pretty good telegraphic authority that Capt. Price, U. S. A., who is now in the East, will, upon his return to Arizona, have the general superintendency of our military telegraph line, which line the Captain helped to construct and which he will, no doubt, keep in good repair. We pray for his appointment."

Foreign Telegraphic Notes.

ON the first of April telegraphic operations at Woolwich Arsenal and Dockyard, England, as well as at other government establishments, were taken under the charge of the General Post-office authorities.

The Eastern Extension, Australasia and China Telegraph Company (Limited) have announced an interruption of their Saigon-Hong-Kong cable. Messages for China and Japan must, until further notice, be sent via Russia by the Great Northern Company's lines. The tests received give the fault at a distance of 230 miles from Hong-Kong, in a depth of 118 fathoms. Instructions have been given for the repairing ship to proceed from Singapore to the locality of the fault without delay.

Advices from Panama, of April 23d, state that the Cuba Telegraph Cable is now in good working order. A message from Liverpool, dated April 17th, was received at Panama on the 19th.

The report of the Eastern Extension, Australasia and China Telegraph states: The total earnings of the company for the year ending 31st December, 1873, amounted to £223,323, the working expenses to £48,992, and the repair and maintenance of the cables to £14,116. Interest on debentures and income tax have absorbed a further sum of £3,239, leaving a balance of profit for the year of £156,974. Three interim dividends of 1½ per cent. each, aggregating £89,887, have already been distributed, and there now remain £67,087 for appropriation. The directors now declare a further dividend of 2 per cent., free of income tax, making a total of 6½ per cent. for the year, which will absorb £39,950, leaving a sum of £27,137, which will be carried to the reserve fund, thereby raising it to

£41,554. The debenture debt, which at the commencement of the year amounted to £17,100, has been reduced to £13,100 by taking up the bonds as they became due.

The traffic receipts of the Eastern Telegraph Company for the month of March last amounted to £34,899 against £33,572 for the corresponding month last year, a decrease of £1,163.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended March 31, 1874, and bearing that date.

149,152.—ELECTRIC RAILWAY SIGNAL.—Frank L. Pope, Elizabeth, N. J. Application filed December 21, 1872.

Series of semaphoric signals operated by electro-magnets. Signal operating circuit closed by wheels and axles of train, bridging rails of insulated section. Signal kept in position after circuit is broken till released, by current sent back from next signal in series after train has passed later. Secondary signal, placed ahead of primary circuit closer, operated automatically by primary signal after latter is set,

1. The combination of the following elements: A signal disk, moved in one direction by an electro-magnet, and in the other by a weight or its equivalent; an electric circuit including said electro-magnet, and which is only closed by and during the passage of a locomotive or train; and a lug secured to the signal disk, and acted upon by a holding or retaining device or power, whereby the said disk will be kept displayed after the said circuit shall have been broken, substantially in the manner and for the purpose specified.

2. The combination of the following elements: An insulated section, *a a*, of a railroad track, forming part of an electrical circuit, including an electro-magnet which controls the movements of a visual or semaphoric signal; a visual or semaphoric signal moved in one direction by an electro-magnet and in the other by a weight or its equivalent; mechanism for retaining or locking the said signal in position against the action of the said weight or its equivalent; a second circuit closer, *b b*, operated by a passing locomotive or car, and a wire or conductor, 18—the said elements being so arranged relatively to each other that a locomotive or train passing over the insulated section *a a* will cause the signal to be displayed, and to remain displayed until the said locomotive or train has closed the second circuit at *b b*, when the said signal will be released or reversed, so as to assume its normal position, substantially as and for the purpose herein specified.

3. The combination of the following elements: A signal disk, provided with a counter-balancing device, so as to automatically either display or conceal itself; an electro-magnet for causing the said signal disk to be displayed or concealed, said magnet being included in an electrical circuit which is under the control of a locomotive or train; and suitable mechanism for retaining or locking said signal against the action of its counter-balance—such mechanism being operated by a second electrical circuit distinct from the first, substantially in the manner and for the purpose specified.

4. The combination of a primary and a secondary signal, each included in and operated by a separate or distinct branch of the same circuit, with a circuit-breaking device *F*, arranged and operated substantially in the manner and for the purpose specified.

5. The combination of the signal magnet *M* with the circuit-breaking device *F*, arranged to cut off the current from the magnet *M* before the completion of the stroke, substantially as and for the purpose herein specified.

6. The combination of the electro-magnet *N* and its armature *n* with the signal disk, substantially as and for the purpose herein specified.

7. The arrangement of the primary signal upon the line of a railroad at the distance of a train's length, or more in the rear of the circuit closing device which actuates said signal, substantially as and for the purpose herein specified.

8. The arrangement of the circuit closing device which actuates the primary signal upon the line of railroad in the rear of the secondary signal, substantially as and for the purpose herein specified.

9. The combination of the following elements: A visual or audible signal, moved in one direction by an electro-magnet and in the other by a weight or its equivalent; a device for releasing, reversing, or stopping said signal or signals, operated or controlled by an electro-magnet; a line wire, 18 or 20, including said electro-magnet; and a circuit closer, *T*, attached to and operated by the mechanism of a primary or secondary signal, substantially as and for the purpose specified.

10. The arrangement of the circuit closing device *T*, relatively to the insulated section of track *a a* and the primary signal, so that any one of a series of signals cannot be released or reversed until the train is under the protection of a succeeding signal, substantially as herein specified.

11. The combination of the following elements: A primary circuit composed of the conductors 1, 2 and 3, and the rails *a a* of a railroad track connected thereto, so arranged that the said circuit will be completed by establishing a metallic connection between two of the said rails, insulated from each other; a secondary circuit, operated or controlled by a relay, *C*, placed in said primary circuit; a visual or semaphoric signal, *G*, and an

electro-magnet, *M*, substantially as and for the purpose herein specified.

12. The combination of the following elements: A primary circuit, composed of the conductors 1, 2 and 3, and the rails *a a* of a railroad track connected thereto, so arranged that said circuit will be completed by establishing a metallic connection between two of the said rails insulated from each other; a secondary circuit, operated by a relay, *C*, placed in said primary circuit; and an audible signal, *P*, under the control of an electro-magnet, substantially as specified.

149,252.—TELEGRAPH APPARATUS FOR CABLE USE.—William E. Sawyer, Washington, D. C. Application filed February 12, 1874.

Depression of a key closes circuit to key-locking devices and to magnets *G*, bringing arm *D* into revolving wheel *H*, causing partial revolution of cylinder *B*, which closes circuits to keys *E* or *F* as a + or — current is to be sent over the cable. All currents are used for signals.

1. The combination, with the lettered keys, having an end shoulder or rabbet, as shown, of the vibrating locking armature *C*, the same being suitably connected electrically, whereby the armature holds one of the keys depressed, but prevents depression of the others till the circuit is broken, as and for the purpose specified.

2. The cylinder *B*, having strips *x* on its upper side and studs and strips *x'* on its opposite side, in combination with keys *A* having metallic connecting points, and the plates *Z*, sending instruments *E* and *F*, combined as shown and described.

3. The combination, in a receiving instrument, of the bar *Z* attached to needle *T* and having aperture *o*, with the traveling sensitized strip to direct a ray of light thereon, as and for the purpose described.

4. The mode of signaling or recording signals through a submarine line or cable, by utilizing all electrical impulses, or each movement of the galvanometer needle or needle bar, to form on the sensitized strip a positive sign, or part of a complete sign, of a word or letter, as set forth.

5. The alphabet, as shown and described.

6. The combination of the cylinder, having metallic projections on its periphery, keys having corresponding projections, plates *Z*, sending instruments *E* and *F*, the cable or wire connection, the galvanometer, the bar *T* having an eye, *A*, and the traveling sensitized strip, as shown and described, whereby dashes or curves are formed lengthwise of the strip and sidewise or oblique to the line of motion, to be read from left to right instead of from top to bottom, in reference to an imaginary zero-point, as at present, the same being connected in a continuous line, as specified.

7. The combination of the detent armature, revolving spur-wheel, magnets *G*, cylinder *B*, having metallic projections, the keys having metallic projections on the under side, and wire, as shown and described.

Married.

BERRY—PASHBURG.—At the residence of James Higgins, Austin street, San Francisco, California, April 27, by Rev. W. D. Clark, Mr. THOS. H. BERRY, of the Atlantic telegraph office of that city, to Miss BETTIE PASHBURG, of Yreka, Cal.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining. May be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

ELECTRICITY AND MAGNETISM.

By FLEEMING JENKIN, F. R. S.

Illustrated with 174 Engravings, 12mo. cloth, \$1.50.

J. VAN NOSTRAND, IMPORTER AND PUBLISHER,

23 MURRAY ST. and 27 WARREN ST.

*** Copies sent free by mail on receipt of price.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"
"History of America," "Civil War in America;" Member
of many Scientific and Learned Societies of Europe
and America; Commander of the Order of Dan-
nebrog, Denmark; Order of St. Olaf,
Norway, and of the Sword Order,
Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800
pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his
own expense, and he hopes telegraphists throughout the world
will accord to it a patronage commensurate with its merits. For
nearly thirty years the author has been connected with the
telegraphic systems of both hemispheres and an observer for
general instruction, and this work will contain the substance of
facts thus collected, having especial reference to practical tele-
graphy.

The first four volumes will be ready for printing in May, and
the whole work may be issued in monthly parts of quarter or
half volumes.

Vol. I will contain a general history of electrical discovery
by ancient and modern philosophers—the experiments of Otto
Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek,
Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and
others who practically manipulated static electricity; the whole
prepared especially for the telegraphists as useful information
in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic bat-
tery, and the many improvements and modifications of this
telegraphic generator of electricity, considering the experiments
of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and
Grove. Also, magneto and thermo electricities, and the applica-
tion of their respective forces for telegraphic and useful pur-
poses.

Vol. III.—In this volume will be considered Terrestrial Mag-
netism, Aurora Borealis, Magnetic Needle, Ships' Compass, and
Magnetic Phenomena generally. Also, Electro-Magnetism as dis-
covered by Ersted and manipulated by Schweigger, Ampère,
Arago, Sturgeon, Henry, Faraday, Jacoby and others. The ap-
plication of these discoveries for practical telegraphy by invent-
ors, from time to time.

Vol. IV.—A general history of the ancient and modern tele-
graphic systems, semaphoric and electrical, including telegraphs
of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil,
Morse, Bain, House, Hughes and others. Also, the construction
of overland, subterranean and submarine lines, including con-
ductors, insulators, paratonnerres, and telegraphic implements
generally.

Vol. V.—This volume will give a full account of the various
telegraphic apparatuses for simple and automatic manipulation;
the combination of circuits for repeating or translating; double
and duplex transmission. It will also contain a large amount of
general information for practical telegraphists, respecting con-
ducting and non-conducting compositions, tables, and a Diction-
ary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it
will not be mathematical. The illustrations are designed for
specific instruction, and their explanation concise. It will be
so arranged that either one of the volumes may be bought by
those not wanting the whole.

Each volume will have a complete Table of Contents and an
Index.

The above must be regarded as an approximate division of the
subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.

Will not jar open.

Slight pressure of the finger required to put lever in circuit
or cut out.

Acknowledged to be a decided improvement.

Price, same as the ordinary key.

Superintendents and Purchasing Agents are invited to examine
our **EXTENSIVE FACILITIES** for supplying the

"BEST" GALVANIZED WIRE,

OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,

BROOKS' OR GLASS INSULATORS,

SUPERIOR INSTRUMENTS AND BATTERIES,

at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful informa-
tion for Superintendents and others interested in the Science of
Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for horse and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THEIR CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by anyone.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
 CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
 And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
 E. HOWARD, & CO., Proprietors.
 J. HAMBLET, Electrician.

OFFICES:
 114 TREMONT STREET, BOSTON, Mass.
 15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world. It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up
THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
 ETC., ETC.,
OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
 MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
 OF
EVERY DESCRIPTION,
38 VESEY STREET, New York.

NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

RELAYS,
SOUNDERS,
REGISTERS and KEYS.

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,

For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.
Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.

BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for

HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Descriptive Circulars and Price List forwarded upon application to

F. L. POPE & CO.,

DR. L. BRADLEY,
No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-500th of an inch, the layers separated by thin paper. In Helices of silk-insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk-insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order. See our advertisement in other columns.

WATTS & CO., Baltimore.

THE RAILROAD GAZETTE.

TELEGRAPHERS and TRAIN DESPATCHERS, and all men in any way interested in or connected with Railroads, will find this paper interesting and valuable. It is the best Railroad paper in the world.

It is an illustrated journal of 24 quarto pages, about the size of Harpers' Weekly.

PRICE, - - - - \$4 A YEAR.

SATURDAY, MAY 16, 1874.

VOL. X. WHOLE No. 409.

Original Articles.

The New Baltimore (Md.) Office of the Western Union Telegraph Company.

FOR so many years have the people of Baltimore been accustomed to regard the corner of Baltimore and South streets as the telegraph centre for this locality, that the removal of the office of the Western Union Telegraph Company to the elegantly fitted up premises specially arranged for the accommodation of its extensive business in the beautiful brown stone building on the corner of Baltimore and Calvert streets, naturally gave rise to some comment.

A few months since the Western Union Company secured a lease for a term of years from Alex. Brown & Sons, of the principal portion of their banking house, then in process of reconstruction, and immediately commenced preparations for the removal of their wires and business to the new location. This was effected, as has already been stated in THE TELEGRAPHER, on the morning of Saturday, the 2d inst., and everything was speedily in order, and working successfully in the new quarters.

A brief description of the new office may not be without interest to the fraternity, and it is pleasant to note the constant improvement which is being made in the surroundings and accommodations for telegraphers and the telegraph business. The policy of the Western Union Company of late years has been very marked in this particular, and the dingy and restricted quarters which were formerly considered good enough for telegraph offices are being abandoned, and spacious, well lighted, arranged and ventilated rooms provided, to the decided advantage not only of the public and the employes, but of the Company as well.

The new receiving and delivery department are on the first floor of the building, and are reached by a descent of two steps from the sidewalk. Rich black walnut counters, with polished veneered panels, supporting neatly designed frame work, in which are ground glass plates embellished with the monogram of the Company, afford the necessary accommodation for transacting business with the public. At proper intervals along the counter neat silvered standards are seen, each supporting an Argand gas burner, which serves to brilliantly illuminate the room by night, and are a handsome ornament as well by day. This room is connected with the operating department by a pneumatic tube, which is worthy of especial mention. Being both an exhaust and discharge apparatus, it cannot, by ordinary use, be liable to the objection of becoming blocked up, which, in others, is so frequently complained of. An additional noticeable feature is a branch connecting directly with the desk of the receiving clerk, which is at some distance from the main tube, by which he can start messages directly to the operating room, obviating the necessity of calling a messenger to carry them to the box for that purpose. This saves time, as well as avoids any unnecessary handling of the despatches. An ingenious arrangement will be attached to the upper end of the tube, by which an ascending box will break an electrical circuit, and, by ringing a bell below, notify the person in charge of the blast when the messages have reached the top. A mirror placed at the proper angle in the lower part of the apparatus shows when the tube used for sending messages down is clear. Should either tube become blocked both can be connected, and may be easily cleared by creating a vacuum with the exhaust. In short, every precaution has been taken to insure absolute promptness and reliability in the transmission of messages between the lower and upper parts of the building.

On this floor are found the Receiving and Delivery Clerks, Messrs. Isaac Hess, Malcolm Hart and John T. Cross; and the Cashier, Mr. John G. Riley, who served the Bankers' and Brokers' Company for a long time very acceptably as the manager of its Baltimore office, and was well known as a first class operator when the writer of this had not fully satisfied himself that there was no actual necessity for registers.

The operating room, which occupies the entire third floor, is one of the most desirable and pleasant that could be provided for the purpose. Three large windows in front and four on the side, furnish ample facilities for light and ventilation, while two smaller

windows in the rear are available for the same purposes when required.

The operating tables are of the well known Western Union pattern, adopted generally for large offices. There are twenty of these in the room, each arranged for four sets of instruments, which are separated from each other by partitions of heavy hammered glass, with a neat Argand gas burner in the centre, so placed as to afford ample light to all the instruments on the table at night.

The switch board which has been manufactured expressly for this office, is similar to that in the office of the company at 145 Broadway, New York, and which was fully described in THE TELEGRAPHER of January 20, 1872, and will accommodate forty-eight through wires. From the switch board the wires are carried by cables under the floor to the tables. In addition to the regular Morse apparatus there are two sets of duplex instruments, one for the New York circuit and one to provide for cases of emergency; besides two sets of duplex repeaters for the circuits between Washington and Cincinnati, and Philadelphia and Washington. There are also three sets of Milliken repeaters, which are doing the same service at this point, passing dots and dashes, that has made their excellent reputation wherever they have been used.

A Siemens Universal Galvanometer, lately added to the equipment of the office, affords opportunity to the operators of a scientific turn to investigate the phenomena of insulation and resistance.

The fourth floor is devoted to the main and local batteries. One thousand cells of Callaud battery, arranged very conveniently, are kept in excellent order by the intelligent batteryman.

Ascending to the roof, we find a perfect mass of wires coming from every direction and centring to the cupola, from whence they are conducted to the switch board, after passing through the lightning arresters, which are placed in convenient position for examination in case of trouble. This part of the machinery is the only one that calls for criticism, but there are many better and more reliable arrangements for this purpose than the old one of a pair of brass plates with paraffined paper between.

The manager of the Western Union Company in this city, Mr. Archibald Wilson, Jr., has his desk in the operating room, and while looking closely to the interests of the company, has won the respect and esteem of all the employes of the office.

Mr. C. C. Wolff, chief operator, and Mr. Jack Guthridge, assistant, attend to the wires during the day, and our old friend, Mr. Frank Morrison, gives satisfaction to all having business with the office at night, as night manager. The operating force consisting of twenty-two operators, thirteen of whom comprise the day force, and nine the night force, are all well known members of the fraternity, and will compare favorably with the employes of any other office of the company. Some of them have been engaged in the business since the days when it was not unusual to close the office while they went over their divisions to repair a break, or lift the wire from a mud hole. Some remember the late "unpleasantness," and relate their experience in the Confederacy with more relish than the opportunities for obtaining them warrant.

The regular force of the Western Union Company in Baltimore may be summed up as follows:

- 1 Manager,
- 22 Operators,
- 10 Clerks,
- 7 Office boys,
- 1 Janitor,
- 1 Batteryman,
- 2 Liuenen,
- 17 Branch office operators and clerks,
- 42 Messengers

Total, 103 employes.

From this an idea may be obtained of the importance of the office, and of the extent of the telegraph business transacted. The work of arranging the wires through the city in preparation for the removal to the new office, was done under the supervision of Mr. Hubert McAleer, whose duties were most satisfactorily performed. The cupola is reached by 108 wires, many of them loops and city lines, and the connections were so made that at short notice one office could be closed and the work resumed and continued in the other, and it certainly was highly creditable to all concerned that not a single error in the connections was discovered when the change from one office to the other was made.

The first line of electric telegraph in this country was inaugurated between Baltimore and Washington, and has become historical as the starting point of the system which, during a single generation, has developed into such a universal and mighty agency. There are many citizens of Baltimore who refer often to the early days of the telegraph system, when doubts were so generally entertained and freely expressed of the practical success which was even then demonstrated, and with gratification at its rapid progress and development which they have lived to witness, and which has

a fitting and appropriate illustration in the change which has been required in the accommodations for the business of the Western Union Telegraph Company.

Baltimore, May 9.

N.E.

Telegraphic Ability, Natural and Acquired.

BY OLD TELEGRAPHER.

IT has been said that some men are born great, some achieve greatness and others have greatness thrust upon them. So it may be claimed that some are born to telegraphic pursuits, and to them acquiring the telegraphic art comes naturally and easily; while others achieve telegraphic proficiency through a severe course of study and practice. Perhaps there can be cited no instance where eminence in telegraphic acquirement has been thrust upon any individual, but, considering the utter incompetency exhibited by some who fill important and sometimes prominent telegraphic positions, it would seem as though, in their cases at least, telegraphic greatness must have been forced upon them, or it would never have been witnessed.

The natural telegrapher, or one to whom telegraphic proficiency comes easily and without any special effort, is apt to be superficial and mechanical, and, from the lack of close application and industry, seldom becomes more than a mere transmitter and reader of signals. He does not see the use of so much study to master the scientific principles which underlie the telegraphic art, and, when off duty, cares for little but recreation and physical gratification. It is useless to expect anything further from this class. It should not be understood, however, that all who acquire telegraphic proficiency easily are of this character. There are honorable exceptions and those who combine natural aptness with industry, and a desire for the acquisition of useful professional and scientific knowledge, make very valuable and progressive telegraphers, and are seldom in want of employment, and at the highest rates of compensation.

But it is mainly those who are compelled to acquire telegraphic proficiency by application and persistent study and practice who in the end make the most efficient and reliable telegraphers, and are in demand for the more important telegraphic positions. In the earlier stages of their telegraphic education such persons are apt to be greatly lacking in confidence; and when they do get an opportunity to engage in actual telegraphic work are likely to exhibit extreme nervousness, which makes their performance partake more of the plug character than it would were they more confident of their own ability. This, however, soon wears off, and until it does they must harden their sensibilities against the sharp and scornful deprecatory remarks in which operators are wont to indulge in working over the line with beginners or with those whom they regard as less efficient than themselves. They can console themselves with the anticipation that the time will surely come when they will be able to outrank their critics as telegraphic artists, and should learn from their own experience to be more considerate when, in their turn they have become experts, they may be called upon to work with others similarly situated as they are at the time.

The proposition of Perkins in the last number of THE TELEGRAPHER, for establishing a telegraphic organization which shall establish different grades of telegraphers who shall receive from competent authority certificates according to their proficiency, is an excellent one, and would undoubtedly inure to the advantage of the class which we are considering. As the race is not always to the swift or the battle to the strong, so the highest grade would not always be accorded to the operator that could most easily and speedily acquire a mere machine facility of manipulation. While rapidity of manipulation is desirable, accuracy and reliability are more important and more valuable in the end. Accuracy is not unfrequently sacrificed to speed, and to a foolish pride which prevents some operators from "breaking" when receiving, and thus guessing at the words which have been lost or indistinctly transmitted.

It cannot too often be urged upon aspirants for telegraphic honors and emoluments, that the only way in which these can be worthily acquired is by aiming at a thorough knowledge of the scientific principles upon which the telegraphic art is bound; as well as by expertness in the merely mechanical telegraphic duties. The more thorough the knowledge of the telegrapher the more valuable are his services, and this fact will eventually be recognized. It is one great defect of the European telegraphic systems that they aim at nothing and expect nothing of the class known in this country as operators, except mere ability to transmit and receive telegraphic signals. Usually this class know nothing of electrical science, or of any other than the special duty for which they are employed—that of sending and receiving telegraphic signals. There is not the inducement for them to endeavor to rise above this, even, if they had the inclination, for there is little hope that they can ever reach the higher and better paid telegraphic positions. In this country the messenger boy of

to-day, may without any unreasonable presumptions look forward, with proper effort and application, to becoming an operator, manager and superintendent in the course of a few years. When they are liable to be called upon for such important positions and duties, it becomes necessary that adequate preparations should be made. Those who devote their time and attention to acquiring scientific and professional knowledge and information, may reasonably expect to achieve position and compensation in the end. The path may be difficult and laborious, but the object to be attained is worthy of the labor and sacrifice, or if not so considered then it should not be made.

It is not proposed to consider those who have telegraphic greatness thrust upon them. In fact they are worth very little consideration, and any time spent in discussing them would be wasted. As they are indebted to personal favoritism for their advancement, so we may rely upon their downfall when the sustaining power of such favoritism or other adventitious support is withdrawn.

Telegraph Department of the Reading Railroad Company.

THE general offices of the telegraph department of the Philadelphia and Reading Railroad Company in this city have been transferred to the two ground floor rooms on the northeast corner of the new building, along the main hall. The large room fronting along the Philadelphia and Reading Railroad is used as the operating room for the transmission and receiving of messages and has been handsomely fitted up, and presents a neat and tasteful appearance, the counters, tables, etc., being of heavy walnut and ash wood and well finished. In the operating room there are 13 sets of instruments, by which telegraphic communication is had with all points along the Philadelphia and Reading Railroad, and all its branches. One of the principal features of this room is the switchboard, which is adapted for 25 lines. It is 4½ feet long, and 3½ feet wide, and contains about 5,600 pieces of metal and wood, and is so arranged that by simply changing the position of the metallic plug, any two lines can be connected together or changed; also any set of instruments in the office can be connected to any line. The iron wires upon the outside of the building are connected to the switchboard and thence to the telegraphic instruments by means of cable wires, which are encased with neat walnut frames, thereby not exposing any of the wires to view. The batteries are kept in the basement underneath the telegraph office. Another important feature of the office is the manner of giving the correct standard time of the Philadelphia and Reading Railroad Co., to all its telegraph stations, 255 in number, along the main road and all its branches. At three minutes to 4 o'clock P. M. daily, except Sunday, all business on the lines is suspended, and by means of a series of repeaters, all the lines of this Company 36 in number, are arranged so as to be operated and controlled by one operator at the Reading office, who has a chronometer before him, from which the correct time is given. Commencing at three minutes to 4 P. M., the Reading operator says "Time" on all the lines, which calls the attention of all operators to adjust their clocks, and continued at short intervals, until five seconds to 4, when he opens the circuit. At 4 o'clock he makes one tap: at fifteen seconds after 4, two taps; at thirty seconds after 4, three taps; at forty-five seconds after 4, four taps, and at one minute after 4, five taps. By this arrangement every telegraph station is able to get the correct time to the second, daily, and thereby have the railroad clocks and watches of the employes properly adjusted, which is a very important matter in the management of a railroad. The adjoining room west of the operating room is also handsomely fitted up and furnished, and is occupied by Mr. C. T. Sellers, Superintendent, and Mr. H. W. Spang, Assistant Superintendent of the Telegraph Department, who have charge of all telegraph lines, offices and telegraph employes of the Philadelphia and Reading Railroad Company. The Telegraph Department of this company is becoming very extensive. The lines extend from Philadelphia to Chester, Germantown, Chestnut Hill, Norristown, Reading, Pottsville, Lancaster, Columbia, Wrightsville, Harrisburg, Dauphin, Pine Grove, Towey City, Shamokin, Treverton, Ashland, Shenandoah, Tamaqua, Catawissa, Danville, Williamsport and all intermediate points. There are at present 36 distinct lines, embracing 1,680 miles of wire, 255 offices, 410 sets of instruments, and 470 operators, messengers and other telegraph employes. Extensions of lines are constantly being made, and new offices opened. In addition to the telegraph office at the new depot, this Company have offices at 449 Penn Square and 610 Penn street, and thirteen other offices throughout the city for the convenience of the public and the Railroad Company. The rates of this Company for the transmission of messages for the public have always been moderate, and messages are transmitted and delivered with promptness as they have extensive facilities for doing the business, having offices

in all parts of the city of Philadelphia, and connecting with lines of the Franklin and Atlantic and Pacific Telegraph Companies to all parts of the United States.—*Reading (Pa.) Times and Dispatch.*

Telegraphing Above the Clouds.

A FEW days ago Sergeant E. W. Boutelle, of the United States Signal Service, passed through this city en route to Washington, where he is to receive promotion. This gentleman had been stationed at Colorado Springs, in connection with the Pike's Peak Observatory, since last July, when that station was formed. During that time he has had many interesting experiences, both upon the summit of the mountain and in the construction of the line from Colorado Springs up the side of the Peak. During his brief sojourn here he detailed to a *News* reporter some points which may be of interest to the public.

The telegraph line, which reaches from Colorado Springs to the summit of Pike's Peak, is twenty miles in length. It passes along a trail made during the past year, which is far more easy of ascent than any of the old routes. It is now possible to ride an animal from the base of the mountain to the Signal Station on the top of the Peak. Mr. Boutelle has been engaged most of the time keeping the line in repair, and in the discharge of his duties has made fifty-two ascents of the mountain. He has passed one hundred and forty-two times over the Government trail—more frequently than any other man—and is familiar with every foot of the route. The telegraph wires are stretched on poles and along the dead pine trees. The line gets out of repair frequently, by reason of the trees falling and breaking the wire. The extreme cold at the summit has also at times so contracted the wire as to break it.

Life on the summit of Pike's Peak during the winter season is rather precarious. With the thermometer over thirty degrees below zero at times, the wind blowing so strongly that exposure to it is dangerous, the snow driving in blinding clouds, the experience of the observers stationed at that great height was a varied one, and still fraught with a tedious monotony. The signal station is a substantial stone edifice, and is occupied by three officers, who manage the affairs of the observatory at that end of the line.

During the winter Mr. Boutelle, in going up the trail, wandered from the route, and was lost for four days. He managed to make his way to the lake, a few miles from the summit, and there remained in an old log house, with no food, and only a sheet iron stove, that happened to be there, in which to make a fire. With his hatchet he endeavored to cut a trail through the snow for his mule, but it was impossible, the strong wind filling up the opening, and the extreme cold nearly freezing him to death. At the end of four days the weather moderated, and he got through to Jones' ranche, eight miles from the summit, where he was cared for. The snow in places up the trail is from five to thirty feet deep—many ravines being drifted full.

All the provisions are packed to the summit from Colorado Springs, the wood being obtained from the edge of the timber line below the observatory. Wood has cost the Government as high as \$22 per cord, laid down at the house. In the months of December and January it cost 1½ cents per pound to pack provisions from the Springs.

The officers stationed at the summit are R. C. Seyboth (in charge), L. A. Lemman and D. E. O'Leary. At Colorado Springs are Henry Fenton (in charge), and H. W. Tibbetts.—*Denver News.*

Submarine Telegraph Property.

LAST week we called attention to the depression of submarine telegraph stocks, and showed that, as regards the Anglo-American, its intrinsic worth was far in excess of its market value. Since then we have received the announcement of a temporary interruption; but that circumstance, although it has caused a considerable fall in the price of stock—or, perhaps we might with greater accuracy say, has given the "bears" a covert under which they may go in and depreciate it—has in no way modified the opinion which we then expressed. On the contrary, it adds considerable emphasis to it; inasmuch as the transmission of messages remains uninterrupted. There could be no more undeniable proof of the advantage of having a plurality of cables. That is the effect which the "breakage" in question must have upon the mind of every man who rightly considers the circumstance. In itself it is a mere bagatelle. It occurs fifteen miles from shore, in shallow water, so that the repairing of it is a mere matter of time—not of days, but hours—and we dare say that the repairing ship is by this time over the spot, and using the grapnels to bring up the cable that the fault may be made good, and we repeat that the moral of the accident tells well in favor of the plurality of cables. This is further illustrated by the fact that, notwithstanding the interruption of the Eastern exten-

sion cables, the traffic of that company continues to be worked with the utmost regularity to all parts of the East, Japan included—a matter which is of paramount importance now that the famine in India excites such deep sympathy in this country. Why is this? Simply because their working agreement with the Great Northern Company practically gives them possession of a second cable. Looking to these facts, we confess we should like to see those who are entrusted with the management of submarine cables directing their attention to the multiplication of such agreements, if not to complete amalgamation and fusion of interests, so as not only to protect the public, who are their customers, against the probability of delay, but also the proprietors who have entrusted to them the guardianship of their interests. That being our view, we confess to feeling some pleasure when the rumor reached us, which we have reason to believe is correct, that the negotiations pending between the Indo-European and the Eastern are likely to terminate in an agreement of the kind we have mentioned. The statement, too, made by the chairman of the Eastern Extension, cannot be regarded other than satisfactory, that the Australian Governments are negotiating for a lower tariff over the lines, offering to reciprocate the favor by granting the company a subsidy. We all know how Sam Slick sold his clocks. Soft sawder and human nature have the same power over Governments as over individuals. The farmer's wife having enjoyed the use of the clock for a few days did not want to part with it, and just when Governments and peoples have once tasted the enjoyment of rapid communication they can never after do without it. The example of the Australian colonies is one which we hope to see followed by the Indian Government, which owes a deep debt of gratitude to the company which has conferred the boon of telegraphic communication upon the Indian empire, and thereby enabled the authorities there to hold immediate intercourse with those at home. We have seen the advantage of this in the means taken for the alleviation of the famine, and it is impossible to overrate its importance in the event of mutiny or outbreak among the native troops. In the West, we are happy to observe a fusion of interests in the arrangements between the West India and Panama and the Central American Companies. All extensions foreshadowed under that agreement must tend to increase the traffic on the trunk lines, as they are not hampered by parliamentary edicts and working agreements. We repeat, then, that, with these prospects before them, the proprietors of submarine stock need not be at all apprehensive as to the future of their property.—*The Railway News.*

[From the *Alla California.*]

The Pacific Cable.

THE advantages which will result from the laying of a telegraphic cable connecting the United States with the Central Pacific Islands, Japan and China, are potent to the comprehension of all. We have already established steamship lines between San Francisco, Japan and China, and in all probability other steamship companies will soon follow, as the trade between our coasts and the commercial cities of the far East is continually increasing in magnitude and profit. To this trade a strong impetus was given by the building of the Pacific Railroad; and when other railroads are completed, our commerce with Eastern lands is destined to be greatly enlarged. The fleet of merchant vessels upon the Pacific will probably be doubled, and the relations between our country and the countries of the Orient will probably be as close as those existing between the United States and the nations of Europe. That direct telegraphic communication should be established with countries already united to our own by bonds of commercial interest, is of great importance.

Some years ago a telegraph between this coast and that of Asia was considered a necessity, and great progress was made in the surveys, and the line was constructed well into British Columbia. Expeditions were sent forward to Alaska, and across the ocean to Asia, where a portion of the expeditionists spent a year or two in Siberia, making observations and surveys; but, the completion and working of the first or second Atlantic cable, and, perhaps, some other causes, led to the abandonment of the project for a while. And thus, although many portions of the Continent have been girded by the wire, and the seas, bays, and oceans, have the lightning messenger passing through their waters, uniting many nations as one, we in America have no connection of the kind with the east coast of Asia, and the great island continent of Australia, and the islands lying between, except by the lines through the nations or waters of Asia, the Red and Mediterranean Seas, Europe across Ireland and Newfoundland, and under the Atlantic. To hear from Australia, with which we have a large and growing trade and intercourse, the words must travel perhaps thirty thousand miles to reach us six thousand miles away. A line to China would save us three fourths of the distance, cost and time now expended.

The New Western Union Office.—Other Telegraphic Matters of Interest.

BALTIMORE, MD., May 11.

TO THE EDITOR OF THE TELEGRAPHER.

The principal topic of interest here is, of course, the new office of the Western Union Telegraph Company, which has now been occupied for a week. The change from the somewhat dingy and restricted quarters previously occupied is as great as it is gratifying. The associations connected with the old building on the corner of Baltimore and South streets, which for sixteen years has been occupied as a telegraphic headquarters, of course endeared it to many, but it had outlived its usefulness and appropriateness in this respect, and it will soon be numbered with the things that were. It would be a good idea for some competent person to write up its history for the columns of THE TELEGRAPHER, with a record of the companies which have occupied it, and the different managers and other employes who have served within its walls. Such a history could not but prove interesting and instructive, and it is to be hoped that it may be written.

The new office on the corner of Baltimore and Calvert streets is beautifully fitted up for the business, but as it is understood a description of it is to appear in THE TELEGRAPHER of the present week, it is not necessary to refer to it more in detail in this communication.

The enterprise of some capitalists continue to afford opportunity for the development of telegraphic facilities and advantages, and their introduction here, so that we are not in this respect far behind even the metropolitan city of New York. The Gold and Stock Telegraph Co. have had their system of telegraphic reports of financial and business quotations in operation here for some time, and have a good share of patronage. Within the last few days the neat uniforms and intelligent countenances of a number of the messengers of the American District Telegraph Co. have made their appearance upon our streets, which shows that the world moves, and that Baltimore will not be satisfied with anything less than the facilities and advantages elsewhere enjoyed.

The Franklin Telegraph Company, which is now located a few doors from the former Western Union office, have been and are doing a very good business, and, under the management of Mr. Walter Stuart, will continue to deserve well of the public.

The operators here are rather disposed to join hands in the League proposed by Perkins in the last number of THE TELEGRAPHER. They think a combination to advance themselves in knowledge of paramount importance, and are preparing for a branch of the society proposed by I. N. M. in a late issue of your paper.

BALTIMOREAN.

Resignation of Mr. James S. Urquhart, and a Valuable and Appropriate Presentation.

SAN FRANCISCO, CAL., April 25.

TO THE EDITOR OF THE TELEGRAPHER.

ANOTHER old landmark has gone—not where the woodbine twined, but gone out of the fraternity. This time it is Mr. James S. Urquhart, whose resignation as manager of the Western Union Telegraph Co. took effect on the first of April. His associates could not allow him to leave without presenting him with some *souvenir*, which they accordingly did, in the shape of a case full of the most valuable works of poetry, history and science, valued at \$500. Those of the operators who could absent themselves on Thursday, April 25th, repaired to Mr. Urquhart's residence and made the presentation, Mr. Delos J. Howe reading the following address:

“Mr. Urquhart: When you determined to sever your connection with the Western Union Telegraph Company, your friends and associates there decided to present you some sort of testimonial as evidence of the high esteem in which you were held by them. They might have selected a *cane*, but probably thought you were not able to bear it; or perhaps a *watch*, but a man who has so often aided in annihilating *space* and *time* don't want any more watches. A *ring* might have been given, but we reflected upon the quiet simplicity of your tastes and manners—and then there are too many *rings* in the world any way. There is a sort of dreary monotony about most of the friendly and complimentary presentations of our times. It nearly always means a walking stick, a watch and chain, a ring, or shield or badge, loaded down with names and legends, or a meerschaum pipe, which might half kill the recipient to color satisfactorily. Your old associates have invaded this monotony, and, in the spirit of pure friendship and a close regard for your physical, moral

and spiritual welfare, have upon this occasion made you the donee (that is an ancient *law* term, meaning the fellow who gets it) of a choice selection of literary works. A good book is at once a companion and a friend. It is our wish that you may always have a friend, and you *have* hosts of them all around you. Still, you can always feel that there are *these* at home on the shelf waiting for you. Your leisure hours will not be idle hours; and, as you drift quietly through these pages, memory will revive the names of all those who by this means testify their friendship for you and yours.

“Another monotonous thing about presentations is long speeches by the parties presenting or by that person whom they may have selected to perform. That I should not make this address too long I reduced it to writing. In conclusion, therefore, Mr. Urquhart, permit me, without even a suggestion of flattery, to speak for these your friends, and for myself, too, in testimony of your good qualities as a man, your faithfulness as a friend, to your uniform courtesy in all social and business relations and associations. We have observed them all, so has the press, and hosts who have learned to call you *friend*, but who are not present, either here or in the city, even, will *swear* that what we may and *do* say on that point is true. They will ever wish you health, happiness and prosperity, in the full confidence that when you get ‘thirty,’ as we all shall in time, you will report all ‘O K’ on the other side.”

Mr. Urquhart, in a few well selected sentences, thanked the operators for their kindness, and assured them that, although he had *cut out*, he could never forget that the connections were all good, and ready to turn on the battery at any time. That battery was also supplied to him—every cup being represented by a valuable book; and every time he took one in his hand he was *connected* again with the fraternity. He then invited the boys into the dining room, where Mrs. Urquhart had prepared a sumptuous repast at short notice.

Present—Miss Irving (Mr. Urquhart's sister-in-law), Messrs. Frank Jaynes, H. C. Ladd, John R. Yontz, J. Waldo Thompson (of Yreka), Nelson H. Brown, Delos J. Howe, George Sawyer, Len. W. Storrer, T. S. Cunningham, J. W. Collins and the host and hostess.

The viands and wine being discussed, the parlor was again revisited, where songs and music were kept up till midnight, when the party bade their old manager and his amiable wife a hearty *God bless you!* and left for their respective homes.

ROVER.

The Proposed Telegraphic Association.

PHILADELPHIA, PA., May 12.

TO THE EDITOR OF THE TELEGRAPHER.

The communications in regard to a Telegraphic League or Association which have appeared from time to time in THE TELEGRAPHER have been read with much interest. It has struck me, however, as probably it has many others that, as a general thing, they lack the element of practicability, and that the writers had very indefinite ideas of the means of accomplishing the desired objects. Usually, they disclaim any intention of resorting to strikes or forcible measures of any kind for this purpose, but have an impression that in some mysterious and undefined manner the mere organization of an association was to remedy the evils under which the telegraphic fraternity is laboring. They cry “League,” “Association,” “Union,” but to what end?

Certain facts must not be ignored in considering and discussing this matter if we would attain any substantial result. In the first place we must take into account the fact that telegraph managers will, in this matter, act together, and for what they consider to be the interest of their respective companies. Any attempt to establish an improvement in the circumstances of the employes, unless the whole, or nearly the whole of the employes are engaged in, and will adhere to it, will be successfully resisted, and our experience in the past has not been such as to encourage us to expect that this can be relied upon. Any effort to enforce our requirements, otherwise than by moral and persuasive influence must fail. These are truths, and they may as well be accepted as such.

Must we, then, abandon the idea of securing any improvement in our condition? I think that this question has been very satisfactorily answered in the negative in the suggestion made by Perkins in his communication which appeared in the last week's issue of THE TELEGRAPHER. His suggestions in regard to establishing different grades of telegraphers, each of which shall be properly authenticated after a suitable examination by a competent board of examiners, is a very good one, and could, no doubt, be made eventually satisfactory to, and secure the cooperation of most of our telegraph managers. It is manifestly for the interest of all companies to secure, if possible, the class of employes best qualified to discharge satisfactorily and properly the duties of the positions to which they may be assigned.

Let us, then, all take up Perkins' suggestions and prepare to act upon them. It is the only practicable suggestion that I have seen as yet, and the only one which, in my judgment, promises favorable results.

Perkins's Plan for a Union Approved.—Practical Suggestions.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE carefully read the numerous communications from the correspondents of THE TELEGRAPHER for the last three or four months, in relation to Telegraphers' Unions, etc., but none have pleased me so much as the one in your last issue (May 9th), signed Perkins.

It seems to me that such a certificate plan as he suggests would promote much good, and give the really worthy and competent operators a better chance to procure situations, and “bar” the inferior ones out until they became qualified, and had passed a strict and classified examination.

Such examinations can be drawn up to coincide with the number or class of certificate issued, and each operator obtaining one should be required to sign the certificate in their own handwriting. This would, to a great extent, prevent *petty fraud* in exchanging certificates, or, perchance, a *certificate loan*.

A description of the holder of the certificate would not, I think, be out of order, and would be a protection that every *good operator* would willingly be under.

Another point, and I will drop my pen. It strikes me that gradually this system would, by a careful adherence and attention, lead to the classification of salaries, and blot out the evil of paying an indifferent or bad operator as much as a *good* one.

This would, I think, benefit us more, morally, socially and even financially, than all the leagues and unions we could organize. Perkins, let's hear from you again; and boys, all of you, think of this; compare the two and give your opinion. Join hands and circle around. Give me yours, Perkins.

ELI.

Seasonable Mention and a Sensible Suggestion.

TO THE EDITOR OF THE TELEGRAPHER.

THE advent of spring, which in this northern section has been so long delayed, will bring up the usual subjects for discussion in THE TELEGRAPHER, and we may expect to see its columns occupied with communications in regard to vacations and other matters of seasonable interest. For the time, telegraphic leagues and associations will be given the go-by, and we shall babble of the heat and dust of the cities, the discomforts of confinement in close offices, etc., and the beauties of green fields and running brooks (not of Arkansas, however), and the necessity for rest and recreation for those who have toiled through the year, faithfully and laboriously, or otherwise, in the discharge of telegraphic duties.

The policy of telegraph companies in the matter of granting vacations to their employes seems to be pretty well established. It is that such shall be afforded upon condition that a substitute is furnished by the employe or salary deducted for the time he or she is absent from duty. The day when it was customary to allow each season a week or two of relief from duty, without expense to the employe is past. We may consider this a mistaken policy, but that will not help our case, and to what is inevitable we must submit with as good a grace as we can command.

It is to be hoped that the telegraphers will not in making their calculations and arrangements for the coming season, ignore the claims of THE TELEGRAPHER to their consideration, and attempt to economize by dispensing with its weekly visits. The influx of subscriptions should continue through every season. It never takes a vacation, but comes to us regularly, its columns well filled with interesting and instructive matter the whole year round, and we should see to it that its publisher is encouraged by the evidence of our appreciation in a constantly increasing subscription list. Let us all make it a personal duty to canvass among our friends and acquaintances, whether at home or abroad, for additional subscribers, that its influence for good may extend in a constantly widening and deepening circle.

A TELEGRAPHIC SUBSCRIBER AND CANVASSER.

Personals.

Mr. MACALLISTER, night report operator of the Western Union office at Rondout, N. Y., has resigned to engage in the hotel business at Glen Cliff, N. Y.

Miss ELLA M. FRENCH has been appointed Manager of the American Telegraph Company's office at Saginaw, Mich.

Mr. STEPHEN G. SAUNDERS, of the night force at 145 Broadway, N. Y., has resigned, and goes abroad in a mercantile capacity.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The Improvement in the Offices Provided for Telegraph Business.

It is not many years since almost any sort of a room or building, provided it was in a central location, was considered good enough for telegraphic purposes. Even at the present time many even of the more important telegraph offices are very unfit for occupancy for the purpose, but there is a decided improvement in this respect, which it gives us much pleasure to note and record. Formerly very little attention was paid in selecting and fitting up rooms and buildings for telegraph occupancy to their adaptation to the purpose for which they were to be used, and less to the matter of adequate light and ventilation. Most of us have recollections of dark and stifling rooms, crowded beyond all reason with occupants, frequently underground, some of which were almost totally unfitted for any kind of permanent occupancy, in which telegraph employes were cooped up day and night, the consequence of which was visible in the pallid countenances and frequent ill health, and not unusually the prostration and sometimes even the early death of the victims. The principal objects had in view in securing such quarters were, first, a central location, and secondly, as cheap rent as possible.

Soon after we took charge of this paper we called attention to this matter, and continued from time to time to urge a reform which was so much needed. Gradually was noticed a tendency in the right direction in this respect, and the reformation has made very commendable, and a more rapid progress than could have been anticipated.

Our attention has been called to this subject by the description of the new offices which have been recently fitted up in Baltimore for the occupancy of the Western Union Telegraph Company, furnished by a contributor in that city. This will be found of interest to the fraternity generally, and the more frequently our columns are occupied by such descriptions the better shall we be pleased. We judge from this description that the lines of our Baltimore brethren have truly fallen in pleasant places, and that they now have offices which are suitable for their occupancy, and which are a credit to the Company, and will prove attractive not only to them, but also to the public, upon whose patronage all telegraph companies must rely for success. In this respect the Western Union Company has set an excellent example, and one which may be profit-

ably and properly followed by other telegraph companies.

The change in this matter has been remarkable. We might instance many such improvements which we have recorded in the last three years. The most noticeable of these, as we believe it was the first, was the magnificent building fitted up under the direction of Gen. ANSON STAGER, for the Western Union Company in Chicago, and which was destroyed in the great fire. It has been restored, however, and that city is again favored with suitable accommodations for that Company, which again occupies quarters that are creditable to it and to all concerned. Gen. STAGER was a pioneer in this matter of providing suitable and pleasant telegraphic quarters, and deserves to receive the commendation of telegraphers as well as the public for it.

The new Western Union building now in progress of construction on the corner of Broadway and Dey street, in this city, is the most costly and magnificent building ever erected specially for telegraphic purposes in the world. It would seem as if it might provide adequate accommodations for any increase of telegraphic business for many years to come, but the telegraphic system grows so rapidly that it is impossible to predict, with any certainty, what its requirements may be three or four years hence. We printed last week an account of the progress which this splendid edifice had made towards completion, and shall endeavor to keep our readers informed in regard to it from time to time. Had any one predicted ten years ago that the time would come when one Company should find it advisable and necessary to erect such a building for the accommodation of its business, he would have been regarded as a visionary and enthusiast.

But not alone has progress been made by the Western Union Company. The other telegraph companies have also exhibited marked improvement in their surroundings. Every change in this respect has been for the better, and we look forward to the time, which we believe is not very distant, when there will be a consolidation of the companies competing with the Western Union into one organization, which will concentrate its main offices into a building, that, although it may not be as extensive or as costly as the new Western Union building, will be equally well adapted and fitted for its accommodation. Two telegraph organizations, national in their character, can be successfully and profitably maintained, and will prove advantageous to the fraternity and the public. Some kind of competition in the business will inevitably exist, and it is for the advantage of all concerned that the competitors should stand upon more equal terms than they can if one is a unit and the other divided into a number of comparatively small organizations, with, in some respects, divers and conflicting interests. - One and by no means the least of the advantages which may be realized from such a consolidation is the ability which it will afford, and the necessity which it will create for the provision of buildings adapted specially to the use of the consolidated competing companies.

There is yet very much to be done towards improvement in this matter of telegraphic office accommodation, but the progress which has been made and which is being made encourages hope for even more general and important results in the future. We could point out certain offices even now in use in this city which are totally unfit for such occupancy, but their number is decreasing. We congratulate the fraternity, the public and the managers of the telegraph companies upon what has been accomplished, and look forward with pleasurable anticipations for the future.

A Personal Talk with our Readers.

THE task of conducting a strictly class publication, such as is THE TELEGRAPHER, is by no means an easy one. It may seem to those who read each number as it appears, without any special knowledge or consideration of the labor and care required to prepare it, that there can be little difficulty in filling its columns with matter which shall interest its readers. A very brief

experience of editorial supervision and preparation would soon convince them of their error, and they would be less inclined to criticize and condemn its management than before such experience.

We are, perhaps, more painfully and humbly aware of the deficiencies of THE TELEGRAPHER than the greater number of its readers can possibly be. While we spare no labor, thought or effort to make it a credit to the telegraphic fraternity, whose representative it is, and to its conductor, who feels an honest and sincere pride in maintaining and improving its standard, yet at the best it is difficult, if not impossible, always to accomplish as much in this direction as is desired. We are always pleased to receive intelligent suggestions in reference to conducting the paper, and regret, rather, that we receive so few of them than as many as we do.

While we are not disposed to pander to any unreasonable or unworthy desire for mere amusement, or for sensational or denunciatory matter, we yet desire to treat of the topics and to furnish such matter as shall instruct and improve its readers. The object in view in publishing THE TELEGRAPHER, as we have often heretofore stated, is two fold: first, to afford instruction and information in regard to electrical science and the telegraphic art which shall be valuable and calculated to elevate the mental and professional standard of the telegraphic fraternity, and to furnish as complete a record as possible of telegraphic progress and what is done and proposed in telegraphy in this country and throughout the world, and also to publish such gossip and items as shall interest and amuse its readers. This we conceive to be the true idea of what such a journal should be. How nearly we succeed in carrying out this idea we must leave to our readers to decide.

Another difficulty experienced is the variability of the supply of proper matter, or what we consider proper for our columns. Sometimes we are overwhelmed with contributions and communications, and at other times there is an almost entire cessation of them, and we are compelled to rely almost wholly upon our unaided efforts in getting out the weekly edition. As we are practically confined to one subject, although it may be considered as having two branches—electricity and telegraphy and matters pertaining thereto—it is at times difficult, without repetition or the publication of matter either too scientific or technical, or of little or no interest, to fill the columns satisfactorily. The present editor has been writing several columns weekly for the last five years on this subject, and it is not to be wondered at, perhaps, that the mental mill should at times grind slowly and with difficulty, not experienced where there is a greater variety of topics to treat upon. We could easily fill our columns with some sort of matter pertaining to electrical science and telegraphy, but if prepared in this manner without careful and laborious selection and preparation, we do not think that the paper would meet with very general acceptance, or that its existence would be very prolonged.

We have thought it best to take our readers into our confidence, and explain to them some of the difficulties attendant upon the publication of a live telegraphic journal for two reasons: one, that they may judge leniently any defects which they may discover; and the other, that they may be induced to aid us by contributions and communications to maintain the character and variety of its contents. Whenever you have any suggestions to make which it is believed will be of general interest, or information to communicate in regard to electrical or telegraphic matters, we shall always be pleased to hear from you, and all such, properly authenticated, will receive careful attention and find place in our columns. Anecdotes and personal items, provided they are free from malice or uncharitableness, are always welcome, and serve to relieve the paper from too great heaviness, and afford spice, variety and interest to its contents.

Illness of Mr. F. L. Pope.

IN consequence of severe illness, Mr. F. L. POPE has been unable to prepare as yet a continuation of his

important series of articles on the Elementary Principles of Electrical Measurement, which have been received with so much favor by our readers. He has been and is suffering from a return of rheumatic disease, with which he was some years ago greatly troubled, but from which he had been free for some time. Its return was brought on by exposure which was unavoidable. He is now improving, however, and hopes to be about again in a few days.

Correspondents who may have failed to receive attention to their favors from him will understand the reason from the above.

The Swindling Tricks of Telegraph Colleges and Certain Telegraphers.

THE swindling Telegraph Colleges throughout the country do not confine their operations entirely to the victims whom they inveigle into paying them money for so called telegraphic education. A concern at Syracuse, N. Y., operating under the high sounding name of a "BRYANT and STRATTON Business College," after ordering an outfit for its telegraphic department from a prominent firm of manufacturers of this city, leaves them to whistle for their pay, even declining to return the goods when asked to do so. This is not an isolated case by any means, and we mention it as an illustration of the manner in which this nefarious business is rendered more profitable to the conductors.

We regret to be obliged also to add that it is not very uncommon for telegraphers, and even telegraph officials, to order goods, on the strength of their connection with responsible telegraph companies, and then coolly default in payment and leave their confiding creditors in the lurch. We have known of several such instances, and the only possible protection to dealers is to send C. O. D., unless those ordering are known to be honorable and honest. Even when so sent the party furnishing them is liable to be victimized for the express charges.

Another trick of these swindlers is to send for goods C. O. D. two or three times, which are promptly taken and paid for. Having established a sort of reputation, they then ask to have them forwarded without the collection being required on delivery to save express charges on returning the money, and this is sometimes the last that is heard from them. They have made their "little stake," and thereafter favor some other and perhaps rival establishment with their patronage on whom they play the same swindling game.

It is quite interesting to see the "black list" of telegraphic "beats" which the concern above referred to has, and which some day they promise to furnish to us for publication. The firm in question has always practiced great liberality with the fraternity, and the manner in which their confidence, and that of others in the same line of business has been abused, is not creditable to the craft.

The Interests of The Telegrapher.

A CORRESPONDENT, whose communication we publish on another page, makes a very sensible and practical suggestion in regard to the duty of telegraphers not to neglect the interests of THE TELEGRAPHER during the coming summer season. It is important that this suggestion should meet with the consideration which it merits. The summer months are usually not prolific of subscriptions, and we avail ourselves of the opportunity thus early in the season of calling the attention of the friends of the paper (and this should include every intelligent telegrapher) to the subject. The circulation of the paper has steadily increased for the past five months, but to maintain this desirable condition during the next three or four months will require special effort on the part of our friends. We trust that it will be sufficient to call their attention to this matter, and that the heart of the publisher may be made glad by practical evidence of appreciation on the part of those whose interests it is the object of this paper to advance. Procure and send in new subscriptions, as well as renewals of those which are expiring, and the advantage and benefits will be mutual.

The Telegraph.

The Cuba Cable.

THE break in the new cable between Key West, Florida, and Cuba, was located by Mr. Geo. B. Prescott, electrician of the Western Union Telegraph Company, about two miles from Key West, in the heavy shore end of the cable. It was probably caused by an anchor.

The break was found about a mile and a half from the shore, and repaired by Mr. Wm. Mackintosh, the foreman of repairs of the Western Union Company in this city. The cable was evidently cut by an axe, probably to clear an anchor of some vessel which had got fouled by it.

Soundings for the Pacific Cable.

DESPATCHES to the Navy Department, at Washington, report that the United States steamer Tuscarora, Commander Belknap, engaged in taking deep sea soundings, left Honolulu March 18, and arrived at Yokohama, Japan, April 27, having made seventy-two casts, the deepest of which was 3,287 fathoms. She will now examine the southeast coast of Japan, and from there carry a line of soundings to Tonoga, Aleutian Islands, and from thence complete the arc of the great circle to the point reached last fall from Puget Sound.

Foreign Telegraphic Notes.

THE German Reichstag is hereafter going to do its voting by telegraph. The wires are to be so arranged that each member can indicate his vote from his seat. In front of his seat are two buttons, one indicating yes, the other no. A pressure on the button telegraphs the vote to a circular table in front of the President's desk, upon which all the names of the members are written down, so that immediately after pressing the button each member can see a piece of paper appear under his name with his "yes" or "no" on it.

The Indo-European Telegraph Company announce that in consequence of urgent representations made to the Indian Telegraph Department the notice recently issued with respect to charging for compound words has been modified. The Indian Department will now accept as single words all ordinary English words, proper names of persons and places, which are commonly written and recognized as one word. When any *bona fide* doubt exists as to the proper mode of spelling an ordinary English word, the sender's manner of writing is to regulate the charge. All illegal combinations of words will be charged for according to the number of words employed in the combination, and illegitimate combinations of syllables with words will be treated as cyphers, five letters being counted as one word.

The expedition to complete the Brazil section from St. Vincent to Pernambuco of the Brazilian cables is under the command of Captain Halpin; and on his return to England he will undertake the charge of the Great Eastern to lay the new cable for the Anglo-American Company from Ireland to Newfoundland.

The repair of the 1866 Anglo-American cable will be effected about the middle of the present month, by which time it was expected the weather off the coast of Ireland will have moderated.

On the Budget night no fewer than half a million of words were transmitted over the wires from the Central Telegraph Station, London, between 6 P. M. and 2 A. M. Seeing, too, that a large quantity of this news had to be delivered to two or more newspapers in the same town, it is estimated that certainly not fewer than a million of words were so delivered throughout the United Kingdom during the period in question; so that the combined provincial newspapers of the following morning may be said to have contained five hundred columns of telegraphic matter relating to proceedings in Parliament on Thursday night. The transmission of this mass of news was effected chiefly by the Wheatstone instrument, of which as many as twenty-five were called into use on the occasion.

The *Journal Officiel de la Republique Francaise* of the 24th of April quotes from the *Economiste a resume*, which gives in figures the degree of activity of the electric correspondence in different nations for 1871: France, 7,447,000; England, 12,000,000 (not including 700,000 telegrams for the exclusive use of the press); United States, 12,404,000; Italy, 2,583,000; Switzerland, 1,517,000, not reckoning 109,000 despatches in transit and 35,000 service despatches; Germany, 7,108,000; Austria, 3,974,000; Belgium, 2,380,000; Holland, 2,050,000.

The Eastern Telegraph Company have announced the opening for traffic of their new cable between Italy and Egypt, *via* Zante and Candia. The company have now three cables working between Europe and Egypt, which is thus placed in direct telegraphic commuica-

tion with Great Britain, Spain, Portugal, Gibraltar, France, Malta, Italy, Greece and Turkey.

The report of the trustees of the Submarine Cables Trust, to the third annual meeting of the certificate holders, held on Wednesday, April 29th, in London, states that the revenue for the financial year, ending April 15, 1874, has amounted to £33,525 15s. 4d., and the expenses (limited by the trust deed to £2,000) have been £1,924 10s. 5d., leaving a balance of £31,601 4s. 11d.

The shareholders of the Western and Brazilian Telegraph Company have been invited to subscribe to £100,000 ten per cent. loan for twelve months, to enable the Central American Telegraph Company to complete the connections of the Western and Brazilian cables with the West Indies and New York. The loan is to be secured by a deposit of shares, and the Western Company guarantee its repayment.

THE traffic receipts of the Great Northern Telegraph Company for the month of March amounted to 366,851f. (£14,674), and for March, 1873, to 265,494f. (£10,620), showing an increase of 101,357f. (£4,054). The receipts on the China and Japan lines amounted to 157,030f. against 117,337f.; and on the European lines to 209,821f. against 148,157f. in March, 1873. The total receipts for the three months ending the 31st of March last amounted to 977,416f. (£39,097), and for the corresponding period in 1873 to 614,437f. (£24,578), showing an increase of 362,979 f. (£14,519).

The Mexican Telegraphs.

THE session of the Mexican Congress was reopened on the first of April at the City of Mexico. In his message President Lerdo, referring to the extension of telegraphs in the Republic, said:

"With a view of extending, day by day, the telegraph lines, the material on hand is being improved, another considerable quantity having been ordered. Special interest has been and will be taken in the construction of the long lines from Michoacan to Jalisco, San Luis to Durango, Durango to Chihuahua, Mazatlan to Guaymas, Tampico to Matamoros and Tabasco to Chiapa. We ought to expect that very soon the City of Mexico will be in communication by telegraph with all the capitals of the States and the principal ports of the Republic, the wire being carried afterwards to Lower California, for, from the investigations made, such a line seems very convenient."

Visit of Superintendent Gamble to San Diego, Cal.

Col. JAMES GAMBLE, General Superintendent for the Pacific Coast of the Western Union Telegraph Company, and Mr. R. R. Haines, of Los Angeles, Division Superintendent for Southern California, visited San Diego yesterday, returning by the *Orizaba* in the afternoon. Col. Gamble is an old printer and newspaper man, and, after a rest of twenty-five years, tried his hand at our press yesterday afternoon, and "worked off" in good journeyman style two or three sheets of the "outside" of this morning's *Union*. We learn that the special object of Col. Gamble's visit south is with reference to the proposed extension of the Company's lines to San Luis Obispo. When this connection is made we shall have the benefit of two lines from San Francisco.—*The Daily Union*.

The Extension of Telegraphy.

In a very able paper in the *British Quarterly Review* for April we find the following: "The enormous increase of facilities, which has taken place in recent years may also be judged of by considering the extent of the system as regards wires and apparatus. Twenty-two years ago, as we read in 'Chambers's Papers for the People,' the number of miles of telegraph in Great Britain was 3,000. At the time of the transfer of the system to the Post-office there were in existence 15,203 miles of telegraphic line and 59,250 miles of wire. There are at the present moment more than 20,000 miles of line and nearly 110,000 miles of wire; while the number of instruments, which stood at the time of the transfer below 2,000, has been increased to upwards of 8,000. The combined companies forwarded amongst them some six millions of telegrams, and their revenue would be somewhere about half a million sterling. In the first year of the transfer of the system to the Post-office the number of messages had risen to very nearly ten millions; in 1871 more than twelve and a half millions of messages had been forwarded; in 1872 the number had risen to close upon fifteen millions; while for the financial year ending 31st March, 1874, the number cannot be very far short of eighteen millions. The total estimated revenue for the year is £1,220,000, and there is every reason to believe that the estimate will be more than realized."

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended April 7, 1874, and bearing that date.

149,320—**GALVANIC BATTERY.**—Robert M. Lockwood, New York, N. Y. Application filed March 7, 1874.

Copper rests on sulphate of copper, zinc connected thereto by insulating pillars, so that their distance apart remains constant. Flexible skirt fastened to edge of copper, and bearing against sides of cell.

1. The copper plate *a* resting upon the sulphate of copper crystals, and connected to the negative pole by the column *e*, substantially as set forth.

2. The cone *c* above the plate *a*, and connected therewith and having an opening at the top through which the conductor *d* passes, substantially as set forth.

3. The skirt of felt or other flexible material applied to the cone *c*, and closing the space between the other portion of the cone and the cell, substantially as set forth.

149,527—**TELEGRAPH SOUNDER.**—Henry C. Royer, Cleveland, Ohio. Application filed March 3, 1874.

Electro-magnet itself vibrates, being provided with an extended core, pivoted at one end to a U plate.

1. A sounding instrument provided with a hinged or vibrating magnet, moved in one direction by magnetism and gravity, and in a reverse direction by a spring, substantially as herein described.

2. The combination, with the vibrating electro-magnet of the spring *K*, arranged beneath one projecting end of the core of the magnet, and the screw *L* passing directly through such end, substantially as described.

149,539—**TELEGRAPH SOUNDER.**—Henry Splitdorf, New York, N. Y. Application filed February 26, 1874.

Castanets or other sounding cups operated by armature lever.

The combination of sounding cups *E E'* with the armature lever of an electro-magnet, substantially in the manner and for the purpose herein shown and described.

For the week ended April 14, 1874, and bearing that date.

149,561—**ELECTRIC GAS LIGHTING APPARATUS.**—Edwin E. Bean, Boston, Mass. Application filed June 6, 1873.

A small Bunsen burner near the main burner is lighted by the electric spark when the circuit is closed and the gas turned on, and the blaze from it ignites the main burner, immediately after which the small burner is extinguished; all operated automatically by clock work and pneumatic apparatus.

1. In combination with the burner *g* and revolving Bunsen burner *f*, the three way cock *l*, operated by compressed air acting on the flexible diaphragm *p*, the rod *o* and lever *m*, as and for the purpose set forth.

2. The arrangement for automatically shutting off the gas from the burner *f*, consisting of the spring *r*, the rod *o*, pins *s* and lever *m* on the plug *h*, in a manner as herein shown and described.

3. The mechanism for operating the Bunsen burner *f*, consisting of the spring *11*, shaft *2*, ratchet *12*, pawl *14*, wheel *13* and pinion *15*, attached to the shaft *h*, or their equivalents, as and for the purpose set forth.

4. The combination of the escapement *16*, *17*, lever *18*, electro-magnets *6*, *7*, metallic plate *19*, with its spring *20*, and projection *21*, or their equivalents as and for the purpose set forth.

5. In combination with the metallic conductors *4' u'*, the movable rubber disk *1*, with its metallic disk *9*, operated by compressed air acting on the diaphragm *p*, rod *o* and coiled spring *11*, as herein set forth.

149,635—**GALVANIC BATTERY.**—Michael Breslin, New York, N. Y. Application filed November 4, 1873.

The copper or negative plate made in conical or pyramidal form, as set forth, whereby the operative surface is increased, as the sulphate of copper is consumed, as specified.

149,677—**ELECTRO-MAGNETIC ALARM.**—Frank L. Pope, Elizabeth, N. J. Application filed March 5, 1874.

Armature carrying two bell hammers acted on by two magnets alternately, the current being shifted after a full stroke has been made in either direction by one to the other.

1. The electro-magnets *M* and *M'* (either or both), the armature *m* and vibrating rod *D* in combination with the movable slide *K*, and insulated metallic slips *L L'*, substantially as herein specified.

2. The electro-magnets *M* and *M'* (either or both), the armature *m* and vibrating rod *D*, in combination with the hammers *H* and *H'* (either or both), and the bell or gong *B*, substantially as herein specified.

3. The rod *D*, provided with adjustable hammers *H H'* in combination with the bell or gong *B*, substantially as specified.

4. The adjustable metallic slips *L L'* in combination with the movable slide *K*, arranged and operated substantially as specified.

5. The adjustable set screws *G G'* so arranged as to regulate the travel of the slide *K* of the circuit changer *F*, in combination with the vibrating rod *D*, substantially as specified.

149,762—**TELEGRAPH INSULATOR.**—Charles L. Le Barron, Pensacola, Fla. Case B. Application filed January 16, 1874.

A telegraph insulator formed of a block of insulating material and provided with an aperture for the spike, having concave

ends to receive washers, and also provided with a circumferential groove at right angles to the spike aperture to receive the tie wire, as shown and described.

149,763—**TELEGRAPH INSULATOR.**—Charles L. Le Barron, Pensacola, Fla. Case A. Application filed December 31, 1873.

The insulator provided with a slot for the line wire, formed at a right or nearly right angle to a slot for a spike, and extending below the latter, as and for the purpose specified.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL.

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE "SNAPPER" SOUNDER.

NEW STYLES, NEW PRICES.

The unexpected and growing demand for the original "Snapper" Sounder, beyond the expectations of the manufacturers, has delayed the introduction of proposed styles and improvements.

Having increased our facilities and accumulated sufficient stock to enable us to fill orders promptly, the following varieties are now offered for sale at prices which will accommodate all classes.

The "Snapper" Sounder, plain.....30c. 6 for \$1.50.
 " " polished... .35c. 6 for 1.80.
 " " nickel plated spring... 0.40.

A few were manufactured to order with hard rubber knobs. They were so well liked that I have decided to introduce them to the fraternity. The springs are secured by two screws, and, should they break, may be replaced at an expense of 15 cents. They are thoroughly made and finished.

PRICE,  75 CENTS.

To the Dominion 5 cents each extra.

A liberal discount to agents.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material fo

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"
"History of America," "Civil War in America;" Member
of many Scientific and Learned Societies of Europe
and America; Commander of the Order of Dan-
nebrog, Denmark; Order of St. Olaf,
Norway, and of the Sword Order,
Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800
pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his
own expense, and he hopes telegraphists throughout the world
will accord to it a patronage commensurate with its merits. For
nearly thirty years the author has been connected with the
telegraphic systems of both hemispheres and an observer for
general instruction, and this work will contain the substance of
facts thus collected, having especial reference to practical tele-
graphy.

The first four volumes will be ready for printing in May, and
the whole work may be issued in monthly parts of quarter or
half volumes.

Vol. I will contain a general history of electrical discovery
by ancient and modern philosophers—the experiments of Otto
Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek,
Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and
others who practically manipulated static electricity; the whole
prepared especially for the telegraphists as useful information
in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic bat-
tery, and the many improvements and modifications of this
telegraphic generator of electricity, considering the experiments
of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and
Grove. Also, magneto and thermo electricities, and the applica-
tion of their respective forces for telegraphic and useful pur-
poses.

Vol. III.—In this volume will be considered Terrestrial Mag-
netism, Aurora Borealis, Magnetic Needle, Ships' Compass, and
Magnetic Phenomena generally. Also, Electro-Magnetism as dis-
covered by Ersted and manipulated by Schweigger, Ampère,
Arago, Sturgeon, Henry, Faraday, Jacoby and others. The ap-
plication of these discoveries for practical telegraphy by inven-
tors, from time to time.

Vol. IV.—A general history of the ancient and modern tele-
graphic systems, semaphoric and electrical, including telegraphs
of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil,
Morse, Bain, House, Hughes and others. Also, the construction
of overland, subterranean and submarine lines, including con-
ductors, insulators, paratonnerres, and telegraphic implements
generally.

Vol. V.—This volume will give a full account of the various
telegraphic apparatuses for simple and automatic manipulation;
the combination of circuits for repeating or translating; double
and duplex transmission. It will also contain a large amount of
general information for practical telegraphists, respecting con-
ducting and non-conducting compositions, tables, and a Dictionary
of telegraphic technical terms.

The whole work will be written for the telegraphist, but it
will not be mathematical. The illustrations are designed for
specific instruction, and their explanation concise. It will be
so arranged that either one of the volumes may be bought by
those not wanting the whole.

Each volume will have a complete Table of Contents and an
Index.

The above must be regarded as an approximate division of the
subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.

Will not jar open.

Slight pressure of the finger required to put lever in circuit
or cut out.

Acknowledged to be a decided improvement.

Price, same as the ordinary key.

Superintendents and Purchasing Agents are invited to examine

tion for Superintendents and others interested in the Science of
Telegraphy.

A NEW GALVANIC BATTERY.

**Durability, Efficiency, and Economy of Expense
and Labor at last Secured.**

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

Special Agent for Virginia and North Carolina.

J. A. BRENNER, Augusta, Ga.,

Special Agent for Georgia and South Carolina.

L. M. MONROE, New Canaan, Conn.,

Special Agent for New England.

ELECTRICAL CONSTRUCTION AND MAINTENANCE CO.,
San Francisco, Cal.,

Special Agents for California, Oregon and Nevada.

THIS SYSTEM OF

FIRE ALARM & POLICE TELEGRAPH

WITH A CENTRAL OFFICE,

OR

UPON THE AUTOMATIC PLAN,

is now in operation in the following Cities, to which references
made for evidence of its great

SUPERIORITY, VALUE

AND

UNIFORM RELIABILITY.

Albany, N. Y.,
Alleghany, Pa.,
Boston, Mass.,
Bridgeport, Conn.,
Buffalo, N. Y.,
Baltimore, Md.,
Chicago, Ill.,
Cincinnati, Ohio,
Columbus, Ohio,
Cambridge, Mass.,

Milwaukee, Wis.,

New York City,
New Orleans, La.,
New Bedford, Mass.,
New Haven, Conn.,
Newark, N. J.,
Omaha, Neb.,
Philadelphia, Pa.,
Pittsburg, Pa.,
Portland, Maine,
Peoria, Ill.,
Providence, R. I.,
Quebec, L. C.,
Rochester, N. Y.,
Richmond, Va.,
St. Louis, Mo.,
St. John, N. B.,
Springfield, Mass.,
San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter, and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,

No. 50 BROAD STREET (Rooms 12, 13 & 14).

P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

Conductivity—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

American Compound Telegraph Wire Co.,

ALANSON CARY, Treasurer,

No. 234 West 29th St.,

New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
 RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.

15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS

of all kinds,

CHRONOGRAPHS,

ASTRONOMICAL CLOCKS,

REGULATORS,

ETC., ETC.,
 OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
 MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
 OF
 EVERY DESCRIPTION,
38 VESEY STREET, New York.
 NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

RELAYS,

SOUNDERS,

REGISTERS and KEYS.

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
 of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,

For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.

Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.

BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for

HOGGHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Descriptive Circulars and Price List forwarded upon application to

F. L. POPE & CO.,

(P. O. Box 5503.)

38 VESEY STREET.

REDUCTION OF PRICES.
POPULAR, EXCELLENT and ECONOMICAL.
THE NONPAREIL
TELEGRAPH APPARATUS,

For AMATEURS, STUDENTS and SHORT LINES.

Since the introduction of this *Pioneer Low Priced Telegraph Instrument*, a little over a year and a half since, *nearly 2,000* have been sold, and they are constantly more and more sought after.

Hereafter we shall furnish them at the following popular rates:

Single Instruments, including Three Cells Battery, Connecting Wire, Chemicals and Instruction Book..... \$6 50
 Two sets of Instruments, etc..... 12 00

SEND FOR CIRCULAR.

DR. L. BRADLEY,
 No. 9 Exchange Place,
 JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1 800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1 150th to the 1 300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

 Chicago, Ill.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
WATTS & CO., Baltimore.

THE RAILROAD GAZETTE.

TELEGRAPHERS and TRAIN DESPATCHERS, and all men in any way interested in or connected with Railroads, will find this paper interesting and valuable. It is the best Railroad paper in the world.

It is an illustrated journal of 24 quarto pages, about the size of *Harpers' Weekly*.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE, AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors. GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia, has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway,
D. HODGMAN & CO., 27 Maiden Lane,
SHEPARD & DUDLEY, 150 William St.

Address all Communications to

S. BISHOP,
 OFFICE AT FACTORY.

A Bashful Telegrapher's Mortifying Mistake.

BY BETA.

SOON after he began to study morse young Swaghead learned that of all the playful formulae adopted into or growing out of the telegraph business, "Take the other foot," from its preëminence in two kinds of humor, is by far the most popular. With a zeal contemporaneously shown in committing to memory many pages of "Abbreviations in use among Telegraphers," he seized upon and made it fondly his own to that extent that in the beginning he practiced sending upon that clause only, nor superseded it until its manipulation had been fully mastered. On the line where he fought it out that first summer his "Ki Se oser fool," — — — became even more familiar than "Scrutesofspeompany" is elsewhere. When an increased proficiency sanctioned his attempting transmission in the regular course of business, he fitted his pet phrase with special applications and used it more than ever; and for years, in one way or another, it served him daily. What it lost in novelty, as time elapsed, it regained in force of habit, and eventually it became endeared to him, through old associations, as recalling a past which was no less pleasant to look back upon than it had been hard to struggle through. But there came an hour when the poor wretch cursed it and the unknown rascal that invented it; when, so far from recalling boyish trial and triumph merely, it was fraught with horrible suggestions of a more recent and most miserable occurrence.

From that time forth his existence, telegraphically considered, was identified with frantic efforts to avoid sight or sound of the unhappy injunction. So intense in him was this new born hatred that it conquered at once and forever what had become almost a second nature. He never, by tongue or key, used the words again. But it was another matter to prevent others from addressing them to himself.

In his endeavors to that end, he grew into a system of sending so cautious and so painstaking as to induce a breaking up in almost every dot letter and a breaking down in almost every dash one. Yet the harder he strove the oftener the detestable syllables seemed to greet him. Up to this day they have pursued him like an avenging Nemesis. Compelled by fate, he still seeks to escape them, but he has long since abandoned hope. In his last days of beatitude—in those tranquil, happy hours when the entire English language was free to his use, and when no one of the hundred and twenty odd thousand words in the latest unabridged could call other than an innocent flush to his cheek or bring a pang of conscious guilt to his virgin heart—there were in young Swaghead's boarding house a dozen men and one woman. She, too, was young, and pretty, withal—which is more than could have been claimed for Swaghead. Naturally she formed the centre of attraction for their twenty-six eyes—counting her own. Swaghead was so lucky as to sit opposite her at table, and, whether from this conjunction or from that of their respective stars in the astrological firmament, it happened that her charming face—equally delightful when grave and when gay—and her divine form—as graceful in motion as at rest—made upon his susceptible heart a much deeper impression than on all the toughter ones of his eleven rivals put together.

Any man of the family but Swaghead, if blessed with at once such love and such opportunity, would have improved the latter in displaying the former by catering to his soul's idol; but he, although within easy reaching distance and where he could not help seeing just what was lacking on her plate, could never dare assist her to bread or pass her the casters, for the contemptible reason that he was too bashful. The utmost his courage ventured lay in surreptitiously feeding her little pet terrier with dainty scraps from his own platter. He dared not speak to her—he dared not look at her, except as if by accident. To this day, no doubt, she is ignorant of her conquest, unless, indeed, his downcast eyes and vivid blushes may have betrayed it. This weakness would seem to merit rather contempt than pity, but let us consider that the young man's

natural timidity was vastly augmented in this instance by his adoration of its object; that at the worst it was only a result of his innocence, his purity; that, moreover, it could have been dissipated by a little encouragement on the lady's part, for his bashfulness was like the cowardice of the rat, which disappears in a hopeless corner, or before the enticement of cheese. Young Swaghead attributed his failing to a supposed impossibility of inspiring with reciprocal regard the bosom of so glorious a creature, but he promised himself that did she ever display an interest in him his trepidation should vanish on the instant. In short, he was intensely, criminally bashful in so far as he could not take the initiative, and no farther. He huil slight hopes, however, on this hypothetic bravery, for never once by word or sign did she acknowledge his existence. Indeed, unprotected as she was in the company of strange men, it was incumbent upon her to assume a little extra dignity in self-defence. For weeks young Swaghead's furtive glances showed him no more than a dainty form rather erect, two close sleeved elbows very near to two black silk sides, a serene face hewed over a narrow collar and plain brooch, toward the plate, plump wrists showing their starched hands, and round, slender fingers plying the knife and fork. Until at last one day—one eventful day—when it happened that she and he stretched out their hands to the butter with such sudden simultaneousness, that before either could be checked they had well nigh met in the middle of the board. She caught his eye with an amused glance that electrified him into pushing over the dish with a bow; she pushed it back with a heavenly smile and a

"Do help yourself, sir."

"Let me assist you first, pray do," he rejoined, and held out a bit on the knife.

"Oh, thank you," she said, and, passing her plate, received it.

They smiled upon each other again, and then—under the table, beneath the safe cover of a cloth that reached nearly to the floor, he felt upon his foot a cautious timid touch—a gentle, lingering, thrilling pressure gone on the instant. Thinking it accidental he withdrew his foot a trifle and kept his eyes on his plate. In another second, to his supreme astonishment, he received a second touch, and then a third. There was a little tap, a light rubbing on the outside and on the in, then two little taps again, and then a warm, firm squeeze squarely on the toes. Young Swaghead had reached his corner! As the slangy English girls say, this was just the cheese! Before such warmth of encouragement the last vestige of his fears vanished as does the frost from pigs of iron left out all night when cast into the smelting furnace. Straight up his left leg into the very core of his inflammable heart crept a fiery impulse that quickened the whole man into new life. No longer a poor, bashful creature, albeit still a blushing one, young Swaghead felt that thenceforth he could hold his own; and at once he proceeded to put his new found valor to the proof. "If 'two heads are better than one,'" he reasoned, "four feet are better than two—where's her other foot?" And he stretched out his other and poked around till he found her little kid shoe quite over against her chair. He rubbed one side of it, he rubbed the other, he patted its rosette, and with a sly glance at his charmer over the board was going to pat it again when it was hastily withdrawn, its owner flashed an indignant stare upon young Swaghead, her chair was nudged back, she rose, and leaving her dinner unfinished, passed hurriedly from the room. When, after an interval, young Swaghead came out of his daze his very first impression was one that prompted him to carefully raise the cloth and peep under the table; for, although the lady no longer faced him, his left foot was still enjoying the familiar taps and rubbings. And there he saw the little Scotch beast gnawing away at a bene and squatting his hams on the convenient cricket an embroidered slipper afforded. As it chanced, I, myself, left that boarding house that very day and hour, so, of course, I know nothing further about the lady. But there is still a word or two more. If, among my readers, there are any who know young Swaghead, and who, out of some envious obtuseness, cannot translate his morse, I adjure them, by all that is merciful, to weigh with care the phrase in which they shall couch their criticisms. Let them bid him to "frite gorse" to their heart's content, or call him all the hard names in our common vocabulary, but not say to him as "X" says to me, as "V" says to me, as "Hm"—as "Sy"—as "Ro"—as "He"—as—Oh! curse and confound it—a whole dozen of alphabets say to me, "Take the other foot."

Cables and Cable Laying.

As it is probably less than twenty-five years since the first electric cable was laid, one is naturally struck with the very rapid progress which has been made in this department of telegraphy. Almost the first, if not the very first cables that were submerged were those

of the late Electric and International Telegraph Company, between Oxfordness and Scheveningen, generally known as the Hagne Cables. This was about the year 1850, soon after the incorporation of the company, and several of these cables are still in existence, and doing duty in different forms throughout the United Kingdom. Originally they were single wire cables, but having been superseded by others of greater capacity, and carried by a different route, they were fished up, twisted together so as to make four and seven wire cables, and laid down—one from the coast of Scotland to the north of Ireland, and another across the Frith of Forth from Granton to Burntisland. The greater portion of the last mentioned cable has been recovered within the past week or two, and it may be interesting to state, as bearing upon the important question of the "life" of a cable, that its condition was found to be comparatively good. Of course, in considering the "life" of a submarine cable, several circumstances have to be taken into consideration. The nature of the bottom along which it is stretched is all important, while the question of anchorage has an important bearing on the point. The latter would not, of course, affect deep sea cables; but it has had much to do with the damage done to those submerged close to our shores, and necessarily with that to which reference has been made between Granton and Burntisland. Here, however, the bottom is tolerably favorable to the duration of a cable, and to this circumstance is no doubt mainly due the excellent state of preservation in which some portions of the one in question were found. Necessarily, the life of a cable is simply the life of its outer covering or sheath, for the percha with which the core is covered may be said to be almost imperishable. In the cables to which reference has been made the outer sheathing was composed of homogeneous iron wire, which may, to a great extent, account for their excellent condition at this moment. But, of course, several new methods of covering have been introduced since the days of their manufacture; and it will be interesting to notice briefly one of the most recent efforts of manufacturing skill in the telegraphic field.

On Saturday the extensive works of the Messrs. Siemens, at Charlton, were thrown open to a select party of visitors, among whom were Lord Bury, Lord Rosse, Baron de Reuter, Professors Abel, Airey, Maxwell, Odling, Tyndall, and Williamson, Sir Charles Wheatstone, Mr. C. F. Varley, and Messrs. Culley and Preece, of the Engineering Department of the Postal Telegraph Service. These works comprise nearly every branch of telegraphic manufacture, but public interest becomes mainly centred on that part of the operations connected with the manufacture of submarine cables. Nor is there any difficulty in following the interesting process throughout; for you may commence with the raw material at one end of the large block of buildings and conclude with the finished cable as it is being taken on board ship at the other. Here, in huge piles, is the entire percha in its native blocks, for all the world like so many cart loads of mangold wurzel. The natives who collect this useful substance must have a keen sense of the ludicrous, for not unfrequently you come across a piece fashioned like a four-footed animal, or otherwise distorted into the most fantastic shapes. But, once passed through what is called the chopping machine, all inequalities are removed; and, after being subjected to the masticating process, it is gathered up in sieve-like shovels, and resembles nothing so much as a huge dish of mince collops. Then follows a second process of mastication by means of steam heated cylinders, which may be likened to the kneading of dough in the baker's trough, and, finally, hydraulic compression through very fine sieves, so as to crush out any atom of imperfection which may remain. The percha is now in a fit state to be applied to the wire of which it is to become the protector, or, to speak telegraphically, the insulator. The insulated wire is termed the "core" of the cable, and demands an amount of care and skill in the manufacture of which few people have any idea. The work in which the Messrs. Siemens are more particularly engaged at the present moment consists in the manufacture of a cable for the Direct United States Company, which is said to possess one or two peculiar features over any cable hitherto manufactured. The core is composed of a thick copper wire, encircled by eleven very fine copper wires, served with four coatings of gutta percha, and when complete measuring about three eighths of an inch in diameter. The usual form of core is a "strand" of copper wires—i. e., several small wires twisted together rope-like fashion; but it is thought that greater conductivity will be obtained by adopting the thicker central wires, although the core itself must necessarily, of course, be less pliable.

The coatings of gutta percha are applied from the soft mass of that material in contrast to the serving with India rubber, which is applied in long, narrow strips or layers. After the serving with gutta percha comes a serving with Manila hemp, which brings the core up to a thickness of 2-in., and then follows the sheathing with iron wire, which forms the outer cover-

ing of all. Ten iron wires are employed for this purpose, but before being applied to the cable they are each wound with five strings of Manila hemp, so as to impart greater strength, and, perhaps, to some extent, protect them from the action of water. This application is somewhat similar to what is called the "taping" of the iron wires, which has been effected in one or two cables recently manufactured for the Post-office, and which is said to increase somewhat the insulation of the cable, as well as to preserve the outer covering from rust and decay. The hemp covered wires are served with a species of black compound resembling tar or pitch, and after being twisted around the core, they are again served in this manner and finally whipped with Italian hemp, which, however, can scarcely be said to do more than hold the strands in their places until the whole becomes hard and dry. This is what is termed the deep sea portion of the cable. The shore ends are, of course, of varying sizes, graduating from about two and a half inches down to seven eighths of an inch. The testing arrangements are carried out with that care and elaboration which characterize similar operations in all extensive works of this nature. The core is tested coil by coil in tanks at 75° Fahrenheit, and the completed cable is afterwards tested as it is stowed away in the enormous tanks, of which there are no fewer than eight, each thirty feet in diameter, situated within the works. The core and cable testing are carried on in different rooms, and by altogether independent staffs of electricians; while there are constant tests being taken on behalf of the company for whom the cable is being manufactured by its own electricians. Observations are taken at regular intervals on Thomson's Reflecting Galvanometer. These are noted down on printed sheets by the electricians in attendance. Certain signs represent so many units of conductivity or resistance, and certain initial figures, worked out with marvellous dexterity on a calculating machine by a little boy, seem to indicate to the electrical mind all that is required to be known respecting the goodness of the cable. The complete cable is tested every ten minutes in the process of manufacture, and every half hour as it goes out to the ship, so that if a fault should escape unobserved, it is not for want of due effort to find it out.

The Faraday—the new ship to be employed in laying the Direct United States Cable—is undoubtedly a novelty in cable ships. Of this class of vessels, properly so called, there are comparatively few in existence. The Hooper, indeed, may be said to have been the first vessel specially built for cable work, for the Great Eastern and the numerous other vessels which have been employed in this service for some years past can only be said to have been converted to the special purpose, and some of them very badly converted, too. The Faraday is an iron ship of 5,000 tons register, but equal to carrying a gross burden of nearly 6,500 tons. She is 360 ft. long, 37 ft. deep, and has a breadth of beam of 52 ft. Her capacity for cable storage is immense, consisting of three tanks, two of which are 45 ft. in diameter, the other 37 ft. in diameter, and each 27 ft. deep. Five thousand tons of cable can be thus stowed away, and it is calculated that this will be equal to about 1,500 miles of the cable, which is now being taken on board. The testing room is situated in the angle between the two main tanks, so that the cable can be changed over at pleasure without greatly disturbing the paying-out arrangements. Both ends of the ship are alike, and as each is fitted with steering gear, as well as paying out machinery, the motion of the vessel can be reversed at pleasure, with the least possible delay to the work in hand. The cable machinery is on the combined principle—i. e., it can be made either to pay out or to pick up, as may be desired—and as the stern of the ship can be converted into its stem at any moment, any hitch in the operations can be remedied with a *minimum* amount of inconvenience and delay. Some scores of hands are busily employed night and day in storing the cable in huge snake-like coils in the different tanks; but as yet they are a long way from the deck of the ship, and many a turn will have to be given to the magic conductor before the topmost round is completed. In about a fortnight, however, the Faraday is appointed to sail with her first cargo, which will complete the line between a point in New Hampshire, about sixty miles north of Boston, and Newfoundland. Returning to England, she will take on board the remaining portion of the cable, which she will immediately proceed to submerge between Ireland and Newfoundland. The total length of the cable laid in the two operations will be about 3,100 miles, and it is expected that the whole will be completed about August or September next. The Faraday, it may be added, is the property of the Messrs. Siemens, so that she is destined to be employed in many expeditions similar to that on which she is appointed to sail towards the close of the present month.—*The London Times*.

Telegraphs and Telegraphers—One and inseparable.
A shocking event—An electric stroke.

The Telegraphers' Mutual Benefit Association.

ASSESSMENT NO. 62, ISSUED MAY 15, 1874.—DEATH OF EDWARD P. REARDON.

EDWARD P. REARDON of Yonkers, N. Y. (certificate No. 793, issued March 21st, 1870), died April 27th, 1874, of paralysis.

Mr. Reardon allowed himself to become delinquent, but was restored to membership while in health, under the amnesty resolution passed at the last annual meeting.

Members holding certificates numbered up to and including No. 2,231 will please remit for above assessment.

Attention has been called to the last line on page 12 of the by-laws. Several members understand by it that they must remit direct to the Secretary. Members will please erase the line referred to. Its publication was a mistake. Remittances can be made direct to the Secretary, or to the agents, as members may prefer.

W. HOLMES, Secretary.
J. D. REID, Treasurer.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS NOS. 55, 56 AND 57, UP TO AND INCLUDING MAY 12, 1874.

21, 617, 667, 698, 787, 920, 1084, 1098, 1240, 1461, 1462, 1878, 1805, 1813, 1827, 1876, 1917, 1953, 1954, 1962, 1966, 1887, 2005, 2109, 2126, 2161, 2191.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS NOS. 58, 59 AND 60, UP TO AND INCLUDING MAY 12.

8, 21, 31, 42, 78, 82, 84, 90, 136, 139, 143, 154, 156, 158, 160, 164, 185, 186, 187, 206, 252, 255, 280, 316, 323, 328, 341, 346, 350, 352, 357, 362, 364, 366, 371, 376, 379, 381, 382, 412, 414, 418, 481, 482, 527, 552, 556, 557, 565, 569, 574, 586, 597, 605, 617, 655, 667, 690, 695, 697, 698, 705, 710, 712, 717, 723, 724, 725, 728, 730, 733, 780, 781, 782, 783, 785, 786, 787, 791, 802, 823, 825, 836, 838, 841, 842, 869, 870, 874, 876, 890, 897, 904, 906, 908, 920, 926, 942, 944, 949, 954, 956, 957, 959, 960, 963, 964, 977, 979, 1014, 1016, 1030, 1031, 1033, 1034, 1041, 1046, 1050, 1057, 1063, 1871, 1072, 1084, 1085, 1098, 1099, 1103, 1105, 1106, 1107, 1108, 1109, 1110, 1112, 1113, 1115, 1117, 1119, 1120, 1121, 1122, 1123, 1125, 1131, 1139, 1141, 1164, 1190, 1193, 1194, 1205, 1211, 1221, 1226, 1227, 1234, 1235, 1237, 1238, 1248, 1256, 1267, 1268, 1270, 1281, 1283, 1284, 1285, 1286, 1292, 1295, 1336, 1400, 1405, 1406, 1426, 1428, 1430, 1432, 1433, 1461, 1462, 1465, 1469, 1472, 1474, 1475, 1476, 1488, 1490, 1498, 1502, 1504, 1505, 1528, 1529, 1530, 1532, 1556, 1557, 1558, 1559, 1570, 1572, 1579, 1597, 1610, 1611, 1612, 1613, 1616, 1619, 1649, 1656, 1660, 1661, 1662, 1663, 1665, 1667, 1670, 1673, 1676, 1678, 1681, 1682, 1684, 1687, 1688, 1696, 1697, 1698, 1700, 1701, 1702, 1704, 1708, 1709, 1710, 1713, 1723, 1724, 1726, 1727, 1733, 1741, 1746, 1747, 1750, 1751, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1765, 1766, 1767, 1768, 1769, 1771, 1773, 1775, 1789, 1807, 1813, 1827, 1828, 1830, 1837, 1838, 1839, 1840, 1841, 1844, 1845, 1857, 1858, 1859, 1860, 1876, 1888, 1889, 1895, 1896, 1897, 1916, 1917, 1931, 1938, 1942, 1945, 1953, 1954, 1962, 1964, 1966, 1969, 1972, 1973, 1985, 1886, 1987, 1992, 1993, 2005, 2007, 2010, 2012, 2016, 2023, 2041, 2045, 2053, 2056, 2060, 2072, 2079, 2085, 2092, 2095, 2098, 2108, 2109, 2110, 2126, 2130, 2131, 2145, 2151, 2155, 2156, 2157, 2159, 2160, 2166, 2167, 2168, 2171, 2180, 2183, 2184, 2185, 2187, 2191, 2193, 2194.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENT NO. 61, UP TO AND INCLUDING MAY 12.

8, 21, 25, 46, 56, 59, 71, 77, 82, 90, 91, 93, 95, 121, 122, 134, 136, 139, 141, 142, 143, 144, 145, 153, 157, 181, 217, 220, 228, 235, 244, 245, 254, 255, 257, 269, 276, 302, 323, 328, 344, 346, 349, 351, 360, 361, 371, 376, 379, 381, 394, 406, 414, 416, 425, 430, 431, 463, 464, 467, 526, 532, 546, 547, 548, 549, 565, 576, 577, 579, 594, 600, 603, 604, 605, 615, 617, 618, 622, 667, 670, 690, 698, 715, 729, 731, 740, 742, 750, 751, 756, 769, 787, 791, 799, 803, 821, 830, 831, 832, 855, 859, 871, 873, 874, 886, 915, 923, 941, 978, 995, 1013, 1023, 1024, 1039, 1040, 1047, 1054, 1055, 1072, 1081, 1084, 1085, 1099, 1126, 1143, 1144, 1147, 1154, 1167, 1169, 1173, 1175, 1183, 1193, 1194, 1195, 1200, 1210, 1213, 1224, 1226, 1232, 1245, 1251, 1252, 1259, 1260, 1267, 1274, 1276, 1292, 1304, 1325, 1329, 1336, 1359, 1364, 1365, 1368, 1394, 1402, 1403, 1404, 1410, 1412, 1421, 1440, 1444, 1461, 1462, 1484, 1488, 1502, 1511, 1517, 1518, 1519, 1522, 1527, 1537, 1550, 1560, 1571, 1576, 1579, 1582, 1593, 1594, 1596, 1615, 1619, 1635, 1658, 1678, 1695, 1697, 1698, 1707, 1708, 1720, 1721, 1723, 1728, 1729, 1735, 1736, 1763, 1791, 1809, 1811, 1812, 1817, 1827, 1831, 1847, 1852, 1864, 1869, 1874, 1911, 1913, 1914, 1919, 1938, 1943, 1944, 1950, 1953, 1954, 1962, 1966, 1969, 1973, 1987, 2005, 2017, 2019, 2020, 2022, 2024, 2025, 2026, 2027, 2028, 2030, 2035, 2036, 2040, 2049, 2050, 2056, 2057, 2069, 2082, 2086, 2097, 2099, 2102, 2106, 2113, 2128, 2119, 2133, 2135, 2143, 2168, 2172, 2186, 2187, 2191, 2194.

Telegraphic Matters in Central America.

SAN SALVADOR, C. A., April 22.

TO THE EDITOR OF THE TELEGRAPHER.

In reply to your favor, which was received on the 20th inst., it will give me pleasure to furnish you all the telegraphic information from this section in my power.

For the present I can only say that we are now at work on the line to connect this State with Guatemala, and that I expect to complete the section which appertains to us in all this week. How soon the other party will be ready I cannot say, but expect it will be very soon, as they are well advanced in their work.

We have at present in operation twenty six stations, with an extension of four hundred and ninety-two miles of wire, of which one hundred and ninety-two are wired with "Johnsons' No. 9, insulated with glass insulators, and three hundred carrying No. 11 wire of the same makers, and Brooks' paraffin insulators. Of this line I find the wire too small for the work it has to do, and the iron hooks of the insulators certainly burn the wire, particularly in the rainy season, when the discharges of atmospheric electricity are heavy. On account of the heavy discharges of atmospheric electricity I have introduced, and use the Globe Lightning Arresters, which are manufactured by F. L. Pope & Co., and which are found to be a perfect security and far superior to the flat plate arresters. For batteries, I use, on the Western lines, Chester's dilute sulphuric acid battery; and on the Eastern, Hill's gravity battery, No. 2. I have found the first very superior to the other, especially with the native operators, who are not especially attentive, although they are not slow in learning to operate, most of them reading by sound.

The paragraph in THE TELEGRAPHER about the penal laws against the destruction of the telegraphs by the people, only exist in the imagination of the writer. Perhaps there is no country where the people care for the preservation of the wires more than here, although when first put up they gave us a great deal of trouble in this respect. But that has been corrected, and at the present time the severe electric storms to which this region is subject, are the principal and most destructive enemy of the telegraph lines.

There was a project introduced of laying a cable to connect Panama with all the Central American ports, but when the estimates for such a cable were obtained from England, the cost startled the Government, and the project has been abandoned, for the present at least.

During the ensuing dry season I am in hopes we shall see a telegraph in course of construction in Nicaragua. We also propose to extend our lines to Camayagua in Honduras, so it will be seen that we are not idle, and there are few towns in this State where the clicking of the telegraph instruments cannot be heard; and it may well be considered that, taking into account the poverty, and the so lately disturbed state of the country, we are as well to the front in telegraphic progress as could be expected.

A. MAURY.

The Proposed Society of Electricians and Telegraph Engineers.

PROVIDENCE, May 13.

TO THE EDITOR OF THE TELEGRAPHER.

The movement inaugurated by Mr. I. N. Miller I believe to be a good one. That's just what we want—a society for the interchange of thought and experience. I have long wanted to see something of that kind started, for I believe, if managed rightly, it can be made productive of great good. Even those already well versed in electrical matters might find something new and useful.

Notwithstanding the rapid progress which has been made during the past twenty years in the discovery and application of the principles of electricity, I think every one will agree that it might have been far greater had there been some stimulus for investigation, and as you very truthfully remark in your editorial of the 9th instant, some method is required for preventing the waste of time and energy in studying over and experimenting on theories that have been already thoroughly examined by others. Most of us recall an illustration of such wasted energy in the early life of Sir Humphrey Davy, who, soon after commencing his experiments in chemistry, discovered that he was simply making discoveries already known, and then hastened to acquire from books and by association with scientific men a knowledge of the science as far as then developed.

The Telegrapher in Boston.—How it stands a Comparison with other Telegraphic Papers.—A Prediction.—Removal of the Western Union Office.—Personal and General.

BOSTON, May 22.

TO THE EDITOR OF THE TELEGRAPHER.

WHILE I do not see as many copies of THE TELEGRAPHER hereabouts as would be agreeable, I am free to say that its merits are not overlooked by the best men, for all such either take it or exchange some secular sheet for it with those who do take it, and so come to know its contents. I, for one, would not be without it, and it is with pride that I watch it steadily holding its own—not to say advancing—while the lesser specimens of telegraphic journals, which seem to have become an epidemic in the West and in New York, have their little day of triumph and then are gone, practically, for no one cares for them. There was one honest attempt, perhaps, made in New York to publish a telegraphic paper without advertisements (your modern operator seems to think advertisements are an objectionable feature), and it was not so great a success that its publisher—a newspaper man, too, I understand—cared to resume it after circumstances had compelled him to abandon it temporarily. But the old proverb, maintaining that "fools rush in where angels fear to tread," is as applicable now as ever; and, despite the lesson which this episode in class journalism teaches, men, with no appropriate training or capacity that I have been able to discern, with no brains, that have yet manifested themselves, to edit, or taste to revise a newspaper, have stepped forward and propose to foist upon the fraternity from the same city a spurious article. There may be those in our ranks who have no choice between a budget of twaddle in the shape of correspondence and a first class telegraphic journal edited with ability, but the intelligent members of the fraternity have a choice, and their influence is likely to be felt to that extent that THE TELEGRAPHER will keep on its dignified way long after the pretenders, without ever having ruled, shall have flourished and passed away. It is in the nature of things that what is good shall endure and what is abortive shall pass out of mind and perish. It is only a question of time. Will some one be so kind as to cut this prediction out and paste it up for future reference? Thank you.

I didn't mean to say this when I commenced, but it would come out in spite of me. I thought a few words of news from this locality would look well in your paper, and to give it was my intention, so you may cut off that first paragraph, if you don't like it, and I'll never think of being affronted.

The Western Union still flourishes at No. 83 State street, but the time draws near when we shall remove down the street a bit, and go into other quarters. We shall stay there two or three years, I am told, at the end of which time we shall make a permanent change, taking up our habitation in a new building soon to be put up on the corner of Pearl and Milk streets.

There is very little changing here compared with New York, Chicago and other large cities. Our Superintendent, Mr. C. F. Wood, is still with us, and changes but little. Unquestionably, he is one of the finest looking old gentlemen in Boston. Mr. Milliken continues to rule telegraphic destinies in the operating room, assisted by John Duxbury and Charlie Henderson, two of the oldest of the old stagers; Devereaux, McGee, John Milliken, Park Allen, and a good many of the old force who have been here ever since the high toned days when Gerritt Smith, of No. 145 Broadway, H. H. Ward and others sat down and took business like the rest of us. Mat Davin and his brother, T. A. Davin, as well as Beardslee and Stevens, are still with us.

In the branch offices, too, there are many of the Argonauts still pegging away, but doing it so quietly that one scarcely hears of them. Tom Calahan and Ben Winter, the latter the manager, are at the old State House, and Charlie Sawyer is manager for the Franklin, at No. 31 State street, an office with a history extending back as far as that of No. 21 Wall street, in your city. The Western Union gave up this office a year or two ago, and the Franklin "went for it then and there," to use a classic phrase of Mr. John Hays. Mr. Roche is manager of the Franklin main office, and Suel Smith has charge of the business of the Gold and Stock Telegraph Company. Our night manager at No. 83 State street is Mr. E. F. Leighton, and our force of artists includes Sam Eldridge, C. F. Finch, Horatio J. Colson, William McFarland and others.

Tom Maguire, an old time operator, is a celebrity hereabouts, and knows everybody. He is as fond of telegraph operating as a muskrat is of young ducks, and invariably proceeds to the telegraph office to write his dispatches for the New York Herald, of which he is the New England correspondent. Indeed he says he couldn't write a "special" on anything but the back of a telegraph blank, and his practice certainly conforms to this theory. Tom is a good fellow, and the "boys" are always glad to see or hear from him. This,

I believe, finishes up about everything of interest at present, so I will close, intending to call again. OLD CAMBRIDGE.

Congress and the Telegraph.

WASHINGTON, D. C., May 20.

TO THE EDITOR OF THE TELEGRAPHER.

THE indications that the heats and discomforts of summer are near at hand, has set our Congressional Solons to hurrying up business and preparing to get away from this city at as early a day as possible. Both Houses have adopted a resolution to adjourn on the 22d of June, and it is not probable that the session will be prolonged much beyond that date.

In the Senate on Monday last Senator Frelinghuysen, of New Jersey, introduced a bill to give a Mr. Moreno and certain New York and California associates the right to construct and maintain a line or lines of telegraph cable to connect the American and Asiatic coasts, on condition that the work of laying the cable shall be begun within three years from the enactment of the bill. The bill also provides that the Secretary of the Navy shall be authorized to detail one or more steam vessels to be at the disposal of said company to assist in the surveys, in laying and submerging the cable, transporting materials, and generally to afford any assistance calculated to promote the success of the enterprise. This was referred to the Committee on Commerce.

On the same day Mr. Starkweather, of Connecticut, introduced Cornell Jewitt's bill in the House, which is similar to the one pending in the Senate. Until there is some evidence of something behind Messrs. Jewitt and Moreno more substantial than has yet been shown, their chances for obtaining valuable franchises are pretty small.

The electric gas lighting patentees seem to be having some trouble, a suit having recently been entered by Dr. John Vanbrunt against John W. Thompson and others, composing the Electro-Magnetic Gas Lighting Company, to obtain a reassignment of the patent on the ground that they have not fulfilled their agreement. CAPITOL.

Miscellaneous.

ELONGATION OF CONDUCTORS BY ELECTRICITY.—

Various physicists have from time to time studied the modifications in the molecular state of the conducting wires, due to the passage of the electric current. Wertheim arrived at the conclusion that the transmission of the current modified the elasticity of the conductor, but Edlund, on the contrary, by a series of careful experiments, has determined such not to be the case. This latter investigator has found, however, that the elongation of the wire under the influence of the current is sensibly greater than the dilatation due to the elevation of temperature resulting from the passage of the electricity. Two calculations were made of the temperature of the wire, one deduced from the relation previously established between the galvanic resistance of the conductor and its temperature, the other from the elongation of the wire directly measured and of its coefficient of dilatation, equally known. The second mode of determining the temperature constantly gave higher figures than the first, and M. Edlund therefore concluded that the current produced a special elongation in the conducting wire which is added to the expansion resulting from the accession of heat.

Quite recently M. Streintz has taken up this subject, and, by further investigation, has sought to measure accurately the galvanic elongation for different metals.

The observations were made on wires 0.019 inch in diameter and 21 inches in length, the ends of which just touched two levers which carried mirrors placed in the prolongation of their axis of rotation. The divisions of a graduated scale were reflected in the mirrors, and thus the displacement of the extremities of the wires could be accurately read. All the wires, except those of hard tempered steel, showed a marked excess of expansion under the action of the current, which varied according to the different metals, from 11 to 27 per cent. of the dilatation of the wire under the action of heat alone when brought from the normal temperature, 68° Fah., to that fixed as a limit, 131.4°.

M. Streintz sums up his results as follows: 1. The galvanic current causes no other modification of the elasticity of a conducting wire than such as results from the elevation of the temperature produced.

2. Under the action of the current, the conductor expands more than when it is carried to the same temperature without the current; tempered steel alone does not present this excess of dilatation.

3. Galvanic dilatation does not manifest itself immediately on the closing of the current, but gradually, as does caloric expansion.

4. Galvanic dilatation is not the consequence of an electrodynamic repulsion, but probably results from a calorific polarization, or an orientation of the calorific vibrations.

Erroneous Formulæ for Testing Telegraph Lines for Mileage Insulation Resistance.

CELLICOTHE, O., May 18.

TO THE EDITOR OF THE TELEGRAPHER.

AS MR. HASKINS has not come to the rescue of his rule for finding the mileage insulation resistance of different sections of a wire when tested from a single station, it is fair to presume that he has no defence to make, and has allowed it to go by default. Mr. Haskins' rule is not the only one subject to criticism. Varley's formulæ, for instance, gives equally erroneous results in certain cases. In fact, these rules and formulæ will give approximately correct results in some instances, while in others they are totally unreliable. For example, we will take a line 110 miles long divided into two sections of 100 and 10 miles respectively.

A 100 B 10 C

Testing from A with B open = 10,000 ohms, with C open 6,000 ohms. Solving, according to Haskins' rule, we get for mileage insulation A-B = 1,000,000, A-C = 660,000, B-C = 626,000. A glance at these results will satisfy any one of the incorrectness of the mileage insulation of B-C. In fact B-C should be not far from 150,000 per mile instead of 626,000.

Again—Take another case, which is an actual test taken from record book.

A B C

A to B 60 miles, B to C 37 miles.

Tested from A with B open = 31,800 ohms, with C open = 8,400 ohms, wire resistance, 18 ohms per mile. Solving, according to Varley's formulæ, we have the following results:

A to B, mileage insulation = 1,875,600 ohms.

A to C " " = 730,119 "

B to C " " = 1,512,819 "

Here we have one section of line giving a mileage resistance of 1,875,600 and the other section 1,512,819, but both sections tested as one only gives 730,119 ohms per mile. The true resistance of B C in the above case is not far from 425,000, instead of 1,512,819. The rule generally employed in practice is, "Divide their product by their difference." This rule is accurate enough for almost all practical purposes, and is far preferable in ordinary testing to either Haskins' or Varley's rules. It is, however, based upon an erroneous supposition, viz., that the result obtained by testing from A with C open is the joint resistance of the insulation of the two sections B A and B C. To arrive at this joint resistance accurately by measurement it would be necessary to connect both sections together, and make the test from B instead of A. The difference between the tests made at A and B on wires of no very great length is not great enough ordinarily to seriously affect the result. It is possible to ascertain accurately the mileage insulation of different sections of a wire by testing from a single station, but the solution involves a high degree of mathematics, and is too complicated for practical purposes. I. N. M.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The New Telegraph Cables in Progress and Proposed.

AS WILL be seen by reference to our news columns the SIEMENS BROTHERS' new cable steamship Faraday has completed the loading of the first part of the new Atlantic Telegraph Cable, and sailed from Gravesend. It is understood that the section of the cable between Rye Beach, New Hampshire, Nova Scotia and Newfoundland is first to be laid, and then the Faraday will return to England and take on board the additional cable required to complete the line from the Irish Coast to Newfoundland. We do not understand that the United States Direct Cable Co. propose to land their cable at Newfoundland at present, the exclusive right acquired by the Anglo-American Telegraph Company, through its consolidation with the New York, Newfoundland and London Telegraph Company to land and operate telegraphs on that coast, not having yet been legally abrogated. In fact, it is claimed by the Anglo-American Company that it cannot be, except by the purchase by the Newfoundland Government of its entire telegraph property, including not only the lines in Newfoundland but its Ocean telegraph cables and appurtenances as well. This position is contested by the Provincial Government, and, until it is decided, the company maintains its exclusive occupancy of the coast for telegraphic purposes. We are informed that the new cable will, for the present at least, be buoyed off that coast and its first Western station be established in Nova Scotia, where no exclusive concessions interfere with its being done. Unless some mishap should occur, we may expect within a few weeks to see established that competition in Atlantic telegraphy about which so much has been said and written heretofore by discontented patrons and newspapers in this country.

We must confess that we did not for some time regard this cable as likely to be finally laid, but supposed that at some stage in its progress it would be disposed of in some other direction, as was the case with the Great Western Telegraph Company's Cable, which, when about completed, was sold out to the Western and Brazilian Company. In this we have been proved mistaken, and, except for some unforeseen obstacle, we have now no doubt but that the competition in Atlantic telegraphy will soon be in actual existence. Whether it can with a single cable actively and successfully compete with the Anglo-American Company, which

has four cables, and is soon to have a fifth in operation, remains to be seen. The new cable company will labor under some other serious disadvantages, but we do not care to discuss them at this time. As an honest competing enterprise it will have the good will of THE TELEGRAPHER, and its best wishes for its practical and pecuniary success.

As we have before stated, contracts for a term of years have been made between the new cable company and the Franklin, Atlantic and Pacific, and Southern Atlantic Companies, which, together, will contribute a considerable amount of business to the new line.

The additional cable required to lay another cable for the Anglo-American Company is being manufactured, and the Great Eastern, under the command of the veteran Capt. HALPIN, will, during the next few weeks, be once more engaged in adding a new electric cord to those which already connect this Continent with Europe. The Anglo-American Company has always shown much wisdom in its management, especially in the matter of providing facilities for its increasing business in advance of the requirements therefor. A total interruption of communication by its cables, or those under its management, or in connection with it, has never occurred since the company was first organized, and its cables in operation. There is little probability for such an interruption now with the number of cables it has in service. We presume that when the opposition cable is laid and in operation there will be some reduction of rates by the Anglo-American, but to what extent we are not as yet advised. It has been understood that one form which this reduction was to take would be a classification of business, similar to that of full and half rate messages which has proved so successful on the land lines in this country. This would be a politic movement, doubtless, and might prove advantageous both to the company and its patrons.

The U. S. steamship Tuscarora is still actively engaged in taking soundings of the routes for a telegraph cable between the Pacific coast and Japan and China. No company has yet been organized for laying this cable, but it is said that English capitalists are ready to furnish the cable and the capital when the best route is determined, and under suitable concessions from this Government. The utter and apparently unconquerable disinclination of American capitalists to invest in ocean telegraphs gives English capitalists the almost exclusive control and management of the telegraph cable interests of this country, as well as of Europe and the East. The Pacific cable is a necessity, and will undoubtedly be laid in due time, and almost as undoubtedly be owned and controlled in London. We may regret this as deeply as possible, but past experience has proved that our capitalists will not invest their money in such enterprises. In view of this fact the farce which is being enacted now in Washington by a certain well known blatherskite, in relation to Congressional action in regard to a Pacific cable, and a grant to one set of English capitalists as against another as a matter of national interest and importance is absurd. In this he has two purposes—one to maintain a cheap notoriety and the other the hope of obtaining something which he can sell out in England. That he can by any possibility succeed is an idea which reflects severely on the wisdom, or even common sense, of Congress. His reputation is so well known here, and he has been so constant and infortunate in his efforts to obtain grants and concessions from Congress for schemes either utterly impracticable or mercenary in their character, that the Senator or Representative who does not estimate him at his true value and rate his importance as it deserves must, indeed, be inexperienced and fresh from the rural districts. We notice that the act pending in the Senate has been introduced in the House, as he probably finds it impossible to obtain sufficient notoriety from the former body. The so-called act to which we refer is undignified, absurd, illogical and ungrammatical, but it serves its purpose in bringing its author and proposed beneficiary before the public. If there is a real competition for concessions for a Pacific cable the successful party must have some other

spokesman and representative at Washington; but we do not suppose that Congress will take any action on the subject at the present session, which is now drawing to a close.

The New Compulsory Education Law and the Telegraph Messengers.

THE Legislature of this State, at the session which has recently closed, passed an act providing for compulsory education of all children resident in the State between the ages of eight and fourteen years. This act has been signed by the Governor and has become a law, and will take effect on the 1st of January, 1875. It is very stringent in its character, and is likely to cause great inconvenience to the telegraph companies, and especially the American District Telegraph Company, which employs at the present time in this city and Brooklyn, upwards of 400 messengers, of whom probably nine tenths are within the age affected by the law.

The first section of this act provides that:

"All parents and those who have the care of children shall instruct them, or cause them to be instructed, in spelling, reading, writing, English grammar, geography and arithmetic. And every parent, guardian, or other person having control and charge of any child between the ages of eight and fourteen years, shall cause such child to attend some public or private day school at least fourteen weeks in each year, eight weeks at least of which shall be consecutive, or to be instructed regularly at home at least fourteen weeks in each year in spelling, reading, writing, English grammar, geography and arithmetic; unless the physical or mental condition of the child is such as to render such attendance or instruction inexpedient or impracticable.

The second section provides that:

"No child under the age of fourteen shall be employed by any person to labor in any business whatever during the school hours of any school day of the school term of the public school in the school district or the city where such child is," unless the child shall have attended some public or private day school, or been regularly instructed at home in the branches provided in Section 1, at least fourteen weeks of the fifty-two weeks next preceding any and every year in which such child shall be employed; the child shall, at the time of such employment, deliver to the employer a written certificate, signed by the teacher or a school trustee of a district or of a school, certifying to such attendance or instruction. Any person employing a child contrary to these provisions shall, for each offence, pay a penalty of \$50 to the treasurer or chief fiscal officer of the city, or supervisor of the town in which such offence shall occur, the sum to be added to the public school money of the district in which the offence occurred."

The law is so stringent, the penalty so severe, and the manner provided for its enforcement so practical that there seems to be little chance for the evasion of its provisions. It was the evident intention of the Legislature that there should be no opportunity afforded for any exception to its enforcement save from mental or physical incapacity, which would equally prevent the employment in any remunerative manner of the child.

We do not propose to discuss the advisability or propriety of this act, but to consider its probable effect upon the telegraph companies who are large employers of such young persons, and whose service requires constant attention from such employes. A careful examination of the sections, whose substance is given above, will show that there are only two practical methods which can be adopted by those employing a large number of youths within the prescribed ages as a solution of the difficulty. One is to give up the employment of all who are under fourteen years of age, which in the case of the telegraphs, as has been indicated, would necessitate a reconstruction and reorganization of very nearly their entire force; and the other the establishment of private schools at convenient hours, for the attendance of the employes, for the prescribed time. Either of these methods would entail considerable additional expense. It will be seen by reference to the first section that it affords opportunity for the adoption of the latter alternative by employers.

The tenth section provides that two weeks' attendance at half time or at evening school, shall be counted as

equivalent to *one week's* attendance at a regular day school.

This law will, we think, be found of great importance to telegraph companies, and is likely to introduce some complications in the details of the business in this State.

Return of President Orton.

Mr. WILLIAM ORTON, President of the Western Union Telegraph Company, sailed from Liverpool in the steamer of Friday of last week, with his wife, on their return home. Their return has been hastened by the illness of Mrs. ORTON, who has been very much prostrated by the journey and the severe domestic affliction in the death of their youngest son, which was noticed in THE TELEGRAPHER some weeks since.

We understand that Mr. ORTON's health has been somewhat improved by the relief from the pressure of his labors and responsibilities, but is not so thoroughly reestablished as was hoped when he went abroad.

The Automatic Telegraph Company.

THE Automatic Telegraph Company have recently established a number of additional auxiliary offices in this city, so that persons who desire to avail themselves of the cheap rates for telegraphing established by this Company, and their facilities for prompt and rapid transmission of business, can find accommodations for so doing without the necessity of visiting the main office. The advertisement of the Company, which will be found in this paper, will show the comparative cheapness of their charges for telegraphic service, and the location of the offices.

We understand that the Automatic Company is being very liberally patronized, and gives much satisfaction to its customers by the promptness and reliability of the service rendered.

Resignation of Mr. H. L. Hotchkiss.

Mr. H. L. HOTCHKISS, who has been Secretary and Treasurer of the American District Telegraph Company since its organization, has resigned those offices to engage in other business. At a meeting of the directors of the company, held on the 30th of April, the resignation was accepted, and complimentary acknowledgment was made of the ability and fidelity to duty of Mr. HOTCHKISS. Mr. GREENLEAF was chosen to succeed him as Treasurer, and Mr. C. B. HOTCHKISS was appointed Secretary and Assistant Treasurer.

Mr. H. L. HOTCHKISS, who, as Secretary and Treasurer of the Gold and Stock Telegraph Company, and of the American District Telegraph Company, has been connected with the telegraph business for several years, has been admitted to a seat in the Board of Brokers, and has opened an office for the transaction of a general brokerage business at No. 32 Broad street, room 57. He makes a specialty of telegraph stocks, with the values and prospects of which he is thoroughly familiar. He will, no doubt, obtain the success in his new vocation which his ability and merit so well deserve.

Personals.

Mr. J. B. NUGENT has resigned the position of telegraph operator for the Philadelphia & Erie R. R. Co. at Langdon, Pa., and accepted a position with the Pittsburg & Connellsville R. R. as agent and operator at the Bridgeport, Pa., Station.

Mr. W. H. PARSONS has been appointed manager of the Western Union Telegraph Company at Batavia, N. Y.

Mr. ELLIS H. HOLROYD has been transferred from Racine (Wis.) depot to the Chicago office of the C. & N. W. Railway.

The statement in the "Personal" column for April 25th that Mr. R. J. HEWITT had been transferred from the Kansas City, Mo., to the Milford, Mo., W. U. Telegraph office was erroneous. He resigned his position at Kansas City, and has gone to his home at Milford, where there is no telegraph office, for a rest.

Mr. FRANK GLIDDEN has resigned his position at

Lake City, Fla., and is on his way home, to visit his kindred in New England.

Messrs. JOHN & M. J. DORAN, of the cable room at No. 145 Broadway, have both been transferred, at their own request, to Plaister Cove office of the Western Union Company.

Mr. L. E. WELLER is temporarily filling the position at No. 145 Broadway, vacated by Mr. STEPHEN G. SAUNDERS. Mr. SAUNDERS left for San Francisco and Hong Kong on the 19th inst.

Mr. FRANK STEWART, familiarly known as "Fatty," has returned from the wild west, and after paying his respects to Boston, has come back to New York. He is working nights for the A. & P. and Franklin Cos. at 198 Broadway, New York.

Mr. A. L. SEYMOUR, late of the P. & A., is also working at 198 Broadway, *vice* Mr. JOHN MORELAND, gone West.

Mr. GILBERT, manager of the Western Union office at 134 Pearl street, has gone home to recuperate his failing health. Meantime Mr. R. J. CAHILL is acting as manager, the latter's position being filled by Mr. ERVING S. FITCH, of the night force, at 145 Broadway.

Mr. R. J. HEWITT has accepted a situation as extra operator on the Atlantic and Pacific Railroad.

Mr. O. L. PERRY, recently transferred from the Canton, Ohio, Railroad to the Western Union city office same place, has been promoted to manager of the Fort Wayne, Indiana, Western Union office.

Mr. ERDMAN, of St. Petersburg, Pa., has accepted the position in the Canton, Ohio, Western Union city office, vacated by the promotion of Mr. O. L. PERRY.

The Telegraph.

By Cable.

THE UNITED STATES DIRECT CABLE.

LONDON, May 18.—The steamer Faraday, with a portion of the new Atlantic Telegraph cable, of the United States-Direct Cable Company, has sailed from Gravesend.

The New Telegraph Line of The Great Southern Railway.

THE Savannah, Georgia, *Morning News* of a recent date, says: "Jacksonville is enthusiastic over the prospect of cheap rates of telegraphy. The Great Southern Railroad will construct a telegraph line along its route which will probably connect with the Southern Atlantic Telegraph Company at Jessup. This line is in course of construction now. Twenty five miles of the poles are already up, and the entire distance between Jacksonville, Florida, and the Satilla River, Georgia, will be ready for the wire in about two weeks." It is expected that the line will be completed by the first of August. Mr. Paul W. Bossart, formerly of New York, is the Supt. of Telegraphs and the line is being constructed under his supervision and direction.

Telegraphic and Electrical Brevities.

At the annual meeting of the stockholders of the Pacific and Atlantic Telegraph Company at Pittsburg, Pa., on Tuesday, May 5, Mr. William Orton was elected President, and the following named gentlemen Directors, for the ensuing year: Messrs. George H. Mumford, Norvin Green, Roswell H. Rochester, of New York; William G. Johnston, of Pittsburg, Frederick V. Beisel and David H. Bates, of Philadelphia.

A FEW business men in the vicinity of Pascoag, R. I., have set on foot the formation of a telegraphic line to connect Pascoag and Providence, and the poles are being prepared. The length of the line will be twenty-two miles.

Dangerous Illness of a Popular Operator.

Mr. CHARLES H. MIXER, of the Western Union office, at No. 145 Broadway, this city, is lying so ill that his recovery is almost despaired of, at his sister's residence in Washington. He was attacked several weeks since with muscular rheumatism and for upwards of a week was sick in bed at the Park Hotel. During this time he was attended by Dr. J. C. Graham, also of 145 Broadway, and so rapidly mended that ere long he was able to sit up and go down stairs. Encouraged by his improvement he made his preparations and left for Washington to visit his sister, with the intention of remaining a week or ten days. On the journey he took cold, and was compelled to take to his bed on arriving there. Continuing to grow worse day by day, his condition on Monday of last week was so critical that his physician deemed a consultation proper,

and during Monday night he was thought to be dying. Since then he has rallied a little, but there is little hope of his recovery entertained by those who know how little fitted he is physically to battle with disease. He is a western man, coming originally from Illinois, and has worked in Chicago, Washington, New York, New Orleans, and the South, generally, as well as in Texas and on the Pacific coast. He is, therefore, well known, and is esteemed on all sides for his genial though retiring traits of character and his abundant ability as an operator. The announcement of his illness and its possible fatal termination will carry sadness in every direction, for his friends abound everywhere.

He Too Was Weak.

SOMEBODY says that consistency is a jewel, and I don't doubt it. When one of the present New York force was working out west, he served under M. C., a very eccentric and dignified chief operator, who used to go out and hoist in the "pizen" with the boys when all hands had got "30." He was a particular friend of the chap at my elbow, and it was pretty hard work a good many mornings for either of them to tell which was M., and which was "t'other un." But, however serious the debauch, the Chief was invariably at his post at night fall, and apparently as sober as a deacon, while his friend quite frequently found himself unfit for service. One night the latter awoke with a fearful headache, and thinking it useless to attempt to go to work, he scrawled a note saying he was ill, and sent it to the office. He had barely put himself outside of a glass of Seltzer, when he received the following reply, which rather startled him by its Johnsonian style and apparent earnestness:

"Office—Telegraph Company,
April 24th, 187—

SIR:

You are drunk. This folly has been repeated to the detriment of the service much too often, and a recurrence of the offence must result in your peremptory discharge. I cannot and will not tolerate it any longer.

Yours, M. C.

P. S.—Where will you be at nine o'clock? I am on it. M."

It seems scarcely necessary to say that the postscript was about the sweetest morsel that ever followed an official signature; nor need I add that at nine o'clock precisely there was a telegraphic reunion on a small scale at the Occidental.

JOHN OAKUM, in *The Switch*.

Bound Copies of Volume IX for Sale.

We have a few copies of Volume IX of THE TELEGRAPHER, handsomely bound, which may be obtained, if applied for soon, at Five Dollars per copy. The number of these is very small, and those who desire to get them must apply soon, or the opportunity will be lost, as, once disposed of, we cannot duplicate them—some numbers of that volume having been exhausted.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended April 14, 1874, and bearing that date.

149,707—MAGNETO-ELECTRIC APPARATUS.—Ernst W. Siemens, Berlin, Germany. Application filed January 20, 1874.

One pole of permanent magnet bent, extended and provided with an aperture into which the other pole takes, the coil being placed in the space left between the two poles.

1. A permanent magnet having one of its poles extended and surrounding the other pole, an intervening space being left between the poles, substantially as set forth.

2. In combination with a permanent magnet, having one of its poles extended and surrounding the other, a coil inclosed or partially inclosed in the space intervening between the poles, substantially as set forth.

3. In the apparatus for the purpose above referred to, described in reference to Figs. 1, 2 and 3, the electric coil C suspended

within the annular space between the magnetic poles or polar extensions S and N' by conducting wires A extending from the rocking shaft B, and rendered adjustable by the spring lever D and screw D'.

4. The electric coil C, suspended within the annular space between the magnetic poles or polar extensions of a magnet, and provided with the hoop C', or equivalent, for utilizing the coil for the purpose of establishing local circuits.

For the week ended April 21, 1874, and bearing that date.

149,907—ELECTRIC STEAM BOILER ALARM.—William C. Baker, New York, N. Y. Application filed March 21, 1874.

Tube, expansible by heat, placed in case connected to boiler. If water falls so tube is exposed to steam increase of temperature causes it to close circuit to an alarm. Another circuit to same alarm is controlled by a pressure diaphragm. Testing circuit from point where alarm is situated is connected to whole apparatus.

1. The pressure diaphragm and the low water expansion tube, constructed and arranged substantially as specified, in combination with the circuit closer f and v, battery g, and magnetic alarms h k, substantially as set forth.

2. The circuit closing button or key r, electro-magnet s, levers t u, and connections, in combination with the magnetic alarm k, low water and pressure indicators, and connections from a galvanic battery, substantially as and for the purposes set forth.

3. The expansion low water indicator, in combination with a circuit closer, electro-magnetic alarm, and battery, substantially as set forth.

4. The pressure diaphragm m, located at or near the boiler, in combination with the insulated adjustable circuit closer 6 and electro-magnetic alarm, substantially as set forth.

5. An electro-magnetic alarm located at a distance from the boiler, and connected in a metallic circuit from a battery with a circuit closing low water expansion indicator at the boiler, and a circuit closing pressure indicating diaphragm, substantially as specified.

150,030—ELECTRIC RAILWAY SIGNAL APPARATUS.—Thomas S. Hall, West Meriden, Conn. Application filed December 31, 1873.

1. The arrangement of a locking lever, f, acting directly on the signal lever g, substantially in the manner shown and described.

2. The arrangement of a yielding rod, m, made in sections m3 m5, which are acted on by a spring, m4, said rod forming the connection between the armature levers n and the signal lever g, substantially as and for the purpose set forth.

3. The diamond shaped cam r1, in combination with the slide r2, switch rails R, lever r3, keys r12 r13, and signals D S, substantially in the manner shown and described.

4. The diamond shaped cam r1, in combination with the danger signal V of a draw bridge, and with a lever r9, keys r12 r13, and signals D S, substantially in the manner set forth.

150,090—ELECTRIC AND THERMOSTATIC FIRE ALARM.—George S. Shute, Boston, Mass. Application filed January 3, 1874.

Two series of thermostats, each acting, through rack and pinion, on wheels having projections b c, which, coming in contact, close circuit. Thermostats act differentially, causing this contact. Two thermostats in each series act, when quiescent, as springs against each other, steadying the apparatus.

1. The combination of the thermal bar A, the cross head C, and the thermal bar A', all arranged to operate together substantially as described, and for the purpose set forth.

2. The combination of the thermostat A A', the circuit closer b b' c c', and the thermostat L L', one series in the thermostats being placed in an inclosed and the other in an exposed space, all operating together substantially as described, and for the purpose set forth.

150,150—ELECTRIC RAILWAY SIGNAL.—John M. Goodwin, Cleveland, Ohio. Application filed July 14, 1873.

The line wire of a railroad telegraph is carried along a bridge or beam supported above the track, and upon this beam is arranged a key for breaking the circuit. Upon the top of a car is a rock shaft arranged lengthwise the car, and having attached to it a series of fingers, which, when projecting upward, strike the key as the car passes under the beam. The fingers may be adjusted to break the circuit as desired for signaling, or, by means of the rock shaft may be turned so as not to strike the key.

1. The signal keys or circuit breakers and the key guards, or their respective equivalents, constructed and operating substantially as and for the purposes described.

2. The rocker shaft or finger rod, and the adjustable fingers or lathes, or their respective equivalents, attached to or carried by an engine, car, caboose, or other vehicle of any kind, constructed and operating substantially as and for the purposes set forth.

Born.

MAYNARD.—To H. C. MAYNARD, Night Manager of the Western Union, Chicago, Ill., office, April 17, a son.

SHOLES.—To C. G. SHOLES, Assistant Manager of the Western Union, Chicago, Ill., office, April 24, a daughter.

Married.

MUNSON—WOOD.—May 13th, at the residence of the bride's father, by the Rev. Mr. Philp, Mr. A. BRUCE MUNSON, Train Dispatcher G. W. Railroad, Palmerston, to MARY E., only daughter of Mr. Thos. Wood, merchant of Paris, Ontario, Canada.

Died.

LONG.—May 1st, MINNIE, infant daughter of W. C. Long, Operator Western Union, Chicago, Ill., office, aged three days.

"Rosebuds just opening are often ruthlessly plucked."

SCULLY.—At Brooklyn, L. I., Thursday, April 30, 1874, after a lingering illness, Bertha M., daughter of Thomas P. Scully, of the Gold and Stock Telegraph Company, New York.

Obituary.

JAMES B. ST. JOHN.

JAMES B. ST. JOHN, who was an employe of the Michigan Central Railroad, J. L. & L. and G. R. V. Railroads, as a telegraph operator at Jackson, Michigan, died of typhoid fever March 21st, 1874, in that city, in the twenty-second year of his age.

He was better liked, more obliging and kindly in his disposition than any one else on the line. His funeral, at the residence of his parents in Grass Lake, Michigan, was well attended by his brother operators. His pure soul was well fitted for the bourne to which he was called. May we endeavor so to live that we may be prepared to join him in that better land.

THE AMATEUR TELEGRAPHIC INSTRUMENT.

This instrument is in some respects similar to the "SNAPPER SOUNDER," but differs from that device very materially in the matter of form, finish and consequent DURABILITY. The base is composed of the best metal, highly polished, the Spring being Nickel Plated, and capable of producing a clear and pleasant sound. Sent to any address, post paid, on receipt of 40 cents.

The "SNAPPER SOUNDER" will be sent for 25 cents.

“ “ “ with hard rubber knobs, 75 cts.

Address,

G. A. WESTMAN,
544 Nostrand Avenue,
BROOKLYN, N. Y.

THE "SNAPPER" SOUNDER.

NEW STYLES, NEW PRICES.

The unexpected and growing demand for the original "Snapper" Sounder, beyond the expectations of the manufacturers, has delayed the introduction of proposed styles and improvements.

Having increased our facilities and accumulated sufficient stock to enable us to fill orders promptly, the following varieties are now offered for sale at prices which will accommodate all classes.

The "Snapper" Sounder, plain,.....	30c.	6 for \$1.50.
“ “ “ polished,.....	35c.	6 for 1.80.
“ “ “ nickel plated spring...	0.40.	

A few were manufactured to order with hard rubber knobs. They were so well liked that I have decided to introduce them to the fraternity. The springs are secured by two screws, and, should they break, may be replaced at an expense of 15 cents. They are thoroughly made and finished.

PRICE,  75 CENTS.

To the Dominion 5 cents each extra.

☞ A liberal discount to agents.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"
"History of America," "Civil War in America;" Member
of many Scientific and Learned Societies of Europe
and America; Commander of the Order of Dan-
nebrog, Denmark; Order of St. Olaf,
Norway, and of the Sword Order,
Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800
pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his
own expense, and he hopes telegraphists throughout the world
will accord to it a patronage commensurate with its merits. For
nearly thirty years the author has been connected with the
telegraphic systems of both hemispheres and an observer for
general instruction, and this work will contain the substance of
facts thus collected, having especial reference to practical tele-
graphy.

The first four volumes will be ready for printing in May, and
the whole work may be issued in monthly parts of quarter or
half volumes.

Vol. I will contain a general history of electrical discovery
by ancient and modern philosophers—the experiments of Otto
Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek,
Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and
others who practically manipulated static electricity; the whole
prepared especially for the telegraphists as useful information
in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic bat-
tery, and the many improvements and modifications of this
telegraphic generator of electricity, considering the experiments
of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and
Grove. Also, magneto and thermo electricities, and the applica-
tion of their respective forces for telegraphic and useful pur-
poses.

Vol. III.—In this volume will be considered Terrestrial Mag-
netism, Aurora Borealis, Magnetic Needle, Ships' Compass, and
Magnetic Phenomena generally. Also, Electro-Magnetism as dis-
covered by Ersted and manipulated by Schweigger, Ampère,
Arago, Sturgeon, Henry, Faraday, Jacoby and others. The applica-
tion of these discoveries for practical telegraphy by inventors,
from time to time.

Vol. IV.—A general history of the ancient and modern tele-
graphic systems, semaphoric and electrical, including telegraphs
of Ohappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil,
Morse, Bain, House, Hughes and others. Also, the construction
of overland, subterranean and submarine lines, including con-
ductors, insulators, paratonnerres, and telegraphic implements
generally.

Vol. V.—This volume will give a full account of the various
telegraphic apparatuses for simple and automatic manipulation;
the combination of circuits for repeating or translating; double
and duplex transmission. It will also contain a large amount of
general information for practical telegraphists, respecting con-
ducting and non-conducting compositions, tables, and a Dictionary
of telegraphic technical terms.

The whole work will be written for the telegraphist, but it
will not be mathematical. The illustrations are designed for
specific instruction, and their explanation concise. It will be
so arranged that either one of the volumes may be bought by
those not wanting the whole.

Each volume will have a complete Table of Contents and an
Index.

The above must be regarded as an approximate division of the
subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.

Will not jar open.

Slight pressure of the finger required to put lever in circuit
or cut out.

Acknowledged to be a decided improvement.

Price, same as the ordinary key.

Superintendents and Purchasing Agents are invited to examine
our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful informa-
tion for Superintendents and others interested in the Science of
Telegraphy.

A NEW GALVANIC BATTERY.

**Durability, Efficiency, and Economy of Expense
and Labor at last Secured.**

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in **Fire Alarm and Police Telegraphy**, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAYS

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.

For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.
E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS

of all kinds,

CHRONOGRAPHS,

ASTRONOMICAL CLOCKS,

REGULATORS,

OF ALL KINDS.

ETC., ETC.,

All instruments and work from this establishment guaranteed to give satisfaction.

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY AT THE CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION, and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

TELEGRAPH PRINTING A SPECIALTY.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST"
 is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS
 for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
 Instrument with Office Outfit..... 7 50
 Two Instruments and Outfits..... 14 50

 Chicago, Ill.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.
 Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

THE BISHOP GUTTA PERCHA WORKS.

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fuse Wires, Leading and Connecting Wires for **SUBMARINE**
 and **MINING PURPOSES.**

Also, a **NEW COMPOUND** (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for **HOTEL ANNUN-**
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, FOR
TELEGRAPH AND ELECTRIC USE,

AND FOR
BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The **PROPRIETOR** will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable. Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deli-
 vered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK.

have been appointed by me **GENERAL AGENTS** for the sale of
 any Telegraph Cable or Wire manufactured at the Works in New
 York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manu-
 factured by me, at Factory Prices, delivered in New York.

The Elementary Principles of Electrical Measurement.

BY F. L. POPE.

(Continued from page 97.)

Methods of Measurement.

THE apparatus required for making electrical measurements consists:—First, of a standard or known resistance for the purpose of comparison; second, of a galvanometer, by means of which the existence or strength of the electric current is indicated; and third, of a suitable voltaic battery or other generator of electricity.

All the different methods of measurement employed by electricians may be conveniently divided into four classes, viz:

- 1. The method of equal deflections or substitution.
2. The method of unequal deflections or proportion.
3. The electrical balance or bridge method.
4. The differential method, by the use of the differential galvanometer.

The second or proportional method requires the use of a galvanometer, the deflections of which have a known value, such as the sine or tangent instruments before described. In the first, third and fourth methods, however, this is not essential.

Measurement of Resistance.

In practical work the electrician finds that by far the greatest proportion of the measurements he is called upon to make are those of resistance.

The electro-motive force of each of the different kinds of batteries in ordinary use is sufficiently definite and well ascertained for all practical purposes, and to know what result we can produce by means of them, it is only necessary to determine the resistance to be overcome in doing the work.

The Rheostat.

The measurement of an unknown resistance consists simply in comparing it, as accurately as may be, with some recognized and determined standard, such as the Ohm or the Siemens unit.

* According to Mr. Farmer's determinations the value of the electro-motive force of various batteries in use is as follows:
Carbon, with bichromate solution, 1.75 volts.
Grove, " nitric acid, 1.63 "
Carbon, " (Bunsen), 1.59 "
Daniell (also Calland and Hill), 0.93 "
Smees (in good order), 0.62 "
Leclanche, Manganese, (Jenkin), 1.48 "

having resistances corresponding to multiples and sub-multiples of the standard unit, are arranged compactly in a box, so that by combination any required resistance from 1 to 10,000 units or more may be obtained at pleasure.

A series of brass terminals, A B C, etc. (Figure 16), are arranged upon an insulating slab of hard rubber, R, and each of these terminals is connected to the adjacent one by means of a resistance coil, as shown at 1, 2, 3. These terminals are so arranged that a metallic plug, P, with an insulating handle, may be inserted between any two of them, as shown in Figure 16, and when this is done the resistance coil between these two terminals is short circuited or cut out, as is the case with the coil 1 in Figure 16, the current passing directly from

Fig. 15.

one terminal to the other through the body of the plug P, the resistance of which is infinitely small. The most common numerical arrangement of the coils is as follows:

- 1, 2, 2, 5, 10, 10, 20, 50, 100, 100, 200, 500, 1000, 1000, 2000, 5000.

A more convenient arrangement is the following:

- 1, 2, 3, 4, 10, 20, 30, 40, 100, 200, 300, 400, 1000, 2000, 3000, 4000.

With this arrangement the numbers required to make up any particular resistance that is needed may be seen almost at a glance. There are also various ways of arranging the resistance coils and their connections in the box.

Perhaps the most useful arrangement for general purposes is that shown in Figure 15. Binding screws for the attachment of wires are provided at A B C D (Figure 15), and two "infinity plugs," marked INF., which simply serve when taken out to open a circuit altogether. Two keys, K and K', are connected to the coils as shown by dotted lines. The use of these different connections and of the extra coils in the upper row will be explained hereafter.

The wire of which the resistance coils is formed is usually German silver, for the reason that the resistance of this alloy changes less than almost any other

Fig. 16.

with the variations of temperature. The wire is usually insulated by a double wrapping of silk, put on in opposite directions, and the coils are wound double upon bobbins of hard rubber or boxwood, in the manner shown in figure 16, the object of this being not only to neutralize the effect of the induction of the current upon itself within the coils, but also to prevent it from influencing the deflections of galvanometers which may happen to be in its neighborhood.

After having been wound, the bobbins and coils are saturated with melted paraffin, which prevents any moisture from penetrating to the silk covering of the wire, which would tend to partially short circuit the coils, and thus decrease their apparent resistance.

In using a set of resistance coils it is necessary to observe one or two precautions. The brass portion of the plugs should be kept clean and bright by means of

a piece of ehamois skin, and never touched with the fingers, if it can be avoided. Before commencing operations every plug should be in its place, and the operator should try each one with a twisting motion, to make sure that none of them are loose in the holes. Wherever a plug is inserted the same twisting motion should be given it instead of simply pushing it into the hole, in order to insure a thoroughly good connection. When the plugs are all in their places the total resistance of the whole rheostat between D and E, Figure 15, should be a very small fraction of 1 ohm.

Another precaution should never be forgotten in using a rheostat, which is, not to injure it by allowing powerful currents to pass through it from a large battery, when no other sufficient resistance is in circuit. A set of coils may easily receive irreparable injury in this way.

(To be continued.)

The Telegraph Offices in the Corridors of the Capitol at Washington.

ON the 23d of March last a resolution was introduced in the House of Representatives at Washington in relation to the telegraph offices in the Capitol. It was asserted that there was no secrecy possible under the present arrangements, as any sound operator could, if desirous of doing so, become cognizant of the contents of messages sent and received, and the cause of the introduction of the resolution was understood to be that a certain Congressman had, through his private secretary, a telegraph operator, in a fierce contest over an important appointment made by the President, derived an advantage from becoming aware of the contents of messages passing to and fro over the capitol wires, to parties who were opposing him in the matter, even before they reached the parties themselves.

On the 9th inst. a letter from the Architect of the Capitol, in answer to the resolution, was presented in the House, and referred to the Committee on Public Buildings and Grounds, and ordered to be printed.

The following is the correspondence:

"ARCHITECT'S OFFICE, UNITED STATES CAPITOL, WASHINGTON, D. C., May 9, 1874.

SIR: To carry into effect the resolution of the House of Representatives, passed March 23, 1874, directing the Architect of the Capitol to cause the telegraph instruments located in the corridors of the south wing of the capitol to be so isolated that it shall be impossible for any unauthorized person to hear and obtain messages, etc., I have caused the wires to be examined.

It is found that in some cases these wires connect with instruments in hotels in this city, and that all the wires connect with various cities and stations between this and the northern cities.

In consequence of the above facts, I wrote to the officers of the various lines having stands in the capitol, suggesting certain changes, and have received replies thereto from the Western Union and the Franklin Companies, which are herewith submitted.

Mr. J. F. Knapp, operator of the Government telegraph for the south wing, was sent along the lines as far as the city of Boston to make the necessary examination. His report is also herewith submitted.

As from the facts disclosed by Mr. Knapp's report it is evident that the intended isolation of these stands will not prevent the possibility of unauthorized persons obtaining messages, I respectfully recommend that the resolution of March 23 be so modified as to require the telegraph companies to erect suitable screens and to muffle the instruments in the manner recommended by Superintendent Smith, of the Franklin Company.

I also suggest the propriety of passing a law fixing a penalty or punishment on any person who may divulge any message sent by telegraph, or intercept or take off any messages from the wires.

I am very respectfully, etc., EDWARD CLARK, Architect United States Capitol.

HON. JAMES G. BLAINE, Speaker of the House of Representatives.

THE WESTERN UNION TELEGRAPH COMPANY, MANAGER'S OFFICE, CORNER PA. AVE. AND 14TH ST., WASHINGTON, D. C., April 7, 1874.

DEAR SIR: I have your favor of the 6th instant relative to isolation of the telegraph instruments at the Capitol. All the wires of this company already run direct from the Capitol to our main office without passing through any other branch offices. I note your suggestion that the sound of the instruments be muffled, but I do not think it would accomplish the object. A more satisfactory arrangement, I think, is to dispense entirely with the sounder, which has been done in our public office, leaving the operator only his relay to read from, which reduces the sound to the minimum neces-

sary for his own ear. I think you will agree with me that this will effectually secure the obje ct.

Very respectfully,

LEONARD WHITNEY, Manager.

EDWARD CLARK, Esq., Architect, United States Capitol.

EXECUTIVE OFFICE OF THE ATLANTIC AND PACIFIC AND FRANKLIN TELEGRAPH COMPANIES, No. 198 BROADWAY, NEW YORK, April 28, 1874.

DEAR SIR: On receipt of your letter regarding the resolution of the House regarding the telegraph offices in the corridor of the House, I inclose the same to our Manager at Washington, Mr. Kennedy Duff, with a letter of instructions directing him to call upon you in reference to the matter, and to take any steps that may be necessary to meet your views in this matter. My own idea of the best way to accomplish what seems to be required would be to inclose the office with suitable surroundings corresponding nearly to that of the present office of the Western Union Company; then to place in the office a silent instrument, comparatively; that is, an instrument requiring an ear trumpet leading from the instrument to the operator's ear, similar to a description of instrument used at one time by competing companies when the Western Union controlled the Morse patents. Mr. Knapp is familiar with them, and can describe them fully to you. Also to place around the hand of the operator a screen, so that the motion of his hand when transmitting cannot be observed by persons looking into the office. This would seem to me preferable to any attempt to place the operator in a secluded room, as he might in such case allow people inside his office unobserved; whereas, situated in the corridor, the office is so public that an operator will not dare to do such a thing, as it would be too readily observed.

Any plan that is finally adopted will be cheerfully acquiesced in by us.

Very truly yours,

JAS. G. SMITH, Superintendent

HON. EDWARD CLARK, Architect, United States Capitol.

WASHINGTON, D. C., May 7, 1874.

SIR: As directed by you, I have examined the wires running from the different telegraph offices in the corridor of the south wing of the Capitol, and (as near as I can ascertain) find that the Franklin Company's wires connect with the instruments at Willard's Hotel, and the Western Union Company's wires, from their office in the corridor (from which office they transmit all commercial despatches), connect with the instruments in the reporter's gallery of both the House and Senate wings of the Capitol, from which instruments messages could be taken by unauthorized persons.

I have also examined the wires of the different telegraph companies between this city and Boston, and find that the Automatic Telegraph Company's wires only run as far as New York City, but connect with several way stations between here and that city (New York). The through wires of the Western Union and Franklin Companies, which run through to Boston, connect with various way stations, which stations are not allowed to use said through wires except for test purposes, but despatches could be abstracted from the through wires at these way stations by experts.

From my observations and my practical knowledge of telegraphy, I am confident that the removal of the offices in the corridors of the capitol to more private places will not render it impossible for unauthorized persons to obtain despatches from the wires.

In conclusion, I will state that I believe if 'silent instruments'—that is, an instrument requiring an ear trumpet, leading from the instrument to the operator's ear, as proposed by Superintendent Smith, of the Franklin Telegraph Company—were placed in all the offices in the corridors of the Capitol, and screens placed around the stands similar to that of the Western Union Company's, there would be no more danger of the abstraction of a despatch from these stands in their present location than there would be if each were placed in a separate room.

Very respectfully yours,

J. F. KNAPP.

HON. EDWARD CLARK, Architect, United States Capitol.

Pluck.

A PRETTY fair illustration of the amount of pluck contained in the average Yankee is embodied in the appended message, which was sent in reply to one offering assistance. The gentleman who sends the following was a loser by the Williamsburg reservoir calamity to the extent of upwards of half a million of dollars: "Much obliged; nothing wanted at present. Commence on new works to-morrow morning. Not the least discouraged."

The Telegraphers' Mutual Benefit Association.

American District Telegraph Company.

NEW YORK, May 23.

TO THE EDITOR OF THE TELEGRAPHER.

IN your issue of this date you state that the Compulsory Education Law, recently passed by the Legislature, "is likely to cause great inconvenience to the telegraph companies, and especially the American District Telegraph Company, which employs at the present time, in this city and Brooklyn, upwards of 400 messen-

gers, of whom, probably, nine tenths are within the age affected by the law," viz., eight to fourteen. We employ in New York 365 messengers, of whom there are not more than five under fourteen years of age. Our rule is to take none under fourteen, or over sixteen years of age.

Our messengers, in the performance of their duties, are brought in contact with the leading business men of the city, and it has been one of the valuable fruits of our system that we have found remunerative employment not only for hundreds of boys who otherwise would have been idle, but more than a hundred have, within the past two years, found permanent places at an advance upon the wages we pay, with subscribers whom they have pleased.

E. B. GRANT, Vice-President.

"Out West."

May 15.

TO THE EDITOR OF THE TELEGRAPHER.

AFTER three years' "sage brush" I again set my foot on my native heath, or at least what is more like it than the howling wilderness. In the lonely hours of solitude THE TELEGRAPHER was my solace. I watched for its arrival as a lover would for a letter from his sweetheart. Through it I learned how the "boys" were getting on and where they were, and often thought to myself, "Well, I wonder if Jack is as good a hand at draw poker as he used to be, in that little lager beer saloon on West Broadway." Or, "Oh, there's Jim promoted! Well, it's time—long study and patience is at last rewarded." It would have been before, but Jim was no sneak. He had a manly way about him, and your superintendents now-a-days don't appreciate manly ways. A sweet smile and a cunning, insinuating manner is sure to get ahead of honest ability. Pretend you know everything, and you are sure to be promoted; be modest, and your modesty will keep you in the same place. Hammering brass on the wires, instead of hammering it into your face, is an ambitionless career, and a thankless one.

I see now and then, through THE TELEGRAPHER, that some good appointments are made, and I also notice some very bad ones. I see plenty to criticize—if to criticize would do good. I see some honest, able fellows come to the front and speak their minds, and offer some capital suggestions, but what good does it do? Have any of those suggestions been acted upon? Operators look upon each other with suspicion—a severe lesson having been taught them, that the greatest brawlers and the most sanguine strikers were the first to back out and supplicate to the Western Union managers for reinstatement. I heard it said that an operator on the Pacific coast boasts he cost the Western Union more trouble and money than any other living man. I heard his name, also, but I do not give it, because, were I in his place I should be ashamed to make such a boast; for, for every dollar and annoyance he caused that company he lowered, through his impetuous and bad judgment, the standard of compensation, and carried misery and mistrust into many a man's house and heart. But enough of this.

I am out of the sage brush and am travelling around for a few weeks. In a few days more I shall be at my post again, but I cannot go back without fulfilling a duty I owe to the fraternity, which is, to give them the benefit of my observations. To commence with Omaha. Did it ever strike any operator as strange that a first class, steady operator, could not be found to stay in that town over six months? "'Tis true, 'tis pity—pity it is 'tis true." I will ask a few questions of any general superintendent; let us take, for instance, the most liberal of them all, and perhaps, the most able, energetic and competent—General Stager—who, although I have not met him since the little family quarrel we had in '61 broke out, I yet believe is not much changed. If General Stager of to-day is as good a man as the Stager of '58, then I will ask him a few questions.

Would he, as a first class man, who thoroughly understood his business, like to be treated other than as a man? Supercilious foppery does not become any manager, and a first class man is not going to submit in this, the nineteenth century, to "The insolence of office and the spurns that patient merit of the unworthy takes."

A man is a man, even if he becomes a telegraph operator, and yet some managers forget this. Again, sir, would you, operator as you were, like to have any suggestions you may have had to offer treated with contempt and derision? Would it not lessen your desire to advance any subject to such a manager, even though the vital interests of the company demanded it?

Would you, as a first class man, like to be abused over the wire by inferior operators, who, as is often the case, to cover their own inferiority, will pour forth a torrent of invective against you and your writing, and if you retaliate (and, mark me, I do not believe in retaliating, but human nature is human nature still) this plug will at once report you, and the manager sees only

one side, and that is generally the side which reports first; you are abused—told if you cannot conduct yourself better you must go elsewhere, etc., etc. *Elsewhere* that operator is sure to go. Show me an office where first class men stay a long time, and do not desire a change, and I will show you a good manager, both for the company and for the men under him. Pettifogging, spiteful, jealous and irritable natures are not those calculated to become great men nor judicious managers. We find this class of managers and chief operators, who know everything, their great hold is to talk, and if they come across a man of greater brain than tongue, they take his silence for ignorance, and pour forth a stream of rhetoric into his already weary ears. Contradicting them is of no use; you can bring forth the printed rules of the company, or Pope, or Culley, and cite from them till you are tired; the manager knows better; he gets jealous at once of such a man, and the first opportunity to blackmail him is a godsend. The country is flooded with this class of fops and sneaks, whose only recommendation is "I never drink, sir." They are seldom first class operators, but they can recount feats done ten years ago that would make "Old Pratt" hold down his head. Do you like the picture? Every superintendent ought to have one.

Now, General, how many bulls have you traced to the Omaha office within the last year? How many of these were made by strange men, unacquainted with that class of business? How many did you trace to Salt Lake? Now, "look here upon this picture and on this;" the men in the latter place have been there several years; manager, chief and operators cannot be beaten on this continent as reliable, capable men, and they all drink. "Many a night and oft" have I lain on my bunk and listened to Salt Lake and Omaha work, and I wished then and now that General Stager was there also; he would have had the opportunity of realizing the fact that a good operator was worth more than \$125 per month, it a plug was worth \$100. The plan for keeping good operators in one place is—change the manager, and not the operators; in nine cases out of ten this will remedy the difficulty of a constant change of subordinates.

Besides, managers are inclined to throw too much on to the shoulders of operators. I know several who have five other occupations. One of the force is called upon to keep the books, and, hence, either repeaters or way lines are neglected, or an extra man is put on.

Another kind of manager who deserves to be shown up is ye sanctimonious manager, and, with the assistance of Providence, he will occupy my thoughts the next time. I have had sad experience with these sanctimonious managers, who, when known, were no other than lying hypocrites and designing speculators, enriching themselves through their position to spy on honest men's business. How long, in God's name, will this last? How long will superintendents be blindfolded, and operators made the lambs for sacrifice, to cover the iniquity of this worthless, conniving trash? Some of them, to say the truth, are able enough to fill these positions, but is the choice judicious? When the people with whom they transact business cannot be induced to place faith in their integrity, and good operators cannot be found to remain with them, then it is time they were either reduced to the ranks or sent to warmer climates. False zeal costs more than honest industry. The former lives always in a glass house, while the latter enjoys with confidence the pure, untainted light of heaven.

We want to adopt a method for self-preservation. We cannot do it other than by giving to THE TELEGRAPHER our support in every respect, and make it the medium of redressing our grievances, if we have any. A good man need never be afraid, yet I know men high in the confidence of the Western Union executive department who would hate to see some episodes of their official career in print. To this end let us all join hands, and if I see that this letter brings out "the boys," and has the effect for which it is intended, then, and not till then, will you hear again the voice of
THE SAGE BRUSH GOPHER.

The Proposed Society of Telegraphic Engineers.

TO THE EDITOR OF THE TELEGRAPHER.

I HEARTILY approve of Mr. Miller's proposition in THE TELEGRAPHER of May 2d, in reference to organizing an American Society of Telegraphic Engineers. The plan of organization would need, however, to be quite different from that of the sister society in England in order to make it successful, as the conditions in this country are, in many respects, very different. We Americans have two obstacles to contend with in keeping up such a society, which do not exist to anything like the same extent in England. In the first place, our members will probably be scattered all the way from Maine to California and from Canada to Cuba, and, therefore, only a small number of them could be got together, personally, at one time, except at infrequent intervals. The second difficulty is, that every electrician in this country, who would naturally belong

to such an association, is already fearfully overworked, and could not afford to spend very much additional time in carrying out its plans. Take the list of names given by Mr. Miller; there is scarcely a man on it, including himself, that doesn't work like a hod carrier for twelve hours a day, and from that up to twenty-four, upon emergencies, to say nothing of Sundays. Our English brothers work but six or eight hours a day, as a rule, and have some time left for studying, experimenting and writing. Therefore, in our plan of organization we must, of necessity, take these facts into consideration.

There are a few suggestions which have occurred to me, upon which I should like to get the views of those interested.

A good name would be, "The American Electrical Society." This would embrace everything in our line, and be brief and convenient.

I think it would work well to have three classes of members, viz., active, honorary and student, making no distinction between resident and foreign members.

The active membership should be limited to persons of considerable standing and ability, either as electricians or practical telegraphic managers. Honorary membership should be conferred, as a title of distinction, upon such proper persons as may be thought advisable from time to time. The students should embrace that very large class of intelligent and ambitious young operators who are endeavoring to fit themselves for the higher branches of the profession, and who, by becoming members, would have a right to the assistance and instruction of their more experienced associates, whenever needed by them.

The officers needed would be a president, perhaps, a vice-president, secretary and treasurer, and a council of three members. It should be made an absolute condition of admission as an active member, that the candidate should furnish an original paper, either of a theoretical or practical character, of sufficient value and interest to be accepted by the council, and afterwards published in the transactions, and each active member should also be required to furnish such a paper at least once a year, in order to retain their membership. Only by using some pressure of this kind can we ever get anything out of them, for they will otherwise postpone the matter for that leisure hour which never comes. In this way, too, a candidate will have to prove his fitness for membership, or he can't get it. Of course he should be balloted for as well.

An annual meeting of a couple of days might be held, alternating in different cities of the country, and the transactions should be printed in a neat and handsome yearly volume, including all papers contributed by the members and accepted by the council.

Such an organization, I think, would be quite inexpensive, would not require much labor or time, and would be of great value and interest, especially if a really good secretary could be secured. Of course, the whole thing may be greatly improved as it grows older, but I think it would not be advisable, under the circumstances, to attempt too much at first. F. L. POPE.

Elizabeth, N. J., May 27, 1874.

An Electric Surprise.—A Confirmed Telegraphic Rascal.

ALBANY, OREGON, May 10.

TO THE EDITOR OF THE TELEGRAPHER.

YE saints protect us! Oregon, that paradise of the United States) is certainly "going back" on us. Last Monday eve, sitting in our office working, our ears were greeted by that once heard, long to be remembered—*Pop!* of the relay and our eyes fairly "banged out" on seeing the table covered with a halo of fire. The alacrity with which we vacated was somewhat astonishing—we were not in a hurry, but concluded to go.

Recovering from our shock, we were amused at one of our boys trying to work, but who only got into a perfect phrensy over "That d—n fool breaking him;" was going to report him "right away, quick." I remarked that he would have to go to headquarters to "report that feller." He believed me the next moment when a lick came that fairly raised our friend off his feet. He merely remarked, "lightning by jove!" Our friend Johnny Williams, at Gervais did not escape so luckily in regard to office and instruments. He had occasion to go into the freight department and cutting out the office, although the plug was nearly two feet from the line, this space was jumped by lightning, which entered the office, setting fire to the building, and literally splitting the register and key to pieces, but leaving relay un-injured. Johnny had fortunately got out of the way, thus saving his brother operators the trouble of holding a "wake" over him. With the help of some citizens the fire was soon subdued, but not until the office was damaged to a considerable extent.

The line from Aurora to Salem was damaged a great deal by the lightning. A great many poles struck, and in some places the wire was melted. Gervais is the only office that suffered to any extent, although in several

of them some of the "boys" got "upset" or severely shocked, and a great many beat a lively retreat.

This is the first severe lightning spree ever known in Oregon, and we sincerely pray that it may be a long time ere we are visited again. We are all unanimous in the opinion that we would a great deal rather manufacture our own lightning; and protest against this cheap and to us almost unknown article thrown upon us in this way!

It seems that A. J. Curtis, alias J. K. Bear, has made another haul! A few days ago, O. P. G. Plummer, District Superintendent, of the W. U. Telegraph Co., received a photograph and description of the former from C. S. Jones, Superintendent of Telegraph Illinois Central R. R. Co., stating that Bear had made another steal at Waverly, Iowa, January 28th.

It will be remembered that this Curtis—Bear, some time in '70 stole some \$12,000 belonging to the Express Co., while he was agent and operator at Brownsville, Neb. He succeeded in escaping, and came to Oregon, and obtained a situation on our line as agent and operator at Oregon City; and by his prompt attention to business, and pleasant manners, made a great many friends. The officers of the law, however, tracked him down, and came in on him one day as he was sending messages. He asserted that he was glad they had caught him, that he would make no attempt to escape, as he had had no peace since he embezzled the money, and intended to stand his trial, and, if convicted, serve his sentence out, and when out, would turn over a "new leaf entirely"—but the sequel proved otherwise.

He was taken East, and after a rigid examination, sentenced to one year's confinement in the Penitentiary, but was pardoned, and set at liberty before his time had expired.

Such persons steal once too often, and we can't help thinking that Curtis will take up quarters in a hotel with bars across the windows—to keep thieves from breaking in on him.

While you in the East are still having cold weather, we are enjoying nice summer weather. Flowers have been in bloom for three months; strawberries, etc., nearly ripe, and all kinds of "garden sass" in the markets for several weeks. "Dost thou like the picture?"

WEBFOOT.

Personals.

Mr. J. M. MOFFATT, the genial "Patsy," has returned from Plaistow Cove, Nova Scotia, after a stay of nearly two years, and is at present visiting his people in Scranton, Pa. He expects to go to Saratoga for the Western Union when the season opens.

Mr. GEORGE W. SAWYER, of No. 145 Broadway, New York, is at home in Lewiston, Me., taking on a fresh supply of health to meet the coming "spell of weather" in Gotham.

Mr. A. H. BABB, late of the Western Union at St. Louis, is stopping in New York now, having arrived recently. He will probably take a position here about the 1st of June.

Mr. RUSSELL RILEY, formerly of Baltimore, Md., but more recently of the Western Union at Philadelphia, has accepted a position with the A. & P. and Franklin Companies, at No. 198 Broadway, vice Mr. WEBSTER gone to Cincinnati.

Dr. FOWLER BRADNACK has accepted a position with the A. and P. and Franklin Companies, at No. 198 Broadway.

Mr. JOSEPH W. WOOD, late of the day force at No. 145 Broadway, has been promoted to fill the vacancy caused by the resignation of Mr. STEPHEN G. SAUNDERS, and which has been temporarily filled by that prince of good fellows and eminently able operator, Mr. L. E. WELLER. The latter named gentleman returns to the day force, to the sincerest regrets of the night force at his departure thence, and warmly welcomed back by his collaborators of the day.

Mr. CHARLES H. MIXER, of whose illness mention was made last week, is considerably improved, and there is now a fair prospect of his recovery.

Mr. S. W. KEELEY, formerly of the Northern Pacific R. R., at Brainerd, Minn., has accepted a position on the telegraph line of the Lake Superior and Mississippi Railroad, at St. Paul, Minn.

Mr. E. O. ELLIOT, of the Division Superintendent's office of the American District Telegraph Company, 516 Broadway, has been appointed manager of the Fifteenth District office of that Company, at 397 Broadway.

Mr. H. DOHERTY has been appointed manager of the First District office, 102 Broad street, of the American District Telegraph Company.

TELEGRAPH operators who "fritte gerse," are apt to look upon THE TELEGRAPHER as not adapted to their comprehension—and they are right.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Bound Copies of Volume IX for Sale.

WE have a few copies of Volume IX of THE TELEGRAPHER, handsomely bound, which may be obtained, if applied for soon, at Five Dollars per copy. The number of these is very small, and those who desire to get them must apply soon, or the opportunity will be lost, as, once disposed of, we cannot duplicate them—some numbers of that volume having been exhausted.

Congress, Inflation and the Telegraph.

BOTH Houses of Congress having adopted a resolution to adjourn on the twenty-second of June, it is not probable that the session will be prolonged beyond that day. There remains, therefore, only three weeks in which to complete the business actually necessary to be done before the adjournment. Both the Senate and House are laboring industriously to get all the necessary business transacted speedily, and the remaining time will give opportunity for the consideration of none but such matters as must be acted upon. The appropriation bills will occupy a good portion of the time, and these are now being progressed rapidly.

The country has escaped, through the wisdom of the President, a great misfortune through the defeat of the measures which, under a mistaken idea of the demands and necessities of the people, at one time seemed likely to be adopted, for an inflation of our irredeemable currency, and a still further postponement of the time when we shall be able to resume our position among the solvent and specie paying nations of the world. There has been a great change in public opinion in some sections of the country on this question since the President interposed his Constitutional prerogative for the protection of the public credit. Many of those, who before were inclined without much reflection to regard an inflation of the currency of the country as the panacea for the ills under which we are suffering, have been led by the wise and statesmanlike character of the message vetoing the currency act to examine the subject more carefully, and have come to the conclusion that their previous views were erroneous. We believe that the danger which threatened us in this respect has now passed, and the prospect is more encouraging for a gradual revival of business and enterprise. This will not probably be very marked until the latter part of the summer; but we entertain the

hope that the fall trade will inaugurate a new and more substantial season of prosperity.

The telegraph interests of the country have suffered with business interests—generally, and little can be expected in the way of extensions and additions to telegraph facilities until these revive. The reduction in the business of the telegraph lines has compelled a reduction of the number of operators and other employes, which has made it difficult for all who have hitherto found telegraphic employment to obtain situations. The effect upon the business of manufacturing and dealing in telegraph apparatus, material and supplies has been even more marked, and this department has not probably been in so depressed a condition for many years as it is at present. Besides the competition is very great, and the business is divided up as it has never been before. We expect to see an improvement in this, as in other branches of telegraph business in a few months, but there cannot be very much looked for in this respect before another season.

The early adjournment of Congress disposes finally of any probability of anything being done affecting materially telegraphic interests. What the *Springfield Republican* facetiously terms the GARDNER HUBBARD and WILLIAM ORTON debating society will stand adjourned until next winter, and as the next session of Congress is the short one, expiring by Constitutional limitation on the fourth of March next, there is little danger of any important action, in any event, until the meeting of the Forty-fourth Congress, a year from next December. The Government Telegraph advocates, as well as the currency inflationists, have come to grief, and in the case of the former, as well as the latter, we believe the great majority of the people will say heartily "So be it."

With the immense national resources of the country, and the generally intelligent and energetic character of the people, there can be but a temporary check and depression in the onward march to prosperity and wealth. Floods may come and conflagrations destroy, speculation and our trading may for a time partially paralyze industry and limit production; extravagance and an undue haste to become rich may injuriously affect the general prosperity, but we shall now, as heretofore, and at no distant day, overcome all these, repair the waste and loss, and with renewed and increased energy and vigor resume our former position as a people, the most prosperous, and possessing in a preëminent degree all the elements of advancement and wealth.

The telegraph, not only as it is but as it shall be, is one of the elements most conducive to national prosperity and advancement, and as such will fully participate in the advantages of the good time coming. That it is destined to still greater development, there can be no question. Let us wait patiently and labor earnestly and faithfully to hasten the time when telegraphs shall become remunerative to the investors in its capital, and to those who, from necessity or choice, live by engaging in its service.

Arrival of President Orton.

By the steamer Oceanic of the White Star Line, which sailed from Liverpool on the 14th and from Queenstown on the 15th inst., and arrived at this port Sunday evening, Mr. ORTON, President of the Western Union Telegraph Company, and wife, returned from their brief European tour.

We are pleased to learn that both Mr. and Mrs. ORTON have been very much benefited by their trip, and return home much improved in health. Mr. ORTON will, we understand, resume the executive management of the Western Union Company at an early day, which, since his departure, has been for the time under the administration of Mr. A. B. CORNELL as acting President.

Mr. ORTON has been cordially greeted by his numerous friends, who are much pleased to see him once more with them, and, with improved health and energy, prepared to again undertake the management of the

great telegraph company, which, under his able administration, has met with so marked advancement and success.

A Liberal Response.

THE firm of L. G. TILLOTSON & Co., respond to the present financial situation by making a reduction on all telegraph instruments, of their own manufacture, of twenty per cent. on their list of prices. This is a very liberal reduction, and is a new evidence of the enterprise and liberality of this firm. The financial depression and the competition in the manufacture and sale of telegraph instruments and apparatus have had their effect, and excellent articles in this line can now be had at much less than former prices. Competition, whatever may be its effect upon those engaged in the business, is beneficial to purchasers, and we have no doubt but that many will avail themselves of the opportunity now afforded to purchase telegraphic apparatus at even less than panic prices. Those who are likely to need such articles within the next year will do well to purchase now of the advertisers in THE TELEGRAPHER.

A Correction.

THE fourth paragraph of the communication published in THE TELEGRAPHER of last week, on "The Proposed Society of Electricians and Telegraph Engineers," over the signature of "HERMES," should read "privileges which a naturally gracious but much abused public would cheerfully grant," instead of "carefully grant" as printed.

An Error Corrected.

By a communication which appears in our correspondence columns from Mr. E. B. GRANT, Vice-President of the American District Telegraph Company, it appears that we were misinformed in regard to the ages of the major part of the messengers employed by that company, and that very few of them come within the ages prescribed in the law enforcing education of all children in this State under fourteen years of age. It appears from Mr. GRANT'S communication that the rule is to take none under fourteen or over sixteen years of age, which, of course, relieves that company from prospective difficulty in the matter.

The Telegraph.

The American District Telegraph.

THE patrol system, established by the American District Telegraph Company in the Fifteenth District, the office of which is at 397 Broadway, by which subscribers' stores are visited regularly every hour, is to be introduced in the Tenth and Nineteenth Districts, also, and patrol boxes are about to be placed in position in the latter districts.

The office of the Thirty-first District, formerly at 907 Broadway, has been removed to 946 Broadway—adjoining Dodd's Express.

The company have commenced canvassing for subscribers with a view to the establishment of the Thirty-sixth District, with headquarters at Sixty-fifth street and Third Avenue.

The Telegraph in Japan.

THE rapid progress which the Japanese are making is very forcibly shown in their telegraphic extensions. Mr. Thomas J. Larkin, who has been in that country for the last three years—having gone out there from England under an engagement with the Japanese Government, is the Superintendent of the Telegraphs. The metropolis, Tokio, is fully connected by telegraph at all the principal points, twelve stations having been opened in that city. The whole system is constructed on Siemens' iron poles. The lines have been extended about two hundred miles to the north, with a railway system in process of construction. The instruments principally used upon the Japanese lines are Siemens' Morse, worked by the polarized relay, Hawley's Morse (which is not a favorite), Breguet's dial instruments, and, for railway purposes, Siemens' needle instruments and blocks. Porcelain insulators are used, and made in the country, as also galvanized iron for the wires.

The work of construction is being pushed north of Yokohama to Hokodadi. The Japanese operators are

becoming quite expert manipulators, and bid fair to prove, in the future, good telegraphers. All of them understand more or less of the English language. The Japanese use the wires extensively, and the institution is likely to repay the government, which owns the lines, very well.

The New Atlantic Cable.

A PRESS despatch from Halifax, N. S., of the 27th inst., states that the steamship Faraday, with the new Atlantic telegraph cable on board, which sailed from England on the 17th inst., was expected off that coast in a few days. The cable is to be landed at Berry Head, Parr Bay, in Guysboro' county, 100 miles from Halifax. After landing the cable at Parr Bay the Faraday will proceed to Rye Beach, N. H. Mr. Oliphant, the representative of the United States Direct Cable Company, had arrived at Halifax.

The Postal Telegraph Schemes.

ON Wednesday last the Committee on Appropriations of the House of Representatives at Washington, heard Mr. G. P. Lowrey, the attorney of the Western Union Telegraph Company, who argued against the constitutionality of the Hubbard Bill. He also introduced statistics showing the extent of the Western Union lines, and facilities, and business, and the reduction in the charges made by that company since 1868, amounting to fifty per cent., against a similar reduction through the operation of the Government telegraph in England of twenty-six per cent.

Messrs. John K. Porter and George B. Prescott, the latter the electrician of the Western Union Company, were also present at the hearing. The argument was to be continued by these gentlemen on Friday.

Telegraphic Communication with Foreign Countries.

THE Committee on Foreign Affairs of the House of Representatives have agreed to report a bill relating to telegraphic communication between the United States and foreign countries. It is general in its character, and authorizes the Secretary of State to grant permission to lay cables to any citizen or association on the conditions stated in the bill.

Foreign Telegraphic Notes.

THE natives of South America have not realized the benefits of telegraphy, except for the purpose of forming the wires into spear points, and the porcelain insulators, after being broken, into tools for scraping their spear blades into shape. But their hostility to the advance of civilization is unfortunately not confined to simply pulling down wires and breaking insulators, but takes the more serious form of violent attacks on the stations, which, although constructed like forts, and well supplied with arms and ammunition, cannot prevent fatal results frequently occurring from these sudden and desperate irruptions.

On Saturday the cable steamship Hooper left Gravesend with cables of the Central American Telegraph Company, manufactured by Hooper's Telegraph Works, to be laid between Para, Cayenne, and Georgetown, Demerara. When laid, these cables will connect the united systems of the Plato-Brazileira, Western and Brazilian, and West India and Panama Telegraph Companies, and will complete the chain of electric communications between the River Plate and the United States. The total weight of the cables now shipped on board the Hooper is upwards of 3,900 tons, the greatest weight of telegraph submarine cable taken on board by any vessel at one time.

Owing to the bad weather, the connections of the Santos telegraph cable have not been completed, and the Gomos, which arrived on April 2, still remains at Rio with the rest of the cable of the Platino-Brazilian Company.

The communication with the West Indies through the cables of the West India and Panama Telegraph Company is stated to be effected with great rapidity, the lines being in perfect order. A message sent from Demerara on the 28th of April was received in London on the same day.

The Spanish end of the Direct Spanish Telegraph Company's cable having been removed from Bilbao to Santander, direct telegraphic communication with Spain by this route has been reopened.

Mr. Wollaston writes: "An experimental line was laid in August, 1850, and the first submarine cable was submerged in September, 1851, for the Submarine Telegraph Company, between Dover and Saugette, near Calais. The cable contained four conducting wires insulated with gutta percha, protected with hemp, and externally strengthened with galvanized wire. The cable was designed in 1850; the insulated

core manufactured by the Gutta Percha Company; the cable completed by Messrs. Newall & Co., at Wapping, for Mr. Thomas R. Crampton, as contractor with the company, to which I myself acted as engineer. It is satisfactory to know that experience has so fully confirmed the opinion held by the pioneers in submarine telegraphy as to the great qualities of gutta percha as a durable insulator.

The total traffic receipts of the Great Northern Telegraph for the month of April amounted to 354,815fr. (£14,192), and for April, 1873, to 241,251fr. (£9,650). The aggregate receipts from the 1st of January to the end of April amounted to 1,332,231fr. (£53,289), and for the corresponding period in 1873 to 855,688fr. (£34,227).

A telegram, dated 18th April, from Rio de Janeiro, with reference to the telegraphic cables of the River Plate and Brazil Telegraph Company, states that the first portion of the cable taken out by the steamer Ambassador had been successfully laid from Rio to Santos and Santa Catharina, and that the steamer had returned to Rio. The remaining portion taken out from England by the steamer Gomos was to leave on the 21st April, to be laid from Santa Catharina to Rio Grande do Sul, and thence to be joined to the cables to Montevideo, which have been already submerged.

The receipts of the Submarine Telegraph Company for the month of April, 1874, amount to £8,010 against £8,093 for the corresponding month of last year.

The traffic receipts of the Eastern Telegraph Company for the month of April last amounted to £30,766, and for the corresponding period in 1873 to £30,893.

All the Flources.

THERE could be no better illustration of the progressiveness of the age than is afforded every day in the routine of a telegraphist's duty. Time was, and I remember it sadly, when your provincial novice did not plume himself on his familiarity with the ways of city men. Content was he to have a bumy tig entering his meagre business, and in relaxing his mind ever and again by such enjoyment as the work of replenishing his local battery afforded. But that was far back in the azure tinted past, when bucolic he and pastoral she, if they essayed to master the mysteries of the art at all, took their business by a register like Christian people, made no harassing remarks, and were polite to that degree that they always said "O. D., thank you," whenever you sent them a message. Those were halcyon days, truly, but the world moves in more ways than one, and the methods of men and women change correspondingly. How often, alas! in the degenerate present are we awed into that indescribable frame of mind by the fantastic behavior of the modern beginner, which causes the fountains of speech to dry up precipitately and plunges us into that peculiar agouy which overcomes us, only when we are forced to leave the observations of another unresponded to. It is a phase in life's fitful fever involving the same principle entering into the story about the man who was driving up a long and steep hill with a load of potatoes. As he neared the summit the tail board of the cart came out and away went the thirty bushels of esculents in thirty different directions. "Did you swear?" inquired a sympathizer, to whom had been related the details of the mishap. "Swear!" replied the victim, "swear!" why I knew on the start I couldn't do the subject justice, so I jest held in." I have been led into this desultory, and I fear, not very entertaining train of thought, by a little episode happening just across the aisle, and within earshot, as I sat here dating some red blanks preparatory to the grand rush soon to commence. Fred. Catlin, of the Buffalo duplex, days, has agreed to work from 5:30 until 6 o'clock for a way man, and he sails airily down the room to the vicinity of a rather "rocky" railroad wire, with that beatific expression of countenance that fits so well the face of the perfect telegrapher, and which can no more be counterfeited by a base pretender than the look which obtains on the face of the man whose turn is next in a full barber shop to borrow a bit from the Danburian. Fred. scans the solitary message on the hook, devotes himself for a moment to the list of calls tacked up before him, and, having selected his man, he proceeds to raise him. The office responds promptly, when the following dialogue ensues:

Cat. (Scrutinizing the number sheet).—"I don't see your place down here; what is the next number, please?"
 Office.—"Your next number is 1."
 Cat.—"Thank you. No. 1 Now York 9th to —."
 Office.—"Please sqe."
 Cat. (Disgusted of course).—"I sign &."
 Office.—"Never heard you in here before. Where did they dig you out? That's a hot sig. Ha! Ha!"
 Cat.—"Pls take this: No. 1 New York 9th to —."
 Office.—"Look here, young fellow, is that message City or through?"—JOHN OAKUM, in "The Switch."

Berry and his Matchlock.

DORSEY BERRY, or "Dorsey," as he was universally known, was the victim of many little accidents, etc. During the war Dorsey worked in Memphis. One evening, with some of the boys, he visited the Washington Theatre (an Army Variety). Dorsey was feeling happy, having visited "Fred's," under the office, several times before starting. As the boys were finding seats, Dorsey, looking on the stage among the ballet, recognized an old acquaintance—a dancer who had travelled with the same troupe he had several years before (D. was formerly a burnt corkist). H-h-h-hel-l-l-lo, says Dorsey, t-t-th-th-there's the o-o-old g-g-gi-gi-r-l her-her-self, and away went D. upon the stage, and catching up La Belle M. began whirling her around the stage at a lively rate, in less time than it takes to tell it. But the sport was shortlived. Down went the curtain and out went Dorsey through the back window head first into the alley, about ten feet down, thrown by two lusty supes. Dorsey picked himself up and made for the office, which he entered, looking considerably shook up. Never a word to the wondering ops, but goes for a rusty musket in the corner of the room, where, with an old cartridge box, it had lain since the capture of Memphis. Dorsey commenced ramming cartridges down the musket one on the other, relieving the monotony of the operation by ejaculations as I-I-I'll w-w-warm th-the d-d-d-d galutes—I-I-I'll sc-sc-scatter t-t-the d-d-d-d gu-gu-guer-r-r-illies. After using up all the ammunition he went for a cap, but nary a cap to be found. The boys getting a drift of his design, which was to blow up that theatre, told him he'd better give it up, for 't was no go without a cap. N-n-not by a d-d-d sight, said Dorsey, I'll t-t-touch it off with a m-m-match.—The Switch.

Miscellanea.

THE MAGNETIC EQUIVALENT OF HEAT.—There has recently been devised, by M. Cazin, in France, a thermo-magnetic differential apparatus, by means of which, it is stated, the absolute quantity of heat engendered by magnetism may be measured; in other words, the magnetic equivalent of heat may by its aid be determined. The investigator, after observing the thermic effects of magnetism on the core of a rectilinear electro-magnet, around which the wire is rolled in alternately opposite directions, so as to produce several poles, enunciates the following law: "When the alternate spirals, constructed by the wire have the same dimensions, and when they divide the magnet into several equal portions (*concomérations*), the quantities of heat created in the iron core at the opening of the voltaic circuit are inversely proportional to the squares of the number of divisions, the other circumstances not changing." For example, four similar bobbins are disposed around a cylindrical iron tube at equal distances apart, the tube extending a short length beyond the outer coils. In establishing the communications there is obtained, with the same total length of wire and the same total number of points, one, two, or four divisions. The quantities of heat decrease as the numbers $\frac{1}{4}$, $\frac{1}{9}$.

In order to measure this heat M. Cazin has constructed a kind of differential air thermometer, in which air reservoirs are used. Two or three thousand interruptions of the electric current produce, with an ordinary battery, a calorific effect very plainly measurable. By dividing the pressure observed by the number of interruptions, and making a small correction analogous to that employed in calorimetry in taking account of the cooling action of adjacent bodies, the thermic effect of the magnetism is obtained.

A Telegraphic Reminiscence.

It was in war times and during the palmiest days of "Old Ned Raymond" that the following incident occurred. The lines had been down for two days, between "Cn" and "Ku," two of the most thriving cities in the South. There was a man at "Cn" called "Shorty" for short, who was considered to be as "fast" as any in those parts.

Near the close of the second day, as everybody was awaiting further developments, the line suddenly closed, and appeared to be O. K. Ned, being seated at that table, turned up the string a little, and, to his joy, heard "Shorty" after him. Without making preparation he answered "I I Ku," and "Shorty," who was not much on the talk, when he had "biz" on hand, laconically said, "Hrs a cart load of stuff for you, 77?" Ned replied, just as laconically, "I I, let her come and cut it down close." "Shorty" started in on some "Local" he said was old enough to walk; and when he wound up with some Northern press, just at 11 P. M., and said "It's all—ur, no hair pin," Old Ned was just the Northern press and 7 "cities" behind. He gave O. K., saying "I'm a little stiff to-night—ought to see me when I'm in trin," and wrote it all out. Talk about copper-plato! The letters wore made so perpendicular you could lean on them without falling.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: MAY., WESTERN UNION, ATL. AND PAC., AMER. DIST. and rows of stock prices.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ended May 5, 1874, and bearing that date.

150,513.—TELEGRAPHIC FIRE ALARM BOX.—John Beamer and William A. Jackson, Detroit, Mich. Application filed November 3, 1873.

Studs on endless band vibrate key lever for giving signals.

In fire alarm telegraph signal boxes the detachable endless chain N, with groups of studs n, in combination with the wheels O and O', substantially as described and shown.

150,553.—ELECTRO-MAGNETIC HOTEL REGISTER.—Louis Finger, Boston, Mass. Application filed April 5, 1874.

1. The tilting or swinging arms, or armature B, with its sign a', in combination with the electro-magnet G and the stops d and f, or their equivalents, substantially as and for purposes stated.

2. The rod or shipper C, or its equivalent, in combination with the tilting arm or armature B and sign a' and stops d and f, substantially as and for purposes stated.

3. In combination, the magnet G, armature B, stops d f, and shipper C, substantially as and for the purposes stated.

4. The soft iron lever or armature, pivoted in front of an electro-magnet, and so adjusted with relation thereto that, when the circuit is closed, the said lever will first, by attraction of the magnet, be tilted on its axis or pivot to one side of the perpendicular to such an extent that it will then, by its own weight and momentum, be caused to continue said movement and fall beyond the attracting power of the magnet, substantially as shown and set forth.

150,566.—THERMOSTAT AND THERMOSTATIC ALARM.—John H. Guest, Brooklyn, N. Y. Application filed March 14, 1874.

Thermostat bar or tube of one material, acting by lineal instead of differential expansion. Uses rubber for such bar.

1. A thermostat having its expansible or heat indicating portion, or a part thereof, made of rubber or other non-metallic solid, substantially as set forth.

2. A thermostat having its expansible or heat indicating part made of a bar or tube, acting directly by lineal expansion on the alarm or indicating apparatus, substantially as set forth.

3. The combination of a thermostat, having its expansible or heat indicating portion, or part thereof, made of rubber or other non-metallic solid with an electrical circuit, substantially as set forth.

4. The combination of a thermostat having its expansible portion, or part thereof, made of rubber or other non-metallic solid, with devices indicating the temperature, substantially as set forth.

5. The combination, with a detent or circuit controlling device, of a thermostat composed of a bar or tube of one homogeneous metal, acting directly thereon by lineal expansion, substantially as set forth.

WILLIAM BROWNLEE, Dealer in CEDAR TELEGRAPH POLES. OFFICE FOOT OF LIBERTY STREET, DETROIT, MICHIGAN.

THE BEST TELEGRAPH MATERIAL IN THE WORLD AT THE LOWEST PRICES!

The prices on our Catalogue are very low, but we are offering 20 per cent. discount from them on all Telegraph Instruments of our manufacture.

L. G. TILLOTSON & CO., 8 DEY ST., N. Y.

THE AMATEUR TELEGRAPHIC INSTRUMENT.

This instrument is in some respects similar to the "SNAPPER SOUNDER," but differs from that device very materially in the matter of form, finish and CONSEQUENT DURABILITY.

The "AMATEUR SOUNDER" will be sent for 25 cents. " " with hard rubber knobs, 75 cts.

A liberal discount to the trade. Address, G. A. WESTMAN, 544 Nostrand Avenue, BROOKLYN, N. Y.

THE "SNAPPER" SOUNDER.

SPECIAL NOTICE.

All orders dated on and after June 1st will be filled with the new style, polished, "Snapper," at the original price of 30 cents, or 6 for \$1.50.

A few of the old style will be closed out at 25 cts, or 6 for \$1.25. R. W. POPE, P. O. Box 5278, New York. New York, May 30, 1874.

THE "SNAPPER" SOUNDER.

NEW STYLES, NEW PRICES.

The unexpected and growing demand for the original "Snapper" Sounder, beyond the expectations of the manufacturers, has delayed the introduction of proposed styles and improvements.

Having increased our facilities and accumulated sufficient stock to enable us to fill orders promptly, the following varieties are now offered for sale at prices which will accommodate all classes.

The "Snapper" Sounder, plain.....30c. 6 for \$1.50. " " " nickel plated spring... 0.40. or 6 for..... 1.80.

A few were manufactured to order with hard rubber knobs. They were so well liked that I have decided to introduce them to the fraternity. The springs are secured by two screws, and, should they break, may be replaced at an expense of 15 cents. They are thoroughly made and finished.

PRICE, 75 CENTS.

To the Dominion 5 cents each extra.

A liberal discount to agents.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenroek, Franklin, Canton, Dalihard, Watsou, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Oersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacohy and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinhell, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil. Will not jar open. Slight pressure of the finger required to put lever in circuit or cut out.

Acknowledged to be a decided improvement. Price, same as the ordinary key. Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,

BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,

at the same prices offered by other establishments. Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the EAGLES METALLIC BATTERY, now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

QUICK SALES, SMALL PROFITS AND SUPERIOR GOODS.

We are offering any of our unequalled Telegraph Instruments at 20 per cent. discount from list prices.

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
 CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
 E. HOWARD, & CO., Proprietors.

DR. L. BRADLEY,
 No. 9 Exchange Place,
 JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS
 FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
 Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES
 WHICH ARE OF
 Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

RETRENCHMENT BEING THE ORDER OF THE DAY,

we will contribute to the good work, by offering our Superior Telegraph Instruments at 20 per cent. below list prices. Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 9 Dey Street, N. Y.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR,** without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION, and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY, or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

RUSSELLS' AMERICAN
 STEAM PRINTING HOUSE,

17, 19, 21, 23 ROSE STREET, near FRANKFORT,
 NEW YORK,

EXECUTES ALL DESCRIPTIONS OF

BOOK, JOB AND COMMERCIAL PRINTING.

TELEGRAPH PRINTING A SPECIALTY.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
 Instrument with Office Outfit..... 7 50

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.

No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A HAND-BOOK

FOR

ELECTRICIANS AND OPERATORS.

By FRANK L. POPE.

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

—♦—

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,

AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

Bad Medicine.

THOSE good old times when mischievous members of the fraternity amused themselves by sending "specials" from ostensibly distant points to their fellow operators in the same office, or worried some credulous brother by sending to him on the local from the battery room, and continued to send despite the desperate efforts of the receiver to break—those happy days have flown forever. Your modern man of the key has long since "tumbled." There is no game to be got out of him, as a general thing, and the oft repeated attempts to "guy" him "mit ter pack schtroke," or otherwise, in nearly every case end in bringing confusion on the perpetrator of the fraud. Many and ingenious are the jobs put up at the expense of novices and the absent minded and unsuspecting "old 'uns," but the only one of which I have knowledge, that has been carried out with much show of success, is embodied in the sending of a bogus message having a wrong check, so worded that when the sender, commencing at the period, gives the letters, some indecorous phrase is spelled out, much to the astonishment and chagrin of the receiver, and which enables him to see the joke instantly.

To illustrate this, for the benefit of those who have never been victimized, let me relate that, stepping into a Jew store on Chatham street, a while ago, I bought the grandest looking vest I ever saw for a dollar. The circumcised villain measured me, and, referring to sundry tags sewed on to the garment at divers points, assured me that it was made for his brother-in-law in Paris, and would "fit me like the baper on the wall." In the trusting innocence of my heart I bought the waistcoat, and so great is my faith in human nature that I didn't try it on until I reached home. Well, you ought to have seen it. Like the fiddle in Handy Andy's conundrum, "it was the shape of a turkey and the size of a goose," and it fitted me about as well as a soldier's overcoat would fit a harberry bush. The Israelite in attendance told me, when I called for satisfaction, that his brother "was died" last night. He alluded to the individual of whom I made the purchase, and I deeply sympathized with him in his bereavement, and went home in quite low spirits. With womanly shrewdness my wife harnessed the vest one day, and, taking enough out of the back to make young Oakum two suits of home clothes, she returned it to me, saying she hoped I could make it go now, and get my money's worth out of it at least. So, after that, when I was unusually courageous, or got on a fit of despondency, and wanted all Broadway to think I was a mountebank retired to private life, or a three card monte man revelling in the gay metropolis prior to his departure to Coney Island for the season, I lost myself in that gorgeous garment and groped over to the office. To say that my appearance elicited frequent and painful remark from the operators about me would be but to faintly hint at the shower of slurs and innuendoes which my appearance, in connection with that vest, always provoked. It was on one of these occasions that I received the following message, sandwiched in between a half rate and a special, and checked about seven words out of the way:

"When it left last year on upper end, very early reached. Smith has often ordered the things. He also thought very early, said this."

The sender insisted there were thirty-one words, and, according to custom, went ahead period, when I found myself questioned as follows:

"Will you ever shoot that vest?"

By what means the interrogator, many miles distant, came to know of my magnificent article of apparel I leave to others to explain. Suffice it, that at this writing the cause of my tribulation forms an important feature in a rag carpet adorning my mother-in-law's back parlor. I am teaching all the vagabond boys in my neighborhood now to go down in front of that Chatham street store and cry, "I sell sheep." Not that it does those precious Jews any harm, but it amuses the boys. I have no conscientious qualms about this either; for, while it may be regarded as a pernicious habit, it has been productive of good results—

my especial favorite, who "was died" last night, having been resuscitated to an extent enabling him to bound over the counter and get out on to the teeming thoroughfare in precisely seven seconds—which isn't slow for a dweller in that shady bourne from which no traveller returns. But, after all, the sending of those messages is no evidence of smartness. As long as they are sent to other people I enjoy them; but, somehow, I never could see the application of such things when my own dignity is involved.

Now on the cable lines they have a much better way of making their little points; and it is really refreshing to note the way they do "fool" their best friends, and it is intensely funny, moreover, to observe how mad their best friends get about it. A few evenings since an attempt was made to send the appended message to Plaister Cove:

"Nicodemus 42 1/2 sibolet h wayland
eezezeceous oxford Tyndall lowgrade
ziphocerionosophy cantab receicacerous
licoriceroot evenciyelt veyonyi
sampon outmass sympathy lacking
hevenswotafule every thing wrong in taking
advantage our good nature rubblind
sigglecicelyt ciceroneous verniedrimggesillschraft
48529 odontucityet tumblefuvercan—"

How would you like to struggle with that? Of course you wouldn't; no more did the brave Bostonian now working in Plaister Cove. He broke and broke; then he called for Cottrell, saying, "Cot can send those words to me so I can get 'em." But when it was attempted he got wilder than before. It wasn't intended that he should "get it," and he didn't. After half an hour's trying there was an exchange of compliments, and the two offices became intensely personal in their expressions of regard. "Gs" finally said "he would send the message to Duxbury on the other wire, and report the matter at headquarters." Plaister Cove said "Gs" could report and he hanged. It might lose him his situation, but there was no help for it; he might guess at these words until Greenland froze over (it strikes me he said Greenland), and he couldn't get them then unless they were spaced better." The matter ended there for the night, but next day "Gs" relieved the anxiety of the Plaister Cove man (who expected, every time he heard the cable room call, that his discharge was coming) by letting him into the joke, and assuaging his grief at the trick which had been played on him, by saying: "Never mind, Jack, we will come it on Duxbury to-night, and you may help us." It is a great relief to feel that some one is going to be victimized as badly as we have been—that is, human nature the world over—and so Jack came to think it was a pretty good joke after all, particularly as he was to assist at the coming slaughter.

The next night Boston was asked to put Duxbury and Plaister Cove on the same wire, as he is often asked to do nights, to facilitate the handling of business by "Gs." The message given above was addressed to a well known house in Havre, and Leslie proceeded to give it to Duxbury at a moderate rate of speed, and with apparently the greatest care, but in reality mixing up the spaced letters in a manner fearfully artistic and puzzling. The Duxbury man "weakened" perceptibly. No one but those who "took it in" can imagine the degree of merriment the task of transmission elicited. It was never finished, and the upshot of the attempts in that direction was that the victim became as wild as his brother in Plaister Cove had been the night before, compliments and words of fraternal affection being in order, as usual. And if he was indignant before, fancy his boiling wrath when told that the Duxbury men were a set of old grandmothers any way, and that no trouble was ever experienced in getting business to Plaister Cove—to prove which the tormentor called the latter office and sent the message to Jack at the highest rate of speed attainable. The key had hardly closed when "O. K. F." came back sharp and clear, and "Gs" was happy. But the feelings of that Duxbury man, who had hitherto hugged the flattering unctious to his soul that he could take anything in the way of dots and dashes that mortal man can take (and he can, too, no doubt), I shall not attempt to describe. He has never "dropped," and never will until he sees this, I presume, and then—

"Angels and ministers of grace defend us!"

I suspect his wrath towards "Gs" will vanish like the fabric of a dream in the presence of his devouring wish to punch the head of the chronicler of this episode.

JOHN OAKUM.

THE position of Superintendent-in-Chief of the Government telegraphs in Japan has been offered to and accepted by Mr Edward Gilbert, telegraph engineer and Superintendent of the North British Railway. Mr Gilbert, who has been engaged in the telegraph service of the Electric and International Company, the Caledonian Railway and the North British Railway, for a period of twenty-seven years, will, it is understood, leave England for Japan, shortly to assume the duties of his office.

[From the Journal of the Society of Telegraph Engineers.]

On some Points in Connection with the Indian Telegraphs.

BY W. E. AYRTON.

THIS paper is not intended to be at all a complete account of the Indian Telegraph, for to enter at length into the details of this or any other telegraphic administration would require a book rather than a single paper. I have, therefore, only ventured to select one or two points that I thought might be of general interest.

It may be stated, in commencement, that throughout the greater portions of India there exist two distinct lines of telegraph—one in possession of Government, the other in the hands of the various railway companies. These two sets of lines are almost entirely distinct, being under separate management and worked by different sets of employes. The rules, however, relating to tariffs and the reception of messages are the same for both systems, and a message may be conveyed partly over the Government and partly over the railway lines at a single cost to the sender. With this sole exception the two sets of lines differ so widely that I wish it to be understood that anything I say hereafter refers only to the Government, and not to the railway telegraphs.

The application of the laws of electricity to the practical purposes of testing, and to the determination of the best form of instruments and the most suitable arrangement of batteries, having been somewhat developed in India, I have entered somewhat at length into this subject. Many other branches, however, equally important, I have been compelled to leave untouched.

Testing of Lines.

Regular testing of the lines was first introduced into India about the year 1868, and since that time the advantage of executing these tests has been more and more fully appreciated. Every important line is now tested two or three times a week, in the following manner:

With a Wheatstone's bridge or a differential galvanometer observations are made, with both positive and negative currents, of the resistance of the line under the three following conditions:

- 1st. When put to earth through the relay at the distant end.
2d. When put direct to earth (that is, relay short circuited).
3d. When insulated at the distant end.

From the six values thus obtained the following are calculated by equations,* suited to the form of testing instrument employed:

- 1st. The electro-motive force of the natural line current in terms of that of the testing battery, usually 40 cells.
2d. What the apparent wire resistance (A) of the line, including the relay at the other end, would be were there no natural line current.
3d. What the apparent wire resistance (B) of the line, exclusive of the relay at the other end, would be on the same supposition.
4th. What the apparent insulation resistance (C) would be also, on the same supposition. The object of determining (A) at all will be seen hereafter.

If the natural line current be large, so that there is a considerable difference between the observed values obtained with the positive and negative currents, then the real values differ much from the arithmetical mean of the observed values.

The equations from which (A), (B) and (C) are calculated are determined on the supposition that the difference between the positive and negative readings is due to a natural current, uniform throughout the whole line. This is, of course, frequently not the case, as

* N1 - P1 / (P1 + N1 + 1) E

= (N2 - P2) / (P2 + N2 + 1) E also

A = (m1 / l1) * (h(P1 + N1) + 2 P1 N1) / (P1 + N1 + 2 P1)

B = (m2 / l2) * (P2^2 + N2 + 2 P2 N2) / (P2 + N2 + 2 P2)

C = (m3 / l3) * (P3 + N3) / 2

where e is the electro-motive force of the natural line current (earth current), E that of the testing battery; P1, N1; P2, N2; P3, N3 the values obtained with positive and negative currents respectively in the three tests, and l1, m1; l2, m2; l3, m3, the three sets of branch resistances l1, l2, l3 being opposite in the bridge to the unknown resistances.

As the difference between the positive and negative values in the insulation test is frequently due more to chemical action than to a natural current, the arithmetical mean of the two readings obtained, when each current is kept on for the same time, gives, perhaps, the best approximation to the true value.

when, for instance, the natural current flows towards each end of the line, from about the centre, the connection between the line at that point and the earth being formed by dirt or moisture accumulated on the insulators. In such a case, however, it is extremely difficult to ascertain the distribution of the natural potential at different points of the line, and, in addition, the equations for determining the true means from the positive and negative readings, become much more complicated and unsuited for practical use.

The next point to consider is that if the line be long or badly insulated, then (A), (B) and (C) will not represent respectively the real values of the resistance of the line, including the relay, and of the insulation, because in each case a complicated circuit has been tested, consisting partly of wire and partly of insulation resistance. In fact, on such a line (A), (B) and (C) are often very nearly equal to each other, (A) and (B) being less and (C) greater than the true value. For determining (W) and (I) the real values of the resistance of the wire and of the insulators independently of one another, the following two equations are used:

$$W = 2(C - \sqrt{C^2 - B})$$

$$I = \sqrt{C(C - B)}$$

—which are calculated on the supposition that the resultant fault is electrically in the centre of the line, by which I mean on the supposition that the real wire resistance of the line is the same from each end up to the point at which a single leakage could be substituted for all the different leakages without altering the electrical condition of the line. This, of course, is not always the case—for instance, when one end of the line is worse insulated than the other. The same equations for determining from (B) and (C) the real values (W) and (I) are, however, for simplicity always used, and their accuracy in any particular case tested as follows: If the resultant fault be really at the electrical centre of the line, and consequently (W) and (I) be the true values, then the resistance of the relay at the other end should—as could easily be shown—be given by the fraction.

$$\frac{C(A + B)}{C - A}$$

What this resistance actually is can be ascertained by inquiry, for the resistance of every relay in use in India is stamped upon the instrument. If it be found that this fraction gives a value ^{larger} than the true resistance of the relay, then it is known, as may be easily proved by a simple calculation, that the resultant fault is ^{farther from} the testing station than the distant station, and also that the equations used for determining (W) and (I) have given values somewhat ^{larger} than the real wire and insulation resistance. In this way the position of the resultant fault is roughly determined, from which we know the relative insulation of the two halves of the line; and in the case where the resultant fault is about at the electrical centre of the line, then the real wire resistance, and the real resistance of the insulators, quite independent of one another and of all natural line currents, are also found, no matter how badly the line be insulated, nor how strong the natural line currents be, provided they be only constant during each pair of tests. In the case where the resultant fault is not at the electrical centre of the line, then values differing somewhat from the real wire resistance, and the real resistance of the insulators, are determined; but whether they are larger or smaller than the true values is also known.

As an example of the importance of their consideration, I will take the following:

Let the line under test be 500 miles long, and let the relay at the distant end be known to have a resistance of 2000 ohms.

Let A = 3884.6.
 " B = 3611.
 " C = 4500.

Now, if these were taken as the real values, without any correction being applied, we should say that the wire resistance per mile was $\frac{3611}{500} = 7.22$ ohms, and that the insulation per mile was $\frac{3884.6}{500} \times 4500 =$ about 2.2 megohms.

Now from the two equations (1) and (2) we have

$$W = 2(4500 - \sqrt{4500 \times 889}) = 5000.$$

$$I = \sqrt{4500 \times 889} = 2000.$$

$$\text{And } \frac{C(A - B)}{C - A} = 2000, \text{ about.}$$

We know, therefore, that the resultant fault is at the centre of the line, or that the leakages in the two halves of the line are similarly distributed with reference to the centre; consequently the values of (W) and (I) given by equations (1) and (2) are correct. The real wire resistance per mile is therefore $\frac{5000}{500}$, or 10 ohms, and the real insulation per mile $\frac{2000}{500} \times 4500$, or 1 megohm. The values, therefore, obtained for these without applying the correction are respectively 40 per cent. too small and 54 per cent. too large.

In all cases, of course, the exact position of the re-

sultant fault, whether it be at the electrical centre of the line or not, could be determined, and afterwards the true values of the wire and insulation resistance; the exact calculation, however, becomes exceedingly complicated, except when the resultant fault is at the electrical centre of the line.

It is of course very difficult to localize faults accurately upon a line on which the normal absolute insulation is not much greater than the absolute wire resistance, since the worse insulated a line is in its usual state the more difficult it is to localize any extra leakage.

Theoretically correct results can be obtained for "earth faults" by the use of the "centre of gravity" method. To do this, however, it is necessary to know what would be the magnitude and position of the resultant fault, supposing the extra fault, the position of which it is attempted to localize, did not exist. Now, in practice it is almost impossible to ascertain this, since the magnitude of the resultant fault, which is the absolute insulation of the line, varies perpetually during the day and night, even when the line is in good order, and it is almost impossible to predict accurately what it would be at any particular time. A simple correction, however, can be applied to the results obtained by the ordinary tests for "earth faults" and contacts, if it be remembered that the effect of the general leakage of the line is to make the fault apparently farther from the testing station than it really is, if it be in the near half of the line, and nearer to the testing station than it really is if it be in the distant half of the line. Taking into account this consideration, faults are usually localized in India to within one or two per cent. of their real distances. A great deal, of course, depends upon the individual skill and judgment of the tester.

Method of Making the Tests.

The routine for testing is as follows: The testing station commences by calling the nearest station in circuit on the line to be tested, until this station replies and signs. The testing station next signals the word "Testing." The operator at the distant instrument upon receipt of this at once calls the telegraph master (office manager), who gives his initials and takes charge of the instrument himself until the testing is completed. The testing station now signals "Circuit," on which the telegraph master leaves the instrument and line alone until he hears his station called again by the testing station. After the word "Circuit" has been signalled the resistance of the line, including the relay at the other end, is found. Next, the testing station signals "Conductor—minutes;" to which the telegraph master replies with the temperature (dry and wet bulb) at his office, and at once puts the line direct to earth, short-circuiting the relay for the specified time. The resistance of the line excluding the relay is then found. The testing station next signals "Insulation—minutes;" to which the telegraph master replies with the state of the weather and at once insulates the line for the length of time specified. No conversation of any kind, beyond the above, is allowed, unless, of course, the testing station asks some particular question. By following out this routine rigidly the tests are performed with certainty and despatch. When it is required to test a line beyond an office usually in circuit, this office receives orders, "Testing; join a certain line—minutes;" in accordance with which that office short-circuits its galvanoscope, etc., and joins over the particular line for the length of time specified, exactly as if that line did not come into the office at all.

In the case of faults, to determine the position of which I may mention tests are always made at once, day or night; the testing station signals its orders as insulation, conductor, loop, &c., in the ordinary way, provided that communication on all wires in the faulty section be not interrupted. When, however, a post, for instance, has been blown down and all the wires have been tumbled into water so that it is impossible to communicate on any line, then, at the commencement of the next hour (Madras time), three or four o'clock, or whatever it may be after the fault has occurred, the office at the end of the interrupted section insulates all lines from the hour to fifteen minutes past the hour; then puts them to earth through the relay for fifteen minutes, then puts them to earth for the third fifteen minutes; and, for the last fifteen minutes of the hour, loops the wires in pairs, previously settled in printed instructions supplied to each office. This routine is repeated every hour until communication is restored. In this way the testing station knows at any moment exactly what is being done with the ends of the lines at the next office beyond the interruption, and so is frequently able to localize faults, although communication on all lines has been stopped.

After the fault has been localized a telegram is sent, if possible, to the office nearest to the fault, telling them where to send a man and what sort of a fault to look for. In this way one man going from the nearest office is able to remove the cause of the interruption, whereas before the introduction of systematic testing in India, two men travelled along the line, one from each

of the stations at the end of the interrupted section, until one or the other found the fault. These men could not travel at night for fear of passing the interruption, whereas now they may start at once and travel by the most expeditious means up to the spot at which the testing shows the fault to be. Thus interruptions are not only removed at less expense, but, in addition, in a much shorter time than formerly.

I may mention that, where faults have occurred during the night not many miles from the testing station, and on lines whose normal insulation was good, I have, on a few occasions, by localizing the position of the faults very carefully, succeeded in having them removed during the night by men sent out with lanterns, so that scarcely any interruption whatever to the traffic has been caused.

All tests, ordinary and fault, are carefully worked out and tabulated at each testing station, and reports are sent weekly to the office of the Electrical Superintendent in Calcutta for recalculation and combination in bi-yearly reports for submission to the Director General. In this way the electrical history of each line is carefully recorded, from which the relative qualities of the different lines are derived, so that the best lines can be portioined out for working direct the longest distances.

(To be continued.)

No notice will be taken of anonymous communications.

Congress and the Telegraph.

WASHINGTON, D. C., June 3.

TO THE EDITOR OF THE TELEGRAPHER.

LESS than three weeks of the present session of Congress remains, and both houses are working industriously to get through with the business which is absolutely necessary to be done before the adjournment.

As there is scarcely a probability that any action will be taken on telegraphic matters during the brief time remaining, any information under the familiar heading of my communications can scarcely be expected to prove of engrossing interest. Still it is necessary that the record should be as complete as possible for future reference, and that we may know hereafter where to pick up the thread of events.

The House Committee on Foreign Affairs have agreed to report a bill relating to telegraphic communications between the United States and foreign countries, general in its character, and under its provisions the Secretary of State is authorized to grant permission to lay cables to any citizen or association upon the conditions prescribed. Similar bills have been presented and reported heretofore, and one or two have passed either the House or Senate, but have ultimately failed to become laws. It is not likely that any definite action can be had on this new bill at this session. It will be reported and go over with the unfinished business.

There was on Wednesday of last week another session of the "Wm. Orton and Gardner Hubbard Debating Society"—this time before the House Committee on Appropriations. The Western Union Company was represented by their counsel, Messrs. Lowrey and Porter, of New York, and Mr. Geo. B. Prescott, their electrician was on hand with the usual amount of statistical information. Mr. Hubbard was also present, but he had had his say previously, and therefore did not attempt to enlighten or begot the Committee.

Mr. Lowrey addressed the Committee at some length, arguing in the first place that the scheme of Mr. Hubbard is unconstitutional. This was rather a new point to the latter, and did not seem to strike him favorably. Mr. Lowrey proceeded to introduce statistics, prepared by Mr. Prescott, which may be of sufficient interest to present to the readers of THE TELEGRAPHER, showing that the Western Union Company operates more miles of telegraph line than all Switzerland, Sweden, Holland, Belgium, Hungary, Spain, Bavaria, Denmark, Norway, Portugal, Greece, Wurttemberg, and Great Britain combined. It operates more miles of telegraph, and annually transmits more messages than all Germany, Spain, Hungary and Russia, notwithstanding the fact that these countries have nearly the same area of territory, and nearly four times the population of the United States. Europe has a population of 300,000,000, and sends annually 50,000,000 messages, being one message to six persons. The United States have 40,000,000 inhabitants, and the Western Union Company alone sends 15,000,000 messages, being one message to two and a half persons. In 1866 England had 80,466 miles of telegraph wire, and, in 1873, 103,402 miles, being an increase of 22,936, or 28 per cent. In 1866 the Western Union Company had 75,686 miles of telegraph wire, and in 1873 173,517, being an increase of 97,831, or 120 per cent. In 1866

England had 2,151 telegraph offices, and in 1873 5,474 do., being an increase of 3,323, or 154 per cent. In 1866 the Western Union Company had 2,250 offices, and in 1873 5,955, being an increase of 3,705, or 164 per cent. In 1867 England transmitted 7,500,000 messages, and in 1872 14,858,000, being an increase of 7,358,000, or 98 per cent. In 1868 the Western Union Company sent 5,733,394 messages, and in 1873 13,362,832, being an increase of 7,629,438 messages, or 133 per cent.

In 1868 the average toll upon the English lines was 38 cents per message. In 1874 the average toll is 28, being a reduction of ten cents per message, or 26 per cent. In 1868 the average toll upon the Western Union lines was \$1.10 per message, and in 1874, 55 cents, being a reduction of 55 cents per message, or 50 per cent.

Another hearing was to have taken place on Friday, but the committee came to the conclusion that the pressure of business upon them was too great to admit of their devoting any more time to the subject at this session: and so notified the parties, but adding, that any briefs that might be submitted would be carefully considered.

Judge Porter was to have addressed the committee on Friday on behalf of the Western Union Company: and there is room to believe that it was fortunate for Mr. Hubbard that the matter went over, as he would have been likely to have suffered somewhat severely had the Judge an opportunity to take him in hand.

This ends the farce for the present session, and it is to be regretted that it is in the power of any person to renew and revive it another session. It is conceded on all hands that neither Mr. Hubbard's mongrel scheme, nor a Government Telegraph proper, stands any chance; and it is under the circumstances unjustifiable that the telegraph interests of the country should be put to constant trouble and expense to defend themselves against the selfish attacks of any man or set of men.

In order to make his continued residence in Washington profitable, Mr. Hubbard is engaged in various lobby schemes, notably that of the several Bank Note Engraving Companies in their contest with the Treasury Department for the printing of the currency, which, under existing laws, has been transferred to the Department.

CAPITOL.

A Slow Telegraph Repair Steamer.

NEW YORK, May 25.

TO THE EDITOR OF THE TELEGRAPHER.

THERE is always something fascinating for a landsman about the ocean, particularly when there is a wind sufficient to bring in the white capped waves. I had the good fortune, recently, to take a short excursion down the Bay, on the repair steamer William Orton, belonging to the Western Union Telegraph Company. The trip was one of business, of course, but I was fortunate enough to secure a passage; and, for one who is confined within four brick walls, week in and week out, such an opportunity was not to be neglected.

Well, we cast off from the splendid new stone pier, belonging to the Government, at the Battery, about nine o'clock in the morning. The weather was fine, and we took but little heed of time or surrounding objects. The fresh salt breeze was all that we could desire. We started out in company with the Staten Island ferry boat, and we had no idea but what the Orton would walk over the course and distance the ferry boat without the least trouble. As I said before, we paid but little heed to surrounding objects; the "bating breezes" was all that we could enjoy. After about an hour's sail a ferry boat crossed our bow, bound to New York, and, upon further investigation, we found it to be the same boat which left the dock with us. She had made her trip to Staten Island and was on her return, and we were not yet at the first landing. The feeling of perfect satisfaction now changed to one of disappointment. We had before us yet a long voyage, and every tow boat, ferry boat, and even sailing vessels, passed us, and the feeling came over us that we were being laughed at by all those we met or those who passed us. We wanted something more than the invigorating sea breeze to cheer up our drooping spirits; but we had no alternative but to stand by our ship.

In due course of time we made the Narrows. High 12 was fast approaching. The Orton not being expected to make long voyages, her larder was not supplied with anything like the prodigality of a Cunard or White Star steamer. Dix Island was the objective point, and we were now through the Narrows, with a strong S. E. breeze, and a pretty good sea was setting in. Our pilot was supposed to know all the intricate windings and turnings of the various channels, and that we would soon be at our destined haven. We were making a bee line for the island, when all at once we felt a tremendous thump. Ding-dong went the bell, and thump we went again on the shoal. After a long time we succeeded in backing off, and, by a circuitous route, finally reached the island, with appetites ravenous. Mr. Brown, manager from the main office of the Western Union Telegraph Company,

145 Broadway, made tests of the cable connecting Dix Island with Staten Island, which was the object of the expedition. Mr. Roach, in the mean time, had secured a loaf of bread and some cheese, and, when fairly on board the Orton, the viands were spread on the top of a barrel, and the way we poor, half famished mortals laid to would have been a caution to a boarding house keeper, provided we were to be judged by the manner in which we made way with the bread and cheese. It was really a "feast for the gods."

After our appetites were appeased, the next important question was, at what time should we reach New York? Some of the party had engagements at five o'clock. We reached the Narrows at three o'clock. The Orton was doing her best, but, the tide being against us, we could make but little headway. It was finally agreed that we should stop at Quarantine, so that those who choose could take the four o'clock ferry boat. The Orton made her dock at about six o'clock, and a happier set of fellows was never seen than we were when again on terra firma.

The Orton is a good boat, and well adapted for the use for which she was intended, i. e., laying and repairing telegraph cables; but it was, no doubt, a great error in not putting into her a twenty inch cylinder instead of the fourteen inch one with which she is provided, then she would have power and a good rate of speed.

LANDSMAN.

A Defence of Tobacco and Tobacco Smoking Telegraphers.

TO THE EDITOR OF THE TELEGRAPHER.

"Tobac ist mein leben,
Tobac ist mein lust."

THE several writers on the subject, from Miss N. B. down to "Elias"—the former being a young maid, the latter an old one—have decided, in their own minds, at least, that "ladies dislike cigars, therefore men should never smoke."

Although it is well known that tobacco smoke, when issuing from a cigar held in the lips of a brother is far more obnoxious to the average feminine nose than when a cousin indulges in the weed, especially if he be "one who makes himself at home about waists;" yet, notwithstanding this fact, we will admit, for the sake of peace, that of the foregoing syllogism thus much is correct—"Ladies dislike cigars"—but we fail to see that "therefore."

Ever since Eve made Adam eat the apple (she had been smoking cigarettes, and tried apples to destroy the scent—they are of great utility in that respect—and was disposed to be even less selfish upon finding they acted upon her quite emetically) the ladies, bless 'em, have had their own sweet way, and it is about time some poor masculine entered at least a protest against this sort of thing.

Men like to smoke, therefore ladies should overcome their dislike to the fragrant narcotic, or, at least, should endeavor, as befits their gentle nature, to wean, as it were, the man from his love of tobacco. This is, surely, a better way than to say, "There's that great, nasty, black pipe again! Take it away from here, or I'll break your head with this broom! Do you hear?" The man and his pipe go out together, but he lights it again, and under its magic influence all his angry thoughts concerning that gentle spouse vanish in clouds of incense; whereas, had he not this consolation, his anger might have so far overpowered his usual wisdom as to cause him, in a moment of passion, to actually "spank" that woman! The thought overpowers me—I must light a cigar.

"Thy gentle spirit lulls the laboring brain, lured back to thought the flights of vacant mirth"—which reminds me that tobacco is a sedative, when not taken to excess. Many young men are troubled with an overplus of "nervous vitality," the effects of which are a loneliness, and a desire for company of some kind, even when so situated that to go into society is next to impossible. We, ourself, live two miles from a young lady—we live three miles from another one, but we don't mean her—I (following John Phoenix's example, I drop that "we," I'm not used to it) am busy all day, and at night, if any one was with me, I should not smoke; but as it is, I light a cigar and am contented. Miss N. B. would probably advise, "Get married."

No, thank you—"a young man married is a man that's married." As a pickpocket observed, on running into the Y. M. C. A. rooms because a man was beckoning to a policeman, having missed his wallet, "Of two evils, I prefer the lesser."

Is smoking the only thing which becomes a bore when out of place? "There is a time for all things," and that young man who offends the public by smoking in his office does not deserve a—pipe of tobacco. With the exercise of a little common sense respecting time when and place where one smokes, nobody's olfactories need be offended. My letter and cigar come to an end together.

TOM.

The Proposed Telegraph Organization.

TO THE EDITOR OF THE TELEGRAPHER.

OF course, I am pleased with the attention given my suggestion in a late issue to your correspondents. Those with whom I have spoken favor it strongly, and the more I considered it the better I think it myself. New York City, being the great centre in every respect, the movement should be inaugurated there, as a more successful start can likely be made, because more talent, interested in the welfare of the profession, is necessarily congregated there.

The gentlemen who must first consider and originate a plan of organization will have many questions to consider in connection therewith, and I would be glad if your correspondents would freely make such suggestions as occur to them.

Should the association have something of the character of Free Masonry, as regards secrecy? It may be thought best to have passwords, signs and lectures, in order to prevent impositions, as has been suggested by the loan of a certificate.

How many degrees shall we have? I think two is enough. Three would certainly answer. Shall the degrees be known by numbers, or shall they have names indicating the advancement made by the possessor? What shall be the title of the officers necessary?

PERKINS.

Electric Protection for Express Cars on Railroads.

CHILLICOTHE, O., June 1.

TO THE EDITOR OF THE TELEGRAPHER.

ROBBING express messengers upon railroads while trains are in motion has become a matter of frequent occurrence, and a greater safeguard for valuables and the lives of employes seem to be demanded. It is not a difficult matter for two or three armed ruffians to step upon the forward end of an express car in the night, and, after the train has gained a rapid speed, burst in the door and commence a murderous attack upon the express messenger before he can summon assistance. I would suggest that an electric bell be placed in the baggage or postal car of every express train, with wires leading to the express car, and by a simple contrivance no door could be opened from the outside without ringing the bell, or, by a touch, the messenger could ring the bell himself. The doors could be opened from the inside without ringing the bell. By this arrangement it would be impossible for any one to gain admittance to the car without sounding a signal in the baggage or postal cars, thus summoning assistance instantly. It would not cost over twenty-five dollars to equip a car with such signals, and the annual maintenance would not exceed five dollars. Perhaps there are cars so equipped now; if so, I have not heard of it.

I. N. MILLER.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended May 12, 1874, and bearing that date.

150,846.—TELEGRAPH RELAY.—Thomas A. Edison, Newark, N. J. Application filed June 27, 1873.

Current of a small opposing local battery thrown through relay. A rheostat in its circuit enables it to be adjusted to first neutralize any current due to leaks.

1. The magnets *d* and *e*, arranged to operate at opposite sides of the armature lever *f*, in combination with the battery *k*, circuit 3, rheostat *l*, key *b* and connections 2 thereto from the main line *c* and the circuit 3, as set forth.

2. An electro-magnet connected in a circuit with a battery at both stations, combined with a rheostat and counter current, to neutralize the effect in the magnet of a current arising from leakages in the line, substantially as specified.

Born.

KING.—June 1st, 1874. To Mr. Charles C. King, of the Albany, N. Y. Western Union Office, a son.

Died.

DOLAN.—In this city, May 27th, of consumption, DENNIS DOLAN, line repairer of the Gold and Stock Telegraph Company.

EAGAN.—WILLIAM EAGAN, an operator in the Western Union Office, 145 Broadway, New York, died in this city, Saturday, May 30, of Bright's disease of the kidneys.

ANNETT.—At Cheyenne, Wyoming, May 26, 1874, LOUIS JAMES, son of C. F. ANNETT, aged one year and eight months.

Obituary.

WILLIAM EAGAN.

In the death of Mr. WILLIAM EAGAN, who expired on Saturday morning last, at his home, 42d street, in this city, the Company loses a faithful employe, and his associates mourn the loss of a friend and genial companion. He had been confined to the house but a few days, having been at the office as late as the Tuesday preceding his death. He had, however, been suffering for some time from Bright's disease of the kidneys, which ultimately caused his death. He was a young man of twenty-three or twenty-four years of age, quiet and unobtrusive in his ways, and leaves many friends among his late associates who mourn his early demise.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The Farce Played Out.

THE first session of the Forty-third Congress is nearly concluded, and, as will be seen from our Washington letter, the House Committee on Appropriations have closed the hearings on the Government telegraph schemes. It is not expected that the Committee will make any report at the present session on the subject, for, even if they did, there could be no time for consideration of the subject, much less for any action upon it.

The matter has degenerated into something very like a farce, and it would be allowed to subside entirely but for the persistency of one man, who seems determined to keep up the agitation of the subject, although it has been evident for some time past that there is not the slightest probability of his accomplishing anything that even looks like success. We allude, of course, to Mr. GARDNER HUBBARD, who, session after session and year after year, appears at Washington with his postal telegraph project, so called, and, with the aid of Senator RAMSAY, Chairman of the Senate Committee on Post-offices and Post-roads, keeps telegraph companies stirred up and puts them to the trouble, annoyance and expense of opposing his plan for confiscating their property for the benefit of himself and those whom he sees fit to associate with him for the purpose.

It is an absurdity to call Mr. HUBBARD's scheme a Government or Postal Telegraph project. An examination of the bill, which has been several times reported in the Senate by Mr. RAMSAY, will show that the Government has little interest in the matter in case his bill should become a law, further than to provide the major part of the facilities for doing the business, and defraying a good share of the expense; the profit, if any, inuring to the corporators for whose benefit a telegraphic monopoly is proposed to be established. Of course, there is not the slightest probability that any such one sided arrangement will receive Congressional endorsement and legislation; but, nevertheless, the telegraph interests are obliged at great expense and trouble to be constantly defended, lest it should appear that they are indifferent, and thus some show of plausibility be given to Mr. HUBBARD's pretensions.

What little of popular support these Government telegraph projects may have had at one time has long

since been withdrawn from them, as the people have in the discussion become better informed in regard to the facts and the principles in regard to the subject. It has been realized that a postal telegraph, properly so called, means that the telegraph lines shall be conducted and managed by Government officials at the expense of the Treasury for the benefit of the few. The plan of Mr. HUBBARD, who, so far as we understand, does not even claim to be in favor of an actual Government ownership of the lines, is even more objectionable than this. He proposes to have established by law a telegraphic monopoly in the hands of himself and friends, in which the Government shall be partners to the extent of sharing the cost, while they pocket the proceeds.

It cannot be denied that Mr. HUBBARD has greatly injured the telegraph interests of the country, and more especially those engaged in competing with the Western Union Company. It has even been charged that he was really working in the interests of that company, and that the apparent contest between them was all a sham, and that an understanding actually existed between him and the managers of the Western Union Company that he should pursue the course he has and does. We do not believe that such is the case, however, because, while in some respects his course may aid the plans of the Western Union Company, it at the same time is injurious and annoying to it.

The honesty of Mr. HUBBARD's pretensions, that in this matter he is actuated by a regard for the interests of the people, may well be called in question, from the fact that he combines with his telegraph projects a general lobbying business at Washington, adverse to the interests of the Government. He is the paid lobbyist of the Bank Note Engraving Companies in their opposition to the engraving and printing of the currency being done by Government officials and employes and in the Treasury Department. He is also engaged in other lobby schemes, and doubtless finds his profit in them. We mention these facts to dissipate the idea that some have entertained that in his persistent telegraphic lobbying he was actuated by the regard for public interests which he has claimed.

We perhaps owe our readers an apology for occupying so much space in treating of this matter, which has, we doubt not, become as wearisome to them as to us, but it is one in which we are all interested; and the only hope which Mr. HUBBARD and those engaged with him can have of success is in tiring out the telegraph interests and the public, and in some unguarded moment obtaining legislative action which shall in some way commit Congress to his plan. An attempt of this kind was made, we think, at the last session of the Senate, to secure the passage of the HUBBARD bill in the Senate on a Saturday, when but few members were present, and had it not been for the opposition of Senator CONKLING of this State it might have been successful. It will be seen, therefore, that however wearisome and disagreeable the subject may be, it is necessary that it should be kept before the public, and we know of none in which practical telegraphers have a deeper interest. We hope, however, that it may not be necessary to trouble our readers with it again for some time to come, as the farce is about played out, so far as this Congress is concerned.

In conclusion, we will merely repeat what we have before said, that, as between the HUBBARD scheme and a Government telegraph proper, we think the latter decidedly the most preferable; but we are confident that no more injurious and damaging action could be possible for telegraph employes, the public, and telegraph interests, than for the Government to acquire the ownership, management and control of the telegraphs of this country.

The Western Union Dividend.

THE long anticipated and much talked of dividend on the shares of the Western Union Telegraph Company was declared on Wednesday last, and it is believed that regular dividends will hereafter be paid

to the stockholders. This is a gratifying evidence of the prosperity of the telegraph interests.

The immediate effect of the declaration of this dividend was a decline of about one per cent. in the market price of the stock, as a larger dividend had been anticipated; but this was subsequently recovered when the report to the directors (which is published elsewhere) was generally made known.

Telegraphic Science in India.

THE more scientific portion of our readers will find much to interest them in the valuable article by Mr. AYRTON on the telegraph system of India, which we reprint from the *Journal of the Society of Telegraph Engineers*, and the first instalment of which will be found in the present number of THE TELEGRAPHER. Ten years ago the telegraphic system of India was probably about the worst and most inefficient in the world. Its management was literally a byword and a reproach. It is a fact that at one time the officials actually issued a circular to the public requesting them not to send any messages during the rainy season, except such as were absolutely necessary! Again, in his official report for 1860, the Government electrician set forth the remarkable theory that insulation could be altogether dispensed with, for the reason that "distilled water, which rain chemically is, is a capital insulator of voltaic currents."

But within a few years a most extraordinary improvement, amounting almost to a revolution, has been brought about mainly through the efforts of Col. ROBINSON, R. E., now Director-General of telegraphs for India; and it is probable that at the present day there is not a telegraphic system in the world that is operated on more thoroughly scientific principles than that of India. The methods of testing and measurements are described by Mr. AYRTON in a concise and clear manner, and some of the regulations, especially the provisions for testing by rule when all the wires are interrupted, might be introduced in some parts of our own country, where the conditions are similar, with great advantage. It is also of interest to know that, although their ideas and methods of working are essentially English, yet they have introduced the American sounder and the American method of operating by sound almost universally, and seem to be strongly prejudiced in its favor, as might be expected from people who have tried it. We commend this and the succeeding portion of Mr. AYRTON's article to the careful attention of our American telegraphers, assuring them that they will find much of value and interest therein.

The New Atlantic Cable.

THE new cable steamship Faraday, which was built for the SIEMENS BROTHERS specially for the work in which she is engaged, has arrived upon our coast, and before these lines are read will probably have commenced laying the cable of the United States Direct Cable Company from Rye Beach, N. H., which is to be the western terminus. The Faraday has on board the cable required for that portion of the line from Rye Beach to Tor Bay, Nova Scotia, where it is to be landed, and from thence to the coast of Newfoundland, where the eastern end will be buoyed, and the Faraday return to England for the balance of the cable. Her second trip will be from the landing place on the Irish coast to the Newfoundland coast, where the two ends of the cable will be spliced, and, if no mishap occurs, the line will be in readiness to commence business. It will not, for the present at least, be landed in Newfoundland, for reasons which we have already explained.

In a few weeks, therefore, we may reasonably expect that a competing ocean telegraph line, connecting the United States and Europe, will be in operation, and the enterprising and persevering promoters of this cable have the best wishes of THE TELEGRAPHER for their practical and pecuniary success. The length of the circuit to be worked will, there is reason to fear, inter-

fare somewhat with the speed of transmission over it, but the company may perhaps have means for overcoming this. If successful in the competition with the Anglo-American Company, this cable will be the precursor of others to be laid hereafter.

It will doubtless be of advantage to the telegraph companies in this country to have an independent cable telegraph line with which to connect, and the result may be the building up of a united competing system in this country, which shall prove formidable to the Western Union Company. If it shall have this effect the future of the telegraphs not connected with the Western Union combination will be more encouraging than their past has been.

Defective Postal Arrangements.

WE are informed that some of the subscribers to THE TELEGRAPHER, especially west of the Rocky Mountains, are troubled by irregularity in the receipt of their papers. This arises in part, no doubt, by defective postal arrangements. Great care is exercised in forwarding the papers regularly from this office. Probably three quarters of our weekly edition goes through the Post-office. These are almost invariably deposited in the New York Post-office Friday afternoon, there having been not more than two or three exceptions to this in the last three years. There used to be delay and sometimes failure in this Post office, but under Postmaster JAMES the New York is one of the most admirably managed offices in the country, and all mail matter is promptly forwarded. The trouble consequently must be either in the Post-offices to which the papers are sent or on the route. Subscribers who fail to get their papers regularly and promptly should call the attention of their local postmasters to the matter and have an investigation made into it. They may rely upon it that the papers are regularly mailed here, and promptly forwarded from the New York Post-office.

A New Telegraphic Establishment.

As will be seen by their advertisement, Messrs. PATRICK, BUNNELL & Co., of Philadelphia, have established a branch of their house at No. 22 Dey street, in this city. They do not propose to abandon their quarters, which they have so long occupied, at No. 38 South Fourth street, Philadelphia, or diminish in any way their former facilities in that city, but seek by this movement to increase and extend their business. They have been very successful, and the instruments and apparatus manufactured by them have a deservedly excellent reputation, every attention being bestowed to make them in every respect creditable to themselves and satisfactory to their customers. As practical telegraphers they know what is required, and as business men they realize the importance of good workmanship and materials in the manufacture of their goods.

Personals.

Mr. A. H. BABB has accepted a position with the A. and P. and Franklin Companies, at 198 Broadway, New York.

Mr. M. G. CHIPMAN, formerly of No. 145 Broadway, but more recently with the Franklin Company, at Waterbury, Conn., has accepted a position with the A. and P. and Franklin Companies, at No. 198 Broadway, New York.

Mr. P. J. TIERNEY, formerly of No. 145 Broadway, has resigned his position with the Western Union Co., in Omaha, and takes a position soon in Chicago.

Mr. HORATIO N. WILLIAMS has resigned his position at Providence, R. I., on account of ill health, which has caused his absence from the office since last November. Mr. WILLIAMS is one of the oldest operators in the country, having been identified with the first line of telegraph which penetrated New England. He was afterwards manager of the American Company's office at Worcester, Mass., a position held by him for many years. After this he returned to Providence, as manager of the Independent. Relinquishing that position he became assistant manager of the American office in the same city. His failing health compelled him, a few years later, to exchange the onerous duties

of that position for another with the C. N. D., which, also, he now gives up. Mr. WILLIAMS has many friends all over the country, and he will be well remembered by the old timers, all of whom will regret to learn of the misfortunes that have overtaken him.

The office of the Western Union Telegraph Company at Lake George, N. Y., was opened for the season June 1st, and Mr. C. E. ARNOLD, of the Albany (N. Y.) office of that company, who had charge of the office last summer, has again been appointed manager and operator.

Miss CLARA HAINING, telegraph operator for the Great Western Railroad, at Paisley Station, Bruce Co., Ontario, Canada, is visiting her friends at Hoboken, N. J., on a month's leave of absence.

Mr. J. F. McAULIFF takes the position in the Albany, N. Y., Western Union, vacated by the transfer of Mr. C. E. ARNOLD to the office of that company at Fort William Henry Hotel, Lake George, N. Y.

Mr. JAMES D. WHITE, of the Western Union Telegraph Company, at Bay City, Mich., has accepted the position of report operator, Jackson, Mich., office of the same company.

The Telegraph.

Resumption of Dividends by the Western Union Telegraph Company.

A MEETING of the directors of the Western Union Telegraph Company was held at the Executive offices of the company at noon on Wednesday, June 3, at which President Orton presided, and presented the following report, which was accepted and adopted, together with the annexed resolutions:

To the Directors.
The net profits of the company for the eight years commencing July 1st, 1866, and ending June 30th, 1874—those for the present month of June being estimated—are \$23,077,069.23.

Of this sum there has been distributed in dividends to stockholders..... \$4,857,239 34
Disbursed for interest on the Company's bonds... 2,530,749 98

\$7,387,989 32	
The balance, \$15,689,079 91, is represented as follows:	
Paid for the construction of new lines and the erection of additional wires.....	\$4,920,868 53
Paid for the stock of companies leased to the Western Union, subject to an annual rental.....	700,299 95
Western Union stock (72,877 shares).....	4,054,483 07
Gold and Stock Telegraph Company's stock (47,710 shares).....	1,173,509 00
Internat'l Ocean Telegraph stock (10,384 shares)	961,556 42
Pacific & Atlantic Telegraph stock (56,636 shares).....	597,585 50
Anglo-American Telegraph stock (£1,308).....	10,000 00
Western Electric Manufacturing Company's stock (500 shares).....	39,000 00
Western Union bonds redeemed and cancelled.....	1,068,575 00
Western Union building, Broadway and Dey street, mortgage sinking fund.....	60,000 00
Real estate, exclusive of Broadway and Dey street property.....	328,769 86
Patents (the Page and Duplex Telegraph).....	61,758 00
Cable steamer.....	12,665 19
Western Union bonds not cancelled (\$7,500).....	6,750 00
Fraction of share, old issue, redeemed and cancelled.....	42 50

Total..... \$13,990,863 02
Leaving a balance of net profits..... \$1,698,216 89

Represented as follows:

Cash on hand and due from agents.....	475,000 00
Call loans.....	400,000 00
Advanced on account of the new building, Broadway and Dey street, in excess of the building mortgage bonds.....	300,000 00
Poles, wire and other materials, and other supplies on hand.....	423,216 89

Of this sum, \$1,400,00 is the net profit for the six months ending June 30th, instant—about \$740,000 being the net profit of April, May and June. This is an increase of more than \$250,000 over the net profits of the same three months last year (1873). In view of the large reduction in rates throughout the South and West, which took effect on the 1st of July, 1873, and of the universal depression in most kinds of business which followed the financial panic of September last, such a result is most gratifying, and seems to furnish grounds for the belief that, as the general business of the country improves, the receipts and profits of the company will continue to increase. The Executive Committee have had under consideration for some time past the subject of a disposition of the unappropriated profits above stated. They were at first inclined to recommend a dividend equal to the net earnings of the current six months, which would be about 4 per cent. on the capital outstanding. To do this, however, would necessitate either the funding of the amounts expended for construction and on the new building, in excess of the loan made for that purpose, or the sale of a portion of the company's stock now in the treasury. On mature deliberation it is deemed advisable to do neither, but to limit the dividend to the profits of the current quarter. This course they have unanimously advised

me to recommend to the Board, and, in pursuance, I submit the following resolutions:

Whereas, The business and financial condition of the company justify the resumption of regular dividends to the stockholders, which, in the judgment of this Board, should be made quarterly; therefore,

Resolved, That a dividend of two per cent. from the net earnings of the three months ending June 30 be, and the same is hereby declared payable on the 15th day of July next.

Resolved, That for the purpose of such dividend the stock books be closed at the close of business on the 25th instant, and be opened on the morning of the 16th of July.

WM. ORTON.

The New Atlantic Cable.

The steamship Faraday, with that portion of the cable of the United States Direct Cable Company to be laid between Rye Beach, N. H., and the coast of Newfoundland, arrived at Berryhead, Nova Scotia, on Saturday last, May 30. She landed the shore end of the cable Sunday morning, and proceeded to Rye Beach Sunday afternoon.

Berryhead is the southwest side or point at the entrance to Tor Bay.

Foreign Telegraphic Notes.

Messrs. GRANT BROTHERS & Co., of London, have announced that the half yearly coupons, due the first of May, on the seven per cent. first mortgage building bonds of the Western Union Telegraph Company, will be cashed at the fixed exchange of 4s. per dollar—equal to £7 per coupon.

The traffic receipts of the Eastern Extension, Australian and China Telegraph Company, for the month of April, 1874, amounted to £16,670, against £18,333 for the corresponding period of 1873.

The number of messages (of twenty words) passing over the line of the Barcelona-Marseilles cable for the month ending April 30, 1874, was 4,064.

The Eastern Telegraph Company announces the opening for traffic of its new cable between Italy and Egypt via Zante and Candia. This company has now three cables working efficiently between Europe and Egypt, which is thus placed in direct submarine telegraphic communication with Great Britain, Spain, Portugal, Gibraltar, France, Malta, Italy, Greece and Turkey.

The German Union Telegraph Company have declared a dividend, for the year 1873, of £1, 1s. 2d. per share of £15.

The Hamburg-Heligoland Telegraph Company have declared a dividend at the rate of 8s. 11d. per share, of 100 thalers or £15.

The total number of messages forwarded from postal telegraph stations in the United Kingdom, for the week ended May 9, 1874, was 375,870—an increase of 46,488 on the corresponding week of the previous year.

The administration of the Russian Telegraph Department has just issued a new code of regulations with reference to the employment of females in the service, according to which 30 per cent. of the appointments may be filled by women and girls, whose salaries commence at 300 roubles, rising annually to the maximum of 600 roubles. The latter sum is at present paid only in the Amoor provinces, whilst in the offices of Russia in Europe the pay ranges between 300 and 420 roubles. Extra gratifications are now promised to those female telegraphists who are able to translate English messages; and can operate with the apparatus on Hughes's system.

It is reported that the German Reichstag are about to introduce a newly invented apparatus for taking the votes by electricity. Even with the aid of this invention it will not be possible for them to vote in a more shocking manner than our own Congress has on some recent occasions.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinhilf, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil. Will not jar open. Slight pressure of the finger required to put lever in circuit or cut out.

Acknowledged to be a decided improvement. Price, same as the ordinary key.

Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

- "BEST" GALVANIZED WIRE,
- OAK OR LOCUST SCREW PINS AND BRACKETS,
- CROSS ARMS,
- BROOKS' OR GLASS INSULATORS,
- SUPERIOR INSTRUMENTS AND BATTERIES,

at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

THE "SNAPPER" SOUNDER.

SPECIAL NOTICE.

All orders dated on and after June 1st will be filled with the new style, polished, "Snapper," at the original price of 30 cents, or 6 for \$1.50.

A few of the old style will be closed out at 25 cts, or 6 for \$1.25.

R. W. POPE,

P. O. Box 5278, New York.

New York, May 30, 1874.

THE "SNAPPER" SOUNDER.

NEW STYLES, NEW PRICES.

The unexpected and growing demand for the original "Snapper" Sounder, beyond the expectations of the manufacturers, has delayed the introduction of proposed styles and improvements.

Having increased our facilities and accumulated sufficient stock to enable us to fill orders promptly, the following varieties are now offered for sale at prices which will accommodate all classes.

- The "Snapper" Sounder, plain.....30c. 6 for \$1.50.
- " " " nickel plated spring... 0.40.
- " " " or 6 for..... 1.80.

A few were manufactured to order with hard rubber knobs. They were so well liked that I have decided to introduce them to the fraternity. The springs are secured by two screws, and should they break, may be replaced at an expense of 15 cents. They are thoroughly made and finished.

PRICE,  75 CENTS.

To the Dominion 5 cents each extra.

A liberal discount to agents.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs-

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System
OF
FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

QUICK SALES, SMALL PROFITS AND SUPERIOR GOODS.

We are offering any of our unequalled Telegraph Instruments at 20 per cent. discount from list prices.

L. G. TILLOTSON & CO.,

8 Dey Street, N. Y.

CHARLES T. CHESTER,
104 Centre Street,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be produced in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.
 Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS
 manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES
 constructed in the best and most substantial manner, and on reasonable terms.
 Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.
 For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.
 S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

American Compound TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.
 Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
 Conductivity—insuring great improvement in the working of lines in any condition of the weather.
 And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
 Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.
 Address—
American Compound Telegraph Wire Co.,
ALANSON GARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
 The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for telegraphic and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,
 (P. O. Box 5503.) **38 VESEY STREET, N. Y.**

RETRENCHMENT BEING THE ORDER OF THE DAY,

we will contribute to the good work, by offering our Superior Telegraph Instruments at 20 per cent. below list prices. Quality will be strictly maintained.

 9 Dey Street, N. Y.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,

PATENTED APRIL 8, 1873,

L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.

 Five per cent. discount for cash in advance.

GEO. H. BLISS & CO.,
 SOLE AGENTS,
 41 THIRD AVENUE,
 Chicago, Ill.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.
 Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS.

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

Original Articles.

Telegraph Gossip.

If my experience is worth anything in regard to cheap telegraph rates as a means of putting telegraphy within the reach of the poorer classes, I certainly believe it will fail in its purpose.

The manner some persons assume when writing a telegram is often amusing. For instance, if Miss Jennie wants to send a familiar message to her sweetheart, it is quite perceptible in the expression of her face how dear he is to her.

One of the meanest tricks played upon me was done by a shabby young man who, with quite a business like air, asked me to change a five dollar note for Gen. Tweed, whose office at that time was in my vicinity.

Every operator knows how little the real sense of a message impresses him while taking it from the sounder. You don't "sense" it, as the old folks say.

(From The Ghost of Telegraphica.)

Jottings Here and There.

Mr. GEORGE C. WEBB, from Oswego, N. Y., succeeds Mr. W. H. Hargrave on the regular night force at No. 145 Broadway, New York.

Mr. D. W. McAneeny is with the night force for a week or two in place of Mr. Sawyer, in addition to working his own trick on the day force.

Master John H. Young, a graduate from the force of office boys at No. 145 Broadway, succeeds Mr. Cunningham, on the 15th instant, as operator at the Bay State House, Worcester, Mass.

A package of newspapers addressed as below were mailed at the New York post-office the other day, but the sender received notice that the postage with the appended superscription would amount to seventy-two cents.

I sent another, just like this, about a month ago, and some mail bag man went through it—which one I do not know.

Mr. William H. Hargrave, one of the oldest men on the night force at No. 145 Broadway, has been transferred to the day force at his own earnest solicitation.

A friend, who has given The Ghost frequent assurance of his interest in its welfare, sends the following lines for insertion.

EXTRACT FROM THE WIRE DIARY AT "Z" OFFICE (16 Broad Street, New York.)

12 M.

The blazing hour of noon has come, And Montreal is "open."

'Tis a case of that peculiar kind Where you can't form an opinion; You cannot almost always tell About this New Dominion.

If "Bu's" Morse man's on "report" All efforts will be in vain; The bane of my existence is That man who works the BAIN.

This Burlington "report" excuse Gets run into the ground; But 'tis useless to sit chinning here—I'll send my biz "around."

12:37.

The wire trouble 's been removed Just as I've had my say. Again I bear my cross. There's "X," So Montreal 's "O. K."

R. G. S.

And this, I believe, comprises all the things worth knowing which the log book at present contains.

JOHN OAKUM.

[From the Journal of the Society of Telegraph Engineers.]

On some Points in Connection with the Indian Telegraphs.

BY W. E. AYRTON.

(Continued from page 134.)

Insulation.

ALTHOUGH testing for faults is of immense utility, the regular testing, which has now been carried on for about four years, under the Electrical Superintendent, Mr. Schwendler, has produced even more valuable results.

2500 + 50 + 10^6 (2500 + 3000) = 8000 nearly. 50 + 10^6 + 2500 + 3000

In the second case the current leaving the receiving station, if the same battery be employed, will be almost equal to—

$$2500 + \frac{2000(2500 + 3000)}{5000 + 2500 + 3000} = \frac{E}{5000} \text{ nearly.}$$

Therefore, with the bad insulators, the current leaving the sending station will be $\frac{2}{3}$ of what it would be if all the insulators were good. Consequently, the introduction of these bad insulators will increase the consumption of battery materials by about 60 per cent. Now let us consider the current arriving at the receiving station. When all the insulations are good this will be about equal to—

$$\frac{50 \times 10^6}{50 + 10^6 + 2500 + 3000} \times \frac{E}{8000} = \frac{E}{8000} \text{ nearly.}$$

In fact, scarcely any of the current will be lost en route in this case. When the one per cent. of bad insulators are introduced the current arriving at the receiving station will be about—

$$\frac{5000}{5000 + 2500 + 3000} \times \frac{E}{5000} = \frac{E}{10,000} \text{ nearly.}$$

Therefore the current arriving at the receiving station will, with the bad insulators, be about $\frac{1}{10}$ of what it would be if all the insulators were good. We may, therefore, say that, in the particular instance we have been considering, the introduction of this one per cent. of bad insulators increases the consumption of battery materials by 60 per cent., and diminishes the received or effective current by 20 per cent.

From some thousands of Robinson insulators that I have lately been testing at Messrs. Siemens, I find that the average resistance, after one minute's electrification of a good Schunberg porcelain, is about four million megohms, of a good Pinder Bourne porcelain about two million megohms, and of a good Defuisseaux porcelain about five hundred thousand megohms, the insulators being in all cases inverted in pure water, with water in both porcelain cups, but with the edges of the porcelain cups dry (artificially dried with hot irons, if necessary). We might, therefore, reasonably expect that a line composed of such insulators should have, in the dry, hot weather of India, a minimum insulation of 1,000 megohms per mile, if the insulators be not damaged. It will be seen, then, in the instance previously taken, a rather low resistance was taken for the good insulators, and the harm done by the insertion of bad insulators was not made greater than it really is. These results being fully appreciated by Col. Robinson, have induced him to establish at Calcutta, Bombay and Madras, regular arrangements for continuous insulator testing, and now no single insulator is used in India that has not been previously tested at one of these places in the following way: First, each finished insulator, as it arrives from Europe, is tested individually with a delicate Thomson's galvanometer, to see that the resistance of the insulator after one minute's electrification is not below a certain standard. Next, the insulators are joined together in hundreds and the average resistance found. The importance of testing insulators individually is only beginning to be fully appreciated.

The following plan has usually been adopted in Europe: An agreement is made between the buyer and contractor that each insulator is not to have less than a certain resistance. The insulators are only tested in hundreds; and if the hundred have more than one hundredth part of the specified resistance per insulator, they are all passed. If, therefore, 99 of them had a resistance much above contract, and one a resistance much below contract, still the hundred might have a joint resistance much above the hundredth part of the contract resistance per insulator, and the one with low resistance would not, therefore, be detected. The buyer may answer that he does not care about this; all he wants is a certain insulation per mile. Unfortunately, however, any insulator that has a resistance much below the rest will probably go on deteriorating, since the cause that originally diminished its resistance may probably go on increasing, until the insulation per mile fall much below what is required, although it may have been considerably above when the insulators were first put up on the line.

As far as has been ascertained at present it appears that the defects in these solitary insulators are produced by excessively minute cracks in the head of the porcelain, or the part that fits into the iron hood, and by an accumulation in these cracks of moisture which forms a connection between the stalk and hood. These minute cracks are certainly, in many cases, not produced by simple mechanical injury—such as insulators might receive in travelling, or when upon the line from excessive strain caused by the wire, since a considerable percentage of some porcelain insulator cups sent out to India, and to which neither hoods nor stalks had ever been fitted, were defective in the manner I have described, and had, individually, less than a megohm resistance.

If the solitary bad insulators be scattered at all uniformly over a line, the only way in which they then can be detected is by testing every insulator singly. Now, to carry a delicate galvanometer and a large battery from post to post for this purpose would be exceedingly in-

convenient. To avoid this Mr. Schwendler has devised a powerful magneto-electric arrangement, by which a rapid succession of reverse currents, sufficiently strong to be detected by the fingers, is sent through an insulator if it be very bad, or strong enough to be detected by the tongue (which is a cheap, and remarkably delicate galvanoscope), if the insulator be less bad, but having a resistance below a certain amount, depending, of course, upon the power of the electro-magnetic machine.

At about every twenty miles or so, in all lines, shackles are introduced, by which the line is electrically broken, communication being in ordinary cases established by two spirals of their wire soldered respectively to the line wire on each side of the shackles, and ending in eyes faced with platinum which are usually screwed together. By this arrangement a lineman can disconnect the line at about every twenty miles, and communicate in either direction. This was particularly necessary before the introduction of scientific testing, as it was by first endeavoring to communicate in one direction and then in the opposite that the man who had been sent out in case of interruption knew on which side of him the fault lay; and even now, when the faults are localized by testing, as their distance can only generally be found within one or two per cent., it is often of great use on a long line for the man to disconnect nearest to the spot localized, and see on which side of him the fault exists.

Earth Plates.

In Europe the ordinary way to make an "earth" is to use the iron gas, or water pipes, but in most places in India such pipes do not exist, so that some large piece of metal has to be buried for that purpose. A coil of iron wire, a piece of an iron post, or a copper plate have been used at different times. Now, as the nature of the ground in the immediate neighborhood of this buried piece of metal greatly affects its electrical utility, it becomes a question of great practical importance to determine in absolute units the resistance of the "earth" used in each particular case.

It might at first sight appear possible to obtain the resistance of the "earth" at a distant office by testing the resistances respectively of two lines put to earth at that office, and comparing the sum of the resistances so obtained with that of the loops. There are two reasons, however, why such a system would be extremely inaccurate: first, because, even if the lines were perfectly insulated, as the resistance of an "earth" is, or should be, exceedingly small compared with that of the line, the slightest possible error made in taking the circuit resistance would produce an enormous percentage of error in the calculation of the resistance of the "earth;" secondly, as the insulation of most lines is not generally very good, the resistance of the loop is frequently greater than the sum of the resistances of the two lines when put to earth at the distant station, so that, if the fact of leakage were not considered, the earth might be said to have a negative resistance.

The following method, suggested by Mr. Schwendler, and fully developed in a paper I read before the Asiatic Society at Bengal, is at present in use by the Indian Telegraph Department, and is open to none of these objections:

Select two other earths which are neither in metallic connection with one another, nor with the telegraph earth to be tested. Two iron telegraph posts near the office answer the purpose very well, only care must be taken that there is perfect metallic contact between the leading wire and the iron post in each case. In the dry season it would be advisable to pour water over the three "earth" used. Measure the resistance between each set of "earth," and in this way obtain three independent equations, containing the three resistances of the three "earth," and the known resistances of the three leading wires going respectively from each earth to the testing arrangement. From these three equations the required resistance can be found, and the question would be completely solved did the earth circuits behave as simple metallic circuits. This, however, is not the case, for, in the first place, an earth long used for telegraphic purposes frequently acquires a highly polarized state giving rise to a current; secondly, if the "earth" employed are not of the same material—for instance, if the one is an iron post and the other a copper plate—they will form with the ground a galvanic element giving rise to a current; and lastly, the testing current itself polarizes the "earth." Consequently, the measurement of the same set of earths, taken successively with positive and negative currents, will not agree, and they will differ from each other much, if the current due to the "earth" is considerable in comparison with the testing current itself. To obtain the real means in each case, it is, therefore, necessary to employ the same sort of equations as were used in the case of line testing; the formula, however, in this case being somewhat more complicated, since the resistance of the testing battery cannot now be neglected in comparison with the other resistances, as is usually done in ordinary line testing.

The "earth" in many cases having been shown by testing to have a somewhat high resistance, they are now all made as follows: a copper plate, four or five feet square, is buried at a convenient depth, and the connection with it made by a wire insulated from the ground. The object of insulating the wire is to prevent it from becoming highly polarized, as it would be were the greater portion of the current to escape from its comparatively small surface, since, of course, the chemical action produced at any surface is (other things being the same) proportional to the whole current escaping, divided by the area of surface.

(To be continued.)

A Quaint Conceit.

A CORRESPONDENT of *The Railway Gazette* furnishes to that paper very interesting extracts from the diary of a gentleman familiar with American and English railroads, relating his experiences and observations during a journey across the Peninsula of India and Bombay to Calcutta, in which occurs the following quaint conceit:

"The Government telegraph posts, etc., are very worthy of notice. They are uniform all over India. They are slightly coned wrought iron tubes, very light and strong. Every fifth post is guyed with wire rope. The sockets of the arms slide over the top, and are of wrought iron galvanized. The whole thing looks very neat and workmanlike, and is in strong contrast to the various clumsy posts of the railway companies.

"One cannot speak of telegraphs in India without mentioning the king crow. Whether the bird be really corvine or not, I do not know; but he looks like a very small, tender crow, with a very long, forked tail. What the king crow did before the introduction of telegraphs and railways is hard to say. I believe he did nothing, but was one of the 'unemployed forces of nature.' Generation after generation of king crows were laid, hatched, lived and died, without fulfilling their proper calling. But their day came at last; with the introduction of telegraphs and railways they are called upon to fill their 'sphere.' Their mission was evidently to sit on the wires and keep an eye on the railway. It is true that the kingfishers are also given to sit on the wires; but this, with them, is evidently an amusement. Every one knows that their 'sphere' is to catch fish; but with the king crows it is evidently a business, and their sole end and aim in life. Every span of wire has its king crow, and there they sit, nodding their heads at every passing train. If railway directors only took half as much interest in the line as the king crows do there would be a little less waste of money than there now is. In this land of megalomania it would not be hard to fancy that when a director dies his soul goes into a king crow, and that a retributive justice thus compels him to watch constantly the railway that during life he neglected."

A Pleasant Telegraph Location.—The Attack on Barrow's Creek, Australia, Telegraph Station.

A BRIEF account of the attack of the Australian savages in the Barrow's Creek Telegraphic Station, and the killing of Mr. Stapleton, the station master (an American), and of a lineman, was printed in the TELEGRAPHER for May 9th.

The following details of this occurrence have been forwarded to the Adelaide journals by Mr. Todd, Superintendent of Telegraphs: On the evening of Sunday, the 22d ult., the whole of the station party, consisting of Mr. Stapleton, the master, and seven others, including a civilized native boy, were outside the building, smoking. They were holding a conversation with a young black fellow whom they proposed sending up the line on horseback with one of the linemen, when they were suddenly attacked from the eastern corner of the station house by a large body of natives, who speared Mr. Stapleton. Being perfectly unarmed the assailed made immediately for their station, to which there is only one mode of ingress; but here they were repulsed by a shower of weapons, and Mr. Flint, the assistant operator, and police trooper Gason were both wounded. Finding their retreat fenced off, they ran around the building in the hopes that they would be followed. This ruse appears to have been successful, for, on making a second attempt to enter the gate, they found it unguarded, and they accordingly entered; but not before John Frank, one of the linemen, had been fatally wounded. The party, when inside of the building, which is secure as a fortress, immediately armed themselves, and three shots were fired through the window at a body of natives at a distance of twenty yards, and afterwards two rifle shots at a distance of 100 yards. Next day, at 7 A. M., the natives made their appearance all armed, and seemed meditating a second attack, and four rifle shots, reaching a distance of 500 yards, were fired to disperse them. The trooper reports that it is probable that one or two of the shots

took effect, as some of the natives were seen to fall, and he thinks there is no doubt that some of the natives were mortally wounded in the affray of Sunday evening. John Frank, the lineman, was speared in his right side, the weapon penetrating his heart and passing through the back in a downward direction. He died immediately after entering the kitchen. Mr. Stapleton, the station master, was also fatally injured. He was wounded in the left side, the size of the wound being reported to be about one inch broad and three inches deep. He also received a nasty injury in the left thigh. He died on Monday afternoon. Mr. Flint, the operator, was speared in the leg, and the wound penetrated to the bone, at a distance of seven inches below the hip. The black boy, who was saved by being dragged through the window, was wounded half an inch below the right collar bone. He also received a spear wound in the left side between his fourth and fifth ribs, and his right hand was badly torn. Mr. Flint, who telegraphs to Mr. Todd while in great pain upon his bed, hopes to be all right in a few days, and he believes the boy will also recover. It is stated that the object of the natives in making the attack was to obtain supplies of flour and mutton. The following description of the station, published some time ago by the *South Australian Register*, will prove interesting, and show to the friends of those interested that the building is specially erected for the purpose of defence:—"Barrow's Creek is the prettiest station on the overland line, but it is a perfect hotbed of hostility. The building, like that at Charlotte Waters and Alice Springs, is of stone, and forms three sides of a square, with high walls and a strong iron gate across the back. In front of the house there are four windows, well protected with iron bars; there are also loopholes all round the house, but no other openings to the outside. All the doors open into the yard, the house is roofed with iron, and when the gates are closed it is a perfect fortress, which could be successfully held by three or four resolute men against very great odds. There are six men all told at each of the interior stations, and sometimes the work is warm enough for them. The natives pull the wire down and cut away great quantities of it for the purpose of arming the points of their spears. They also smash the porcelain insulators and use the sharp edged pieces to serape their spear blades into shape."

Berthon's Collapsible Barge.

AMONG other scientific devices with which the Faraday is supplied, with the view of facilitating the laying of the Direct United States Cable, is a "collapsible" barge, the principle of which is the invention of the Rev. E. L. Berthon, a name already well known in nautical circles in connection with his "Perpetual Log." The principle was originally applied by Mr. Berthon to lifeboats, a number of which, it is stated, are in course of construction. The barge was built by Mr. E. P. Berthon, the son of the inventor, and is to be used in laying the shore ends of the cable, of which it will carry from twenty to thirty tons with a very light draught of water. The proportions of length to breadth in the barge are very unusual, being nearly two to one, the dimensions being: Length, 31 feet; width, 16 feet; and depth, 4 feet. Such, however, is its collapsibility, that, stowed away on the deck of the Faraday, it only measures 2 feet at its greatest width. The barge is cellular in construction, and when a small confining rope is cast off it expands automatically, inhaling into its ten cells about 500 cubic feet of air. During the process of expansion the jointed bottom boards, which are 14 feet wide, fall into their places, and lever stanchions being placed under the gunwales, the barge is ready for lowering in a minute or two. When in the water a very substantial platform is lowered into the barge, composed of beams 7½ inches thick and 1 inch planks. Upon this deck the cable will be coiled, and will be payed out over a large iron sheave at the stern post. The barge weighs about 25 cwt., and having great powers of flotation with light draught, is expected to be very serviceable in laying the shore ends of the new cable. The principle, moreover, appears to be one which it might be found desirable to introduce into the lifeboat service.—*London Times*.

West India and Panama Telegraph.

THIS company has, by purchasing up the concessions and rights of the Central American Company, not only removed a formidable rival from the field, but has secured a control of the traffic between North and South America for the next forty years, and between each of those grand divisions of the western continent and the Leeward Islands. In order to estimate what may be the extent of this traffic we have to look at the character of the trade of the several countries which will be accommodated by the company's lines and cables. Men are content to wait for ordinary gossip and friendly communications until they can be supplied to them by the ordinary post-office arrangements; but in the mar-

kets of the world there is an extraordinary amount of impatience, and hunger, and thirst after commercial information, and hence it is, that where there is much buying and selling of commodities, there the electric telegraph is kept in fullest play. Looking to Brazil, to the Plate Districts, to Chili, to Peru, and north of the Isthmus to the States of Central America, we find them producing in abundance all those articles of commerce—cotton, coffee, sugar, tobacco, peltry, breadstuffs, guano, &c.—about which the merchants of London, Liverpool, New York, Boston, Havre, and the other great commercial centres of the world chiefly busy themselves. Again, there is a vast amount of capital, both American and British, invested in remunerative public works in those countries, and in developing their mineral resources, and, as is only natural, the shareholders in these concerns are anxious to be placed on immediate speaking terms with the local managers of those enterprises. Such are the sources from which the company is now deriving, and hopes to increase its revenue, and the more those resources are dealt with the more numerous will be the messages interchanged between the source of supply and the immediate sources of demand. Independently of subsidies, the annual revenue is estimated at £108,000 per annum, not taking into account what may be the annual increment of that trade for the next forty years, during which period, as has been already stated, the West India and Panama Company will enjoy the monopoly of it. The financial arrangements necessary to carry out the agreement with the Central American Company practically involve a very little increase of capital. That company is to receive £900,000 in fully paid up ordinary £10 shares for the full surrender of their property, which is money's worth for money. A sum of £100,000 will be employed in duplicating and renewing existing lines, as well as to lay the cable to Surinam. There will be issued to the shareholders £100,000 of 10 per cent. second preference shares, which will be, to all intents and purposes, a working capital. Out of this sum the company will provide a maintaining ship to look after the repairs of the several cables, and thus secure an important saving in the cost of keeping the lines in proper working order. This consolidation brings all the working lines of the world into harmonious action.

The plan proposed is well adapted for resuscitating this unfortunate West India and Panama Company, placing its affairs upon a sound and prosperous basis, and securing at the same time an ample return to the shareholders upon the capital invested. Taking the estimate of the company's original prospectus of a total revenue, with conditional subsidies, of about £170,000 per annum—but the total, after payment of the rebate, to be inclusive instead of exclusive of the North and South American traffic—and allowing £35,000 per annum for working expenses and maintenance of a repairing ship, the balance of £135,000 would suffice to pay a dividend of nearly 7 per cent. per annum upon the proposed total ordinary capital of the company of £1,471,910, besides providing for the dividend on the preference shares already issued, and on the additional preference capital now proposed to be raised.

Military Telegraphs.

CONGRESS appears to be bestowing a favorable consideration upon the bill authorizing the construction of a military telegraph line from Fort Sill to San Antonio, and thence to the Gulf coast. We also learn that the Secretary of War, Generals Sherman and Sheridan, and other prominent military gentlemen, are warmly in favor of the project to continue the Arizona line by way of the Rio Grande settlements on to Santa Fe. To show the paramount importance of such constructions in the Territories, especially those like Arizona, being settled up in face of Indian hostilities, we will cite only the one case of the recent San Carlos outbreak and its prompt termination. The Apaches broke out there about February 1st, and immediately commenced their murderous depredations upon the settlers on the Gila and San Pedro rivers, extending their incursions to the doors of Tucson. But equally quick with their irruption was the alarm sounded by the telegraph, and at once expeditions of soldiers and friendly Indian scouts were on their way to the mountains in which these marauders were thought to have taken refuge. This outbreak is now ended; our troops have fought the enemy in their chosen stronghold, and the Indians are now only too glad to accept General Crook's terms. The cost of this telegraph has been a mere song, and its maintenance, we have every reason to believe, does not cost Government anything—the receipts of the line from citizen patronage about defraying expenses and paying operators' salaries. To continue this to the Verde and the Apache reservations in this Territory, and, in one word, to connect by the electric wires all the important reserves and prominent military stations in Arizona, New Mexico and Texas, will be the wisest and most economical act of legislation regarding army or Indian affairs our Congress will have performed since the war. The whole work con-

templated can be put up by soldier labor, equipped and supplied, for less than \$250,000.—*Arizona Miner*.

Electric Protection for Express Cars on Railroads.

TO THE EDITOR OF THE TELEGRAPHER.

AN apparatus, similar to that suggested by Mr. Miller in the last number of THE TELEGRAPHER, was patented May 28th 1872, by Samuel J. Hoffman, an old telegrapher, now residing, I believe, at Mobile, Alabama. The patent was published on page 347 of Volume VIII of THE TELEGRAPHER. It was a very simple and practical arrangement, being so arranged that when the safe was put into its proper position in the car the circuit was switched through it, and it could neither be opened or moved from its position, nor could the door of the express car be opened by any unauthorized person without sounding an alarm in the engine or in the baggage room. I am under the impression that the Southern Express Company has made use of this invention, but know nothing about the particulars.

F. L. POPP.

Elizabeth, N. J., June 8th, 1874.

The Secrecy of "Government Telegrams" Secured by the use of the Automatic Telegraph.

TO THE EDITOR OF THE TELEGRAPHER.

IN reference to the intercepting or taking off messages from telegraph wires, as referred to in the resolution introduced on the 23d of March last in the House of Representatives at Washington, involving the want of secrecy in the handling of Government telegrams, Mr. Edward Clark, in his reply to the Hon. James E. Blaine, Speaker of the House of Representatives, very truly says that in some cases the wires connect with instruments in hotels, and that all the wires connect with various cities and stations between Washington and the northern cities.

Permit me to say that the trouble does not end here, and that Mr. J. G. Smith's suggestions, as regards the use of silent Morse instruments in any form, offers no security whatever against the abstraction by unauthorized persons of telegrams from the through wires at way stations, or at any point on a line of telegraph by any ordinary Morse operator as well as by experts, and, therefore, does not, in my opinion, meet the requirements, in as far as relates to the abstraction of Government or other despatches.

The only security lies in the use of the "automatic telegraph," for the following reasons: First, by causing the pulsations of electricity to travel at any rate of speed above that at which a Morse expert is only able to interpret the same either by feel, taste, or by sound. I here refer to the American automatic telegraph, which has been in practical public operation for over two years between Washington and New York. It is an impossibility for the greatest Morse expert to abstract by feel, taste, or by sound, at any point on this line, during automatic transmission of a telegram, as in such attempts it becomes to the party "ignotum per ignotius." And in regard to the office, the *modus operandi* is that of silence; and it matters not how many persons may be in each office during the transmission or reception of a message, by my automatic system no one but the copyist need know its purport; and, to meet the copyist's case, Mr. Edward Clark suggested the propriety of passing a law fixing a penalty or punishment on any person who may divulge any message sent by telegraph.

GEO. LITTLE,
Passaic City, New Jersey, U. S. A.

June 9, 1874.

New Bonds of the Western Union Company.

THE Western Union Telegraph Company are having engraved \$1,500,000 of new bonds. As some misapprehension existed on the street, with respect to the uses for which these bonds were intended, Mr. Mumford, the Secretary of the company, said that in a year from next November \$1,500,000 of the company's bonds would mature. The recent forgeries of Western Union bond certificates had created some uneasiness among the bondholders, and the company had ordered the preparation of a new lot of bonds having twenty years to run, and being exchangeable for the old bonds at the option of the holders. By this measure the old bondholders would be protected by a new, ornate, and more complicated bond, and the debt of the company would not be increased a dollar.—*New York Tribune*.

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

A Section of the New Atlantic Cable Laid.

THE arrival of the cable steamship Faraday at Portsmouth, N. H., on Monday last, after laying the section of the new Atlantic Cable between Berry Head, Nova Scotia, and Rye Beach, N. H., has attracted much attention to the enterprise, and has proved a sensation for the citizens of Portsmouth and that section of the country. As will be seen from the report, which we print in another column, the Faraday has successfully laid the section of the cable between Tor Bay, Nova Scotia, to within ten miles of Rye Beach, N. H., where the cable is to be landed and now awaits the arrival of her consort, the steamer Ambassador, with the heavy shore end of the cable, which, from some unexplained delay, did not sail from England until the 2d instant, and, therefore, will not arrive, probably, before Saturday or Sunday. After the laying of the shore end at Rye Beach, the Faraday will proceed to lay the remaining cable on board between Nova Scotia and the Newfoundland coast, and then return to England, take on board the long section of the cable, and proceed to lay it from the coast of Ireland to the coast of Newfoundland, where it will be connected with the buoyed end of the cable previously laid.

It will thus be seen that some weeks must yet elapse before the cable will be completed and communication established over it, even if no unforeseen obstacles or accident should intervene to cause delay. Thus far the enterprise seems to have been successful, and the qualities of the Faraday as a cable steamer, for which purpose she was specially constructed, have been practically tested. We do not anticipate any greater delay in the inauguration of this competing telegraphic enterprise than is indispensable to do the necessary work; and during the next month we confidently anticipate announcing that an independent Atlantic cable telegraph is in operation.

The origin of this enterprise may not be generally known. In 1866 a company was organized in this country under the name of the American Atlantic Cable Company, for the purpose of laying an independent Atlantic cable, and, in March of 1867, an Act of Congress granted to the company the right to land and operate telegraph cables on the coast for twenty years. The promoters of the enterprise then attempted to raise the necessary capital to lay a cable from Holland to the

United States. This attempt was a failure, and for a while the project lay dormant. Subsequently another attempt was made to procure the means required to lay a line from Ireland to the United States, which met with but little success. About two years ago the requisite amount was subscribed, £1,350,000, and in February, 1873, the contract for the construction and laying of the cable was made with the well known house of SIEMENS BROTHERS, of London. They contracted to construct the cable, lay it at their own risk, and deliver it to the company in working order, thirty days after connection is made and the cable in operation.

A new company had meantime been organized called the Direct United States Cable Company, which acquired the rights of the American Atlantic Cable Company, and raised the capital. No capital was invested in it in this country, as our capitalists have no faith in ocean telegraph enterprises, and persistently refuse to invest any money in them. The experience of the new company, in this respect, was not different from that of the old companies, neither of which ever succeeded in securing any material pecuniary assistance here. The capital of the new company was mainly raised in England, though portions of it was subscribed in France, Belgium and Holland. The Company possesses a charter in New Hampshire under the title of the New Hampshire Land and Ocean Telegraph Company to obviate any possibility of interference with their operations in that State.

Two of the contractors, the Messrs. SIEMENS, came over in the Faraday, and were present at the banquet given by the citizens of Portsmouth, on Tuesday evening last, at the Rockingham House, where they were feted and lionized. We should imagine that it must seem strange to them that they should be thus enthusiastically received by a public which utterly refuses to aid them in their great undertaking pecuniarily, and not only them, but all other ocean telegraph enterprises of magnitude.

As a people we are ready to glorify the projectors and those who carry out enterprises which are of public benefit and utility, but we don't propose to invest any money in such enterprises so long as foreigners will do it for us. We retain, however, our inalienable right of grumbling at and denouncing those who do us these favors as soon as the brief season of glorification and congratulation is over. This part of their experience has yet to come for the managers and investors in this last enterprise; but they may rely upon it that the press and people of the United States will not be modest or backward in exercising this right.

The Telegraph in Wall Street.

WE do not propose to treat of the admirable and ingenious special telegraphic facilities which have been provided for the use of the brokers and others who have business in gold, stocks and other securities—with these our readers are tolerably familiar, but with the dealings and dealers in telegraph stocks. Within the last two or three years telegraph shares have become an important element in the business of the "street," and are dealt in, at times, to an enormous extent. More than a third of the entire capital stock of the Western Union Telegraph Company has, at times, been bought and sold within a few hours on the street and in the Stock Exchange. More recently the shares of the Atlantic and Pacific Telegraph, the American District and the Gold and Stock Companies, have been placed on the list of shares dealt in at the Stock Exchange, and have been bought and sold to some extent. The Western Union stock is a favorite with the brokers, as it fluctuates constantly—sometimes as much as three or four per cent. in a day, and is, consequently, a good one for those who wish to make a profit by a turn, as it is termed—that is, by buying or selling for a rise or fall, as the case may be.

All sorts of stories in regard to this stock are constantly circulated; dividends are declared or the company is rapidly going to the dogs—it is about to absorb,

or has obtained the control of all the competing companies—a powerful opposition has been or is being organized, etc., etc., as the interests of those telling the tales is on the "bull" or "bear" side. Within the last two years more dividends have been decided upon, according to our voracious stock jobbing friends, than would have made the fortunes of even moderate holders of its stock. "Points," in regard to Western Union, are constantly plentiful on the street as blackberries in August, and may, of course, be implicitly relied upon. Any persons who have money to invest can be accommodated to their heart's content, and if it should not prove a permanent investment, whichever way they may operate, may consider themselves fortunate, especially if they are guileless and inexperienced in the taking ways of Wall street operators.

We have no doubt but that eventually telegraphs will become reasonably profitable; and the Western Union Company, as our readers are aware, has just declared a moderate dividend, but, as yet, there is no especial encouragement for those who desire to obtain regular returns of income for capital invested. We should be glad to see telegraph shares taken out of the list of "fancy" stocks and placed among "investment" shares; and, with proper management, we think it can be done. This would, however, spoil them for the purposes of the speculators and brokers, for whom regular dividend paying stocks have little attraction or—profit.

An Editor and Telegrapher in Luck.

IN 1862 Mr. FREDERICK J. GRACE, editor of the *Journal of the Telegraph*, who was then a telegraph operator, was employed in a professional capacity with the United States expedition to recapture New Orleans, and was on board Farragut's fleet when it ran past the forts up to the city. A large amount of property was captured and turned over to the Government. The matter was brought before Congress after the war was over, and an Act passed authorizing the payment of prize money from the Treasury to those engaged in the capture, and Mr. GRACE has just received notice from the Fourth Auditor of the Treasury Department that \$350 has been awarded to him as his share.

We congratulate our cotemporary on this streak of luck, and it will afford much pleasure to his numerous friends to hear of his good fortune.

Lightning and Thunder all Round.

THE very hot weather, which has prevailed lately, has resulted in extraordinarily severe electrical storms in widely extended districts of country. Such a storm took place in New York and vicinity on Tuesday evening of this week, and for some hours the flashes of lightning and reverberations of thunder were incessant, and, at times, terrific. The lightning struck in many places, and things were decidedly lively around the telegraph offices. The discharges of atmospheric electricity along the line of the New Jersey Central Railroad were so excessive that the operators were driven out of some of the offices, fearing to remain in the vicinity of the wires and instruments.

Personals.

MR. W. J. USSERY, formerly day operator at Jarvis station, Canada, Air Line of the Great Western Railroad, has been appointed agent at the Stevensville, Ontario, station of the same company. He had the agency for the Montreal Telegraph Company at Jarvis for about fifteen months, and conducted it to the satisfaction of the public as well as the company.

THE Bureau County Republican of Princeton, Ill., says: W. J. JOHNSTON, the efficient manager of the Great Western Telegraph Company in this city started West on Tuesday, with his family. He expects to be gone several weeks, and will do up Kansas, Iowa and Missouri before his return to this city. GEORGE WATERSON fills his place during his trip.

MR. WM. E. SMITH, manager of the San Diego, Cal., Western Union office, has returned to the San Francisco, Cal., office of the same company.

MR. D. W. THOMPSON has accepted the appointment

of manager of the San Diego, Cal., Western Union office, *vice* Mr. WM. E. SMITH, transferred to San Francisco, Cal.

The Telegraph.

The New Atlantic Cable.—Arrival of the Steamship Faraday at Portsmouth, N. H.

The steamship Faraday arrived at Portsmouth, New Hampshire, on Monday last. Her arrival was delayed by dense fogs—in consequence of which two or three days were lost. She has successfully laid the section of the new cable, of the Direct United States Cable Company from Berry Head, Tor Bay, Nova Scotia, to the New Hampshire coast. No hitch or accident of any kind occurred in laying the cable from Nova Scotia to within ten miles of the shoals, where it is buoyed.

The Faraday is now in the harbor, at Portsmouth, and lies at one of the Government buoys. She is much the largest craft, ever in those waters, and attracts a great deal of attention.

Mr. Siemens, who is on board of her, and has general charge of the work, received a despatch from London, on Monday, stating that the steamer Ambassador, with the shore end of the cable for Rye Beach, did not leave England until the second instant, and, consequently, she cannot arrive as soon as was expected—probably not before the 12th inst., or later. She was not constructed specially as a cable ship, but is a fast boat, and has been engaged in cable laying before. The stay of the Faraday at Portsmouth is uncertain, but she will probably remain until after the arrival of the Ambassador, after which she will proceed to lay the remaining cable on board between Nova Scotia and the Newfoundland coast. This having been done, she will return to England, take on board the remainder of the cable, and lay the long section between Ireland and Newfoundland. The deep sea cable is very strong and light, weighing only three tons to the mile. The shore ends are, as usual, very large and heavy, being two and a half inches in diameter, and weighing eighteen tons to the mile. There are also two others, intermediate sizes, for the shoal waters off the coast.

As soon as the actual arrival of the Faraday was known, the cutter Levi Woodbury, with Colonel Eastman, the agent and representative of the cable company in this country, ex-Governor Smith, of New Hampshire, representatives of the press, and other citizens on board, steamed out from Newcastle, and the party were taken on board the Faraday near the shoals, and, as this section of the cable had all been laid, Captain Trott and Mr. Siemens were kind enough to take up a portion of it, and exhibit the process for their information and gratification.

Mayor Miller, and a Committee from the Board of Aldermen of Portsmouth, went on board of the Faraday, down the harbor, and tendered Captain Trott and his officers, and the electricians on board, the courtesies and hospitalities of the city. A splendid dinner was served in the handsome saloon of the Faraday, complimentary to the visitors, Mr. Siemens presiding.

A banquet, complimentary to the officers of the ship and the party of electricians, was given at the Rockingham House Tuesday evening by the citizens of Portsmouth.

Extension of the Atlantic and Pacific Telegraph to Long Branch.

The Atlantic and Pacific Telegraph Company having leased the Marine and Inland Telegraph Company's lines, have opened an office in the West End Hotel at Long Branch, N. J. The lines are being put in first rate condition. This line extends to Sandy Hook, and formerly connected with the Pacific and Atlantic Telegraph lines, now worked by the Western Union Telegraph Company.

The Reporting Telegraph in Canada.

The Financial Telegraphic Quotation Reporting System, which has been in operation in this city for several years, and in other American cities, is about to be introduced in Montreal, Canada. The instruments and apparatus of the Gold and Stock Telegraph Company are to be used.

The New Western Union Telegraph Building.

The upper stories of the new building of the Western Union Telegraph Company, corner of Broadway and Dey street, are making good progress. The walls are completed, and the iron framework for the roof is being put up. The building will soon be covered in, and work on the interior will be commenced. To passengers on the North River ferries, approaching the city, the telegraph building and the new Post-office building, on City Hall Park, loom up in a most imposing manner.

A Strike of American District Telegraph Messengers.

TELEGRAPHIC strikes have been rather out of favor for the last few years, but a small one occurred in this city recently, which, however, was of brief duration, and failed to accomplish its object.

The messenger boys of the American District Telegraph Company are paid \$4 per week for their services in all of the districts, but heretofore while in some districts they were required to devote but eight hours a day to their duties, in others they were on duty ten hours, although receiving the same wages. Last week the company decided to fix the time at ten hours throughout the city. This naturally did not please the eight hour boys, and some twenty of them from the thirty-first district waited upon Vice-President Grant, at No. 62 Broadway, to demand an increase of wages. Three or four of the leaders were discharged on the spot, and the others fined one dollar each for leaving their posts without permission, and this ended the affair.

Foreign Telegraphic Notes.

The Colony of Demerara, West Indies, has voted \$24,000 for the construction of a telegraph line to connect the west coast of the colony with New Amsterdam.

A press despatch from Panama states that despatches sent through the West Indian cables do not come through in a few hours, as the cable officials have publicly announced, and, consequently, great losses may occur from the delay. For example, New York despatches of the 20th of May, to connect with the steamer for the South leaving on the night of the 24th, were not delivered from the office of the Colon Cable Company here till the morning of the 25th, after the steamer had sailed, although they were received in Panama on the morning of the 24th. Why there should be this detention of twenty-four hours in the said company's office is what no one can make out. Delays are by no means uncommon, and naturally lead to much complaint. New York telegrams of the 7th inst., intended to connect with the steamer leaving for Peru on the morning of the 10th, were not delivered till the 11th. This causes a detention on the isthmus of at least one week.

Telegraphic and Electrical Brevities.

THE office of the North Shore Telegraph Company, at the Pavilion Hotel, Glen Cove, L. I., has been opened for the season with Miss Montfort as Manager.

It is rumored that an opposition to the American District Telegraph Company is about to be started in New York. It is rather difficult to see how such a company can prove remunerative; but competition is said to be the life of trade, and parties investing their money probably know how it is.

The Colusa, Lake and Mendocino, California Telegraph Company have opened offices in Turner's, in Bear Valley and Mountain House, on the road to Sulphur Springs.

The Western Union Telegraph Company rank the San Diego office third in importance in California.

The *San Diego* (Cal.) *World* says: Mr. J. B. Smith is at present fingering the military telegraph instrument. If the necessities of the line demand a special operator it is to be hoped Mr. Smith will be permanently stationed here.

Return of Mr. W. E. Smith to San Francisco, Cal.

Mr. WM. E. SMITH, who, for the last two years, has been Manager of the San Diego, Cal., Western Union Telegraph office, in which position he has obtained the esteem and good will of the press and the public by his ability and courtesy, has been recalled to the San Francisco office of the same company.

The *San Diego World* of May 27 thus pleasantly refers to his departure:

"Mr. Wm. E. Smith, late Manager of the Western Union Telegraph Company in this city, has been called by the General Superintendent to San Francisco, his services being required to fill a position at the headquarters of the Pacific Division. Mr. Smith leaves San Diego with the good wishes of hosts of friends. As a representative of the Western Union Company he has, so far as our experience teaches us, managed the affairs of that corporation with ability and impartiality, and, as an urbane gentleman in his personal relations with the people of San Diego, he has certainly commanded the esteem of all who came in contact with him. Mr. Smith is succeeded by Mr. D. W. Thompson, an old and valued employe of the company, and a gentleman who comes highly recommended, not only by the Western Union officials but by the best citizens of

Yreka, where he has been on duty for the past eight years."

The *Daily Union* of that city also compliments Mr. Smith and his successor as follows:

"Mr. Wm. E. Smith, who has during the last two years so ably managed the office of the Western Union Telegraph Company in this city, has been called to San Francisco to take a position at the headquarters of the Pacific Division. Mr. Smith is relieved by Mr. D. W. Thompson, an old and experienced telegrapher, and a gentleman in every sense of the word. It was our pleasure to meet Mr. Thompson yesterday, and we most cordially commend him to the business community of San Diego."

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ending May 12, 1874, and bearing that date.

150,847.—RECEIVING INSTRUMENT FOR CHEMICAL TELEGRAPHS.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C.—Case 72. Application filed July 29, 1873.

A stylus for a chemical receiving instrument, in combination with mechanism for communicating to such stylus a rapid vibration toward and from the paper for the purposes set forth.

150,848.—CHEMICAL OR AUTOMATIC TELEGRAPH.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C.—Case 64. Application filed January 15, 1873.

Uses an induction coil as a relay or repeater at intermediate points, the induced current taking place of fresh battery current.

A circuit for chemical telegraphs composed of the primary circuit, operated by the transmitting instrument, and an induction relay coil to act in the receiving instrument by a secondary circuit, substantially as set forth.

Trade Mark registered during the week.

1,792.—MECHANICAL TELEGRAPH INSTRUMENTS.—Ralph W. Pope, Elizabeth, N. J. Application filed April 16, 1874. "Snapper."

For the week ended May 19, 1874, and bearing that date.

151,004.—ELECTRICAL CONDENSER.—Charles A. Browne and Isaac S. Browne, North Adams, Mass. Application filed February 14, 1874.

Each metallic sheet is embedded separately in rubber, which is then vulcanized, and a series of these thus used to form condenser.

An electrical condenser composed of rubber plates, with embedded tin foil plates constructed of independent sections, substantially as herein described, for readjusting and replacing ruptured plates, substantially as specified.

151,100.—SUPPORTS AND CONNECTIONS FOR PORTABLE TELEGRAPH APPARATUS.—Valentine Haüy de Forville, St. Petersburg, Russia. Application filed February 24, 1874.

Attached to posts at intervals along line of railway, wires being brought down thereto, and continuity of circuit preserved through a plug connection between the plates to which the wires are led. When used with a portable apparatus, central plug is removed and circuit formed through instruments placed in support.

The combination of the plates X Y Z, the bolts x y z, and plug K with the telegraph wires y' and z', and with a ground wire, z'', for operation as set forth.

151,101.—PORTABLE TELEGRAPH APPARATUS.—Valentine Haüy de Forville, St. Petersburg, Russia. Application filed February 24, 1874.

Improvement on De Forville's previous patent. Intended to be carried on railway trains. Cam wheels actuating key connected by a yoke, having a finger taking into spaces of cam, so as to fasten the series when proper cam wheel is under key. Case containing apparatus is temporarily fastened, when used, to a second box having contact plates corresponding to central plate in brackets placed in posts at suitable intervals along line of railroad.

1. The slides C' and springs X Y Z, arranged for operation, in connection with the plates v' w' and boss a'', substantially as and for the purpose described.

2. The yoke r, having an index finger, n, in combination with the sliding cams p, shaft f, and comb s, substantially as shown and described.

3. In combination with the plate p and index finger n, the combs s, substantially as and for the purpose specified.

Born.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.
A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.
It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.
Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.
THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for the manufacture and sale of the
EAGLES METALLIC BATTERY,
now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.
The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.
These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.
Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.
No. 2 is a round cell, designed for main line. Price, \$2.

Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

QUICK SALES, SMALL PROFITS AND SUPERIOR GOODS.

We are offering any of our unequalled Telegraph Instruments at 20 per cent. discount from list prices.

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
A LANSON OARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL
DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSI-
NESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.

OFFICES:
114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH
in the world.
It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up
THE ELECTRO-MAGNETIC WATCH CLOCK,
which is the best watchman's time recorder in the world. Also,
ELECTRIC AND CONTROLLED CLOCKS
of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Rouald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

GEO. H. BLISS & CO.,
SOLE AGENTS,
41 THIRD AVENUE,
Chicago, Ill.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
No local required. Always ready for temporary offices.
Just what is wanted for officers' cars.
Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
WATTS & CO., Baltimore.

THE REASON WHY
THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

Bill Body's "Recollections."

BY JOE HIBBARDE.

OUR sojourn at Hayforks Junction was brief—not necessarily, but conveniently so. Three weeks was as long as we desired to remain, and it was convenient for us to accept another situation at its expiration. We met a curious character there, and he made our stay more utterly miserable than it might otherwise have been by his never ending "recollections" of those who had "gone before."

Bill Body never tired of telling us of those who had preceded us at the Hayforks, and as he had one or more "recollections" of each individual operator who ever worked there, and the number was legion, his supply of yarns was simply inexhaustible.

No historian ever recorded Bill Body, and there is no earthly reason why any should. He was a character such as every man has met, and whom none regret to leave behind. It was with great self-possession and calmness, and with very little outward demonstration that we learned, a few years ago, of his demise; but there has always been one deep regret since—we would like to have attended his funeral; we think we could have enjoyed it; and it is so seldom we do enjoy a funeral we are very sorry to have missed so rare an occasion.

It was a sultry evening in June, and we were all sitting outside, near the window, trying to comfort ourselves as much as possible with our pipes and reflections. For one, I was thinking of the past—of home, my mother, and of my old chums at school—wondering if Jimmy Dubbs would ever turn up with that half a dollar I loaned him when he ran away, ebuekled when I remembered it was counterfeit—and was drifting from this thought to others, when Bill Body's familiar and oft dreaded voice was heard, which brought me back to the living reality.

He began: "Henry Francis Goombs was the kind of a dnek one likes to see. Does a feller good to git into sich s'eicity as him once in a while. He come 'ere when they was buildin' the tunnel down on the left fork five or six years ago this last spring. He was jest the kind of a feller, he was. Allus dry 'n ready to set 'em up for the boys, 'n never complain' any 'eause we didn't 'turn the compliment. We didn't used to put on all that rigamajig to his name, though; we jest called him Goomey. He said that sounded more nat'ral, 'sides it was so handy to slap him on the back and say, 'Goomey, hev suthin'—while if you wanted to put the handle all on he'd choke afore you got through with it. So we cut it short, but we didn't slap him any to speak on. But he didn't care a cent about that. We hadn't no monee nor credit neither, an' all he had was his credit. So it all 'mounted to the same thing.

"Goomey was the curusest feller, he was. 'Tarnally git'n into some scrape or other. 'Peard he liked to have some job onto his hands, and Joe actooly seen him shed tears when things went smooth fur two or three days and he hadn't notbin' to 'count fur.

"His hours was f'm one o'clock at night, and he'd git ebuek full of old Fillet's tangle 'n he wouldn't sleep any till he come to work; but law, the boys all sed he didn't amount to nothin' after that.

"One night he come over and Williamsburgh was after him on number one—wanted to git orders to the fast express train. Goomey was more'n half seas over as usual, 'n he got holt of the wrong key—the one on the branch wire. He ansered up, but it didn't make no sort o' difference on number one, so he ansered agin slow 'n keerful. Then he did it kind o' sassy, 'n sed suthin' about them Williamsburgh chaps bein' druek. But they kept right on callin' jest the same, only a little more jerky and impatient. Then he sot down 'n leaned his head in his hands a spell 'n begun to meditate. He kept a thinkin' 'n thinkin' es much es five minits, 'n there was Williamsburgh peltin' away like all possessed. Finally, he straightened up, 'n looking straight at the machine, sed, kind o' sorryfully, but es if he meant bizness, 'I'll give you jest one more chance, 'n then he ansered slow 'n delibert like, makin' it over two or three times.

"But when he heard the same old lunc a hummin'

over 'n over agin, which showed all his pains hed been unregarded, he huy a sigh and sed, in a solomocly way: 'Well, there's only one thing to do, 'n I'm gwine to do it. I 'low I'll shet yer clack somehow. There's more'n one way to skin a eat, 'n I'll jest try t'other way.'

"And, by George, d'ye know what he did! He shoved back his chair, rose unstidly 'n went out doors 'n got a chunk of coal es big es a good sized stone 'n come in 'n let drive at the machine. But, Christopher Columbus, he didn't come within two foot of that, but he hit the kerosene lamp dead in the centre, 'n then there was fun roud the Hayforks. It set fire to the paper 'n things 'n finally burned the shanty slick 'n clean; ust to stand jest below where this is. He watched it, lugubrus like, till the wires snapped into two, 'n then he sed, sez he: 'I knew I could dry them fellers up one way of I couldn't another,' and then he lit out, 'n that's the last's ever ben heard of him in these parts.

"Everybody hated to see him go. He wasn't much like the next galoot they sent here—don't think o' his name nor don't want to. Temprince chap he was, 'n wouldn't cuss with the boys any, nor play keards or smoke, and—"

Here, to my infinite relief, I heard my call from within, and left Bill Body to edify more appreciative listeners than I.

A New Organization of Telegraph Employes.

THE telegraph employes of the St. Paul and Sioux City Railroad Line have established a telegraphic organization, and have adopted the following constitution, which has been furnished THE TELEGRAPHER for publication:

CONSTITUTION OF UNITED TELEGRAPHERS.

ARTICLE I.

Section 1. This circuit shall be known as Division No. —, of United Telegraphers.

ARTICLE II.

Section 1. The object of this organization shall be to elevate our profession to the highest degree of proficiency, to assist worthy members in time of need, and to promote the cultivation of kindly feelings among all persons employed in any capacity connected with telegraphy throughout the world.

ARTICLE III.

Section 1. The officers of this Division shall consist of one Division Operator, one Assistant Division Operator, one Division Secretary, one Division Treasurer, and three Division Directors, whose term of office shall be one year.

Section 2. The election of officers shall be by wire, and shall take place at the first meeting in ——. They shall be voted for separately, and must receive a majority of all the votes to entitle them to an election, and shall enter upon their respective duties immediately thereafter.

Section 3. It shall be the duty of the Division Operator to preside at all meetings, to enforce a proper observance of the Constitution and By-Laws of the Division, and he shall have a casting vote in case of a tie upon any question.

Section 4. The duty of the Assistant Division Operator shall be to perform the duties of the Division Operator in the absence of that officer.

Section 5. The duties of the Secretary shall be to keep all the books of the Division, except those of the Treasurer, attend to all correspondence, call meetings of the Division, keep a roll of the members, which he shall call at the opening of every meeting, and perform such other duties as may be provided in the following articles.

Section 6. The duties of the Treasurer shall be to receive and disburse all the funds of the Division, keep a book of individual accounts, pay all bills approved by a majority of the officers and members, and render vouchers for the same, and at each regular meeting, when called upon to do so, report the financial condition of the Division.

Section 7. The duties of the Directors shall be to investigate applications for assistance made by members of the Division, or of any Division organized under this Constitution; to order the Secretary to call special meetings, and to present to the officers and members of the Division the wants and condition of applicants, and to perform such other duties as are not provided for in this Constitution.

Section 8. No officer shall be entitled to compensation for labor unless the members of the Division shall see fit to grant such compensation.

ARTICLE IV.

Section 1. Those desirous of becoming members can be proposed at any regular meeting, but must be balloted for at the next ensuing meeting.

Section 2. Upon a ballot for membership three negative votes shall exclude the candidate.

Section 3. Any person whose application for mem-

bership has been rejected may renew the application at the expiration of two months after such rejection.

Section 4. When a rejected candidate or expelled member leaves the circuit to which application has been made for membership, or from which such member has been expelled, it shall be the duty of the Secretary to notify adjacent circuits of the same in writing, and of the cause of rejection or expulsion, if known.

Section 5. All persons who are elected to membership must authorize the Division Secretary, in writing, to add their names to the list of members under the Constitution and By-Laws, pay their initiation fee and regular dues to the Treasurer, and furnish their address to the Division Operator and Secretary within five days after notice of such election has been given, or forfeit the right to membership under such election.

Section 6. When a member wishes to withdraw from the Division to join another Division, a final card can be obtained, through the Secretary of the Division, to that which the member wishes to join, provided such member is clear of the books of this Division, and the application is accompanied with fee.

Section 7. Members shall pay monthly as dues a sum not less than ten cents.

Section 8. The fee for initiation shall be fifty cents.

Section 9. The fee for joining by card shall be twenty-five cents.

Section 10. The fee for final card shall be five cents.

ARTICLE V.

Section 1. Any member who may be indebted for four months' dues, unless out of employment, or unable to perform duty, shall be expelled from the Division.

Section 2. Any officer negligent in the performance of duty shall be fined twenty-five cents for each offence, and, if not paid, shall be expelled after the second offence.

ARTICLE VI.

Section 1. Any member in good standing shall, in case of sickness or disability, be entitled to receive such benefits as may be fixed by the majority of the members present at the meeting at which the application is presented, unless destitution is caused by intemperance or immoral conduct.

Section 2. When a member is sick or destitute it shall be the duty of such member to report the same to the directors of the Division, when assistance is required from the Division.

ARTICLE VII.

Section 1. The stated meetings of the Division shall be held monthly on ——— at — P. M.

Section 2. The Division Operator shall call special meetings for business at the request of a regular quorum of members, or whenever he may deem it expedient to do so.

Section 3. Ten members shall constitute a quorum for the transaction of business at regular or special meetings.

ARTICLE VIII.

Section 1. The Treasurer of this Division shall give a bond in the sum of one hundred dollars, for a membership of thirty or less, and twenty-five dollars additional for each additional ten members to the Division. This bond shall be signed by two responsible parties of the place of which the Treasurer elect is a resident, and must be placed in the hands of the Secretary previous to the retirement of the Treasurer of the year previous.

ARTICLE IX.

Section 1. In case of any office becoming vacant, the vacancy shall be immediately filled by a new election.

ARTICLE X.

Section 1. Every alteration, amendment or addition proposed to the Constitution or By-Laws, shall be delivered in writing to the Division Operator, who shall publish the same to the members. At the next regular meeting it shall be considered, and the Division Operator instructed how to present it to the annual meeting of the State Association.

[From the Journal of the Society of Telegraph Engineers.]

On some Points in Connection with the Indian Telegraphs.

BY W. E. AYRTON.

(Concluded from page 140.)

Signaling Instruments.

THE receiving instrument employed in India is what is called a sounder—that is, a simple electro-magnet, the armature of which is held back by a spring. For each current passing through the electro-magnet two distinct sounds are produced by the armature striking against two stops, which limit respectively its downward and upward motion. If the signaling current be of short duration these two sounds follow one another in rapid succession, and the signal produced is equiva-

leat to a dot. When the signaling current is of longer duration the interval separating the two sounds is longer, and the signal is equivalent to a dash. The advantage of the sounder over the ordinary Morse recorder, or any other instrument read by sight, is that it is so very much more easy for the signaler to hear the instrument and write down the message than to have perpetually to look backwards and forwards from the receiving instrument to the paper. It is just as much easier for a signaler to receive with a sounder than with a Morse recorder as writing from dictation is easier than writing from a copy. The only case where Morse recording instruments are used in India is where messages are being received from or are en route to places outside of India, Burmah or Ceylon. To facilitate this reading by sound the receiving signaler gives an acknowledgment by sending a dot at the end of every word, and the sending signaler continues repeating the word until he gets this acknowledgement. This is the same plan as is adopted with the ordinary needle instrument. This, of course, prevents the necessity of asking for repetition of various words at the end of the message. There might be a little difficulty in using this plan with the Morse instruments in England, as on account of the double current system that is extensively used in this country the line is disconnected from the key by a switch while receiving. This switch is dispensed with in India, as only the copper current is used. On all circuits, long or short, Siemens' polarized relays are employed, and this is obviously the most efficient and economical mode of working.

It is possible, of course, to produce good signals in one or the other of two ways—either by using a strong signaling current, and then the relay may be dispensed with, or by using a weak current and working the receiving instrument with a strong local current generated in the receiving office. Now, on every line a certain percentage of the current leaving the sending station is lost, therefore the smaller the current leaving the sending station the less is the absolute loss; and not only this, but the percentage lost on any particular line increases somewhat with the current, Ohm's law not being strictly true for leakage of insulators, or perhaps rather the resistance to surface conduction varying with the current. Consequently, there is a double gain in using a small signaling current, and working the receiving instrument with a strong local current generated in the receiving office.

The next point to consider—a point which I think has been much disregarded on long lines in other countries—is, what should be the best resistance for the relay to be used on each particular line? If a line were perfectly insulated the best resistance of the relay would of course be equal to the sum of the resistances of the line wire and the signaling battery at the other end; or, as the resistance of the battery is not large compared with the resistance of the line, we may say that if the line were perfectly insulated the best resistance of the relay would be equal to the resistance of the line. Mr. Schwendler, however, by taking into account the average per mileage leakage on the different lines in India, has calculated that the resistance of the relay should be about five eighths of the true wire resistance of the line, and, consequently, the relays for the different lines are now made in accordance with this rule. We have not yet, however, used any relays having more than about 3,600 or 4,000 ohms resistance.*

Of course, in using this rule of Mr. Schwendler's, the farthest distance from which the relay will have to be worked without translation must be considered, as that will be the case in which the current will be weakest, and when it will be most important to have the best resistance for the relay.

As the plan of receiving an acknowledgment after every word sent is, as I have already explained, used in India, the line cannot be disconnected from the receiving instrument during sending. The static charge which accumulates in a line when a current is sent, and which is always discharged at both ends of a line, will therefore be discharged partly through the relay of the sending instrument. If the line be very long, and the static charge, therefore, considerable, this return current, as it is called, may be strong enough to work the relay and produce a signal at the sending station. Every signal that a signaler sends is, therefore, repeated on his own instrument, and this is very likely to prevent him recognizing the acknowledgment sent by the distant station after each word, as he would confuse it with the return current.

To avoid this a key was for some time used which put the line to earth between the two positions in which it put the line to the battery and to the relay respectively. To do this effectively required that the back portion of the lever of the key should move through a considerable space, if it was to be moved

easily, with no greater manual force than is ordinarily used in signaling, or else that a considerable force should be employed if the handle were only to move through the ordinary space. Either of these conditions were, of course, incompatible with rapid signaling. This scheme was, therefore, abandoned, and the following more ingenious discharging arrangement adopted: The line is connected in the ordinary way with the axis of the key, the copper pole of the battery with the front stud, and one terminal of the relay with the back stud, and the other terminal of the relay and the zinc pole of the battery being connected with the earth. Between the copper pole of the battery and the front stud of the key there is inserted a Siemens polarized relay, called a discharging relay, the tongue of which is always connected with the back stud of the key. When the signaling current is sent, the tongue of this relay is moved slightly by attraction, and put in connection with the earth, in consequence of which the back stud of the key is also connected with the earth, and the relay belonging to the receiving instrument is short circuited. Now, on account of the residual magnetism in the relay of the discharging arrangement, this state of things is maintained for a short time, even after the signaling current has been broken. When, therefore, the lever of the key, which is attached to the line, is disconnected from the front stud, and allowed to come in connection with the back stud, it finds the relay of the receiving relay short circuited, and which remains short circuited a sufficient length of time for the line to discharge itself; no signal, therefore, is produced at the sending station by the return current. Before, however, the acknowledgment arrives from the distant station, the residual magnetism of the discharging relay, which lasts, of course, but for a short time, has ceased, the back stud of the key is disconnected from the earth, and the relay of the receiving instrument is fit for receiving. To increase the residual magnetism of the cores of the discharging relay its coils are shunted. This, of course, diminishes the sensibility of this relay, but enables the momentarily induced current generated, on breaking the battery current on signaling, to be utilized in prolonging the effect of the signaling current on the discharging relay. The best resistance of this shunt, as Mr. Schwendler has lately determined from mathematical considerations, is equal to the resistance of the coils of the discharging relay.

When a portable receiving instrument is required, a very compact arrangement in the form of a Siemens polarized relay is employed, the tongue of which in this particular case is made of sufficient bulk to produce audible sounds in striking against the stops that limit its motion.

Batteries.

The cell in universal use in India is the Menotti, or modified Daniell. It consists of a round earthenware glazed jar, about five inches high, at the bottom of which is placed a disk of copper, to which is attached an insulated copper wire. Above the disk are put about eight ounces of crystals of sulphate of copper, above this sand or sawdust, and lastly, at the top, a zinc disk. The sand or sawdust is useful in preventing the sulphate of copper from rising to the zinc plate. The electro-motive force of this cell is remarkably constant, and the resistance, when the cell is in good order, varies from ten to twenty ohms, depending on the amount of sand or sawdust and the tightness with which it is packed. The resistance is of little consequence, when used as it is in India, on lines the wire resistance of which is from 1,000 to 7,000 units or more. For local circuits these cells are also used, but joined partly in parallel circuit—that is, copper to copper, etc., and partly in series—that is, copper to zinc, etc.

The sounders are now all made of about thirty ohms resistance, but they have been made at different times of all resistances, from three to thirty units. In each office the sounders are divided into sets according to their resistances. Each set of sounders is worked with a distinct local battery, arranged according to the number and resistance of the instruments forming the set, the actual arrangement in each case being determined by printed rules given to each office. These rules are calculated from the fact that a single sounder of the ordinary size, wound with wire so as to have about thirty ohms resistance, gives good signals with four Menotti cells in series. Such sounders, it is clear, could be worked with a portion of the line battery belonging to the particular instrument, so that in an office having no sounders of less than about thirty ohms resistance no local batteries need be necessary.

All batteries are tested three or four times a week for electro-motive force and internal resistance, and the result recorded in a book to be examined by the Superintendent and Assistant Superintendent on their periodical visits. All new cells are, also, similarly tested before being joined up in any battery. The instrument used for this battery testing is a peculiar kind of tangent galvanometer, designed by Mr. Schwendler. This galvanometer is wound with a thick and a thin coil, and has attached to it two other coils of wire of suitable resistance, which can at pleasure be put in circuit or not with the two galvanometer

coils respectively. By this instrument the internal resistance of a battery can at once be found in Siemens or B. A. units, and the electro-motive force in terms of a standard cell. It possesses, also, the following advantages:

(1.) Considerable sensibility, owing to the magnet being light and well balanced. (2.) That it is compact and very portable. (3.) That it can be used as a receiving instrument for strong or weak currents. A detailed account of this instrument may be found in a paper that I read before the Asiatic Society of Bengal, and reprinted in *The Engineer*.

The number of cells to be used in the line batteries of the different circuits is obtainable from the following rule:

		During Dry Seas.n.	During Wet Season.
For every hundred miles of No. 1 wire,		4	6
“ “ “ “ 3 “		5	8
“ “ “ “ 4 “		6	9
“ “ “ “ 5½ “		8	12
“ “ “ “ 8 “		12	18
“ “ “ “ 9½ “		16	24
“ “ “ “ 12½ “		32	48

which, with the average insulation of the lines in India, has been found from experience to allow a considerable margin above the minimum number of cells necessary to produce good signals. Of course, in using this rule, the farthest distance the battery has to work direct must be considered. In addition to this, information is also given to each office of the lengths and ganges of the various sections of all the lines in the divisions of India in which that office is situated—so that every telegraph master is in a position to decide what number of cells he should use in the dry and in the wet weather respectively for each line.

When a very portable battery is required—as, for instance, when a man proceeds out on interruption duty—the following arrangement, originally devised by Captain Mallock, is employed: An oblong wooden box, about a foot long, three inches wide and three inches deep, is subdivided into cells by divisions, which, themselves, consist each of a zinc and copper plate soldered together. The cells are filled with sand moistened with dilute sal ammoniac. This battery is, of course, not particularly constant, but is handy and portable.

Every office is supplied with a Swiss commutator, consisting of a series of vertical and horizontal metal bars, all insulated from one another, any one of the vertical bars being able to be connected with any one of the horizontal bars with a screw plug. By this arrangement any line can at once be connected with any instrument, or direct to any other line, or to earth, or to the Wheatstone's bridge, or differential galvanometer, if the office be a testing station. The metal bars should be fixed on an ebonite and not a wood backing, as is sometimes done, as the wood warps, and then the holes in the vertical bars do not coincide with those in the horizontal. At every office, also, there is a Siemens plate lightning discharger, of the proper size for the maximum number of lines to come into the office. By a late universal order the lightning discharger at every office is placed between the line and the commutator, and not, as formerly, between the commutator and the instrument. This ensures two important results: 1st, that the commutator is preserved from atmospheric discharge. 2d, any leak in the lightning discharger, caused by dirt or otherwise, will be discovered from the ordinary insulation tests of the line which are made from commutator to commutator.

Electricity in Commerce.

Not many years ago, even at the lectures of the Royal Institution, electricity was treated as a child's toy. People laughed at seeing each other undergo the electric shock, and all the young people were highly amused when they saw the hair, "like quills upon the fretful porcupine," stand on end upon a wig block; and even the lecturers did not attempt to carry the matter further than to show that the subtle agent which they were able to obtain by friction from a piece of amber was identical in some respects with the awful and terrible thunderbolt. Now, however, the state of things is quite different. First came the electrotype process, which cheapened the manufacture of all plated ware. Next came the telegraph, and now we can wait a sigh from Indus to the Pole. It is needless to dwell here upon the immense durable advantages which civilization and commerce have derived from the use of the electric fluid as the world's messenger; and one evening last week we had the satisfaction of witnessing a series of experiments which demonstrated to all who were present—some of them the most eminent electricians of the age—that the efforts which have been for years past made to turn the fluid to account as an illuminating agent, have at last culminated in success. It is not here necessary to particularize the several methods which have been hitherto tried to subdivide the current. It is sufficient to mention that, as each defect

* This resistance will seem very great to the American telegrapher, but it should be borne in mind that on the Indian lines only one relay is in circuit with the line at a time, even the sender relay being cut out, while on the American plan of working all the relays are in circuit at once, even sometimes as many as 35 or 40.—ED. TELEGRAPHER.

was detected, ingenuity, directed by perseverance, was brought to grapple with it, until experimentalists have, at length, brought the arrangements to a state of perfection. It is extremely difficult, in a notice of this kind, to explain the character of the exposition we witnessed the other evening. It will be sufficient to say that the carbon points were ignited in vacuum, which is Kosloff's system, and that the current obtained from Gramme's magneto-electric machine, which is the property of the Electric Power Company, was distributed among nine lamps, and passed about from one to another with as much ease as ordinary gas can be distributed. With the Gramme machine—the very same which has been employed in sending the current to the top of the Clock Tower at the Houses of Parliament—running at about 200 revolutions per minute, a moderate light was obtained, which was greatly improved at 300 revolutions, the maximum of intensity being obtained at 450 revolutions. The strength of the light depends upon three things—the power of the machine and the number of its revolutions, on the length and thickness of the carbon rods, and on the quality of the carbon. The experiments showed that with the same strength of current and the same number of revolutions double the amount of light was obtained with the three long carbon rods as compared with the six short ones. The experiments demonstrated satisfactorily the fact that the electric current could be subdivided, and hence, if practice confirms experiment—which it is believed it will—there is a wide field open for the application of Kosloff's system. And it should be here remarked that the form of lamp used by the inventor is also experimental, and its variation does not affect the principle. He leaves it to mechanical science to devise a lamp which shall meet the varied requirements of light-houses, mines, submarine works, railways, and other purposes, to which, it was the general opinion of those present on Tuesday, the principle is thoroughly applicable.

Such is the opinion of such men as Sir C. Wheatstone, R. Sabine, C. E., F. Braby, H. Kember, Col. Wortley, Capt. Davis, J. L. Muter, H. Holmes, M. Westerton, E. H. Walenn, W. Abbott, and of several others who feel an interest in the extension of the use of electricity to other purposes. As an illuminant its reputation is now completely established. Mr. Douglas, the engineer of the Trinity House, has reported most favorably of it, giving it the preference of every other light tried in the Clock Tower of the Houses of Parliament, on account of its safety, its cheapness, and its immense illuminating power, which he found to be three times greater than that of gas supplied with 300 cubic feet per hour. He adds that the light has been in use for the last two and a half years at Souter Point Lighthouse, on the Durham coast, and that it has never been known to fail for one moment.

We are convinced that we shall soon see the use of the fluid further extended. Metals can be dressed free from deterioration in the flame created by the fluid, which can also be turned to account as a means of heating our boilers—nay, may do away with the necessity for them, by superseding steam as our motive power.—*The Railway News.*

A Bull, and its Pecuniary Consequences.

CALIFORNIA, June 1st.

TO THE EDITOR OF THE TELEGRAPHER.

It was on a pleasant evening in June, 187-, that Billy B., the night operator at Summit Station, sat tipped back in a capacious arm chair, his feet elevated at an angle of forty-five degrees above his eyebrows, and a cheap edition of Shakspeare's plays, open at Act 1st, "Midsummer Night's Dream," lying on his lap. Some "owl" down the road kept up a merry ticking on his soulder, with the familiar call of "Sm," but no response was given. Perhaps the evening zephyr has touched his cheek with a balmy kiss, that threw him into a peaceful slumber, but, more likely, he is making up at night what he lost during the day.

Presently the "beautiful snoozer" stirs, in an instant he seems wide awake; darting his right hand forward he throws his key open, and with the dexterity of one who manipulates a key to perfection, rattles off "I, I, Sm."

The following message is rapidly traced:
"B. C."

"To Proprietor Summit Hotel.

"Have 100 gallons coffee for my men on arrival of No. 1.

(Signed), Lieut. MORGAN,
"Commanding detachment Co. B."

Billy promptly delivered the message. A happy smile overspread the landlord's countenance, for he had had government contracts before. He grasped the dinner gong, and never before did that gong give forth sounds so loud and long. It quickly summoned to his side half a score of cooks, waiters and maids; the order of the night is read, and each assigned to a post of duty. All now is bustle. The Summit Hotel being only an eating place for train men and passengers, the stock of tin ware and cooking utensils was not very extensive. Billy and the landlord skirmished around the premises for tinware, and in lieu of coffee pots, etc., clothes boilers, dish pans, milk pans, dippers, and even oyster cans were filled with water and ground coffee, and placed upon any available spot where heat could be transmitted to their contents. Quantity, not quality being desired, Billy utilized the wash basins, and made three gallons over his office fire. But two hours would elapse before the train should arrive, and it was doubtful at one time, on account of the lack of vessels to hold the beverage, if the requisite quantity could be made. What hurrying, shouting and swearing! Everybody got soaked with coffee; everything that would hold fluid contained coffee; even the china pitchers and wash basins in the rooms fitted up for the accommodation of guests had to be used. The landlord hummed around as merrily as a Sacramento mosquito; and though Billy collided with the chief cook, while carrying two of his costliest pitchers, smashing them and spilling their contents over the dining room floor, he laughed heartily over it.

Fifteen minutes before the train was due he found he had the required quantity all made. Proud of his success, and appreciating Billy's efficient services, he placed him in charge of the bar until the train arrived. To say Billy was a veritable "Knucklebone Johnny" behind that bar would be drawing it very mild. It was every man for himself, and Billy, who could manipulate a glass of "Cutter's lightning" with even more dexterity than a current of Callauds was best man in the crowd. The train arrived. Lieut. Morgan, accompanied by two men, each carrying a five gallon can, entered the hotel. The cans were quickly filled, and the men departed. "Bring on your other cans," shouted the landlord. "What other cans?" asked the lieutenant. "To hold this coffee you ordered," replied the landlord. "I ordered?" and the officer gazed about him in astonishment at the array of cans, crockery and waiters. "Yes," shouted the landlord, drawing forth his message and exhibiting it. "You ordered one hundred gallons of coffee." "I ordered but ten gallons, and here's your money for it," replied the officer, throwing down a five dollar greenback. "All aboard," shouted the conductor, and the lieutenant rushed from the room. The landlord was now frantic; he quickly followed the officer out, but the train had started, and in a few moments was thundering down the mountain side a mile away.

Then the landlord swore, and made for the telegraph office. A very emphatic, if not very elegant, salutation fell on Billy's ear. Billy was astounded. He immediately called up the "B. C." man, and told him "g. a. 'have', in that coffee message." "B. C." sent back, "Have 10—ten." That was enough. Billy had a large sized "bovine" on his hands, but his proud nature would acknowledge no error. As soon as he had succeeded in quieting the excited landlord a little he went for that "B. C." man. The line was "red-hot" that night. The wordy combat waged fierce and warm for hours, but "Morse" suffered most; dashes fell to the level of dots, and spaces were for the nonce disregarded.

The landlord endeavored to revenge his wrongs by starving Billy out, but Billy managed to have rations sent from the next station, and subsisted almost entirely on bread and cheese until he was transferred to another station, four or five days after the coffee feast. Billy had just begun to congratulate himself in escaping without pecuniary loss, and at having a much pleasanter position in his new quarters, when the pay car arrived. Billy, with light heart and nimble step, quickly presented himself before the paymaster. That official handed him part of his wages, and the following voucher for the balance:

Wm. B—, SUMMIT, June 187-.
"King of Koffee,"
To "Cardwell," Dr.
To 90 gallons coffee..... \$18 00
To 2 pitchers..... 5 00
Received payment..... \$23 00
Billy got mad over it! WART.

Discoveries and Progress in Electrical Science.

PHILADELPHIA, June 15.

TO THE EDITOR OF THE TELEGRAPHER.

If you will allow me a little space in your columns I will endeavor to give you a short article which, perhaps, may be interesting to some of your readers. No one will hesitate to endorse my assertion, I think, when

I say that wonderful and mysterious is the era upon which we have just entered; the twilight of a new dispensation has already dawned upon us, old landmarks are fast being obliterated and time honored theories exploded.

The philosophers and professors of the old school have at last been driven from their brainless theories, and are taking shelter under the shattered banner of conservatism. Radicalism is the order of the day, and he who dares not consult the signs of the times, and investigate the mighty truths beaming upon us, is only fit for the past, when men's minds revolved in a circle, and their highest aspirations were to repeat the lessons taught by their masters.

The time was when animal force predominated and man's powers were only measured by his capacity for muscular endurance—the powers of the surrounding elements being unknown—and his progress, safety and protection depended wholly on his physical resources. Manifest destiny was onward and upward, in spite of the combined powers of Church and State to strangle every new discovery in the cradle of its infancy, and consign its authors to the shades of forgetfulness. Like a two-edged sword it has cut its way through the dire errors of the past, and now stands brilliantly arrayed in the resplendent glory of its own victory. Knowledge is the result of accumulated experience. Our present greatness is but the product of all past ages. Each generation contributes something important for the benefit of its successors.

In the early period of man's existence his knowledge must have been restricted to a few simple facts, presented directly to his material or external senses. The imponderable phenomena of nature could have cast but a dim shadow over his obscured vision, and all exhibitions of the imponderable forces must have been attributed to miraculous interposition. No wonder, then, that the mysterious agent, electricity, the most subtle in nature, should have remained concealed for so long a period. The earliest record of its existence dates no further back than twenty-four hundred years.

Samuel F. B. Morse, in 1832, while steaming upon the broad Atlantic, saw through his mind's eye the silent and mysterious workings of the electro-magnetic telegraph. His enthusiasm upon the subject knew no bounds. While investigating one of the grandest enterprises ever conceived by mortal man, his phlegmatic companions around him only laughed at his supposed lunacy. Failing to procure pecuniary aid to utilize his theory, in 1837 an earnest appeal was made to Congress for the requisite funds; such, however, was the obtuseness of the honorable functionaries at Washington, that the point was not seen or reached by them till 1843, when the required aid was appropriated. Thus struggled along for eleven years, for want of the paltry sum of thirty thousand dollars, one of the most important discoveries ever revealed to man. Morse lived to realize the fulfillment of his most radical anticipations. The same Samuel F. B. Morse who, in 1840, was without fame, friends or credit to procure even an electro-telegraphic apparatus, has since been honored by men of science, courted by kings and emperors, making tributary to his genius all the civilized nations of the earth. Thus it will be seen how hard it is not only to overthrow the errors of the past, but to introduce to public favor any new invention or discovery, however plausible. Thales, a celebrated Grecian philosopher, is said to have been the first to discover this marvellous agent. His discovery simply demonstrated the existence of an unknown force or power. By rubbing his hand across a piece of amber it imparted to it a mysterious power, capable of attracting to itself light contiguous bodies. This discovery, although simple, was sufficient to immortalize the name of Thales. This power derived its name from the substance with which it was first detected. Amber, in the original Greek, is called *electron*, from which the term electricity is derived. The terms magnetism, galvanism, voltaism, faradism, etc., have no reference to different substances, but simply represent the names of individuals foremost in developing their versatile powers. Magnetism is but another name to represent one phase of the same mysterious agent. Instead of being excited by friction it exists inherently in a certain ore, first discovered by Magnes in Asia Minor, from whose name the word magnetism is derived. This ore is known by the familiar name, loadstone. It is now extensively found in various parts of the United States, and is called magnetic ore.

In 1747 Benjamin Franklin entered upon a thorough investigation of the subject. In 1751 his investigations and experiments were embodied in a series of letters, afterwards published, causing at the time great excitement both at home and abroad. In these letters he promulgated his theory of the storm cloud, differing only in volume and degree. In accordance with his suggestions, two Frenchmen—Dolibar and Delvore—each erected an apparatus for extracting from the storm cloud the dread messenger of death.

May 10th, 1752, Dolibar succeeded in bringing down the fiery messenger, announcing its presence by sparks

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 6 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The Improvement in Business and Telegraphic Prospects.

ALTHOUGH business generally continues to be very dull, and speculation languishes, there are indications that the worst is probably past, and that by the close of the summer there will be a noticeable and encouraging revival of enterprise and business. At this season of the year there is usually a lull in business matters, and business men are more intent upon arranging where they shall spend the brief vacation, and seek recuperation of their vigor and energy, than upon initiating new and important enterprises. It cannot be denied, however, that there is more than the usual dulness the present season, consequent upon the prostration following the panic of last fall. Labor is to a greater extent than usual unemployed, and the active capital of the country is temporarily pressing upon the great financial centre of the country, where it meets with but a limited demand; and there is a plethora of money in the banks and other financial institutions in this city, which can readily be obtained in any desired amount, upon call, with first class securities as collateral, for from two to three per cent. interest. In ordinary times this would lead to an active speculation in stocks, but at the present time the prices of stocks, and even of first class securities, are much lower than those obtained previous to, and even a few weeks subsequent to the panic of September and October last. The protracted depression in business, and the unfriendly legislation of some of the Western States, is seriously affecting the railroad interest, and the prices of the shares and bonds of even first class dividend paying railroads are quoted at low figures.

Notwithstanding all this we think that the prospect is improving. One element of disquiet and uncertainty is practically disposed of for some time to come. There is now no danger of an inflation of the irredeemable currency of the country, and but little prospect of any considerable reduction of its volume. The position taken by President GRANT in opposition to inflation, and in favor of a return to a specie basis, has saved us from a great misfortune, and is one of the most important services that he has rendered to the country. We are gradually returning to a sounder financial basis, and, although some suffering is inevitable in the process, we shall eventually be more really prosperous for it. We are not yet entirely out of the woods, but the

prospect is brightening, and there is reason to believe that clear skies and bright sunshine will before long enliven the gloom which has for so many months overshadowed the business and financial interests of the country. The indications are that the crops will turn out well notwithstanding the backward spring and the devastation of freshets in some sections; and with good crops and reviving confidence the country cannot but be prosperous.

Intimately connected as are telegraph interests with the general prosperity of the country, every telegrapher must be interested in the improving prospects. The panic last fall checked telegraphic progress for the time being, and affected telegraphic interests quite as seriously as any others. Projects for extension and increase of telegraphic facilities were suspended, and have so remained until the present time. There will be fewer miles of telegraph built the present season than for many years previous. Still there will be some important additions to the telegraphic lines as it is. As we have stated, the Atlantic and Pacific Telegraph Company is to construct a line from Chicago to Omaha, to accommodate its business west of the latter place, and to afford a permanent connection through its own line with its system in that section of the country. We print this week in our columns of telegraphic news some additional and interesting particulars in regard to this new line. Besides this the same company will make other though less important additions to its facilities during the season, the aggregate of which will be considerable. The Southern and Atlantic Telegraph Company is distributing the poles for the extension of its lines south of Mobile, and will soon recommence actively the work of construction, intending to reach New Orleans in time for the fall business. Many of the lines in the south have suffered very severely this spring from the great freshets, but this damage is now repaired, and the work of construction recommenced. We understand that the Automatic Telegraph Company have in view some important movements, but cannot at present give our readers the details. We do not hear of any specially important additions to the Western Union system, but presume that that company will do something in this direction. The new Atlantic Cable is expected to be in operation in the month of August next, and if it proves successful, it will be an important addition to the facilities of the companies competing with the Western Union combination.

Altogether there is a visible and important improvement in telegraphic prospects; and if we do not realize in this direction all that could be desired, there is good reason for the belief that there is a good time coming, and that at no distant day. With reviving industrial and financial prosperity, and freed from the danger of government interference, the future of the telegraphs in this country is hopeful and promising. With economical and good business management there is no reason why telegraph property should not prove remunerative to investors as well as employés.

Telegraphic Enterprise of the English and American Press.

THE London correspondent of the *New York Tribune* recently referred to what, in that country, is considered a remarkable exhibition of enterprise on the part of the *London Times*, which expends \$17,000 per year for the use of a telegraph wire between London and Paris.

The *Tribune* very justly remarks that this enterprise "does not look so large to Americans as the letter of our correspondent would show that they think it in London. There is no first class New York journal which does not spend far more than this on the telegraphic transmission of news between Washington and New York; and there is no one which would not laugh at the idea of being confined to the use of a single wire."

There is no doubt of the fact that in the telegraphic transmission of news the American press is far in advance of the English and Continental press of Europe. We have not at hand the statistics in regard to the

quantity of news despatches transmitted by telegraph in this country, but it is enormous. No newspaper in this country can maintain its position as a leading journal without a very free and costly use of the telegraphs. In addition to the press despatches received through the Associated Press and the American Press Association, every newspaper of any pretension, and many of no special pretension as regards importance, has special despatches from correspondents in Washington, the capitals of the respective States, the Dominion of Canada, and even in Europe, who constantly transmit voluminous telegraphic reports of matters of interest, at an aggregate expense the amount of which would shock the ideas of newspaper publishers abroad. The patronage derived by telegraphs from the press makes an important figure in the annual receipts, and as the largest part of this is transmitted after business hours, it is particularly acceptable, and generally remunerative, although the prices charged are less than the regular rates for commercial despatches.

The enterprise of the American press in this respect is one of its principal and most important features, and their patrons would not be content with the meagre abstract reports which are generally deemed satisfactory in foreign journals. There has been an improvement in this respect in the leading European papers in the last few years, but they are yet far behind their American cotemporaries.

The Nonpareil Telegraph Apparatus.

THIS favorite instrument has recently been improved and a straight lever key substituted for that formerly used, and it is now the best instrument for the purposes for which it is offered, as well as the cheapest.

Messrs. F. L. POPE & Co. have sold over 2,000 of these instruments since they were introduced, and are still meeting with a demand for them.

They have just had printed a new catalogue and price list of telegraph apparatus and supplies sold by them, which may be had on application.

(Correspondence continued from page 147.)

and shocks. Eight days after this experiment the rod erected by Delyore also presented similar phenomena. These facts being unknown to Franklin, he, too, was kiting for similar results, and on the 3d of June following succeeded in bringing out from the sullen brow of the dark cloud the errand boy of the nineteenth century, announcing his presence by several smart raps over the knuckles.

For fear of failure his little son was his only confidant and attendant. He elevated his kite among the angry clouds and cagerly watched for a response. Not a fibre moved upon the cord. He presented his knuckle to the key; there was no response; minutes seemed like ages flitting before him. Upon this experiment hung the realization of failure or success. At length a slight tremor was detected in the fibres of the cord; a ray of hope gleamed upon him; on presenting his knuckle to the key he experienced a slight shock, attended with a feeble spark, increasing in power and brilliancy, till caution forbade further experiments. Thus lightning itself was snatched from its swaddling robes and received from man its first lesson.

The discovery was complete, and Franklin felt that he was immortal.

Although Franklin was not the first to attract the fleet messenger from his sullen retreat, yet it was from his suggestion that the first success was achieved, and to him there is accorded the authorship of this grand achievement. From this time onward nothing of importance occurred till the well known experiment of Galvani with the frogs, in 1790, which sat all Continental Europe in a Galvanic blaze, and finally euded in smoke. Voltaism arose from the ashes of Galvani, paving the way for our present electrical greatness.

AN OPERATOR.

Promotion of a Grand Trunk Railroad Train Dispatcher.

TORONTO, ONTARIO, CANADA, June 12.

TO THE EDITOR OF THE TELEGRAPHER.

MR. JAMES MEXON, train dispatcher of the Grand Trunk Railway, Toronto Division, has been promoted to the position of Chief Train Dispatcher of the Detroit Division of the same road, under the superintendency of Mr. Morse, the old railroad manager, and his headquarters removed to Port Huron, Michigan. His loss in our office will be felt, as he was generally well

liked, by not only his professional associates but by all who knew him.

We all sincerely wish him good fortune and prosperity in his future business and social career.

TORONTO BOYS.

Personals.

Mr. G. F. JONES, formerly of the Washington, D. C., Franklin Co.'s office, has accepted a position with the Western Union Telegraph Co., at office corner Third and Chestnut streets, Philadelphia, Pa.

Mr. CHAS. H. HAZLETON has been transferred from the McGregor, Iowa, to the La Crosse, Wis., office of the Northwestern Telegraph Co.

Mr. ALFRED BURROWS, formerly of the Guelph, Ontario, office of the Dominion Telegraph Co., who has just returned from a trip to England for his health, which has been much improved, has been transferred to the Orillia, Ontario, Canada, office of that company.

Mr. JACK MACDONALD (Canada Jack) has recrossed the borders, and is working for the Western Union Company in Detroit, Mich.

Mr. WALTER G. BROWNSON has accepted a position at No 145 Broadway, N. Y.

The Telegraph.

By Cable.

COMPLETION OF THE BRAZILIAN CABLE.

LONDON, June 15.—The steamship Africa is now making the final splice of the Brazilian cable near Madeira. Captain Halpin, the commander of the expedition, hopes to have the work completed by the 21st inst. All is going on well.

LISBON, June 16.—The steamship Africa has returned to this port after successfully submerging her section of the Brazilian cable. The line has been tested, found to work satisfactorily, and handed over to the Brazilian Cable Company. Unbroken telegraphic communication is thus established from England, through Lisbon and Madeira to St. Vincent, Cape Verde Islands.

A Model Telegraph Line.

The Atlantic and Pacific Telegraph Company are erecting a line of telegraph between Chicago and Omaha, five hundred miles, using a charcoal iron galvanized No. 10 wire, and twenty-two cedar poles to the mile, with Brooks insulators. The line is constructed by George H. Bliss & Co., of Chicago. It is to have twenty-two relays in the circuit, and the guarantee of the contractors is that it works in the rain or most humid weather, in a single circuit upon that length, to the full Morse speed of any line in clear weather, and better than a No. 6 wire on ordinary insulators. Such wire cannot be worked with that number of relays in rain without an intermediate repeater, and, with a repeater, no line can be said to be worked at full capacity of a shorter wire without repeaters.

The resistance of this circuit will be equal to a No. 6 wire three thousand miles in length. The cost of this model line per mile is not half that of a No. 6 wire upon ordinary insulators; hence the economy of using a better insulation.

Six years since Mr. F. L. Vandenburg constructed a line of two wires from Ogden to San Francisco, one thousand miles, using a No. 9 wire, except on the portion over the mountains, where a No. 11 steel wire of greater strength was substituted. At the time many doubted whether this line could be worked in circuit on account of the great length and resistance, especially in the rainy season, but with the Brooks insulators there has never been any difficulty. In a letter from Mr. Vandenburg, dated San Francisco, May 23, incidentally referring to this line, he states, "My one thousand mile circuit works as well as when first completed."

The Progress of the New Atlantic Cable.

The cable steamer Faraday, which is engaged in laying the new Atlantic Cable, did not await the arrival of her consort, the Ambassador, at Portsmouth, as it was supposed she would do, but sailed for Halifax, Nova Scotia, on Thursday, June 11. She arrived at Halifax on Saturday, when she took on board a supply of coal, and then proceeded to lay the section of the cable between Nova Scotia and the coast of Newfoundland. It is understood to be the intention to return to Portsmouth after the arrival of the Ambassador, but whether this will be done is uncertain. Both the Faraday and the Ambassador will, after laying the cable on board, return to England, when the Faraday will take on board the deep sea cable and proceed to lay the section from the Irish coast to Newfoundland. It is expected to complete the cable and have it in working order by the end of August.

Foreign Telegraphic Notes.

THE South Wales Telegraph has arranged with Queensland and New Zealand to get a cable laid from Singapore to the Queensland coast, and will ask Parliament to sanction it before the session closes.

The French Government, according to the London Times, with a view to obtain a reduction of rates for telegraphic despatches to the east, has granted a concession to an Anglo-French combination of capitalists for the exclusive right to lay cables between the south coast of France and the eastern shores of the Mediterranean, with special privileges for the direct and uninterrupted transmission of messages from England through France to the east. The concession further grants a reduction of one half of the ordinary rates over the French telegraphic system.

A prospectus has been issued in London of the Black Sea Telegraph Company (limited), with a capital of £130,000 in shares of £10 each, of which 10,000 shares are for subscription. The company have acquired exclusive concessions for thirty years from the Emperor of Russia and the Sultan of Turkey, for establishing a submarine telegraph between Odessa and Constantinople, which, besides affording telegraphic facilities for the trade of the Black Sea and Sea of Azov, will, by means of the system of the Eastern Telegraph Company, which now extends to Constantinople, complete a telegraph route to foreign countries for every part of Russia. The Telegraph Construction Company have contracted to lay the cable early next month for £97,000 in cash and £30,000 in full paid shares. The President of the Great Northern Telegraph Company is chairman.

A dividend of 7 1/2 per cent. was declared May 20th, at the meeting of the Reuter Telegraph Company, making, with the interim dividend of 2 1/2 per cent. in October, a total distribution during the year of 10 per cent.

The increase in the export of telegraphic wire and apparatus from Great Britain was remarkable in the last four months compared with the preceding year. The sums were respectively £429,643 and £122,099.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENT NO. 62, UP TO AND INCLUDING JUNE 10TH, 1874.

4, 6, 25, 33, 56, 59, 61, 67, 90, 91, 93, 98, 99, 100, 121, 133, 134, 140, 141, 142, 144, 148, 153, 154, 156, 158, 160, 164, 175, 176, 177, 201, 202, 220, 235, 244, 245, 247, 254, 257, 276, 341, 346, 350, 367, 379, 380, 392, 393, 406, 411, 412, 425, 430, 431, 434, 438, 463, 482, 548, 552, 561, 577, 590, 600, 603, 604, 622, 646, 659, 661, 694, 703, 715, 723, 724, 728, 729, 735, 741, 750, 751, 756, 780, 823, 830, 831, 855, 874, 876, 883, 897, 929, 930, 931, 932, 954, 956, 957, 959, 960, 963, 964, 978, 979, 995, 998, 1023, 1024, 1040, 1046, 1047, 1055, 1072, 1084, 1103, 1139, 1143, 1152, 1173, 1175, 1196, 1198, 1200, 1211, 1213, 1221, 1224, 1225, 1234, 1235, 1248, 1251, 1252, 1259, 1268, 1273, 1290, 1292, 1325, 1329, 1359, 1364, 1365, 1385, 1389, 1390, 1391, 1409, 1440, 1470, 1485, 1517, 1518, 1552, 1555, 1560, 1568, 1582, 1591, 1593, 1594, 1635, 1656, 1658, 1667, 1669, 1672, 1695, 1707, 1718, 1720, 1721, 1728, 1763, 1765, 1766, 1767, 1789, 1790, 1791, 1809, 1811, 1812, 1830, 1831, 1837, 1838, 1847, 1860, 1869, 1874, 1877, 1881, 1906, 1907, 1911, 1913, 4914, 1915, 1938, 1943, 1951, 1957, 1970, 2017, 2021, 2024, 2025, 2027, 2035, 2036, 2044, 2050, 2057, 2065, 2069, 2086, 2089, 2097, 2099, 2106, 2110, 2113, 2116, 2118, 2138, 2142, 2145, 2147, 2156, 2157, 2160, 2162, 2164, 2186, 2191, 2194, 2195, 2203, 2205, 2206, 2208, 2223, 2224, 2225.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENT NO. 61, UP TO AND INCLUDING JUNE 10TH, 1874.

31, 42, 76, 84, 154, 156, 158, 160, 164, 176, 177, 201, 202, 206, 247, 252, 312, 316, 341, 350, 411, 412, 418, 441, 482, 552, 556, 557, 566, 534, 590, 597, 642, 646, 648, 655, 659, 694, 701, 703, 710, 712, 717, 723, 724, 728, 735, 741, 780, 791, 782, 783, 785, 786, 790, 802, 809, 815, 823, 836, 838, 841, 842, 897, 904, 906, 916, 926, 929, 930, 931, 932, 944, 954, 956, 957, 959, 960, 963, 964, 979, 980, 998, 1000, 1002, 1014, 1016, 1030, 1031, 1033, 1034, 1041, 1046, 1050, 1057, 1061, 1080, 1105, 1106, 1107, 1108, 1109, 1110, 1112, 1113, 1115, 1117, 1119, 1120, 1121, 1122, 1123, 1133, 1139, 1141, 1152, 1191, 1198, 1211, 1221, 1234, 1235, 1255, 1256, 1268, 1273, 1281, 1283, 1284, 1285, 1286, 1289, 1290, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1366, 1405, 1409, 1415, 1426, 1427, 1430, 1431, 1432, 1433, 1457, 1458, 1465, 1469, 1470, 1471, 1474, 1475, 1476, 1481, 1485, 1503, 1513, 1528, 1529, 1530, 1552, 1558, 1573, 1586, 1597, 1616, 1649, 1666, 1667, 1673, 1684, 1687, 1688, 1696, 1700, 1701, 1702, 1704, 1709, 1710, 1713, 1724, 1730, 1737, 1746, 1747, 1750, 1751, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1765, 1766, 1767, 1768, 1769, 1771, 1785, 1789, 1790, 1813, 1828, 1830, 1837, 1838, 1839, 1840, 1841, 1857, 1859, 1860, 1877, 1889, 1895, 1896, 1897, 1907, 1915,

1958, 1965, 1996, 1997, 2007, 2010, 2012, 2023, 2033, 2041, 2044, 2045, 2074, 2075, 2085, 2089, 2110, 2134, 2145, 2147, 2156, 2157, 2160, 2164, 2171, 2183, 2184, 2185, 2191.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS 58, 59 AND 60, UP TO AND INCLUDING JUNE 10TH, 1874.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended May 19, 1874, and bearing that date.

150,953.—PRINTING TELEGRAPH.—George W. Howe, Stevenson, Ala. Application filed June 20, 1873.

Type in a reciprocity rack. Proper type, when in position, thrown up against paper. Six keys used, the combinations of which controls all the types through one, two or three pulsations acting in different magnets.

1. In a printing telegraph instrument, a mechanism for transmitting at regular and fixed intervals of time from one to three currents or waves of electricity, which shall enter the main line separately through separate magnets controlling a series of pins, and upon arriving at the distant instrument follow corresponding paths through magnets controlling an equal number of pins, substantially as herein set forth.

2. The key-board, constructed substantially as described, in combination with the register magnets I, revolving arms K', and circuit keys or levers L, or their equivalents, as and for the purposes set forth.

3. The frame f above the key-board, and the pieces g, or their equivalents, pivoted, substantially as and for the purposes herein set forth.

4. The magnets I, in combination with the series of pins i, or their equivalents, substantially as set forth.

5. The series of register pins i, or their equivalents, for the purposes herein set forth.

6. The long register lever K, armature J1, uprights k k1 k2, arms m m1 m2, rollers n n1, chains p p1, eccentric wheel L, type frame M, and spring v, or their equivalents, operating substantially as and for the purposes herein set forth.

7. The printing magnet I, in combination with the revolving key closer and local circuit closing key or lever L3, or their equivalents, as and for the purposes herein set forth.

8. The upright lever w, spring d1, horizontal arm y, spring a' and catch z, or their equivalents, as and for the purposes set forth.

9. The upright lever v, horizontal lever N, and sounding plate O, or their equivalents, as and for the purposes herein set forth.

10. The horizontal arm P and the curved rocking piece st pivoted thereto, or their equivalents, as and for the purposes herein set forth.

11. In a printing telegraph instrument separate and independent type, movable up and down in a frame or holder, for the purposes herein set forth.

12. The movable type frame M, constructed and operating substantially as and for the purposes herein set forth.

13. The wire 4, or its equivalent, in combination with the type and type frame, substantially as and for the purposes herein set forth.

14. The index D' and pointer G', in combination with the type frame, as and for the purposes set forth.

15. The crank p2 on the axle of the spool T, for the purposes herein set forth.

16. The notched arms v2 pivoted to the paper roller frame B1, and the spring w2 pressing between them, substantially as and for the purposes set forth.

17. The upright arm z1, cross arm b2, screw rod a2, nut a2, and adjusting wire or thread f2, or equivalents, as and for the purposes set forth.

18. The long horizontal rods R, upright arms y1, curved or angular pieces b, spring w1, and catch z1 on the long printing lever K, substantially as and for the purposes herein set forth.

19. The arms K' K' confined by friction on the shaft and provided with wheels or rollers y2, and one of them provided with a tooth or projection, z1, as and for the purposes herein set forth.

20. The revolving arms K', in combination with circuit closing keys L and L', or their equivalents, as and for the purposes herein set forth.

21. The main line circuit closing levers L, or equivalents, in combination with the revolving arms, register and key-board, as and for the purposes set forth.

22. The stop d2 c3, relay magnet R', and local magnet V', in

combination with the revolving key closer, as and for the purposes set forth.

23. Additional instruments connected to a telegraph line in the manner specified, in combination with the revolving key closer, to close the circuit through the same, substantially as specified.

151,102.—PORTABLE TELEGRAPH APPARATUS.—Valentine Haiy de Porville, St. Petersburg, Russia. Application filed April 9, 1873.

Intended to be carried on railroad trains for use by those unskilled in telegraphy, being placed on brackets attached at intervals to posts.

1. The series of circuit breaking cams *g*, arranged to slide on the rotating shaft *f*, in combination with the operating key *h*, the index plate *p*, and the magnet, substantially as shown and described.

2. The guides *s t u* and impression wheel *v*, in combination with the inking roller *y*, tape reel *k*, armature *z*, and clamping rollers *w w*, all arranged for operation, substantially as shown and described.

3. The cams *g*, constructed to signal words or sentences by rotation in one direction, or numerals, when rotated in the reverse direction, in combination with the lever key of a telegraph instrument, substantially as shown and described.

4. The switch *x*, in combination with the clamping rollers *w w* and crank *i*, for operating the tape motion in receiving a message, substantially as specified.

151,157.—ELECTRIC CONDUCTING CORDAGE.—Thomas L. Reed, Providence, R. I., assignor of one half his right to Eugene F. Phillips, same place. Application filed December 15, 1873.

1. Electric cordage for switch boards, and electrical therapeutic apparatus composed of a metallic conductor, closely coiled with a tubular interior, and embraced or enclosed in and by an insulating jacket of braided or woven fibrous material, substantially as described.

2. The combination, with a spirally coiled metallic conductor, of a terminal tip, which is provided with a neck for entering the tubular interior of the coil and a shoulder for connection therewith, substantially as described.

Born.

INCORRECT ANNOUNCEMENT.

THE announcement of the birth of a son to Mr. H. C. Maynard, night manager of the Western Union, Chicago, Ill., office, in THE TELEGRAPHER for May 23, was incorrect, he having become the happy father of a daughter on that occasion.

RICE.—At Albany, N. Y., June 10, 1874, to S. C. Rice, operator, Western Union telegraph office, a son.

JONES.—Sunday, A. M., June 7th.—To G. F. Jones (formerly operator at 609 Pennsylvania avenue, Washington, D. C., Franklin Telegraph office), of the Western Union Company's (Third and Chestnut street, Philadelphia, Pa.) office, a son.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as yearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and it is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Table of prices: Single Instruments with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50; Two sets of Instruments, etc., 12.00.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil. Will not jar open. Slight pressure of the finger required to put lever in circuit or cut out. Acknowledged to be a decided improvement. Price, same as the ordinary key. Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,

at the same prices offered by other establishments. Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

THE BEST TELEGRAPH MATERIAL IN THE WORLD AT THE LOWEST PRICES!

The prices on our Catalogue are very low, but we are offering 20 per cent. discount from them on all Telegraph Instruments of our manufacture.

L. G. TILLOTSON & CO.,
8 DEY ST., N. Y.

THE "SNAPPER" SOUNDER.

NEW STYLES, NEW PRICES.

TRADE MARK "SNAPPER,"
PATENTED MAY 12, 1874.

The unexpected and growing demand for the original "Snapper" Sounder, beyond the expectations of the manufacturers, has delayed the introduction of proposed styles and improvements.

Having increased our facilities and accumulated sufficient stock to enable us to fill orders promptly, the following varieties are now offered for sale at prices which will accommodate all classes.

- The "Snapper" Sounder, plain.....30c. 6 for \$1.50.
- " " " nickel plated spring... 0.40.
- " " " or 6 for..... 1.80.

A few were manufactured to order with hard rubber knobs. They were so well liked that I have decided to introduce them to the fraternity. The springs are secured by two screws, and, should they break, may be replaced at an expense of 15 cents. They are thoroughly made and finished.

PRICE,  75 CENTS.

To the Dominion 5 cents each extra.
A liberal discount to agents.

Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System
OF
FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

QUICK SALES, SMALL PROFITS AND SUPERIOR GOODS.

We are offering any of our unequalled Telegraph Instruments at 20 per cent. discount from list prices.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.
Favorable arrangements will be made with line constructors, telegraph employés, &c., for the introduction of the Printer.
For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 60 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,

38 VESEY STREET, New York.

NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

RELAYS,
SOUNDERS,
REGISTERS and KEYS.

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,

For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.

Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.

BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for

HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Send for New Catalogue and Price List.

F. L. POPE & CO.,
(P. O. Box 5503.) **38 VESEY STREET.**

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description.
This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

 Chicago, Ill.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms.

None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.

No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY
 THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

Downey's Lament.

If I say it meself, shure an' its no flattbery,
I do try and make out to kape a clane batthryer;
But there's some of those fellers that works those way wires
Talks about "locals" in a way I admires.

Now, luek at these William's by's, Lord bless your sowl,
Don't know a good local from a bricklayer's trowel;
But they come to me mornin's wid "Mike, luek ye here!
Could a man take from this, lest he had a tin ear?"

I luek to the local, an' fot does yez think—
Faith, there's nary corode on the copper nor zinc;
There's nothin' at all to cra-ate any bother,
And jars and the porous cups well filled with wather.

Av course, I'm expected the batthryers to clane,
And fot should I know if their local mashaue
Was broken, or had olms, or divil knows fot;
But them by's are the ones to make me red hot.

Well, the only thing I do to get me relafe
Is to skip all those way wires and call on the chafe;
And when he's not busy or too badly rusht,
He goes for thim, sayin', "why can't yez adjust?"

An' 'pon me owld sowl, fot I till yez is thrue,
A wake local's made sthrong by the turn av a skrew.
If agin for those by's ary local I scrub,
May I ne'er take out crasses agin wid a club.

So write 'em up lively, now, in the next Plug—
Yez can give 'em a fotograf too of their mug;
Yez can write it in prose, or vorse, if yez like,
And fen yez have finished it plase sign it

MIKE.

—The Plug.

[From *The Boston Journal of Chemistry*.]

The Telegraph in War.

THE important part which the modern system of electric telegraphing played in the late war in this country is but imperfectly understood. The field telegraph was in constant use during the entire four years, in both the Union and Confederate armies, and it directed the movements of advancing columns, flashed orders on battlefields, and sent commands from headquarters to right, centre and left of the immense lines which extended over miles of country. No modern general would enter upon a campaign without calling the lightning to his aid; it is now a recognized part of the material of war. Gliding on its secret path through the wide network of cable and wire, it tells him what is passing each hour in the remotest part of the theatre of war, and transmits the commands which decide the fate of nations. In all the more recent wars in Europe and in Africa the field telegraph was in constant use. A correspondent of the London *Popular Science Review* gives the following very interesting account of the same in a recent number of that journal:

It is just twenty years since, for the first time, the electric telegraph was used in the field, and to our own army belongs the honor of having led the way in its adoption. The trenches and batteries before Sebastopol were traversed and connected by lines of telegraph, and the French soon followed our example and constructed a similar system in their own lines—while later on a cable laid across the Black Sea put the armies in the field in direct communication with Paris and London. Since that time a regular telegraph corps has been organized in every European army. And the field telegraph was used by the French in Italy in 1859, and in their campaigns against the Kabyles in Algeria; and in America both the Federals and Confederates made free use of permanent and temporary lines during the War of Secession, the Southern cavalry, in particular, displaying great daring and enterprise in riding round the flanks of the Federal armies, seizing their telegraph lines, sending false messages to the Northern generals, and then cutting the line and retiring as rapidly and secretly as they came. It was, however, in the Prussian army, and in the great campaigns of 1864, 1866 and 1870-71 that military telegraphy attained its greatest development; and after the experience of these three wars, the Prussian telegraph corps is probably the most efficient in Europe.

The object of the field telegraph is to keep the headquarters of an army in communication with its several corps, and at the same time with the general telegraph system of the country. The line may be

either an aerial or a ground wire, or a combination of both, the former being stretched on poles, while the latter is insulated by being enclosed in a light cable, about half an inch thick, and laid along by the road sides or across the fields. The uninsulated wire and the cable are both issued to the telegraph corps coiled on small drums, several of which are carried by each store wagon. In those companies which are to erect a wire stretched on poles, the wagon carries five English miles of uninsulated galvanized iron wire, one mile insulated in gutta percha, 1,000 yards of the cable, and 200 poles with insulators attached, all the wire being coiled on twelve drums. If it is intended to lay a ground line, the wagon carries eleven drums of the cable, one of wire covered with a light coat of gutta percha and tarred hemp, and a few poles and insulators, for carrying the line across small hollows or raising it overhead in crossing roads. Beside these stores the wagon contains all the tools necessary for the work, and a light step-ladder is hung underneath it.

The line is very rapidly and easily constructed. In the case of a ground line it is simply paid out from the drums on the hand or wheelbarrow, being buried in a shallow trench or elevated on poles, when it is necessary to cross a road where the insulation of the cable might otherwise be injured by the wheels of passing vehicles. During the invasion of France, the Prussians frequently avoided the roads in order to protect the line from the *franc-tireurs*, and made considerable *detours*, concealing it in woods, ravines and watercourses. Where the uninsulated wire is used poles are erected about fifty paces apart, the hole to receive each pole being made by driving a sharp pointed iron bar into the ground with a heavy mallet. As soon as a pole is fixed the wire is run through the hook on the top of the insulator, and stretched tight by a man holding it over his shoulder, who keeps it in this position until the next pole is ready to receive it. Wherever there are trees or walls near the line, the work is still further lightened by dispensing with the poles, and merely attaching the wire to the insulators specially constructed for this purpose. In this way the line was erected for the Ashantee expedition, the negro laborers carrying only a light ladder to ascend the trees, a small axe to clear away the boughs, and a gimlet to make the hole for the spindle of the insulator. It never took, we are informed, more than five minutes to fix an insulator to a tree; but in those few places where trees were not available, fully half an hour was occupied in erecting each pole, and even then it was often unsteady and had to be propped and guyed.

In Europe, where there is an extensive telegraph system in operation in every country, there is no need of the field telegraph lines extending from the front of the army to the base of operations. Far less than this is required. All that is necessary is to connect the headquarters of the army with the nearest point on a permanent telegraph line, and in most European countries an army in the field would seldom, if ever, be more than ten miles from such a line. Ten miles of the field telegraph can easily be erected in half a day; indeed, the Austrian engineers assert that on favorable ground they could do the work in two hours. In most cases, of course, the advancing army would have to repair the permanent lines which would be partially destroyed by the retreating forces, and in this way twenty-five miles of wire were often erected by the Prussians in a single day. As soon as an army moves forward, the field telegraph line previously erected is taken down and recoiled on the drums, while a fresh line is laid from the new headquarters to the nearest permanent telegraph. This is done with a view to economizing the material, an enormous amount of which would have to be carried with the army, if the lines it left behind it in its advance were not removed, and the poles, wire and insulators employed in their construction again utilized. The hand barrows of the Austrian telegraph corps are designed to be used in recoiling as well as uncoiling the wire, and for this purpose are fitted with a crank handle and ratchet wheels, so as to enable a man to turn the drum and wind the cable upon it.

Besides the ordinary field telegraph companies, the French army includes a mountain telegraph corps, organized with a view to operations on the mountainous frontiers of the south, or to be ready to carry a line over a range of hills in an ordinary campaign, thus avoiding a long *detour* in the valleys, or securing lateral communication with troops divided from the main army by the hills. As the mountain line would have to be laid along narrow rocky paths, and through lofty passes, all carriages and wagons are dispensed with, and their place is taken by a train of mules. In a mountain telegraph company several of the mules are each laden with two drums of the insulated cable, the instruments and batteries are carried on pack saddles on the back of others, and others again transport the baggage, provisions and forage of the company, and also a light tent, to form a station whenever messages are to be sent along the line.

While the field telegraph affords a commander a rapid and certain medium of communication with his

base of operations and the various corps of his army, it must be remembered that it is one which is continually liable to interruption by an enterprising enemy. Wherever a general has to contend with an army well provided with good cavalry, he will find it extremely difficult to protect his telegraph lines from being destroyed by daring raids of his opponents. There are several easy ways of making a telegraph line temporarily useless. The simplest and most obvious method is to pull down the poles and cut the wires into pieces; but when this is done the damage is easily detected, and the repairs at once commenced. The interruption will, therefore, be far more serious if it can be effected in a way which will not permit of its exact locality being so readily discovered. This can be done by cutting the wire, introducing a piece of gutta percha or any other non-conducting substance into the course of the circuit, and connecting the ends of the wire with it, so as to give it the appearance of one of the ordinary joints or splices of the line. At the same time a few poles can be pulled down in another place, and the wires cut, and the probability is that the engineers who repair the line will not discover the hidden interruption of the circuit until after they have restored the gap, and found that the wire is still cut somewhere else, and even then the place where the non-conducting substance is introduced will not be discovered until some time has been employed in carefully testing the line with the galvanometer.

But there are other dangers to telegraphic communication in the field besides the mere damage to the line. If the enemy's cavalry get possession of a station they can easily send messages containing false information or delusive orders to well known officers of the opposing force, while the place from which they are sent and the assumed name in which they are despatched, will give the messages an appearance of authenticity which, if it does not completely deceive the recipient, will at least be the cause of considerable doubt and perplexity to him, and, perhaps, make him hesitate to accept the accurate information or authentic orders received from other sources. Again—even without occupying a station it is possible to read the messages which are passing along a telegraph line, and thus perhaps discover important secrets. All that is required for this purpose is a small portable receiving instrument and a few yards of copper wire to connect it with the line. A single individual thus equipped can "tap" a telegraph line in the daytime by receiving the message in the ordinary way; and at night (when, of course, it would be easier to approach the line) by listening to the clicking of the armature against the electro-magnet of the instrument. But all these dangers are only of a partial or temporary character. By carefully patrolling and testing the line it cannot be interrupted for any length of time without the damage being observed and repaired. By adopting a secret arrangement that there shall be a certain number of letters in the two or three words at the beginning or end of every message, a despatch sent by an enemy can in most cases be detected. And, again, by employing a cipher alphabet, it will be difficult for any one who taps the line to obtain information from the messages which fall into his hands.

From this brief sketch of the structure and uses of the field telegraph the reader will understand what an important part it plays in modern war.

Line Repairing in Queensland.

THE following account of the perils by flood and field of a Queensland telegraph station master, during the late very rough weather in the North, has been furnished the *Brisbane Courier*:

About twelve o'clock on the 22d of January we lost circuit on the St. Lawrence side. The rain was falling in torrents, and trees were being rooted up by the wind and carried away in every direction. However, there was no help for it—I had to go. I reached the Denison Creek at dark, where I camped, the words "wet through" conveying but a faint idea of the state I was in—matches and everything else floating about in my pockets and saddle bags, so that a fire was out of the question. There I stayed all night, and it rained without intermission the whole time. In the morning the creek was running bank high, and trunks of trees floated past me very often. After considering a while, I resolved to strip, unsaddle my horses, and try with one barebacked. In I plunged and away went the horse, swimming beautifully down the stream, faster than ever I saw anything but steam go before. We reached the opposite bank successfully, but some little distance below where we went in. I then rode, just as I was, to Funnel Creek, a distance of ten miles, to see if the break was between the two creeks, which I felt sure was the case, but not so. On reaching Funnel Creek I found it over the banks, the roaring of the waters, and the amount of drift being something frightful. To think of crossing would be madness, so I retraced my steps to Denison Creek, where I had left my pack horse and equipment, but, being unable to re-

cross it, I remained where I was in the pelting rain all night and till noon next day. Things then becoming serious I fully determined to try it at all risks, so plunged in again, and as my horse had had a good spell, and was desirous of regaining his mate, he swam splendidly and regained "de oder shore." I remained there that day just to recruit myself, and then tackled it again with both horses and equipment, crossed successfully, and remained at the creek for the night. Next morning stripped, and taking my best horse, with the saddle and as few tools as possible, again made the attempt to cross Funnel Creek. I had, however, been too sanguine, for I had hardly got fifty yards into the stream, or about one third the way across, when horse and myself were rolling over and over like corks in the boiling water. I was beginning to feel the water gurgling in my throat when I got free of my horse, and shortly after went bump against a tree, which I instinctively clutched, pulled myself up to the surface, and straddled across a branch. On casting my eyes up stream I saw my horse caught against another tree, but with his legs uppermost, so I gave him up for lost, and was just turning my eyes away when he gave a struggle, freed himself, and floated in my direction.

As he came past I made a grab and caught him in the ring of the bridle, and succeeded in pulling him up, and held him till I was quite exhausted, and then let him go, when he struck out and reached the bank a quarter of a mile below where he went in. The blood was now running from my nose and ears, and I felt a dizziness coming over me, so moved higher up the tree, and having fortunately taken the precaution to have a strap holding a knife, pipe, pouch and tobacco with me, I strapped myself firmly to it. I suppose I fainted, for when I found myself again the sun was over the yard-arm, so I must have been there several hours, having started at daylight. I felt very weak, and my back and legs were literally skinned with the sun; so I lowered myself down into the water, and again strapped myself on with my head and shoulders just above the surface. A log coming on sideways soon made me shift out of that, and I got up as high among the leaves as possible, and made a covering for my head with twigs and leaves. Feeling desirous of a smoke, I fished some matches out of a Leichardt bean, stuck them in my whiskers to dry, which they soon did, and so managed to luxuriate in a smoke. Towards evening I began to feel hungry, and to add to my uneasiness, the creek, instead of falling, kept rising slowly. I determined to vacate my seat; so, getting on to a limb about three feet from the water, I made a dive head first in. When I came to the surface I found myself about five yards from the tree, nearer the bank, but about twenty yards below it. I now struck out for my very life, and down, down I went, not seeming to get a bit nearer the bank, until I came to a turn in the creek, where I made a great effort and managed to reach the edge and touch bottom with my feet. In the meantime the native police had been sent out after me, and the *Copperfield Miner* had a report in its columns that I had been drowned. I returned to my station, started again next day, and camped at the creek. A man was sent with provisions for me and orders to return; this I declined to do, and before the men left me had another try, but my horse knew too much for me, so I tried the pack horse. He, however, only got into swimming water when he jibbed on it, turning short round, and in doing so upsetting himself and me, I losing in this attempt a saddle and clothes. I then sent the man back with a request for two black boys, who came down two days after; and at the seventh attempt I got across the creeks safely, finding seven breaks on the line and thirty-five insulators carried away.—*Melbourne Argus*.

The Telegraph in Central America.

NOTWITHSTANDING the many difficulties which have had to be overcome, the telegraph has made considerable progress, and is still being pushed forward as energetically as possible in the States of Central America. The State of San Salvador has been the most prominent in this work, and the telegraph lines already connect many of its principal places, and are being constantly further extended. The lines are also being continued to connect that State with the adjoining States, and within a short time the line to Guatemala will be completed; and the construction of a line connecting San Salvador with Comayagua, the capital of Honduras, will soon be commenced.

From a communication, or report, by Mr. A. Maury, the Superintendent of the Salvadorian telegraphs, to the Government, made at the commencement of the present year, which has been translated for THE TELEGRAPHER, an interesting account of the telegraphs in that State, and the difficulties which have been encountered and overcome, and which are yet experienced, are given. The Central and South American telegraphs are owned and operated by the governments of the several States and countries, and are more ex-

tensively used for Government purposes than for private correspondence, though they are all open to private use, and the patronage for commercial and social messages is increasing as the system is extended and developed, and the public become accustomed to the use of telegraphic facilities.

The interesting report of Mr. Maury alludes, in opening, to the creditable fact that the Republic of San Salvador took the lead of her sister States in the introduction of the telegraph, and to the obstacles with which she had to struggle, arising from the elements, financial embarrassments, and the ignorant superstition of her rustic population, and says: "From the City of Salvador in every direction the traveller beholds, bordering the roads and spanning the wide-spread plains, the mystic thread that places in immediate communication the most widely separated regions. * * * * Such is the admirable work that, almost from the commencement of its construction in this country, and particularly in its organization as it exists to-day, I have had the fortune to direct—sharing in all the difficulties of its construction as in all its triumphs over material obstacles, as well as over the mistaken malevolence of its credulous enemies, until I behold it almost perfect itself, and come to be an indispensable power in the life of the people; and I feel a glow of satisfaction and pride as I witness each day its increasing estimation and its general utility among all classes of our population."

After referring to the good faith of the employés, to whom are necessarily entrusted the most important secrets and confidences in regard to private and government affairs, he alludes to the increasing appreciation of the telegraph on the part of the municipal authorities and the people of the towns and cities of the Republic, who, for the sake of securing its introduction, undertake the cost of its construction and maintenance. In this manner have been added to the list of stations the towns of Quezaltipeque, Cotepeque, Yzalco, Atiquesaya, Tucuopa and Metopan.

"Guatemala stretches out her hand towards us, and the wire issuing from her centre will come, early, I trust, in the ensuing season, to connect with ours, binding more closely the ties of friendship and welding the chain of fraternity between the two neighboring Republics. Thus the impulse given ever advances, and each step leads onward to ultimate perfection."

The receipts of the Salvador telegraphs do not pay the cost of maintenance and operation, though they are increasing satisfactorily; but taking into account the Government messages transmitted—which, if charged for at regular rates, would amount to a large sum—the lines are not only self-supporting but pay a handsome profit on the capital invested.

On the 20th of December, 1869, the Supreme Government made a contract with Mr. Charles H. Billings, an American, for the construction of the first line of telegraph between the capital and the port of La Libertad. Having procured the necessary material Mr. Billings began the work on the first of March following, inaugurating the first office in La Libertad on the 27th of April, 1870, and that of Santa Tecla on the 20th of June following. "On the 30th of May the contract for the Western line was signed, on which the first telegram that passed along the wires was transmitted from Nejapa to this city on the 20th of October, and successively were opened the offices of Apico the 15th, Cotepeque the 16th, and Santa Ana the 18th of the following December, concluding with that of Acajutla the 6th of February, 1871; the work having lasted nearly a year, in which interval a sufficient number of youths of the country were instructed in the telegraphic art so as to carry on the business of the rising stations.

Afterwards the Provisional Government of Marshal Gonzales, penetrated with the importance and utility of the movement, signed a contract with Mr. Stanley McNider for the eastern lines, with offices at Suchitoto, Chalatenango, Ylobasco, Sensentepeque, Cojutepeque, San Vicente, Zacatecoluca, Usulután, Chinameca, San Miguel and La Unión—which last office was opened on June 18th, 1872.

It being found very difficult to maintain this line—which followed the cart road from Zacatecoluca, crossing the river Zempa at its widest part, and traversed extensive forests, where falling trees constantly interfered with the wires, the route being almost uninhabited—a new contract was made, June 8, with Mr. McNider, for the building of a direct line between Chinameca and San Vicente, which was commenced on the first of July following, under the direction of Mr. Maury. To avoid the dense forests and uninhabited districts it was proposed to construct this line through the open plains and valleys to the north of the volcano of Signatepeque, but on arriving at the margin of the Zempa, with the wire run on the 19th of that month, he was obliged to suspend operations on account of the opposition of the Governor of San Vicente. Finally, the Government not appreciating the inconveniences and difficulties of maintaining the lines, which have since become so evident, decided, against the opinion of the contractor, upon another route, which occasioned three months' delay in the construction of the

line, and increased the cost and subjected it to the same difficulties and disadvantages before mentioned.

The inhabitants of several towns and cities, eager to possess the advantages of telegraphic communication, offered to take upon themselves the expenses of construction and operation, which resulted in an extension of the lines of seventy-nine leagues, which brings all those places in instantaneous communication with the capital and the rest of the Republic. In the east there is less enterprise; "for, notwithstanding there are in these districts ninety-six leagues of wire with twelve stations, there still exist wide spaces without any communication, where apathy reigns undisturbed although it has many large populations; they do not aspire to facilities they have not known.

From what has been said, it can be seen that the three ports of the Republic and the three frontier garrisons are in such close relations with the centre, that a few moments is sufficient to ask for and obtain information at any desired time, and the same may be said of all the interesting points of the State.

The total cost of these lines aggregates \$83,360.37. The total annual expense of operating and maintaining the system is estimated at \$21,200. The revenue derived from correspondence is about \$900 monthly—an annual aggregate of \$10,800—which leaves a deficit of \$10,400. This does not include any amount for the official use of the wires, which is much larger than (Mr. Maury estimates it at four times) the private business.

The remainder of the report is occupied with details of accounts, defects of organization, and the necessity for more executive authority being vested in the Director or Superintendent of the system.

The Survey for the Pacific Cable.

THE U. S. steamer *Tuscarora*, engaged in soundings for the Pacific Cable, arrived at Yokohama, Japan, April 22d, after a passage of thirty-four days from Honolulu, Sandwich Islands, *via* Port Lloyd, Bonin Islands. The survey of the Southern route, from San Diego, California, to Yokohama, *via* the Sandwich Islands, is now complete. The result of the first portion of the survey, from San Diego to Honolulu, has already been printed in THE TELEGRAPHER. We gather from the report of Commander Belknap to the Navy Department that the weather, after leaving Honolulu, was generally very favorable for the work, and that seventy-three casts were made, the deepest being 3,287 fathoms, at which depth the working of the patent reel of Sir William Thomson and the piano wire was as admirable and satisfactory as ever. At that great depth a person standing on the topgallant forecastle, and watching the muning out of the wire from the reel in the gangway, could tell the moment bottom was reached.

A glance at the profile charts shows that after the ocean bed proper is reached, near San Diego, the bed descends in comparatively gentle curves and undulations to the vicinity of the Hawaiian Islands, where a depth of 3,054 fathoms is found; thence, westward, the bed slowly drops till the lead reaches down to 3,287 fathoms, or about three and three quarters statute miles, in the neighborhood of the Bonin group.

But while the bed is comparatively regular, and the character of its soil nearly uniform between San Diego and Honolulu, a range of submarine mountains is found to exist between the Hawaiian and Bonin groups, with soil of varying character, the valleys sending up light yellow-brown ooze or mud in the specimen cups, and the sides and tops of the mountains coral, limestone and sand, with fragments of lava. In three or four instances, too, solid rock was struck, the cups coming up empty and the points freshly hattered. In others the ooze from the plateaus was found to contain particles and fragments of lava; and, in one specimen brought up, sixty miles from the base of one of the submarine peaks, quite a lump of the same material was found. Coral, sand and lava, is also found all the way from the Bonin group to the coast of Japan, and, in short, the entire region west of the Hawaiian Islands would seem to have been subjected, at some remote period, to volcanic disturbances.

Six of these submarine mountains were discovered, ranging from 7,000 feet to 12,600 feet in height, and Marcus Island, which rises scarcely more than from thirty to sixty feet above the surface, lies directly in this range. A cast some eight miles from that island gave a depth of 1,499 fathoms, coral and lava bottom, and the high, wide white beach, occasionally broken with large, black, volcanic looking rocks, presented the same dazzling white appearance characteristic of the beaches on the shores of the Bonin group—and those beaches are all composed of broken coral. Hence, it may not be unreasonable to suppose that Marcus Island forms the apex of a volcanic cone or island, perhaps, in ages past, much higher than now. A thick growth of trees crowns the island, and myriads of birds were flying over and around it.

The ocean bed between the Bonin and the entrance of Jeddo Bay is irregular, as might have been sup-

posed, from the almost continuous chain of islands lying nearly parallel to the route sounded. The deepest water found was 2,435 fathoms, and the next deepest 1,669 fathoms.

Should a cable ever be laid by this southern route, a good place to land it in Port Lloyd would be in or near the ten-fathom hole.

Poetry of Telegraph Poles.

WHAT a receipt for preserving wood—to fill its pores with music! How this wild tree from the forest, stripped of its bark and set up here, rejoices to transmit this music!

When no melody proceeds from the wire I hear the hum within the entrails of the wood, the oracular tree, rejoicing, accumulating the prophetic fury. The resounding wood, how much the ancients would have made of it!

To have had a harp on so great a scale, girdling the very earth, and played on by the winds of every latitude and longitude, and that harp were (so to speak) the manifest blessing of heaven on a work of man. Shall we not now add a tenth muse to those immortal nine, and consider that this invention was most divinely honored and distinguished, upon which the muse has condescended to smile—this magic medium of communication to mankind?

To read that the ancients stretched a wire round the earth, attaching it to trees of the forest, on which they sent messages by one named Electricity—father of Lightning and Magnetism, swifter far than Mercury—the stern command of war and news of peace; and that the winds caused this wire to vibrate so that it emitted harp-like and Æolian music in all the lands through which it passed, as if to express the satisfaction of God in the invention! And this is fact, and yet we have attributed the instrument to no god.

I hear the sound of the wood working terribly within. When I put my ear to it, anon it swells into a clear tone, which seems to concentrate in the core of the tree, for all the sound seems to proceed from the wood. It is as if you entered some world cathedral, resounding to some vast organ. The fibres of all things have their tension, and are strained like the strings of a lyre. I feel the very ground tremble underneath my feet as I stand near the post. The wire vibrates with great force, as if it would strain and rend the wood. What an awful and fatal music it must be to the worms in the wood! No better vermifuge were needed. As the wood of an old Cremona, its every fibre, perchance, harmoniously tempered, and educated to resound melody, has brought a great price—so, methinks, these telegraph posts should bear a great price with musical instrument makers. It is prepared to be the material of harps for ages to come—as it were, put a-soak, a-seasoning in music.—*Thorau.*

Miscellaneous.

ELECTRO-PLATING WITH COBALT.—The following process of George W. Beardslee, of Brooklyn, N. Y., is stated to form a thick and useful covering, which will very perfectly protect the plated surface from the action of the elements, and form a most beautiful plating, very white, exceedingly hard and durable, tenaciously adherent, and not liable to tarnish: “Dissolve the pure metal cobalt in boiling muriatic acid, and evaporate this solution to dryness. Then dissolve from four to six ounces of the salt thus obtained in a gallon of distilled water, to which add ammonia sufficient to show on test paper the solution just slightly alkaline. Then prepare an anode of the metal cobalt, in granular form or broken into small pieces, free from impurities, as follows: Take a plate of carbon, or of some other material that is a conductor of electricity, but not susceptible of being attacked by the plating solution, and place it within a sack or envelope made of some material that is neither a conductor of electricity nor attackable by the solution, formed with open meshes or interstices through which the solution may freely circulate. This envelope should be made to conform in shape to the carbon plate, and large enough to leave a space between it and the plate of, say one half an inch to one inch; then fill this space with the granules of cobalt, which will, as is evident, surround the plate and be in contact with it. By an anode thus constructed a large surface of the cobalt is readily and conveniently exposed to the action of the solvent, and the steady flow of the entire battery current through the cobalt is secured, thereby rendering the dissolution and deposition of the metal steady, uniform and very perfect. This anode is to be connected with the copper pole of the battery by connecting the wire to the carbon plate and suspending it in the plating solution before described, and the article to be plated is connected in the solution with the zinc pole in the usual way. A battery power of from two to five cells (Smee’s battery) will be sufficient to do good work. Care should be taken not to permit the solution to lose its slightly alkaline charac-

ter, as, if this is not maintained, the plating operation will be rendered imperfect, the tenacity, adherence and uniformity of the deposit becoming thereby impaired.—*Scientific American.*

GAS PRESSURE ALARM.—When two neighboring buildings are illuminated by gas derived from the same source it frequently happens that the extinction of the lights in one building causes the pressure of gas in the other to become greatly increased, and sometimes to result in accident. M. Launay proposes, as an alarm to give warning of this over pressure, a bisulphate of mercury battery, in which the liquid is in communication with the gas by means of a siphon, so that the pressure of the gas, in varying, raises or lowers its level. If the pressure is above a certain fixed limit, the liquid is raised so as to come in contact with the metallic portion of the battery, establishing a current which sounds an electric alarm. M. Launay also suggests that a simple method of determining leaks in gas pipes throughout a building is to force some strongly odorous smoke into the supply pipe. The fumes of incense, for example, escaping in any room, would be readily distinguished from gas, and the locality of the leak discovered.

GALVANIC ELECTRICITY WITHOUT CHEMICAL ACTION.—At a recent meeting of the Physical Society Mr. Fleming showed his new battery, in which the metallic contact of dissimilar metals is entirely avoided. The arrangement consists of thirty-six test tubes of dilute nitric acid, and the same number of tubes of sodium pentasulphide, all well insulated, alternating with one another. But strips of alternate lead and copper connect the neighboring tubes, by which means the terminals are of similar metal, and a current of sufficient intensity to violently affect a quantity galvanometer obtained. The potential increases, as in the ordinary galvanic arrangement, with the number of cells employed, until sixty cells showed an electromotive force exceeding that of the same number of Daniell’s elements. In this new battery the acid lead is positive to copper, while in the sulphide it is negative. Mr. Fleming further showed how, by using the single fluid nitric acid, and the single metal iron, a similar battery could be constructed, provided one half of each iron strip was rendered passive. This is an important discovery, for it seems to revive the theory that chemical action is not necessary in a galvanic apparatus to produce electricity. At all events, it is of sufficient interest to merit the sound inquiry into its principles which physicists seem likely to make.

SOCIETY OF ARTS.—The Albert Gold Medal of this society, instituted to reward distinguished merit in promotion of arts, manufactures and commerce, has been awarded for the present year to C. W. Siemens, D. C. L., F. R. S., “For his researches in connection with the laws of heat, and the practical application of them to furnaces and the arts; and for his improvements in the manufacture of iron; and, generally, for the services rendered by him in connection with the economization of fuel in its various applications to manufactures and the arts.”

A Lady who Tolerates the Use of Tobacco.

TO THE EDITOR OF THE TELEGRAPHER.

HAVING read the communication in your issue of the 6th inst., in “defence of tobacco and tobacco smoking telegraphers,” over the signature of “Tom,” I feel inclined to say a few words on the subject. I think he is mistaken when he says that “ladies dislike segars.” I for one must acknowledge that I really like the smell of a good segar in its proper place—in the open air; although I consider smoking an expensive, often unpleasant to others, and an utterly useless habit. True, your correspondent says it acts as a sedative when not taken to excess, but the worst of it is there are so few gentlemen who do not to such an excess that the effect is anything but sedative.

I agree with “Tom” that the ladies would do much better if they would “try and overcome their dislike to this fragrant narcotic.” Now, sisters all, try and learn to overcome your dislike to this pet habit of your brothers, husbands and lovers; for, be assured that if they are once convinced that we really like their pipes and segars, they will soon give them up of their own accord—will you not, young men? Don’t all speak at once. In conclusion, I don’t think “Tom” speaks his heartfelt opinion when he says what he does about getting married, for people who say such things are generally the very ones who don’t think them. But per-

haps he does, since, as he confesses, that he is contented with a segar in the place of a young lady, whose company he might have by going only three miles for it. My friend, I am afraid you are inclined to be indolent. ELINOR.

A Matrimonial Epidemic Among the Oregon Telegraphers.

ALBANY, OREGON, June 15.

TO THE EDITOR OF THE TELEGRAPHER.

NANITCH mika ticka nika? Hyas close wawa: waka halo ciosa nika. Hoopla! Set ’em up again. Whoopee!

I am a victim of a series of the most diabolical conspiracies ever known. Some time since, in a fit of recklessness, I volunteered, or rather agreed to furnish a suitable obituary for THE TELEGRAPHER of every Oregon telegraphic artist that ceased to lead the life of a bachelor, not for a moment supposing that any one of them would have the moral courage to go through all the tribulations requisite to avail themselves of my proposition. But, “’Twas ever thus,” etc.; a series of painful surprises awaited me. One by one, and sometimes two by two they have dropped out, until to-day (my experience has made me cautious about speaking with confidence of anything beyond the present moment), out of sixteen to whom that offer was extended, there remain but four who have not availed themselves of it, by becoming steady Benedicts! And what has caused this outburst of indignation is the presumption, impudence, or whatever you may call it, of Wheeler, of Shedd’s office, coming to our city and carrying away as his bride one of the belles of this hitherto famed place; and right on top of that comes to me the intelligence that one who mastered the art of the dots and science of the dashes under me is on the eve of leading a fair damsel to the altar!

I have been doing a little figuring, and the result is as follows: 12 from 16 leaves 4; 1 from 4 leaves 3; and at this rate 3 from 3 leaves—what?

Query.—If the same energy were displayed by every single person in this State that has been shown by the railroad telegraphers in regard to getting married, how long would it be before the bachelors and “old maids” would become extinct in Oregon?

But these thoughts perplex me too much, and I will have to “disconnect” and get ready for two more “splices,” when I hope to get a “breeze,” and there will be a rest for, that will be enjoyed by

WEEFOOT.

Wanted—A Dictionary.

BOSTON, June 23.

TO THE EDITOR OF THE TELEGRAPHER.

“By gorry that sticks me!” was my first thought after reading in the *Journal of the Telegraph* of June 15th an editorial advertisement with this title, viz: “Wanted—A Character.”

I am not so much surprised at this strange necessity as I am at the profound attempt of the editor near the close of his advertisement, where he says the applicant for position must “bear the alembic of a higher standard.”

Alembic is good! Alembic ought to be promulgated! My first exclamation, when perusing this alembic qualification, was that this editor had got beyond his depth—that he was trying to indulge in some phantas magorical expression, but without a definite idea.

With almost unbecoming jest and merriment I repeated, “Alembic is good!” I took down my unabridged and went for alembic. Much to my surprise I saw that alembic meant “A chemical vessel used in distillation, the beak of which is fitted to the neck of a receiver.”

Here then was a clear and satisfactory explanation of the cabalistic word. The editor evidently intended that as his company manufactured most of its supplies, and as its operators required an artificial stimulus, that applicants should bring an improved whiskey still, and that the beak of which should be fitted to the neck of the receiver—that is, to the neck of the operator and clerk receiving messages. Now, as this is the only meaning of the word, this must be the correct interpretation of the editor’s idea—if indeed he had one—and, with considerable unction, I again repeated, “Alembic is good!”

Now, I think of calling on this editorial Don Quixote and shall bring my alembic with me. It is one of the best alembics in this country, and a first class giascutus and lipitadino both go with it; and I shall be pleased to attach my apparatus to the neck of this learned editor, that he may be convinced of its practical superiority.

Once more I repeat, “Alembic is good!” O. K.

A TEXAS man recently declined to receive a telegraphic despatch from a yellow fever locality lest he might catch the disease,

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Bound Copies of Volume IX for Sale.

WE have a few copies of Volume IX of THE TELEGRAPHER, handsomely bound, which may be obtained, if applied for soon, at Five Dollars per copy. The number of these is very small, and those who desire to get them must apply soon, or the opportunity will be lost, as, once disposed of, we cannot duplicate them—some numbers of that volume having been exhausted.

The Season and its Consequences.

THE summer, which has been so long delayed, has unmistakably come at last, as the intense heat which has prevailed during the past week has assuredly demonstrated. We do not propose to inflict upon our readers a seasonable treatise upon the weather, or even to treat upon the atmospheric electrical demonstrations and exhibitions incident to the heated term, and by means of which electrical equilibrium is restored. These are trite and well worn topics, and we must confess to having fallen back upon them ourselves when hard up for subjects, as editorial writers not unfrequently are, and the atmospheric condition was such as to incapacitate from any serious mental labor. Our real object in alluding to the "heated term," which is upon us in all its calorific excess as we write, is to offer it as an excuse for any lack of interest which may be found either in the editorial or other columns of THE TELEGRAPHER. With the thermometer in the vicinity of 90 degrees, and every pore in the body exuding rivulets of perspiration, who can be wise, witty or instructive? Wisdom and instruction do not come by inspiration or intuition, but are the results of severe mental labor and practical experience; and who of us is capable of undergoing either under such atmospheric conditions? We have noticed, during the years in which it has been our lot to conduct this paper, that when the summer solstice has been fully inaugurated, and a high temperature and atmospheric electricity prevail, that most of the numerous correspondents of the paper give themselves a vacation, so far as writing for its columns is concerned, and that the subjects which interest them so much for nine months in the year that that portion of the paper which is devoted to their use is usually too circumscribed to accommodate their desire to discuss them, is scantily supplied with the productions of their pens. We cannot blame

them for this; for if we, whose business it is to write, find it so difficult at such a time, how can it be expected that those who write only from voluntary impulse, or because they desire to be heard in its columns, should afflict themselves, or afflict those who may read them, with their heated compositions? However, we trust that we shall not be entirely deserted by our regular contributors, and that they will, at least when a cool day or two may intervene, remember that the demand for "copy" is as great in hot weather as in cool, and lend us a helping hand and pen.

Many excuses have been offered for editorial dullness, but we think that of the heat is about the best, unless we should all be converted to unwonted candor, and acknowledge that it is natural and inherent, which we fear our readers may long ago have decided to be the case. However this may be, it is too hot for controversy, and each one has full liberty to think and decide as shall seem best to him or her, at least until cooler weather comes, and the year's crop of mosquitos has been gathered.

There are other beneficial effects of a heated season besides and beyond its effect upon the writers for the press. For instance, Congress, which a few weeks since was unable to agree upon finances, appropriations, or apparently anything else—or if an agreement between the members could be secured, a similar desirable condition of affairs between it and the President was wanting, and, in consequence, the session which began in December threatened to continue until the Potomac was again frozen over—when Old Sol asserted his ascendancy, and the summer heats and odors of Washington began to develop themselves, with what unanimity they commence to set the business of the two Houses in order, dispose of such measures as must be acted upon, postpone the others to a more convenient season, and, shaking the dust of the capital from their feet, hie themselves away to the green fields, watering places, or if this was impossible, to meet their constituents and explain to them those things which had seemed illogical or inconsistent when seen through the medium of press reports.

It is, indeed, a beneficence that brings about such a desirable result. Only consider for a moment what a terrible thing it would be for frequent and protracted sessions of the "WM. ORTON and GARDINER HUBBARD debating society" to be held under existing atmospheric conditions! Well might the members of the Appropriation Committee of the House and the Post-office Committee of the Senate pray to be delivered from such an affliction, and exclaim, with MERCUTIO, "A plague on both your Houses!" Only think of HUBBARD detained from the shores of Massachusetts Bay to watch and aid his telegraph monopoly project and counteract the statistics of the erudite PRESCOTT, and President ORTON summoned to the fray at short intervals to defend the telegraph interests of the Western Union Company against the onslaughts of the persistent HUBBARD! And then the unfortunate committeemen, already inextricably bewildered by the conflicting statistics mercilessly projected upon them by HUBBARD and SAUER on the one hand, and PRESCOTT on the other, and the unanswerable arguments pro and con of Messrs. ORTON, LOWERY, HUBBARD, RAMSEY, and last, but not most afflictive, of Colorado JEWETT—how could they be expected to endure more during this hot weather and live? We more than suspect that it was mainly out of consideration for all these parties that both the Senate and House resolved to bring the session to a close, and give them time to recuperate their energies and begin the never ending game over again next winter. Had this not been done, undoubtedly, before the sweltering dog days had come in August, an additional long row of tombstones would have made its appearance in the Congressional burying ground, upon each of which might be truthfully engraved the epitaph, "This man was talked to death on the subject of the postal telegraph!"

We will not pursue the painful subject further. Happily this sad fate has been avoided by the adjournment of Congress on Tuesday last, and now for a few

months we may have peace. Very likely our readers, who have followed us thus far, think that it is time we should give them a rest, and in this we fully concur. In conclusion, we would merely say that we trust no reader will exhaust his or her mental energies in trying to ascertain what this essay is about, or why it is written, and to save them from any unnecessary effort in that direction, will confide to them the secret that its purpose is to fill the space in the columns of THE TELEGRAPHER which is usually devoted to the leading editorial article.

The Volume Half Completed.

THE present number of THE TELEGRAPHER completes the first half of the Tenth Volume. Time passes so rapidly that it seems but yesterday that we wrote the article introducing the present volume to our readers; but six months have elapsed since that pleasant duty was performed, and from the middle of winter we are in the midst of summer.

The experience of the past six months has demonstrated the hold which THE TELEGRAPHER has upon the regard and esteem of the telegraphic fraternity of the country. The circulation has increased over the previous volume, and we are constantly receiving commendation and encouragement which is of the most gratifying character. We are assured, by those best capable of judging, that the present volume is an improvement, in almost every respect, over any which has preceded it, and that the paper has become indispensable to those who desire to keep up with the advance which science and the telegraphic art are constantly making.

Our advertising patronage is all that can be desired, and, in fact, not unfrequently exceeds the limits which we can devote to it. The value of THE TELEGRAPHER as an advertising medium is acknowledged, and the generous advertising patronage which it is favored with, is a convincing and satisfactory evidence of the fact.

This is the dull season, and we hope that the friends of the paper will bear this in mind, and will exert themselves to maintain and increase its subscription list, during the next two months especially. Efforts to that end at the present time will be doubly welcome and appreciated. We shall endeavor not only to maintain the present high character and value of the paper, but to still further add to them. No labor or expense requisite to this end has been or will be spared. THE TELEGRAPHER has become one of the established institutions of the country, and, as the representative of the telegraphic fraternity and of the great telegraphic interests of the country, should receive even a more general and liberal support than has already been accorded to it.

Quite a number of subscriptions expire with this number. These we hope to have promptly renewed, and accompanied by many in addition. Let every telegrapher, and every friend of an organ of the telegraphic fraternity, remember that the more liberal the patronage received the better paper can we furnish them with.

Congress and the Telegraph.

IN its anxiety to get away from Washington, and, perhaps, because of the muddle which, evidently, the subject has got into, Congress has adjourned without taking any action on the postal telegraph. We predicted this result at the commencement of the session, and the correctness of this prediction has become more and more apparent as the session progressed. Early in the winter it was the evident intention of Congress to give the subject the go by, and as little attention has been bestowed upon it as possible.

The next session is the short one—commencing on the first Monday of December next, and ending, by Constitutional limitation, on the fourth of March—and in this time there will be no opportunity, even if there was the desire, to give any considerable attention to the subject; so that telegraph interests may be considered practically safe from Congressional interference for the next year and a half, and, if wisely admini-

tered in the meantime, it will be a long time before any serious effort will be made to interfere with the existing telegraphic status. Believing as we do that this is the best policy for all concerned, we are rejoiced that the danger of such interference, which at one time was by many considered imminent, has been averted.

Now, let our telegraph managers pursue a wise and liberal policy, and go on and extend the lines and facilities to meet any reasonable demand of the public, avoiding any effort to establish a monopoly of the business, and they may calculate on a permanent condition of the present telegraphic status. So mote it be.

The Completion of the Euro-po-Brazilian Cable.

THE last section of submarine telegraph cable of the Brazilian line has been successfully laid, and South America has been placed in direct telegraphic communication with Europe. This is an important event, and completes another link in the electric girdle around the world. It has been justly the occasion of much rejoicing in Brazil and Portugal, and the usual congratulatory messages have passed between the Governments of those countries upon the establishment of telegraphic connection between the two countries.

The good work goes bravely on, and with the laying of the cable between our Pacific Coast and Japan and China the electric cord will engirdle the earth. This cannot be much longer delayed. The cable, and the capital for this will, no doubt, come from England—through the enterprise of whose scientists and capitalists the control of nearly the entire submarine telegraphs of the world has been centred in London—our own citizens generally confining their participation in such enterprises, however intimately connected with their interests, to fault finding and grumbling at alleged extortions of those who have risked their money in establishing them.

Personals.

Mr. WM. E. SMITH, who has occupied the position of manager of the Western Union Telegraph office at San Diego for two years, takes temporary charge of that company's office in Oakland to-day. Mr. SMITH is, besides being a first class lightning manipulator and genial gentleman of "fibre," a writer of no mean calibre.—*Daily Alta California, June 11.*

Mr. E. W. H. COGLEY, of the Western Union Baltimore, Md., office, has accepted a position with the same company at No. 145 Broadway, N. Y., vice Mr. CHARLES H. PARR, transferred to the day force.

Mr. CHARLES H. MIXER, quite recovered from his recent serious illness, has returned to duty at No. 145 Broadway, New York. Probably there has been no return there in a long time which has been a source of so much genuine gratification to all as that of Mr. MIXER.

Mr. GEORGE W. SAWYER, after quite a prolonged stay in the good State of Maine, is at his post at No. 145 Broadway, New York, again, looking as hale and hearty as a river pilot.

Mr. FRED. N. COOK, night operator with the Franklin Company at Providence, R. I., has resigned, to accept a position with the Western Union Company at Worcester, Mass.

Mr. D. W. GRANDY, late night operator in the Western Union office at Worcester, Mass., has accepted a position on the night force at 83 State street, Boston, same company.

The Telegraph.

By Cable.

LAYING THE EUROPO-BRAZILIAN CABLE.

LONDON, June 19.—The steamship Edinburgh, engaged in laying the section of the Euro-po-Brazilian submarine telegraph cable from St. Vincent, Cape de Verde, to the coast of Brazil, was at noon to-day in latitude 2 deg. south, longitude 32 deg. west.

LONDON, June 22.—The steamer Edinburgh, which is laying the telegraph cable from the Cape de Verde to Brazil, has arrived off the Brazilian coast. The following despatch was received to-day from on board:

"NOON, SUNDAY.

"Spliced on the intermediate cable in 1,100 fathoms

this morning. Hope to make the final splice at three this afternoon. The cable is in perfect condition."

THE EUROPO-BRAZILIAN CABLE COMPLETED.

LONDON, June 22.—The Brazilian cable has been successfully laid, and London is now in telegraphic communication with Brazil. The following despatch was received to-day from the officers of the Cable Company:

"PERNAMBUCO, June 22, 1874.

"The cable is in perfect order and will be opened to the public for business to-morrow."

REJOICINGS OVER THE COMPLETION OF THE EUROPO-BRAZILIAN CABLE.

PERNAMBUCO, June 23.

The successful laying of the submarine cable, bringing Brazil into telegraphic communication with Europe, has been the occasion of much pleasurable excitement in this country, and there is a general jubilee in Pernambuco

CABINET CONGRATULATIONS BETWEEN RIO AND LISBON.

LISBON, June 23.

The usual pleasant messages have passed between the governments of Portugal and Brazil over the establishment of telegraphic communication between the two countries.

TELEGRAPHIC CONFERENCE.

LONDON, June 23.

The London Post of to-day says an International Conference will assemble at St. Petersburg in 1875, for the purpose of revising the rules and regulations adopted by the Paris Convention of 1865, for the government of telegraphic lines.

Some twenty-two States are expected to be represented by delegates.

Foreign Telegraphic Notes.

INTELLIGENCE has been received in London that the steamship Gomes, belonging to Messrs. Siemens Brothers, having on board a section of the River Plate Telegraph Company's cable, had grounded at Rio Grande and become a total wreck. The crew was saved.

At a meeting of the shareholders of the Cuba Telegraph Company, held in London June 12th, resolutions were passed authorizing the raising of additional capital for laying a duplicate cable on a section of their line, in anticipation of the increased traffic about to be brought upon it by the Amalgamation of the Central American system with that of the West India and Panama. The chairman made a very satisfactory statement with respect to the improvement of the traffic, the receipts for the month of May showing a considerable increase over those of the previous month, and looked forward to still better results as soon as the union between the North and South American systems was completed and ready for business.

Reuter's Telegram Company (Limited), in view of the expected early establishment of direct telegraphic communication between Europe and South America, are organizing the extension of their system to the South American Continent. Agents will be appointed for the regular transmission of important political and commercial news to and from Europe and South America. The company will also undertake the transmission of private telegrams of one word and upwards. The names of firms and their various correspondents will be registered forthwith, free of charge, in order that the service may commence upon the opening of telegraphic communication.

Gas Lighting by Electricity.

A NEW pneumatic gas lighting apparatus, now being introduced by Mr. Asahel Wheeler, of Boston, Mass., was recently tested at Providence, R. I., with satisfactory results. A current of compressed air is transmitted from a central engine to diaphragms at the burners, the moving of which turns on the gas, which is then lit by an electric spark. Forty lights were kindled and extinguished simultaneously with great rapidity. It is stated that by this device all the street lamps in a city may be lit by the movement of a single lever, at any certain point.

Telegraphic Poetry.

THE operators of the Western Union Telegraph Company are becoming very "spruce" with regard to their toilets since the pretty compositor of a newspaper opposite has established herself beside the window. One of the operators—a very classic looking widower—has donned a white vest, to make himself

more conspicuous than his rivals. On his desk was found the following:

"I'd like to be a type,
And in my little case,
To be handled by an angel,
And look into her face—
For tho' 'tis pale 'tis charming,
As she looks across the street;
I'd bask in sunshine of her smile—
My heart is at her feet."

To which the red haired Italian added:

"Oh! charmer! quench the fire
Cremating this poor elf,
And stop his mad desire
Of a-killin' of hisself."

If that fair compositor has a heart she cannot resist that touching appeal.—*San Francisco Bulletin.*

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ending May 26, 1874, and bearing that date.

151,209.—AUTOMATIC TELEGRAPHY AND PERFORATORS THEREFOR.—Thomas A. Edison, Newark, N. J.—Case 83. Application filed September 2, 1873.

Roman letters formed by perforations. Depression of one key selects and actuates the required punches, from a number thereof, to form the letter corresponding to such key. Message is chemically printed at receiving end in Roman letters.

1. A strip of telegraphic transmitting paper perforated with holes of uniform size, grouped together to represent ordinary letters or figures, substantially as set forth.

2. The mechanism for making groups of perforations in a strip of paper in imitation of letters or characters, the same consisting of punches massed together in a square, or nearly so, and mechanism intervening between such punches and the finger keys, for selecting from such mass of punches those that are required for perforating characters corresponding with the characters upon the respective finger keys, substantially as set forth.

151,335.—ELECTRO-MAGNETIC CAR BRAKE.—Francis F. A. Achard, Paris, France. Application filed January 15, 1874.

Circular magnets on an axle suspended by pivoted frame; circuit closed thereto; they are attracted against axle of wheel, which communicates rotary motion to the magnets and drums attached thereto, brake chains being wound up on latter.

The suspended shaft A, carrying the circular magnets L L, the central magnet C, and the loose drums F F, combined with the axle Q and brake chains H, substantially as and for the purpose specified.

For the week ended June 2, 1874, and bearing that date.

No. 151,568.—THERMO-ELECTRIC PILE. Charles Clamond, Paris, France. Application filed May 22, 1874.

1. The mode of uniting the negative strip with the bar by means of a metallic ring or bent, soldered to or making part of the strip, and incorporated into the body of the bar by casting, substantially as set forth.

2. The manufacture of the bars of thermo-electric piles, by casting the same in moulds preliminarily heated to near the fusing point of the thermo-electric material, as set forth.

3. The combination, with the elements A, of the central perforated radiating cylinder B, made of refractory material, the pipe E, and the Bunsen burner C, the same being arranged and operating together, as herein shown and set forth.

For the week ended June 9, 1874, and bearing that date.

No. 151,750.—ELECTRIC SIGNAL APPARATUS FOR FIRE HOSE.—JOSEPH BUCHTEL, Portland, Oregon. Application filed April 1, 1874.

Sections of both wires always connected, and both he lices at each coupling protected by a single sheath.

In a fire telegraph the insulated wires D D, embedded in the hose A, and having their sections connected by the double coil D', enclosed in the case F, substantially as shown and described.

Born.

WELLER.—At Brooklyn, Long Island, Sunday, June 21, to Mr. L. E. WELLER, of No. 145 Broadway, N. Y., a daughter.

Married.

WHEELER—BASSETT.—At the residence of Jacob Norcross, Esq., Albany, Oregon, June 11, 1874, by the Rev. S. G. Irvine, Mr. CHARLES R. WHEELER, operator at Shedd's Station, O. & C. R. R., to Miss ORPHA BASSETT, of Albany.

Still another! A terrible epidemic is sweeping off the Oregon telegraphers into matrimony very rapidly. The one in this case had the presumption to come to Albany and carry off a cousin of the undersigned—chief monner—but who forgives them both, and wishes them a long, happy and prosperous life.

THE NONPAREIL TELEGRAPH APPARATUS,
NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible. Since its introduction over 2,000 of them have been sold, and it is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50
Two sets of Instruments, etc., 12.00

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

THE "SNAPPER" SOUNDER.

NEW STYLES, NEW PRICES.

TRADE MARK "SNAPPER,"
PATENTED MAY 12, 1874.

The unexpected and growing demand for the original "Snapper" Sounder, beyond the expectations of the manufacturers, has delayed the introduction of proposed styles and improvements.

Having increased our facilities and accumulated sufficient stock to enable us to fill orders promptly, the following varieties are now offered for sale at prices which will accommodate all classes.

The "Snapper" Sounder, plain.....30c. 6 for \$1.50.
" " " nickel plated spring... 0.40.
" " " or 6 for..... 1.80.

A few were manufactured to order with hard rubber knobs. They were so well liked that I have decided to introduce them to the fraternity. The springs are secured by two screws, and should they break, may be replaced at an expense of 15 cents. They are thoroughly made and finished.

PRICE,  75 CENTS.

To the Dominion 5 cents each extra.
A liberal discount to agents.

St. Louis, Mo.,
St. John, N. B.,
Springfield, Mass.,
San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

QUICK SALES, SMALL PROFITS AND SUPERIOR GOODS.

We are offering any of our unequalled Telegraph Instruments at 20 per cent. discount from list prices.

L. G. TILLOTSON & CO.,
8 Day Street, N. Y.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,

No. 50 BROAD STREET (Rooms 12, 13 & 14).

P. O. Box 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—

American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,

No. 234 West 39th St.,

New York.

MAGNETO-ELECTRIC ALPHABETICAL
DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.

OFFICES:
114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH
in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,
which is the best watchman's time recorder in the world. Also,
ELECTRIC AND CONTROLLED CLOCKS
of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.

All Instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
OF
EVERY DESCRIPTION,
38 VESEY STREET, New York.

NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

**RELAYS,
SOUNDERS,
REGISTERS and KEYS.**

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,
For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.
Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.

BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for

HOGHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Send for New Catalogue and Price List.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratournerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS

for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without **ANY ATTENTION** whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.

No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY
 THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

 23 MURRAY STREET and 27 WARREN STREET.

THE BISHOP GUTTA PERCHA WORKS,
 422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,
 FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,
 AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

THE PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable. Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

SARGENT & STUDLEY, 26 Park Place,
 RUBBER CLOTHING CO., 363 Broadway,
 D. HODGMAN & CO., 27 Maiden Lane,
 SHEPARD & DUDLEY, 150-William St.

Earth Currents.

THE questions of the hour appear to be, "What is a farad?" and "How can the true resistance of a wire be obtained when an earth current flows over it?" The farad matter seems to be satisfactorily explained but there still exists doubt in relation to the latter.

It is generally conceded by scientists that different points upon the earth's surface possess different potentials, and, if two such points be connected by a telegraph wire, a current of electricity will flow over the wire in a direction toward the point of lowest potential. This may account for the earth currents found upon lines of considerable length; but earth currents are also found upon lines of only a few yards in length. If two gas posts be connected by an insulated wire, a current will be found to flow over it. If two similar pieces of iron, or other metal, be buried in moist earth, or immersed in a jar of pure water, a current is established upon connecting the two pieces of metal by a wire. It is probable that the cause which produces the difference of potential, when two plates are buried in moist earth, is identical with that of plates immersed in a jar of water. In other words, that two metal plates buried in the earth and connected by a wire act simply as a cell of battery.

It is not so important to know the origin of these earth currents as to know how to eliminate them in testing. This point seems to be unsettled yet. The following diagram will show how the earth currents affect the test:

The diagram represents the design of the Wheatstone balance, manufactured by Messrs. Gray & Barton. The battery current, starting from B, on reaching D, finds two routes. If both routes have an equal resistance the current divides in two equal parts, one part reaching the earth at F, the other at the extremity of the line at a. No part of the current will flow through the galvanometer G. But an earth current entering the line at b, on reaching c, finds three routes to the ground—one through G, E, R and F; one through G, I, D and B, the other through J, D and B. When there is no earth current, the resistance unplugged in order to bring the needle to zero, is the true resistance. If, however, an earth current enters the line at b, a portion of it passes over the bridge and deflects the needle. In order to counteract the effect of the earth current upon the needle the balance must be changed, so that a portion of the testing current will flow over the bridge equal to the earth current, and in an opposite direction. It is evident that by this change the resistance unplugged will not be the true resistance of the line, but either too great or too small, according to the direction of the earth current.

For example: Suppose the two first branches of the bridge have equal resistances, the third branch a resistance box with 60 ohms unplugged, the fourth having in circuit a line of 60 ohms resistance—by closing the battery key no current will flow through the galvanometer (if there is no earth current) because the branches are proportional. Now, suppose an earth current be introduced upon this line, it would flow to the point c, in diagram, and a portion pass over the bridge deflecting the needle. In order to bring the needle back to zero we must unplug or plug up resistance, as the case may be. In this case, suppose we have to plug up 10 ohms, making the total resistance un-

plugged 50 ohms—by reversing the poles of testing battery the current that before neutralized the earth current now passes in the same direction as the earth current, and the force tending to deflect the needle is double that of the earth current alone. In order to again bring the needle to zero we should have to unplug an additional resistance twice as great as was plugged in the first place, or 20 ohms. The mean between 50 and 70 ohms in this case would approximate the true resistance. It would not be absolute, because, in changing the resistance, we change the joint resistance of the bridge and vary the testing current. It would be necessary to unplug a little over 70 ohms to balance the needle.

From the foregoing we conclude that the mean between the positive and negative readings is the true resistance, or very nearly so in certain cases. In working short lines especially, care should be taken to have the battery current pass in the same direction as the earth current; the earth current will then assist the battery current; whereas, if they pass in different directions, the difference between the two currents would be the effective working current. By alternately grounding the two poles, one can tell by the working of instrument which one gives the best result.

Chillicothe, Ohio, June 24. I. N. MILLER.

A New System of Duplex Telegraphy.

IN *The Telegraphic Journal* of October 1st, 1873, Mr. Preece makes a statement to the effect that if there was no extra adjustment necessary to maintain a balance in duplex telegraphy, it would be "simplicity itself," and that this "is a problem remaining to be solved." Being but a callow telegrapher and scientist I submit the following, and invite criticism or improvement, if worthy of either:

At terminal office B, from copper plate + of main battery, M B', say fifty cups, all the current goes to main line M L through armature a, for it cannot go to ground G, through battery I B', of fifty cups, because it meets a like pole; therefore, the outgoing current does not affect relay R' at that station.

At terminal office A the incoming current divides one half through relay R, armature a, and battery I B to ground G; the other half through rheostat Rh' of same resistance as relay R, through armature a', and main battery M B to ground G. At terminal office B the outgoing current goes to ground and through earth to B, same as the other current went to main line from B—the other apparatus at each end being arranged exactly alike, with the above exception. When key K' is opened by sending operator, the circuit of local battery L B' is broken (which operates the two sending sounders in the local circuit, the armatures of which perform the office of keys), and the armature a' opens main battery M B' branch of main line, therefore no current goes to relay R from B. But the half of outgoing current from A, which went through M B', now flows through relay R'; but being forced to flow through a resistance or neutralizer I I B' of sufficient resistance to neutralize this added current, it does not affect relay R', for the instant key K' is opened armature a' opens relay branch of main line between the two connections of the L I B' circuit.

Thus, with common instruments and without any extra resistance above half of that relay opposed to main current, half of battery current, less main line leakage affects receiving instrument, without any changing of adjustment above that required in the single working circuit. I claim the above as my invention.

S. J. M. BEAR.

Mitchell, Iowa, June, 1874.

It has just been learned that Galvanism was discovered by a man named Swammerdam, 130 years before Galvani called attention to it. The world, however, will not willingly change the name in order to give him the honor belonging to him. Swammerdamism would be awful.

[From *The Telegraphic Journal*.]

Electrical Apparatus used by Robert Houdin.*

ROBERT HOUDIN'S house was called the Priory. The entrance was for carriages by a large gate, for visitors on foot by a door on the left. A box on the right received newspapers and letters. The house stood about 430 yards from the entrance gate, and a broad winding carriage-way led to it across a park shaded by aged trees.

The door on the left is painted white and has on it, at the usual height, a plate of gilt copper, bearing the name, "Robert Houdin." Under this plate there is a little knocker, also gilt. The visitor lifts the hammer according to his taste; but however feeble the stroke, a bell peals through every part of the house at 430 yards distance, and does not cease to ring until the lock is opened. In order to open this lock it is only necessary to push in a button in the wall. By the bell ceasing to ring the servant is made aware that he has shot the lock, and at the same time that the bolt is shot. The name of Robert Houdin disappears suddenly, being replaced by an enamelled plate bearing the word "Entrez," painted in large characters. The door closes with a spring, and when once shut no one can go out again without enacting certain formalities. As it opens it automatically causes a bell to give two distinct peals at two different angles of its opening and shutting. These four little peals, although produced by different movements, are heard at the Priory, spaced by silences of equal duration. To illustrate, let us suppose that a solitary visitor arriving at the gate knocks thereat, the people at the house open the lock, and the visitor enters, pushing the door, which shuts instantly by means of a spring. The four strokes of the bell caused by the opening and shutting of the gate followed, at equal intervals of time—drin, drin, drin, drin—so that the people at the house are aware only one person has

arrived. Supposing, however, that several visitors come, the first enters pushing the door, and according to the rules of politeness holds it open until each has passed, but the interval between the two first and the two last peals is proportional to the number of persons who have entered. The chime is heard thus—drin—drin—drin—drin, and the calculation of the number is very easy to an experienced ear. An habitual visitor makes himself easily known. He knocks, and knowing what ought to happen, he does not stop, as one might say, at the foolish tricks of the gate. The door

has no sooner been opened than the four equidistant peals are heard and announces his entrance. It is not the same in the case of a new visitor. When the word "Entrez" appears his surprise causes him to pause, and it is only after the lapse of some seconds that he makes up his mind to push in the door. His step is slow, and the four peals are like his step—drin—drin—drin—drin. The people at the Priory prepare to receive a new visitor. Again, the travelling beggar lifts the knocker timidly. Fearing some mistake he hesitates to enter, and if he does so, it is only after some seconds of waiting and uncertainty. As the people at the house hear the peal thus—d-r-i-n—d-r-i-n—d-r-i-n—d-r-i-n, they know that some poor person is about to enter. They go forth to meet him and are never deceived. Suppose, however, that some one comes to pay a visit in a carriage, the footman descends from his seat and immediately proceeds to open the little gate. Having entered he finds hanging on the inside the key of the large gate, which an inscription points out to him. He has nothing to do but to open the two folding doors. This double movement is heard and seen at the house by means of the chimes, and a tablet placed in the hull on which are painted these words: "The doors of the gate are—the blank space being followed by the words "open" or "shut," according to the state in which the gate is. M. Houdin continues, with this tablet I can assure myself every evening that the gates of the house are shut.

Let us go on, however, to describe the letter-box. It is closed by a little swinging lid, arranged in such a manner that when it is opened it causes an electric peal to ring at the Priory. The postman has an order to put in at once with a single movement all the newspapers, and then in the same way the circulars, after which he puts in the letters one by one. The number of each kind sent is made known to a person at the house, so that if one is not an early riser he can count the different parts of his post-bag lying in bed. To avoid the trouble of sending letters to the post-office in the village we write in the evening; then, by turn-

* Abstract of a paper by the late Robert Houdin in *Les Mondes*.

ing an index, called a "communicator," we change all the arrangements; that is to say, the postman the next morning, when putting his letters into the box, instead of sending a peal to the house, hears one near him, which tells him to go there and take the letters. My electric porter leaves me nothing more to desire. His performance is most exact, his fidelity is above all proof, his discretion is without equal, and as to his expense, I doubt whether it would be possible to give less for so perfect a servant.

I now proceed to give some details of a plan, by the aid of which I can take care that my horse shall have his proper amount of food at the right time. This horse is a mare, a good natured old girl, somewhat aged, which answers to the name of "Fanchette." We regard her as almost the friend of the house. Fanchette has a person appointed to feed her. This is a very honest boy, who, in consequence of his honesty, does not take offence at my electric plans. But before this servant I had another who was an active, intelligent man, passionately attached to the art which was formerly cultivated by his master. He only knew one trick, but he executed it with rare ability. This trick consisted in changing my oats into five franc pieces. The stable is only forty-four yards distant from the house, but in spite of this distance it is my workshop which makes the distribution. A clock is charged with this duty, and is assisted by the aid of an electric communication. The distribution takes place three times a day at fixed hours. The distributor is of the greatest simplicity. It is a box of the form of a funnel, filling the measure in a proportion regulated beforehand. But it might be asked, would not a person steal the oats from the horse as soon as they fell into the manger? No. For the electric arrangement which causes the oats to fall into the manger could not have effect unless the door of the stable is locked. But could not the thief be shut in along with the horse? That is not possible, because the bolt will not shut except from the outside. Then one could wait until the oats had fallen in to go in and take them away. Yes; but there is a warning of this by a chime, arranged in such a manner as to be heard in the dwelling house if any one opens the door before the oats are entirely eaten by the horse.

The clock of which I have just spoken has the duty also of transmitting the hour, by the same electric thread, to two large dials placed one in front of the house and the other at the gardener's lodge. The first indicates the hour to the whole valley, the second—since the gardener's lodge faces all our windows—gives to the people of the house a uniform and regular time. This time is communicated by the same process to many different dials in many parts of the dwelling. There belongs, common to all these dials, a single bell, which can be heard by the inhabitants of the Priory, and also by the whole village. It is on the top of the house, under a sort of campanile, and is used to call the people together at meal hours. I placed, under this bell a clock-work sufficiently powerful to raise the hammer at the required time. But as it is necessary to wind up the weights of this machine daily, I availed myself of a lost, or, to speak more correctly, a not utilized force, to perform this duty of itself. For this purpose I established a connection between the folding doors of the kitchen, situated on the ground floor, and the winding part of the clock at the top of the house, arranged in such a way that in going and coming at their work the servants constantly wind up the weights of the clock without any idea of what is going on. This is almost a perpetual motion about which one need never take any trouble. An electric current lifts the catch of the striking part, and causes it to make the number of strokes indicated by the dials. This distribution of the time gives me the power of using on certain occasions a little trick which is very useful to me. When for any cause I wish to have my meals sooner or later, I secretly press a certain electric spring, and I put on or back at my will the dials and striking arrangements of the house. The cook often finds that the time passes very quickly, and I gain a quarter of an hour more or less which I should not have obtained otherwise. It is again the same regulator which every morning, by the aid of electric connections, awakes three persons at different hours. The alarm rings for that purpose sufficiently loud to awaken the heaviest sleeper, and it continues to strike until the person to be called displaces a little spring at the extremity of the room. For that purpose he must get up, and then the point is gained.

I torment my poor gardener well with my electricity. Would one believe that he cannot warm my conservatory beyond 10 degrees of heat, or lower the temperature beyond 3 degrees of cold without my knowing it? In the morning I say to him—"John, you raised the heat too high; you broiled my geraniums;" or, "John, you are in danger of freezing my oranges; the thermometer has fallen to 3 degrees below zero." John scratches his ear and does not answer; I am sure he regards me in some measure as a sorcerer. A similar arrangement is placed in my wood store to warn me of the least danger of fire. However

trifling in value my precious objects may be, I endeavor to preserve them, and for this purpose I think it right to take precautions against thieves. All the doors and windows of my house have an electric communication which connects them with the chimes, and are so arranged that when one of them moves the bell rings the whole time of its opening. What a nuisance it would be if the chimes sounded every time a person opened a window or wished to go out of the house. It is not so. The communication is interrupted all day, and is only established at midnight. The clock for feeding the horse establishes this. When we are away from the house the electric communication is permanent, and in case of opening with malicious intent, the great chime of the clock—of which the catch is raised by electricity—rings without ceasing, and produces the sound of alarm. The gardener, and even the neighbors, thus warned, the thief would easily be taken in the trap. We amuse ourselves often with shooting with a pistol. We have a very well arranged ground for this purpose; but in place of the usual way of announcing the part of the target struck, the one who makes a bull's eye sees a coronet of leaves suddenly appear on his head. There is in my park a deep road which it is sometimes necessary to pass. There is no kind of bridge for this purpose; but on the edge of the ravine a small seat is to be seen. The person out walking sits down, and he is no sooner seated than he finds himself transported to the other side. The traveller puts his foot on the ground, and the little seat returns to bring another passenger. This arrangement works both ways; there is the same aerial voyage in returning.

A New Printing Telegraph.

Mr. GEORGE W. HOWE, of Stevenson, Ala., has recently taken out a patent on a printing telegraph apparatus which possesses many novel features, differing widely from any of the previously existing inventions in this line. Instead of employing a separate key for each letter, Mr. Howe makes use of six keys only. By pressing down single keys, six different letters may be printed. By combinations of two keys twelve more letters are obtained, while the remaining letters are formed from combinations of three keys. By a peculiar arrangement of mechanical circuit closers, governed by synchronous mechanism at the two ends of the line, and working in combination with the keys, two or more instruments may be simultaneously employed in transmitting over the same line. The essential principle of Mr. Howe's system consists in transmitting, at regular and fixed intervals of time, from one to three pulsations or waves of electricity for each letter, which, on arriving at the distant instrument, are, by means of a synchronously moving commutator, distributed into three different magnets, which, under the influence of positive and negative currents, control a series of six pins. By their different combinations these pins control the necessary mechanism for printing all the letters of the alphabet. The printing apparatus is actuated by a local circuit and electro-magnet. Each complete instrument consists of a key-board of six keys, a printing register and a revolving circuit closer or commutator, provided with an automatic unison stop. The auxiliary instruments consist simply of a key-board and register.

Instead of being placed upon the periphery of a wheel the type are in a straight row, in a movable, horizontal type box or port rule, and are each capable of a vertical independent movement. When a letter is to be printed, the type box is moved horizontally until the desired letter is brought to a given point, and the type bearing that letter is then struck upward by the printing mechanism against the paper, which is in the usual form of a long strip.

It would be difficult to convey a proper idea of the details of this unique invention without the aid of numerous illustrations; but the general principle of its operation will be readily inferred, by those versed in such matters, from the necessarily brief and imperfect description given above.

The Telegraphers' Mutual Benefit Association.

Assessments Nos. 63, 64 and 65, issued June 25, 1874.

DEATH OF MARCELLUS C. HART, A. R. WALSH AND T. W. PRIEST.

MARCELLUS C. HART (Certificate No. 996, issued October 27, 1870), died at Collinsville, Ill., April 21, 1874, of consumption.

Anthony R. Walsh (Certificate No. 2079, issued July 8, 1873), died at Louisville, Ky. Mr. Walsh, in a temporary fit of insanity, threw himself from an upper window of the Galt House, Louisville, May 3d, 1873.

Thurlow W. Priest (Certificate No. 1730, issued December 21, 1872), died at Kalamazoo, of epilepsy, May 9th, 1873.

Members holding certificates numbered up to and including No. 2250 will please remit for above assess-

ments. Those numbered from 2251 to 2260, inclusive, will please remit for Nos. 64 and 65. No. 2262 should remit for No. 65.

By reference to the statement on second page of this sheet, it will be seen that the reserve fund is now \$3,828.17, requiring only \$172.00 more to enable the association to meet an assessment without calling on the members.

The payments of assessments have been well and faithfully made. The falling off of 133 members is to be regretted, but it is hoped they will reconsider their action, and, by application for readmission, make the payment of the next assessment from the reserve fund sure.

Let the payments for assessments 63, 64 and 65 be met and made without the loss of a single member. The notice of an assessment is evidence of the faithfulness of the member for whom the call is made, and having shared the protection which his prompt payments aided in giving, there should be no faltering in contributing to the fund his heirs have a right to expect.

The initiation fee of \$1.50, increased by the increase in the reserve fund to \$2.50, is now \$3.50.

Agents and members will please take notice of this fact, so as to be able to inform applicants for membership.

W. HOLMES, Secretary.
J. D. REID, Treasurer.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENT NO. 62, UP TO AND INCLUDING JUNE 23, 1874.

5, 13, 26, 31, 53, 55, 70, 72, 76, 80, 84, 89, 97, 101, 108, 114, 136, 139, 146, 171, 178, 181, 183, 189, 190, 191, 193, 197, 198, 206, 218, 227, 230, 240, 252, 271, 280, 312, 316, 319, 323, 328, 353, 357, 362, 364, 366, 371, 376, 382, 402, 414, 418, 441, 456, 466, 468, 469, 470, 471, 475, 476, 484, 511, 512, 514, 516, 554, 555, 556, 557, 560, 565, 569, 573, 574, 575, 584, 586, 594, 642, 648, 655, 662, 663, 664, 665, 669, 670, 690, 701, 710, 712, 722, 730, 733, 752, 772, 781, 782, 783, 785, 786, 787, 802, 803, 808, 809, 820, 836, 838, 841, 842, 848, 870, 871, 886, 901, 904, 905, 906, 916, 922, 926, 927, 938, 939, 942, 943, 944, 949, 980, 1000, 1002, 1014, 1016, 1026, 1030, 1031, 1033, 1034, 1041, 1050, 1057, 1038, 1063, 1074, 1075, 1076, 1080, 1085, 1093, 1099, 1100, 1101, 1102, 1105, 1106, 1107, 1108, 1109, 1110, 1112, 1113, 1115, 1117, 1119, 1120, 1121, 1122, 1123, 1131, 1141, 1144, 1149, 1164, 1187, 1190, 1191, 1193, 1194, 1226, 1227, 1233, 1237, 1238, 1240, 1241, 1245, 1255, 1256, 1270, 1277, 1281, 1282, 1283, 1284, 1285, 1286, 1288, 1289, 1294, 1304, 1307, 1308, 1309, 1311, 1312, 1313, 1314, 1815, 1317, 1318, 1319, 1320, 1321, 1322, 1336, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1353, 1354, 1355, 1356, 1366, 1371, 1372, 1375, 1376, 1398, 1405, 1406, 1415, 1417, 1418, 1427, 1428, 1430, 1431, 1432, 1433, 1437, 1438, 1448, 1449, 1457, 1458, 1465, 1469, 1471, 1474, 1475, 1476, 1481, 1483, 1490, 1497, 1498, 1500, 1501, 1503, 1505, 1508, 1513, 1515, 1522, 1528, 1529, 1530, 1532, 1546, 1558, 1569, 1572, 1573, 1576, 1580, 1586, 1596, 1597, 1603, 1604, 1605, 1607, 1608, 1616, 1619, 1620, 1626, 1631, 1639, 1649, 1650, 1652, 1653, 1655, 1660, 1601, 1662, 1663, 1665, 1666, 1673, 1676, 1681, 1682, 1684, 1687, 1688, 1692, 1699, 1700, 1701, 1702, 1704, 1709, 1710, 1713, 1714, 1723, 1724, 1732, 1733, 1737, 1737, 1745, 1746, 1747, 1750, 1751, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1768, 1769, 1771, 1773, 1775, 1785, 1794, 1795, 1796, 1797, 1799, 1804, 1807, 1813, 1815, 1817, 1823, 1824, 1828, 1835, 1839, 1840, 1841, 1844, 1845, 1852, 1857, 1858, 1859, 1863, 1864, 1889, 1895, 1896, 1897, 1916, 1917, 1921, 1923, 1924, 1926, 1931, 1942, 1964, 1965, 1969, 1978, 1985, 1986, 1987, 1991, 1992, 1993, 1994, 1996, 1997, 2007, 2010, 2012, 2015, 2016, 2020, 2023, 2033, 2041, 2045, 2053, 2060, 2061, 2072, 2074, 2075, 2084, 2085, 2092, 2094, 2098, 2101, 2108, 2109, 2114, 2119, 2120, 2123, 2125, 2130, 2131, 2134, 2136, 2141, 2155, 2159, 2165, 2166, 2167, 2170, 2171, 2180, 2183, 2184, 2185, 2193, 2198, 2207, 2209, 2210, 2214, 2217, 2226, 2227.

ASSESSMENTS NOS. 63, 64 AND 65.

4, 21, 131, 188, 208, 277, 286, 289, 464, 564, 626, 722, 742, 858, 859, 923, 932, 1357, 1489, 1516, 1862, 2197.

ASSESSMENT NO. 61.

5, 51, 178, 185, 186, 187, 271, 319, 466, 468, 469, 470, 471, 475, 514, 516, 560, 652, 695, 697, 705, 801, 943, 1026, 1063, 1071, 1187, 1371, 1400, 1449, 1497, 1504, 1532, 1556, 1557, 1570, 1603, 1604, 1605, 1607, 1608, 1613, 1620, 1639, 1653, 1655, 1670, 1690, 1691, 1692, 1699, 1741, 1745, 1798, 1799, 1807, 1835, 1923, 1924, 1926, 1945, 1946, 1947, 1978, 1994, 2015, 2094, 2109, 2141, 2151, 2165, 2170, 2192.

ASSESSMENTS NOS. 58, 59 AND 60.

271, 288, 1026, 1207, 1604, 1607, 1608, 1609, 1692, 1699, 1798, 1934, 1978, 2128.

ASSESSMENTS NOS. 55, 56 AND 57.

1798, 1933, 1934.

MISCELLANEOUS.

58.—19, 800, 1933.
59.—19, 800, 1933.
63.—64, 414, 509, 825, 912, 916, 917, 1169, 1178, 1678, 2196, 2201, 2221, 2236, 2237, 2242, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260.
64.—64, 509, 912, 917, 1178, 2237, 2261, 2262.
65.—2261.

Telegraphic Base Ball Celebration of the Fourth of July.

THE readers of THE TELEGRAPHER will doubtless remember a very humorous account of a base ball match between the Dots Base Ball Club of Buffalo, New York, and the Dashes of Cleveland, Ohio, played at Erie a year ago, from "Owton A. Flye," in which the Dots retired without achieving that success anticipated when they started for the fray. These clubs are composed respectively of the employés in the Western Union offices in the two cities.

The Dots have invited the Dashes to visit them to-day at Buffalo, where they propose to entertain them, and, if possible, send them home happy but vanquished.

The following correspondence will, no doubt, be read with interest by all telegraphers:

THE DOTS TO THE DASHES.

BUFFALO, June 8.

W. N. Hinman, Esq., Secretary Dashes B. B. C., Cleveland, O.

At a meeting of the Dots Base Ball Club held to-day, resolutions were adopted instructing me, on behalf of that organization, to send you a cordial invitation to visit us here on the glorious Fourth, when the second game of the series will be played. Your entertainment here will be amply provided for. An early reply from you is desired, so that many necessary arrangements may be perfected. It is desirable that you bring as nearly as possible the same nine with whom we struggled at Erie a year ago. Defeat has rested heavily on our heads in the days that are gone, and that ambition which is the underlying prop of our lives seems anxious to mark out for us a far more exceeding weight of glory. Yours, with an eye to victory,

J. W. LARISH, Secretary.

THE DASHES TO THE DOTS.

CLEVELAND, OHIO, June 17.

J. W. Larish, Esq., Secretary Dots B. B. C., Buffalo.

Your exceedingly cordial letter, containing the hospitable invitation, was duly received, and a meeting of the Dashes held on Saturday, the 13th instant. In accordance with instructions I then informed you by telegraph that it was the unanimous desire of the members to become the recipients of your generous liberality, and each individual player is vigorously exercising his muscularity in anticipation of the coming fray, resolved to claw the pinions of the aerial Dots and unmercifully extinguish that eagle "eye to victory" which glares upon us. We cannot play with exactly the same nine we did last year—one died during the past winter and another has left the office—but at least six, and perhaps seven of the participants in that game will seek to gather fresh laurels on the coming Fourth. Yours, with intensified composure,

W. N. HINMAN,
Secretary Dashes B. B. C.

Below are the names of the members of each club:

One Way to Stop It.

Who knows but, perhaps, the day will come when all the conversation of this earth shall be conducted with the snapper sounder?

Xantippe's scolding might, perchance, have sounded more musically to the ear of the distracted Socrates if it had been transmitted to him by this improved (?) method, and one imagines the bull-frog and the katydid sinking into ignominious silence, routed by the echo of thirteen thousand, more or less, of this delectable invention in the hands of juvenile America. The wonder of the day, however, becomes the old story of to-morrow, and only to the ignorant is there anything new under the sun—of the truth of which the following

incident would afford an illustration, if such were needed:

Mrs. Moore, desiring at times to indulge in a little domestic telegraphy, had a wire run from the basement of her domicile to the second story sitting room thereof, and equipped with a pair of "Nonpariels." By the help of a telegraphic friend she and her husband soon learned to communicate deftly with each other, sending down instructions to the servants and superintending household matters generally without the inconvenience of travelling too frequently up and down two flights of stairs. Bridget and Mary, of the lower regions, had watched this mysterious operation with considerable interest, and, as the event proved, had settled upon a theory of their own as to the *modus operandi* of the concern—at all events they evidently considered that it was not altogether a safe thing to have in the room under certain contingencies.

One evening Patrick and Michael had paid a visit to the aforesaid handmaidens, and the quartette had remained in close conference with closed doors until a late hour. The next morning Mrs. Moore discovered the "Nonpariel" carefully covered over with a cloth, and nicely tucked in around the edges! At first she was naturally astonished at such unprecedented caretaking, but when the truth flashed upon her that the unoffending instrument had merely been *blindfolded*, so that it couldn't see what was going on and report it to the "missus" up stairs, she laughed till she well nigh went into convulsions! So do her friends when she tells them the story, and small blame to them.

A Telegrapher Recovers Judgment Against a Railroad Company.

It has for obvious reasons become a figure of speech to say, when a thing seems difficult of achievement, that it will be about as easy to accomplish it as to get judgment against a railroad company. Singular as it may seem, judgment against a railroad company has been recently obtained, and by a telegraphist, too—and of the feminine persuasion, moreover. In the Supreme Court, at Providence, R. I., before Mr. Justice Potter, June 22d, Miss Nelana Brown sued the Providence and Worcester Railroad Company for \$1,113.27, for her services as operator at Waterford, Mass. She alleged that the defendants agreed to give her twenty-five dollars a month, with "extra," until her entire compensation should amount to forty dollars per month; and that afterwards the Western Union Company established an office at the station, and the defendants then agreed to make up to her the difference between her receipts from the telegraph company and forty dollars per month. The defendants contended that they agreed at first to give the plaintiff only \$25 per month, and after the telegraph company opened an office to pay her the difference between her receipts there and \$25 a month, which latter sum was subsequently raised to \$37.50, and finally to \$40. A verdict for the plaintiff, however, was given, as intimated above, and Miss Nelana Brown goes into the country with \$1,113.27 of the railroad's dividend money.

Uncle Jim's Dog.

OLD "Uncle Jim," as everybody called him, who lived at one of the stations along the Pennsylvania Railroad, was the unhappy owner of such a beast. Uncle Jim had a kind heart, and he couldn't bear to take that animal out and drown or shoot him, or take him in and cremate him. He counselled with the telegraph operator, and that ingenious youth proposed a plan. It was that they tie the dog's legs together and throw him into a passing train. A freight train went by that evening at seven, and the wretched cur, yelping and howling, fastened together like a ball, went by in it. Uncle Jim retired early, satisfied that he had seen the last of the dog. The telegraph man did not go to bed so early. He watched for the arrival of the express, due at eleven P. M., and which came from the same direction towards which the freight with the tied-up dog had gone. Shortly after eleven the telegraph man might have been seen, had anybody been awake to see him, slowly wending his way towards the residence of Uncle Jim. He held in his hand a rope, and at the end of the rope was a dog—in fact, Uncle Jim's dog; for that wicked telegraph man had sent a despatch up the country early in the evening.

This was the despatch:

"Operator at —: Some scoundrel threw Uncle Jim's dog on the freight with his legs tied together. Send him back by the express."

When Uncle Jim awoke next morning, after joyful dreams of happy dogless days, he took a walk in the garden. Suddenly Uncle Jim became profane. He heard a familiar sound, and has seen a familiar form. His dog is by his side. He went down town to ruinate some more. He told the telegraph man, and the telegraph man said innocently, "Well, I never!" Uncle Jim shot the dog, and when he found out how it was, he wished he had shot the telegraph man.—*Philadelphia Press.*

Correspondence.

No notice will be taken of anonymous communications.

The Origin of the Term "Plug."

ALBANY, OREGON, June 20.

TO THE EDITOR OF THE TELEGRAPHER.

YESTERDAY my eye met a paragraph *Switch-ed* from *The Plug*, giving its theory regarding the origin of its own name, which is also the name of that large and rapidly increasing class of human beings—suppose they are human, ain't they?—in whose interests the latter *verdant* hued paper is laboring so hard, in response to that plaintive and heartrending appeal from one of the "brave 300" employed on "Tpe 6ejhiit4a8ania R.R.," and who "Fr Vefart" appreciates so much better than "good opsrs."

Now, "Webfoot" has a theory which is *guaranteed* to be *correct*. I commenced the *art* of the dots and dashes, and *science* of the batteries—for it was a "science" to me *then*, after having taken 'em apart for cleaning to get 'em together again—under the guidance and supervision of "Doc Plummer," mentioned by *The Plug*. That was several long years ago, when Doc and Webfoot's father were together, under the firm name of "Rice & Plumber, Physicians and Surgeons" (no charge for advertising), dealing out physic in any desired quantities, and doing their "level best" to make the undertaking fraternity bless 'em forever. Many a long evening can I call to mind sitting around the office fire with a lot of the boys listening to "Doc's yarns," as they were termed; but when he would quietly turn round and remark, "Truth, now, boys," we knew it was so; and many a time have I heard him relate the circumstances mentioned by *The Plug*, which is, in the main, correct, only it omits one letter—"u."

Doc, "the light haired youth of sixteen summers," choose "P" as his *initial*, but the Supt.—DePew, I believe—used that, and informed the youth that he must choose some other letter, or—"forever hold his peace." Being thus vetoed, our youth then used "*Plu*," and the office call being "*G*," the complete word was made.

Doc has been for a long time, and still is Supt. at Portland, Oregon, and is to-day anything but what he "sined" when operator at West Greenville, Pa., in '51.

Anybody having "a more reliable theory" was invited to "come to the front" by *The Plug*. This has induced me to "cut in" with the foregoing, which, I trust, may be of interest to some of the fraternity, as I can vouch for its truth, even if it does come all the way from

WEBFOOT.

Duplex Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

IN a late number of your contemporary, the *Journal of the Telegraph*, a correspondent gives a method of arranging an ordinary relay, so as to answer for duplex working on the differential plan, in cases of emergency, such as often arise from the regular differential relays being burned out by lightning, etc. The plan suggested is that of attaching the outgoing wire from the transmitting sounder, between the two helices of the relay, to the fine wire passing from one to the other, and then connect the line to one of the main binding screws, and the short or rheostat circuit to the other. The editor prints this with an illustrative diagram, and then proceeds to "sit down" on the aforesaid contributor, by informing him that his plan was invented two or three years ago by Mr. Stearns and tried with success on the line between New York and Albany. If our learned friend had examined the original patent of Mr. Stearns, taken out in 1868, he would have found this plan carefully described therein, and equally carefully disclaimed, the credit thereof being given to Siemens and Halske, of Berlin; and, in fact, many of the published works of a dozen or twenty years ago and since show it in that shape, among which may be mentioned the well known work of Mr. Sabine, familiar to most American telegraphers. In point of fact, this arrangement was invented by Siemens in 1849, or not less than a quarter of a century ago. In justice to the *Journal's* contributor it ought to be stated that he doesn't lay claim to the invention for himself.

The headlong manner in which our friends of the *Journal* rush forward to claim every invention in duplex telegraphy, ancient and modern, in behalf of Mr. Stearns (since the Western Union bought his patent, not previously) is inexpressibly funny to those who are well up in the history of the subject, and are thus enabled to see the whys and wherefores of things. The next thing will be the automatic, which is already reported to be in rehearsal, and then look out for more fun.

ONTARIO.

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Bound Copies of Volume IX for Sale.

WE have a few copies of Volume IX of THE TELEGRAPHER, handsomely bound, which may be obtained, if applied for soon, at Five Dollars per copy. The number of these is very small, and those who desire to get them must apply soon, or the opportunity will be lost, as, once disposed of, we cannot duplicate them—some numbers of that volume having been exhausted.

The Fourth of July 1776 and 1874.—Progress and Improvement since the United States became a Nation.

AS THE present number of THE TELEGRAPHER appears on the anniversary of the nation's birthday, it may not be inappropriate that we should improve the occasion to call attention to the immense advance which has been made since the time when the Declaration of Independence, proclaimed at Independence Hall, Philadelphia, marked the creation of a new nation, destined to effect such a momentous change in the history of the world. It is neither our province or purpose to descant upon the patriotic devotion to liberty and independence, then or since, of the American people, although these have been abundantly displayed in resistance to tyranny and oppression upon many a hard fought battlefield, some of which are yet fresh in the recollection of the present generation.

When the Declaration of Independence was made, in 1776, there were in the provinces which united in it some 3,000,000 of inhabitants. These have, in less than a century, increased to 40,000,000. But a small portion of our territory was even partially settled, and a considerable part of that now included in our territorial limits was then really or nominally under other governments, and an unbroken wilderness in which no white man had ever set foot. Steamboats and railroads were unknown, and the electric telegraph undreamed of. Even in the most thickly settled sections of the country communication was slow and difficult, and the dissemination of news and information, which is now accomplished almost instantaneously, uncertain, and requiring days, weeks and months even.

The steamboat first showed the possibility of a better state of things, and its invention and development was the result of the demands of a rapidly increasing and enterprising people. This was in its day

regarded as a most wonderful invention and display of inventive genius, and was even for some time regarded as visionary and impracticable. After some years the locomotive was invented and railroads became practicable. By this time the public had become accustomed to steam power in the navigation of inland waters and on the coast, but little faith was displayed in what was then regarded as the wilder and more impracticable schemes of dreamers and visionaries, of substituting steam for the propelling powers of the horse and mule, hitherto regarded as the swiftest and most practical means of transportation on the land. These visionaries, however, adhered to their folly, and in due time the practical portion of the people conceded their wisdom, and the railroad gradually demonstrated its value as a civilizing agency.

But a greater wonder than the steam engine and locomotive was yet in reserve, and one even more potent as an agent of civilization and progress. This was the electric telegraph, which, after years of scientific research, and as the combination of the studies and discoveries of many studious and learned men, was, in spite of the derisive and ridicule with which the idea was at first received, demonstrated to be a practical and incalculably valuable agency. We do not propose to trace its progress and development from the crude and imperfect form in which it was first attempted. This has been so often done that the story is familiar to us all. Its development, slow at first, as must always be the case with important inventions and improvements, has, in this country, progressed so rapidly that it is sometimes difficult for those of us even who are and have been intimately associated with it, to realize it. Not only is every part of this great extent of territory in instantaneous connection with the whole country, so that events occurring in sections thousands of miles apart are simultaneously known, but even the most ordinary and common transactions of daily life are carried on and facilitated by its means. The dealings in and quotations of merchandise, bonds and securities of all descriptions, are instantly reported and made known to parties interested; places of business are connected by private telegraph lines and instruments; messengers are called for and despatched at brief telegraphic notice; the occurrence of conflagrations notified automatically, and those whose business it is to extinguish them before they have gained headway are summoned, not only to the locality, but informed of the very room in which they originate; the fire departments of great cities are rendered vastly more efficient, and constantly new applications of this infinitely valuable, useful and efficient agency are made, so that no one can tell to what extent it may be made available.

Vast as is the present territory of the United States, extending from the Atlantic to the Pacific Ocean, it is, in fact, owing to the agency of steam and electricity, more homogeneous, and the different sections more intimately associated and connected, than was possible with the comparatively limited territory which comprised the original thirteen States. The most enthusiastic of the revolutionary patriots, and the wildest dreamers of that period, could have no conception of the future which steam and electricity would give to the nation at whose birth they assisted. We, their descendants, at this recurrence of the glorious anniversary of our nation's nativity, may well be proud of what has been accomplished, and look forward with sanguine anticipations of what yet may be in store for us. Time and distance have been annihilated, the marvellous achievements of even a recent time have become the familiar every day performance of the present.

Looking outside of our own territory, extended as it is, we see even greater marvels. Thousands of miles of ocean have proved no barrier to the triumph of steam and electricity. Great steamers plough the waters of every ocean, and in spite of winds and waves, have reduced to a comparatively brief period the time required to effect a transit from shore to shore. The electric cord binds continents and islands together, and from

the furthest east to the remotest west places all nations and people in instantaneous connection with each other. Europe and the British Isles are to-day practically less distant from us than in 1776 were localities in our own country a thousand miles apart. Daily and hourly are we informed of what is transpiring in all quarters of the globe, so that India, China, and all peoples and nations have, in fact, become our neighbors, and we know of and can sympathize with them in their joys and sorrows, their successes and tribulations. Steam and electricity are, indeed, the Archimedean levers which move the earth and make one all nations which dwell upon it.

We can see and realize what a century has accomplished. We cannot see or realize what another century may effect, but may look forward with hope and faith that the work which has progressed so rapidly will be prosecuted until even greater results have been attained. The world indeed "does move," and all attempts to impede its progress must prove futile. We have faith to believe that eventually steam and electricity will put an end to wars, and that the immense masses of men whose lives and energies are now wasted in armies and navies will contribute by their intellect and labors to the advancement of the welfare and comfort of the human race, and that through their agency the sword shall be beaten into a ploughshare and the spear into a pruning hook. When this has been accomplished, then, indeed, may we look for the millennium to commence, and our descendants may celebrate with renewed and ever increasing energy and appreciation the glorious anniversary of our national independence.

Resignation of Postmaster General Creswell.

IMMEDIATELY upon the adjournment of Congress Postmaster General CRESWELL sent to the President his resignation, which was accepted by the latter in a very complimentary letter to the retiring official. Mr. EUGENE HALE, of Maine, at present a representative in Congress from that State, was tendered the appointment and accepted it, and entered upon the duties of the office on the first instant.

The active efforts which have been made by Mr. CRESWELL to obtain a transfer of the telegraphs of the country to the Post-office department, and his failure to accomplish it, will serve to render his administration memorable in telegraphic annals. What the views of his successor are upon this subject we are not fully informed as yet; but it is not probable that, knowing as he does the disclination of Congress and the people to assume such a burden, that he will make it a special purpose of his administration to secure it.

Aside from his course on the telegraph question, Mr. CRESWELL has made a very efficient Postmaster General. If he has failed to secure the management of the telegraphs, his administration of the department has been signalized by the abolition of the franking privilege, and many other important reforms have been introduced during his term of office. The office of Postmaster General, if properly administered, is the most laborious, and the labors of its occupant are the least appreciated of either of the Cabinet officers. The business of the Post-office department brings it intimately and constantly in contact with the whole body of the people of the country, and its head is held more directly responsible by the public and by the members of Congress for any real or supposed defects, errors, or shortcomings, than any other member of the Government. It is an arduous, and, to a great extent, a thankless position, and one which we should suppose would be considered anything but desirable, under any circumstances, and much less so if the difficulties and perplexities of the telegraph were added to those which are already inseparable from it.

Telegraphic Reminon.

THE annual reunion of the telegraph operators along the line of the Erie and New York Central Railroads takes place to-day at Rochester, N. Y. Those who have been so fortunate as to be present at those which

have been held heretofore have enjoyed the occasion very much, and we have no doubt but that which takes place to-day will be fully equal to any which have preceded it.

Progress of the New Lines of the Atlantic and Pacific Telegraph Company.

THE Atlantic and Pacific Telegraph Company has recently constructed a new line from Springfield to Athol, Mass., a distance of about sixty miles, and it is now in operation.

The new line of this company from Chicago to Omaha is making very good progress, and will be completed within the contract time. This work is being done under the personal direction and supervision of Mr. GEO. H. BLISS, of Chicago. BROOKS insulators are used, as has already been stated in THE TELEGRAPHER, under a contract with Mr. BROOKS to maintain the capacity of the line in the most unfavorable weather at a high standard.

The Atlantic and Pacific Company is exhibiting much energy and enterprise in extending and increasing its facilities, even under the existing dulness and business depression.

Hon. Eugene Hale Declines the Office of Postmaster-General.

HON. EUGENE HALE, of Maine, whose appointment to and acceptance of the office of Postmaster-General we mention in another article, on Wednesday last withdrew his acceptance, and Mr. CRESWELL continues to act in that capacity until his successor can be determined upon and is qualified.

It is understood that Mr. HALE withdrew his acceptance of the position on account of his health.

Tillotson & Co. as Advertisers.

WE have often had occasion to refer to the enterprise and liberality of Messrs. L. G. TILLOTSON & Co. From the first issue of THE TELEGRAPHER to the present number they have availed themselves constantly of its columns to make known their ability to supply every article that can be called for in their line. The money expended in this way has proved an excellent investment, as their large and lucrative business in telegraph and electrical apparatus and supplies has very satisfactorily demonstrated. With ample capital and facilities, and an excellence of manufacture which is maintained under all circumstances, it is not surprising that theirs should be the leading house in the trade. Besides their extensive telegraph business they have an endless assortment of every article required for railroad purposes, and, no matter how dull may be the season, No. 8 Dey street is always a busy place, and TILLOTSON is always on hand to cheerily greet the numerous customers which throng his establishment.

F. L. Pope & Co. and their Specialties.

THE specialties which have been introduced by Messrs. F. L. POPE & Co. during the past three years have been received readily and thoroughly appreciated. They were the first to introduce the cheap telegraph apparatus for learners, amateurs and short lines, and the fact that at the present time their instrument, improved as it has been from time to time, maintains its position in the market and is sought after by purchasers, guarantees its superiority and excellence. Their metallic battery also has met a want which had long existed, and is rapidly growing in popular estimation and appreciation. Besides this, they offer a stock of telegraph instruments, insulated wires, etc., which is well worth the attention and patronage of purchasers. Their new circular and price list should be in the hands of every person who has occasion for anything in their line, and will be forwarded on application, or may be obtained on personal application at their place of business, No. 38 Vesey street.

Personals.

Mr. FRANK H. BROWN, late manager of the Southern and Atlantic Telegraph Company's office at Savannah, Georgia, is requested to put himself in communication with Mr. G. H. GRACE, General Superintendent, Macon, Georgia.

Mr. A. R. CARY has accepted the position of night operator at Tilsonburg, Ontario, with the Canada Southern Railway.

Mr. C. W. GEARHART, the well known and efficient telegraphic artist, has received an appointment at Maricopa Wells, Arizona, on the military telegraph line.

Mr. C. W. ROTHROCK has been appointed operator and assistant agent, Lehigh Valley Railroad office, at Mahanoy City, Pa.

Mr. D. B. MITCHELL, of the Western Union office at 145 Broadway, New York, has gone for a brief sojourn among his friends at Toronto, Canada.

Mr. E. C. BOILLEAU, late of the Western Union Washington, D. C., office, has accepted a position at 145 Broadway, New York, *vice* Mr. E. S. RISDON, transferred to the Duxbury, Mass., office of the same company.

Mr. P. V. DE GRAW, late of the Western Union Washington, D. C., office, has accepted a position with the same company at No. 145 Broadway, New York, on the night force, *vice* Mr. DENNIS HARMON, transferred to the day force.

Mr. FRED. N. COOK, mentioned in this column as having changed his base from Providence, R. I., to Worcester, Mass., has been induced to keep his faith pinned on the Franklin Company, and still reposes his trust in Providence.

Mr. HENRY S. KNAPP, of the Western Union office at 14 Broad street, New York, has been appointed District Deputy Grand Master of the Masonic Order for the Third District, which embraces Brooklyn and Kings County, excepting the Eastern Division of Brooklyn.

Mr. JOHN F. WALSH, of the Thirty-fifth District of the American District Telegraph Company, has been appointed in charge of delivery at the Grand Central Depot.

Mr. FRANK SMITH, manager of the Twenty-fourth District of the American District Telegraph Company, has resigned.

The Telegraph.

By Cable.

CONGRATULATIONS ON ANGLO-BRAZILIAN CABLE.

LONDON, June 26.—Queen Victoria and the Emperor Dom Pedro have exchanged congratulatory messages upon the successful laying of the Brazilian cable.

Congratulations Exchanged between the Emperor of Brazil and the President of the United States on the Completion of the Anglo-Brazilian Cable.

JUST before leaving Washington for his trip to Virginia, on Thursday of last week, President Grant received the following despatch by cable from the Emperor Dom Pedro:

TO THE PRESIDENT OF THE UNITED STATES.

The inauguration of the electric telegraph between Europe and Brazil, which also unites us to the Republic of the United States, is a cheering sign of improved international relations, as also a bond of friendship and a powerful instrument of civilization.

I congratulate my great and good friend, the President of the United States, upon this happy event.

DOM PEDRO, Rio de Janeiro.

PRESIDENT GRANT'S REPLY.

EMPEROR OF BRAZIL, Rio de Janeiro.

I congratulate you upon the telegraphic connection just established between Brazil and the United States. May it prove as close a link in national friendship as in communication.

U. S. GRANT.

The New Atlantic Cable and the Atlantic and Pacific and Franklin Telegraph Companies.

UP to the time at which this is written the new cable steamer *Faraday* had not arrived at Portsmouth, N. H., although she is several days overdue, having sailed from Halifax, U. S., on the 14th June. Her arrival is hourly expected, and should she make her appearance before THE TELEGRAPHER goes to press the fact will be stated.

The steamer *Ambassador*, with the shore end of the cable, is still at Portsmouth, in the lower roads, await-

ing her arrival. As the *Faraday* has the small boats and steam launch which are to be used in laying the shore end, the cable on board the *Ambassador* cannot well be laid until her return.

The Atlantic and Pacific and Franklin Telegraph Company, which has the contract for connection with the cable at its landing place at Rye Beach, are engaged in the construction of the additional lines required to establish the necessary connections with the system of telegraphs competing with the Western Union Company and the companies included in its combination. Wires connecting with the cable are to be built reaching New York by two routes. One line will be built from Rye Beach to Boston, connecting at Boston with a new wire which is to be put up on the poles by the shore line route. This line will follow the highway from Portsmouth to Boston, and will be about fifty-six miles in length. The other wire will go *via* Portsmouth, Haverhill, Lawrence and Lowell to Worcester, and from the latter city *via* the Springfield route to New York. By these two wires, besides connecting the cable by two entirely separate and independent routes to New York, all the important cities and towns in New Hampshire, and additional ones in Massachusetts, will be brought into the circuits of the competing lines. It is further proposed to extend the system of competing lines to Portland, and from thence to all important points in the east. Also, to construct, *via* Concord and White River Junction and St. Johnsbury, a new and independent route to Montreal, Canada, and Ogdensburg, N. Y., where it will connect with the existing line of the Atlantic and Pacific Company.

With these additions to existing facilities and others which are in progress, and the connections with Europe to be furnished by the new cable, there becomes practicable a new and powerful combination for press reports outside of that now existing between the Western Union Company and the Associated Press, and newspaper proprietors and managers will be rendered independent of that organization. This is an important matter for the press of the country, and one which has been fully and carefully considered in making the arrangements of circuits and locating the new lines to be built. The intention is to have every section of the country and every important point covered by the wires of the competing companies, and this seems to be in a fair way of accomplishment within a reasonable time. The Southern and Atlantic Company are extending to New Orleans, and, by the construction of and taking in lateral lines, will soon have the South, so far as the seaboard route is concerned, very well supplied with telegraphic facilities. It is expected that by the first of September next the cable will have been laid and will be in operation, and that a considerable portion of the land wires requisite to make the connections above indicated will be up and working.

The new lines to connect with the cable are to be constructed of No. 6 Compound Telegraph Wire, and Brooks' new patent insulators are to be used, and with these their capacity for business will be much in excess of ordinary iron telegraph wires with glass or inferior insulation.

Reported Loss of the Cable Steamer *Faraday*.

A PRESS despatch from Halifax, N. S., of the 1st inst., states intelligence received from Picton represents that the cable steamer *Faraday* struck an iceberg off Halifax and is a total wreck. No details of the disaster were given.

The Southern and Atlantic Telegraph Company.

IN order to expedite repairs, and give a more local supervision of wires, the lines of the Southern and Atlantic Telegraph Company have been divided into circuits, with what are termed circuit offices at Gordonsville, Va.; Charlotte, N. C.; Macon, Ga.; Columbus, Ga.; Selma, Ala.; and Mobile, Ala., by the General Superintendent, Mr. George H. Grace, whose headquarters are at Macon, Georgia.

The Economy of Good Insulation.

OVER twenty years since a plain, ungalvanized No. 10 wire was taken down from the turnpike in Ohio and Indiana by the telegraph company, and placed on the line of the Michigan Central Railroad. The resistance of this line was so great it was of little or no use in rain, and was finally turned over to the railroad company. The railroad company had difficulty in working their wires with a large number of relays in the circuit in rain. In 1868 the railroad company re-insulated with Brooks insulators their wires—two in number—from Detroit to Chicago. One was a galvanized No. 9, the other this plain old wire. It was the intention of the company to replace the old wire with new galvanized, but it was found that, with the new insulation, the old wire could be worked at full capacity in rain over three hundred miles, the entire circuit, when a new No. 6 wire upon common insulators, be-

longing to the telegraph company, was worked with great difficulty and at a very slow rate of speed. This old wire is still in use and doing good service, although the resistance is nearly one hundred units per mile.
Query.—How many thousands of dollars have been spent in replacing wires that would have done good service for years with good insulation?

The American District Telegraph Company.

THE American District Telegraph Co. at present deliver Western Union messages at the Nineteenth, Twenty-eighth, Thirty-first, Thirty-fifth and Forty-fourth Districts. On July first the company, in addition, assumed the delivery and joined forces with the Western Union Company at the Grand Central Depot, Forty-second street; Eighth avenue and Fourteenth street; Eighth avenue and Twenty-third street, and Fifteenth District, No. 397 Broadway.
 The dividing line between the Thirty-first and Thirty-fifth Districts has been changed from Twenty-fourth to Twenty-sixth street.
 The messengers appear to-day for the summer in Panama hats, at an expenditure of about \$5.

Foreign Telegraphic Notes.

THE traffic receipts for the month of May of the Great Northern Telegraph Company were 365,264 francs, against 328,797 francs for the corresponding month of last year. The total traffic receipts from January 1 to May 31 were 1,647,495 francs, against 1,184,486 for the corresponding period last year.
 The number of messages (of twenty words) passing over the Barcelona-Marseilles cable of the India Rubber, Gutta Percha and Telegraph Works Company, for the month ending May 31, was 5,478, against 4,067 for April.

Telegraphic and Electrical Brevities.

Mr. H. C. Bradford, the popular and efficient manager of the Western Union Telegraph Company, at Providence, R. I., is extending the line from that city to Rocky Point, the great summer resort of Narragansett Bay, to Oakland Beach, Rhode Island, a new watering place three miles from Apponang, on Greenwich Bay.
 Robert Dunning, an employe of the Western Union Telegraph Company, while watching a race in Fleetwood Park, Westchester, N. Y., from the top of a telegraph pole on the Harlem railroad, last Saturday afternoon, fell to the ground, a distance of about forty feet, sustaining serious internal injuries.

Miscellaneous.

CHEMIC ACID SOLUTION FOR BATTERIES.—The *Scientific American* says an improved recipe, by which a stronger current is produced, is as follows: 12 parts, by weight, potassium bichromate in 150 parts water, with the addition of 25 parts of sulphuric hydrate.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost. Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATIS & CO., Baltimore, Md.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

THE "SNAPPER" SOUNDER.

NEW STYLES, NEW PRICES.

TRADE MARK "SNAPPER,"
PATENTED MAY 12, 1874.

The unexpected and growing demand for the original "Snapper" Sounder, beyond the expectations of the manufacturers, has delayed the introduction of proposed styles and improvements.

Having increased our facilities and accumulated sufficient stock to enable us to fill orders promptly, the following varieties are now offered for sale at prices which will accommodate all classes.

The "Snapper" Sounder, plain.....30c. 6 for \$1.50.
" " " nickel plated spring... 0.40.
" " " or 6 for..... 1.80.

A few were manufactured to order with hard rubber knobs. They were so well liked that I have decided to introduce them to the fraternity. The springs are secured by two screws, and, should they break, may be replaced at an expense of 15 cents. They are thoroughly made and finished.

PRICE, 75 CENTS.

To the Dominion 5 cents each extra.
A liberal discount to agents.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THERE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

QUICK SALES, SMALL PROFITS AND SUPERIOR GOODS.

We are offering any of our unequalled Telegraph Instruments at 20 per cent. discount from list prices.

L. G. TILLOTSON & CO.,
8 Dey Street, N. Y.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT RÉPÉATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor **SILLIMAN**, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent **Platina Connection**, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDER** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.
Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.
For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.
Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring
EFFICIENCY AND RELIABILITY.
Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL
DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of
THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Heury, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, senaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bahu, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.
 Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.
 See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY
 THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

PURE GUTTA PERCHA GOODS

IN THE
UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,

FOR
 TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
 SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,

AND FOR
BLASTING AND MINING PURPOSES,

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable, Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deli-
 vered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

VOL. X. WHOLE No. 417.

Original Articles.

"A Duplex Review" of the English and American Systems of Automatic Telegraphy.

By GEORGE LITTLE,

Consulting Electrician to the Automatic Telegraph Company, Inventor of and Patentee of the American Automatic Telegraph System.

ENGLISH SYSTEM. AMERICAN SYSTEM.
WHEATSTONE'S. LITTLE'S.

Professor WHEATSTONE asserted in his paper, published in the *Philosophical Transactions*, "On the Laws which Regulate the Transmission of Electric Currents," that the *Speed of the English automatic system of telegraphy depends entirely upon the rate at which successive currents of electricity can be transmitted through a conductor without coalescing*. He fixed this limit of speed on fifty miles of line to be, for practical business, equal to twelve hundred letters (not words) per minute, and that in practice one English automatic wire was found to represent three Morse wires.

Mr. Culley, the Engineer in Chief of Her Majesty's Postal Telegraph Department, says that the Wheatstone automatic system, as it is at present employed by the post-office, in its telegraphic correspondence between London and the principal cities, works at a speed from twenty to one hundred and twenty words per minute. But when the land line is increased to *three hundred miles*, with sixty miles of cable in the circuit, the speed will be only from *forty to eighty words per minute*.

Sir Charles Wheatstone's method of manipulating the electric currents, in the operation of his automatic system, consists in the alternating of reverse currents, in order to reverse the polarity of the electromagnets, and thereby set in motion polarized armatures, connected with the receiving instruments.

And, in addition, to compensate for loss of current to earth, brought about by the introduction of an artificial resistance equal to or more than the rest of the entire circuit at the receiving end of the circuit, between the receiving instrument and the end of the line (especially a cable), interpolating or compensating currents are made to pass to the line direct, through a high resistance, to increase or diminish the strength of the operating current. Thus,

I WAS about the same time, namely, 1869, following up my experimental investigations in relation to the then supposed insurmountable difficulty (as demonstrated by my distinguished countryman, Sir Charles Wheatstone), and which resulted in the discovery and introduction by myself (among many other salient features) of what I designate the *overflow dam*, at the receiving end of a line of automatic telegraph, whereby the speed was increased for all practical business purposes (as Mr. Prescott, the electrician of the Western Union Company, said of the *Bain* system in 1870, of from fifty to sixty words per minute on one hundred miles of line) up to (as the Hon. William Orton, the President of the Western Union Company *conceded* in January, 1873,) thirty-six thousand words per hour on about three hundred miles of line of one wire, by my system (over sixty thousand words has been transmitted in one hour over the same line of one wire)—an amount of work which would require at least *sixteen* Western Union Morse wires, together with *thirty-two* expert Morse operators to transmit and receive in the same time.

The Hon. George Harrington, the President of the Automatic Telegraph Company, in his official circular of March 10, 1872, says this great desideratum has been accomplished by Mr. George Little, whose method of manipulating the electrical currents permits telegraphing to be done automatically, and reduces the demand for capital and the current expenses to a minimum, with results of *immense magnitude* (at the same time doing away with the defects of the Morse instrument, that may be interpreted by any Morse expert by feel, taste, or by sound).

Twenty years since Bain obtained forty to sixty words per minute on (as Mr. Culley says) lines of about sixty to seventy

to work the Wheatstone's automatic system direct, the line has to be manipulated with four independent currents.

In the English automatic system *electro-magnets* are employed, which not only *reduces speed*, but necessarily involve so many compensating currents that the utmost speed, under extraordinary conditions, obtainable by that system, is *admitted officially* as one hundred and twenty words per minute on very short lines of say fifty miles.

Wheatstone has been more than twenty years working out his problem in automatic telegraphy.

In the application of the *Stearns duplex system* to the English automatic system, in order to work both ways over the same line wire, the result would be to double up all of the before named complications, and thereby render the same practically useless. But, assuming the speed to be increased thereby up to one hundred and sixty words per minute on fifty miles of line (which is all it would be in *theory*), all such attempts must be looked upon (as remarked by that eminent electrician, Mr. Sabine) as little more than "feats of intellectual gymnastics."

Quite recently a distinguished *Scottish writer* on this subject of automatic telegraphy, after careful inquiry, undertakes to say (I quote his own words), "But if we had done much to establish telegraphy as a practical and useful art, it remained to another country (*America*) to furnish that link in the chain which has rendered the system *universal*."

It is officially admitted that the working of my American automatic telegraph system in Great Britain has also been attended with "*success*."

May my fellow citizens of the United States reap its benefits in common with all *nationalities*. The venerable Professor Morse predicted (shortly before his demise) that there must be a *change*.

Without drawing invidious comparisons, it is now, after over two years of constant working in all weathers, day and night, between Washington and various other important cities of the United States, safe to assume that the American automatic telegraph system—inexpensive, progressive and popular—will be the system of the future.

An eminent electrician in Her Majesty's Postal Telegraph Department, writing to me under date of February 10, 1874, says, " * * * We in England are watching with much interest the characteristic growth and advancement of telegraphy in *America*, and we are quite willing to learn and to be taught."

Passaic City, New Jersey, U. S. A.,
July 4, 1874.

The Laws of Derived Circuits.

A CORRESPONDENT puts the following question, which he says was suggested by reading one of my articles on Electrical Measurement. He writes: "Why does a short circuit cut out a magnet? If we have two circuits from the same battery, one having 10 and the other 100 ohms resistance, would not the current in each be the same if the other was broken; and if not, why not? Of course, it is conceded that the 'quantity' of the battery is limited by its own powers of solution of its materials, but the question is confined to cases within such limits." The writer of the above is far from being the first person who has been puzzled by the above matter, and for the benefit of all interested I will try to explain the laws of the electric current in their application to this case, in as clear and concise a manner as possible. The laws concerned therein are two in number:

I. The effective force of current traversing any closed

miles in length; then Bain had recourse to that stumbling block in the way of fast automatic telegraphy, the electro-magnet, in order, as he supposed, to bridge over the difficulty of its application to long lines, and be found his speed cut down in consequence to the ordinary Morse standard.

But "*Notatu dignum*," all honor to my British fellow countryman for the first inception of automatic telegraphy. "*He who rules all things rules well*."

In the American system one current only, by peculiar manipulation, being required to manipulate the same at *any speed* up to five thousand words per minute, according to length of line.

I have also been over twenty years working out my problem in automatic telegraphy.

By the application of Gintl's duplex system to the American automatic system, the speed could be increased (according to length of line) up to *seven thousand five hundred words per minute*. But owing to the great length of lines operated in this country, together with the ever varying climatic conditions, it would be highly imprudent to attempt to work any automatic system both ways over the same line wire, while at the same time it would be quite useless in a practical point of view.

circuit is found by dividing the total electro-motive force by the total resistance of that circuit.

II. When an electric current divides itself between two parallel or alternative routes, the fraction of the total current passing through each route will be directly proportionate to the conductivity of that route, and therefore inversely proportionate to its resistance.

I will answer the questions of my correspondent first, and then endeavor to explain the reasons why.

A short circuit does not, under any circumstances, absolutely cut out a magnet. There is always a small portion of the current still traversing the helices of the magnet, though far too little to have any appreciable effect on it, unless observed with very delicate apparatus, the reason of which is obvious from the second law.

When two circuits are connected with the same battery, the current in one circuit is always *increased* by breaking the other circuit. If the "quantity" of the battery were *infinite*, or, more properly speaking, if it had absolutely no internal resistance, the opening and closing of one circuit would not affect the current of the other. It is not possible in practice to have a battery absolutely *without* internal resistance, and, therefore, the opening and closing of either circuit must affect the other to some extent. The less the actual resistance of the battery the less the effect will be, and *vice versa*. By applying the laws above enunciated, the reason why this is so may be ascertained.

The diagram represents a battery, to which are connected two closed circuits having respectively 10 and 100 ohms resistance. We will suppose first that the battery is absolutely without internal resistance (which, as above stated, is an impossible condition in practice), and that its electro-motive force is 1 volt, although for the purposes of this article it does not matter how great or how small the latter is assumed to be. If the shorter circuit *only* is closed we have then an electro-motive force of 1, divided by a resistance of 10, giving us a current represented by the fraction 0.1. Opening the shorter circuit and closing the longer we have an electro-motive force of 1, divided by a resistance of 100, giving a current of 0.01. If now we close both circuits, what is the joint resistance of the two? It is obviously not the sum of the two, because it is not to be supposed that the addition of an alternative route could by any possibility increase the resistance of the one already existing; neither can the true joint resistance be found by subtracting one from the other, for if this were the case, and each route had a resistance of 100, the joint resistance would be nothing, which is absurd. The true rule is to divide the product of the two resistances by their sum, and the quotient is the joint resistance. The truth of this rule is abundantly verified by actual measurement with a galvanometer. Applying this rule to the case in hand we have $10 \times 100 = 1000 \div 110 = 9.09$ (the joint resistance of the two circuits).

By the first law the total current flowing from the battery will be found by dividing 1 by 9.09, and will, therefore, be 0.11. By the second law this will divide between the two circuits inversely as their resistances; therefore the current of the long wire will be 0.01 and that of the short wire 0.1, exactly the same as when they were separately attached to the battery. So we see that, with no resistance within the battery, it makes no difference whatever in the current of one circuit whether the other circuit is closed or not. Now, let us suppose the battery to have an internal resistance of 1 ohm, and then calculate the results in the same way. The short wire alone gives $1 \div (10 + 1) = .0909$, and the long wire alone gives $1 \div (100 + 1) = .00918$. Now, if we close both wires at once, the joint resistance of the two is the same as before, 9.09, to which we must now add the 1 ohm in the battery, giving a total resistance of 10.09 ohms in the whole circuit. The current leaving the battery will now be equal to 1 divided by 10.09, which is .00991 according to the second law; one eleventh of this current, or .00901 takes the longer circuit, and ten elevenths, or .0901, the longer circuit.

Therefore, with 1 ohm resistance in the battery, we get the following result for the long wire:

With short wire open..... .00918
" " closed..... .00901
And for the short wire,
With long wire open..... .0909
" " closed..... .0901

The practical result of this is, that the less the inter-

nal resistance of a battery the more wires can be worked from it without materially interfering with each other. Thus a Grove battery, the resistance of which is not half an ohm per cell, will carry 40 or 50 telegraph lines, while a gravity battery, with a resistance of 4 or 5 ohms per cell, which is eight or ten times as much as the Grove, will not carry more than 4 or 5 such lines, as practical telegraphers abundantly proved by experience long before the true philosophy of it was generally understood. If the above explanation is not perfectly clear I will be happy to answer any further questions to the best of my ability.

F. L. POPE.

Elizabeth, N. J., July 6, 1874.

The Associated Press, the Central Pacific R. R. Co. and the Telegraphs.

THE California newspapers belonging to and not included in the Associated Press are very bitter and aggressive in their attacks upon one another, the Associated Press and the Central Pacific Railroad. A short time before the adjournment of Congress a despatch was published in the San Francisco *Bulletin*, intimating that the House Committee was bribed to defeat an investigation of the Central Pacific Contract and Finance Company's affairs. This company occupied a somewhat similar position to the Central Pacific that the Credit Mobiliere did to the Union Pacific Railroad Company. The *Los Angeles Herald* denounces this despatch as false, and charges that it was manufactured for the purpose of intimidating the committee by the General Agent of the New York Associated Press. Mr. J. W. Simonton, who is also a part owner of the *Bulletin* and *Call*. It proceeds to give the following explanation of the relations of the different parties in this matter, and the motives which actuate them: "The general reader has noticed the Associated Press despatches are always antagonistic to the Central Pacific Railroad Company, but it is not every one that understands the motive which prompts this antagonism. It is this: The railroad telegraph lines destroyed the news monopoly so long held by the Associated Press. The Pacific Coast Associated Press is composed of the San Francisco *Bulletin* and *Call* and the Sacramento *Union*. These three papers are the bitter enemies of the Central Pacific Railroad Company. But for the telegraph lines built by that company these three papers would hold a monopoly of Eastern telegraphic news, and no other journal on the Pacific coast could or would obtain a line or word of Eastern report until after it had appeared in their columns. * * * The Atlantic and Pacific Telegraph Company using the railroad wires have practically destroyed the Associated Press monopoly, and not only furnish other journals with fresh news, but have caused a reduction of one half in the subscription price of the old monopoly papers. * * * If Governor Stanford would refuse to allow the use of his wires for the transmission of news despatches or lease his lines to the Western Union, the Associated Press would have nothing to say against the Central people, and the three papers we have named would soon forget all about the Contract and Finance frauds."

Telegraphic Base Ball Match.—The Dashes again Victorious over the Dots.

THE return game of the Dashes Base Ball Club, of Cleveland, Ohio, with the Dots Base Ball Club, of Buffalo, N. Y., to which reference was made in the last number of THE TELEGRAPHER, came off at Buffalo on the Fourth of July, and resulted in another triumph for the Dashes. These clubs are composed of employés of the Western Union Company at Buffalo and Cleveland. The following excellent report of the game is taken from the *Buffalo Express* of Monday last:

"The time for the game of base ball between the Dashes, of Cleveland, and the Dots, of Buffalo, was put down at 10 A. M. At 4 o'clock, Saturday morning, the Cleveland parties, some fourteen in number, arrived in the city, and were escorted by their Buffalo brethren to the Continental Hotel. There rest, refreshments and social converse were indulged in until the arrival of the 'busses, into which the whole party crowded, and were driven up to the grounds on the Park Front, near York street. Although it rained a little during the ride, at the time of their arrival at the scene of conflict the sun shone forth in a manner which augured for a favorable day. Both clubs were dressed in uniform, that of the Buffalo boys differing only in having blue and white instead of blue stockings, white shirts and pants being worn alike by both clubs. A large crowd witnessed the game, there being over five hundred persons present, with a small sprinkling of ladies. The Dashes are a muscular nimble set of players, and we heard it whispered that among their number could be found one or two of the famous Forest City Club. The particularly good playing of their catcher, who wore a monogram P. C. on his shirt, seemed to give the rumor credence. At any rate, we

are obliged to confess that, whatever may be the reason, the Dashes are a stronger and more experienced set of players than their friends, the Dots. From the first inning it was evident that the game was in the hands of Cleveland's representatives, and we may say, perhaps, that many on the grounds felt surprised that the score was kept as low as it was. The toss being won by the Dashes, the Dots went to bat and retired quickly with no tallies. The summary treatment thus shown them had a slightly demoralizing effect, and by means of loose fielding allowed their opponents to roll up ten tallies. In the second inning only one tally was obtained, but by the change of pitchers, succeeded in keeping the Dashes down to five.

"The Dots went to bat in the third inning somewhat calmed down, and taking advantage of a sky-scraper by Barker, and some loose pieces of fielding, succeeded in scoring six tallies. Interest in our boys now began to revive, and some applause greeted their success. Nevertheless, the Dashes came in and continued their lead with a run of seven. Then the Dots went to the bat. During this inning Greene made a splendid catch in centre field, and Hunter, who tore his 'impossible-to-run-about-withoutables,' laid off till the seventh inning for repairs. The Dots secured four tallies, and by crowding themselves down to work kept the score of their opponents down to the same figure. In the fifth inning the Dots went out with a goose egg, and by means of sharp play gave the inside a chance to make but one tally. A foul catch by Kendrick was loudly applauded in this inning, as was also a fly catch by Gurley in the sixth inning. Several double plays were made by both clubs during the game, and several opportunities to make them overlooked by both. From the middle of the game until the end the Dots kept the score of their opponents down much better than was at first expected they would be able to do. The catching and pitching of the Clevelanders bothered the Dots considerably; and yet we must commend the Buffalo boys for the pluck and courage they exhibited to the end of the game. Considerable wild batting was indulged in on both sides, as two or three black eyes and damaged hats will testify. The umpiring gave great satisfaction to both parties, while the spirit manifested by every one taking part in the game was good natured and friendly in the extreme. We append the score of the game:

DASHES.		R.	O.	DOTS.		R.	O.				
Bohn, p.	4	3	Dolan, c. f.	1	3				
Melton, r. s.	2	4	Voas, l. f.	2	3				
Jones, s.	5	4	Dudley, s. s.	2	3				
Hoffman, c.	4	2	Lees, c.	3	2				
Greene, c. f.	2	5	Waud, 3d b.	2	2

Hunter, r. f.	2	3	Kendrick, p.	1	4				
Gurley, l. f.	4	1	Larish, 1st b.	2	3				
Total	35	30	Total	17	30				
Innings	1	2	3	4	5	6	7	8	9	10
Dashes	10	5	7	4	1	0	4	0	0	4
Dots	0	1	6	4	0	0	0	4	2	0
Umpire	—Mr. C. F. Howard, of Essex B. B. C.										
Scorer for Dots	—Mr. Frank Kitton.										
Scorer for Dashes	—Mr. J. T. Hanford, of Cleveland.										
Time of game	—2 hours and 40 minutes.										

After the game both clubs returned to the Continental, where they sat down to a big dinner, and afterwards took in the regatta and balloon ascension. At Schenkelberger's Garden they found a cool entertaining place to pass the evening, after a day of unusual excitement and activity. Yesterday morning the Dots chartered the Maggie L. Wilson and took the Dashes and party down to Navy Island, and to Sheenwater to dinner. The 9 o'clock train last evening conveyed the Cleveland boys home, feeling that, though they had been victorious at a game of base ball, the Dots of Buffalo could not be beaten in the hospitable manner in which they entertain guests.

"Keep Cool."

SPEAKING of bulls, "Gnimmuc," in the Springfield, Ohio, *Daily Republic*, says:

"A case in point is called into remembrance which came under our notice. It occurred in Cincinnati during the Exposition, when the hotels were crowded with visitors, and one might consider himself fortunate if he got any kind of lodgings. One of the operators received a telegram for the Burnet House from a Sushee at a little town in Kentucky. The message read about as follows: 'I will be there on Saturday; keep cool.'"

"The operator thought at the time it read rather queer, but being used to receiving all kinds of curious things, he let it go without further inquiry. A few days afterwards a lady arrived at the hotel, and, after registering her name, inquired if her room was ready. The clerk answered that he was full. 'Why?' replied the lady, 'did you not get my telegram?' On referring to his file he found the message, and showing it to her said, 'You say *keep cool*, but don't say anything about reserving room; I did not understand it so, and there has been no apartment saved for you.' It then came out that the word 'cool' should have read 'room,'

which made some difference. You can well imagine there was one pretty mad woman just about that time, and the invectives she hurled on the unfortunate telegrapher were neither mild nor complimentary. The affair soon leaked out at the office, and the standing joke on Dick for several months was 'Keep cool, old boy.' While on matters telegraphic, I may mention a despatch sent by a gentleman to his lady friend, who was about to sail for Europe, 'Good bye all—Numbers, sixth chapter, twenty fourth verse.' Those having the curiosity to look it up will find the selection befitting. The announcement of a birth is made in rather dubious Latin, 'Hurrohri per taurine puer cuu vitrosus optimus, elegautum,' which we suppose means, three cheers for the bully boy with an elegant glass eye. We were going to relate the story of the regular Saturday night telegram sent to Springfield in years gone by, which ran in unvarying language each time, 'Love and a kiss; long letter to-morrow;' but we refrain, not wishing a storm about our ears, and remembering we should not tell tales out of school.

[From the *Scientific American*.]

Bunsen's Battery Improved.

To the Editor of the *Scientific American*.

WHILE Bunsen's battery is one of the most intense in use, considering its cost, there are two serious objections to its general adoption. The first is a want of continuous action, which renders it entirely unfit for many purposes; secondly, the offensive and deleterious vapor, which arises from it while in action, is an objection of scarcely less importance.

I have been laboring for some time to improve the constancy of this form of battery, while at the same time preserving its intensity; and this I have accomplished by filling the porous cup around the carbon with coarsely powdered (it should be powdered about as fine as gunpowder) graphite, which is a hard substance, obtained from the inside of gas retorts. The battery is set in action by moistening the powder with nitric acid, which is done by pouring a few spoonfuls into the porous cup. I have found that the current developed by this arrangement will be sustained for a long period of time, while its intensity is equal, if not superior, to that when acid alone is used. The poisonous vapor arising from the battery is very little, owing to the small quantity of acid employed.

There is, however, a circumstance attending the use of this battery, on which it will be well to make a remark. Sometimes, in making connection with the carbon, a screw is forced into it; and when this is the case, the screw becomes corroded and partially cuts off the current, and in some instances I have known it to cut the connection almost entirely off. If the points of the screws were plated with platinum or gold, the difficulty would be completely overcome.

Friendsville, Ill.

JAMES POOL.

Constructing Electro-Magnets.

A CORRESPONDENT of the *English Mechanic* describes a new form of electro-magnet constructed by him, which, he claims, is much superior in its effects to those of the ordinary construction. A number of pieces of iron wire, of No. 16 gauge and twelve inches in length, are each wound with fine insulated wire, commencing half an inch from one end and winding closely for 2½ inches towards the centre, and then going with two or three long turns to a point three inches from the opposite end, which is wound in the same manner as the first, leaving the ends of the wire long for subsequent attachment. The wire thus covered was dipped in spirit varnish and laid away to dry. A number of them were afterwards bent into the form of a horseshoe and surrounded in the bundle with a number of pieces of similar No. 16 iron wire, but not covered. The whole was then wound in the usual manner with eight layers of No. 16 insulated copper wire, to which all the ends of the inside wire were soldered. The magnetic effect is stated to have been surprising.

Weak Lightning.

THE hamlet of Wilkesbarre, in the Quaker-wealth of Pennsylvania is ahead on the slow lightning. Last week Dame Nature went in to rehearse in the elements. Great agitation prevailed, and among other big things perpetrated, was the exploit of a streak of lightning. The electrical bolt struck a railroad track at the mouth of a mine, followed the iron for one mile and a half under ground and nearly killed a man. The idea of the electric fluid taking passage on a railroad to facilitate its movements is new and comical. But that it should so tire out after a mile and a half of subterranean travel as to be unable to kill a man, when it had a fair chance to hit him, is at least refreshingly consoling, and could hardly have occurred in any but a comet year. The whole affair reminds one of the boy who placed some damp

powder upon a hot stove to dry it, and on its igniting ran into the yard to get a pail of water to extinguish it. "Why," said he, in explaining his loss, "before I got back with the water more than half the darned stuff had burned up."

Novel Application of Telegraph Wire.

Mr. L. SCHWENDLER showed, at the meeting of the Asiatic Society, a crow's nest made of pieces of telegraph wire, twisted together in a most ingenious and knowing manner. He said that lately such nests had been found frequently, and that it seemed as if the crows of India benefited by the introduction of Western civilization, and were by no means behind the age. As long as the crows built their wire nests on trees and buildings only, he as a telegraphic engineer would not object, but often they selected telegraph posts, between which and the telegraph wires they built those wire nests, causing what are known as "earth" and "contact," and interfering with communication. Crows, however, were by no means the only animals interfering by their domestic arrangements with overland telegraphy. Wasps built their mud nests in the porcelain insulators, causing, in rain and dew, leakage from the wire to the ground. Birds of prey frequently dropped dead fish and other offal upon the wires, causing contact. These were all frequent sources of temporary interference with telegraphic communication upon overland lines, and they, combined with many other facts, not necessary to mention, seemed to show that it would be a very great advantage to use subterranean telegraphs instead of overland lines.—*Calcutta Englishman.*

The Cuba Submarine Telegraph.

At an extraordinary general meeting of the Cuba Submarine Telegraph Company, held in London recently, the chairman, Mr. T. Hughes, said the vessel which had been sent out in December last to repair the break in the cable had accomplished that object. The cost of the repairs and hire of the vessel had been £20,500, in addition to which the company had lost about six months' traffic, which might be estimated at from £12,000 to £13,000. To prevent the risk of a similar loss of traffic in the future the directors had decided on the construction and laying of a duplicate cable. There was also the necessity for a second cable to accommodate the largely increasing traffic with the West Indies and South America. The length of the new cable would be about 400 miles, and a very favorable tender for the construction and laying of it had been received from Messrs. Hooper's Company, and in the event of that tender being accepted the cable would be laid in the autumn of the present year. To pay for the duplicate cable additional capital of £60,000 would be required, which was proposed to be raised by the issue of 6,000 shares of £10 each, bearing a cumulative preference dividend of 10 per cent., convertible into ordinary stock at the option of the holders. He concluded by moving a resolution to that effect, which was seconded, and, after considerable discussion, was adopted.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion. No notice will be taken of anonymous communications.

Telegraphic Matters in Washington.—A Tornado and its Prostration of the Telegraphs.—Improvements in the Western Union Office, etc.

WASHINGTON, D. C., July 8.

TO THE EDITOR OF THE TELEGRAPHER.

THIS city seems to have dropped entirely out of the correspondence columns of THE TELEGRAPHER, but although we are now left by Congress, the President, and most of the Cabinet to ourselves, we are not entirely without the pale of national and telegraphic interest.

The retirement of Postmaster General Creswell from office was not unexpected to his friends and those having intimate business and social relations with him. It has been known for some time that he was weary and disgusted with the thankless labors of the position and would leave it with much more pleasure than he entered upon it. His failure to secure the telegraphs to the Post-office management has greatly annoyed him, and it had become evident that it was an impossibility to do so, certainly for a much longer time than remained to the present administration, and so he abandoned the task in disgust. His proposed successor, Mr. Hale, could not stand

the summer heats and smells of the capital, and so he fell out even before he had fallen in, and the country was deprived of the benefit which might have been derived from his administration of postal affairs. Ex-Governor Jewell, of Connecticut, now United States Minister to Russia, to whom has been tendered and accepted by cable the appointment of Postmaster General, is an ex-telegrapher, and served his time at the key as a practical operator, and when he was here as a Member of Congress, delighted to refer to his former telegraphic experience. He will reach here in about two months, when his views on postal telegraph and other matters of interest will, no doubt, be speedily ascertained by interviewers.

We celebrated the "glorious Fourth" here by getting up a tornado and storm, which for violence, fury and destructiveness, excelled anything within the recollection of the oft quoted "oldest inhabitant." Houses were unroofed, trees blown down, awnings, signs, etc., flying in all directions. This was followed by a deluge of rain, which completed the devastation and ruin; that will make July 4, 1874, memorable to inhabitants of Washington for many years to come.

The effect of the storm upon the telegraph lines was very disastrous. All the wires extending north from the city were prostrated and broken, poles blown down, etc., and all communication north completely suspended for several hours—a condition of affairs which has not occurred before for many years. Four large poles were blown down and broken off at the ground, and a great many minor breaks occurred in the heart of the city. At Beltsville, ten miles from Washington, on the Baltimore and Ohio Railroad, the wreck of a church was blown across the Western Union wires, completely demolishing them. Between Baltimore and Philadelphia the damage to the Western Union wires was also considerable. The lines of the Franklin Telegraph Company were also seriously damaged in the city and north of here. The Automatic Company came through with only a few trifling breaks in the city, but north of Baltimore its line suffered considerable damage. By noonday following, however, all of the companies working out of the city were working through, with half of the usual complement of wires on the Western Union and Franklin Companies' lines.

The Western Union Company are fitting up a new operating room in the main or old building occupied by the company on the corner of Pennsylvania avenue and Fourteenth street—an improvement which was much needed, and will add greatly to the comfort of the operating force, their present quarters being extremely uncomfortable in the summer on account of the heat. The fourth and fifth stories have been knocked into one room, with a lofty ceiling, excellent ventilation, and affording additional floor room. The view from this room is also extensive and pleasant, and all hands are very much pleased with the change.

The old operating room is to be used as a battery room, and the Callad substituted for the Grove battery. The entry clerks who now occupy the ground floor of the extension, will be removed to the room under the new operating room.

Business has, of course, fallen off considerably upon the adjournment of Congress, and the operating force has been correspondingly reduced. Among the changes in the Western Union office, Mr. J. Neisou has gone to St. Louis, and Messrs. Gove to Philadelphia, Boileau and De Grau to New York, and Brown and McArthur to the Virginia Springs. John Staleup has resumed work in the Western Union office here after a temporary sojourn in Florida. The genial Harry Bertram, late manager of the Washington office of the Automatic Company, is now employed on the Baltimore and Potomac R. R., where he holds a responsible and lucrative position.

An attempt is to be made to introduce here the American District Telegraph system, but its success is somewhat problematical. It has proved successful in Baltimore, and there is now no doubt will be permanently established in that city.

The Secretary of War has under consideration the subject of constructing the military telegraph line along the Texas border, an appropriation for which was made at the last session of Congress.

WASHINGTON.

Telegraphic Bulls and Personals.

SAN FRANCISCO, June 25.

TO THE EDITOR OF THE TELEGRAPHER.

HERE are some "bulls" that were perpetrated not long since by some of our ambitious young "plumes." I'll mention no names, as some of the parties are slightly on the muscle, and might make it disagreeable for me. I'm not afraid, only cautious. One of the parties was operating in an office where the messenger "boy" was a youth who would turn the scales at 200 easily. He had this boy running around town one hot day, looking for "John Bellar;" not being able to find such a man, he took the advice of an operator who had been there,

and gave the message to "John Bemar," who proved to be the owner. "J. N. E. Hacker" also caused some delay until it was suggested that "J. N. Thacker" would be an improvement, when the message was re-copied and soon reached its destination. To say the "boy" was hot would be drawing it mild indeed. Another quill copied "Niro" for "Niece," in some report, "M. J. Kilston for A. J. Ralston;" and "(sig.) H. T. Draft for Sight Draft," were also turned out by this enterprising youth.

Mr. Thomas R. Knox, late night operator, at "S" Sacramento office, sailed for New York last week. He proposes to devote his future to the study of law. Tom leaves many warm friends, both in Sacramento and this city, who wish him success in his new profession.

Tom Lee, the man who never breaks, takes the position vacated by Mr. Knox.

Mr. L. N. Jacobs, Manager A. & P. Tel. Co. in this city, has taken a run up among the snow clad peaks of the Sierras, where he will view the romantic scenery around "Tahoe" until his health improves. MAUDE.

The Morality of Using Tobacco.—A Defence of the Telegraphic Fraternity.

TO THE EDITOR OF THE TELEGRAPHER.

IN so confidently speaking of the alacrity with which young men would yield up their pipes and segars, should the ladies "learn to like" and desire them, Miss Elinor but reckons on their proverbial gallantry, and their established custom of giving up everything for the sake of peace. Even we, ourselves, though nobody's "brother, husband, or lover," should Elinor "learn to like a pipe," would take pleasure in presenting to a lady sensible enough to say, "I really like the smell of a good segar," as nice a little brown pipe as ever she put to her lips—our pet meerschau— the companion of many otherwise lonely hours, and from which we would part with a tear in our eye.

That all ladies do not dislike the fragrance of tobacco we were well aware, and have met some who have smoked segars, but we were just mean enough to deny Miss N. B. the pleasure of saying, with a sarcastic curl of her lip, "nice ladies, those;" therefore, allowed her "Jennie" and "Elias" their own way, on the principle of dealing gently with the erring—especially when of the weak and gentle sex.

Tobacco being "expensive" is a matter which concerns the smoker alone—its "uselessness" is to be settled hereafter, before a Judge who will not admit prejudicial witnesses; and of its being "disagreeable to others," we have only to say: If the fragrance of this tranquilizing herb is too overpowering to unaccustomed nostrils, such as thine, then don't smelt of this weed; "that's the kind of a fellow I am."

The death sentence pronounced on billiards by Misses "Nettie" and "Jeunie" comes with very poor grace from those whom Nature has peculiarly adapted to some of the intricacies of the game. The little smoking we have done has not "sunk us so far beneath the level of the brute," as "Elias" poetically says, but that we can remember how a woman's skill at "nursing" helped us along wonderfully in the game of life; and, since then, we have had numerous exemplifications of the readiness with which ladies can "make" or "avoid" a "kiss," as they please. To put one's arm around them is a game of 396 "points," judging from the wonderful manner in which they are fastened together with pins; and those poor fellows who are married can bear witness to their "jawing," and that they "scratch" awfully unless they are allowed to go for the "pocket."

Soberly speaking, those who claim telegraphers are immoral, "fast," and unsteady, basing that opinion on the small chauce beer and segars have when some operators are around, and the occasional game of billiards, are not only mistaken in their estimate of the fraternity, but biased in their standard of what constitutes a moral, upright, Christian gentleman—than which no profession can produce more favorable specimens than telegraphy.

The length to which this letter has run convinces us that "Elinor" was right in saying we were indolent. We began, and were too lazy to stop. TOM.

Origin of the Term "Plug."

UPON the authority of two telegraph superintendents we give their explanation of the origin of the term "Plug;" as applied to telegraphy. In 1851 there was a light haired youth of sixteen summers (not C. H.), who struck dots and dashes at West Greenville, Pa. The office call was "G," and the youth signed "Pl." By constant use it verged into the word "Plug," and has continued in use ever since. Doc. Plummer, now superintendent at Oregon, is familiar with the facts in the case. If any one has a more reliable theory than the one we have given, it would, no doubt, be acceptable to all telegraphers.—*Plug.*

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

Special Notice.

The legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster. The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Telegraphic Journalism.—Its Failures and Successes.

THE suspension of another of the publications started within the last few months to furnish the telegraphic fraternity with a journal which it was supposed would prove more popular than others whose object it is to instruct as well as amuse, noticed in another column, suggests the idea that those who regard THE TELEGRAPHER as too elevated in its tone and character to meet the views and capacity of telegraphers, have been somewhat mistaken. There seemed to be for a time an epidemic of such publications as that referred to but we have never anticipated that they could become permanent. *The Switch* was, in many respects, the best of its class, and if either of those recently started could succeed, its prospects might be considered excellent, and, in fact, it has proved the longest lived of either of them so far.

For nearly eleven years THE TELEGRAPHER has pursued the even tenor of its way, and its prospects were never better or more promising than they are at present. The truth is, it meets a necessity, and while the field for it is a good one, it so fully occupies it that there is not much room for another telegraphic publication depending upon its patronage for support. We believe that, all things considered, it more nearly meets the views and supplies the requirements of the fraternity than any similar publication in this country has ever done, and that this is the reason why it is permanently successful. It is true that even THE TELEGRAPHER is not so generously supported, so far as subscriptions are concerned, as it should be, and there is much room for improvement in this respect; but it is more generally read and appreciated by the fraternity than any telegraphic publication has ever been before in this country.

While it is designed to devote a portion of its space to articles intended to exhibit the more amusing phases of telegraphic personalities and service, this is by no means its main purpose. Even the lighter sketches which it contains usually contain elements of instruction, warning and improvement, which are not lost upon its readers. Its scientific and practical articles are prepared by able and practical writers, electricians and telegraphers, and are carefully edited, and convey an amount of useful information and instruction which

cannot be obtained in any other publication, and which are worth, to any telegrapher who desires to become proficient, and excel in his profession, much more than the price of subscription many times over. The information which it contains from week to week keeps its readers thoroughly informed of the progress which is being made in telegraphy throughout the world, and a volume of the paper gives a complete telegraphic history for the year. Especial attention is given to this department of the paper, and, we think, very little that is worthy of record escapes notice in its columns. The "correspondence," which has always been a leading feature, is also of much interest and importance. It is true that some communications appear which do not possess any very great merit, or display very thorough acquaintance with the matters of which they treat; but the idea is, and has been, to afford the fraternity, and all who are interested in telegraphic and electric matters, a chance to be heard, and communications which are properly written, and do not contain libelous personalities, are never rejected.

We have referred to these matters again, not so much to set forth the merits of THE TELEGRAPHER as to indicate why it survives and flourishes, while other telegraphic publications, after an ephemeral existence, disappear and are soon forgotten. All of those to which we refer, with perhaps one exception, possess good and interesting features, but their scope is not sufficient to enable them to become permanent. We have welcomed them all as they have appeared, and they have had our best wishes for their prosperity, and we have never regarded them as in any sense competitors of this paper. An experience in newspaper management, extending over several years, has shown that it requires special and peculiar qualifications, conditions and purposes, to secure support not only for telegraphic but for journals of any character or description. As we have before remarked, newspapers and journals *grow*; they do not usually spring into immediate, profitable existence. It would probably surprise many of our readers to learn of the amount of money which was expended in publishing THE TELEGRAPHER before it became self-supporting. As a matter of fact, it was never so until within the last four or five years, and had it not been originally published by, and at the expense of the National Telegraphic Union, it would not at the present time, probably, be in existence.

We do not say these things for the purpose of discouraging anybody who thinks he is called upon to attempt telegraphic journalism from engaging in it. Before doing so, however, such a one will do well to carefully consider and investigate the subject, and ascertain not only the expense necessary to be incurred but the patronage likely to be secured.

Journalism, at the best, and especially telegraphic journalism, is a laborious, frequently vexatious and troublesome pursuit, and no editor or publisher can reasonably expect to please all of those who read his publication. Almost every individual has his or her ideas of how a journal should be conducted, and there are probably but a small minority who are not confident that they could improve on the best and most conscientious efforts of the person to whom the task of editing and managing any given newspaper is committed. We have had but little reason to complain of criticism in this respect, and, perhaps, have received more commendation than the paper is fairly entitled to, but still there has been enough of the former to prevent us from becoming too much puffed up, or overconfident in our ability and acquirements. However, we strive to do the best that we can, and we think that our efforts to present to the fraternity here and elsewhere a creditable sheet, have not been wholly unsuccessful. We know that THE TELEGRAPHER is by no means perfect, but we are confident that each volume that appears is an improvement on those which have preceded it, and shall continue our endeavors to improve it from time to time, and to labor to advance the best interests of the telegraphic fraternity and its status, and have no doubt but that we shall receive an adequate support.

The Cincinnati Industrial Exposition of 1874.

THE Board of Commissioners of the Cincinnati Industrial Exposition have issued a pamphlet containing their rules and premium list for the year 1874. The cover of this publication is gotten up in refulgent chromatic glory, while the interior is handsomely printed on cream tinted paper with a red line border, as a gentle intimation that things are going to be done up in style. The exposition opens this year on Wednesday, September 2d, and continues until the evening of Saturday, October 3d.

This exposition has always been noted in years past for its great display of electrical and telegraphic apparatus, which has been got together under the stimulus of a very liberal premium list. The list this year is much the same as last, and, for the benefit of any of our readers who may wish to compete, we print a copy of the list, which is as follows:

DEPARTMENT K.—CLASS 60.

No. 571	Best system of Fire Alarm Telegraph (in operation).....	Gold Medal.
" 572	Best Adaptation of The Telegraph to domestic use.....	Silver Medal.
" 573	Best Telegraphic Railway Signals	"
" 574	Best Fire Alarm Signal Box....	"
" 575	Best Telegraph Instrument for Stock Quotations.....	"
" 576	Best Set of Instruments for Electrical Measurement.....	"
" 577	Best Battery for force, durability and economy.....	"
" 578	Best Electric Light.....	"
" 579	Best Ship Telegraph, electric or pneumatic.....	"
" 580	Best Electric Hotel Annunciator	"
" 581	Best Combination of Morse Instruments.....	Bronze Medal.
" 582	Best Box Relay with Key.....	"
" 583	Best Pocket Relay.....	"
" 584	Best Morse Register.....	"
" 585	Best Single Cut-out.....	"
" 586	Best Switch for 4 to 20 wires...	"
" 587	Best Sounder.....	"
" 588	Best Key.....	"
" 589	Best Electro-Magnetic Motor...	"
" 590	Best Electric Watchman's Clock	"
" 591	Best Dial Instrument.....	"
" 592	Best Lightning Rod.....	"

We regret to see that the commissioners have repeated the mistake of previous years—that of putting the electrical and telegraphic apparatus in the same class with optical and philosophical instruments, and which in practice makes it very difficult, if not impossible, to procure judges competent to give thoroughly intelligent awards in both these departments. With this exception, however, there is little room for criticism. The awards in this class have, however, given very general satisfaction in previous years, as far as the electrical apparatus, at least, is concerned, and this will undoubtedly be the case this year. The coming exhibition bids fair to exceed in extent and interest any of its predecessors, and it is hoped that the inventors, manufacturers and dealers in electrical apparatus, will be well represented this year, as has been the case heretofore.

Suspension of "The Switch."

THE SWITCH, a Chicago journal, devoted to local telegraphics, has suspended publication. It may possibly be attempted to revive it at a future day, but this is looked upon as very uncertain. As this was regarded as the best of the new school of telegraphic newspapers, its discontinuance will doubtless be regretted by many who regarded its semi-monthly appearance with interest. So far as we know, this leaves in existence only *The Plug*, published at Cincinnati, and a rather feeble but more pretentious sheet, as regards dimensions, in this city.

Journalism is at the best an uncertain venture; and especially is this the case with class journals, which must derive their support from those engaged in one business or pursuit. Newspapers *grow*, seldom springing into immediate and profitable existence, and require to insure permanence and success, capital, enterprise, energy, and, at least, some journalistic experience.

During the more than ten years that THE TELEGRAPHER has been published, several attempts have been made to establish telegraphic journals in this country, none of which, dependent upon the patronage received for continuance, have been successful. Meantime it has pursued the even tenor of its way steadily, increasing its circulation, and favored with all the advertising patronage desired, and at times even unable to afford the space for all the latter which is pressed upon it.

Another Atlantic Cable Completed.

THE new cable to be laid by the Anglo-American Telegraph Company has been completed by the Telegraph Construction and Maintenance Company of London, and will be taken on board the steamship Great Eastern, which is expected to sail on the 27th inst., to lay the cable between the coast of Ireland and Newfoundland.

The policy of the Anglo-American is, and has been, to provide facilities in advance even of the requirement for them, which in telegraphy is certainly a very wise policy. We understand that notwithstanding the general business depression the business of the Anglo-American is better than it has been at any time heretofore, and exhibits a steady and gratifying increase.

A Chance for Inventors.

WE would direct the attention of the scientific portion of our readers to the advertisement of the United States Electro-Motor Company, which will be found in another column. This company offers a bonus for the production of a galvanic battery suitable for the purposes of the company, which ought to be sufficient in amount to stimulate some of our inventive geniuses to produce the required article. Though the conditions are somewhat difficult, yet we know of no insuperable difficulty in the way of their fulfillment, and have little doubt that a successful candidate for the prize will make his appearance in due time. The gentlemen composing the company are well known in telegraphic and business circles in this city, and there is no doubt of their ample responsibility and disposition to fulfil their promises, as set forth in the advertisement.

Lightning and Lightning Arresters.

ONE of the greatest perils for telegraph instruments and batteries, at this season of the year, arises from an excess of atmospheric electricity, with which the wires are constantly liable to become charged, and frequently without the slightest notice or warning. How much damage is done in this way every year it would be somewhat difficult to estimate, even approximately. River cables and other short cable lines are thus frequently rendered useless, and the work of discovering and repairing the damages is both slow, troublesome and expensive.

This peril may be effectually guarded against by the use of properly constructed lightning arresters, and one of the best of these to be had is the *Globe Lightning Arrester*, manufactured and sold by F. L. POPE & Co., of this city. By the use of these arresters damage from atmospheric electricity may be certainly avoided, and the peculiarity of their construction and arrangement avoids the danger of the line circuit becoming grounded through them from any cause.

Personals.

MR. G. FRANK STEWART, late of the 198 Broadway, New York, office, of the Atlantic and Pacific Telegraph Company, has accepted a position with the same company at Buffalo, N. Y.

MR. WILLIAM S. LEWIS has resigned his position on the night force of the Western Union Company, at 145 Broadway, New York, and has gone home to Lexington, Illinois, to look after other interests. So pleasant a companion, and so good an operator, cannot be otherwise than missed by operators and management. The many friends he leaves behind would be pleased to see him back again.

MR. H. L. GRAMZON, until within a year past one of the "old men" at No. 145 Broadway, New York, has resigned his position with the Atlantic and Pacific Company, at Syracuse, N. Y., and returns to the Western Union office, 145 Broadway, New York, as the successor of Mr. WM. S. LEWIS.

MR. M. G. CHIPMAN, late of the Atlantic and Pacific office, at 198 Broadway, New York, has been transferred to the Syracuse, N. Y., office of the same company.

MR. H. W. CLARKE, recently night report operator for the Western Union Company at Wilkesbarre, Pa., has accepted a position with the same company at 145 Broadway, New York.

MR. A. H. BABB, and recently of the Atlantic Pacific office at 198 Broadway, N. Y., has accepted a position with the Western Union Company at Albany, N. Y.

MR. B. C. KEELER, an undergraduate at the Michigan University, Ann Arbor, Mich., has temporarily accepted a position with the Western Union Company at No. 145 Broadway, N. Y., with the intention of rejoining class betimes.

MR. W. E. BISHOP has accepted a position with the Western Union Company at No. 145 Broadway, New York.

MISS G. W. HARKNESS, only sister of Mr. W. E. SMITH, Manager of the Western Union Telegraph office at Oakland, California, died in London, England, on the 5th ult.

The Springfield, Ill., *Journal* says that Mr. O. A. STEPHENSON, formerly a telegraph operator at Jacksonville, has been appointed General Superintendent of the Chicago and Paducah Railroad.

MR. JACK WOLLARD has resigned his position as night operator at Blue Cañon, for the Central Pacific Railroad, on account of ill health.

MR. J. K. L. CURRIER has been appointed night operator for the C. P. R. at Blue Cañon, *vice* WOLLARD, resigned.

MR. G. R. CRAWFORD has resigned his position as agent and operator for the C. P. R. at Blue Cañon, and gone West, Mr. G. W. HILL, from Summit, filling the vacancy.

MR. ADOLPHUS McMERRICK has been appointed agent and operator for the C. P. R. at Summit, Cal.

MR. SORELLE PEARSON, late Receiver Western Union Telegraph Company at Chicago, Ill., has been appointed Cashier on Central Division, Atlantic and Pacific Telegraph lines, at Chicago.

MR. F. SCOTT SMITH has resigned his position in the Albany, N. Y., Western Union office on account of ill health, and returned to his home in Cooperstown, N. Y., where he will, for the present, have charge of the office in the Cooper House.

MR. FANCHER, formerly of Lansingburgh, N. Y., office, takes the position in the Albany, N. Y., Western Union office resigned by Mr. F. SCOTT SMITH.

MR. A. BABB, late of St. Louis, Mo., and A. and P. office at No. 198 Broadway, New York, is temporarily employed in the Albany, N. Y., Western Union office.

The Telegraph.

By Cable.

THE NEW ANGLO-AMERICAN CABLE COMPLETED.

LONDON, July 4.—The new telegraph cable of the Anglo-American Company was completed to-day. The Great Eastern is to leave, to lay the cable between Ireland and Newfoundland, on the 27th of this month.

The Missing Cable Steamer Faraday.

IN the last issue of THE TELEGRAPHER was printed a report from Halifax, N. S., of the total wreck of the cable steamer Faraday, from collision with an iceberg. This report was telegraphed from Pictou, on Wednesday of last week, by Mr. Chipman, who, in a letter to the *Press* (newspaper) of Halifax, says he obtained the information from Mr. William Earle, of the cable staff at Port Hastings, who stated that he had received it from St. Pierre.

A subsequent report contradicted the rumor, and stated, under date of Halifax, July 3d, that communication had been had with the Faraday, and that after leaving Halifax she experienced continuous fogs near Torbay, and was greatly delayed, but that it was hoped she would reach Portsmouth, N. H., in a few days.

This report also lacks confirmation up to the time this is written, but it is expected that she will soon make her appearance. A vessel which arrived at Halifax on Monday last reports having passed a large steamer at anchor, which was supposed to be the Faraday, but had no communication with her.

Messrs. Siemens Brothers ordered by cable despatch, on Thursday of last week, the steamer Ambassador to

leave Portsmouth in search of the Faraday, and to report at Halifax. The Ambassador arrived at Halifax, but did not see the Faraday.

A cable despatch from Messrs. Siemens Brothers to Mr. Harrison, on the same day, directed him to go in search of the Faraday. He arrived by special train at Halifax on the same night and hired a tug, and left Halifax at four o'clock on Friday morning.

A press despatch from Halifax, N. S., of Wednesday last, states that the North German brig Rover reports: Saw the cable steamer Faraday, on June 27th, ninety miles southeast of Halifax, engaged in picking up cable.

Up to the time this is written no certain or definite tidings have been received from the Faraday, and there is considerable anxiety about her.

The Protection of Government Telegraph Lines.

THE Secretary of War, in a general order, has published, for the information of the army, the act passed at the last session of Congress to protect lines of telegraph constructed or used by the United States from malicious injury and obstruction, which makes it a misdemeanor to injure or destroy any of the works, or property, or material of any telegraph line constructed or in process of construction by the United States, to be punished by a fine of not less than \$100 nor more than \$1,000, or with imprisonment not exceeding three years, or both.

Telegraphic and Electrical Brevities.

THE Western Union Telegraph Company has opened an office at Southampton, Long Island, with Miss M. Vanderburgh as operator, Miss Vanderburgh was formerly of the "Fa" Hartford, Conn., office, where she achieved a pleasant fame. Southampton may be regarded as trebly blessed, in that the genuine Atlantic breaks upon its shores in a subdued murmur, bringing health and appetite with it; that it has been put in telegraphic communication with New York and the rest of the world, and that its telegraphic facilities are administered by so able and amiable a young lady.

The Western Union Telegraph Company having paid to the Union Trust Company the sum of \$30,000 in currency, being the annual payment to the sinking fund, the Trust Company will receive proposals, on or before the 1st August, for the sale of the bonds of the Western Union Telegraph Company to the extent of \$59,000 in currency, being the total amount of funds now in hand applicable to this purpose. The Trust Company reserves the right to decline all proposals for the sale of the said bonds at a greater premium than 10 per cent. above par in currency.

At the annual meeting of the Maine Telegraph Company in Bangor, Me., June 24, the following directors were elected: William Galloupe, Albert Holton, Albert W. Paine, Jacob A. Smith, Bangor, Me.; Hiram O. Alden, William H. Simpson, Belfast, Me.; Bien Bradbury, Wm. P. Merrill, Portland, Me.; Edward F. Littlefield, Winterport, Me. The board subsequently chose H. O. Alden, President and Wm. P. Merrill, Secretary and Treasurer.

The lines of the Maine Telegraph Company are leased to and worked by the Western Union Telegraph Company.

The Atlantic and Pacific Telegraph Company have opened an office in the Grand Union Hotel at Saratoga, N. Y.

Foreign Telegraphic Notes.

THE Brazilian cable has been opened to the public for the transmission of messages to Madeira, with stations at Funchal and Ponto do Pargo, and to St. Vincent.

The number of messages passed over the Cuba Telegraph line during the month of April was 1,475, estimated to produce £1,800; and for the month of May, 1,823 messages, estimated at £2,200.

TO ELECTRICIANS AND INVENTORS.

OFFICE OF THE UNION ELECTRO-MOTOR CO., }
62 BROADWAY, NEW YORK, July 8, 1874. }

The attention of Electricians and Inventors is invited to the following proposition: The

UNION ELECTRO-MOTOR COMPANY

Desire to procure a

GALVANIC BATTERY

Fulfilling the following requirements:

1. It must be capable of maintaining a steady current of 6 farads per second through a resistance, external to the battery, of two tenths of an ohm, with not more than six pairs of plates. This is, approximately, equal to the current developed by 3 of Chester's No. 2 carbon cells, charged with mixed nitric and sulphuric acid in the porous cells through 50 feet of No. 18 copper wire .049 inches diameter.

2. It must be absolutely free from fumes, and from liability to leak or spill its contents under any ordinary circumstances. If possible, it is desirable that a battery should be provided to work without liquids—in other words, a dry battery.

3. It must be capable of standing for a considerable length of time unused without material depreciation, and yet be ready to give out its full power at a moment's notice whenever required.

4. It must be self-supplying to an extent which will render it capable of furnishing a current, as above stated, for not less than 300 hours in succession without renewal.

5. Other things being equal, preference will be given to the battery occupying the smallest space.

For the best battery fulfilling the requirements herein specified a premium of

FIVE HUNDRED DOLLARS

will be paid, in accordance with the decision of the judges, if the battery is adopted by the company—which shall also have the privilege of exclusive ownership by paying the additional sum of

FIFTEEN HUNDRED DOLLARS.

This offer will remain open until November 1, 1874.

Judges.—MARSHALL LEFFERTS, President of the Gold and Stock Telegraph Company; GEORGE B. PRESCOTT, Electrician of the Western Union Telegraph Company, and FRANK L. POPE, Electrician.

E. B. GRANT, President.

H. H. DUNCKLEE, Secretary.

THE "SNAPPER" SOUNDER.

TRADE MARK. PATENTED MAY 12, 1874.

POLISHED, 30c., OR 6 FOR \$1.50.

POLISHED, WITH NICKEL-PLATED SPRING, 40c., OR 6 FOR \$1.80.

POLISHED, WITH KNOB AND SCREW FASTENINGS, 75c.

PRICE,  75 CENTS.

Sent post paid on receipt of price.

R. W. POPE, Box 5278, N. Y.

SMITH & HALL,

HAMILTON, ONT., Agents for the Dominion.

Brooklyn, N. Y.

BLISS RESERVOIR BATTERY.

PATENT APPLIED FOR.

Price per Cell, \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

GEO. H. BLISS & CO.,

41 THIRD AVENUE,

Chicago, Ill.

THE BALTIMORE BATTERY.

Acknowledged to be Superior to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

PARTRICK, BUNNELL & CO.,

22 DEY STREET, NEW YORK.

38 South Fourth Street, Philadelphia.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Descriptive circulars and price list forwarded upon application to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System
OF
FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

QUICK SALES, SMALL PROFITS AND SUPERIOR GOODS.

We are offering any of our unequalled Telegraph Instruments at 20 per cent. discount from list prices.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.
Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS
manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES
constructed in the best and most substantial manner

WHOLESALE MANUFACTURING AND CONSTRUCTION CO.
S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.
Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring
EFFICIENCY AND RELIABILITY.
Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,
New York.

LEWIS' TELEGRAPH MANUAL:

A few copies of the last edition of
THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Cauton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,

PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DRY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

the most durable, handsome and best insulated Braided Wire
manufactured.
PAINTED, PARAFFINE or SHELLAC WIRES
also furnished at the lowest prices. Iron or Compound Wires
covered upon reasonable terms.
We are also prepared to furnish a new style of
ELECTRIC CORDAGE,
which has been pronounced by all superior to any in the market.
The American District and Gold and Stock Telegraph Com-
panies have been supplied from my works with a greater
portion of the office wire used by them.
Sample Card and Price List furnished when requested.
Phillips' Wire can be had of

General Superintendent's Office,
AMERICAN DISTRICT TELEGRAPH CO.,
NEW YORK, January 1st, 1874.

E. F. PHILLIPS, Esq.
Dear Sir: Your office wire is a decided success. We have
used it exclusively for two years and consider it the best in the
market.
Respectfully,
W. H. SAWYER, Genl' Supt.

JOSEPH MOORE & SONS,
(Established 1820.)
535 & 537 CHINA STREET,
(Below Green St.,) PHILADELPHIA, Pa.,
MANUFACTURERS OF
INSULATED WIRES.

OFFICE WIRE—Plain, Braided, Prepared, &c.
INSTRUMENT WIRE—Cotton and Silk Covered, &c.
FLEXIBLE CORDS, all kinds, &c., &c.
We warrant all Wire to be of the highest conductivity, tested
by our Galvanometer, which compares with the tests of the
highest authority in this country.

TILLOTSON'S EXCELSIOR
TELEGRAPH INSTRUMENT.

(PATENTED JUNE 24, 1873.)

This apparatus is constructed of the best material, and finished
equal to any Telegraph Instrument, and is warranted first class
in every particular. It is especially adapted to the require-
ments of Students of Telegraphy and the operation of Private
Telegraph Lines.

Price, complete, Sounder and Key mounted on finely
finished Mahogany Base, with one Cell Hill's Patent
Battery, with Chemicals, eight feet of Office Wire, and
"Smith's Manual of Telegraphy"..... \$7 50
Two sets..... 14 50
Price of Sounder and Key only..... 6 50
" " with Cut Out and Lightning
Arrester attached..... 7 50

SEND FOR CIRCULAR.

TELEGRAPH PRINTING A SPECIALTY.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
 Instrument with Office Outfit..... 7 50
 Two Instruments and Outfits..... 14 50

THE AMATEUR'S
 TELEGRAPH APPARATUS.
 (Patented April 16th, 1872.)

ONE CUP BATTERY, CHEMICALS, WIRE AND
 MANUAL WITH EACH INSTRUMENT.
 Complete outfit for the Student or short line use.

Price, complete,
Seven Dollars.

Key and Sounder only..... \$6 00
 " " with Lightning Arrester..... 7 00
 Five per cent. discount for cash in advance.

GEO. H. BLISS & CO.,
 SOLE AGENTS,
 41 THIRD AVENUE,
 Chicago, Ill.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
 WATTS & CO., Baltimore.

THE REASON WHY
 THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A HAND-BOOK
 FOR

ELECTRICIANS AND OPERATORS.

By FRANK L. POPE.

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND

FULLY ILLUSTRATED.

8vo, cloth, \$2.00

Copies sent free by mail on receipt of price.

THE BISHOP GUTTA PERCHA WORKS,
 422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
 ONLY MANUFACTURER
 OF
PURE GUTTA PERCHA GOODS
 IN THE
UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,
 FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS,
 ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
 SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,
 AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with increasing
 superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any
 Telegraph Cable or Wire manufactured at the Works in New York,
 at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manufactured
 by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale
 in New York by

SARGENT & STUDLEY, 26 Park Place,
 RUBBER CLOTHING CO., 363 Broadway,
 D. HODGMAN & CO., 27 Maiden Lane,
 SHEPARD & DUDLEY, 150 William St.

THE TELEGRAPHER

A JOURNAL OF ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, JULY 18, 1874.

VOL. X. WHOLE No. 418.

Original Articles.

"The Dutch have Taken Holland!"

THE New York Times of Friday, July 10th, devoted a column to a description of what it terms "New Inventions in the Science of Electrical Transmission," the inspiration of which was evidently derived from Western Union sources.

Wednesday afternoon last, at the Broadway office of the Western Union Telegraph Company, a test was made of an invention which promises to be of almost more importance to the present age than were Morse's first achievements to the people of his own time. The test resulted successfully, and it proved that four messages can be simultaneously sent on a single wire in opposite directions, and with no more liability to mistake than as if an equal number of wires were used.

We are surprised to learn from the above article that, notwithstanding the fact that the duplex apparatus, in one form or another, had been experimented with by Gintl, Siemens, Frischen, Edlund, Precece, Farmer, Stearns and others, from 1849 to the present day, and has been in every day service on one or more wires of the Franklin Company since 1868, it never was actually invented until the Western Union Company adopted it, "so recently as three years ago."

But the new arrangement beats all! "In one instant it will quadruple the usefulness of the 175,000 (?) miles of wire used by the Western Union Company." "It is a new process of multiple transmission, by which two messages can be sent simultaneously in the same direction over the same wire, and either message can be dropped at any way station."

in page 160 of Sabine's Electric Telegraph, does the same thing in a perfectly feasible and effective manner.

Stark employs two keys at the sending station and two relays at each receiving station. Either key can be worked separately, or both simultaneously, without interference, and copies of either or both communications can be dropped at any way station. The arrangement is perfectly practicable in every respect. The principle is much the same as that of the duplex, making use of differing strengths of current upon the same line wire.

Theoretically there is scarcely any limit to the number of communications that can be simultaneously kept up over one wire. The practical limit is found in the number of different intensities of current to which the relays can be adjusted. For example, suppose we arrange five keys at a sending station, and connect them so that the first key would send a current of five cells of battery, the second of ten cells, the third fifteen, the fourth twenty, and the fifth twenty-five—and we also arrange five relays at the receiving station on five different adjustments, so that the first key would operate one relay, the second two relays, and so on.

Those who are curious to see the manner in which this problem of quadruple transmission has been worked out, will find a description of Bosscha's method in Dr. Schellen's Elektromagnetische Telegraph.

Instead of this so-called "discovery" being the "solution of all difficulties in the future of telegraphic science," it would be more likely to open up an entirely new set of difficulties.

One thing is certain, if the Western Union Company are going to "speedily put in practice this new system," one of the first things they will find it essential to do will be to pull down their old glass insulators and get their lines into a condition of at least decent insulation in rainy weather. If they will do this it is quite possible that the quadruplex may yet become a practicable system on the limited number of circuits where such a device is needed; but, in the words of Mr. Orton (edition of 1869), "If there is any practical value in the apparatus, its use—like that of the Morse telegraph—is freely open to all."

As if this were not enough, we are next treated by the Times man to a dissertation upon musical telegraphy, apropos of a recent invention of Mr. Elisha Gray, of Chicago, which has lately excited much attention in telegraphic circles. Mr. Gray is well known as an inventor of much ingenuity and originality, and has a deservedly high reputation for his achievements in the line of electro-mechanism.

they can be readily compared with portions of our own article:

[From the N. Y. Times, July 10, 1874.] [From THE TELEGRAPHER, May 22, 1869.]

About two months ago Mr. Elisha Gray, of Chicago, a gentleman well known in the electric telegraph world as a maker and inventor of some of the most valuable instruments now in use, conceived an idea which would be an extraordinary development of telegraphic science, if he could only succeed in practically demonstrating it.

One of the most remarkable recent inventions connected with telegraphy is the telephonic one, an instrument which transmits directly the pitch of a sound by means of a telegraph wire—either an air wire or submarine cable. This instrument is a German invention, and was first exhibited in New York, at the Polytechnic Association of the American Institute, by Dr. Van der Weyde.

Short as has been the lapse of time since he first began his experiments, he has succeeded, almost beyond his own anticipations, in perfecting an instrument which will convey sound by electricity over an unbroken current of extraordinary length.

It is clear, from the foregoing explanations, that no quality of tone can be transmitted—much less can articulate words be sent—notwithstanding the enthusiastic prediction of some persons, who, when they first beheld this apparatus in operation, exclaimed that now we would talk directly through the wire. It is from its nature able to transmit only pitch and rhythm, consequently melody, and nothing more.

Mr. Chandler says that he regards it as the first step toward doing away with manipulating instruments altogether, and that he believes that in time the operators will transmit the sound of their own voice over the wires, and talk with one another instead of telegraphing. The writer has seen this novel instrument at work, and has heard music played on a small melodeon, or piano key-board, transmitted through an unbroken circuit of 2,400 miles, and reproduced on a violin attached to the receiving end of the wire.

The point coming in contact with this small vibrating disk is connected with the ground wire, the other pole of the battery with the air wire or submarine cable. It is clear, from this explanation, that at every contact of the platinum point a wave of electricity will be sent over the wire, and as many waves in a second as there are contacts; and as there are many contacts as there are vibrations in every second, the number of electric waves will always be exactly equal to the number of vibrations corresponding with the pitch of each tone; he it fifty, one hundred, two hundred, or five hundred in every second.

The apparatus, by means of which this extraordinary feat in telegraphy is accomplished, has been named by Mr. Gray the telephonic, or an instrument designed for the purpose of transmitting sound to a distance. To this transmitting instrument the conducting wire is attached, the other end being attached to the receiving apparatus, which may be anything that is sonorous, so long as it is electrically connected with the strip of metal stretched between the strings at a point where the bridge of the instrument is ordinarily placed, will, on receiving the sound transmitted through the conducting wire from the piano, give out a tone very similar in quality to that of an ordinary violin.

The instrument in which this succession of waves is made audible at the other end of the telegraph wire is founded on the fact first investigated by Professor Henry, of the Smithsonian Institute, at Washington, that iron bars, when becoming magnetic by means of electric currents passing around them, become slightly elongated, and at the interruption of the current are at once restored to their original length. It consists of an elongated wooden box, of which the top is made of thin pine wood, similar to the sounding board of a stringed musical instrument, to which the iron bars are attached two bridges, carrying long pieces of moderately thick and very soft iron wire, which, for nearly their whole length, are surrounded by a coil similar to the coil of the electro-magnets used in telegraphing. One end of this coil is attached to the telegraph wire, the other to the ground wire, as represented in the figure. At every instant that a contact is established at the station where the sound is produced, and a current wave thus transmitted, these wires will become magnetic, and consequently elongated, and they will be shortened again at every interruption of the current; upon the character of the receiving apparatus, which may be a violin prepared as described above, a tin hoop, with foil paper heads stretched over it, after the fashion of a baby's rattle, a nickel five cent piece, an old oyster can, and a thin

sand other things. A sound, sufficiently loud to read Morse telegraphic characters, made by interrupting, with the common telegraphic key, one sustained note has been obtained, under favorable circumstances, at the receiving end of the wire without any more scientific sounding apparatus than that of a piece of common tissue paper.

Aside from the intense interest which this discovery will naturally excite in the scientific world—as to the causes which produce this extraordinary electro-physiological phenomenon, and the gratification it will afford to all lovers of the marvelous—it is evident that, although the practical uses to which it may be put cannot as yet be recited, quite enough has been demonstrated to show that, from its basis, a new system of telegraphy, both for aerial and submarine lines, of a simple, rapid and economical character, can be introduced. Mr. Gray has applied for patents of his invention in this country and in all the countries of Europe.

The above extracts "would go to prove" that some of our "noted electricians" not only "know little at present of the future of electric science," but that a good deal of the past in that science has also failed to attract their attention.

We wonder, also, if the somewhat over-enthusiastic Mr. Chandler ever heard of the old joke that used to be current in telegraphic circles, that the direct talking plan was once tried between New York and Philadelphia, but had to be given up on account of the Philadelphia operator's breath smelling too strongly of bad whiskey!

Seriously, we would be the last to detract in the smallest degree from the praise and honor due to the worthy inventor, equally worthy whether he puts into practical or useful form some grand original discovery of his own, or whether he only improves, perfects and renders available the previous inventions of others. But in the latter case it is the grossest injustice to give praise without stint to the latest comer, while the previous laborers in the same field are passed over utterly without recognition; and when this is done, as in the present instance—whether intentionally or otherwise, matters not—it is but an act of simple justice, for one who knows the facts, to use what means may lie in his power to set the matter right.

Bill Body's Recollections.

(No. 2.)

BY JOR HIBBARD.

It was one of the balmy, breezy Sunday afternoons during our stay at the Hayforks, while we were stretched at full length in the shade of the one solitary cherry tree of which the whole county boasted, our thoughts soaring far above the robins and blackbirds which were devouring the ripe and luscious fruit on the overhanging branches—soaring far into ethereal space—and while we were prospectively soaring far into the future, and thinking of heaven and the angels, and wondering if we, as an angel, would be restricted in our comforts and enjoyments—wondering if we would not be permitted *once* in a while to enjoy our Havana, if we would only carry a spittoon under our arm (wing is meant), or if, perchance, our Yankee ingenuity should ere we stepped forth from this footstool, devise and patent a smoke, ashes and saliva consumer with which we might enjoy ourself undisturbed and undisturbing. It was during moments of this kind, while we were thinking all about these matters, that Bill Body broke in upon our tranquil reflections and began—

"I wish you could ha' seen jest the one whitest man that ever stepped into *this* ranch," pointing over his shoulder with his thumb at the telegraph office. "He was missed powerfully when he left here; he's missed yet. No one will ever satisfactorily supplant *him*." (Complimentary already.)

"He was the best customer old Fillet ever had, I reckon. I *spose* he's *owin'* him yet, but he allus sed he'd r'ather never pay a man than cheat him out of an honest debt. 'n I reckon this debt is an honest one. He had the quarest name, though. I ever see—so kind o' odd and peculiar. He took *his* drops to the call of Johnny Smith."

"Hem! Seems as though I have *heard* of Johnny," remarked I.

"Have ye? Well, now, he *ain't* no slouch, is he? kind o' quar and peculiar, though, jest like his name. Ust to call me Boddv, as ef I *warn't* anybody unless it was called to me. Powerful humiliation to me, that. Now *you* knows my name is *Body*—B-o. B-o. d-y dy, Body, perounced jest the same as Podunk—that is, the last of it is."

"Ah! Podunkdy *isn't* slow," we inwardly mused—"particularly for the place."

"I cal'l'ate Johnny never laid by any great amount of cash—leastwise not fur any great while. Half a day and one night was all he wanted to get rid of his filthy lucre. He used to say he preferred filthy liquor to filthy lucre—fur, if liquor did lead to evil, lucre did the same thing; fur didn't the bible say it was the root? He never sent any money to his old mother—that's Mrs. Smith, you know—'cause he didn't want her to learn extravagance, 'n get worldly notions into her head, and hate to die, maybe, fur he cal'l'ated she was pretty well prepared now, 'n 'twould be a pity to have so much wasted after all her trouble. No, he never sent her a red, although she was a widder, and blind, and palsied, and considerable deaf, and, in fact, had already been dead several years. You know she *wasn't* dead, only he jest told the parson that one day when he was reprovin' him fur hein' so neglectful to her. And then the parson cried with him, 'n sed he hoped he'd live good and meet his mother in Heaven; and Johnny sed he hoped so too, and blubbered some; 'n then, after the parson was out of sight, around the corner, he saluted him with his finger tips in close proximity to his nose, 'n then pulled out a bottle and sed, 'Come, boys, les give him a bumper.' Great contrast atween him 'n the next one—Dutiful Harkins, we ust to call *him*. He warn't called Dutiful afore he kim here, I don't reckon, but *we* give him that name. He was a lean, lank, lubberly goshin', but the best hearted and hest natured feller in the world, 'n jest as lazy as he was good natured. Green! wal, I reckon you'd swear he was an infantile cucumber, only he was *big-ger*, of course. Ust to send all *his* money home, after he'd paid his bills, 'cept a small 'lowance, in case of necessity. The boys ust to play all sorts o' tricks on him. One night, when he laid on the table asleep, and it come up an awful thunder shower, they took a piece of copper wire about four foot long and fastened it to the top wires of the switch and tied it to one leg, and then tied the ground wire to the other, sayin' they was goin' to see bow he'd work as a lightnin' arrester, 'n then they went outside, to wait fur developments. They didn't wait long, fur jest then there kim an awful crash—must ha' struck close by, somewhere—and—well, it *waked* Dutiful up, no kind o' doubt about that, 'n it roused him clean off'n that table 'n into the fur corner of the room so quick the boys stood there wonderin' what had become of him. They thought maybe it had singed him up like as if he'd been a hair, and they war powerful scart for a minit. But bymeby he commenced to grunt, 'n then they found him back behind the door—that is, they found *something*, and they supposed it was Dutiful, 'cause it bad some scraps of copper wire mixed up along with it; but it was the wust lookin' Dutiful I ever see. They fetched him too after a while, though, so's he went to work in a fort-night, and then they treated him better for a spell; but bymeby the thing wore away, and they begun to put their heads together to hatch up sutbin' else. Finally, one o' 'em got one o' the boys down the road to make up a bogus message, and sign it Ablam E. Goodsell, and Dutiful hunted all over the surrounding country in the rain to deliver it. You see that was before the trick was known round about like it is now, and Dutiful didn't see what a *blame good sell* it was till after he was cuched; but he did *then*, for he got the rheumatix, and had to quit.

"And then they sent Jeddly Robbins here. Jeddly had a girl down the road, 'n he ust to go down every Saturday night, and he was gittin' awful spoony, when, one day, some vagabond down at Cromwell sent him a message, sayin' she would be on number two that afternoon (two didn't stop here then), and signed her name to it. Wal, what d'ye 'spose he did, but just jump on a freight train 'n go up to Greening's, where two jest slacked, 'n bought a ticket, 'n got on. Of course he didn't find her, but he was in fur it, fur the train didn't stop agin till it got to Elmwood, thirty miles from here, and he couldn't git back till next afternoon, 'ceptin' he walked, and I don't cal'l'ate he'd do much a walkin'. That, of course, give him *his* ticket of leave.

"Larky James had jest kim out here, lookin' fur a job, 'n so he stepped right in behind Jeddly. Larky was appearin'ly from the interior somewhere, and unsophisticated, 'cause he'd never seen country life, you see. He had a curious way of tellin' everything in the dearest kind of earnest, so that ef one *knew* he warn't tellin' the truth you'd find yourself believe him. Larky went fishin' over in Stoddard's pond one day, and didn't catch nothin'; found out afterwards he tied the bait onto the line above the hook, expectin' it would operate same's a steel trap set for a polecat, and, of course, he hated to come home empty handed; so he found a grocery over there, and hought a codfish and four or five mackerel, 'n reckoned he'd astonish the natives when he got back. But we knew more about them waters than he did, so we asked him if they warn't *salt* fish. He sed of course they war. Wal, ses I, them waters ain't no ocean, only jest a little lake, or pond, so to speak. I thought I had him there, fur he hesitated, and I 'sposed he was losin' his grip, but

presently his face lit up a trifle, and he spoke out confidently and firmly: 'Who sed it was an ocean? I didn't *think* of such a thing; its likely there's a *salt mine* there somewhere!' I sed, 'that's so; I didn't think o' that.' But he got hifalutin', and we couldn't stand him nohow, so we sent him on a wild goose chase out to Martinsburg, where we told him there was a job waitin' that would pay him a hundred dollars a month. And *then* we got a character here—"

And so I suppose Bill Body would have gone on, if my landlady had not announced tea ready at that moment—gone on till now, maybe, and my obituary would have occupied this space instead of yours, next week, after you had read this.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS NOS. 63, 64 AND 65, UP TO AND INCLUDING JULY 11TH, 1874.

8, 16, 23, 37, 53, 56, 64, 65, 74, 77, 86, 88, 91, 93, 133, 138, 145, 157, 215, 217, 220, 254, 269, 301, 346, 349, 352, 372, 383, 385, 394, 414, 416, 434, 467, 526, 532, 536, 542, 546, 547, 549, 555, 564, 576, 587, 594, 600, 603, 615, 661, 703, 714, 715, 721, 731, 740, 764, 821, 825, 830, 832, 873, 880, 916, 917, 929, 941, 1001, 1011, 1023, 1024, 1039, 1050, 1081, 1126, 1143, 1147, 1169, 1173, 1175, 1178, 1183, 1195, 1199, 1200, 1210, 1232, 1252, 1259, 1260, 1300, 1306, 1329, 1345, 1364, 1365, 1394, 1402, 1403, 1404, 1409, 1410, 1440, 1444, 1484, 1488, 1511, 1517, 1518, 1527, 1532, 1571, 1590, 1623, 1630, 1632, 1658, 1697, 1698, 1735, 1763, 1811, 1812, 1831, 1894, 1900, 1901, 1906, 1907, 1919, 1926, 1944, 1950, 1965, 1995, 2019, 2027, 2030, 2036, 2049, 2069, 2082, 2118, 2133, 2135, 2174, 2175, 2190, 2201, 2202, 2208, 2204, 2205, 2206, 2214, 2228, 2229, 2232, 2240, 1241, 2244, 2257, 2259, 2262.

ASSESSMENT NO. 62.

8, 78, 95, 138, 169, 182, 185, 186, 187, 211, 232, 273, 288, 294, 347, 428, 429, 481, 496, 497, 499, 500, 503, 505, 506, 507, 508, 527, 555, 566, 597, 605, 671, 692, 695, 697, 705, 714, 717, 725, 766, 812, 869, 873, 880, 899, 908, 920, 952, 1038, 1069, 1071, 1104, 1134, 1135, 1136, 1182, 1207, 1217, 1295, 1400, 1421, 1426, 1461, 1462, 1488, 1495, 1496, 1504, 1519, 1553, 1556, 1557, 1559, 1570, 1609, 1610, 1611, 1612, 1613, 1670, 1677, 1697, 1698, 1712, 1722, 1741, 1743, 1777, 1778, 1802, 1854, 1945, 1946, 1947, 1966, 1972, 1995, 2004, 2022, 2026, 2063, 2064, 2066, 2095, 2112, 2128, 2132, 2146, 2150, 2151, 2175, 2178, 2182, 2189.

ASSESSMENT NO. 61.

27, 138, 169, 182, 232, 237, 238, 242, 246, 258, 273, 288, 294, 347, 398, 428, 429, 451, 453, 455, 457, 496, 497, 499, 500, 503, 505, 506, 507, 508, 555, 671, 692, 766, 804, 880, 1038, 1104, 1134, 1135, 1136, 1153, 1182, 1207, 1275, 1450, 1495, 1496, 1553, 1609, 1677, 1712, 1715, 1716, 1722, 1731, 1743, 1777, 1778, 1786, 1939, 1941, 1974, 1975, 1976, 2037, 2063, 2064, 2066, 2105, 2115, 2128, 2132, 2146, 2150, 2163, 2175, 2177, 2182.

ASSESSMENTS NOS. 58, 59 AND 60.

555, 671, 1038, 1777, 2175.

MISCELLANEOUS.

63.—95, 121, 211, 553, 764, 952, 1995, 2026, 2119, 2168, 2178.

64.—95, 211, 414, 916, 952, 1995, 2178, 2201.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that hereafter an acknowledgment of the receipt of an assessment should be taken as a receipt for all previous assessments.

"John Oakum."

THE Attleboro' (Mass.) *Chronicle* prints the following. It would now seem that for once, at least, a prophet is not without honor in his own country:

"When the former editor of this paper retired from its conduct, he left many friends who still follow him with kindly interest. We have been among those who have wished him well, and enjoyed an intimate personal acquaintance with him. Since leaving here Mr. Phillips has been engaged in the telegraphic art at 145 Broadway, N. Y., devoting his spare time to writing for the New York *Graphic*, *Hearth and Home*, and the leading telegraphic journal of the country, THE TELEGRAPHER. Among telegraphers he stands at the head as a writer of their peculiar style. Everybody on the wire knows him. We publish this week an article of his from *Hearth and Home*, a journal which professes to accept nothing which is not first class, and which has among its corps of contributors such as Edward Eggleston, whom some regard as the leading American Author. Our readers will recognize the signature of "John Oakum," appended to 'Sand,' on the first page, as one with which they are already familiar. We have reprinted several articles from the *Graphic* and other papers in previous issues. To our mind they evince

ability of more than ordinary excellence, and show a facility in the use of English that promises distinction for the future. The originality of his style commends it especially. Our New York correspondence, we have no doubt, our readers find highly acceptable, though of course it differs entirely from the nature of such articles as those of 'Sand.' Will our predecessor and our present correspondent accept our heartiest congratulations for his success."

The Last Message.

"DR. GOSSE gave full medical instructions up to near the end, and when he (Mr. Stapleton, the station master at Barrow's Creek) appeared to be getting worse, Mrs. Stapleton, who resides in North Adelaide, was sent for by Mr. Todd. She conversed with her fast sinking husband by wire, and while messages were still being sent from here asking for further information, a telegram came announcing his decease."—[The *South Australian Register's* report of the affray with the blacks of Barrow's Creek.]

In reference to the foregoing "Geoffrey Crabthorn," a regular contributor to the *Register*, has the following verses:

There's a threadlike creek in a stony bed,
With dull brown tufts of a stunted shrub;
An open plain, where the grass is dead,
And sombre forest and tangled scrub.
There's a long low range, stretching far away,
And rudely fashioned of rough hewn stone,
In the mellowing light of the fading day
Stand the high white walls of a station lone.

In darkened room of the building drear
There's a deep red stain where the life stream ran,
The poisoned point of a broken spear,
And the pain pinched face of a dying man.
There's a faithful friend, who has faintly heard
A whispered wish from the trembling mouth;
There's a throbbing needle that sends the word
Twelve hundred miles to the peaceful south.

There's a woman who sits in a lofty hall,
And waits with a wan and bloodless face—
While terrible moments seem to crawl—
For a word, one word from the far off place.
There's a message that comes on its path of fire—
The whispered wish of the station lone—
And an answer that flies on the mystic wire
From the woman that sits with the face of stone.

Husband and wife—but how far apart!
With never a clasp of the dear one's hand;
Yet mighty science, how great thou art—
They speak o'er forest, and scrub, and land,
And the pain pinched features no longer wince,
And a tear of joy from the dim eye slips
At the fond, last words that a moment since
Came fresh and warm from the wife's sweet lips.

Correspondence.

Quadruple Transmission by the Morse Telegraph System.

TO THE EDITOR OF THE TELEGRAPHER.

PERMIT me to say a few words through the columns of THE TELEGRAPHER in reference to an article on 'Telegraphy in the *New York Times* of the 10th inst., on a supposed new discovery made by Mr. George B. Prescott, the Electrician of the Western Union Telegraph Company, the development of which is ascribed to the enterprising policy of Mr. Wm. Orton, the President and Executive Manager of that company, who is represented as saying that the "new discovery" may be called the solution of all difficulties in the future of telegraphy. This "new discovery," by the way, as is well known to all electricians, and must have been known to Mr. Prescott, is a very old one, dating back to 1846, and since much experimented with as a curious philosophical problem by two Germans, at least, published and described in the *Polytechnisches Blatt*, of Vienna, in 1854 and 1855—also referred to in the English works of that eminent electrician, Mr. Sabine, and others, in 1869.

Now, admitting (which I am willing to do for the sake of argument) that the statements referred to are correct, let us see what would be the gain to the company in the number of words transmitted per minute. Mr. Prescott says "the usual rate upon Morse lines does not exceed seventeen words per minute" (I quote Mr. Prescott's own book, *The History, Theory and Practice of the Electric Telegraph*, p. 149); then add about one half for duplex transmission, say nine words per minute (which in practice is all the gain), making a total of twenty-six words per minute, then add fifty per cent. by, we will say the German method of quadruple transmission (which in daily practice would be quite useless), the gain would in theory and on a com-

paratively short line be equal to twenty-five and a half words per minute, which, divided up into four messages, leaves the same subject to all the old Morse difficulties, such as liability to interpretation by feel, taste, or by sound, by any Morse operator, and may be so appropriated; and, in addition, there would be the inevitable complication of the Morse apparatus, adapted to quadruple transmission, in combination with some sixteen or more conflicting compensations, in order to meet, among other difficulties, that of climatic changes.

Being somewhat conversant with the subject, I will conclude by asserting that more work could be accomplished in the same time, on the same length of circuit, by the comparatively slow automatic process of Wheatstone. As to what is being daily actually accomplished by my American Automatic Telegraph system, "*Magna est veritas et prevalebit.*"

GEORGE LITTLE,
Passaic City, New Jersey, U. S. A.

July 11, 1874.

The Comparative Actual Speed of the Automatic and Morse Telegraph Systems.—What the Public Really Want.

NEW YORK, July 11th.

TO THE EDITOR OF THE TELEGRAPHER.

I NOTICE in THE TELEGRAPHER, under the head of "Original Articles," Mr. George Little undertakes to show that, by the automatic system of telegraphy, an equal number of words can be transmitted on one wire in the same space of time as would require, under the Morse system, sixteen distinct wires and thirty-two Morse operators.

Mr. Little's system does not, as he claims, transmit thirty-six thousand words an hour, but it does characters, which, after having been received, must be translated. On this point Mr. L. is silent. I am inclined to the opinion that the number of translators and time necessary to put the thirty-six thousand words into copy, so that it may be read by any one, will be equal to the amount of time expended by sixteen wires and thirty-two Morse operators. In other words, I, as a patron of the Western Union, cannot economize time by transferring my patronage to the Automatic Company, and I do not think even Mr. L. will claim I can. Cooching this, the next and only things which can influence the support of the public are rates.

I am in no way interested in the Morse system, but, on the contrary, have always hoped and believed that a system will be developed which will be, as compared to the present, what rapid transit (when completed) will be to the horse railroad. I will admit, however, that (and it is a formidable weapon in the hands of the opposition) the same amount of territory could be controlled under the automatic system (provided that system is not over estimated) as the Western Union lines do, at one fourth, if not less, than the present capital of that company, from the fact that you require so few wires. This is economy in construction. As to economy in force for office work (as I said in the beginning), I incline to the opinion that the number of translators one of the automatic wires would require, and their salaries, would equal in number and amount that required by sixteen wires under the Morse system.

Now, if the automatic can perform all it claims (and I hope and trust it may), there can be no great difficulty in carrying out the project intimated by a morning daily a few days ago, as being under consideration by the various railroad companies not controlled by the Vanderbilt party (who, as you are aware, are the back bone of the Western Union), and supported by Colonel Tom Scott, Mr. Watson and the B. and Ohio R. R., if the article in question has any truth in it.

With the opposition lines now in operation and lines owned by the railroad corporations consolidated, I think capitalists might be induced to invest, provided the railroads subscribe liberally—then with the automatic system a formidable opposition could be organized which would reduce the rates, which, after all, is what the public want; they must be the party benefited after all; to them the present rate of speed is as satisfactory as the rate of speed by which they are compelled to part with their money is unsatisfactory.

FRANKLIN MORSE ROGERS,
4 Exchange Court.

A "Bull" and an Atrocious Pun.

CALIFORNIA, July 2.

TO THE EDITOR OF THE TELEGRAPHER.

ON a sunny day in June, 187—, as the fledgling of Morse, at Summit Valley, was seated in his elegant office trying to while away his time by practising sending forty words a minute with his key closed, and just as he seemed most likely to succeed, for some mysterious cause (to the outsider) he suddenly ceased writing and listened attentively for a second, then leaning

forward and opening his key he rattled away, I I Dv. The following message was then traced in the highest style of art:

"Blue Canon.

Bally Jones.

Send Book Ox Team in parlor to Sacramento.
7 paid. J. A. JOHNSON."

Without noticing that the check was wrong, according to the way he had received it, he hurriedly signed his letter M, carefully folded the message, and, enclosing it in an envelope, started for the hotel. After delivering the message to Bally he returned and sat down with the air of one who had sustained his reputation as a first class man, telegraphically speaking.

He had been seated probably fifteen minutes, when, happening to glance towards the door, he observed an excited individual approaching, who proved to be the party to whom the message was addressed. If the aspiring knight of the key had any doubt as to the cause of the individual's excitement, all doubt was dispelled when Bally let the following words drop out of his mouth like a red hot shot out of a cannon, "What in the h—l does Book Ox Team in parlor mean?" Taking the message and scrutinizing it carefully our hero observed the check was not correct, according to the way the message read—there being eight words in it, and upon asking B C to repeat it he found it should read, "Send Book-Oxley in parlor to Sacramento," instead of "Ox Team." After explaining it satisfactorily to Bally he returned to his instrument to commune with nature alone, but was roused from his reverie by some fellow (who had been listening) manipulating very slowly and carefully, so that there could be no mistaking its meaning, "Hadn't you better go with that ox team to explain where the 'bull' comes in?" It is almost needless to state that he sent no reply, but then he wasn't mad, oh, no!

A. P. LUG.

Origin of Popular Terms.—When does an Operator Cease to be a Plug?

PORTSMOUTH, O., July 10.

TO THE EDITOR OF THE TELEGRAPHER.

I LIKE the idea of some of your correspondents of digging up the origin of terms, and, with your permission, will propound a question or two.

The term "O. K." is becoming very general, in our country at least, especially in the telegraphic business—no message being sent, I believe, without its use.

I believe it was first used by some eccentric individual whose duty it was to endorse certain papers "All Correct" over his signature, and he wrote it thus, "Oh Koreect." If this be correct, who was this individual, and on what occasion was it used?

Again. It seems very general for telegraph operators to term all "plugs" who are less skilled in the "electric art" than themselves. The question is, how much of a telegrapher must one be when he ceases to be a "plug?" More anon. D.

Mr. Bean's Duplex Telegraph System.

STEVENSON, ALA., July 10.

TO THE EDITOR OF THE TELEGRAPHER.

IN response to Mr. Bean's invitation for criticism on his system of duplex telegraphy, as illustrated in THE TELEGRAPHER of July 4th, I would like to ask him what is to prevent the current from both batteries, M B' and I B' going to line when key K' is closed?

G. W. HOWE.

Telegraphic Bulls.

A PENNSYLVANIA correspondent sends the following specimens of telegraphic bulls, which have lately come under his notice on the line upon which he is employed:

"John Smith, _____
House burued five o'clock this morning."
TOM JONES."

This was received by an amateur as follows:

"Folks better five o'clock this morning."

Another writes as follows:

"To _____, Condr., No. 50.
Overslept ourselves. Will be out on No. 7.

JOHN BROWN."

To show that the amateurs don't make all the bulls, it should be said that this was received by an "old timer."

"Over in Sept. Ourselves will be out on No. 7."

A COUNTRY paper says that, in reply to a question from the lecture committee of the chief town of the district, as to the subject of a lecture to be given at the institution, the lecturer telegraphed, "A Taste of Naples and Rome." The operator made it read, "A Taste of Apples and Rum."

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JULY 18, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster. The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

"More Startling Inventions for Rapid Telegraphing."

ABOUT five years ago a thick pamphlet was published by the Western Union Telegraph Company in opposition to the proposed union of the telegraphic and postal systems, which was widely circulated among members of Congress and others interested. The author of this document, in a paragraph under the title which heads this article, took occasion to disparage and ridicule the automatic and duplex telegraphs, the latter of which had even then been more than a year in successful and continuous operation upon the lines of a competing company, and had been referred to by the advocates of the postal telegraph as an improvement of considerable value. The conclusions which the Western Union pamphleteer arrived at may be briefly summed up as follows:

1. The duplex is a very old invention.
2. It is of no practical value whatever.
3. If it was of any practical value its use is free to everybody, including the Western Union Telegraph Company.

These conclusions appear to have afforded great satisfaction to the faithful at that time, for we find them substantially repeated in President ORTON'S report to the stockholders the same year, in which he remarks, in reference to the duplex, that it "has long occupied a prominent place among speculative telegraphers, and has recently been extensively advertised by the promoters of various competing lines." The sequel of all this is well known to our readers. Within less than three years the Western Union Company purchased the duplex patents at a good round price, when, presto! that much abused invention underwent an instantaneous transformation. It suddenly became one of the most wonderful, extraordinary and valuable discoveries that had ever been conferred upon the human race, if we may judge from the reiterated assertions not only of the official organ but of President ORTON'S report for 1873.

But all this is as dust in the balance compared with more and greater wonders that still lay behind, only awaiting a fitting occasion to be unveiled to the open mouthed amazement and admiration of a somewhat credulous world! Not until last week did such an occasion present itself. On Thursday, however, some

of the New York dailies gave currency to a rumor to the effect that an alliance had been formed between the Pennsylvania, Erie, and Baltimore and Ohio railroads, and the Automatic Telegraph Company, which would enable the latter concern to extend their lines to the principal Western cities, whereupon, by means of their improved machinery for telegraphing, which, in rapidity of transmission throws the duplex entirely in the shade, they would unquestionably be able to knock the future dividends of the Western Union—in the expressive idiom of the vulgar small boy—"higher than Gilderoy's kite!"

Our Western Union friends, however, were by no means caught napping. With a wise forethought, which cannot be too highly applauded, they had previously chartered a Bohemian, and, after taking him round to the grand radiating electrical dispensary in the rear of 145 Broadway, had literally crammed him to the muzzle with scientific lore. On Friday—the very next day after the appearance of the above article—they pointed him directly at Wall street, and fired him off in the columns of the *New York Times* with a most terrific detonation, to the great temporary demoralization of the enemy! As soon as the smoke cleared away a little a reporter of THE TELEGRAPHER was dispatched to the scene, whereupon it was discovered—this was a "discovery," mind, and not an "invention"—that the greater part of the noise was in reality nothing more than Chinese thunder, and that little or no actual damage had been done.

The truth is, things have changed within five years. The Western Union Company's shares have been placed on the list of the Stock Exchange; in other words, it has become a speculative concern, and like the puny rivals which its officers were accustomed to refer to in such contemptuous terms, it has at length itself taken to the extensive advertising of "startling inventions for rapid telegraphing." An article in another part of this paper would rather seem to point to the conclusion that the alleged wonderful inventions and discoveries of the *Times'* article bear a strong resemblance to Falstaff's lurch—"a pennyworth of bread to a most intolerable deal of sack." The scientific articles which appear in the New York dailies are sufficiently amusing as a rule, under any circumstances, but in comparison with the productions of the inspired penny-a-liner of the *Times*, most of them are but as the feeble glimmer of the splintering tallow dip to the retulgent glory of the noon-day sun.

Telegraphic Rumors and Fancies.

IN the absence of sensation topics, the comet and the TILTON-BEECHER scandal being worn nearly threadbare, and the business at the Stock Exchange being exceedingly dull, some of the New York dailies have gone extensively into the manufacture and publication of reports and statements in regard to new telegraphic combinations and so-called inventions, which are expected at an early day to revolutionize the telegraph business.

The financial editor of the *Evening Post* led off with a startling statement of what was proposed to be done by the Automatic Telegraph Company, in connection with the leading railroad companies, as follows:

"For some time past it has been known that an effort was making to establish a new telegraph company, and it is now reported that the negotiations to this end have been nearly completed. We have been unable to obtain full particulars in regard to the scheme, but hear that three of the railroad companies running the principal trunk roads from the Atlantic seaboard to the West (exclusive of the New York Central) propose to build telegraph lines over their roads, and such roads as they control, for a new telegraph company, which will take these lines on a 999 year lease. The railroad companies, in consideration of having free use of the telegraph lines, are to keep them in repair. The instrument used is to be that of the Automatic Company, and it is claimed that the new company will be able to reduce the cost of conveying messages by telegraph from one quarter to one half present rates. Mr. Peter H. Watson, of the Erie Railway, has been mentioned as President of the new company, and it is said that this is the secret for his recent refusal to accept

another election as President of the Erie. We have been unable to learn whether there is any connection between this project and the new Atlantic cable which the Faraday is now laying."

The design of this statement, which is a repetition, more in detail, of similar reports which have been promulgated at intervals of from three to six months during the past year and a half, was evidently to "bear" Western Union stock, and that it had the intended effect was evident in a decline of two or three per cent. in the quotations. We have investigated the matter, and are assured by leading officials of the Automatic Telegraph Company that no such arrangement has been made or is likely to be made at present, and doubtless Mr. WATSON was as much surprised as anybody to learn of his intended transfer from railroad to telegraph management.

Our Western Union friends, to counteract this device of those who were short of the stock, on Friday of last week had printed in the columns of the *Daily Times* a statement in regard to a wonderful invention which immediately quadrupled the facilities of that company, and rendered unnecessary the expenditure of any more money for line construction. We have elsewhere exposed the absurdity of this so-called invention and the assertions in regard to its value and importance. The Street evidently was not in the mood for "bulling" Western Union, and its effect was not perceptible in the quotations.

The New York *Tribune*, not to be outdone in the good work, supplemented these reports with the following:

"One of the Erie directors, prominent in the organization of the new telegraphic combination, said, yesterday, that for twelve months past efforts have been made to unite the organizations competing with the Western Union. The project had not been successfully carried out in respect to the union of all the companies, but the extension of the lines of the Atlantic Company would very probably hasten the negotiations now pending.

The principal obstacle to the union of all the outside lines is the attitude of the Atlantic and Pacific Telegraph Company. This organization has grown very steadily, and the officers laugh at the idea that they are likely to enter into any combination. They state that their success has long since been assured, and that they will enter into no combination like the one proposed."

On Tuesday last the *Tribune* devoted nearly a column to the automatic and quadruplex systems, the invention of both of which it attributes to a person who has as much claim to one as the other, and none to either; the gist of which is that while the automatic is a big thing it is of small account, and cannot compete with the marvellous quadruplex. This opinion, however, it does not set forth as that of the writer, but of our friend, Mr. GEO. B. PRESSCOTT, electrician of the Western Union Telegraph Company.

We think this vein is nearly worked out now, and shall hope to have a rest for a few weeks, and until the new Atlantic cables are laid, when another excellent opportunity will be afforded for the display of enterprise on the part of our newspaper manufacturers.

We are informed that there is this much truth in the reports in reference to the Automatic Company: The managers of that company are endeavoring to complete arrangements for extending the lines, and expect, before long, to construct a line between New York and Boston. Only this and nothing more.

The Telegrapher in Texas.

MR. D. W. H. VOORHIES, of the Western Union Telegraph office at Houston, Texas, has kindly consented to act for THE TELEGRAPHER in that section, and to look after its interests. We hope that the friends of THE TELEGRAPHER will cooperate with Mr. VOORHIES, and that we shall soon receive a large addition to our list of subscribers in Texas, and elsewhere in that section of the country.

We shall also be pleased to receive information relative to telegraphic matters in the south and southwest, and communications from the fraternity in that section on matters which interest them more especially.

Safety of the Cable Steamship Faraday.

THE cable steamship Faraday arrived at Portsmouth, N. H., on Thursday of last week all right, and thus relieved the serious apprehensions for her safety which had been caused by her long detention in consequence of fogs. The shore end of the cable having been successfully laid, she will proceed to complete the task, which, unless she again becomes befogged, she has yet time to do before the season in which it is practicable to lay cables across the Atlantic ocean has passed. It is to be sincerely hoped that there may be no further delay, as such delays entail serious loss on the contractors, and it will cause a general disappointment if there should be a failure to get the line in operation during the present season. It is important that the experiment of an independent cable should be tried, and if it proves successful, practically and pecuniarily, undoubtedly other cables will be laid at no distant day. If otherwise, it will be very difficult to obtain the large amount of capital requisite for another such enterprise.

Resignation and Appointment of a Supt. N. Y. Fire Alarm Telegraph.

MR. C. KINNEY SMITH, who has for some years past been in charge of the Fire Alarm Telegraph of this city, recently resigned that position, and Mr. JOHN H. EMERICH, of the regular night force of the Western Union Telegraph office at 145 Broadway, has been appointed Superintendent in his place, and has entered upon the discharge of his duties.

Under Mr. SMITH'S administration the efficiency of the department has been greatly increased, and he has exhibited much practical and executive ability in the arduous position which he has held with so much credit to himself and advantage to the city.

Mr. EMERICH, the new Superintendent, has been connected with the department in a subordinate capacity for several years, and thoroughly understands the duties and requirements of his new position. The appointment has, of course, necessitated his retirement from the night force at 145 Broadway.

Mr. EMERICH is one of the old stock of telegraphers, and has been identified with the telegraphic service for many years. He was in the War Department at Washington during the late war, and was one of the original staff in the cable room up to the time of the "strike," when, like many others, he sacrificed a promising business future for the sake of maintaining a principle. He is excellently qualified for his new and responsible position, and the Fire Department is to be congratulated on having secured so competent an officer.

Personals.

THE Western Union Telegraph Company has opened an office at the Maritime Exchange and News Room, 66 Beaver street and 113 Pearl street, New York, of which Mr. R. M. MATTOCKS has been appointed manager.

Mr. J. L. KERR has been transferred from the office of the Montreal Telegraph Company at Toronto, Canada, to the Buffalo, N. Y., office of the same company.

Mr. J. A. ROBLIN has been appointed train despatcher and chief operator Sacramento, Cal., Div. C. P. R. R.

Mr. C. R. SNEARER has been transferred from Reno, Nev., to Sacramento, Cal., office C. P. R. R.

Mr. ED. NORRIS has been transferred from night to day force in the Sacramento, Cal., office C. P. R. R.

Mr. E. SOMMERVILLE has been transferred from the Sacramento, Cal., W. U. office to San Francisco, Cal., office same company.

Lieut. JOHN EGAR, a rising "uth," of strong military proclivities, succeeds Mr. SOMMERVILLE as night operator at Sacramento, Cal.

Mr. NED PEARSON is at Oakland Wharf, C. P. R. R., suffering from Mr. ARCHIE LISTER, who is suffering from a severe illness.

Mr. THOMAS R. KNOX, recently of the Atlantic and Pacific, Sacramento, Cal., office, arrived in New York per steamer from Panama on Monday last, in good health after a pleasant voyage.

The Telegraph.

By Cable.

THE ANGLO-AMERICAN 1866 CABLE REPAIRED.

LONDON, July 15.—The Atlantic cable, laid in 1866, was successfully repaired yesterday afternoon, and is now in perfect working order.

The Cable Steamship Faraday at Portsmouth.—Delayed by Fog.

THE cable steamship Faraday, for whose safety serious fears were entertained, and whose total loss by collision with an iceberg was at one time reported, fortunately, as it proved, erroneously, arrived at Portsmouth, N. H., on Thursday of last week. She was detained by dense fogs on her return trip from Halifax, N. S., to which place she had gone for coal.

Her consort, the steamship Ambassador, which had been out in search of the Faraday, arrived at Portsmouth on Monday last, and on Tuesday the shore end of the cable was landed, the work being completed on Wednesday morning last.

The cable for the beach at Straw's Point was taken off the Ambassador in the launches specially provided for the purpose, which were on board the Faraday. Operating instruments have been set up in a private house near Straw's Point. Governor Straw and other distinguished men were at the Point. Bonfires were burning on shore; rockets sent up from the Ambassador and private residences, and the scene Tuesday evening is represented to have been one of great animation and interest.

After completing the laying of the cable at Straw's Point the Faraday and Ambassador sailed for Torbay, N. S., from which point the cable will be laid to the coast of Newfoundland, after which the Faraday returns to England and will load the balance of the cable and proceed to lay it from the coast of Ireland to the Newfoundland coast, where the ends will be connected, and, unless some unanticipated difficulty should be experienced, the new line will be in working order. After successfully operating it for thirty days, Messrs. Siemens Brothers, the contractors, will turn it over to the Direct United States Cable Co.

Wreck of Cable Steamer Gomos.—Telegraphic Communication in South America delayed.

A PRESS communication from Rio Janeiro, dated June 7, gives the following details of the wreck of the cable steamer Gomos:

"The British steamer Gomos, engaged in laying the telegraph cable on the southern coast of Brazil, has been wrecked with about one hundred miles of cable on board, though no lives were lost. This disaster will postpone through cable communication with the River Plate for six months longer, as she was landing an end at Rio Grande du Sol, for the purpose of laying the cable between that city and the frontier of Uruguay, when she was lost, and with her the cable intended for that last wanting link. It is also reported that the cable on the Uruguayan coast has parted. On the other hand, the Uruguayan land lines have reached within twenty miles of the Brazilian frontier, and should join on with the Rio Grande lines by July; but the Brazilian lines, whether government or private, are proved so unreliable that little account is made of them."

Foreign Telegraphic Notes.

THE directory of the Transandinian Telegraph Company have been informed by the manager of the River Plate Telegraph Company that he expects telegraphic communication to be established with Rio, Pernambuco and Para by the end of August.

The manager of the West India and Panama Telegraph Company's cables is now in Cayenne, superintending the laying of a submarine cable from Para to Demerara, which will connect Jamaica in six weeks with Para, Pernambuco, Bahia, Rio de Janeiro, Montevideo, Buenos Ayres, Valparaiso, Chili and Bolivia.

The number of messages forwarded from postal telegraph stations in the United Kingdom, during the week ended the 13th June, 1874, was 375,174—an increase on the corresponding week of the previous year of 35,402.

The first report and statement of the liquidation of the French Atlantic Telegraph Company was to be submitted by the liquidators at a meeting summoned for the 26th ult. After making a sufficient reserve to meet further contingencies and expenses the liquidators propose to distribute 4s. per share.

At an extraordinary general meeting of the West India and Panama Telegraph Company, the special resolutions adopted on the 30th May, for the increase of

the capital to £1,900,000, the purchase of the Central American, and other matters were unanimously confirmed.

New South Wales, Queensland, and New Zealand have ratified the arrangements for a duplicate cable *via* Normanton.

The total number of messages forwarded from postal telegraph stations in the United Kingdom, for the week ended June 20, 1874, was 388,651—an increase on the corresponding week last year of 47,100.

The directors of the Eastern Extension, Australasia and China Telegraph Company, have declared an interim dividend, for the quarter ending 31st March, at the rate of 6 per cent. per annum, or 3s. per share, free of income tax.

The directors of the Eastern Telegraph Company have notified that, subject to the final audit, the accounts show a balance which will enable a dividend to be recommended, at the meeting on the 14th July, of 4s. per share, making, with previous payments, 6 per cent. for the year ended the 31st of March, carrying to reserve about £39,000.

Telegraphic and Electrical Brevities.

A TELEGRAPH cable from Long Island City to New York was cut Tuesday afternoon, and the wire stolen. The thief was arrested at a late hour Tuesday night.

A general meeting of the stockholders of the Southern and Atlantic Telegraph Co. will be held at the executive offices of the company, No. 51 New street, New York, Wednesday, July 22.

Specimens of the different sizes of cables manufactured for and used by the Direct United States Cable Company, now being laid for that company between the United States and Ireland, are on exhibition in the receiving office of the Atlantic and Pacific Telegraph Company, No. 198 Broadway, New York, and attract much attention.

The Duplex System on Long Submarine Cables.

THE *Telegraphic Journal* of London, in its issue for June 15th, publishes a communication from Mr. C. V. De Santy, under date of Gibraltar, May 25, as follows: "It must prove interesting to your readers to learn that the possibility of working the duplex system of telegraphy on long submarine cables is no longer a matter of doubt.

"After fourteen months of experiments I have at length succeeded in obtaining very satisfactory results on the Gibraltar and Malta cable (1,121 nautical miles), and do not doubt but that on receiving some additional instruments I shall be able to practically establish permanent correspondence between Gibraltar and Malta on this system."

The Brazilian Telegraph.

WE congratulate the shareholders of the Construction and Maintenance Company upon the success with which the laying of the Brazilian Telegraph has been carried out. The work is not only one of great importance as a means of direct communication between Europe and South America, but will, in a financial point of view, be of great service to the Eastern Telegraph Company, in bringing additional traffic to their cable at Lisbon, where they are connected with each other. The contract price was £1,400,000, and a very large portion of that amount is clear profit, and will go to reward the shareholders of the Construction and Maintenance Company for their enterprise. As is usual on such occasions, courtesy takes precedence of commerce, and complimentary messages have been flying through the cable from and to Brazil. The Emperor is so elated that he is profuse in his congratulations. We know not whether he has communicated with any of the private friends he acquired during his recent visit to this country, but, as a member of the Geographical Society, he has requested Sir H. Rawlinson to convey to his *confidres* his acknowledgment of the favorable manner in which they received him. The rates per twenty words from any telegraph station in Great Britain or Ireland are as follows: To Madeira, £1 1s. 6d.; to St. Vincent, £2 17s. 6d.; to Pernambuco, £6 2s.; to Bahia and Para, £8 6s.; to Rio de Janeiro, £9 6s.; to Monte Video (by post from Rio de Janeiro), £9 7s.; to Santos, Santa Catarina and Rio Grande du Sol, £10 9s.; Half these rates for every additional ten words. Postage to the Gold Coast and Cape of Good Hope from Madeira or St. Vincent, 1s. 6d. Arrangements have been made for homeward messages, by which telegrams from all places in postal communication with Madeira and St. Vincent may be forwarded to their destination by telegraph immediately on the arrival of the mail steamers.—*The Railway News.*

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: JULY, WESTERN UNION, ATL. AND PAC., AMER. DIST. and rows of stock prices for days 9-15.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ended June 16, 1874, and bearing that date.

152,031.—ELECTRICAL TEMPERATURE REGULATOR.—William C. Baker, New York, N. Y. Application filed March 27, 1874.

Temperature raised too high causes the thermostat to close circuit to a magnet, shutting off warm air and admitting cool air.

152,199.—TELEGRAPH KEY.—Raudall W. Walker, Oxford, N. Y. Application filed April 25, 1874.

The improved telegraph key for transmitting despatches simultaneously over several lines, composed of insulated plates A', as many as there are lines to be connected, which are provided with s'awtooth projecting front and rear lugs or extensions e e, for attaching the contact screws and connecting wires, substantially as set forth.

For the week ended June 23, 1874, and bearing that date.

152,281.—TELEGRAPH RELAY.—Patrick B. Delaney, Washington, D. C. Application filed November 28, 1873.

Armature at each end of magnets having retractile springs of different tensions. One armature sometimes directly in main line circuit, so as to completely break such circuit, giving notice that line is in use, even in "leaky" weather.

- 1. A relay having two armatures and two armature levers, capable of different adjustments, substantially as and for the purpose set forth.
2. In combination with a relay magnet having two armatures, the additional magnet, substantially as and for the purpose set forth.
3. In combination with a telegraphic circuit, an armature and its stops, arranged to momentarily break such circuit on the movement of the armature between its stops, substantially as and for the purpose set forth.
4. In combination with a relay having two armatures, one or more sounders, the circuits of which are closed by the movement of either armature of the relay, substantially as and for the purpose set forth.

152,356.—TELEGRAPH KEY.—Theodore M. Foote and Charles A. Randall, Brooklyn, N. Y. Application filed March 20, 1873.

Depression of key lever closes circuit from one pole; elevation reverses circuit.

- 1. The combination, with the rocking lever of a key provided with screws, as described, of springs upon which the screws make a sliding contact when the lever is raised or depressed, substantially as described.
2. The screws s' s' s' in a key, K, in combination with a battery, and with circuit connections thereto, substantially as shown, the alternate raising and depressing the lever of said key, causing alternate positive and negative currents to be sent over the main circuit.

EXTENSION.

28,874.—IMPROVEMENT IN POST HOLE DIGGER.—Granted to John Lee, June 26, 1860.

- 1. The hollow self-discharging digger, constructed and operating as set forth.
2. The wheel A and levers B, in combination with the digger C, operating as described and for the purposes set forth.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost. Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

TO ELECTRICIANS AND INVENTORS.

OFFICE OF THE UNION ELECTRO-MOTOR CO., 62 BROADWAY, NEW YORK, July 8, 1874.

The attention of Electricians and Inventors is invited to the following proposition: The

UNION ELECTRO-MOTOR COMPANY

Desire to procure a

GALVANIC BATTERY

Fulfilling the following requirements:

- 1. It must be capable of maintaining a steady current of 6 farads per second through a resistance, external to the battery, of two tenths of an ohm, with not more than six pairs of plates. This is, approximately, equal to the current developed by 3 of Chester's No. 2 carbon cells, charged with mixed nitric and sulphuric acid in the porous cells through 50 feet of No. 18 copper wire .049 inches diameter.
2. It must be absolutely free from fumes, and from liability to leak or spill its contents under any ordinary circumstances. If possible, it is desirable that a battery should be provided to work without liquids—in other words, a dry battery.
3. It must be capable of standing for a considerable length of time unused without material depreciation, and yet be ready to give out its full power at a moment's notice whenever required.
4. It must be self-supplying to an extent which will render it capable of furnishing a current, as above stated, for not less than 300 hours in succession without renewal.
5. Other things being equal, preference will be given to the battery occupying the smallest space.
For the best battery fulfilling the requirements herein specified a premium of

FIVE HUNDRED DOLLARS

will be paid, in accordance with the decision of the judges, if the battery is adopted by the company—which shall also have the privilege of exclusive ownership by paying the additional sum of

FIFTEEN HUNDRED DOLLARS.

This offer will remain open until November 1, 1874.

Judges.—MARSHALL LEFFERTS, President of the Gold and Stock Telegraph Company; GEORGE B. FRESCOTT, Electrician of the Western Union Telegraph Company, and FRANK L. POPE, Electrician.

E. B. GRANT, President.

H. H. DUNCKLEE, Secretary.

THE "SNAPPER" SOUNDER.

OFFICE WIRE, BRACKETS,

INSULATORS, LINE TOOLS, ETC.

Send for Catalogue and Price List.

PARTRICK, BUNNELL & CO.,

22 DEY STREET, NEW YORK.

38 South Fourth Street, Philadelphia.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDER made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 60 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL
DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
E. HOWARD, & CO., Proprietors
J. HAMBLET, Electrician.

OFFICES:
114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH
in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up
THE ELECTRO-MAGNETIC WATCH CLOCK,
which is the best watchman's time recorder in the world. Also,
ELECTRIC AND CONTROLLED CLOCKS
of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
OF
EVERY DESCRIPTION,
38 VESEY STREET, New York.

NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

**RELAYS,
SOUNDERS,
REGISTERS and KEYS.**

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,
For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS—
Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

**BRADLEY'S BOX RELAYS AND SOUNDERS.
BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,**

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for
HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the
EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Send for New Catalogue and Price List.

LEWIS' TELEGRAPH MANUAL.
A few copies of the last edition of
THE TELEGRAPHIC MANUAL,
by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muscheubrock, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollastou, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Heury, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two- or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard.
Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight.. \$50 00

Sounders, from..... 4 50 to \$6 50

Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00

Relays, from..... 9 50 to 16 00

Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars.
The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

THE NONPAREIL TELEGRAPH APPARATUS,
NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and it is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices :

Single Instruments, with three cells of Battery, Chemicals,

Connecting Wire and Instruction Book, \$6.50

Two sets of Instruments, etc., 12.00

Send for our new Circular and Price List.

 Chicago, Ill.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
 WATTS & CO., Baltimore.

THE REASON WHY
 THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.
 L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

S. BISHOP, Proprietor,
 ONLY MANUFACTURER
 OF
 PURE GUTTA PERCHA GOODS
 IN THE
 UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,
 FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
 MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,
 Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
 SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,
 AND FOR
 BLASTING AND MINING PURPOSES.
 In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors. GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

VOL. X. WHOLE No. 419.

Original Articles.

Little's "Condenser Rheostat,"

As used by the Automatic Telegraph Company.

It is well known to telegraph scientists that the effect of an iron core introduced into the centre of a retarding coil or helice will be to assist (in addition to the accumulative resistance of the coil itself) in the accumulation of more current; in other words, the current allowed to escape by way of the overflow dam will become more retarded; for, until the current allowed to escape (by way of what I term the overflow dam rheostat) becomes retarded, condensed or accumulated, the iron core will not become magnetized, but, on breaking circuit, the coils will absorb the residuum (if any) stylus current and thereby prevent the same from following the path to earth (offered by my canary colored prepared paper), by sudden absorption of the same, the coils or helices assuming in this case the function of any properly constructed condenser or accumulator made for such purpose. In either case the current so absorbed would go to earth by way of the rheostat at the receiving end of the line.

Since the use of iron cores by myself, in 1868-69-70, I have preferred the ordinary condenser, when properly constructed. The introduction of iron cores, to augment the accumulative power of the coils or helices, was discovered by and used by Romagnose in 1802, and by Sir Charles Wheatstone, Preece, Culley, and many others since. To the first use of which (by me) in an automatic chemical telegraph, and of which there are many forms, I hold a broad claim.

There are also many forms of the (my) overflow dam (to earth) rheostat, used with a condenser, as also an accumulator, or condenser itself, to which, in an automatic chemical telegraph, I also hold a broad claim, by virtue of patents applied for and obtained since 1869.

In the provisional specification of my English patent (for my automatic telegraph system), No. 1,207, April 22, 1872, I state that it is necessary to regulate the force of the electric currents. For this I use an adjustable rheostat similar to that in my English patent, No. 2,286, of 1871; and the electro-magnet or magnets are put inside the rheostat. In cases where the rheostat requires to be very compact, the same is made with a series of small coils inserted in the bed and connected with conductors, over which the adjuster slides, to make connection "through ONE or MORE of those coils."

GEORGE LITTLE,
Consulting Electrician to the Aut. Tel. Co.; Inventor of and
Patentee of the American Automatic Telegraph System.

Passaic City New Jersey, U. S. A., July, 1874.

INSTRUCTIVE POSTSCRIPT.

(Extracts.)

* * * * The Little's "Automatic System."
* * * General MARSHALL LEFFERTS, Engineer in
Chief, Western Union Telegraph Company, October
21, 1869.

Little's automatic telegraph process. * * * I
have thought much on the subject, and desire to re-
iterate, with emphasis, what I have said before. The
results obtained by this method are surprising. GEO.
B. HICKS, General Agent of the Western Associated
Press, Cleveland, O., January, 1868.

By the Little's automatic system twelve columns
of the *New York Herald* can be transmitted and re-
ceived (over one line wire) in one hour. D. H. CRAIG,
Ex-General Agent of the New York Associated Press,
December 1, 1869.

In the fall of 1870 the editor of the *Scientific Ameri-
can* recorded from personal observation the receipt of
600 words per minute in clear, sharp signals.

Automatic or Cheap Telegraphy.—This great de-
sideratum has been accomplished by Mr. George
Little's method of manipulating the electrical currents.

* * * On the 5th of February, 1872, we made the
automatic test between Charleston, S. C., and New
York (over 900 miles). That test was satisfactory.
Hon. GEORGE HARRINGTON, President of the Auto-
matic Telegraph Company.

* * * Please call on the Hon. George Harrington,
the President of the Automatic Telegraph Company,

* * * and he will show you that the world does
not stand still. HIRAM BARNEY, June 24, 1872.

The Hon. William Orton, President of the Western
Union Telegraph Company, January, 1873, concedes
that 12,000 words were transmitted in legible signals
over a circuit of 300 miles in 34 minutes.

An eminent electrician in her Majesty's Postal Tele-
graph Department, writing to me under date of Febru-
ary 10, 1874, and April 8, 1874, says the automatic ex-
periments here were very successful. * * * * We
in England are watching with much interest the char-
acteristic growth and advancement of telegraphy in
America, and we are quite willing to learn and to be
taught. G. L.

Duplex Telegraphy.—A Combination of the
Bridge and Differential Systems.

In the diagram of my duplex apparatus, published
in THE TELEGRAPHER of July 4th, the resistance or
battery operated by armature *a* at A should have been
shown the reverse of what it actually was—that is, a
like pole should be towards I B same as at B, except +
poles are connected at B, and — poles at A. I send
you the following, which I consider an improvement
in the arrangement above mentioned:

By a combination of the differential and bridge prin-
ciples, as shown in the annexed diagram, all of the re-
ceived current affects the receiving instrument.

The outgoing current from terminal B is prevented
from going to ground G through the I P branch, by
being met by a like pole, *c*, of same potential as the
pole *c* of main battery M B, from which it started, and
is prevented from operating receiving instrument at B
on its return to zinc pole *z* of battery M B, by having
three routes to traverse at B, viz: from ground G to
junction *b*, around limb R of a differential duplex
relay, is one route of 500 ohms resistance; second,
from G through rheostat Rh of 250 ohms, from junction

a on bridge wire around relay spool R, in an opposite
direction from that of first route, thence to junction *b*;
and third route from junction *a*, on the branch of bridge
wire around spool D, in an opposite direction from that
of the other wire on same limb (i. e., in same direction
as the other bridge branch around limb R), thence to
junction *b*, where the three currents reunite and flow
to *z* of M B, through a rheostat Rh² of 1,000 ohms.
Now, one half of said returning current flows through
first route, because the other two routes together are
of same resistance as first route, viz., Rh 250 and
 $\frac{500 + 500}{2} = 500$ ohms; the other half divides equally
at junction *a* on bridge, thus one fourth of the return-
ing current flows around each limb, both in an oppo-
site direction from first half, and neutralizing the effect
of first half of returning current upon relay, i. e., the
two halves neutralize each other, and relay remains un-
affected, for all its wires (4) are exactly alike in resist-
ance and number of convolutions. All of the out-
going current, from A through the earth to B, has its
full effect upon the receiving relay D R at B, thus:
from ground it takes only two routes—first, through
limb R of 500 ohms and rheostat Rh² of 1,000 ohms—
1,500 ohms in all, exclusive of battery resistance;
second, through rheostat Rh of 250 ohms, and around
limb D of 500 ohms—750 ohms in all; therefore, twice
as much of current from A affects limb D as it does
limb R, yet none of it passes over bridge, because the
proper proportion for maintaining the "balance" is
never changed while operating, or by line variation, for
whenever the duplex sending key D K is opened rheo-
stat Rh² is thrown into R branch, having same resistance
as the battery M B, without breaking the main line M L
connection, in same manner as common duplex sending
now in use. For the sake of simplicity I have omitted
the battery resistances, which can be provided for, and
the resistances changed to make the incoming current
equal in both spools of relay, or nearly so, and at same
time lessen the general resistance. The "bridge" pro-
portion or balance, according to this description, is
500 : 1,000 : : 250 : 500—the two ends of bridge being
connected to branches between first and second
couple, i. e., one end between 500 and 1,000 and the
other end between 250 and 500. If I understand the
action of the static charge or return stroke provided
for in present duplex systems by a condenser, in my
plan it will neutralize itself by taking the Rh² branch,

dividing at *b* and flowing in opposite directions through
D R in equal parts.

Both terminals are exactly alike, except at A the
arrangement is to earth, and at B to line with + poles.
I claim this as my invention.

SIMEON J. M. BEAR.

Mitchell, Iowa, July, 1874.

Telegraphs in Mexico.

THE following statement, in regard to the telegraphs
in the neighboring Republic of Mexico, is from the
official report presented to Congress by the Depart-
ment of Public Works:

"Of the lines thus far in operation some belong to
the Federation, some to the States, and others to private
companies.

"The following telegraphic lines belong to the Fed-
eration:

"The one which starts from the City of Mexico
passes through Cuautitlan, Tepeji del Rio, Arroyozarco,
San Juan del Rio, Querétaro, Allende, Dolores Hid-
dalgo, San Felipe, San Luis Potosi, Montezuma, Char-
cas, Matehuala, Salado, Gomez, Farias, Saltillo, Mon-
terey, Cadereita Jiminez, Cerralvo Mier, Camargo,
Reinosa, and the Port of Matamoros; there being a
telegraph office at each one of the twenty-three places
mentioned, and comprising a distance of 1,400 kilom-
eters in length. At Matamoros this line connects with
those of the United States and consequently with Euro-
pe.

"The line which leaves Querétaro passes through
Celaya, Salamanca, Irapuato, Guanajuato and Leon,
with branches to Salvatierra, Valle-de Santiago, Pen-
jamo, Chitzeo, and Dolores Hidalgo—telegraph offices
being established in each one of the places men-
tioned; the length of this line with its branches is 398
kilometers.

"That which starts from the City of Mexico, 222
kilometers in length, and which passes through Toluca,
Ixtlahuaca, Tlapujahua, and Maravatio, from which
latter point it communicates with Salvatierra, closing
the circuit at Celaya, which facilitates communication
between the capital of the Republic and the interior
lines, independently of that which is established *via*
Querétaro.

"The telegraph line which passes through Tacnabaya,
San Angel, Tlalpam, Cuernavaca, Puente de Ixtla,
Iguala, Chilpancingo and Tixtla Guerrero, comprises a
distance of 376 kilometers, and will be continued as far
as the port of Acapulco. (The line has been finished
to the said port since the publication of the report
from which these data are taken.)

"The line which starts from the port of Mazatlan
and passes through Coacucodia, Pánuca, Copala, Ceyto-
es, Durango, Nombre de Dios, and ends in Chalchihui-
tes, is 498 kilometers in length.

"The line from Tehuacan to Oaxaca, which, is 251
kilometers in length and passes through Teotitlan and
Cuicatlan.

"The line which starts from Minatitlan and is to place
in communication the States of Vera Cruz, Tabasco,
Campeche and Yucatan with the capital of the Re-
public; two sections of the said line are already in
operation—one from Minatitlan to San Juan Bautista,
and the other from Campeche to Champoton. The
whole line when finished will be 639 kilometers long.

"The following telegraph lines also belong to the
Government: Those established in the States of Yu-
catan and Campeche, with offices at Mérida, the port of
Progreso, Sisal, Huemanac, Tixkokob, Izamal, Acan-
cek, Mama, Tzul, Tekax, and Maxcanun in Yucatan,
and in Kalkini, Tescelcachan, Iturbide, Champoton and
Campeche in the State of the same name. These lines
are 520 kilometers in length.

"The State of Zacatecas owns the line which begins
at San Luis Potosi and passes through Ojo Caliente,
Zacatecas, Fresnillo, Sombrerete, Chalehuhites, Aguas-
calientes, Jerez and Villanueva; this line is 660 kilo-
meters long. The State of Michoacan owns the line
which starts from Salvatierra and passes through
Acámbaro, Maravatio, Morelia, Pátzcuaro and Arío.
This line is 190 kilometers in length.

"The line of the Jalisco Company which starts from
Leon, passing through Lagos, San Juan de los Lagos,
Aguascalientes, Pegueros, Tepatitlan, Zapotlanejo,
Guadalajara, Tepic and San Blas, and a branch from
Guadalajara to Zayula, Zapotlan, Colima, and the port
of Manzanillo, is 930 kilometers long.

"The Vera Cruz Telegraph Company owns the lines
which start from the said port and run, one to Mina-
titlan and another to the port of Tampico; the former
passing through Alvarado, Tlacotalpam, Tuxtla and
Acayucan, and the latter through Jalacingo, Papantla
and Tuxpan.

"The line which runs from this city to Vera Cruz,
passing through Riofrio, Puebla Acatzingo, la Cañada,
Orizaba, Córdoba and Vera Cruz, also belongs to a
private company; and the other line, which follows
along the Mexican railroad as far as Nopalucan, and
then passes through Tulacingo, Perote, Jalapa and
Vera Cruz. This company, likewise, own the lines

from Mexico to Pachuca and Tulancingo, from Puebla to Tehuacan, from Puebla to Tlaxcala, and from Mexico to Chalco and Ameca.

"The telegraph of the Mexican Railway Company goes from this capital to Vera Cruz, following the railroad and the branch to Puebla.

"The extent of telegraph lines already in operation and being constructed in the Republic is as follows:

Owned by the Government.....	3,802	kils.
In course of construction.....	1,050	"
Owned by the States.....	970	"
Owned by private companies.....	2,179	"

Total number of kilometers.....	8,001
Or, about.....	5,000

"The total number of telegraph offices owned by the Government is 73."

The Lightning's Vagaries.

THE house of Mr. E. W. B. Canning, a well known resident of Stockbridge, Mass., was struck by lightning during the storm of June 7th. Mr. Canning was absent at the time and did not return until some three weeks afterwards. The singularity of some of the phenomena, of which the effects were still distinctly visible, led him to furnish the following detailed and interesting account of them to the *Springfield Republican*. He writes:

"My house is furnished with a rod, which is fastened to the west chimney of its front portion, running through proper insulators down the north side over the tiled roof of an eight feet projection and entering the ground deeply, some thirty feet from the place where the traces of the lightning remain on the outer and inner walls of the building. Several trees—maple and elm—stand near the house, whose tops exceed the highest point of the rod, one of the former being less than ten feet from and directly opposite the place where the unwelcome visitor seems to have made its exit. The bolt appears to have been divided; for that the conducting rod did its duty, in part, at least, is proved by one of the family, who was in the act of closing a window immediately in front and not ten feet from it, and who saw the fluid pour along down it like a stream of molten silver. To the others of the household, who were seated in the library—one of the front rooms—the remainder of the bolt, as it entered the room, resembled two balls of fire, one bursting through the wall and the other rolling along the carpet. The simultaneous flash and crash stunned and blinded them for a few moments, all receiving a shock more or less intense. The room was entirely dark at the time, and it was not until a transient lull in the storm that an investigation revealed the results of the explosion. The apartment was filled with a sulphurous odor, mingled with that of burnt woolen. The western portion of the library is an extension of six feet beneath an arch, and its ceiling is some eighteen inches lower than that of the main room. A double window, reaching to the floor, divides its western wall, on either side of which hangs a picture from hooks attached over a grooved chestnut cornice. Directly over the southernmost of these hooks is an orifice about an inch in length by a quarter in width, pierced by the bolt. Thence to the picture frame the cord was blackened, and several inches of a small copper wire with which it was slightly wound were fused. On the wall near the cord ring on the frame a ragged and irregular hole, as large as an ordinary man's fist, is torn through the plastering, from whose edges, burned inward, it might be inferred that there the fluid entered the room. But the lathing beneath is indented outwardly, as though it had been struck by a heavy, round-faced hammer. The plastering was thrown, in the finest powder, over even the farthest portions of the room. The closest search has failed to discover where the fluid entered the house externally, through wall or roof; but, from the casing outside, under the clapboards and about five feet below the hole in the library, a splinter, some two feet by three inches, was torn off and thrown twenty feet away, revealing beneath two large nails, whose attraction probably determined its point of departure. Thence it seems to have leaped into the earth on the edge of the terrace, and close to the roots of the nearest maple, scooping out the soil like the path of a cannon ball into a hillside. Clumps of turf were thrown upon the sill of my neighbor's window, more than thirty feet distant.

"But to some of the more peculiar features of the case: On the satin-faced buff paper of the library, and directly under and on both sides of the picture cord, there is portrayed the versimilitude of a vine, with leaves alternate, dashed with great distinctness, and in color a very dark bronze. Seven or eight leaves are distinguishable, growing smaller and less distinct toward the ceiling. Their shape resembles that of an ivy leaf, a sprig of which was trimmed over the arch, six feet before it, and which was loosened and thrown down by the shock. I am half inclined to consider

this a specimen of the photographing process of the electric fluid, occasionally recorded in descriptions of the effects of lightning. The copy is so true as to have deceived me, when I first saw it by lamp light, into asking where that vine came from. Students in physics will recall what I mean; instances of which, though uncommon, are yet by no means unknown, where images of objects immediately in front of the operating fluid are faithfully portrayed upon a neighboring surface. Only yesterday a gentleman gave me an instance in the case of his brother, who was instantly killed by lightning, a week ago, in Virginia. He was sitting near and opposite an open window, and on a hillside in front of it stood a dead tree towering with huge limbs over the humbler vegetation. On preparing the body for burial this tree was found most faithfully copied beneath his clothing upon his breast. The vine before mentioned more nearly corresponds with such facts than anything that has occurred in my own experience hitherto.

"Another curious fact, unnoticed till some days after the occurrence, is this: The ceiling of my library was replastered last May. A queer pox-marked appearance on portions of its originally smooth surface led to a revelation that small pieces had been nicked out all over it. This I attribute to the tinge of iron in the graules of the sand in the mortar (all the sand herabouts is thus affected) attracting the fluid and causing their dislodgement. If this be true, it proves the universal pervasion of the subtle agent through the premises.

"The storm during which all this happened was more severe and of longer duration than any remembered by 'the oldest inhabitant.' The dwellers on the heights above the village say that it was the meeting of two highly charged clouds, that were observed to follow each a range of hills on either side of our town, and, coming in contact at the point of the valley, paused and 'fought it out on that line' from eight o'clock Sabbath evening till three next morning, and then, seemingly exhausted, went growling down the Housatonic.

"A singular phenomenon in the vegetable world appeared so directly after that elemental conflict as to warrant the belief of our fruit growers that it is attributable thereto. On many of the fruit trees, particularly the pears, there was, next day, observed a blight, which, without scarring or crisping the leaves, turned them entirely black—in some cases the foliage of solitary twigs, and again that of whole branches.

"During the storm several dwellings in our town were struck with greater damage than my own. A few beasts were killed, and fields, meadows, gardeus, and particularly highways, badly washed by the floods that fell. But a more enduring *souvenir* has been left upon the side of Monument mountain in a huge furrow, which, as seen from the village, suggests a giant's grave scooped in the dense forest during that night of terror. I am informed that it is some thirty rods long by two or three wide, and looks like the path of an immense shell along the earth, tearing up trees, rocks and soil, and throwing them into a chaos of debris on every side. It is not a gully occasioned by a water-course, but bears rather the marks of a tremendous thunderbolt ploughing its furrow along the ground."

Telegraphers' Annual Reunion.

THE sixth annual reunion of the Western Union Telegraph operatives of this State was held in this city Saturday, the Fourth of July. At a meeting of the telegraphers of this city, held on June 15th, to make arrangements, the following committees were appointed:

Committee on Invitation.—P. K. Jones, Rochester; W. F. Drake, Rochester; P. G. Wright, Rochester; John Kelly, Syracuse; A. J. Schall, Syracuse; Tom Graham, Auburn; A. L. Howe, Utica.

Committee on Reception.—Vincent Marling, H. P. Mulligan, C. A. Wickhouse, P. K. Jones, P. G. Wright. The majority of the lightning operators arrived by lightning train at 11.20 P. M. Friday, and the balance on the early train Saturday morning, and were quartered at the Brackett House, which Hildreth & Bro. run by lightning. There were about seventy-five in the party, and, after having gone through Jim Erwin's culinary department, they were escorted by Messrs. Butler, Mulligan, Redman and other employes of the Rochester office to a commanding point to witness the grand procession. After "taking that in" they were marched to the Western Union office, thence to the Brackett House. There they met the Syracuse and Auburn delegations, and the party boarded the street cars and proceeded to the Bennett House, where they found the steamer Falling Waters awaiting their arrival. Just after the boat started the rain came down in torrents, but the boys kept under cover. The rain soon stopped falling, and the ride down the river was greatly enjoyed, the party taking observations from the deck of the steamer. They landed at the Spencer House, and immediately "struck out," by way of the beach,

for "The Cottage," where H. S. Moody & Son took them in charge. "Hod." furnished them with refreshments, and made them feel at home during their short stay. The telegraphers, before leaving, formed in front of The Cottage in the shape of the latest comet and gave "Hod." three lightning cheers. His Honor appeared on the balcony uncovered, and made a speech that would have done credit to that veteran pisciculturist, Seth Green. The comet's tail was straightened, the line again formed, and the party, "in a body," proceeded to Manager Cheney's cottage, where they were warmly welcomed by Mr. C. and his family, who had preceded the party. After a pleasant time here, enjoying the lake breezes, viewing the cottages that line the beach, and getting an idea of our popular summer resort, they boarded Conductor Smith's lightning train and were whirled back to town. The party desire us to extend their thanks to Conductor Smith for favors rendered. Then came the dinner in the spacious dining room of the Brackett House. The *table d'hote* was all that could be desired. Nothing was left undone to please the guests, and the Messrs. Hildreth and James Erwin were given a vote of thanks for their efforts in behalf of the lightning party. The "phunnists" of the party were Charles E. Stag and C. A. Scheffer, of Elmira; Brown, of Corning; Palmer, of Palmyra, and Schawl, of Binghamton. They made several "bulls," however, and were "cashiered" before leaving town. After the banquet the party went through Powers' block, tower and all, and then repaired to the river bank, where they were placed upon telegraph poles and witnessed the boat races. The Erie operators left on the 5 P. M. train for Buffalo, via Avon, thence to their posts of duty. Several of the Central operators remained until yesterday afternoon. All were highly pleased with the manner in which they were entertained while here. We found all of them gentlemen, and should esteem it a privilege to meet them again.—*Rochester Evening Express.*

The Telephone.

A CERTAIN malefactor, who hides his individuality under the generic name of Gray, has invented an instrument the awful uses of which he has concealed from the vulgar by calling it the telephone. The telephone is an instrument whereby Gray confesses, or, as he definitely puts it, claims that he can transmit sounds through "an unbroken circuit of 2,400 miles." He has played a piano, a melodeon, a violin, a drum and a tin can at those distances into the astonished ears of a reporter who, "in spite of much talking, had no difficulty in determining what tune the manipulator was playing." So long as this lethal invention is put into practice by the operator at the expense merely of casual reporters, it does no great harm. Perhaps the inventor may be defensed by the reverberation of his own fantasias, but that is of small account. The doubtful legend which attributes to a mediæval monk the invention of gunpowder, goes on to relate that he was blown through the ceiling by a premature explosion. There is something soothing in the thought that the inventor of the telephone may be defensed or driven into howling frenzy by the result of what his mischievous brain has devised. It would be sport to see Gray hoist by his own telephone. But the telephone has larger and more lamentable uses than the extinction of Gray. We spare our readers the dreadful details of how the new telephone works. It is enough that it can transmit sounds for 2,400 miles in such wise that "an accidental false note is immediately detected." The burglar alarm telegraph will at once be profaned to the uses of Gray, and every household hold a hurdy-gurdy. Our sympathies will be on tap like our Croton, and we will turn on Theodore Thomas, and the Philharmonic, and pay our bills quarterly. So far, the telephone is not so bad. But special correspondents know what the operator is capable of in the way of distortion when he is only required to read and transmit the words of what he fondly imagines to be his own language. To what new atrocities he will ascend when to him is also entrusted the transmission of tones no man can tell. Inevitably we shall have telephonic reports of every new opera crashing in the walls. The operator will cry havoc and let slip the discords of the damned, while enraged musicians flee shrieking into the streets, and *prima donne*, listening to the reverberant reports of their own achievements, will expire of grief and shame. The cadenzas of Di Murska will spread over the land, becoming flat and cacophonous as they go, and the false notes of Liszt be flashed under the sea to listening and shuddering nations.

Even this is not the worst. Has anybody reflected what an adjunct to the jubilees of Gilmore the telephone will supply? Hitherto the majority of mankind has borne with complacency the announcement that Gilmore was about to give a jubilee, consoling itself with the thought that it did not live in Boston. Now alienage from the Commonwealth of Massachusetts will be no protection against him. He will fall like dew upon the just and the unjust, and shine alike upon the Phil-

adelphian and New Yorker. One touch of nature will make the whole world kin and crazy, until the outraged race rises in its might to rend Gilmore limb from limb, and defile the grave of the inventor of the telephone.

An Important Legal Decision.

A DECISION, involving very important principles, was rendered in the United States Circuit Court, at Chicago, on Tuesday last, by Judge Drummond, in the case of the Atlantic and Pacific Telegraph Company vs. the Chicago, Rock Island and Pacific Railroad Company. The telegraph company, accepting the Act of Congress of July 24, 1866, entitled "An Act to aid in erecting telegraph lines and secure to the Government the use of the same for postal, military and other purposes," commenced the construction of a line along the route of the Rock Island Railroad, between Chicago and Omaha. The railroad company ordered the telegraph company to desist after a few poles were set. Thereupon the telegraph company applied to the United States Circuit Court for an injunction restraining the railroad company from interfering with the construction of their lines, claiming that, as the Rock Island Road carried the United States mail, it was a post road, and came under the provisions of the Act of 1866.

The railroad company was represented by Messrs. Williams and Thompson, attorneys. It was claimed by them that the Act in question applied only to roads traversing the public domain; that the right of way, which had been condemned and purchased by the railroad company under State laws, was the property of the railroad company, and, under the fifth amendment to the Constitution, could not be taken without compensation.

Judge Drummond, in his decision, held that the Act of July 24, 1866, limits the powers therein conferred to such military and post roads of the United States as are owned or exclusively controlled by the Government; that the Act does not include railroads which have been designated as post routes by other Acts of Congress, over which the Government exercises no control, but simply contracts for the carriage of the mails of the United States; that neither under the Act of 1866 nor under any other Act can Congress take or authorize the taking of the private property of a railroad corporation for the purpose of erecting and maintaining a telegraph line without compensation for the franchise so sought to be granted.

Miscellaneous.

MARINE GLUE FOR WOODEN BATTERY CELLS.—This compound is made by digesting pure India rubber in twelve parts of mineral naphtha, with the addition of gentle heat, which should be done in a safe place. When completely dissolved add twenty parts of powdered shellac; reheat, and stir until the whole is liquified, and then pour out on slabs of slate or polished metal, marble, etc. Cut to convenient size. When required for use melt in an iron pot and apply with a brush. It melts at 248° Fahr.

ELECTRICITY PRODUCED IN MECHANICAL ACTIONS.—Certain phenomena of electricity of tension, observed in leather belting by M. Joulin, have recently been the means of directing the attention of that physicist to the subject forming the above heading. He has constructed machines in which the mechanical tension of the belt can be varied at will, and has used for conducting pulleys the following materials: Iron, brass, zinc, red copper, white iron, lead (the last four metals applied in thin laminae to wooden pulleys); the imperfect conductors, walnut wood, leather, hardened rubber, in sheets of 0.36 inch, applied to wood; cloth and silk fastened in form of cushions, also to wooden pulleys.

In the machines formed of metal and leather, in the latter body electric tensions of surprising intensity were found. Independently of the long sparks obtainable, a metallic wire brought near the belt was traversed with a continuous current powerful enough to deflect the needle of a galvanometer, with electricity of tension to weakly decompose water, and in slightly modified Geissler tubes to produce a distinct stratification of the electric light. The circumstances influencing the electric production may be referred to three causes—separation, more or less rapid, of the bodies; the complex mechanical action of incrustation, depending, in the case of leather, on the elastic state and dimensions of the pulley, and the number of incurvations in a given time; lastly, the common temperature of the two bodies or that of one of them.

The cable box of the Western Union Telegraph Company at Ravenswood, where the wires are united with the cables under the East River, was robbed of several "arresters" on Tuesday of last week.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion. No notice will be taken of anonymous communications.

Automatic Telegraphy.

NEW YORK, July 16.

TO THE EDITOR OF THE TELEGRAPHER.

EDITORS, reporters and inventors have been unusually occupied of late in discussing the merits and demerits of the various systems of telegraphy which have recently come to the surface, and the stories which have been promulgated in regard to my favorite system of automatic telegraphy are so erroneous and unjust that I cannot allow them to pass without some notice.

To gentlemen, who, like yourselves, are familiar with the history of automatic telegraphy in this country, it must be infinitely amusing to witness the antics of the tribe of ignorant pretenders who parade themselves before the public as "Consulting Engineers and Inventors of Automatic Telegraphy." To General Leferts, far more than to all other inventors in this country, are we indebted for the present American system of fast telegraphy, which was brought before the public in 1869-70 by myself, and its practical success was fully demonstrated by me a year later over a line specially constructed for the purpose between New York and Washington—the same as now used by the Automatic Telegraph Company.

From August, 1870, till near the close of the year the Leferts American system of fast telegraphy was worked at pleasure over 282 miles of wire between the above named cities, at the rate of 500 to over 1,000 words per minute, recording accurately and beautifully.

During the whole fall of 1870 Mr. Thomas A. Edison and Mr. George Harrington were daily visitors at my office, and witnessed rapid and perfect telegraphing—more rapid and more perfect than have been done over the Automatic Company's wire during the past three years; and at that time, 1870, neither Mr. Harrington or Mr. Edison had ever before seen or conceived of automatic or fast telegraphy.

In 1871 the automatic system, fully developed in all its essential parts, was passed under the control of Mr. Harrington, as President of the Automatic Telegraph Company, on the pledge of his ability to raise all the needful capital to build competing lines throughout the country, but which he utterly failed to do.

About the time Mr. Harrington formed the Automatic Telegraph Company he made a secret alliance, in his individual capacity, with Mr. Thomas A. Edison, of Newark, for the purpose of getting up a rival system of fast telegraphy, and during the past three years the Harrington-Edison "Ring" have let slip no opportunity to extol the Edison so-called inventions, which, though of some value in covering up the approaches to fast telegraphy, are in no sense essential to the original Leferts system of 1870—nor does any one of the Edison inventions for transmitting rapidly on long or short circuits equal, and much less excel the Leferts devices.

The "relay magnet," which one enthusiastic but evidently very verdant reporter was made to believe was the crowning invention of Mr. Edison, after "one hundred and twenty-six consecutive nights of experiments in 1873," was in use from the first moment the line was opened, in August, 1870. The relay magnets were continued at every office on the line from that time till it was passed over to Mr. Harrington's Automatic Company in 1871, and Mr. Edison and Mr. Harrington invented the "relay magnet" in 1873, after they had seen it in daily and successful use for several months in connection with the Leferts system, in 1870. Those Edison and Harrington worthies have done a great deal just such inventing as this in connection with fast telegraphy, and it seems to me it is about time their bubble should be pricked.

It is probably true that the Automatic Company have, under Edison's management, adopted some of his devices, as in no other way can I account for the inability of the managers to telegraph recently even 100 words per minute over a circuit which was worked three years ago, before Mr. Edison had anything to do with the automatic system, at a high rate of speed, and can and will be again when the management passes into the hands of gentlemen of practical common sense, who have no fraudulent personal contracts or bogus inventions to bolster up.

Whilst the Harrington "Ring" have been for three years murdering fast telegraphy, by ends attempts to get up a new system, with the idea of wresting from the original inventors and promoters of automatic telegraphy their just rights, other parties have not been idle, and there is now passing through the patent offices of this and all European countries an entirely new system of fast telegraphy, which has been sufficiently tested in my presence to authorize me in say-

ing that it will work and record in circuits of more than 3,000 miles as rapidly and as reliably as the system now in use by the Automatic Company will work in a circuit of 500 miles of land line. But the great feature of the new invention is its adaptability to the working of long cable lines, which its owners are prepared to guarantee at high speed—300 to 500 words per minute—plainly recorded in circuits of 3,500 miles.

If, therefore, the little "Ring" of mutual admirers who now run the automatic machine spend many more nights in experimenting, they will be likely to have their labor for their pains, as the system which they have been so long coddling has become antiquated, and as useless, as a competing system, as the fifth wheel to a coach.

I observe that one of the writers upon this subject quotes Mr. George B. Prescott, the electrician of the Western Union Telegraph Company, as to the utility and value of fast telegraphy. As that gentleman and his chief, Mr. Orton, published labored arguments in 1869-70 to prove that it was impossible for me to telegraph over about 60 words per minute in circuits of 250 miles, whilst I found no difficulty whatever in telegraphing over 1,000 words per minute in much longer circuits, and, at the present time, without improved machinery, can telegraph over 3,000 words per minute with perfect ease, I do not think Mr. Prescott's judgment ought to be accepted upon this subject as of much value. Certain it is that it is quite possible to prove to the satisfaction of any intelligent and disinterested person, that if the Leferts system of automatic telegraphy, as developed by me three years ago, was taken out of the hands of antiquated fossils and ignorant pretenders and put into the hands of practical men, telegraphing could be done far better and at full fifty per cent. less cost than it can possibly be done by any of Mr. Prescott's double or quadruple apparatus for working the Morse system.

Mr. Prescott's statement that unskilled operators cannot work the perforating machines used by the Harrington-Edison people is quite true; but the only reason those crude, lumbering machines are used, is because the invention is claimed (quite erroneously) as belonging to the Harrington-Edison "Ring," and, therefore, must be forced into public use; but there are other perforators infinitely superior to those used in the Automatic Company's offices—perforators which can be correctly worked at sight by any fairly intelligent child of ten years of age; but these simple, cheap and easily worked machines were not invented by any of the "Ring," nor are they under the control of it; but they, nevertheless, exist, and in due time the public will have the benefit of their use.

I hazard the prediction that with these simple, reliable and inexpensive, but yet rapid perforators, and by a greatly improved system of recording in lines and pages, the public will, ere five years, perforate and translate their own messages, and thus be able to communicate ordinary business letters by wire, between all parts of the country, for 25 cents or less.

D. H. CRAIG.

Origin of the Telegraphic Signal "O. K."

78 and 80 BROADWAY,
NEW YORK, July 20th.

TO THE EDITOR OF THE TELEGRAPHER.

THE initials or letters "O. K.," employed as a signal in telegraphic practice, were derived from the political campaign of 1840, when the words "Oll Korreck"—represented by "O. K."—were in universal use in speeches and in the press.

In 1844 the experimental line between Baltimore and Washington commenced its career with the campaign of that year, particularly with the nomination of Polk by the Convention then sitting at Baltimore. The line had been working but a few days, and the nomination of Polk—then an obscure politician of Tennessee—was received in Washington with doubt, but in due time the mail confirmed the news given by telegraph, and then people began to think there was no trick about the telegraph. The letters "O. K." were used in that campaign as they were employed in 1840.

As a response to the reception of a message Morse employed the letters "I, I," but the everyday slang, "O. K.," used on all occasions, was readily employed by the telegrapher. Besides, the letters "O. K." are more distinct, telegraphically, than "I, I," for signals. Though in use from the commencement of the telegraph as a signal, they were officially adopted by the Telegraphic Convention at Washington in 1853.

TAL. P. SHAFNER.

M. TOMMASI, inventor of the hydro-electric cable, a device by means of which signals are transmitted through fine tubes filled with water, has lately succeeded in sending ten signals per second over a distance of two miles and a half. A full description, with illustrations of the invention, is contained in the *Science Record* for 1872.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The Western Union Official Organ and Duplex Telegraphic Inventions.

In its issue of the 15th instant the *Journal of the Telegraph* is moved by the remarks of our correspondent, ONTARIO, which appeared in our paper of the 4th inst., to attempt a retort upon THE TELEGRAPHER. ONTARIO, in the communication referred to, briefly exposed the absurdity of the attempts made through the *Journal* to claim everything of value in connection with duplex telegraphic inventions for Mr. J. B. STEARNS (whose duplex patents have been purchased by the Western Union Company). Characteristically, no pretence even was made of showing that our correspondent was incorrect in his statements in regard to the particular device referred to; but, smarting under the exposure of the ignorance exhibited in that quarter of what actually belongs to Mr. STEARNS, in claiming for him a device described in his patent of 1868, and expressly disclaimed by him as belonging to Messrs. SIEMENS & HALSKE, of Berlin, an effort is made to ridicule a system of duplex telegraphy described and illustrated in the same issue of THE TELEGRAPHER. It is assumed by this erudite editorial writer that this plan is sanctioned by what he is pleased to term the "scientific editor" of this paper, when it is expressly stated in the first paragraph of that description, by the author, whose real name and address is attached to the article, that it is submitted for criticism or improvement. This disingenuousness is evidence either of ignorance and stupidity or of intentional unfairness. We have neither endorsed or otherwise the plan of Mr. BEAR, and have had no occasion to do either.

It may be that the editorial writer is unable to comprehend the fact that THE TELEGRAPHER and the *Journal of the Telegraph* are conducted on diametrically opposite principles. One is an independent telegraphic journal, while the other is conceded to be merely the organ of the Western Union Telegraph Company. The columns of THE TELEGRAPHER are open to the presentation of the views and inventions of all respectable telegraphers and telegraphic inventors, whether they are regarded as sound or valuable in official and editorial circles or otherwise. We are by no means so inflated with the idea of our own acquirements, knowledge and ability, as to flatter ourselves with the belief that all telegraphic and editorial wisdom

and knowledge centre in the editorial chair or chairs of THE TELEGRAPHER. We regard it as possible that some original ideas may be presented by others worthy of consideration and space in our columns.

The *Journal* is conducted strictly as an organ, and it is intended that nothing shall appear in its columns which does not inure, or is not intended to inure directly to the interests of the Western Union Company, or of its leading officials. In the design to advance these interests, inventions and scientific discoveries and principles are either ignored or contemned in its columns, as may seem most practicable or advisable. We have no telegraphic axes to grind, and are not, therefore, under the necessity of disparaging or ridiculing at one time what subsequently are extolled as most wonderful inventions, merely because in the meantime it has become our interest to do so. This is the difference between an independent telegraphic journal and an organ.

In whatever receives our editorial endorsement, either in practical telegraphy or electrical science, we seek to be first of all correct; and that we have been careful in this respect is shown in that we have never been obliged to retract or change our position on any important points. We do not jump at conclusions, or sustain at one time what we are subsequently obliged to oppose or condemn. THE TELEGRAPHER being the acknowledged authority in electrical and telegraphic science and art in this country, we cannot afford to prostitute its columns because our interests may appear to lie in a certain direction. We do not ignore facts merely because they fail to coincide with theories, and make the paper ridiculous by praising and extolling at one time what we have before condemned and denounced—not on account of any new light upon the subject, but because in the meantime the proprietorship of certain patents has changed hands.

The readers of THE TELEGRAPHER are well aware that it has always awarded to Mr. STEARNS the fullest credit for all that he has done towards the advancement of duplex telegraphy. As president of a telegraphic organization his opportunities for introducing the system into practical use were unusually favorable, and what is more important, he possessed the knowledge, ability and enterprise to avail himself of these opportunities. Had it not been for Mr. STEARNS the duplex would to-day unquestionably occupy the same position, in public and professional estimation, that it did for twenty years previous to its introduction by him on the Franklin line in 1868—that of a mere scientific toy, of no practical value. Mr. STEARNS persevered, in spite of opposition and ridicule, until he had established the fact that the duplex system was just as practicable for through circuits of ordinary length as the Morse system itself. Some four years after the time when the duplex first began to be employed in every day service, an attempt was made to work it on a 500 mile circuit between New York and Buffalo. A somewhat unexpected embarrassment was experienced from the effects of static induction, which Mr. STEARNS soon surmounted by the ingenious and beautiful device of applying a compensating condenser. The credit of this latter invention unquestionably belongs solely to Mr. STEARNS, although several unsuccessful efforts have been put forth in certain English journals to deprive him of it. What our correspondent referred to was the evident attempt on the part of the *Journal of the Telegraph* to claim in behalf of Mr. STEARNS a great deal more than he actually invented, and, in fact, much more than he ever claimed for himself. It, however, sees fit to say:

"We here beg leave to remark that thus far Mr. Joseph B. Stearns is the first and only man who has invented and put in operation a successful system of duplex telegraphy. We are not unmindful of the great efforts put forth in this direction by Gintl, Siemens, Frischen, Newhall, Hughes, Farmer and other distinguished electricians and inventors. But as Mr. Stearns was the first, and thus far the only person to practically solve this great problem, we have thought it no more than his due to accord him his just claims."

As the *Journal's* editorial writer seems disposed to

make a point on this matter, will he please inform us if there is any device, or combination of devices (other than the condenser) to be found in the differential duplex, as now or heretofore used on the Western Union lines, and which is in any degree essential to the successful daily operation of the instrument in practical business, which was not known or used by others prior to the introduction of the apparatus of Mr. STEARNS in 1868, and if so, will he be so kind as to specify the same?

If by saying that Mr. STEARNS was the first to practically solve this great problem, the *Journal* means that he was the first to employ the duplex for regular telegraphic service, we will not dispute the assertion, although Dr. SCHELLEN in his work (edition of 1867) gives an elaborate description, with engravings, of a duplex (gegensprechen), which he states was then regularly working between Amsterdam and Rotterdam, in Holland. But if, on the contrary, he means it to be understood that Mr. STEARNS was the first and only inventor of a successful system of duplex telegraphy, and that the essential elements of such a system are covered by the patents now owned by the Western Union Company, we think the assumption is open to question.

Automatic Telegraphic Inventions.

In an article published in *The Tribune* of Tuesday, the 14th inst., to which a brief reference was made in the last number of THE TELEGRAPHER, it was stated that THOS. A. EDISON'S claims to certain inventions in connection with automatic telegraphy were undisputed. This statement provoked the following communications, which appeared in the *Tribune* of Saturday last, and which indicate that the *Tribune's* informant had grossly deceived that paper in regard to the claims of EDISON to the inventions referred to:

A CLAIM OF PRIOR INVENTION.—MAGNETIC INDUCTIVE COMPENSATION SAID TO BE IMPRACTICABLE.

To the Editor of the Tribune.

SIR: Will you do me the justice to submit the following reply to an article on the automatic system of telegraphy which appeared in your issue of yesterday? In reference thereto allow me to say that the principle of inductive compensation for lines of telegraph is public property, and covered by English patents upwards of twenty years old, and abandoned for the following reason: That it was found impracticable, and is physically impossible to neutralize a flowing or galvanic current of low tension on long lines by an induced magnetic current of high tension. Allow me to inform your subscribers that I was the first to use, in November, 1868, in New York, in the presence of Mayor Medill of Chicago, the late Geo. B. Hicks, of the Associated Press at Cleveland, Gen. Marshall Lefferts, and several other gentlemen of scientific attainments, a series of inductive relay magnets and rheostats at the end of an automatic line. But were it necessary to use inductive compensation as a substitute for the condenser, the effects could be produced with properly constructed coils or helices; but it is not at all requisite, if the lines be properly constructed by the free use of iron poles in good damp connection with the earth, or by the free use of the English and German pole wires to earth, in connection with an overflow dam, and any suitable form of accumulator at the receiving end of the line.

The coils or helices surrounding the iron cores perform the functions of a condenser or accumulator as well as the office of an "overflow dam rheostat." To each of which, in combination with an automatic chemical telegraph, I hold a broad claim by virtue of some seventy patents throughout the world.

Finally, the use of coils in any form at the receiving end of a line of automatic telegraph, so as to allow of an overflow of the line current to earth, or, as I term the same, an overflow dam, cannot be used without an infringement on my "American Automatic Telegraph System," patented.
GEO. LITTLE, C. E.
Passaic City, New Jersey, U. S. A., July 15, 1874.

To the Editor of the Tribune.

SIR: In the article on "Improved Telegraphy," in the *Tribune* of Tuesday last, describing "the automatic system," there are some statements which were made under a misapprehension of facts. It is stated that two difficulties prevented for some time the success of automatic telegraphy, viz: The want of means for punching the characters rapidly, and "the existence of what is called the 'after current,' in consequence of which a dragged line was produced on

the prepared paper, instead of clear dots and dashes;" that Mr. Edison "overcame the difficulty by placing a magnet at each end of the line, in such a position that it sends a counter current into the wire, which neutralizes the after current." You add: "The claim of Mr. Edison to be considered its sole inventor is undisputed. In the words of George B. Prescott, "Mr. Edison in this respect stands above all the electricians in the world. Mr. Edison also invented the perforating machine used by the Automatic Telegraph." As to the latter assertion, I beg leave to state that my brother, Frederick J. Grace, is the inventor of the perforating machine in question, and that there is now pending in the Patent Office an "interference" case to determine the validity of his claim, in which I am interested. As to the assertion that it is "undisputed" that Mr. Edison is the inventor of the device referred to for "neutralizing the after current," I have only to state that it is well known that Mr. Edison's claim to that invention is and always has been from the very first disputed by me. I used the magnets at each end of the line, for the purpose described, long before Mr. Edison had anything to do with automatic telegraphy.

GEORGE H. GRACE.

New York, July 16, 1874.

Telegraphic Inventions and Inventors and The Telegrapher.

THE usual midsummer dullness in telegraphic matters has been suddenly dispelled, and our columns are availed of to discuss the matters of interest to the telegraphic fraternity impartially. As THE TELEGRAPHER is not an "organ," its columns are freely open to those who may have anything to present of interest telegraphically. The attempt which has been made in certain quarters to claim for a person not entitled thereto certain telegraphic inventions, has stirred up others interested to vindicate their rights in the premises, and are not likely to prove very advantageous to the individual referred to, or those who are backing him in his efforts to appropriate the discoveries and inventions which justly belong to others. Certain skilfully concocted schemes, from which much advantage was anticipated, have been badly damaged and demoralized already, and are likely to prove abortive and fruitless. THE TELEGRAPHER will always be found on the side of right and justice in such cases, and, so far as we can prevent it, no charlatan or unprincipled appropriator of other's property and rights, in connection with electrical and telegraphic inventions, shall meet with success. This matter is not by any means yet ended, and our readers may expect that for some time to come our columns will be enlivened by the ventilation of these matters.

Personals.

Mr. CLIF. E. MAYNE, of the Chicago, Quincy and Burlington Railroad, at Cromwell, Iowa, has retired from telegraphy to engage in other business.

Mr. H. GARNER has been transferred from Tunnel No. 3, on the C. and N. W. R. R., to the train despatcher's office of the same road at Baraboo, Wis.

Messrs. STEVENS, AMSDON and AVERY, of the Chicago Western Union day force, who have been absent on vacations, have returned, looking very much refreshed and invigorated thereby.

Mr. ROGER B. PEARSON, formerly Superintendent Western Division Pacific and Atlantic Telegraph Company, has resigned his position on the Western Union day force at Chicago, Ill., to accept the position of General Manager American District Telegraph Company, same city.

Mr. F. W. CUSHING, formerly night report operator, Northwestern Telegraph Company, St. Paul, Minn., is "subbing it" for Mr. DELANO, of the Western Union Chicago day force, the latter having taken a vacation.

Mr. H. H. HUNT, one of the "old stand bys," formerly of the Western Union Chicago force, but who has been for some time past devoting his time to paper manufacture, has returned to Chicago and is now "subbing" it for the W. U. Co. there.

Mrs. W. H. LOUDERBACK, of the Western Union Chicago day force, is absent on a vacation.

Miss LILLIE SMETHELLE, of Metropolitan Chicago day force, fills Mrs. LOUDERBACK's place quite acceptably—Miss SMETHELLE's place being filled by one of PORTER's college graduates.

Mr. W. H. LOUDERBACK, of "Qu." Philadelphia fame, has been appointed a receiver in the Western Union main office, Chicago.

Mr. HAZLETINE, formerly manager McGregor, Iowa, Northwestern Telegraph Co.'s office, but more recently manager of Lacrosse, Wis., office of the same company, has resigned on account of the work being too arduous, and is now "subbing" for the same company in Milwaukee, Wis.

Mr. MARTIN RYAN, an old experienced telegraph manager and superintendent in Canada, who, some two years since, worked on the W. U. night force, Chicago, is now actuary of the Protection Life Insurance Company of Chicago, one of the rising institutions of the northwest. Besides this, he sits in the editorial chair of the *Advocate*, printed by the same company, and is one of the Board of Directors and a member of the Executive Committee. What MARTIN don't know about insurance ain't worth knowing.

Mr. J. B. NUGENT has resigned the position of operator at Langdon, Pa., on the Philadelphia and Erie Railroad, and has accepted the situation of agent with the Pittsburg and Connellsville Railroad at Bridgeport, Bedford County, Pa.

The Telegraph.

The Cable Steamers.

THE cable steamers Faraday and Ambassador left Halifax on Wednesday last for Torbay, N. S., to commence laying the cable from that point to the Newfoundland coast.

Telegraphic Communication Between the Courts and Lawyers' Offices.

AT a special meeting of the Board of Aldermen of this city, held last Tuesday afternoon, a petition from the New York Law Telegraph Company was presented by Alderman Billings, asking for permission to place their instruments in the Register's office and the various court rooms in the Court House. After the petition had been read a resolution was offered by Alderman Billings to give the company the permission requested. He said a subscription list had been opened by lawyers, who wished to have telegraphic communication between the courts and their law offices.

After some discussion the resolution was adopted by a vote of 8 in favor to 3 against it.

Landing of the Shore End of the New Atlantic Cable.—Scenes and Incidents.

THE following interesting account of the landing of the shore end of the new Atlantic telegraph cable is taken from a special despatch to the *New York Times*:

PORTSMOUTH, N. H., July 15.

The shore line of the direct Atlantic cable is laid, and the end now lies embedded in a flat and desolate field at Straw's Point. The landing was made last night in the presence and with the assistance of a large assemblage of ladies and gentlemen. The Ambassador anchored yesterday afternoon about three quarters of a mile off the Point, and the cable boats were stationed at her stern for the reception of the shore end of the cable. It is a powerful wire, two and three eighths of an inch in diameter, weighing seventeen tons to the mile, and wound with powerful steel wires. The wire was passed over the wheels from the tank and pulled by seamen with the boats, being laid in coils from the outside toward the centre.

At 1.45 o'clock in the morning these boats started for the shore, the distance from the ship to the beach having been previously accurately measured by instruments. At nine o'clock in the evening a line was attached to a strong rope, which was made fast on the shore and drawn taut on the ship. The cable from the boats was paid out slowly, and kept taut by strong pressure from a beam pressed upon the wire, which acted as a lever as it passed out. The Faraday launch preceded the other boats, steaming along the rope connecting with the shore. Two cutters followed, each containing a crowd of cable hands, who had hauled on the ropes and drew the last boat containing the cable in a direct line to the shore. The night was rather dark, and the procession of boats, lighted by solitary lanterns, presented a gloomy appearance, while the stillness was broken by the "Heave ho" of the cable hands, and the wild, uncouth songs with which they accompanied their clock-like motions as they worked along the ropes.

One hundred salutes were fired from the shore, and volley after volley rolled and echoed over the waves as the cable neared the land. The Captain's gig accompanied the line, now directing the motions of the launch in port, and again falling to the rear, where the huge cable could be seen leaving the boats by jerks, as if unwillingly, and lighting up the water to the bottom

with the phosphoric light excited by its motion. When the boats arrived on shore a large assemblage was in waiting, and the advent of the cable was greeted with cheers and volleys. A trench had been dug to the life boat house on the beach, and the powerful wire was laid down in this, being hauled up the beach by officers, friends, reporters, townspeople, and, in fact, everybody, including ladies. From 3 to 4.30 A. M. the work of hauling up the cable was continued, and the splice to the already buried end completed. After the work was completed the boats for the Ambassador returned.

Next came the work of splicing. The outer and protective coat of wires, twelve in number, and each composed of two wires wound together, were first unwound from each section of the cable, then a deep winding of tarred and prepared oakum, which exposed another roll of eleven wires, was unwound. Beneath these is another winding of oakum, which covers a solid gutta percha case of three layers, enclosing the main conducting wire of seven strands of very fine copper wire. When the wire was laid bare at the end of each section, the gutta percha being cut away about two inches, each wire was filed down so as to shape them for jointing. They were then laid together, and wound with extreme care with fine copper thread, and over this melted gutta percha was carefully dropped and rolled. The successive covers were then wound and connected, care being taken to avoid more than one covering at the same point. The work was completed at 6:30 o'clock. The tale of the delay of the Ambassador is a repetition of that given concerning the long trip of the Faraday. It was caused by fogs and nothing more. The steamer started on the 3d of July, struck a fog immediately, and remained in it two days. On the 11th they passed a wreck, which they feared might be the ill fated Faraday, but a nearer inspection proved these fears false. Passing the spot where the Atlantic was wrecked was another fearful reminder of the horrors which they had been taught to expect, but still no wrecked Faraday could be seen. After putting in at Halifax the Ambassador proceeded to Torbay, which is described as a wild, desolate country, like the other Torbay from which it takes its name, and there the news was received that the Faraday was in Portsmouth.

Telegraphic and Electrical Brevities.

THE Manhattan Telegraph Company's submarine cable was cut at the east side of Blackwell's Island on Tuesday night, last week, and the cable pulled ashore at Ravenswood, L. I. The heavy chains that secured it were cut, and the cable was sawed into short pieces and taken away in a boat.

Mr. G. E. Smith, who erected for the late Professor Morse the first line of telegraph poles in this country—that between Washington and Baltimore in 1844—died a few years since at his residence in Newfield, Maine.

Foreign Telegraphic Notes.

TELEGRAPHIC communication between San Salvador and Guatemala, C. A., has been established.

It is proposed to lay a telegraphic cable from Port Limon, Costa Rica, to Aspinwall, with land lines to connect with Nicaragua, San Salvador and Guatemala.

SEND FOR CIRCULAR.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

WATTS & CO.,

47 HOLLIDAY ST., BALTIMORE

OUR ILLUSTRATED CATALOGUE NOW READY.

TO ELECTRICIANS AND INVENTORS.

OFFICE OF THE UNION ELECTRO-MOTOR CO., }
62 BROADWAY, NEW YORK, July 8, 1874. }

The attention of Electricians and Inventors is invited to the following proposition: The

UNION ELECTRO-MOTOR COMPANY

Desire to procure a

GALVANIC BATTERY

Fulfilling the following requirements:

1. It must be capable of maintaining a steady current of 6 farads per second through a resistance, external to the battery, of two tenths of an ohm, with not more than six pairs of plates. This is, approximately, equal to the current developed by 3 of Chester's No. 2 carbon cells, charged with mixed nitric and sulphuric acid in the porous cells through 50 feet of No. 18 copper wire .049 inches diameter.
 2. It must be absolutely free from fumes, and from liability to leak or spill its contents under any ordinary circumstances. If possible, it is desirable that a battery should be provided to work without liquids—in other words, a dry battery.
 3. It must be capable of standing for a considerable length of time unused without material depreciation, and yet be ready to give out its full power at a moment's notice whenever required.
 4. It must be self-supplying to an extent which will render it capable of furnishing a current, as above stated, for not less than 300 hours in succession without renewal.
 5. Other things being equal, preference will be given to the battery occupying the smallest space.
- For the best battery fulfilling the requirements herein specified a premium of

FIVE HUNDRED DOLLARS

will be paid, in accordance with the decision of the judges, if the battery is adopted by the company—which shall also have the privilege of exclusive ownership by paying the additional sum of

FIFTEEN HUNDRED DOLLARS.

This offer will remain open until November 1, 1874.

Judges.—MARSHALL LEFFERTS, President of the Gold and Stock Telegraph Company; GEORGE B. PRESCOTT, Electrician of the Western Union Telegraph Company, and FRANK L. POPE, Electrician.

E. B. GRANT, President.

H. H. DUNCKLEE, Secretary.

THE "SNAPPER" SOUNDER.

TRADE MARK. PATENTED MAY 12, 1874.

POLISHED, 30c., OR 6 FOR \$1.50.

BLISS RESERVOIR BATTERY.

PATENT APPLIED FOR.

Price per Cell, \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cells. It will run as a local battery for six months without attention, and as a main battery for a longer period.

GEO. H. BLISS & CO.,

41 THIRD AVENUE,

Chicago, Ill.

ANNOUNCEMENT!

Messrs. PARTRICK, BUNNELL & CO.

hereby announce to the telegraphic and electrical interests of all sections that they have established a

GENERAL TELEGRAPH AND ELECTRICAL SUPPLY DEPOT

— AT —

22 DEY STREET, NEW YORK,

where they will keep in stock all styles of First Class Latest Improved

MORSE TELEGRAPH INSTRUMENTS,

SUPERIOR QUALITIES OF BATTERY MATERIAL

AND SUPPLIES OF EVERY DESCRIPTION.

AT LOWEST MARKET RATES.

The stock will include all our celebrated specialties in

CHAMPION LEARNERS' INSTRUMENTS,

NEW GIANT SOUNDERS, PERFECTED,

IMPROVED CURVED KEYS,

ELECTRIC BELLS, IN GREAT VARIETY,

NEW WESTERN UNION PIN SWITCHES, WITH IMPROVED

LIGHTNING ARRESTERS,

LATEST AND BEST FORMS OF GRAVITY BATTERIES.

Together with LINE WIRE,

OFFICE WIRE; BRACKETS,

INSULATORS, LINE TOOLS, Etc.

Send for Catalogue and Price List.

PARTRICK, BUNNELL & CO.,

22 DEY STREET, NEW YORK.

38 South Fourth Street, Philadelphia.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

(P. O. Box 5508.)

Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The **Electro-Mechanical Gong Striker**,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the
original **FARMER & CHANNING PATENTS**, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THESE**
CAN BE NO QUESTION.

*The cooperation of TELEGRAPHERS in securing its in-
troduction into their localities is cordially invited, and
their efforts will be duly appreciated and
compensated.*

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that
will work practically with a single DANIELL cell, a **BATTERY**
that does not require to be taken down but once a year, and the
very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.
MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

(P. O. Box 5503.)

38 VESEY STREET.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"

"History of America," "Civil War in America;" Member

of many Scientific and Learned Societies of Europe

and America; Commander of the Order of Dan-

nehrog, Denmark; Order of St. Olaf,

Norway, and of the Sword Order,

Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, Housé, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any attention whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

MANUFACTURER OF
TELEGRAPH INSTRUMENTS
OF ALL KINDS,
GALVANIC BATTERIES,
JONES' PATENT LOCK SWITCH,
PATENT ELECTRIC GONGS,
PRINTING TELEGRAPH INSTRUMENTS.
ALSO, ON HAND AND FOR SALE,
D. W. PUTT & CO.'S Mechanical Telegraph
Instruments,
"Pope's Modern Practice of the Electric Telegraph,"
AND A FULL ASSORTMENT OF
TELEGRAPH MATERIALS AND SUPPLIES
AT THE LOWEST PRICES.

CANADIAN TELEGRAPH SUPPLY
MANUFACTURING COMPANY,
MANUFACTURERS OF
All kinds of Electrical Instruments
AND
TELEGRAPH SUPPLIES.
All orders promptly filled, at reasonable prices.
Office and Factory,
352 and 354 KING STREET, WEST,
Toronto, Ont.

WESTERN ELECTRIC
MANUFACTURING COMPANY
FURNISH ALL DESCRIPTIONS OF
Copper Office and Magnet Wire,
OF OUR OWN MANUFACTURE,
WITH
EVERY VARIETY OF INSULATION,
FINE RESISTANCE WIRE and DOUBLE and
SINGLE CONNECTING CORD.
Western Electric Manufacturing Company,
CHICAGO.

CHARLES WILLIAMS, JR.,
(ESTABLISHED 1856.)
109 Court Street, Boston,
has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
MANUFACTURER OF
REED & PHILLIPS'
PATENT INSULATED TELEGRAPH WIRES,
(PATENTED, NOVEMBER 15TH, 1873.)
Lock Box 169. PROVIDENCE, R. I.
Having recently enlarged our factory, we are now prepared
to furnish at short notice any style and quantity of
BRAIDED LINEN or COTTON COVERED WIRE,
saturated and finished with our Patent Compound, which makes
the most durable, handsome and best insulated Braided Wire
manufactured.
PAINTED, PARAFFINE or SHELLAC WIRES
also furnished at the lowest prices. Iron or Compound Wires
covered upon reasonable terms.
We are also prepared to furnish a new style of
ELECTRIC CORDAGE,
which has been pronounced by all superior to any in the market.
The American District and Gold and Stock Telegraph Com-
panies have been supplied from my works with a greater
portion of the office wire used by them.

Sample Card and Price List furnished when requested.
Phillips' Wire can be had of
L. G. TILLOTSON & Co. New York.
CHARLES T. CHESTER "
F. L. POPE & Co "
W. HOCKHAUSEN "
PATRICK, BUNNELL & Co. Philadelphia.
WATTS & Co. Baltimore.
CHARLES WILLIAMS, JR. Boston.
THOMAS HALL "
GEORGE H. BLISS & Co Chicago.

General Superintendent's Office,
AMERICAN DISTRICT TELEGRAPH CO.,
New York, January 1st, 1874.
E. F. PHILLIPS, Esq.
Dear Sir: Your office wire is a decided success. We have
used it exclusively for two years and consider it the best in the
market.
Respectfully,
W. H. SAWYER, Gen' Sup't.

JOSEPH MOORE & SONS,
(Established 1820.)
535 & 537 CHINA STREET,
(Below Green St.) PHILADELPHIA, Pa.,
MANUFACTURERS OF
INSULATED WIRES.

OFFICE WIRE—Plain, Braided, Prepared, &c.
INSTRUMENT WIRE—Cotton and Silk Covered, &c.
FLEXIBLE CORDS, all kinds, &c., &c.
We warrant all Wire to be of the highest conductivity, tested
by our Galvanometer, which compares with the tests of the
highest authority in this country.

TILLOTSON'S EXCELSIOR
TELEGRAPH INSTRUMENT.

(PATENTED JUNE 24, 1873.)
This apparatus is constructed of the best material, and finished
equal to any Telegraph Instrument, and is warranted first class
in every particular. It is especially adapted to the require-
ments of Students of Telegraphy and the operation of Private
Telegraph Lines.
Price, complete, Sounder and Key mounted on finely
finished Mahogany Base, with one Cell Hill's Patent
Battery, with Chemicals, eight feet of Office Wire, and
"Smith's Manual of Telegraphy"..... \$7 50
Two sets 14 50
Price of Sounder and Key only 6 50
" " with Cut Out and Lightning
Arrester attached 7 50
SEND FOR CIRCULAR.
L. G. TILLOTSON & CO.,
No. 8 DEY STREET, N. Y.

GEO. W. RICHARDS. WM. BEALE HALE,
Late First Assistant Examiner of
Electrical and Telegraphic
Apparatus, U. S. Pat-
ent office.
RICHARDS & HALE,
SOLICITORS OF UNITED STATES
AND FOREIGN PATENTS,
No. 6 Federal Buildings, cor. 7th and F sts., opp. Patent Office,
Washington, D. C.

CALLAUD BATTERIES
KEPT ON HAND, AND ORDERS FILLED BY
W. MITCHELL M^oALLISTER,
728 Chestnut Street, Philadelphia,
CHARLES WILLIAMS, Jr.,
109 Court Street, Boston,
AND BY THE
WESTERN ELECTRIC MANUFACTURING CO.,
AGENTS FOR THE UNITED STATES.
220 East Kinzie Street, Chicago, Ill.

WALLACE & SONS,
MANUFACTURERS OF
BRASS, COPPER & GERMAN SILVER WIRE.
Also, BRASS, COPPER and GERMAN SILVER,
in the Roll and Sheet.
We make the manufacture of Electric Wire a specialty—
especially the finer sizes of Copper for conduction, and German
Silver for resistance purposes—guaranteeing the conductivity of
the same in every instance to be superior to that of any other
manufacturer in the market.
WAREHOUSE,
89 Chamber Street, N. Y.
MANUFACTORY,
Ansonia, Conn.

SECURITY MESSAGE HOOK.

PATENT APPLIED FOR.

The damage from the loss of a single message will equip a line many times with our new Hook, which gives great security.
Price..... .30 cents each.
" per dozen.....\$3.00.
Liberal terms to the trade.

GEO. H. BLISS & CO.,
41 Third Avenue, Chicago, Ill.,
General Agents.

RUSSELLS' AMERICAN
STEAM PRINTING HOUSE,
17, 19, 21, 23 ROSE STREET, near FRANKFORT,
NEW YORK,
EXECUTES ALL DESCRIPTIONS OF
BOOK, JOB AND COMMERCIAL PRINTING.
TELEGRAPH PRINTING A SPECIALTY.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS
for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
Instrument with Office Outfit..... 7 50
Two Instruments and Outfits..... 14 50

L. G. TILLOTSON & CO.,
8 Dey Street, New York.

AHAND-BOOK OF PRACTICAL TELE-
GRAPHY.

By R. S. CULLEY,
ENGINEER TO THE

**ELECTRIC AND INTERNATIONAL
TELEGRAPH COMPANY.**

Published with the sanction of the Chairman and Directors of the Electric and International Telegraph Company, and adopted by the Department of Telegraphs for India.

FOURTH EDITION,

REVISED AND ENLARGED.

1 Vol. 8vo, cloth.....\$5 00.

Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books, eighty pages, 8vo, sent to any address on receipt of ten cents.

D. VAN NOSTRAND, Publisher,
23 MURRAY STREET, N. Y.

THE AMATEUR'S
TELEGRAPH APPARATUS.

(Patented April 16th, 1872.)

ONE CUP BATTERY, CHEMICALS, WIRE AND
MANUAL WITH EACH INSTRUMENT.

Complete outfit for the Student or short line use.

Price, complete,
Seven Dollars.

Key and Sounder only..... \$6 00
" " with Lightning Arrestor..... 7 00
Five per cent. discount for cash in advance.

GEO. H. BLISS & CO.,
SOLE AGENTS,
41 THIRD AVENUE,
Chicago, Ill.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard. Brass or nickel plated always on hand.

No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
WATTS & CO., Baltimore.

THE REASON WHY
THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
8 Dey Street, N. Y.

MODERN PRACTICE OF THE ELEC-
TRIC TELEGRAPH.

A HAND-BOOK

FOR

ELECTRICIANS AND OPERATORS.

By FRANK L. POPE.

23 MURRAY STREET and 27 WARREN STREET.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF
PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,

AND FOR
BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deli-
vered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
any Telegraph Cable or Wire manufactured at the Works in New
York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods man-
ufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
sale in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway,
D. HODGMAN & CO., 27 Maiden Lane,
SHEPARD & DUDLEY, 150 William St.

WHOLE No. 420.

Original Articles.

Telegraphic Inventions—Old and New.

BY OLD TELEGRAPHER.

THE present excitement and discussion in telegraphic circles over what purport to be new telegraphic discoveries and inventions, will no doubt eventuate beneficially. This excitement and discussion has occurred at intervals from the time the first practical and successful line of electric telegraph was established. During that time important advances have been made in the telegraphic art, and the discoveries and developments in electrical science have brought telegraphy to a position and importance which could scarcely have been foreseen, or anticipated by those upon whom devolved its inception and demonstration as one of the principal factors in the problem of modern civilization.

The idea of instantaneous communication between distant points by means of the electric telegraph was so startling, and so contrary to the previous conceptions of other than a very limited number of persons, who had made the science and art a study, that their faith in it was regarded as a wild enthusiasm, and themselves as impracticable visionaries. Most of the readers of THE TELEGRAPHER are, to some extent, familiar with the difficulties and discouragements under which the inventors and promoters of electric telegraphy labored in the early days of the telegraph. Aside from the lack of faith in it which they had to encounter, and of adequate pecuniary means to demonstrate the practicability, importance and value of the system, little or nothing was known of the proper construction of telegraph lines, and the apparatus devised for electrical transmission of signals was crude and imperfect. But even under these disadvantages the results obtained were so wonderful, as then regarded, as to overcome, to a considerable extent, the objections and incredulity with which their project had been received, and the fact was soon recognized that a new element had been introduced, which must, at no distant day, to a considerable extent revolutionize modern society.

It is not the purpose of the writer to narrate in detail the progress of telegraphic invention and discovery. The story has been so often told that it has become trite and familiar. Besides, to treat it worthily and properly, would require more space than can be accorded in a single newspaper article. From the original Morse-Henry telegraph system to the Automatic telegraph of to-day, is a step almost as marked and wonderful as from the old semaphore telegraphs to the former. Step by step has the science and art progressed, until at the present time it is hazardous to predict what the limit of progress and development shall be. The electric telegraph now enters so intimately into all the details of business and social life that it is difficult for the present generation, who are so familiar with telegraphic facilities, to conceive how the world could ever have got along comfortably and satisfactorily without it. New uses and adaptations of it are constantly discovered and made, and so great have been its triumphs that the public eagerly accept any new claims and pretensions in that line almost without question or cavil. It is therefore hard to convince the majority of readers, when any pretensions of remarkable inventions are made, that they are not founded in fact, and that those who make them are not really entitled to the credit which they claim. It is capable of demonstration, however, that many such claims have no foundation, and that those who make them are really merely revamping old, and, in many cases, impracticable ideas and experiments, which have been tested and found mere scientific toys.

Hundreds of individuals have, during the last thirty to forty years, devoted much time, study and research in this direction, and have produced theories and even practical applications which have proved futile and impracticable in actual and constant use. Many of these have been forgotten and are unknown, except to the student and those who have familiarized themselves with the history of electrical science and telegraphic art. It is from these forgotten experiments that not a few of the recent so-called telegraphic inventions are derived by those who aspire to fame and pecuniary remuneration by their introduction.

THE TELEGRAPHER has recently ventilated one of these barefaced attempts to impose upon the leading telegraph company of this country, and upon the public a pretended invention and improvement, which, it was claimed, would at once quadruple the capacity of all telegraph lines whose owners were so fortunate as to secure the privilege of using it! It is not necessary for the writer to add to the exposé of this pretended invention (?) which has already appeared in these columns. That bubble has been pretty effectually pricked, and we shall, probably, hereafter hear little of this remarkable invention. The so-called inventor has a decided faculty of appropriating other people's ideas and inventions, new and old, and has yet to justify by original performance the genius and talent which in several instances he has succeeded in impressing others, who should be better informed, with the belief that he possesses.

When the writer first engaged in telegraphy the art had made considerable progress, and there were then in practical use the Morse, Bain and House telegraph systems. The Bain, or chemical system, has gone out of use except in so far as it is adapted to automatic telegraphy. The House printing telegraph has been succeeded by the combination printing telegraph, which combines the House and Hughes printers in an improved instrument, and is used to a very limited extent by the Western Union Company, who still hold some unexpired patents on it. The Hughes printer proper is quite extensively used in Europe, where Prof. Hughes has been more successful in securing its adoption than he was in this country. The Morse system, as is well known, is now, as it always has been, the one most extensively and generally used in this country, and it is likely to be some time yet before it is superseded by any other system. The only really important and valuable improvements which have recently been made has been the making practical the duplex telegraph in actual use, and the automatic telegraph, which is confidently believed by many to be the telegraph of the future. That practical automatic telegraphy is a comparatively new invention cannot be doubted. That it is destined, at no very distant day, to be developed and introduced extensively into practical use on the principal telegraphic routes, and that it will effect a marked change in telegraphic business, will hardly be questioned except by those who have interests which would be affected unfavorably thereby. While the writer is hardly prepared, as yet, to concede all that is claimed for it by its especially enthusiastic advocates and promoters, enough has already been demonstrated, even upon the limited scale upon which it has been tried, to show its great importance and value.

As usual, many persons have had, from the original conception of the idea of rapid automatic transmission, a part in its development to its present advanced state. It is not proposed to discuss here the claims of those who pretend to be inventors of automatic telegraphy. Here, again, the pretended inventor of the quadruplex telegraph comes prominently forward, and with as little real claim to the one as the other, although Mr. Prescott, the electrician at headquarters of the Western Union Telegraph Company in this city, recently informed the reporter of a daily paper that his claims were "undisputable;" a statement which indicates that that gentleman has not kept himself informed of current telegraphic history, or else allowed his zeal on behalf of his new friend and associate to outrun his regard for strict accuracy in his statements.

The automatic telegraph, as is the case with other systems in use, is undoubtedly the result of the research and inventions of many persons, which, combined, go to make up the system now in successful operation, so that no one individual can properly claim to be the inventor of the automatic telegraph system.

The establishment of long submarine telegraph lines rendered necessary a different description of apparatus for the transmission and communication of signals. The reflecting galvanometer supplied this necessity for the time, and rendered practicable the use of very light batteries upon such lines, without which it would have been impossible to maintain their insulation for any length of time. With the reflecting galvanometer and the transmitting apparatus employed, the transmission of telegraphic signals over long submarine lines has been necessarily comparatively slow. Efforts are now being made, and with indications of success, to develop improved systems of working, and apparatus which shall increase the capacity of such lines, and make it possible to record the signals. It is believed that ere long the application of the duplex arrangement to long submarine lines will be found practicable, and many intelligent, scientific and practical telegraphers are busily employed in devising other means for increasing the capacity of such lines. That success will eventually crown the efforts of one or more of them is probable. The necessity has generally resulted in producing the apparatus required to supply the want. With increased capacity the relative expense of cable telegraphy will be reduced, and cheaper rates for such service can be afforded, which is what the public

require to render the use of ocean telegraphs more general and popular.

Of the numerous telegraphic inventions for special uses, ingenious and valuable as many of them are, there is not time or space to treat in this article. With these the readers of THE TELEGRAPHER are tolerably familiar. Much skill, talent and inventive genius has been devoted to these specialties for several years past, and they have resulted in adapting the telegraph to many of the necessities and requirements of our busy and enterprising people. These inventions for special purposes have chiefly been made and put into practical use in this country, and thus far have not been adopted to any extent in Europe, where the people are slower in making changes and innovations upon established habits and customs. The reporting telegraphs, the various systems of fire alarm and burglar telegraphs, the District Telegraph System, etc., are essentially American inventions, and most of them are of comparatively recent date. They have met with prompt and cordial reception in this country, because they supply necessities and afford facilities which are recognized as being of great value and importance. New adaptations of electrical communication to popular use are constantly being made, and it is impossible to tell to what extent our requirements may eventually be supplied through the agency of electricity, of which we know in reality so little, further than that it pervades all creation, terrestrial and celestial, and without which existence would be impossible; and that while we can, to a certain extent, control and utilize it, yet it remains as much a mystery and wonder as ever.

To the intelligent telegrapher electricity affords a subject for study and investigation which can never become exhausted or uninteresting. Much as has been discovered and many as have been the telegraphic inventions and adaptations, the field seems to be practically limitless, and none need despair of opportunities in this direction. Much time and labor which is wasted may be saved by first obtaining information as far as it is attainable. Not only in telegraphy but in many other directions old devices are constantly being reinvented by those who do not take pains to inform themselves as to what has previously been done. This is frequently mortifying and discouraging, but may be avoided by previous investigation of the subject.

For the honest inventor and experimenter the writer has the fullest sympathy and earnest desire for success—for the impostor and charlatan, whether in telegraphic or other inventions, only contempt, and a desire that such may meet with the exposure merited. It is gratifying to know that for the latter THE TELEGRAPHER supplies a medium through which their fraud and pretensions may be shown up, while for the former it has encouragement and recognition. In this it is doing a good work, and proving its right to be considered a really independent scientific and telegraphic journal.

Financial Failure of the British Telegraph.

THE financial outlook of the British Telegraph under Government auspices and management is anything but encouraging. For a long time it has been impossible to obtain any adequate or comprehensive statement as to what the system cost the British Treasury in the outset, or what have been the annual expenditures for construction, maintenance and working, inquiries in this direction having been generally met with the response that it was not yet possible to separate capital from expenditure, and that, therefore, the public must be content with knowing that messages were transmitted at the rate of a shilling for twenty words, no matter whether the distance traversed was half a mile or five hundred. At last, however, we are in possession of information that enables us to discern something definite concerning the actual situation.

When the purchase and State control of the Telegraph was first brought before Parliament, the estimate of cost, founded on the judgment of experts, was £2,200,000, or \$11,000,000. When the business, however, had been assumed by the State, it was found that the Government had in reality bound itself to a much greater expenditure, and that the actual cost would not be less than £7,500,000, or \$37,000,000. This was about all the information that Parliament or its committees could get until Sir Lyon Playfair came in as Postmaster General and successor to Mr. Mousell, in the last days of the Gladstone administration. This new official, being of an eminently practical turn of mind, and withal taking warning, perhaps, by the fate of his predecessor, who retired under a cloud for allowing Mr. Scudamore, the Telegraph Superintendent, to expend some four millions of dollars without the authority or knowledge of Parliament, determined to know accurately what there was to be known, and as the result of such determination we have before us a British Treasury document bearing date March, 1874, which brings up the account of the telegraph to the 1st day of January, 1873, the latest date for which Parliament or the Treasury has any exact returns—a

fact in itself not a little singular and suggestive. The figures tabulated are as follows:

Capital Account.....	£8,667,800 or	\$43,339,000
Gross Receipts, less amount paid to submarine telegraph companies.....	970,083 or	4,850,415
Expenditures in respect to Salaries, Rents and Maintenance.....	825,275 or	4,126,275
Balance applicable for Interest and Sinking Fund.....	144,808 or	724,040
Annual Charge for Interest, Jan. 5, 1873.....	258,390 or	1,291,950
Deficiency of Telegraph Revenue to meet Interest on Telegraph Stock, for year ending Dec. 31, 1872.....	113,583 or	567,915

In other words, the financial result of the British Telegraph under State management up to the commencement of 1873, showed a deficiency of receipts adequate to meet expenses and interest (the latter calculated at three per cent., the rate on consols, by which the capital is represented) of nearly six hundred thousand dollars. Had five per cent. been paid—the lowest rate at which the United States has been able to borrow, and a lower rate than France or the best railroad corporation in the United States can obtain—the deficit would have increased to nearly one million five hundred thousand dollars.

It is also to be observed that the capital account of the British Government Telegraph is not yet closed, but a further addition, on account of arrearages, of at least \$10,000,000 is anticipated. At the same time, many of the expenses actually incurred in the management of the telegraph are charged to the account of the Post-office, and so go to swell the cost of the Mail Department of the Post-office, and diminish that of the Telegraph Department. For example, the telegraph manager receives a salary from the Telegraph Bureau of £300, and another from the Post-office of £1,500, although his duties are exclusively telegraphic. In a similar way many of the extensions and alterations of buildings to accommodate the telegraph are charged upon the Post-office. In short, the whole showing is a most singular one, not at all creditable to official management.—*New York Tribune.*

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS NOS. 63, 64 AND 65, UP TO AND INCLUDING

JULY 25TH, 1874.

- 5, 13, 25, 26, 28, 46, 54, 59, 60, 61, 67, 72, 75, 82, 89, 101, 103, 108, 113, 114, 129, 134, 136, 139, 140, 146, 148, 228, 235, 240, 244, 247, 257, 267, 278, 279, 281, 282, 283, 285, 312, 319, 323, 328, 350, 351, 367, 371, 376, 378, 380, 381, 391, 392, 393, 402, 405, 406, 413, 425, 441, 456, 463, 516, 520, 533, 548, 553, 554, 565, 575, 577, 579, 584, 604, 622, 648, 656, 672, 678, 680, 685, 690, 701, 708, 729, 734, 735, 741, 769, 787, 791, 801, 803, 809, 820, 848, 883, 886, 915, 927, 930, 931, 939, 943, 978, 980, 995, 998, 1000, 1002, 1005, 1013, 1047, 1055, 1058, 1061, 1080, 1085, 1093, 1099, 1102, 1148, 1149, 1152, 1154, 1191, 1193, 1194, 1196, 1226, 1227, 1233, 1241, 1245, 1251, 1255, 1266, 1276, 1307, 1308, 1309, 1311, 1312, 1313, 1314, 1315, 1317, 1318, 1319, 1320, 1321, 1322, 1325, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1359, 1366, 1368, 1372, 1385, 1389, 1390, 1391, 1407, 1412, 1415, 1427, 1437, 1438, 1448, 1451, 1454, 1455, 1456, 1457, 1458, 1481, 1482, 1500, 1501, 1502, 1503, 1506, 1507, 1513, 1515, 1522, 1524, 1550, 1554, 1555, 1560, 1564, 1568, 1569, 1570, 1572, 1573, 1580, 1586, 1589, 1591, 1593, 1594, 1615, 1620, 1625, 1634, 1635, 1656, 1666, 1676, 1681, 1695, 1708, 1723, 1729, 1736, 1737, 1773, 1775, 1785, 1794, 1795, 1796, 1797, 1804, 1809, 1817, 1823, 1824, 1827, 1852, 1869, 1874, 1881, 1911, 1913, 1914, 1915, 1916, 1942, 1943, 1951, 1957, 1969, 1970, 1999, 2006, 2001, 2021, 2025, 2028, 2029, 2038, 2050, 2057, 2060, 2065, 2083, 2086, 2097, 2103, 2113, 2114, 2119, 2123, 2125, 2134, 2137, 2138, 2142, 2143, 2145, 2147, 2154, 2162, 2169, 2172, 2178, 2187, 2191, 2192, 2195, 2196, 2212, 2213, 2216, 2218, 2219, 2221, 2223, 2224, 2233, 2236, 2237, 2238, 2239, 2242, 2250, 2252, 2253.

ASSESSMENTS NOS. 63 AND 64.

- 255, 344, 361, 1205, 1742, 2040, 2181.

ASSESSMENT NO. 62.

- 27, 143, 238, 242, 246, 258, 381, 398, 451, 453, 455, 457, 790, 804, 1153, 1450, 1502, 1563, 1715, 1716, 1731, 1786, 1933, 1939, 1941, 1974, 1975, 1976, 2037, 2163, 2177.

The Eastern Telegraph Company.

AT the fourth ordinary general meeting of the Eastern Telegraph Company, which was held at the Cannon street Hotel, London, on Tuesday, July 14th, the chairman, John Pender, Esq., M. P., made some statements of the experience of that company from a reduction of its Indian tariff, which are of interest.

The Chairman said that "the revenue for the half year

showed the small increase of £1,676 as compared with the corresponding half of the previous year. The reason why such a small increase only had been made was comparatively simple: the Indian tariff was reduced, but there had not been that increase in traffic which they might naturally look for. On the other hand, the amount which had been lost on the Indian system had been recouped to a certain extent by the opening of new lines, and, therefore, the slight increase which he had mentioned was shown. No doubt the reduction of tariff would, in the end, bring an increase of traffic. What he might call the social traffic in India had not been developed to the extent he anticipated. During the last six months, also, they had had a good deal of extra expense in working the direct cable; they had been working the greater part of that time with one cable, and the other under repair. There had also been somewhere about £300,000 worth of the cable positively lying dead for about six months—namely, the Levant system. In consequence of some misunderstanding with the Egyptian Government the company was prevented from landing its cable, but he was happy to say that this difficulty had been removed, and that portion of the line now came in as a feeder to the other sections. The Brazilian line was also opened the other day, and was working in a satisfactory way, and when the cable was repaired to Lisbon the company would have the full benefit of the additional traffic from that Brazilian line. The system, with the exception of one of the cables, was working satisfactorily, although it had not increased in the ratio which was anticipated; but there had been great depression of trade all over the world, and that might account for it to some extent. He, however, hoped they were about to see a better state of things, and that this company would participate in its advantages. In conclusion, the Chairman moved the adoption of the report and accounts, and the declaration of a dividend of 4s. per share, making, with the previous payment on account, a total dividend for the year of 6 per cent."

Sir James Anderson seconded the resolution.

In answer to Mr. Powell,

The Chairman said that the negotiations for a joint purse traffic arrangement with the Indo-European Telegraph Company were discontinued, owing to objections raised by the Governments from which the Indo-European Company held their concessions.

A discussion ensued, in which Lord Hawke, Mr. Ford, and other gentlemen took part, after which the resolution was put and carried.

Some formal business was then transacted, and the proceedings closed with a vote of thanks to the chairman and directors.

How to Find the Electro-motive Force of a Battery.

WE have been approached as to how a person should go to work about finding the electro-motive force of a battery. This question has puzzled several people, but to our mind it seems perfectly clear, that is to say, the fluid portion of the battery. Everybody knows, in fact most all of the little children in our neighborhood have been telling incessantly, as it were, that one vebel of electricity decomposes .00142 grains of water or develops .000158 grains of hydrogen. (Ah! hydrogen; how the word savors of good old times. If there's anything we do like it's hydrogen or Holland gin mixed.) Or 1721 C. C. mixed gas (but *ain't* mixed gas good; soda water), and all this at an O. C. and barometric pressure of 760 ^{mm}. As we observed before, everybody knows this, but how to *work* it out? Ah! "that's the question: whether it's better to suffer the Bradley that we have, or fly to Culley's that we know not of, must give us awful pause" for a few days. But to resume: electricity decomposes hydrogen. The solar orb decomposes dogs, cattle and other business. The proper way is to make a proportion of it thus: If the sun decomposes 16.91 square inches of dog, allowing .21 for resistance of the hair, in 41568 hundredth thousandth of a second by Higdon's new watch, and electricity decomposes .00142 hundredth thousandths grains of water in the same time by the new gold watch Jot Spencer has—to get, how long will it take a Bradley galvanometer to measure the resistance of a Bologna sausage? Now, Newton, sail in and leave Jones and the Calland in the dim dis.—*The Plug.*

A Misstatement Corrected.

THE following letter from Hon. Ezra Cornell is published in the *Ithaca Journal*, and refers to an item in its telegraphic despatches. The inference in the last paragraph is incorrect, Hon. F. O. J. Smith being still living:

Editor's Journal.

I observe in your notice of the death of G. E. Smith the statement that he set up the first line of telegraph poles in the country, between Washington and Baltimore. I can inform you that there was no person by

the name of Smith connected with Prof. Morse, in any way, with the setting up of the first line of telegraph poles between Washington and Baltimore. Hon. F. O. J. Smith, of Portland, Me., had a contract from Prof. Morse for laying the pipe for the conductors for the telegraph between those two cities. He laid ten miles of the pipe, through the agency of the machine which I invented for that purpose, extending from Baltimore to the Relay House. At that point the work was tested, and the insulation was found to be insufficient, and the project of putting the pipe down was discontinued. This was in December, 1843. Here Mr. Smith's connection with the matter ceased. In April, 1844, Prof. Morse decided to put his wires on poles, placing the entire charge of the work, in all its departments, in my hands. The Smith you refer to as having died a few weeks ago in Maine may have been Hon. F. O. J. Smith, who would now be nearly seventy years of age. Yours respectfully, EZRA CORNELL."

An Improved Astatic Galvanometer.

IT is desirable, in many investigations in magnetism, to free a needle not only from the inductive action of the earth, but also from its directive influence. Prof. Trowbridge, of Harvard College, adopts the following method; An ordinary tangent galvanometer is so constructed that its coil is free to turn about a vertical axis and also about a horizontal one. The coil is first placed in a plane perpendicular to the magnetic meridian; it is then twined about its horizontal axis until the component of the strength of the current in the horizontal plane shall be just equal and opposite to the earth's magnetism. Under these conditions the needle is evidently in a state of unstable equilibrium, and if placed perpendicularly to the magnetic meridian, will vibrate through small arcs, free from the influence of the earth, and subject only to the attraction in the field of force in which it may be placed. A bar of soft iron placed in the vertical plane passing through the suspension of the needle perpendicular to the magnetic meridian, at a suitable distance from one of the poles, will bring it back to zero. This method constitutes, practically, a new astatic system.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion. No notice will be taken of anonymous communications.

America.—Its Universal System of Rapid Automatic Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

AS a citizen of the United States of America, I feel greatly exalted in having been made the chosen instrument (under the guidance of a great and mysteriously beneficent Providence) in the discovery and development of that enduring link in the chain of telegraphic invention which has made the telegraph a still greater marvel in the field of electrical science, and thereby rendered the same practically universal.

GEORGE LITTLE,
Passaic City, New Jersey, U. S. A.

(Extracts.)

* * * It is very important in my judgment, and in the judgment of Gen. Lefferts, that a certain gentleman should see your "automatic system." * * * D. H. CRAIG, to George Little, November 24, 1869.

* * * "Little's automatic telegraph process." * * * To my mind the experiments were very satisfactory. * * * Any desired length of circuit can be worked. * * * From my long practical knowledge of the wants of the press, and the defects of the Morse system of telegraphy, it seems to me that I cannot recommend the new system too strongly. GEORGE B. HICKS, General Agent of the Western Associated Press, Cleveland, Ohio, December, 1869.

* * * By the "Little's automatic system" the overwhelming advantages of this new fast system has been conclusively demonstrated on a telegraph line over two thousand miles long. * * * This fast system of sending messages by telegraph, invented by George Little, Esq., covers the entire system of automatic fast telegraphy. The distinguished scientific telegraphic expert, George B. Hicks, Esq., of Cleveland, Ohio, who, after more than a week's critical examination and testing, reported as per letters annexed. D. H. CRAIG, New York, December 1, 1869.

* * * We have before us a pamphlet of twenty-two pages on "Little's Automatic System of Fast Telegraphy." American editorials, 1869.

* * * By the terms of your communications of March 10th and 17th last, you accorded to me the space of six months, from the first of April ensuing, to

complete arrangements for the sale of your automatic telegraph patents for the United States. D. H. CRAIG, August 31, 1869.

Automatic telegraphy. * * * We claim for Mr. Little the whole credit of teaching us the truly wonderful and beautiful art of transferring the rapid signals upon paper. Other electricians had accomplished sixty or seventy words per minute over two or three hundred miles in length. But any attempt to transmit signals at a greater speed invariably ended in utter confusion of, or the mixing of the signals at the recording end of the line wire. But Mr. Little transmits and records accurately and reliably even fifteen hundred words (seven thousand five hundred flashes) per minute. * * * There is no evidence in or out of the writings of scientists that any electrician or telegrapher, before Mr. Little, ever succeeded in accurately and practically recording, at one end of a long wire, extremely rapid signals sent from the opposite end. And, just here, let me inform you, is the great and the only difficulty connected with automatic or fast telegraphy. D. H. CRAIG, June, 1872.

* * * But if you or any of your correspondents think proper to venture to assail any of my past statements as to the merits or capabilities of the "Little system of automatic telegraphy," I pledge myself to successfully explain the fallacy of the arguments which you or they may bring forward against the system. D. H. CRAIG, July, 1872.

* * * We now receive, day and night; * * * in fact, do anything you want done. Just received long and perfect message. * * * E. H. JOHNSON, Charleston, S. C., General Manager Automatic Telegraph Company, Oct. 26, 1872.

* * * Can do two hundred to two thousand words per minute from Charleston, S. C. HARRY BERTRAM, Manager Automatic Telegraph Company, Washington, November 27, 1872.

NEW YORK, Oct. 12, 1872.

The Hon. FRANK IVES SCUDAMORE, Chief of Postal Telegraph Dept., London England.

* * * My system of automatic telegraphy has been completed, and the instruments and appliances perfected for its successful inauguration. * * *

I am, sir, very respectfully,

Your obedient servant,

GEORGE LITTLE.

* * * And I have had painful evidence, more than once, in discussing the merits of the "Little system of automatic telegraphy" with gentlemen of the Morse persuasion, that my mission would be more popular if I ceased to recommend the new system because of its extreme simplicity. D. H. CRAIG, August, 1872.

* * * But perhaps the most notable events of these early days of the "Little system" were the dignified fulminations of the able gentlemen at the head of the great monopoly. D. H. CRAIG, December, 1872.

Ever since the introduction of the electric telegraph as a means of communicating intelligence rapidly, efforts have been made, both in this country and in Europe, to perfect a system of automatic telegraphy. * * * GEORGE B. PRESCOTT. G. L.

The Telegrapher and the Official Organ.

CLEVELAND, OHIO, July 28.

TO THE EDITOR OF THE TELEGRAPHER.

THE communication of "Ontario," and the sharp rebuke which is therein administered to the Western Union official organ for its attempts to claim everything of importance in connection with the duplex system (since his patents were purchased by the Western Union Telegraph Company) for Mr. J. B. Stearns, was read with much interest and approval, not only by myself but by other Western Union employes. We were surprised at the feeble and ridiculous attempt to break the force of that communication, which appeared in the last issue of the *Journal of the Telegraph*, and anticipated the rejoinder which that article would be likely to call forth from THE TELEGRAPHER. We were more than satisfied, we were delighted at the artistic and scientific manner in which the writer of the *Journal's* editorial was demolished, and especially at the exposition of the ignorance or intentional deception shown in claiming for Mr. Stearns what he expressly disclaims for himself, in connection with the invention of duplex telegraph apparatus. We are now waiting with augmented interest to learn whether the writer of that editorial will comply with the challenge in your reply to point out the points in Mr. Stearns' patent, with the exception of the condenser, essential to a duplex telegraph system. The general opinion, so far as I have been able to ascertain, is that the writer will not, after his former rough experience, dare to undertake a continuance of the discussion with THE TELEGRAPHER, which has thus far so completely and thoroughly demolished him, but will take refuge in a dignified silence on the subject in the future. Some are inclined to think that after what has been said some reply must

be made or attempted. If it should be, we have no doubt but that THE TELEGRAPHER will be able to attend properly to the case.

It is dangerous for the *Journal* to depart from its established policy of general platitudes in its editorial columns, or to undertake to tilt with THE TELEGRAPHER, especially when it has so weak a case. It is quite probable that this fact will be recognized at headquarters, and that you will for the future be let severely alone.

Your explanation of the difference between an independent telegraphic journal and an "organ" was excellent, and its sharp points are fully appreciated by the fraternity, more especially by those who are employes of the Western Union Telegraph Company. You are making THE TELEGRAPHER not only an instructive but a readable and interesting paper, and have the good wishes of a large majority of the reading telegraphers of the country. May you prosper in the good work, and may the subscription list increase with a rapidity commensurate with the deserts of the telegraphers' paper. Of advertising I see you have plenty. BUCKEYE.

Some Bulls—by the Perpetrator.

TO THE EDITOR OF THE TELEGRAPHER.

CONTRARY to the general rule of driving your "cattle" to other folks' pasture, I'll acknowledge these as my own: "Express my coat to (sig.) *Ourney Sign-piper*." After studying over that "sig." for half an hour or so I got it, "Express my coat to *Signourney* (sig.) *Piper*." Another for a Mrs. "*Shoiman*." I hunted the city over myself, but to finally copy the name in Morse characters to find "*Mrs. Sherman*." Received notice of an excursion to hear "*Col. Fax*" speak, but not remembering such an army officer's name, concluded it must mean *Colfax*, which latter proved to be the case. But I've quit perpetrating such things now. "MR. BRAN."

Necessity for a Telegraphers' Association.

TO THE EDITOR OF THE TELEGRAPHER.

IT affords me great pleasure to read THE TELEGRAPHER each week, and I find all parts of it interesting and instructive; but lately I have been more than ordinarily interested in a subject which has been agitated by a number of your correspondents, namely, the expediency of organizing an association for the purpose of protecting and improving our mutual interests. Ever since I first learned, or rather commenced to learn to wrestle with "bottled lightning," I have felt that we, as a class, are badly in need of such a society, and have daily been hoping that some one better known and more experienced than myself would take the initiatory steps in the matter, but there seems to be a general hanging back, and disinclination to do anything more than talk about it. There is one idea which seems to prevail among the fraternity in regard to managers, superintendents and others in authority having a prejudice against such an organization, which seems to me to be rather erroneous. Let an association be organized with a fully defined purpose to improve not only the interest of employes but also employers, by a determined opposition to such a wholesale manufacture of "plugs" as is going on at present, by a classification of operators, and many other much to be desired objects which such a society could accomplish, and we will very soon find that we have the sympathies and co-operation of managers and superintendents.

It is hardly necessary to speak of the so-called "telegraph colleges," except to denounce them as frauds both in intention and result, as there is hardly one of ten who attend them for a term of six months that will be tolerated on any wire or in any office; but the great evil to our profession is the great numbers who are learning in way offices all over the country, regardless of their abilities or education. The consequence is, there are multitudes of ignorant, inefficient operators, who are ready to take a position anywhere at any pay, and as many offices have too little business to pay a good operator, superintendents are compelled to hire them.

Imagine the delay of business caused by the manager of an office in the western part of New York State, who accomplished the astonishing feat of receiving an ordinary death message in thirty minutes by actual timing—said message containing nine words, exclusive of address and signature—the wire and instruments working well. Another manager of my acquaintance, who had one operator and a message boy under his control, only occupied ten minutes in receiving a message of equal length; but then "the race is not always to the swift." A short time since he copied and delivered a message which read, "Can you beat sticaborines Monday, if not, where will Emily go?" This was unintelligible to the party addressed, and with the aid of operator and message boy he managed to make it read, "Can you be at St. Catharines Monday, if not, where will I meet you?" comment is needless. Another bright youth, in a large repeating

station not far from New York, happened to arrive at the office earlier than usual in the morning, and finding all the wires open asked a brother operator what was the matter. Upon being informed that there was a "Jones Lock Switch" at the terminal station, he remarked that "he didn't see the use of locking the wires up over night" I trust some one who is experienced in such matters will take this matter in hand, and do something more than I am now doing—talk. I feel certain that if such an association is once started the fraternity at large will respond to the call, and in a short time we would have a thriving and useful organization, of which we will be proud.

C. WETAIRS, R. J.

Telegraph Train Orders and Reports.

STEVENSON, ALA., July 22.

TO THE EDITOR OF THE TELEGRAPHER.

SOME time ago several interesting articles on the above subject were published in THE TELEGRAPHER. I am not a train despatcher, but have worked for different roads, both north and south, but on none of them have I found so simple a system as is used on this road—the Nashville, Chattanooga and St. Louis. To illustrate I will briefly mention two or three points.

In giving orders to extra and construction trains this form of order is used:

"C D 22.

To West

S

Run to Chattanooga extra (12).

Sig., J. W. T."

"C D 22.

To Carroll

S

Work between Stevenson and Shellmound extra (12).

Sig., J. W. T."

Is it any better or safer to say, "Run to Chattanooga, keeping out of the way of all regular trains," or, "Work between Stevenson and Shellmound, keeping out of the way of all regular trains.

On this road 12 means, "How do you understand?" 13 means, "I understand." I consider this an improvement. It is not exactly proper to have signal "13" mean two different things.

Another great saving is made in train reports. When every station reports arrival and departure of all trains in figures much time is uselessly wasted. On this road passenger trains leaving stations on time, or not over two minutes late, are simply reported "O. T." (on time); if late, the arriving time is not reported, unless the train stops over three minutes, but the departure is given in figures; but as passenger trains are nearly always "O. T." we seldom have occasion to use figures in reporting them. In reporting freight trains the arrival is given in figures, the departure, when on time, is given "O. T." same as passenger trains.

By following these and other rules which I will mention in my next, much more work can be done over a line and on busy roads. This is a matter of considerable importance. H.

How a Short Line May be Made to Work with More Strength.

DOUBLE WELLS, GA., July 22.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE a line one third of a mile long, use eight cups Collaud battery and two No. 1 pony sounders. Line works so weak that it cannot be heard distinctly; can I make it work without using relays; if so, how can it be done? By answering through the columns of your valuable paper you will greatly oblige an interested plug. F. H. O'BRIEN.

Answer.—Your difficulty may arise either from an insufficient earth connection at the ends of the line, or from insufficient resistance in the magnets of your sounders. It is necessary to have a more perfect earth connection for a short than for a long line. If the difficulty arises from this cause it may be remedied by running another wire and working the instruments on a metallic circuit. If from lack of sufficient resistance in the magnets, by having them rewound with finer wire.—[EDITOR OF THE TELEGRAPHER.]

A Reply to Mr. Howe.

MITCHELL, IOWA, July 22.

TO THE EDITOR OF THE TELEGRAPHER.

IN reply to Mr. Howe's inquiry, suppose a current does flow to line from I B', this current alone will not attract armature of relay R' if adjusted high enough. S. J. M. BEAR.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Telegraph Lines in the Streets of Cities.

In the *Staats Zeitung*, a German daily newspaper, published in this city, for July 22d is printed an article on "Telegraph Lines in the Streets," which embodies the views of Mr. WM. ORTON, the President of the Western Union Telegraph Company, on the subject of placing the wires underground in cities, and especially in New York, where the multiplicity and constant increase in number of the telegraph poles and wires has become a serious inconvenience. We have had the article translated for our columns, as follows:

"The desire has been frequently expressed that the unsightly telegraph poles might be removed from our streets, and the eyesight cease to be offended by the festoons of rags, paper, kite tails, etc., so frequently suspended upon the numerous wires overhead. In the principal cities of Europe the telegraph wires are laid underground, and the idea of introducing this system in the cities in this country, and especially in New York, has often been mooted. Mr. Wm. Orton, the President of the Western Union Telegraph Company, has, however, always strenuously opposed the introduction of this system. The principal objection urged by Mr. Orton is the difficulty experienced in working satisfactorily subterranean or underground lines. In reference to this objection the statement of Mr. Culley, the Electrician of the British Government Postal Telegraphs, covers the point—that is, that no attempt to solve the question of laying and working underground wires need be expected to be made as long as it is possible to carry them on the surface.

Mr. Orton further asserts that the damage done to the wires by storms and violent winds is not as disastrous and troublesome as the damage and injury caused by lightning upon wires underground. The cable lines passing through the Hudson river are often injured in this way, and expensive repairs are continually required on them in consequence. Sometimes the gutta percha insulating coating is melted, and not unfrequently even the wires are destroyed.

Mr. Orton also referred to the interruption of traffic on the streets if 500 underground telegraph wires are to be in use in the city; the streets would be constantly torn up and travel interfered with; and besides, the permanence and reliability of the wires underground would be interfered with and interrupted by the sewer and other necessary work upon the streets. In Paris the underground telegraph wires are practicable in consequence of the system of immense sewer canals which underlie the entire city, and through which the wires are carried; and in London this is also partially the case. In no American city of any size, Mr. Orton claims, has it thus far been possible to lay and maintain an underground telegraph.

But, in spite of all these objections and difficulties,

Mr. Orton states that the Western Union Company has determined, as soon as the new building now being erected for that company is completed and occupied, to try the experiment, and determine whether the wires of the company can be placed and operated underground without causing too great an outlay by the company, and without injury to their practical working."

This subject is one of such pressing and daily increasing importance that its practical consideration cannot be much longer delayed, and we are pleased to learn, on such excellent authority, that the Western Union Company has determined to attempt a practical solution of the problem. The first objection made by Mr. ORTON, according to the *Staats Zeitung*—that of the difficulty of working satisfactorily the underground wires—would have some weight if it were proposed to carry them underground for a considerable distance, but for the few miles of subterranean lines required to relieve the streets of this and other cities of the unsightly and cumbersome telegraph poles, and the nuisance of a multitude of wires crossing and re-crossing in all directions over the streets and buildings of the city, the static induction would be scarcely perceptible in their operation.

The further objection—the damage to which such wires are subject from atmospheric electricity or lightning, can be effectually guarded against by proper arrangement of lightning arresters, and by proper and thorough insulation of the wires. This is provided for in a system of glass lined iron pipes, through which the wires, properly insulated, are conducted, which has been patented in this country and in England, and which we think must eventually be adopted for this purpose.

The real and principal objection of the telegraph managers is disclosed in the latter part of the article, and that is the expense of such a system to the telegraph companies. This is unquestionably a serious matter; but the expense can be so divided, by having the wires of all the companies and of private parties included in one system, as to make it relatively less onerous; and by this means a large part of the difficulty arising from the constant digging up of the streets may be avoided. A company for this purpose was chartered by the legislature of this State a year or two since, but we do not hear that it has made any material progress with the work.

The Decision of Judge Drummond.

IN the last number of THE TELEGRAPHER we printed a report of a decision by Judge DRUMMOND, of the United States Circuit Court, at Chicago, of considerable importance to telegraph companies. The case arose from the attempted construction of a line along the route of the Rock Island Railroad, between Chicago and Omaha, under the Act of Congress of 1866, which gives the right to any telegraph company that had accepted the Act to construct its lines on any post route in the United States. After setting a few poles the telegraph company was ordered to desist, and the company applied to the United States Circuit Court for an injunction restraining the railroad company from interfering with the construction of their lines. The case coming before Judge DRUMMOND, after argument, he decided adversely to the telegraph company, and the injunction was refused. The case will probably be carried to the Supreme Court of the United States for final decision. It is of great importance to all parties that there should be, as speedily as possible, an authoritative and final decision of the question whether railroads on which the United States mails are carried are post-roads, within the meaning of the Act of Congress of 1866, and subject to the right of way conferred by that Act upon telegraph companies.

There have been three decisions upon this point in the lower United States Courts, two of which were in favor of the telegraph companies, and this last decision by Judge DRUMMOND, adversely to them.

A similar case, which was decided in favor of the Southern and Atlantic Telegraph Company, has already

been appealed to the Supreme Court, and it is believed that a final decision can be had during the term which commences in December next at Washington.

Gray's Telephone.

AN erroneous idea of the Telephone, recently invented by Mr. ELISHA GRAY, of Chicago, Ill., has been given by the account printed in the *New York Times*. The invention, as it really is, is a most ingenious and likely to prove a useful one.

Mr. GRAY's method of transmitting musical tones and reproducing them at a distance is briefly as follows: Imagine an ordinary induction coil with the secondary wire continued so as to include a telegraph line of say 1,000 miles. Let a man place his body in this circuit by taking hold of the wire with his left hand, and laying his right hand upon some resonant substance, a conductor of electricity, which becomes the other electrode. If induced currents are made to flow in the secondary circuit in the usual way, there will arise a quivering in the muscles of the man's right hand, which produces a vibration in the resonant substance sufficient to be easily heard. And the sound which results from this contact of the man's cuticle with the sounding electrode is always of the same pitch with that of the vibrating spring which breaks and closes the primary circuit.

The principles thus briefly stated are a discovery made by Mr. GRAY, and, so far, no one has appeared to claim to have made the discovery before him. They are of great scientific interest, and as Mr. GRAY has already shown a genius for applying the principles of electrical science to practical results, we hope his new discovery will be made practically useful and thereby become an invention.

In a future number we shall indicate, in detail, some of the methods by which this result promises to be attained. At present we will merely say that as a matter of fact Morse writing has been sent through long lines, and received by this method with less than one hundredth part of the battery power commonly employed. Very competent judges, as good, probably, as we have in this country, are inclined to think that by this method the speed of cable transmission can be greatly augmented. Experiments seem to indicate that the Telephone is the basis for a practical multiplex telegraph system.

From the foregoing concise description of this interesting and brilliant discovery it will be seen that we were right in the surmise, expressed in our issue of July 18th, that Mr. GRAY was not responsible for the account of the telephone which was published in the *New York Times*, and extensively copied by the daily papers in all parts of the country. For his method, both of transmitting and of reproducing the tones, is so novel and so infinitely ahead of the VAN DER WEYDE process, that great injustice was done by applying to it the language used to describe the old process, which has long since proved to be of no value.

And as an evidence that Mr. GRAY, and his attorney, ALEXANDER L. HAYES, Esq., of Boston, are not open to the charge of ignorance of what has been done heretofore in the same direction, we will state that the specification of one of Mr. GRAY's patents contains a description of the VAN DER WEYDE telephone, for the purpose of contrast, and this description was on file in the Patent Office six weeks before the *Times* article appeared.

Mr. GRAY has been allowed two patents on two different applications of the telephone—both applied for and allowed at the same time. He is going to Europe to complete his experiments in regard to cable working. We wish him all the success which he so well deserves, both on account of his ingenuity in electrical devices and the unassuming manner in which he conducts his labors.

JOSH BILLINGS says, "Success don't konsist in never making blunders, but in never making the same one the second time."

The Cincinnati Industrial Exposition.

SINCE the notice of the Cincinnati Industrial Exposition of 1874 was printed in THE TELEGRAPHER of July 11, a supplemental premium list has been issued by the Board of Commissioners, which will be of interest to telegraphers and manufacturers of electrical and telegraphic instruments and apparatus. The mistake of the Commissioners to which we alluded—that of putting the electrical and telegraphic apparatus in the same class with optical and philosophical instruments—has been rectified, and they will this year be in a class by themselves. The following additional premiums are offered in class 60:

- Best General Display of Telegraphic Instruments and supplies—gold medal.
- Best Type Writer—silver medal.
- Best Amateur Telegraphic Instrument—bronze medal.
- Best Electric Bell—bronze medal.
- Best Automatic Mercury Fire Alarm—bronze medal.
- Best Electric Medical Apparatus—bronze medal.
- Best Insulator—bronze medal.
- Best Electric Clock—bronze medal.
- Best Insulated Covered Wire for Office Use—bronze medal.
- Best Insulated Covered Wire for Line Use—bronze medal.
- Best Electric Gas Lighting Apparatus—bronze medal.
- Best Printing Instrument for Private Lines—bronze medal.
- Best Burglar Alarm—bronze medal.
- Best Automatic Telegraph System in Operation—bronze medal.
- Best Duplex Telegraph System in Operation—bronze medal.
- Best System Telegraphic Call Bell, for Stores, Manufactories, etc.—bronze medal.

Mr. E. C. ARMSTRONG, of No. 318 West Third street, will take charge of any electrical and telegraphic apparatus which parties may desire to exhibit, who cannot conveniently attend the exhibition personally, and will see that they are properly displayed and taken care of, and will also attend to returning them at the close of the exposition. For his services he will make no charge, only requiring that the entrance fee and actual expenses incurred shall be paid by the exhibitors.

We can guarantee that anything intrusted to his care will be properly attended to, and that whatever he promises he will perform.

The coming exhibition promises to exceed in completeness and brilliancy either of those which have preceded it, and to surpass any similar display ever made in this country. No labor or expense will be spared to make it the industrial exposition of the present year. The achievements in this line on the part of the managers are a sufficient assurance that what they undertake they will perform in the best and most satisfactory manner.

The New Atlantic Cable.

THE steamships Faraday and Ambassador will probably, by the time this paper is printed, have completed the laying of the cable of the Direct United States Cable Company between Tor Bay and the coast of Newfoundland, and be ready to start on the return voyage to England to load the cable to be laid between the coast of Ireland and Newfoundland.

We understand that the cable between Tor Bay and Rye Beach has been connected with the instruments, and that that section, at least, works very satisfactorily.

It has not yet been determined whether the cable will be landed in Newfoundland or not; but if matters should not be satisfactorily arranged by the time the long section of the cable is laid, the two ends will be spliced together, and Tor Bay, Nova Scotia, will, for the present, at least, be used as the repeating station. The additional lines of the Atlantic and Pacific and Franklin Companies will be completed to Portsmouth and Rye Beach, N. H., in ample time to establish the

connection with the new cable, when its laying is completed.

Failures to Receive The Telegrapher Regularly.

WE have lately had many complaints from subscribers of failure to receive their copies of THE TELEGRAPHER, transmitted through the mails, regularly. We can only say that the papers are mailed regularly at this office every Friday afternoon, and should reach subscribers within three hundred miles of New York on Saturday or Monday, according to distance and mail facilities. The wrappers are directed by the same person who has done the work for the past two years, and every care is taken that none shall be omitted. In many cases where such failures occur an investigation at the receiving Post-office will discover where the difficulty lies. Where such failures occur frequently subscribers should insist upon a thorough search being made at the office for the missing papers. It is not improbable that with all reasonable care and diligence a name may be occasionally missed in preparing the wrappers, and a paper occasionally get missent or lost in the mails, but when, as is sometimes the case, as reported to us, the paper fails to the same person every two or three weeks the difficulty will usually be found in the local Post-office, or in the appropriation of the paper by some impecunious or larcenous telegraphic associate.

We are always willing to supply duplicates of missing numbers whenever informed of the failure to receive them.

A Telegraphic Insurance Agent.

Mr. W. C. LONG, of the Western Union Telegraph office, Chicago, Ill., has accepted an agency of the Protective Life Insurance Company of that city. He retains, at least for the present, his position with the Western Union Co., and has opened an office at his residence 170 Centre street, Chicago, with office hours from 7 P. M. to 10 P. M., where he can be seen every evening except Sunday between those hours.

Mr. LONG is an industrious and intelligent telegrapher, and deserves to succeed. We have no doubt the fraternity in Chicago will do all they can to aid him in this new undertaking.

Personals.

Mr. WM. HOLTHAM, late manager of the Maysville, Cal., office of the Atlantic and Pacific Telegraph Company, has been appointed agent and operator for the Central Pacific Railroad at Modesto, California.

Mr. H. W. FULLER, late freight clerk and operator at the depot office of the Central Pacific Railroad at Maysville, Cal., has been appointed manager of the city office of the Atlantic and Pacific Telegraph Company at that place.

Mr. R. J. HEWETT has accepted the position of agent and operator for the Atlantic and Pacific Railroad at Osage City, Mo.

Mr. J. M. HETRICH, of Superintendent Fuller's office, Phillipsburg, N. J., Central Railroad of New Jersey, has relinquished his situation and left for the West to engage in other business. The numerous friends he leaves behind wish him success and prosperity in his new vocation, and will always be glad to see him back again.

The Telegraph.

The Southern and Atlantic Telegraph Co.

A GENERAL meeting of the stockholders of the Southern and Atlantic Telegraph Company was held at the office of the company, No. 51 New street, in this city, on Wednesday, July 22. Mr. J. R. Crenshaw's resignation as President was presented and accepted.

Amendments of the by-laws of the company were adopted, by which the election of President as well as other officers was made the duty of the Board of Directors, instead of the stockholders, as heretofore, and other changes were made, calculated to facilitate the operations and management of the company.

Mr. Henry Hentz, the President of the New York Cotton Exchange, was elected President *pro tem.*, and Mr. Charles W. Blossom, Vice-president, will have the active executive management in the future.

Progress of the New Atlantic and Pacific Telegraph Line.

THE new line of the Atlantic and Pacific Telegraph Co., between Chicago and Omaha, has been completed to Joliet, Ill., and the office at that place was opened for business on Wednesday last. The poles for this line are all up as far as Rock Island, and the work is progressing favorably. The decision of Judge Drummond, reported last week, does not interfere at all with the progress of the line.

Foreign Telegraphic Notes.

THE receipts of the Submarine Telegraph Company for the month of June, 1874, amounted to £8,647—an increase of £829 over the corresponding month of 1873.

The traffic receipts of the Great Northern Telegraph for the month of June amounted to 391,913fr., and for June, 1873, to 265,763fr. The aggregate receipts for the six months ending with June amounted to 2,089,408fr. (£83,576), and for the corresponding period in 1873 to 1,450,239fr. (£58,009).

The principal submarine telegraph companies recently held a conference at the offices of the Eastern Telegraph Company, in Broad street, London, for the purpose of examining and revising the regulations which were sanctioned by the Telegraph Convention of Rome, with a view of submitting at the next International Conference, to be held at St. Petersburg next year, such alterations as may in their opinion tend to the more effective working of the international telegraph system, and more especially as regards the regulations concerning telegrams exchanged with countries out of Europe. Major Bateman Champain, R. E., represents the Indo-European Telegraph Department; Sir James Anderson, with whom are Mr. Wells and Mr. Ansell, the Eastern Telegraph Company; Mr. Weaver, the Anglo-American Telegraph Company; Mr. Andrews, the Indo-European Telegraph Company; Colonel Glover, India Submarine Telegraphs; Mr. Eriksen, the Great Northern Telegraph Company; Major Wood, the Western and Brazilian Telegraph Company; Mons. Chauvin, the Direct United States Telegraph Company; and Mr. Malcolm J. Brown attended on behalf of the English Telegraph Company.

The report presented to the Eastern Telegraph Company, on the 14th ult., recommended a dividend of 4s. per share, making, with their previous payment, 6 per cent. for the year, and an appropriation of £38,993 to reserve, thus raised to £121,838.

The financial report of the *London Railway News*, for the week ended Friday evening, June 17, states that telegraph securities had exhibited considerable firmness in the London market.

During the past week the prices of the leading securities have advanced. At the settlement just completed the names passed for investment in these securities were of an influential character, and the supply of stock in the hands of dealers extremely limited. Anglo-American, Eastern and Eastern Extensions have fully recovered the quarter's dividend just declared. It is understood the traffic receipts over all the lines are rapidly augmenting, in sympathy with the general revival of trade. Added to this, the preliminary arrangements now being made by the representatives of the various companies to attend a telegraphic conference at St. Petersburg, give confidence to investors that the interest of the shareholders, equally with that of the telegraphing public, will receive a due amount of attention.

It was expected that the Great Eastern would sail July 27, to lay the fifth cable of the Anglo-American Company, which has been paid for out of the reserve funds of the company, and which will consequently be purchased without any increase to its present capital.

In the six months ended June 30, 1874, the value of telegraph wires, apparatus and material exported from Great Britain was £1,579,754; in the same period in the preceding year, £702,440.

The Black Sea telegraph cable, between Constantinople and Odessa, has been opened at a charge of 12fr. for twenty words.

The Anglo-American Telegraph Company have notified that the 1866 cable, which was broken on the 13th of April last off Valentia, Ireland, has been successfully repaired by the company's steamship, the *Minia*, Captain Welch, and that it now works perfectly.

The Telegraphic System in the Island of Cuba.

THERE are twenty-four different telegraphic circuits established in the island of Cuba, and the number of telegraph offices exceeds 200. Cuba also forms the centre of an important submarine telegraphic system, consisting of three cables—that from Havana to

Florida; that from Batabauo to Santiago de Cuba, belonging to the Cuba Submarine Telegraph Company, and that from Santiago de Cuba to Jamaica, belonging to the West India and Panama Telegraph Company.

How a Practical Joker was Sold.

We will run the risk of it being old to our readers, although old to records. Some six or seven years since, our well known, quiet and reticent friend Charley Scott, lately at Detroit, being seized with a sudden freak of hilarity, thought to create wholesale sport for this office by ringing in a sell on the boys, making a confidant of Billy King, who, by the way, now edits the *Evening Herald*, Evansville, Ind. 'Twas in the dead of winter; icicles were prevalent, and a warm fire one's best friend. But great sacrifices must be made for fun. Charley, armed with a *Commercial* of ancient date, bled to the battery room on the ground floor, with the temperature of Siberia, selected an old special, and called C. In the meantime the boys had been posted by William, and some one answered "IIC," and passed on to another instrument. Charles then started at a brisk pace with a two thousand word special, gradually increasing his speed. Now and then some one would, in passing, open the key and say to go ahead, last word, and pass on. With confidence Charley proceeded, and when he closed some one happened to be passing, and said O. K. Charles then ascended the five flights of stairs and gained the operating room, and, after partially thawing out, asked Billy to see a copy of a long special which he understood was received. Billy said it had been sent to the *Commercial* office. Rush No. 2 to *Commercial* office and found all specials had been sent to the compositors' room. Four flights more, and, upon inquiry, the compositor promptly remarked, "Get out of here, you're drunk." Charley returns to the office, with perspiration flowing in torrents from his brow, and was met by sounds of mirth and hilarity. The whole office on one wasn't fair, and he went home; but he wasn't mad! oh, no! —*The Plug.*

Dog Killing by Electricity.

WHETHER the slaughtering of scores of dogs by carbonic acid gas, as practiced in this city, is a painless operation to them seems rather questionable from the length of time which their struggles continue. A correspondent asks why cannot electricity be used? He suggests that with a powerful battery and a good sized Rhumkorff coil, that will give a spark of from twelve to eighteen inches, thirty or forty dogs at a time might be killed instantly and painlessly. The wires could be led along the floor connecting with every staple to which the animals are secured. The chain and metal collar would serve to conduct the shock to the body. —*Scientific American.*

Miscellaneous.

THE MAGNETIZATION OF STEEL.—If a recently tempered steel needle be introduced into a magnetizing bobbin connected with a battery of constant current, battery and bobbin comprising the circuit, it acquires a total determined magnetism at the end of a period which appears not to exceed that of its introduction. On slowly withdrawing the needle, it is found to retain residual magnetism which, together with the total magnetism, increases with each repeated introduction until a limit is reached. The needle may be magnetized in the bobbin by three other methods:

1. *Establishment.*—Introduce the needle; establish the current; slowly withdraw the needle.
 2. *Interruption.*—With a closed circuit introduce the needle slowly; break the current and withdraw the needle.
 3. *Instantaneous Charge.*—Introduce the needle; establish and break the current; withdraw the needle.
- Repetitions of any of these three processes (all things being equal) insure an augmentation of the needle's magnetic movement.

LIGHTNING rods just now are a current topic, both on account of the thunderous summer at hand, and of the seasonable liveliness of the paramilitary rod vendors. Rods which invite the lightning and assist it to cleave things generally after its arrival, are unquestionably of a discouraging sort. A German physicist proposes to utilize poplars by inserting in the lower part of the tree a metallic rod connected with the earth by a chain, so that the electric fluid cannot leave the tree to dart at any object placed within a short distance. The poplar tree is not a handy sort of thing for an agent to carry about with him; but in some way he will manage to do it.

Everything can be learned, even virtue.
Placed on file—the handle.
Variety is the spice of life.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended June 23, 1874, and bearing that date.

152,427.—**ELECTRIC LIGHTING ATTACHMENT TO GAS BURNERS.**—Adolph T. Smith, New York, N. Y., assignor, by mesne assignments, to Abraham L. Bogart, same place. Application filed March 19, 1874.

Turning the cock closes circuit to magnet, which actuates the armature, which, in turn, makes and breaks the circuit till the turning on be completed. The break being near the issuing gas, it is lit by the spark thus made.

1. The helix D, arranged on the body of a gas burner, said body being made to form the core of the helix, in combination with the armature P, and contact points a b, and an electric circuit, substantially as described.
2. The combination of the burner A, helix D, armature lever E, and wires a b, with a switch spring, G, and cam H, secured to the plug of the gas cock, all constructed and operating substantially as set forth.
3. The cam H, provided with two wings, e e, in combination with the gas cock C, substantially as and for the purpose described.

152,444.—**MAGNETIC SAFETY OR RELIEF VALVE.**—Chas. S. Westland, Providence, R. I., assignor of two thirds his right to William D. Hilton and Alanson Work, same place. Application filed April 27, 1874.

The valve lever being raised its contact with the magnet is broken, diminishing the force acting to hold the valve shut, allowing it to open widely.

1. The combination, substantially as described, of a magnet with a safety valve which is held to its seat mainly by a spring, or by a weight—the magnet operating in conjunction with the weight or spring for the purposes specified.
2. The combination, substantially as described, of an adjustable magnet with a safety valve, whereby the magnet may be made to exercise a variable degree of force in holding the valve to its seat, substantially as described.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

(P. O. Box 5503.) 38 VESEY STREET, N. Y.

TO ELECTRICIANS AND INVENTORS.

OFFICE OF THE UNION ELECTRO-MOTOR CO., }
62 BROADWAY, NEW YORK, July 3, 1874. }

The attention of Electricians and Inventors is invited to the following proposition:—The

UNION ELECTRO-MOTOR COMPANY
Desire to procure a
GALVANIC BATTERY

Fulfilling the following requirements:

1. It must be capable of maintaining a steady current of 61 amperes per second through a resistance, external to the battery, of two tenths of an ohm, with not more than six pairs of plates. This is, approximately, equal to the current developed by 3 of Chester's No. 2 carbon cells, charged with mixed nitric and sulphuric acid in the porous cells through 50 feet of No. 18 copper wire .049 inches diameter.
2. It must be absolutely free from fumes, and from liability to leak or spill its contents under any ordinary circumstances. If possible, it is desirable that a battery should be provided to work without liquids—in other words, a dry battery.
3. It must be capable of standing for a considerable length of time unused without material depreciation, and yet be ready to give out its full power at a moment's notice whenever required.
4. It must be self-supplying to an extent which will render it capable of furnishing a current, as above stated, for not less than 300 hours in succession without renewal.
5. Other things being equal, preference will be given to the battery occupying the smallest space.

For the best battery fulfilling the requirements herein specified a premium of

FIVE HUNDRED DOLLARS

will be paid, in accordance with the decision of the judges, if the battery is adopted by the company—which shall also have the privilege of exclusive ownership by paying the additional sum of

FIFTEEN HUNDRED DOLLARS.

This offer will remain open until November 1, 1874.

Judges.—MERRILL LEFFERTS, President of the Gold and Stock Telegraph Company; GEORGE B. PRESOTT, Electrician of the Western Union Telegraph Company, and FRANK L. POPE, Electrician.

E. B. GRANT, President.

H. H. DUNCKLEE, Secretary.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost. Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

BLISS RESERVOIR BATTERY.

PATENT APPLIED FOR.

Price per Cell, - - - \$2.00.

This Battery gives a stronger current than the same size Hill or Calland Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

BOX RELAYS, with or without Keys on base, a specialty; superior in all respects.

IMPROVED COMBINATION INSTRUMENTS for main line.

RELAY, SOUNDER and KEY on same base, making an elegant set.

WILSON, HASKIN, WESTERN UNION and PLUG CUT-OUTS.

HASKIN'S AUTOMATIC REPEATERS, LIGHTNING ARRESTERS, GROUND, BATTERY and REPEATING SWITCHES.

WESTERN UNION (new style) SWITCH BOARDS.

ELECTRIC BELLS, single or vibrating stroke.

MEDICAL INSTRUMENTS, cheap and reliable.

AGENTS FOR

- KIDDER'S MEDICAL APPARATUS,
- JONES' LOCK SWITCH BOARDS,
- HILL'S ANNUNCIATOR and FIRE ALARM,
- PUTT'S MECHANICAL INSTRUMENTS,
- UNITED STATES ELECTRIC GAS LIGHTING APPARATUS.
- POPE'S RAILWAY SIGNALS,
- SELDEN'S PRINTER,
- ANDER'S MAGNETIC DIAL and PRINTER
- GROVE, CARBON, BUNSEN, DANIELLS, LECLANCHE, LOCKWOOD, CALLAUD, SMEE and GRENET BATTERIES.

AGENTS FOR

- HILL'S and the EAGLE BATTERY,
- KERITE and GUTTA PERCHA WIRES and CABLES.

AGENTS FOR

- MOORE & SONS' and PHILLIPS' MAGNETIC and OFFICE WIRES.

AGENTS FOR

- ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK, and AWL CLIP.

AGENTS FOR

- WASHBURN & MOEN'S celebrated GALVANIZED WIRE; also, AMERICAN COMPOUND WIRE.

AGENTS FOR

- BROOKS' INSULATORS,
- KENOSHA INSULATORS,
- SCREW GLASS INSULATORS,
- TELEGRAPH POLES,
- BRASS ECCENTRICS,
- HAND VICES,
- STEEL CLIMBERS,
- STUBBS and PATENT PLIERS.

VAUGHAN'S AUGURS and TOOLS in variety.

SULPHATE OF COPPER, NITRIC ACID, SULPHURIC ACID; the finest in the Market.

TELEGRAPH BOOKS, MESSAGE PAPER, REGISTER PAPER, and STATIONERY.

SECOND HAND RELAYS, CUT-OUTS and REGISTERS very cheap.

AGENTS FOR

Repairing and Model Work promptly attended to. **Bliss' Manual and Price List furnished free on application.**

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;
the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.
Messrs. GAMEWELL & CO. are the owners of the
original FARMER & CHANNING PATENTS, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by
MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the
AUTOMATIC SYSTEM,
the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of
FIRE ALARM AND POLICE TELEGRAPHS
has met with the universal approbation and commendation of
the
People, Municipal Authorities,
AND THE
PRESS

throughout the UNITED STATES and CANADA.
NO EFFORT, TROUBLE OR EXPENSE
is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the
EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be
ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,
but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THESE**
CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its in-
troduction into their localities is cordially invited, and
their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,
AND MANUFACTURER OF
INSTRUMENTS,

BATTERIES,
AND EVERY DESCRIPTION OF
TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE
HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that
will work practically with a single DANIELL cell, a BATTERY
that does not require to be taken down but once a year, and the
very best MAIN LINE SOUNDERs made

Our CATALOGUE, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE. COPPER FOR CONDUCTIVITY. STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world. It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,
which is the best watchman's time recorder in the world. Also,
ELECTRIC AND CONTROLLED CLOCKS

of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
OF
EVERY DESCRIPTION,
38 VESEY STREET, New York.

NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

RELAYS,
SOUNDERS,
REGISTERS and KEYS.

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,

For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.

Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.

BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for

HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Send for New Catalogue and Price List.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacohy and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

NEW YORK, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.50.

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

ONE CUP BATTERY, CHEMICALS, WIRE AND
MANUAL WITH EACH INSTRUMENT.
Complete outfit for the Student or short line use.

Price, complete,
Seven Dollars.

Key and Sounder only..... \$6 00
" " with Lightning Arrester..... 7 00
Five per cent. discount for cash in advance.

GEO. H. BLISS & CO.,
SOLE AGENTS,
41 THIRD AVENUE,
Chicago, Ill.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
No local required. Always ready for temporary offices.
Just what is wanted for officers' cars.
Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
WATTS & CO., Baltimore.

THE REASON WHY
THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
8 Dey Street, N. Y.

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A HAND-BOOK
FOR

ELECTRICIANS AND OPERATORS.

By **FRANK L. POPE.**

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND
FULLY ILLUSTRATED.

8vo. cloth..... \$2.00

Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books sent per mail, on receipt of ten cents.

23 MURRAY STREET and 27 WARREN STREET.

THE BISHOP GUTTA PERCHA WORKS,
422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
ONLY MANUFACTURER
OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,
FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,
Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS,
ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES.
In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with increasing
superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered
at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
any Telegraph Cable or Wire manufactured at the Works in New
York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods manufactured
by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
sale in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway,
D. HODGMAN & CO., 27 Maiden Lane,
SHEPARD & DUDLEY, 150 William St.

The Improvement in Telegraph Line Construction.—Theories and Practical Results in the Past.

BY OLD TELEGRAPHER.

In previous articles which have appeared in THE TELEGRAPHER the writer has referred incidentally to some of the peculiarities of the construction of telegraph lines in the early days of the electric telegraph in this country. It is a subject which might be followed out more fully than it is possible for me to do, with interest and perhaps profit to the present generation of telegraphers. In fact, I do not feel myself qualified to discuss the matter very elaborately, and will, therefore, confine myself to a general consideration of some of the theories of line construction which have found adherents and earnest advocates in the past, with the results of attempts to put them in practice, and of the improvements which have since been made in this direction.

As is familiar to most telegraphers, after the general idea of the electro-magnetic telegraph had been pretty well developed in theory, the first attempt to construct a line over which the signals were to be transmitted was made between Baltimore and Washington—Congress having finally, though reluctantly, and with little or no faith in its success, appropriated forty thousand dollars for the purpose. The original idea was to put the wire underground, in a lead pipe made for the purpose, and a machine for digging the trench into which it was to be buried was devised by Mr. Ezra Cornell and Mr. F. O. J. Smith, both of whom are yet living, in the enjoyment of handsome fortunes, derived mainly from their connection with the development of the telegraph interest. On account of the lack of insulation of the wire encased in the lead pipe this plan was found to be impracticable, and after a few miles of it had been laid the machine was conveniently broken, and operations necessarily suspended for the time. It was decided to put the experimental wire on poles, and the line was finally constructed in this manner, as have been all the long lines in this country since. The line thus constructed worked, it is true; but, owing to bad insulation and the crude character of the instruments employed, it would hardly be regarded as a first class line by the telegraphers of the present day.

In connection with the telegraph everything had to be learned, and line construction among the rest. Some of the ideas which were advanced from time to time, even by those most deeply interested in the success of the telegraph, would greatly amuse the telegraphers, who are now better informed as to what is necessary to constitute a decent telegraph line. Wooden poles or posts were, naturally, in a country abounding in timber, adopted as the support of the wires and insulators, and as they are yet cheaper than any substitute which has been proposed, they maintain their position in this respect to the present day, and are likely to do so for many years to come. Almost every telegraph constructor and manager has his own idea as to the best size for the poles, though generally those of from twenty-five to thirty feet in length have been adopted. Many lines have been built, however, with poles which were comparatively mere pipe stems in appearance. It is not necessary to inform the reader that such lines were and are intended to last only long enough to enable the contractor and builder to get his pay and get out of that section of the country. One superintendent conceived the idea that very short poles were the proper ones to be used, and some years ago a line might be seen along the railroad between Springfield and Worcester suspended on twelve foot poles. The disadvantages of this system of construction, however, soon manifested themselves, and I believe this was the only line thus built.

The theories in regard to the wire conductors employed have been numerous, and not unfrequently as ignorant as might be expected from those who originated them. The surface theory, as it was called—that is, that electricity was transmitted mainly upon the surface of the wire, and that, therefore, the more surface that could be obtained with a given quantity of metal the better would be the conducting properties of the wire—at one time had many believers.

Two or three lines were accordingly constructed with a twisted wire, composed of a number of small strands, and naturally in a comparatively short time became oxidized and very brittle from the exposure to the atmosphere and the alterations of wet and dry weather. Some believed that a small conductor, of No. 10 wire, for instance, was just as good, as it certainly was much less costly to purchase or handle than a larger wire, and not a few lines were built of this, and sometimes even smaller wire. Of course, they did not last long. Others believed in obtaining and using the largest sized conductor possible, and No. 6, and sometimes even No. 4 wire has been used for this purpose.

There is no doubt an advantage in the use of these very large conductors, and when properly put up, if inferior insulation is used they are decidedly preferable. The objections to the use of such large conductors consist in the first place of the greater cost of the wire, and secondly, of the much greater difficulty and expense of handling and putting it up. They necessitate, moreover, large and more numerous poles than relatively smaller wire, and the advantages derived from their superiority as conductors may be obtained in a different and less troublesome and expensive manner. The Western Union Company has used a good deal of this large wire on its new lines on the main telegraphic routes, and has undoubtedly found it advantageous in improving the capacity and reliability of its lines, with such conductors as that company, for reasons which it cannot be difficult to understand, persists in using.

In the first year or two of the construction of telegraph lines copper wire was regarded as essential to be used, and in a metallic circuit at that, requiring two wires in all cases to complete the circuit. The unsuitability of copper wire for the purpose, from its extreme ductility, was soon demonstrated, and also the discovery of the earth circuit obviated the supposed necessity of furnishing an expensive conductor to complete the electric circuit. The discovery of the earth circuit was unquestionably one of the most important which has ever been made as regards facilitating the rapid advance of the electric telegraph throughout the world.

It has been in the insulation of telegraph conductors or wires that the most numerous theories, and the most remarkable displays of genius have been made from time to time. It was understood from the first that some method of insulating the wires was indispensable, but the ideas, as regarded the means of accomplishing this, were exceedingly crude, and as various as the persons propounding them. Glass in some form was employed on all the early lines of telegraph, but some of those who were regarded as bright and shining lights in the telegraphic galaxy of the day regarded glass insulators as too expensive, and one of them, the late Amos Kendall, I think, wrote a sharp letter to Mr. Henry O'Reilly, who was then engaged in constructing one of the earlier lines, for his extravagance in using glass insulators, and suggesting that it would be much cheaper to cut a notch in the top of the poles and wrap the wire with tarred hemp and place it in the notch! Mr. O'Reilly failed to realize the wisdom of this suggestion, and persisted in using the glass insulators, which were the best known at that time, in spite of the expense. The letter making the suggestion is still in existence, and has been deposited by Mr. O'Reilly in the library of the Historical Society, in this city, with a large number of other MSS., and publications, and data, in reference to the early telegraphic history of the country, where they may be preserved, as their value and importance deserve, for present and future use.

For several years glass was regarded as the only practicable insulator for telegraph wires, the only difference being in the shape and method of supporting them so as to secure the best results. Experiments were made with other substances from time to time, but they resulted in the return to glass. Prof. Royal E. House, the inventor of the House Printing Telegraph Instrument, also invented an insulator, which was used to some extent on the House lines, so-called. It was irreverently styled "the dinner pot insulator" by telegraphers of that day on account of its size and peculiar shape. The insulator consisted of an outer shell of iron, cast with the thread of a screw on the inside. The interior of the insulator was coated with glass. A screw was cut upon the top of the pole and the insulator screwed into it. As long as the glass remained intact the insulator was a very good one, but unfortunately the expansion and contraction of the iron from the effects of heat and cold had not been taken into account, and the glass was soon fractured from this cause. Again, the insulator furnished an excellent object upon which amateur sportsmen could exercise their skill with rifles, pistols, etc., and as at that time the wires, especially in the Western part of the country, ran for hundreds of miles through the forests, many of the House insulators were soon decorated with bullet holes, which seriously interfered with their insulating properties. They were quite expensive,

also, costing some fifty or sixty cents apiece, and they did not long remain in use on any line.

It would require too much time and space to recall the many modifications of this idea of Prof. House, of an iron shell, with glass insulation inside, which have made their appearance from time to time, only to be discarded in their turn for the same cause, the impossibility of keeping unfractured the glass coating. Some of these were of such a shape and manufacture that outwardly they appeared to be perfect, while, in fact, they afforded no insulation at all, and, consequently, caused much annoyance and trouble to the operators and line repairers, and great loss and damage to the companies. The Lefferts insulator, so called from having been designed by Gen. Marshall Lefferts, was for some time very popular and quite extensively used. This consisted of a wooden plug, some 16 to 18 inches long, with a knob on the end in which a hole was bored, and in this a glass insulator with an iron hook east in it was placed, and secured from falling out by a wooden pin, which fastened the insulator in the aperture prepared for it. These have gone out of fashion now, however, and none have been made for some years past.

The different styles of fauey insulators which have appeared from time to time have mostly ceased to be made, and the insulators now used are various forms of glass—the best and most generally used being that known as the screw glass insulator—the poorest, that manufactured specially for the Western Union Company and known as the Western Union insulator; the Kenosha or Carbon insulator, and the Brooks improved paraffine insulator. The latter is considered the best, and although its original cost is greater than either of the others, it has shown itself to be in fact the cheapest and most economical.

When we contrast the best lines now built with those which some years ago were regarded as first class, it must be conceded that there has been a decided improvement in their construction. It is true that a good deal of poorly constructed line is still put up, but this is generally the fault either of the contractor, who in this way seeks to increase unduly the profits of his job, or from the parsimony and ill-judged attempted economy or poverty of the company or parties for whom they are built. The use of very large iron wires for conductors, especially by the Western Union Company, has been referred to in this article. The necessity of this for increasing the capacity of the wires may be avoided, either by employing the equivalents of such wires manufactured by the American Compound Telegraph Wire Co., of this city, or by using a more perfect insulation for smaller wires, such as is furnished by Mr. Brooks in his improved paraffine insulator, with which he guarantees, for a small annual payment, to maintain a No. 9 iron wire in continual wet or foggy weather at the same conductivity and capacity as the larger wire under ordinary atmospheric conditions.

The compound telegraph wire manufactured under the patents of Messrs. Farmer and Milliken of Boston, if proper care is taken in putting it up originally, is guaranteed to give the best results. Combining as it does lightness and strength, the conductivity of copper with the strength of steel, it is easily handled, and when once in place should last in effective service for many years. It is essential, however, that care should be taken that it is properly handled, and the patent joint which is furnished with it should be used, as joints and splices made carelessly and in the ordinary way are apt to interfere with the copper coating of the interior steel wire and impair its conductivity. From such careless and improper handling discredit has at times been cast upon this wire which it does not deserve. It is destined eventually to occupy an important and leading position as a telegraphic conductor, and will be extensively used. The smaller number of poles and insulators required when this wire is used really reduces the first cost of a line, especially if the Brooks insulators are employed, to very nearly that when ordinary iron line wire is employed.

Marked as has been the improvement in the construction of telegraph lines heretofore, there is still much room for further improvement. The progress in that direction from year to year is encouraging, and telegraph managers are coming to understand that inferior material and careless construction will not pay in the long run. With such lines as can be built with the material and insulation now available, and with the improved systems of working telegraph lines which are coming into use, the capacity of such lines for business will be largely increased, and the relative cost of the service reduced, so that with them the telegraph, at even lower rates than are now charged, may be made profitable to investors, and afford a better remuneration to intelligent and competent employes.

Mr. ELISHA GRAY, Supt of the Western Electric Manufacturing Co. of Chicago, Ill., and inventor of many valuable improvements in telegraphic and electrical instruments, sails for England in the steamer Baltic, of the White Star line, from New York to-day.

Cap. De Costa.

BY JOHN OAKUM.

THOSE who read a previous paper in these columns, entitled "Posie Van Dusen," may remember that a gentleman bearing the name of Cap. De Costa was incidentally introduced. Less attention was devoted to him than to the others, because he had never performed any of the marvellous feats which so redounded to the glory of Jim Lawless, nor had he ever won distinction in the peculiar respects in which it is vouchsafed that none but McCloskys shall achieve victory and renown; and yet De Costa was an original in his way—a genuine ingot in the mine of humanity. It was his misfortune, however, in common with most of his class, that the retention of lucrative situations is not compatible with a free indulgence in wine and wassail. And thus it came to pass, in the year of our Lord 1860, that Mr. De Costa had been so regularly and persistently dismissed from the service of the American Company, in New York, as to render it somewhat difficult to persuade managers that he deserved a situation. From August, 1860, until June, 1862, very little is known of the gentleman's history or his whereabouts. Vague rumors are still whispered concerning his operations during the period mentioned, but the theories of his disappearance are so diverse in their nature that unless Mr. De Costa possessed the unusual boon of ubiquity he could scarcely have filled the bill. One story runs that he passed the interval in driving a mule team on some route having Santa Fé for its remote terminus; another says he was engaged in New Jersey, where he flourished a shepherd's staff and looked after a flock, as pastoral in their seeming, no doubt, as the average animals from the west, as seen at Communipaw; while still another informant holds that, at intervals during the entire period, telegraphers seeking relaxation in a game of billiards at the National, saw, sometimes hovering in a dark corner, a face mysteriously familiar though changed and shy of notice, and others dropping in at Branch's after "30" for a lunch or some liquid comfort, noticed that a figure, which, according to Mike's testimony had been "hanging over that chair and baking himself all night in a comatose state," always came quickly to an upright posture and disclosed that it possessed legs and the faculty of locomotion, by speedily gliding up the steep stairs and disappearing down Ann street as if propelled by shame and humiliation.

But these distracting theories of De Costa's whereabouts do not alter the circumstance that on the 8th of July, 1862, he appeared in a terribly demoralized condition at the office of a western superintendent, between whom and himself a dialogue, something as given below, is said to have taken place:

"I hear operators is skurce," said De Costa, with the skill of a diplomat. "Good many gone to the war and more going d—n soon; I'm an operator, old man, aud, look here—I want a job."

"Indeed!" returned the gentleman, "but your manner, sir, is hardly what is due to men in my position, and you seem to have been drinking. I really fear we have no vacan—"

"Oh, that's played!" broke in the Captain, "I've been here before; I'm sorry if I ain't been respectful, but, d—n it, man, you don't seem to understand that good operators is skurce." And, as if in atonement for anything unfriendly in his manner, he squirted a stream of tobacco juice in very inconvenient proximity to the official boot, and fell to whistling "Auld Lang Syne."

What he said was true; the demand for operators was threatening to exceed the supply; circulars calling for "sound operators," to go into the army, were freely distributed, and telegraphic officials were well aware that the facilities for handling the wonderfully increasing business were likely to be crippled from a lack of operators. But the superintendent did not fancy the manner of the applicant and he prepared to annihilate him.

"No," he began, "old acquaintance should not be forgot, and with the record which you have, Mr. De Costa, the company is not likely to let your fame pass from memory; but we really don't need you. We only want a few operators just now, and it is essential that those should be absolutely first class—men capable of sending a message with one hand and receiving one with the other—who can work two wires at once, so that—"

"Look here, cully," interrupted De Costa, speaking most confidentially. "Look here, cully, you say you want men that can do that? Well, I'm your oyster. You want to engage me on the spot at your highest salary."

It is not within my province to describe the process of thought by which these two came ultimately to agree. De Costa's impudence may have awed the official into submission, or a fine sense of humor may have led the gentleman to give the veteran another trial. At all events, my friend of the military title found his way to the operating room that very afternoon, and was enrolled on the list at the "highest salary," as he had suggested. During his stay his rela-

tions were tolerably pleasant, though some of his collaborators were taken down a peg or two occasionally by his manner of answering their inquiries. A message of his receiving, containing upward of a hundred words, was once handed to a new operator for transmission to some point in the east. It was beautifully written and filled the blank completely. The sender got on gloriously until he reached the bottom and then he was unable to see the check. He looked for it at the top and on the margin, but his "eager and expectant gaze" was each time disappointed. As a last resource he marched over to Cap.'s desk and said, very dumurely:

"Mr. De Costa, you seem to have omitted the check by some—"

"Omitted the devil," responded Cap., a little pompously, observing, with a wink at his interrogator, "nice oopy, ain't it?" Then he turned it over and pointing to the middle of the back, exclaimed, "Why, you tow topped lunthead, what do you call that?" The check was there on the back, looming up solitary and alone, like the Latin inscription "Hic" on the tombstone of the departed inebriate.

His friends thought he had reformed, and, indeed, his behavior for a few months was so much better than was expected, that the position of all night man, which had become vacant, was tendered him. The duties were light, with hours from 1 A. M. to 8 A. M. As a general thing he took scarcely a half dozen messages, besides sending a little press to San Francisco, and jogged on the even tenor of his way as happy as a bird. But there came a sad, regretful pay day night when Cap. met with a misfortune. He looked upon the wine when it was red. "On horrors head horrors accumulate," you know, so it was not surprising that, after he had relieved his men, that San Francisco should offer a "special." I fancy that deep emotions were working in the old boy's breast when the doleful information came bumping across the plains, but, be that as it may, deep emotions were working in several other breasts next morning. A special, which should have appeared in the New York Tribune that day, for reasons which the reader may surmise, hung innocently on its hook in the San Francisco office until long after the cock's shrill clarion had waked the eoboes of the new born day.

The manager—or "Charley," as the Captain always called him—by some strange chance came earlier to the office that morning than usual, to find the door open, the fire gone out and the room vacant. The butt of a cigar lying on the "overland" desk indicated that De Costa had sat pondering there on his duty and the feasibility of his performing it. The circuit closer was open, a piece of tin, which Cap. always took with him when he changed his base, was gone from the sounder, and on a blank lying loose among many others was written in pencil, in a neat chirography, unmistakably his, the following laconic adieu:

"Charley:

I works no more; I resigns.

CAP."

Fast Telegraphy.—The Western Union Company Caving in.—The President and Electrician Give it Up.

TO THE EDITOR OF THE TELEGRAPHER.

THREE or four years ago the annual address of the distinguished gentleman who now presides over the Western Union Company with so much dignity and snavity, and who "debates" its peculiar excellences through each succeeding session of Congress, contained the following touches of rhetoric and science—the latter of which was understood at the time to have emanated from that shining light in electrical science, the very popular electrician of the W. U. Co.:

1. "It is currently reported that a new telegraphic bubble is about to be floated, having for inflating power a wonderfully rapid means of transmitting despatches by the automatic process. The patent for the automatic or fast system is owned by the Western Union Company, and no cause, therefore, exists for apprehending its use upon rival lines; but, inasmuch as we have given it a long, thorough and expensive trial, the result of which is that we have discarded it as totally impracticable, I deem it proper to give the subject a brief mention."

(2.) "Messages cannot be sent by this system at a faster rate of speed than by the ordinary apparatus, except over comparatively short distances; that it cannot be used upon a wire strung upon poles with other wires, nor will it work during a magnetic storm,

except by the employment of a double line. Taking all of its merits and demerits into account, it is so greatly inferior to the Morse and other systems in use that it cannot be profitably employed, either in connection or in competition with them."

(3.) "The value of the telegraph does not consist in the amount of time which can be saved by it over the mail or other means of communication, but in the practical annihilation of time. A telegraphic despatch, for example, might occupy two days in going from New York to London, and yet reach there eight days in advance of the mail, but this would not be a proper performance of the functions of the telegraph. Instant and constant communication is what is required, and hence the introduction of any apparatus which interposes an unnecessary delay in the preparation of dispatches, either for transmission or delivery, is a change for the worse. This is a disadvantage which the so-called fast systems labor under, and which will forever preclude their use."

(4.) "The automatic system, however, is especially unfitted for the transmission of press reports, as this process enables but one station to receive at the same time, whilst the Morse wires can be connected throughout the country, and the news sent to every office with a single manipulation."

(5.) "The double transmitter, an apparatus for working both ways over one wire at the same time, has also long occupied a prominent place among speculative telegraphers, and has recently been extensively advertised by the promoters of various competing lines. During the past twenty years there have been several inventions for accomplishing this result, the first being that of Dr. Gintl, of Germany; but while it is possible, under certain exceptional circumstances, to transmit messages both ways at the same time over one wire, the conditions under which this result is obtained are such as to render the general use of the system impossible."—*Annual Report of President Orton, 1869-70, pp. 37-39.*

It is humiliating that gentlemen who have the assurance to present themselves to the shareholders of that great company, should be known to have cherished and promulgated such profound ignorance as to the science of electricity and telegraphy, and at this late day, as we see embodied in the above extracts. Permit me to point out some of the more extraordinary statements embraced in the sentences which I have quoted:

(1.) The "wonderfully rapid means of transmitting despatches by the automatic process," consisted of the modest claim of Mr. Craig on behalf of the Lefferts and Little system of fast telegraphy, of transmitting speed of 150 to 200 words per minute, which was, a few months afterwards, on a fair average Morse circuit of 300 miles, exceeded by more than five times the utmost that was claimed for the new system—over one thousand words per minute having been transmitted as easily as fifteen words per minute can now be transmitted by the Morse system. The "patent" to which reference is made was the Bain-Humaston system, and as a curious illustration of the scientific knowledge which directs this model would-be monopoly, it may be stated that after the Lefferts-Little system had been worked successfully between Washington and New York for over a month, at the rate of over 1,000 words per minute, the electrician of the Western Union Company was called upon by President Orton to make good his assurances, embodied in the Annual Report, that the alleged new fast system was "owned by the Western Union Company," and to this end gave his whole mind to such improvements on one of the New York and Boston wires as even to rival, in electrical tests, the celebrated compound wire used by the Automatic Company between New York and Washington. And whilst this was going on very splendid automatic machines were produced at the machine shops of the Western Union Company, embodying the latest improvements of the combined wisdom of the distinguished electrician, engineer, inventor, master mechanic, executive officers and chief operators—and, to assure the company against the possibility of a failure, that walking magazine of electrical science and mechanical skill, Professor Farmer, was imported from Boston, and the Western Union building was largely surrendered to this brilliant array of talent for some ten or fifteen days. The result is told in a letter before me, from one of the chief actors, who says: "The New York and Boston wire used was in the most perfect condition, and gave better electrical results than the automatic wire between New York and Washington, but we found it impossible to telegraph at any time during our testings, and record so that it could be read, over sixty-two words per minute." So much for the Western Union Company's "fast system," and the brilliant minds by which the scientific and practical departments of the company's vast business is directed. Well might the President say "the Company's fast system was totally impracticable."

(2.) Every one of these statements was true enough, so far as they related to the "fast system" of the Western Union Company; but, as we have already shown, that the systems which the report went out of its way to assail, were as different as *conceded ignorance and modest intelligence*. The statements made in the paragraph quoted were not only destitute of every shadow of truth, but if the author or his scientific adviser had known even the rudiments of *modern* electrical science, he would have realized that his bold assertions were destitute of probability and even of common sense.

(3.) Who, after reading this and the preceding paragraphs, would imagine that the same electricians and executive officers of the Western Union Co. could be induced to travel to Europe and spend months of time in telegraphic investigations, and finally return home with a heavy investment, in this present year of grace, in the antiquated, exceedingly complicated, slow and unreliable Wheatstone automatic system, which has been in practical operation in England for at least ten or fifteen years without commending itself to one of the Continental Governments, where the regular Morse system is preferred for economy, reliability and accuracy? Yet, verily, such is the fact; and those innocent people of the W. U. Co. are so pleased at their success in getting hold of a live system of automatic telegraphy, that their antics are positively laughable. The Wheatstone Perforator requires even more skill to operate it than is required to operate the Morse system, while the perforators of the American fast system can be operated at sight, and they have been worked up to 140 words per minute against a speed of about 25 words by the Wheatstone machine—and, after the Wheatstone machine has perforated a message, it cannot be sent over an ordinary Morse circuit at a rate of speed over above 60 to 70 words per minute, whilst by the American system, which the managers of the W. U. Co. have so grossly belied, it is perfectly easy to transmit messages, in similar circuits, 1,000 words per minute.

(4.) There never was a greater perversion of the truth than is exemplified in this paragraph. The American fast system is absolutely perfect in regard to every matter and thing herein stated, and the press will find it, when it shall have passed into the hands of competent telegraphers, one of the greatest hoons of the century, inasmuch as it will enable every enterprising journal of the country to get over columns of special and exclusive news, from all parts of the country, in less time and for less money than is now required to get over a few paragraphs from Washington. This paragraph was written to deter certain newspaper men from raising, as promised, a million and a quarter of dollars to build trunk lines to the leading cities of the Union, and had temporarily the effect desired—but it was purchasing a respite from effective opposition which will ultimately be dearly atoned for.

(5.) In order to appreciate the exceeding richness of this paragraph on the duplex or double transmitter system, your readers ought to have placed before them the extraordinary paragraphs in the official "journal" of the W. U. Co. in commendation of this old and worthless (because too expensive) system of double or triple writing over one wire—but even the paragraphs to which I refer convey but a faint idea of the *exultation* and glow of language and gesture with which the electrician of the W. U. Co. describes to the gaping crowds, interested in the stock speculations of the company, the improvements which he and that brilliant genius of Newark have brought out in connection with the duplex system—claiming to send and receive from each end of a Morse wire, simultaneously, as many as three or four messages—all of which is undoubtedly true; and the same thing, substantially, has been done at pleasure by intelligent electricians for twenty-five years past. It was done even with the printing telegraph machines, by Professor Hughes, between this city and Philadelphia, as long ago as 1856. But the extraordinary statements of the distinguished electrician, and his every way well matched genius from Newark, are perfectly unctuous when they come to speak of the great *saving* to the company and the great increase of wire facilities for doing business; and in order that your readers and the shareholders may see the opposite side of the picture, I will present the most favorable view of the triple duplex which can, truthfully, be presented, and from it they can judge how long it will take, after the W. U. Co. shall have fully adopted the Prescott-Edison methods of telegraphing, to exhaust the last dollar in the treasury.

As a comparison has been publicly instituted between the American automatic and duplex Morse system, on the score of economy, etc., I will first give the figures for the automatic system and then for the Morse, the duplex, double and triple duplex systems:

Estimate.

Cost of telegraphing 300,000 words over any given circuit:

American Automatic System.

- 15 perforators, each 2,000 words per hour—10 hours, 300,000 words.
- 10 copyists (in Roman print), with 10 readers of telegraph characters, each copyist 3,000 words per hour—10 hours; 300,000 words.
- 2 transmitters and receivers.
- 37 operatives—girls, \$2 per day.
- \$74 actual cost of labor to telegraphing 300,000 words, but the wire only half occupied.

Morse System.

- 30 operators, with 30 wires, send, and 30 operatives receive 30,000 words per hour, or 300,000 words in 10 hours.
- 60 first class operators, \$4 per day.
- \$240 actual cost of labor—over 3 to 1 in favor of the automatic system.

Duplex Morse System.

- 40 operators, on 20 wires, transmit 30,000 words per hour—10 hours, 300,000 words.
- 40 operators receive the same.
- 80 first class Morse operators, \$4 per day.
- \$320 actual cost of labor to telegraph 300,000 words—being \$80 more than it would cost to telegraph by the regular Morse system.

Double Duplex System.

- 45 operators on 15 wires transmit 300,000 words in 10 hours.
- 45 operators receive the same.
- 90 first class Morse operators, \$4 per day.
- \$360 actual cost of labor, being \$120 more than it would cost to telegraph by the regular Morse system.

Triple Duplex System (the great invention of Prescott and Edison).

- 48 operators on 12 wires transmit 300,000 words per day.
- 48 operators receive the same.
- 96 first class Morse operators, \$4 per day.
- \$384 actual cost of labor—being \$144 more than it would cost to telegraph by the regular Morse system, and \$310 more than it would cost to telegraph the same over one automatic wire—the difference in labor being at least *five to one* in favor of the automatic system and against the Prescott and Edison *improvement*. If the managers of the W. U. Co. continue to keep those two brilliant electricians at work, it seems quite likely the company will reach bankruptcy before its shareholders reach another dividend.

However, discouraging as is the exhibition of the duplex humbug, it is really brilliant as compared with the exhibit that will be made with the imported Wheatstone system, which is just now cracking in operative shell at 145 Broadway. ANTI-HUMBUG.

The First Crucial Test of the American Automatic Telegraph System.

TO THE EDITOR OF THE TELEGRAPHER.

I HEREWITH bring to your notice some incidents connected with the first practical test (on a long line wire) of my American Rapid Automatic Telegraph System, June 20, 1869, in the presence of the Hon. Joseph Medill, Mayor of Chicago; Gen. Marshall Leferts, Engineer-in-Chief of the Western Union Telegraph Company; George B. Hicks, Esquire, Telegraph Expert, General Agent of the Western Associated Press, Cleveland, Ohio; Dan'l H. Craig, Esquire ex-General Agent of the New York Associated Press, and several other gentlemen of scientific attainments.

It had previously been arranged with my distinguished friends to meet me on the above date in New York, at such an hour as we could most conveniently have the use of the principal and longest line wires leading out of the city. I at that time resided in Rutherford Park, New Jersey.

On the morning of the 20th of June, 1869, I made my way to the railway depot, to be told by the station agent that all traffic between that place and New York City by rail was at a standstill, owing to the fact that a large freight locomotive had, together with some loaded freight cars, broken down the bridge which crossed the Passaic river, in which the wreck was lying.

"Here was a dilemma." Ten miles from New York by rail—about fifteen miles by the old post road, and no public conveyance—what was I to do in order to fulfil my engagement on Broadway, New York, by midday, and it then being about eight o'clock, A. M., and I still at Rutherford Park? I just made up my mind, "*Deo volente*," to be on hand by hook or by crook, so I trudged on foot about one mile up over the hills to a small farm house, and prevailed upon a Bavarian farmer to hitch up his thin and shabby horse to his much more shabby and much patched wagon. After the fixing of sundry latches he finally got his establishment ready for the start, and drove by the old circuitous route some ten miles to a settlement called Union Hill.

During our journey I inadvertently referred to the inverted cup insulator, so useful throughout the whole

world, and some of which were visible along a portion of our route. Ou which my Bavarian friend, by name Hofman, volunteered to inform me that he was born in the City of Munich, in Bavaria, and that previous to his emigration to the United States of America he was employed as cutter of ornamental stone work; that in the City of Munich he had seen frequently and knew Professor M. Steinheil, the discoverer, in 1837, of "the earth circuit." "And," said my old Bavarian friend, "I shall sell my farm and return to my native City of Munich." (This he actually did some two years later.)

On our arrival at Union Hill I had to let my intelligent and very communicative friend (who, by the by, was a devotee of king Gaubrinus) put up at a Lager Bier Haus, there to await my return in the evening, it being then about 12 M. I then took a horse car and started along the high rocky cliffs towering above the beautiful and noble Hudson river, until I arrived some four or five miles near New York, at a city called Hoboken (a place owned pretty much by the *millionaire* family of the late great engineering genius, Edwin A. Stevens—the founder of one of the most attractive and well kept Technical Colleges in the United States, and which reflects the highest honor, also, on the surviving members of this, the munificent Stevens family, who have a most magnificent seat in the immediate vicinity of the College). I then took a steam-boat down the river Hudson some two miles, after which I had to walk three fourths of a mile to my point of destination on Broadway, New York City, where I arrived in time to demonstrate to my distinguished visitors the *experimentum crucis* in the first practical test of my American system of fast automatic telegraphy—which passed over with marvellous results, such as were by no means anticipated by the learned gentlemen present on that occasion. I got through the demonstration late in the afternoon, and returned to Union Hill, where I found my Bavarian farmer friend in an impotent frame of mind, brought about by an excessive impouring of king Gaubrinus' lubricating fluid. But, notwithstanding that, I was enabled to get him back over the same route to Rutherford Park, where I arrived late at night of the same day, and thus got safely over all the obstacles in the way of travel, and that test has been followed by the practical introduction of that system of telegraphy upon which is now centred the notice of the most eminent men in the field of "electrical science." Involving, among many other salient mechanical features (including new canary color, deliquescent and other chemical formulas), the discovery and application by myself of the *accumulators*, *condensers*, *discharging* "magnetic condenser Rheostat," and the (overflow to earth) "*rheostat dam*."

GEORGE LITTLE, C. E.,
Passaic City, New Jersey, U. S. A.

August 1st, 1874.

Action of Washington, D. C., Western Union Employees on the Death of James T. McCook.

WASHINGTON, D. C., July 30.

TO THE EDITOR OF THE TELEGRAPHER.

At a meeting of the employees of the Western Union Telegraph Company in this city, held on Thursday, July 30th, the following preamble and resolutions were adopted, and the Secretary directed to forward you a copy for publication:

"Whereas, We are called upon to perform a sad and mournful duty—God, in His infinite wisdom, having removed from our midst by death our late pleasant companion and colaborer, James T. McCook, an operator in this office, who died on the evening of July 28, 1874—therefore, be it

"Resolved, That we deeply deplore the loss of our late associate, and desire to place upon record this expression as a tribute of respect, our appreciation of his worth and good qualities, and our deep regret that one of our number, so young and promising, should be stricken down thus early in life.

"Resolved, That our heartfelt sympathy and condolence is hereby extended to the family of the deceased in their severe affliction.

"Resolved, That a copy of these resolutions be forwarded to the mother of the deceased and furnished to the telegraphic journals for publication.

"J. B. AUSTIN, Secretary."

THE Postmaster of this city has made arrangements with the Gold and Stock Telegraph Company, whereby communication will be established between the General Post-office and Stations D (at Cooper Union) and F (at Twenty-fifth street and Third avenue). This change is expected greatly to facilitate postal business, and, if found successful in actual practice, the system will be extended, so as to perfect communication between all the other stations, and also between them and the General Office.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, AUGUST 8, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The Telegraphic Situation.

THE present year has thus far proved an exceptional one as regards the extension of telegraphic lines, and the increase of telegraphic facilities in this country. With the exception of the new line of the Atlantic and Pacific Telegraph Company from Chicago to Omaha, to complete the connection of the Eastern with the Pacific divisions of its lines, the new lines required to establish connection at Rye Beach, New Hampshire, with the cable of the Direct United States Cable Company's cable, and the extension of the lines of the Southern Atlantic Telegraph Company towards New Orleans, comparatively little additional line will be constructed. The Western Union Telegraph Company is constructing but little new lines, and its reconstruction is confined to what is absolutely requisite to maintain its wires in fair condition.

The reasons for this exceptional condition of telegraphic affairs are evident—how long they will continue to operate is what cannot now be certainly foretold.

The shock which was given to business and enterprise by the unexpected panic and prostration of business last fall was so severe, and the causes which led to it were so deep and serious, that necessarily a considerable time is required for the restoration of confidence and the renewal of active business enterprises. The telegraphs naturally suffer with other business interests, not so materially in the amount of business done over existing lines, although its effects in that direction have been quite serious, as the disinclination which is created on the part of capitalists to make new investments in telegraphic property. In fact, new enterprises of every description are checked, and for the time most of them suspended or held in abeyance, and are likely to be so for some time to come. The anomalous spectacle is presented of the financial centres of the country suffering from a plethora of funds, while at the same time it is almost impossible to obtain the means required for any new enterprise, however promising it may be. With first class collaterals any amount of money can be obtained on call in this city at the rate of from two to three per cent. per annum, and good business paper is in demand at from five to seven per cent. per annum. At the same time business generally is almost suspended, and probably not one quarter of the business houses are more than paying expenses.

Even speculation in stocks, usually stimulated by an easy money market, drags, and the dealings at the Stock Exchange are only upon the most restricted scale.

It is believed that with the close of the summer there will be a revival of business to a considerable extent, but not upon the scale with which we have been familiar for the last ten or twelve years. The crops promise to be excellent, notwithstanding the drawbacks in some localities from floods, droughts, and the depredations of insects. This will have a tendency to give business a start on the road to recovery which will be beneficial. The moving of the crops will put into active circulation much of the capital which is now seeking temporary investment in this city, and in due time this will put new life into all descriptions of business. A renewal of active and profitable business operations will react favorably upon telegraphic interests, and will eventually create a demand for additional facilities. It is hardly probable, however, that this will come in time to warrant anticipations of any decided improvement during the present year.

Discouraging as has been the condition of business during the past ten months, there is no doubt but that the check, rude as it was, and considerable as has been the damage to some, and suffering of many in consequence, will, in the end, prove beneficial to the country. We were going too fast, and were all living beyond our means, and had the panic been postponed for a year or two longer, the prostration would have been more complete, and the recovery slower than it has been or is likely to be. It has taught the nation to economize, and to realize that we were not in reality as prosperous as was generally supposed.

Of course there is much talk of new telegraphic enterprises, and magnificent schemes, on paper, are agitated; but for the present, at least, these are not likely to amount to much in reality. Wonderful inventions are also announced, destined to revolutionize telegraphic business, and afford the maximum of results with the minimum of means. Some of these inventions, however, will, in time, with proper management, realize to some extent the expectations of those who are interested in them, while others are frauds, and can never amount to anything practically. Of the former, automatic telegraphy is the most valuable, and will vindicate its importance in the future telegraphic history of this country and the world. Its practical development has been retarded by causes which we do not care, at this time, to discuss, but it should, ere this, have made much greater progress towards general introduction than it has done. We are not prepared to concede, as some of its more enthusiastic advocates and promoters have claimed, that it will supersede all other telegraphic systems, but it has sufficient merit and importance to entitle it to a leading position in the telegraphic future. However much it may be officially contemned and ridiculed in quarters where antagonistic interests and prejudices warp the judgment and create hostility, it will, in the end, triumph over all such obstacles, and its legitimate value, as a practical system of rapid telegraphic communication, be established. When this result shall be attained depends largely upon the ability and honesty with which it shall hereafter be managed by those who may have it in charge. It should not longer be delayed, to serve the interests or supposed interests of any party seeking to appropriate honors arising from the labors and inventions of others.

Upon a careful review of the telegraphic situation we see no cause for permanent discouragement. The present depression is but temporary, and will be succeeded, sooner or later, and we are confident at no very distant period, by renewed activity, which shall again bring into active and profitable requisition all the telegraphic skill and talent of the country. Active and vigorous competition in the not very distant future will make telegraphy once more an attractive and remunerative business.

We trust that we may be excused if we urge once more upon the managers of the several companies and

lines competing with the Western Union the vital importance of combining their forces and enterprises, and the adoption of the most reliable and improved telegraphic systems, in order that they may obviate the disadvantages under which they now labor, and be able to compete on something like equal terms. All obstacles to such a consolidation must, sooner or later, be put aside; and, until it is done, it is impossible that entirely satisfactory results can be rendered.

The Necessity for a more Thorough Education of Telegraph Operators.

It always affords us gratification to notice, in the editorial columns of our official contemporary, the *Journal of the Telegraph*, anything which coincides with us in our efforts to elevate and improve the professional status of the telegraphic profession in this country. In the last issue of that paper we find an article in regard to the qualifications and acquirements required of those who aspire to telegraphic positions in some European countries, with very just and sensible comments upon the subject, in connection with the actual proficiency and knowledge of many of the profession here.

It has been urged in THE TELEGRAPHER, from time to time, that the professional telegraphic standard in this country was too low, and that not only the interests of the telegraphers themselves, but also of the employers and the patrons of telegraphic lines, would be advanced by the adoption of some system which would insure the requisite knowledge and ability on the part of those who are employed in the more responsible telegraphic positions. The following extract from the article of our contemporary will illustrate, more forcibly than we could do, the present status of many of those even who are recognized and employed by the Western Union, as well as the other telegraph companies in such positions:

"Now, we do propose that something shall be required of men and women entering the service beyond a clean collar and two fingers of one hand educated in a rude way to dot and dash making. How much knowledge shall be required we will not predict. He must certainly know his telegraphic letters, and make them correctly; he must write a clear hand; he must have a knowledge of circuits and office connections; he must be informed respecting the company's rules. Yet these simple requisitions are objected to. 'I fear,' says the manager of a large office, 'if this were required here, I would be left almost alone.' Another says, 'Don't do it; the extent of ignorance is fearful.' Another writes, 'It is a lamentable fact that very many of our first class operators in large offices are ignorant on the points named.' We ask, can this ignorance of the commonest knowledge of a great business be true? We fear it is."

It is mortifying to those who desire and are laboring for the improvement and elevation of telegraphers, that such a state of things should exist. That it does exist is undisputable.

How the situation is to be changed and improved our contemporary does not point out. That it should be, and as speedily as possible, we presume that no one will question who has the best interests of all concerned at heart. We have repeatedly pointed out the only way in which this improvement may be effected—that is, by the cooperation of telegraph employers and employes. It can only be done by a proper classification of telegraphers and telegraphic situations—a classification which shall be generally recognized by both parties, and which shall be well defined and authenticated. This can be done through the joint action of employers and employes, acting through an organization which shall be encouraged and its objects promoted by the telegraph companies. That such an organization is practicable we have no doubt; but so long as any association of telegraph employes is discouraged by the Western Union Company, under the mistaken idea that it must be inimical to the interests of telegraph employers, we fear that things must go on in the same old way.

The loss and damage which is constantly entailed upon telegraph companies and their patrons by the incompetency and insufficient education of its employes,

in their duties, if prevented by a proper standard of professional acquirement and proficiency, would, if the net amount were saved and divided between the companies and such employés, add materially to the net revenue of both parties. In what other great business enterprise would there be tolerated so many employés, especially those upon whose intelligence and proficiency success so largely depends, who had acquired only the merest rudiments of the knowledge requisite to the proper discharge of duties?

For the present telegraphic *status* of their employés telegraph companies and employers are largely responsible. So long as the only question, or the main one considered in employing telegraphers, is merely at how small a compensation their services can be obtained, we need not expect any material improvement. It seems not to be realized by telegraph employers that low priced service is not always cheap service. When it shall be, and proper encouragement is afforded to those who seek to be something more than mere manipulators of telegraph keys, and readers of telegraphic signals, we may look for the commencement of a new and improved telegraphic condition. But as long as college plugs, and others not better qualified, can easily obtain situations because they are ready to accept them at any rate of compensation which may be offered, there is but little encouragement to those who are calculated to honor the profession, to devote themselves to telegraphic pursuits, and expend the time and study requisite to enable them to become creditable and profitable telegraphic employés.

Now that there are indications that at the headquarters of the great telegraphic organization of the country, which employs many thousands of telegraphers in its service, that these facts are beginning to be appreciated, we have a hope that the time is not very distant when this much needed reform may be realized.

The Summer Passing Away.—Experience and Prospects.

THE summer season is rapidly drawing to an end, and in a few days its record will be closed, and we shall have entered upon what is generally, in this country, the most pleasant and, in some respects, the most satisfactory portion of the year. The crops are being gathered already, and promise to yield abundantly, and however unfortunate and depressed the present year has been in a business point of view, there is no danger now of scarcity of the products of the earth, except in limited sections, from causes specially operating upon certain localities.

Those who have been able to avail themselves of the opportunities for rest and recreation which the season has afforded will be returning to their usual avocations, it is to be hoped, with renewed strength and energy, and improving prospects, so far as business is concerned. The telegraphic fraternity have doubtless enjoyed as much, if not more than usual, the vacations and intermission from labor, for there has been even less than the usual pressure upon the telegraph lines at this season of the year, and by mutual aid and assistance probably most of those who desired it have been able to enjoy the annual vacation which all should have.

Heretofore the columns of THE TELEGRAPHER have been occupied during the spring and summer with communications on the vacation question, but there has been little if any of this the present season. The transition from the old to the new order of things in this respect seems to have been completed, and the policy of the telegraph companies so fully established, that it is considered useless to discuss it further, or to indulge in complaints and repinings in consequence. There has been much to be said on both sides of the question, and although we are still of the opinion that it would be good policy to allow telegraphers, who labor faithfully during the year, an opportunity to rest for a week or two during the summer and early fall, without requiring them to supply a substitute, yet, as

the matter has been finally decided the other way, and those immediately interested have acquiesced in that decision, it is better for all to submit quietly and cheerfully. This has been generally done, and we consider the discussion as practically closed.

With the opening of the fall season we look for a revival of business, and for improving prospects generally. This matter we have more fully discussed in another article, and, therefore, need only allude to it here in passing. The lesson of the past year has been a severe one, and we trust that it may not be necessary that it should be repeated for many years to come. It has taught us frugality and economy, which we had almost forgotten in a seeming but delusive prosperity following the war and the consequent financial inflation. We were generally making money fast—on paper—and spending as a nation much more than we could afford for articles of luxury and for extravagant living. With nations, which are but an aggregation of individuals, pay day must come some time, and however great may be our resources, and apparently profitable our enterprises, if we spend more than we produce, when it does come it is apt, after such experience as we have had during the past few years, to find us unprepared, and to necessitate retrenchment and the practice of a rigid economy, in order to compensate for past extravagance and lay the foundation of a renewed prosperity.

It is useless to regret the past—let us then all go forward cautiously but surely—and when another summer season comes round we may be in a much better condition to enjoy it, and can welcome with renewed and increased zest the relaxation and pleasure which it is calculated to afford.

The Direct United States Cable.

THE steamer Faraday completed the laying of the section of the Direct United States Cable from Nova Scotia to the coast of Newfoundland on the 25th ult., and immediately sailed with her consort, the Ambassador, for England. Upon her arrival there she will take on board the remainder of the cable and proceed to lay it from Ireland, to connect with that already submerged between Newfoundland and the United States.

The Oracle Dumb.

THE official organ of the Western Union Telegraph Company has failed to respond to our request to point out the "device, or combination of devices (other than the condenser) to be found in the differential duplex, as now or heretofore used on the Western Union lines, and which is in any degree essential to the successful daily operation of the instrument in practical business, which was not known or used by others prior to the introduction of the apparatus of Mr. STEARNS in 1868." Having undertaken to retort upon THE TELEGRAPHER and its contributors for the exposition made by our correspondent, "Ontario," in the paper of July 4th, of the absurdity of the attempts made through that paper to claim everything of value in connection with duplex telegraphic inventions for Mr. STEARNS, we supposed that the writer of the editorial article in question would be pleased and gratified at the opportunity afforded to show the grounds upon which such sweeping claims had been made; but, perhaps, upon an investigation of the subject, he found that he had inadvertently put the official organ in an untenable position, and concluded that the less said about it the better.

At any rate, the failure to respond to the request which was made in good faith by us, must be taken as an admission that we were right in the matter, and that there is nothing to be said in explanation or justification of the extravagant claims of the *Journal of the Telegraph* on behalf of Mr. STEARNS, and indirectly of the Western Union Company, which is the owner by purchase of Mr. STEARNS' duplex patents in this country. It will be remembered that the *Journal* even went so far as to claim for Mr. STEARNS a device

which he described in his patent of 1868, and expressly disclaimed, as belonging to Messrs. SIEMENS and HALSKE, of Berlin.

If the official organ can afford to let the matter rest where it is we certainly are content, and we have no doubt but that our readers will fully appreciate the wisdom of such an ignoring of it, rather than the pursuit of the less disingenuous if more candid policy involved in an acknowledgment of error.

The Wheatstone Automatic and the Western Union Telegraph Company.

It is rather late in the day for an attempt being made to introduce the WHEATSTONE automatic system in this country, when there is already in daily practical business operation here a much more rapid and reliable automatic system; but this, we understand, is the latest enterprise of the managers of the W. U. Telegraph Company. A pair of WHEATSTONE instruments and punchers have been imported, and are now being experimented with at 145 Broadway, with a view to their introduction upon the lines of that company. This fact causes considerable amusement in telegraphic circles, in view of what is known of the capacity of the WHEATSTONE apparatus as regards speed, and the length of circuit which can be worked with it.

What has become of the wonderful quadruplex arrangement which, according to Mr. ORTON, was to solve all the difficulties which threatened the telegraph in the future? That remarkable production of inventive genius seems to have sunk into a sudden obscurity, and to have been abandoned for the WHEATSTONE. If what was so confidently asserted in Western Union official quarters, in regard to the quadruplex, had any actual foundation in fact, it certainly would excel the WHEATSTONE in performance two to one. But perhaps the genius which reinvented the quadruplex is to be applied to quadruplexing the WHEATSTONE, which, if successful, would increase its capacity to 240 words per minute—not a very remarkable performance, it is true, beside the authenticated achievements of the American automatic system, but much better than our Western Union friends have ever succeeded in doing heretofore. We should like to see the quadruplex WHEATSTONE automatic system in operation, and trust that when it is we may be permitted to witness and report upon its performance. We guarantee that our report shall be truthful, which is more than can be said of recent statements of others in regard to certain remarkable inventions which were expected to revolutionize telegraphy in this country.

Personals.

Mr. G. A. TAYLOR has resigned the Oakland, Oregon, office of the O. & C. R. R. and accepted a position with the Western Union Co. at Yreka, Cal., repeating office, vice — PECK, resigned.

Mr. G. Q. STEWART has been appointed manager of the Yreka, Cal., W. U. repeating office, vice Mr. J. WALDO THOMPSON, transferred to the San Diego, Cal., office of the same company.

Mr. CHAS. FRASER, formerly operator for the Great Western Railway at Merriton, Canada, has been appointed agent of the Montreal Telegraph Co. at Galt, Ontario, Canada.

Mr. J. H. WOODRUM has been appointed agent and operator at Oakland, Oregon, O. & C. R. R. line.

The Telegraph.

Foreign Telegraphic Notes.

A TELEGRAM, under date Bombay, June 29, states that Schwendler's system of duplex telegraphy over a single line is working satisfactorily between Bombay and Calcutta.

A deputation from the Anglo-American Telegraph Company, consisting of Lord Monck, Captain A. T. Hamilton, Sir D. Gooch, M. P., Mr. Cyrus W. Field, Mr. F. A. Bovan, Mr. W. Barber, Mr. C. Burt, Mr. H. Weaver and Lord William Hay, has had an interview with the Earl of Carnarvon, at the Colonial office, in reference to the company's claims to exclusive rights to lay cables between Ireland and Newfoundland.

Time Telegraph of the Reading Railroad Co.

THE manner of giving the correct standard time of the Philadelphia and Reading Railroad Company to all its telegraph stations, 255 in number, along the main road and all its branches, is as follows: At three minutes to 4 o'clock P. M., daily, except Sunday, all business along the lines is suspended; and by means of a series of repeaters all the lines of this company, 36 in number, are arranged so as to be operated and controlled by one operator at the Reading office, who has a chronometer before him, from which the correct time is given. Commencing at three minutes to 4 P. M., the Reading operator says "time" on the lines, which calls the attention of all operators to adjust their clocks, and is continued at short intervals until five seconds to 4, when he opens the circuit. At 4 o'clock he makes one tap; at fifteen seconds after 4, two taps; at thirty seconds after 4, three taps; at forty-five seconds after 4, four taps; and at one minute after 4, five taps. By this arrangement every telegraph station is able to get the correct time to the second, daily, and thereby have the railroad clocks and watches of the employes properly adjusted, which is a very important matter in the management of a railroad.

A Good Education.

THE late Edward Everett condensed into a single brief paragraph his estimation of what constituted a good education. Here it is: "To read the English language well, to write with despatch a neat, legible hand, and be master of the four first rules of arithmetic, so as to dispose of at once, with accuracy, every question of figures which comes up in practice. I call this a good education. And if you add the ability to write pure, grammatical English, I regard it as an excellent education. These are the tools. You can do much with them, but you are hopeless without them. They are the foundation; and unless you begin with these, not with flashy attainments, a little geology, and all other ologies and ophies are ostentatious rubbish."

THE Great Western Telegraph Company are fortunate in their selection of an operator in this city. There is no more expert manipulator of the keys, or accurate recorder of despatches, than Dan Farrell, Jr., and our thanks are due for the promptness with which our despatches are always delivered and the correctness which characterizes them.—*Galesburg (Ill.) Republican-Register.*

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended July 7, 1874, and bearing that date.

152,772.—ELECTRO-MAGNETIC MOTORS.—W. S. Sims, New York, N. Y. (Filed Mar. 17, 1873.)

The magnets and armatures of an electro-magnetic motor are serrated across their polar faces, the revolving magnets approaching the stationary armatures in a direction parallel to the serrations, the promiunces of each extending into the depressions of the others.

The combination, in an electro-motor, of an electro-magnet, the polar face of which is grooved or serrated, with a polarized or unpolarized armature, correspondingly grooved or serrated, the one being arranged to approach the other in the direction of their grooves or notches across their polar faces, as and for the purpose specified.

For the week ending July 14, 1874, and bearing that date.

153,063.—ELECTRIC TELEGRAPHS.—Theodore M. Foote and Chas. A. Randall, New York, N. Y. (Filed June 27, 1874.)

1. The combination of the armature a, provided with a polarizing helix or helices, M1 and the electro-magnets M2, having electrical circuit connections, as described, and arranged to act upon said armature, substantially in the manner and for the purpose set forth.

2. The combination of the electro-magnets M2, provided with the extended cores c c', the electro-magnets M1, and helix M', the helix M' being arranged transversely to the magnets M2 and

between the cores c c', substantially as and for the purpose described.

3. The method of transmitting electrical signals, the same consisting in sending over the lines regularly alternating currents of opposite polarity and of equal duration, the dots and dashes being distinguished by the space left after the transmission of any single impulse, substantially as and for the purpose described.

4. A fillet of paper perforated for telegraphic transmission in two rows, each row serving to transmit currents of a polarity opposite to those transmitted by the other row, the perforations in both rows being of equal size, and in each row intervening between those in the other row, substantially as described, and for the purpose set forth.

153,064.—ELECTRIC TELEGRAPHS.—Theodore M. Foote and Chas. A. Randall, New York, N. Y. (Filed June 26, 1874.)

1. The fillet of paper for direct recording chemical telegraphs, provided with the extra row of perforations, the perforations in the extra row coming directly after each and every perforation in the row or rows corresponding to the message, as set forth.

2. The fillet of paper perforated with an extra row of perforations between each and every perforation in the row or rows corresponding to the message, in combination with an extra pen or stylus, connected to pole of battery opposite to the recording battery, for the purpose of discharging or freeing a telegraph line or cable of an unavailable or surplus electricity, as set forth.

3. The fillet of paper, perforated with an extra row of perforations between each and every perforation in the row or rows corresponding to the message, in combination with an extra pen or stylus, connected to earth, for the purpose of discharging or freeing a telegraph line or cable of unavailable and surplus electricity, as set forth.

4. A fillet of paper, perforated with an extra row of perforations, in combination with an extra pen or stylus, connected to earth, and a discharging or extra battery at the receiving end of a line, for the purpose of discharging or freeing a telegraph line or cable of unavailable and surplus electricity, as set forth.

5. The method of working automatic or chemical telegraphs, consisting in the transmission of alternating currents of opposite polarities, one current effecting the recording, the other acting as a discharging or freeing current, and being thrown upon the line immediately after each break in the circuit of the recording current, substantially as described, and for the purpose specified.

6. In automatic or chemical telegraphs, the method of obviating tailings or blurs, and of effecting a ready discharge or freeing of the line, the same consisting in throwing upon the line immediately upon each and every break in the circuit of the recording current a current of opposite polarity, substantially as and for the purpose specified.

7. The combination, with the transmitting drum, of a recording and receiving drum and circuits connecting them and the line, the transmitted current being thereby thrown through the recording drum, and a copy of the message sent taken, substantially as and for the purpose described.

8. The combination, with the motive power driving the receiving and transmitting drums of an automatic telegraph apparatus, of an adjustable governor, substantially as and for the purpose specified.

9. The combination, with the transmitting drum of an automatic or chemical apparatus, of two or more styluses, insulated from each other, and connected to opposite battery poles, substantially as and for the purpose specified.

L. G. TILLOTSON,

8 DEY STREET, N. Y.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines, Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS.

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with Iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL
DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.

OFFICES:
114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world. It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,
which is the best watchman's time recorder in the world. Also,
ELECTRIC AND CONTROLLED CLOCKS
of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

SOLE AGENTS.

New York, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.50.

Agents for towns, and counties wanted.

GEO. H. BLISS & CO., Gen'l Agents,
41 Third ave., Chicago, Ill.

ANSON STAGER, Pres't. ELISHA GRAY, Sup't. ENOS M. BARTON, Sec'y.

WESTERN ELECTRIC MANUFACTURING COMPANY.

No. 220 KINZIE STREET, CHICAGO.

TELEGRAPH, WIRES, INSTRUMENTS,
BATTERIES, TOOLS,
INSULATORS and SUPPLIES.

Annunciators for Hotels, Steamships, Dwellings.

Our Annunciators are the most extensively used and the most perfect in operation.

Automatic Mercury Fire Alarm, for Hotels, Steamships, Public Buildings.

Five years' operation have proved its merits.

SEND FOR CIRCULAR.

HAMBLET'S ELECTRO-MAGNETIC WATCH CLOCKS AND TIME DIALS.

Western Electric M'g Co., Chicago.

TELEGRAPH WIRE, Numbers 8, 9 and 12.

UNION BRAND, AND

UNION BRAND EXTRA QUALITY.

JOHNSON'S WIRE.

BROOKS' INSULATORS, GLASS INSULATORS and BRACKETS.

KENOSHA INSULATORS, all kinds.

PAINTED CROSS-ARMS.

KENOSHA CROSS-ARMS.

OFFICE WIRE, many varieties.

COPPER & COMPOUND KERITE WIRE.

CABLES TO ORDER.

Western Electric M'g Co., Chicago.

GEO. H. BLISS & CO.,
41 THIRD AVENUE,
Chicago, Ill.
PRIVATE LINE INSTRUMENTS.

Price, \$10.00.

This Instrument is well finished, and gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length. Give length of line in ordering Instrument. One cup of BLISS RESERVOIR BATTERY is furnished with each Instrument.

GEO. H. BLISS & CO.,
CHICAGO, ILL.

W. HOCHHAUSEN,
Manufacturer of
ELECTRICAL INSTRUMENTS.

132 WILLIAM STREET (rear),

Between Fulton and John Streets, NEW YORK.

One half of actual size

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard.
Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight..\$50 00

Sounders, from..... 4 50 to \$6 50

Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00

Relays, from..... 9 50 to 16 00

Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars.
The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and it is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50

Two sets of Instruments, etc., 12.00

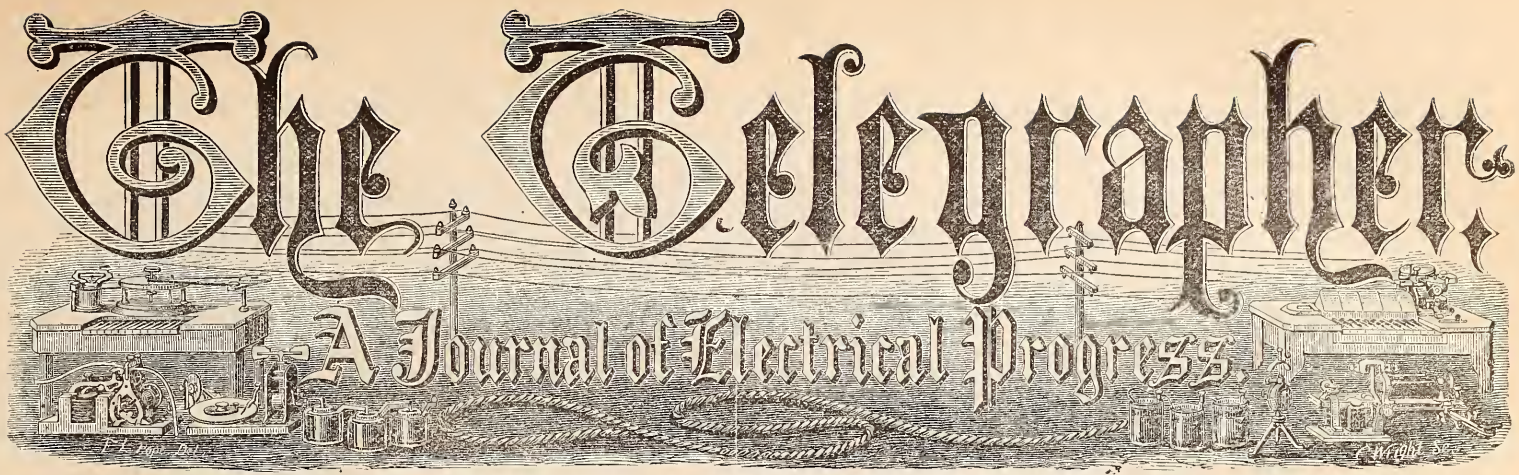

Send for our new Circular and Price List.

F. L. POPE & CO.,

(P. O. Box 5503.) 38 Vesey street, N. Y.

has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
MANUFACTURER OF
REED & PHILLIPS'
PATENT INSULATED TELEGRAPH WIRES,
(PATENTED, NOVEMBER 18TH, 1873.)
Lock Box 169. PROVIDENCE, R. I.
Having recently enlarged our factory, we are now prepared
to furnish at short notice any style and quantity of
BRAIDED LINEN or COTTON COVERED WIRE,
saturated and finished with our Patent Compound, which makes
the most durable, handsome and best insulated Braided Wire
manufactured.
PAINTED, PARAFFINE or SHELLAC WIRES
also furnished at the lowest prices. Iron or Compound Wires
covered upon reasonable terms.
We are also prepared to furnish a new style of
ELECTRIC CORDAGE,
which has been pronounced by all superior to any in the market.
The American District and Gold and Stock Telegraph Com-
panies have been supplied from my works with a greater
portion of the office wire used by them.
Sample Card and Price List furnished when requested.
Phillips' Wire can be had of

 SOLE AGENTS,
 41 THIRD AVENUE,
 Chicago, Ill.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY
 THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,
 FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,
 AND FOR

BLASTING AND MINING PURPOSES,

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deliv-
 ered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

WHOLE No. 422.

Original Article.

The Necessity for a More Thorough Training and Education of Telegraphers.

THE coöperation indicated in the editorial article which appeared in the last number of THE TELEGRAPHER between the official organ of the Western Union Telegraph Company and the former, on the important subject of a more thorough training and education for telegraphic employes in this country, is encouraging. The importance of the subject will warrant much more earnest attention and consideration than it has yet received, and it is to be hoped that it will not be suffered to pass out of mind and notice again until something tangible and permanent towards a reform in this respect has been accomplished.

This subject should be agitated and discussed not so much because it is for the interest of the employers and the patrons of the line, although these must not be overlooked, as in that of the employes themselves. It is one of the most discouraging features of the telegraphic situation to-day that really so little interest is taken, and so little actual importance attached to the subject in which all are so vitally interested, whether telegraphic employers or employes. There is really no standard of ability and acquirement in this country to distinguish between the really competent first class employes—those who are qualified to discharge intelligently the higher and more important duties of telegraphic service and those whose qualifications enable them to perform properly only the mere mechanical and subordinate duties. There is, in fact, no classification of either the telegraphic situations or the employes except an uncertain and undefined one that has grown up haphazard through customs which vary with every telegraph line and company. That such a state of things in so important a profession and business should exist is and must be a matter of surprise to any one who will reflect upon it.

It is a mistaken idea of economy on the part of telegraphic employers that leads to the bestowing of situations upon individuals because they are willing to serve for a few dollars less per month than are others, without proper regard to their qualification and ability. It is a very damaging error to allow telegraphic appointments to be made through personal favoritism. There is, in fact, no business done in which "civil service reform" is more imperatively needed than in that of the telegraph. It is also a very serious error on the part of telegraph employes to oppose either actively or through indifference such an improvement in this respect as has been indicated in the articles to which reference has been made, and in others of a similar character which have preceded them. The status of those who realize the importance of the telegraphic service and the necessity which exists that the qualifications and acquirements requisite to a proper understanding and discharge of telegraphic duties should be clearly established and defined, is lowered and impaired, through the carelessness, indifference and disregard thereto, which almost universally prevails.

As has already been well said, the reform can only be accomplished by the joint and united action of telegraph managers and employers and telegraph employes. That it must be effected eventually would seem to be indisputable, but it must be acknowledged very little progress has been made towards it as yet. It has failed to secure the support of telegraph employers through anticipation that it would, perhaps, add to the actual current expenditure for carrying on the business. This objection would be found of little, if any, force in actual practice. It is not so much that the aggregate amount paid for telegraphic service is too small as that it is not properly apportioned. Some telegraphers are unquestionably paid more than their ability, natural or acquired, entitle them to, and occupy situations for which they are not properly fitted, while others are paid less, and not infrequently are assigned to and compelled to accept situations and compensation inferior to what should be accorded if these were properly classified and assigned. Another reason why the support of telegraph managers and employers is not cordially given to such a reform is that they fear the result of encouraging an organization of telegraph employes,

not seeing that the true policy is to encourage and aid their employes in organizing and maintaining an association which shall be national in its character, and which should represent and speak for the employes, in establishing such reforms and regulations as shall be for the benefit of all parties. As it is at present, there is no one who can speak for more than one individual, and united and effective action is impossible. It is not necessary that such an association should be similar in its character and purposes to the Telegraphers' League, which is the bugbear that creates hostility on the part of employers, or that it should be of the nature of a Trade Union, dictating to and attempting to coerce by mere force of numbers and combination the employers to its behests. The telegraphic fraternity should be composed of so intelligent a class, and possess such a moral weight, as to secure all necessary and advisable reforms without resorting to the tyranny which has at times characterized what are known as Labor Associations or Trades' Unions. They should occupy a position somewhat in advance of the hod carriers or bricklayers of the country, and should rely upon something more and higher than brute force or compulsion to accomplish their objects. It is not anticipated by anybody that another Telegraphers' League, or another telegraphers' strike will be likely to occur among the present generation of telegraphers, and therefore the fears and apprehensions of telegraph employers which have been alluded to are groundless and should not be allowed to stand in the way of needed reforms.

Until there is a very general improvement in the training and education of telegraph operators the best results can never be attained on any line or by any company. It is probably no exaggeration to say that in no other business or profession requiring special education and training, is there so little regard paid to the proper qualification of those who are employed in it. Matters of the greatest importance, involving very often not only fortune but life even, are recklessly and unthinkingly intrusted to employes who have but the rudiments, and sometimes not even these, of the knowledge and practice requisite for the assured proper discharge of their duties. If no mistake is made, or no accident happens, it is more through good fortune and good luck than otherwise. The columns of THE TELEGRAPHER about every week contain accounts of more or less "bulls" perpetrated by telegraphers, but these are invariably of the more harmless and amusing kind; of the more serious ones and those which result disastrously very little is ever seen in print. That they are numerous, every telegraph manager and every telegraph operator of any considerable experience well knows. That most of them would be avoided and prevented by a more thorough training and education of the telegraph operators cannot be questioned. The amount of business that can be transacted over one wire equipped with only really good operators would astonish one who has had experience on one worked in the usual way, mostly by operators not remarkable for their qualifications. It is the telegraphers who are efficient and reliable, and who have aspirations above the mere manipulation and translation of dots and dashes that make the telegraph as peculiarly successful as it is. It is they who keep up even to its present standard the reputation of a profession which should stand as high as either the learned professions, so-called, in the estimation of the public.

That the time may soon come when the number of these shall be increased, and when they shall comprise the majority instead of the minority of those who are known and recognized as telegraphers, we should all desire. This subject might be pursued, and, perhaps, profitably, to a much greater length, but as much has been said as the readers of THE TELEGRAPHER can bear at this time, I will close with the expression of the hope that we may hear through its columns from others who desire the elevation of the telegraphic fraternity, and have at heart a just pride in its achieving a reputation and standing, to which, properly trained and educated, it would be fully and cheerfully accorded.

The Rapid Development of the Electric Telegraph Business.

A FEW days ago a telegraphic despatch from Maine announced the decease in that State of Mr. G. E. Smith, who constructed for Professor Morse the forty miles of magnetic telegraph from Washington City to Baltimore, which constituted the original of the vast system of telegraphs now extended throughout the world. That line was completed for use in the last week in May, 1844—the first news despatched having been sent over the wire on the 29th of May. The quite recent death of the constructor of that line naturally carries the mind backward over the thirty years of existence of the magnetic telegraph, and brings into bold view the feeble beginning of the marvelous progress of this peculiarly American work. After the patient but persistent efforts of Professor Morse for several years, Congress, in 1843, made an appropriation of \$30,000 for

an experiment with the Morse telegraph between Washington City and Baltimore, and it was this line that was completed in the spring of the following year. The money, grudgingly granted in the midst of scoffs, and jeers, and references to "animal magnetism, etc.," has been frequently referred to as a munificent gift in the interest of science and the diffusion of intelligence. Perhaps it was, but it may serve at once to illustrate the magnitude of the growth of the telegraph, and how greatly the government profited by its generosity, to say that quite recently, within a period of five years, the Western Union Telegraph Company alone paid to the Treasury in taxes \$850,000, and in gold duties on imports of telegraphic wire \$328,000 more. Thus the investment of that \$30,000 repaid itself in those two items alone, in those five years alone, and from one company alone, more than thirty fold.

Going back to the forty miles of wire between Washington and Baltimore, which measured the whole dimensions of the magnetic telegraph this day thirty years ago, we are better able to appreciate the two hundred thousand miles of wire which form the immense network of the telegraph over the United States to-day. Of these two hundred thousand miles of American wires, which would encircle the globe more than eight times, about one hundred and seventy thousand belong to one company. In June, 1844, there were two operators at work; in June, 1873, there were nine thousand nine hundred and thirty persons employed by one American company, and about twelve thousand by all the American companies. In this exhibit of the growth of thirty years we limit the figures to the statistics of our own country, leaving the Old World out of view altogether.

In some other respects the change wrought by the telegraph in less than the period of one generation is still more striking. It requires no strain upon the memories of even the junior partners of some of our old business houses and offices to recall the anxious times when they were more or less at the mercy of sordid and active men who used carrier pigeons, relays of fast horses with their hardy express riders, semaphore signals from hill top to hill top and along the coast, and other similar expedients for getting advance news of important events, with all the resulting advantages. In those days fluctuations in the prices of commodities in the great markets of the world were frequently secrets known only to a few, who sold their knowledge to another few, and thus a small knot of men in every commercial centre were enabled to buy the property of their uninformed neighbors for far less than its value, or sell their own for far more than its value. Now all business men get their information simultaneously, and, if they wish it, they can get it from all the markets and money centres of the world. The merchant at our Commercial Exchange is in immediate communication with corn, cattle, cotton, produce, shipping and commercial exchanges everywhere in our own country and abroad. The banker on Third street has his wire extending from his office to New York, Chicago, San Francisco, New Orleans, London, Paris, Frankfurt, Berlin, Amsterdam, Constantinople, Bombay, Calcutta, Rio Janeiro and Shanghai, and all cities and countries between. He sits there with instant knowledge of the financial, commercial, political, and other important current events of Europe, Asia, Africa, Australia, the East and West Indies, and South America, as well as of his own country. The telegraph, the Associated Press, and the newspapers within that organization concentrate this universal intelligence, and lay it before the whole public simultaneously at least twice every day; and all this marvellous change and vast and wonderful system that has brought it about is, as the decease of the builder of the pioneer line sharply reminds us, the growth of but thirty years.—*Public Ledger*.

Delay in Laying Submarine Cables.

AT the meeting of the Telegraph Construction and Maintenance Company a vote of thanks, as well timed as it was merited, was awarded to the officers and staff of the company. Every neophyte on the London Press starts with the idea that he is thoroughly competent to write a leading article or a dramatic criticism, and there are men like them, and like them mistaken, who consider the laying of a submarine cable the mere A B C of practical engineering. Those who entertain that idea we would advise to ponder well upon the fact that the Faraday, out since the 16th of May last, has not yet—so far as can be ascertained—succeeded in laying more than 400 miles of cable in shallow water.

We learn also that there will be some delay and disappointment with respect to the completion of the Central American cable, which was taken out by the steamship Hooper. A circular, issued last night by the directors of the West India and Panama Company, states that faults of so serious a character have developed themselves in their cable that the Hooper is on her return home to have the entire cable overhauled. It is further stated that there is a fault in the cable

which has already been laid from Para to Cayenne, so that the laying of the line on behalf of the Central American Company must be delayed for some months. To this may be added the further disappointment caused by the wreck of the Gomos in attempting to lay the River Plate cable by Messrs. Siemens, who are also the contractors for the Direct United States Cable Company.

The following is the circular of the West India and Panama Company above referred to:

"SIR—I am instructed to forward for your information the following copies of communications which have been received from the Central American Telegraph Company. The line between Para and Cayenne has been laid, and is in working order, but a fault is stated to exist on it about 109 miles from Para. This fault is in shallow water, and the steamship Great Northern is already ordered to the spot to effect the repairs. It will be borne in mind that by the terms of the contract no payment becomes due to the Central American Company in respect of either of the sections, Para to Demerara or Trinidad to Porto Rico, until its final completion and maintenance in perfect working order for thirty days have been certified to this company by Sir William Thomson or Professor Jenkin. I am, sir, your obedient servant, CONSTANTINE M. HOOKER, secretary."

Mr. Hooper, the managing director of Hooper's Telegraph Company, says:

"DEAR SIR—I have received a communication from Mr. France, our engineer-in-chief on board the Hooper, intimating that a portion of the cable intended for Cayenne, Demerara section, is faulty. I have no doubt but that the faults are merely mechanical, however occasioned, and although I believe they could be cut out at Para, yet, rather than run any risk whatever, I have sent instructions for the ship to return home, when a thorough investigation of the facts and a complete inspection of the cable may be made at our works. The cable will be sent out again with the remaining section in October, so that the completion of the contract, as a whole, will not be delayed.—Faithfully yours, W. HOOPER, managing director."—*The Railway News.*

New Telegraph Projects in Oregon.

ALBANY, OREGON, July 27.

TO THE EDITOR OF THE TELEGRAPHER.

THE citizens of Astoria, Oregon, are now getting in earnest about the construction of the telegraph line from Portland to that point.

A line from Cornelius, on the Oregon Central R. R., to Astoria, a distance of ninety miles, is estimated to cost \$8,000, but the shorter and more feasible route, from Cowlitz to Astoria, is a distance of but fifty to sixty miles with a cable. From one and a half to two miles of cable would be required; allowing \$1,500 for a cable across the Columbia at Oakpoint, the cost of putting Astoria in telegraphic communication with Portland *via* Cowlitz, and the through line at the latter point, would be about \$6,500; surely a good investment, if only for the purpose of reporting the movements of the shipping up and down the river. As it has been and is yet, there is no chance to hear of a vessel by telegraph from the time she leaves San Francisco till she gets to Martin's Bluff, about sixty miles below Portland, and yesterday official notice was received of the closing of the office at the Bluff, so that the only show now is when they pass Kalama, W. T.

Quite a good local business could be inaugurated between Astoria, Portland, and the fifteen or twenty larger salmon fisheries between Astoria and Kalama.

It is proposed to incorporate a stock company, of \$10,000 capital, and put the line through this fall. Citizens of Astoria, proprietors of the larger fisheries, have signified their willingness to take stock in the enterprise, and it is stated that Col. Gamble, General Superintendent of the W. U. Telegraph, has proposed to take \$2,000 stock if the company should be formed, as also the Salem Flouring Mills Co., who are getting to be our heaviest exporters to Liverpool and other "foreign latitudes." It is to be hoped this will be pushed vigorously now till completed.

The new wire being built by the W. U. Telegraph Co. from Roseburg is now finished as far as Jacksonville, Oregon, about one hundred and twenty miles from Roseburg, and it is being pushed as rapidly as possible. It is proposed to have a new line built from Roseburg to Coos Bay, a distance of some sixty miles, this fall if possible, and connect at the former place with the through San Francisco wire. This will be another "good thing," as there is considerable shipping now between Coos Bay and San Francisco, and every

year the business of the different coal mines and the lumber trade is increasing rapidly. Weather fine and beautiful with us, and the nights—oh, bless 'em—splendid for sleep, a blanket and sheet just right for covers. You poor mortals in the East have our sincere sympathy in your trials with "hot" weather. If you want a *paradise*, "go West," but don't come expecting a telegraph "sit;" they are mighty scarce, and, like Irishmen's fleas, when you think you have 'em it ain't there. Only one good thing, jobs are generally permanent if a fellow keeps sober and don't run the Oregon gals too much; these two things bust any one.

WEBFOOT.

Double Duplex and Quadruple Telegraph.

BENTON STATION, KENTON Co., Ky., Aug. 7.

TO THE EDITOR OF THE TELEGRAPHER.

MY attention has been called to recent notices of an invention answering to the above cognomen. I feel interested in the matter, because I, too, have invented, *some time since*, an instrument answering to the above call. I will here refer you to the file of the *Journal of the Telegraph*, 1871 or 2, to the various articles between the editor and myself on the subject. My invention consisted of the use of two polarized relays and a Morse relay; one of the relays was actuated only by the current from the negative end of the battery, and the other by the positive—the battery being divided. The Morse relay was used to actuate both sounders simultaneously; so that a dot struck on the right hand key would make a dot on the right sounder through the right polarized relay; the left key worked the left sounder through the left polarized relay. An *increased* current only moved the Morse relay, for it was kept open by the spring when the lesser currents were used. Thus *each sounder* responded to *each key* whether separate or simultaneous. I wrote to Mr. Prescott in regard to the feat of actuating *two sounders* on one wire, and he said it was an ingenious invention, but of no practical value.* In a short time I improved by converting my three relays into one relay, calling it a *triple relay*, because it possessed the principle of the two polarized and the Morse combined. I exhibited my instruments last year in the Cincinnati Exposition. Some correspondent, unknown to me, noticed the fact to the editor of THE TELEGRAPHER, and you published it last fall. I had no one to help me in the above inventions. After I invented the above *polarized triple relay* I was assisted very much by reading Mr. Frank Pope's valuable work, especially on the duplex (pages 104-5-6-7, 1870). I studied over the matter, and found to my great satisfaction that by wrapping my *triple relay* with two wires, according to the Siemens & Halske plan, that it would make a double duplex.

I would be glad to give you diagrams representing my sounding keys, reverser and repeater, having it all complete and in working order. So that there is nothing more to do but to apply it to the many wires that need help, and let its influence be exerted for the good of mankind in bringing us closer together in the bonds of friendship, love and truth.

H. C. NICHOLSON, M. D.

Telegraph Schools and their Victims.—Insufficient Education of Telegraphers.

TO THE EDITOR OF THE TELEGRAPHER.

THERE are some things "no feller can find out," as Dundreary has so persistently informed us, and one of these is, what becomes of the majority of the victims of the numerous "telegraph colleges," "institutes," etc. It is true that occasionally one of them turns up on a telegraph line, only to ascertain, however, that the time and money invested in the attempt to learn what, generally, the pretended teachers are incompetent to impart, has been merely wasted. Most of them, however, are never heard of afterwards in telegraphic circles. It would be strange that these so-called telegraph schools should succeed in obtaining so considerable a supply of victims, were it not for the fact that they are generally boys and girls from the country, who have no acquaintance with practical telegraphers, and who are led to believe, by the statements in the lying circulars of the managers, that there is a scarcity of telegraphic labor, and situations are eagerly awaiting them as soon as they have mastered the manipulation of the key, and acquired the requisite knowledge, which they are assured can easily be done in from four to eight weeks. It is useless to waste space in THE TELEGRAPHER in warning such persons against the pretensions of these fellows, because they never see or know anything about the paper. Every telegrapher, however, should warn those who are likely to be inveigled and deceived in this manner against spending time or money in the useless effort to become

* I also wrote to him, Mr. Prescott, in regard to my *triple relay*. I suppose then his duplex system has no triple relay in it. If it has he is trampling on my toes, provided it is a polarized relay actuated by a negative, positive and increased current.—H. C. N.

practical telegraphers without previous training on a regular telegraph line. If they would do this they might reduce the patronage of such concerns, and *perhaps* the so-called teachers might thereby be induced or forced to engage in some *honest* method of obtaining their provender and whiskey.

Another thing, which has always seemed beyond comprehension to me, has been the fact that so large a proportion of those who aspire to telegraphic employment, and not a few of those who are actually engaged in telegraphic service, should be content with a knowledge of the merely mechanical duties of the profession. Of those who are now engaged in telegraphic employment, how large a proportion know nothing of the business beyond the mere manipulation of the key and the reading of telegraphic signals. Of everything besides this they are profoundly ignorant. They know nothing of electric circuits; of the laws which govern electric currents; of the nature and relative value of batteries, or of the manner in which they are made up; of the proper insulation or resistance of wires; of the requisite proportions of resistance in magnets, etc. When any disarrangement or changes occur on the circuits which they work they are utterly incapable of testing or determining their character or of remedying them. They are, in fact, helpless, until some circuit manager or chief operator is at hand to set them right. Such telegraphers are unworthy the name, and when their places can be supplied with more competent and better informed persons they should stand little chance of employment on respectable telegraph lines. It should be the desire and ambition of every telegrapher to become as thoroughly informed as possible in regard to all the branches of the business. It is not by any means necessary that they should aspire to be expert and trained electricians, but they should know enough to take the management of a circuit under any ordinary conditions, and act promptly and intelligently in remedying any difficulties that may arise, which do not require more than an ordinary acquaintance with the principles which govern electrical conductivity and transmission.

There are several other matters which have caused me to reflect seriously upon the defects in the training of telegraphers, but I have occupied sufficient space for this time. If this should be deemed worthy of space in THE TELEGRAPHER your readers may at some future time hear again from

A. H.

Ghosts and Gunpowder.

CALIFORNIA, July 24.

TO THE EDITOR OF THE TELEGRAPHER.

IN 187- A. J. T. was a "burner of the midnight oil" at "Sm." He was a "fancy duck," with blonde hair, and could "frite gerse" with any of 'em, at least he thought so; and he prided himself on being able to win the affections of any young lady he wished.

There was a handsome and accomplished young lady visiting some friends in the neighborhood of T.'s residence, and he became desperately enamored, and, being promoted to agent and operator by the decease of that party, he could hardly find soil enough to tread on. Another young man stood very high in the young lady's estimation, and, as a natural consequence, a jealous feeling arose between them. Each determined to outwit the other. The "lightning manipulator" was a very nervous, timid young man, while the gay engineer was brave and determined. Accordingly, the "steam jammer" employed a third party to assist him. T. was very fond of gunning, so "Nibs" proposed to him to go to the lake, about a third of a mile distant, and shoot some ducks. Nibs loaded, and, of course, carried the gun. When about two thirds of the distance had been travelled two white figures suddenly appeared on a large rock by the roadside. The two stood as if petrified. Suddenly Nibs gave a shriek equal to a steam whistle, and fled toward the hotel, taking care to take the gun, for fear T.'s nerves might be strung to a higher tension than usual by the unearthly appearance of the "steam jammer" and his companion. After Nibs fled T. still gazed at the two figures for some moments; then he called, "Johnny! oh, Johnny!" (that was the deceased agent's given name) "you can have your shirt. I did not mean to keep it. It got mixed with my washing." No response from the supposed ghost, and he turned and fled, overtaking Nibs in about half a mile; he never stopped until he reached the house. Nibs could hardly tell if it was T. or a large bird, he passed so rapidly.

Reaching the house he called for some of Jim's "corn juice" and told his terrible experience. A party was organized to go and interview the ghosts. Of course none could be found, and as the effect upon his mind was all that was required, they tried to lay the vision to nervousness. Some more corn juice, and he was prevailed upon to go to bed. Nibs must sleep with him—he would not sleep alone. They retired, and after getting into bed they left the candle burning. A small hole had been drilled into the candle close to the wick, and a charge of powder put in and nicely

fixed so as to ignite and blow the flame out unceremoniously. Nibs was telling him he had heard of ghosts blowing out the lights, when s-h-h-oot! went the candle. Up he jumped and rushed through the hall, down stairs, and into the bar room, minus pants, etc., This was too much for human nature. He could not be left alone for a moment, for fear a "vision" would join him. The impressio made upon his mind came near proving a lasting one, and it was not until some weeks after he resigned and left the office that he could be made to believe it was a "put up job." It is needless to say the field was clear, and the "steam jammer" had no further trouble getting the "gal."

WILL HONEYCOMB.

How Some Things are Done in the U. S. Patent Office.

TO THE EDITOR OF THE TELEGRAPHER.

HAVE some of the Examiners in the United States Patent Office been keeping company with "Rip Van Winkle," or has our much respected Commissioner of Patents been imposed upon in consequence of the inadvertence or oversight of some of the Examiners in the office under his control? I have some forty-three United States patents in my possession relative to my American system of automatic telegraphy—many of which I find, and I have been advised, that I am legally entitled to reissue for additional claims based upon what is plainly set forth in the said specifications. That being the fact, I am somewhat curious to know why a party by name *F.* and *R.* should, in about seventeen days from the date of their application for a patent, be allowed (what to them must prove to be) old and well known claims, and which is "notoriously patent" to the whole scientific world, belongs to myself. Many of my applications laid in the U. S. Patent Office nearly six months before being acted upon, and very properly so; otherwise, I fail to see how searches could be made by the Examiner by reference to all specifications bearing on the subject rendered during the last "thirty years."

Now, as I (as one of the pioneers of this one of the marvels of science, the electric telegraph,) am somewhat of a walking magazine on such matters, I would like to excite the curiosity of your many readers by putting in type the following "My Duplex Review" of this very recent and very unaccountable proceeding in our model Patent Office.

By exciting the curiosity of your readers, don't yourself be carried away with the idea that I am or that I feel any way hurt (or, as that model of honesty, Abraham Lincoln, would have it, there is nobody hurt) by such proceedings. On the contrary I feel very much pleased to see the strength of my patents enhanced exceedingly thereby. I am the more pleased, because I happen to be one who has worked hard for the good of the many.

GEORGE LITTLE, C. E.

Passaic City, New Jersey. U. S. A., August 10, 1874.

"MY DUPLEX REVIEW."

"G. L. CLAIMS."

"Patent," April 9, 1872.

Dots and dashes may be indicated by a blank or interruption instead of by a colored dot or dash.

"Patent," July 23, 1872.

The recording device brought into action by means of perforations in one line, and the action arrested by the other line of perforations by currents of different polarity.

"Patent," Oct. 18, 1870.

The perforated paper itself the means for operating the extra or "neutralizing circuit."

"Patent," Feb. 26, 1873.

"Plants' condenser or secondary battery," is preferable for this purpose, or the condenser or accumulator as in application dated Oct. 1, 1872.

"Patent," Oct. 18, 1870.

Automatic chemical telegraph, two currents act in opposition to each other and neutralize the action of that which make the mark at the receiving end of the line. The perforated paper itself being the only means for operating the recording and the "discharging, or freeing circuit."

"F. & R. CLAIMS."

"Patent," July 14, 1874.

Dots and dashes distinguished by the space left.

"July 14, 1874."

A fillet of paper perforated in two rows each, serving to transmit currents of opposite polarity.

"July 14, 1874."

A fillet of paper with two rows of holes. The extra row for the purpose of discharging or freeing a telegraph line or cable of "surplus electricity."

"July 14, 1874."

A secondary discharging battery at the receiving end of a line for the purpose of freeing a line or cable of surplus electricity.

"July 14, 1874."

Automatic chemical telegraph, one current effecting the recording, the other acting as a discharging or freeing current, and being thrown upon the line immediately after each break in the circuit of the recording current (operated by perforated paper).

"Patent," Oct. 18, 1870.

In a chemical telegraph to prevent tailings or blurs, sets forth the use of the perforated paper fillet itself to effect this object, immediately the paper intervenes to break the circuit.

"Patent," Nov. 19, 1872.

Shows in a chemical telegraph the combination with a transmitting and receiving drum, two or more styluses.

"Patent," April 22, 1872,

No. 1,207, Great Britain,

"Patent," July 23, 1872,

"Patent," Sept. 1, 1873.

In a chemical telegraph two or more styluses insulated from each other, connected to opposite battery poles, operated by the intervening paper.

"July 14, 1874."

In a chemical telegraph to prevent tailings or blurs showing upon the line, immediately upon each and every break in the circuit, a current of opposite polarity (by the perforated paper fillet).

"July 14, 1874."

Shows in a chemical telegraph the combination with a transmitting and receiving drum, two or more styluses.

"July 14, 1874."

In a chemical telegraph of two or more styluses insulated from each other, connected to opposite battery poles, operated by the intervening paper.

A New Way to Spell "Cow."

ALBANY, OREGON, July 31.

TO THE EDITOR OF THE TELEGRAPHER.

TALKING about bovines large and small, here's one that caused a great deal of laughing at the time it occurred, as it does yet when brought up by any of the "old" boys on the line.

A short time after this road went into operation, and before any regular stock cars had been built, flat cars had been fitted up with racks on them for carrying cattle. One day there were several of these cattle and also several coal cars at "F," when orders were received from headquarters to "have the section men take the racks off those cow cars and send them in on No. 6." Cow cars got our operator. After studying over it awhile he came to the conclusion that that term had been used to designate the cattle cars, and as he never "broke," he was not going to ask for repetition of the order; so out he goes and quietly remarks to the section men, "Boys, get your axes and belt h—l out of those cow cars—their's the orders—every rack off." Belting those racks was the order of business for the next half hour or so. The dispatcher, thinking it took them a great while, asked our friend "if the racks were off of those coal cars yet." Our friend smelled a small sized "bovine," and if ever mortal went lively, he did out of that door. (He afterwards told me confidentially that his coat tails would have furnished a good place to play a game of "seven up" on.) On reaching the cars the "Micks" were going for the last cow car!—his feelings for a moment overcome him, but only temporarily, for the next minute he broke out with "Boys, stop! We have played the deuce—order meant, those coal cars, and I got the a and l for a w, and got it cow. These d—d racks cost \$50 a piece, and here's \$350 gone up. H—l with pop! Leave me to my misery."

But, contrary to his expectations, the only thing that ever came out of this was a hearty laugh, and asking "F." if *c-o-u-l* spelt cow.

WEBFOOT.

Automatic, Duplex and Quadruplex.

NEW YORK, Aug. 4.

TO THE EDITOR OF THE TELEGRAPHER.

JUDGING from your columns, and from those of some of the daily newspapers of this city, there has been a considerable stirring up of the telegraphic dry bones on the subject of fast telegraphy lately. Now, I have no special interest in either of the systems discussed, but I like to see fair play all round, and I don't like to see an evident attempt on the part of anybody to appropriate other people's ideas and inventions, and obtain fame and profit therefrom. The latest attempt in this line has been so thoroughly shown up through the columns of THE TELEGRAPHER that the much ventilated party has found his, as he supposed, well laid schemes all coming to naught. This is as it should be, and, for one, I am rejoiced to see it.

No one is disposed to question the value of the duplex system, worked by the Western Union Company, or, so far as I know, deprive Mr. Stearns of his proper credit in connection therewith. If anybody or anything could do this it would be the parties prominently connected with the Western Union Company, who makes him appear absurd or ridiculous by claiming for him much more than he ever claimed for himself. It is unfair to take advantage of Mr. Stearns' absence from the country to thus injure his reputation, and cause the ignorant or unthinking to look upon him as a participator in these well styled absurd and ridiculous claims in his name. He deserves better treatment at their hands, especially after having suffered detraction and depreciation before his patents were purchased by the Western Union Company. Prob-

ably the exact period when the duplex ceased to be worthless, and used by certain "speculative telegraphers" to advance their opposition schemes, was when the assignment of the patents to the Western Union Company was executed and recorded in the Patent Office.

Of the quadruplex, so called, it is scarcely necessary to speak—that gas bag having been so effectually pricked already. The fifty, more or less, wires, and the numerous keys have probably retired from public or even professional observation, and the author or inventor (?) is, no doubt, engaged by this time in hatching up some new scheme to impose upon the public by reproducing an old acquaintance in a new disguise, and under some new and startling cognomen.

Can you tell me who the inventor of practical automatic telegraphy in this country really is? Mr. Craig used to assure us frequently and emphatically that it was Mr. George Little; now he has evidently gone back on Little, or Little on him, and he says that it is Gen. Marshall Lefferts, but that he's engineering a new automatic system which will see both of the L's, and go them 100 to 1000 per cent. better every time. I am glad to notice that brother Craig still adheres to his ten year old child. I don't know what *might* happen if he should just let up on that child, even temporarily! However he may change his allegiance from Little to Lefferts, and from Lefferts to the unknown inventor of his new system, he is, and always will be faithful to that ten year old infant! This is, at least, consistent and commendable in him.

But not only have we Little, Lefferts and the unknown as inventors of the automatic telegraph, on Mr. Craig's authority, but here comes in Tom Edison again in his renowned character of the "Great Inventor," and he, too, is the inventor of the automatic telegraph system! His patents are numerous, it is true, but their value is not so apparent, and whenever he does patent a good thing (like the pucher, for instance,) some other fellow comes along and says it's his, and, what is worse, is prepared to prove it. Alas! alas! this is a sad, wicked world! Who can we credit as inventors if Thomas proves unreliable and deceptive? Then here comes Grace—I may say two Graces—and they claim a part and lot in the automatic telegraph invention, even, amongst other things, to the identical puncher on which, by hook or by crook, the much inventive Edison obtained a patent. And now, at the end (for the present) of this eventful and inventive history, Messrs. Foote & Randall put in their claim as automatic telegraph inventors, and have paid Uncle Sam's Patent Office ever so many dollars to certify to its truth.

Is it not enough to make any person of merely moderate mental calibre appeal to an editor, one of that tribe which is popularly supposed to know everything, to help him out of his dilemma, and tell him what is what, and who is who? If you should fail me in this extremity, I must give up the conundrum, and you will hear no more from

PETER SIMPLE.

[ANSWER.—Good bye, Peter! We can't help you. We have too much regard for our peace and the prolongation of our existence to take sides in any such controversy.—ED. OF THE TELEGRAPHER.]

Answers to Correspondents.

AN INTERESTED BROTHER.—You don't send us your name and address with your communication, and, besides, your ideas are rather disconnected, and your handwriting is not exactly what a first class telegraph operator's should be. What you say has been substantially repeated in THE TELEGRAPHER many times before, and if it has failed of effect from those who are not ashamed to avow their sentiments personally, it can hardly produce a very startling effect if it appears again over your *nom de plume*.

AN OPERATOR.—We know of no operator who can do what you mention.

C.—Mr. F. Vandenberg, Sacramento, California, is General Superintendent of the Atlantic & Pacific Telegraph Co., and Mr. Jas. Gamble, San Francisco, Cal., General Superintendent of the Western Union Telegraph Co. We are advised that the supply of operators on the Pacific Coast is now in excess of the demand.

Shocking.

AT Ames, Indiana, a citizen, who ought to have known better, recently got himself into trouble with the Western Union Telegraph Company. For some time past the company has had trouble with their main California lines—a singular and unaccountable obstruction occurring and recurring at irregular intervals, which baffled for weeks the efforts of the repairers to trace its origin. The great mystery was cleared up, however, week before last, when it was discovered that the line, as it ran by the house of a prominent merchant passing in its way, very near to the top of a porch, was being tapped by the merchant, who used the company's electricity for the purpose of giving shocks to his visitors. Such shocking conduct as this called down the wrath of the company upon him, and they are suing him in the Indiana courts for the recovery of \$100 damages for trouble and expense caused by his action.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, AUGUST 15, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.
The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

To Subscribers and Friends of The Telegrapher.

WITH the present issue of THE TELEGRAPHER quite a number of subscriptions expire. Under the old arrangement this would be the end of the volume, and formerly a large number of subscriptions ended and commenced in August. The number of these is not now as large as before the change, which made the volume to commence and end with the year, but still a good many do so.

We hope that all of these will renew their subscriptions promptly, and not only so, but will exert themselves to increase the number of subscribers. This can easily be done if all will interest themselves in the good work. The summer months are always very dull as regards subscriptions, but the summer is now nearly over and we anticipate that the usual fall revival will commence very soon. We know that THE TELEGRAPHER is more worthy of support from the telegraphic fraternity now than ever before, and that as a fearless, independent telegraphic journal it has their confidence, as no other similar publication in this country ever has had. We propose to maintain this characteristic of the paper as fully in the future as in the past, and to increase its value, and reliability, and efficiency steadily, as we believe has been done heretofore. The subscription price of Two Dollars per year is so insignificant, in comparison to the value of the paper, that we should suppose that no intelligent telegrapher would be content to be without it.

In conclusion we will merely say to our present subscribers and to those who may hereafter favor us with their subscriptions, or who may exert themselves to obtain subscriptions and the cooperation of others in the support of THE TELEGRAPHER as the representative of the telegraphic fraternity and of telegraphic interests generally, that it will not be suffered to deteriorate in any respect, and that it will be improved wherever improvement is practicable and feasible.

Telegraphic Inventions and Inventors and Western Union Officials.

CONSISTENCY has been declared to be a jewel, probably on account of its rarity. It may be said there is and can be no such thing as unswerving consistency in this age of active development and progress.

We have, during the past few years, had some interesting and amusing demonstrations of the truth of the above statement in the course pursued by certain electricians and telegraph managers with regard to improvements in telegraphic apparatus and systems of operation. These, as they are proposed and actually put in operation, are declared to be old, impracticable, or valueless, but ultimately, as interest changes, are found to be of exceeding value, and are as extravagantly lauded and praised as they have been before unreasonably decried, denounced and ridiculed. The duplex telegraph of Mr. STEARNS, and its treatment before and after the patents were purchased by the Western Union Telegraph Company, by leading officials of that company is a very striking instance of this.

The stultification of those officials must have been most mortifying, and it would reasonably be supposed that, as a burnt child is said afterwards to avoid the fire, they would be exceedingly careful how they committed themselves again in a similar manner. Experience, however, does not seem to have been very effective, as they are now going through the same process in regard to the automatic telegraph system which has similarly been ridiculed and denounced. They are at last convinced that there is something in automatic telegraphy, and are experimenting with the slow and inferior system of Sir CHARLES WHEATSTONE, with what result we are not yet informed. No doubt in due time a column of the *Tribune* or *Times* of this city will be filled with a hifalutin description of the wonders accomplished or to be accomplished by some great automatic invention, which, upon examination, will be found to be the WHEATSTONE apparatus under a new name, the production of the latest inventive humbug employed by that Company.

We allude to these instances as the most recent and widely known, and which have attracted general attention among telegraphers and others. They must inevitably destroy all confidence in the official scientific and practical declarations of the officials who blow cold and hot alternately as the supposed exigencies of the moment may require upon telegraphic improvements of inherent and demonstrable value. It is not apparently considered what the actual merits of any invention or improvement are in treating of them, but how they are likely to affect the interests of this or that Company. When the pecuniary interests change there appears to be not the slightest personal or professional objection to laud as extravagantly as was previously denounced. But we must give credit for one thing—that is, that no attempt is made to explain or excuse the inconsistency, and it is seemingly taken for granted that what has been said to the contrary heretofore will be forgotten, and the latest declaration be swallowed without cavil or reference to former antagonistic outgivings from the same source.

Undoubtedly there may be and often is good reasons for changing even an honest opinion, but in such case the main way is to acknowledge the previous error, and, as far as possible, apologise and atone for it. Then the subsequent convictions are entitled to consideration and respect.

We are watching with considerable interest the gradual development of faith in the automatic telegraphy in Western Union official quarters. It is not a very long time since we were officially assured that automatic telegraphic transmission was impossible at a greater rate of speed than by the ordinary methods, except for very short distances. This has been contradicted, however, officially, and the fact of rapid automatic transmission over long circuits conceded. Various other concessions have also been made of advantages claimed by the inventors and advocates of

automatic telegraphy, and we have no doubt but that the system would be gladly adopted and as extravagantly extolled in the next official report, if it could be secured exclusively for that company.

If we might be permitted to make a suggestion to the managers of the Western Union Company, it would be that investigation into the merits of an invention or improvement should precede, not follow, its rejection or approval. Such investigation should be conducted with a view to ascertain its merits and defects, and not merely to discover either as the present apparent interest of the company or its officials might seem to require.

The ventilation of the great quadruplex invention (?) which was of such enormous value, and which at one stroke quadrupled the capacity of the entire number of miles of line worked by the Western Union Company is an instance of approval and faith before actual practical tests, as remarkable as the previous condemnation of the duplex and automatic systems and apparatus. The pretended inventor of this remarkable quadruplex evidently had made his market before producing his goods. This individual seems to be fortunate in one thing at least, and that is in impressing one person after another with the idea of his great inventive genius, and that fame and fortune is sure to attend a connection with him. It is true that in no instance has this been realized; but then we know that many blawks must be drawn in every lottery, yet this does not destroy the confidence of purchasers of chances in ultimately drawing valuable prizes. It is also true that this person's inventions (?), except those derived from others, always stop short of success, and not unfrequently, as in the case of the quadruplex, may be found substantially described in electrical and telegraphic works, not difficult of access, but still he succeeds in imposing himself and his so-called inventions upon one telegraph official and manager after another. It will be seen from a communication in our correspondence column that another person claims whatever of merit there may be in this latest production of his genius not derived from European sources. It seems to be his fate to always have fame and honor snatched from him by some person who lays claim to his "original" ideas. And yet this person is taken up and made much of by the President and electrician of the Western Union Company! It may be said on their behalf, however, that in this they are only successors to the managers of the Gold and Stock Telegraph Company, the Automatic Telegraph Company, and even of our friend, D. H. CRAIG, who at one time thought him a most remarkable and unappreciated genius, but who was soon disabused of that idea from practical experience and intercourse with him. We may at some future time prepare his telegraphic biography from his entrance and departure from a certain telegraph office in Maine to his present proud position as the friend and collaborer of the electrician of the Western Union Telegraph Company. It will be interesting reading, and will show the gullibility of human nature, even when embodied in telegraphers and electricians.

The Extension of the Telegraph in Central and South America.

THE telegraph is making notable progress in the Central and South American States and countries. The obstacles to be overcome in these countries have been very great, but this is generally being done, and the telegraph is being extended to all the principal cities and towns, and the several States and territories are brought into close and intimate telegraphic communication with each other. This is a substantial and unmistakable sign that they are emerging from the revolutionary and unstable condition in which they have so long been and entering upon an era of civilization and prosperity which shall ultimately develop their immense resources and ameliorate the condition of the great body of their people. The governments are becoming more stable and effective, and their inhabi-

tants are learning that true liberty can only be established and maintained by a regard to law and order, to which most of them have hitherto been strangers. In no part of the world has the telegraph more important functions to perform as a civilizing and ameliorating agent than in these countries, whose progress has been retarded and whose development has been prevented by the ignorance and bigotry of the people, and by the frequent revolutions and changes of governments consequent upon these. With great possibilities and opportunities they have been a byword and reproach, the inhabitants shiftless and impoverished, and the public men ambitious and venal to a degree which can hardly be appreciated by the people of this country, where education is almost universal and liberty and license are not regarded as synonymous terms. Much time will yet be required to thoroughly change and reform the condition of affairs, but the good work has begun, and telegraphs and railroads which are now being extensively introduced are powerful agents in carrying it forward to a glorious accomplishment.

Was He a Pioneer Line Constructor ?

UNDER the title of "A Misstatement Corrected" we printed in THE TELEGRAPHER for August 1, from the *Ithaca Journal*, a letter from Mr. EZRA CORNELL, in reference to the connection of a Mr. G. E. SMITH, recently deceased in Maine, with the construction of the experimental telegraph line between Washington, D. C., and Baltimore, Md., in 1844. It will be remembered that Mr. CORNELL stated that "there was no person by the name of SMITH connected with Prof. MORSE, in any way, with the setting up of the first line of telegraph poles between Washington and Baltimore."

We are informed since that statement appeared that the Mr. G. E. SMITH, whose decease called out the original statement and contradiction, certainly claimed to have been engaged in that enterprise, as a subordinate, in the construction of the line. Perhaps Mr. CORNELL has forgotten him after the lapse of so many years; but, at all events, he has always received credit with those who knew him for having been one of the pioneer telegraph line constructors.

A Number of The Telegrapher Wanted to Complete a Volume.

A SUBSCRIBER to THE TELEGRAPHER desires to obtain a copy of the paper for April 5, 1873, vol. ix., No. 352, to complete his file of that volume, in order to have it bound. Any one having a copy of that number which can be spared will confer a great favor by forwarding it to this office.

Personals.

Mr. ABRAM J. LOCKE has resigned his position on the night force in the Western Union office, at No. 145 Broadway, New York, and has returned to Peace, Kansas. It is said that Mr. LOCKE could come earlier to the office and stay later and keep it up longer than any man who ever put his foot inside the door at No. 145. The gentleman left his farm, his wife and children and everything else behind him and came to New York to earn money to carry out his plans at home. It will be gratifying to all who are interested in the weal of those who "have a purpose" to know that at the end of a year Mr. LOCKE has departed to join his loved ones with some twelve hundred dollars, after paying all his expenses. In sound health and rich in the esteem of every man and boy in the office the self-denials of the year must be essentially softened by the consciousness of a good work well done and an army of new friends enlisted. Mr. LOCKE was one of the old force at Troy, New York, having emigrated to Kansas only a few years ago.

Mr. W. H. CLARK, of No. 145 Broadway, New York, is rusticated at St. Clair, Pa.

Mr. C. FRED HUTCHINSON, recently of the Western Union, Baltimore, office, has accepted a position on the night force, at No. 145 Broadway, New York.

Mr. EDWARD GORDON has accepted a position at No. 145 Broadway, New York.

Mr. W. M. ALLISON has accepted a position at No. 145 Broadway, New York.

Dr. FOWLER BRADNAC has accepted a position with the Western Union Company, at No. 134 Pearl street, New York.

Mr. W. E. TACKLEY has resigned his position with the Western Union Company at Augusta, Ga., and is at home in Lancaster, Pa.

Mr. F. B. RAE, recently chief operator with the A. and P. at Syracuse, New York, has accepted a position with the Western Union Company at No. 145 Broadway, New York.

Mr. J. B. BOGART, late of the N. J. C. R. R., at Wilkesbarre, Pa., has accepted a position at No. 145 Broadway, New York.

Mr. HENRY ROTHMICH, of Providence, R. I., has engaged with the Franklin Company at No. 198 Broadway, New York.

Mr. A. B. ELLISON, chief operator C. & N. W. Railway telegraph, Baraboo, Wisconsin, returned August 1st from a two weeks' trip to Canada.

Mr. F. G. BARDALL has been transferred from Winona Junction, Wisconsin, to train dispatchers' office, C. & N. W. Railway, Baraboo, Wisconsin, night service, *vice* Mr. L. M. SCHNELL.

Mr. ELLIS PURPLE has been transferred from West Salem, Wis., to Winona Junction, C. & N. W. Railway.

Mr. P. J. BYRNE has been transferred from Elroy, Wis., day office, C. & N. W. Railway, to "Hg" Tunnel No. 3, *vice* Mr. A. F. BRIGGS, extra operator.

Mr. F. E. PEARSON has been transferred from Beloit, Wisconsin, night office, C. & N. W. Railway, to Elroy, Wis., day office, same road.

Mr. W. LAWSON has been transferred from Evansville, Wis., to Beloit, Wis., night office C. & N. W. Railway.

Mr. GEORGE C. CHASE has been appointed day operator of the C. & N. W. Railway at W. Salem, Wis.

Mr. C. B. GOSS has been appointed night operator, C. & N. W. Railway, at Evansville, Wis.

Mr. H. J. BOSWORTH, day operator in the Train Dispatchers' office at Baraboo, Wis., C. & N. W. Railway, has resigned, and is rusticated for the present.

The Telegraph.

Telegraphic Communication with Uruguay. — Official Congratulatory Message.

THE following congratulatory telegraphic message was received at the White House on Saturday evening, August 8, and forwarded to the President at Long Branch:

To the President of the United States of North America, Washington.

I am most happy to greet His Excellency, the President of the United States of North America, on the memorable occasion for the nations which the electric wire this day places in immediate communication with each other, thus drawing closer the bonds of sincere and cordial friendship which happily unite them.

(Signed), THE PRESIDENT OF URUGUAY.

Foreign Telegraphic Notes.

THE Eastern Telegraph Company have announced that their Vigo-Lisbon cable was broken on Tuesday morning by the Pacific Company's screw steamer Chimborazo, near Lisbon, in thirteen fathoms of water. It is anticipated that the line will be speedily re-established, and during the interruption messages for Egypt and the East will be forwarded *via* Marseilles.

The total number of messages forwarded from postal telegraph-stations in the United Kingdom during the week ended July 18, 1874, was 410,551—an increase on the corresponding week last year of 48,769.

The managing director of the Brazilian Submarine Telegraph Company states that a number of messages sent to St. Vincent on the 16th of July were in time to catch the Cape steamer, which left Plymouth ten days previously, and he desires "to draw the attention of the commercial world to the advantages thus offered, in order that the respective steamship companies may be induced to arrange permanently to call at that station."

The receipts of the Submarine Telegraph Company for the month of June, 1874, amounted to £8,647 5s. 8d., against £7,718 5s. 7d. for the corresponding month of last year.

The line connecting the Central American Republics of Guatemala and Salvador was opened to the public at 4½ P. M., of the 2d of June, amidst much

rejoicing and enthusiasm. The tariff for ten words is 50 cents between any office in one republic and any in the other, each additional five words or fraction thereof, 25 cents.

The Telegraph Construction and Maintenance Company.

AT the half yearly meeting of the Telegraph Construction and Maintenance Company, recently held in London, the chairman, Sir Daniel Gooch, M. P., said:

"I have very little to say to you to-day. We have completed the Brazilian cable (as you, no doubt, have seen by the newspapers), and on Thursday that longest section will have completed its thirty days' trial, when I hope it will be taken off our hands. The section between Lisbon and Madeira, which was broken last autumn, has remained broken all winter; the depth where the fracture was was 2,500 fathoms, but the staff of officials (and very much to their credit) have been able to recover both ends, and to put a piece in the deepest water in which we have had the operation to do before. (Cheers.) We have, during the past half year, laid the Black Sea cable, which was opened within the last few days. I am glad to say the Brazilian cable shows satisfactory results, so far, in the interests of the shareholders of that company, and I trust it will improve; in fact it has already made more than the calculation which was formed of its earnings. I may mention that the Great Eastern sails in a few days with the other Atlantic cable, and I hope that in the course of a month or two that will have been successfully completed."

In reply to various questions, the Chairman said the charter of the Great Eastern would expire in the autumn of next year; the company only possessed the Hibernia and the Edinburgh, which have been laying the Brazilian cable.

A shareholder asked if there was any intention to pick up the old Atlantic cable.

The Chairman: "I believe there will be no attempt made this year. Captain Halpin has been absent in the Brazils, and is now going to lay the Atlantic cable, and it was considered that by the time that was completed it would be too late to attempt to pick it up this year; but I believe the intention of the Anglo-American Company is to take steps early next year to try and recover that cable and restore it." (Cheers).

Mr. Ford referred in very complimentary terms to the ability, intelligence and zeal manifested by the employees of the company, and the valuable services and assistance received from them. He proposed a vote of thanks to them, which was seconded by Mr. W. Abbott, and passed.

Globe Telegraph and Trust.

THE report states that in exchange for stocks and shares of other companies 119,004 preference and 120,722 ordinary shares of this company have been allotted. Cash subscriptions have also been received for 5,291 preference and 3,841 ordinary shares, making the total subscribed capital at this date £2,488,580. The total revenue of the company accruing from dividends on securities and from interest on loans, &c., amounts to £141,481 for the year, out of which £101,271 has been already distributed in interim dividends. The working expenses for the year amount to £1,267, leaving a balance of £38,943, out of which the directors now propose a distribution of 1½ per cent., or 3s. per share, upon both preference and ordinary shares, making, with the previous interim payments, a total dividend for the year of 6 per cent. on the preference, and of 5½ per cent. on the ordinary shares, carrying forward £1,614. In addition to the dividends credited in the accounts, the company's revenue for the past year includes one third of the quarterly dividend payable on 1st August next on its Anglo-American Telegraph stock. This sum, amounting to £3,539, will be credited in the next year's accounts. In accordance with Article 22 of the Articles of Association, Sir James Anderson, Julius Beer, Esq., and Sir George Elliott, Bart., M. P., will retire, but being eligible they offer themselves for re-election. In conformity with the Articles of Association the annual remuneration of the directors and auditors is to be fixed by the meeting.

Future Work of the Challenger.

IT is one of the appointed duties of the staff of H. M. S. Challenger to make, during her voyage between Port Jackson and Auckland, a connected series of deep sea soundings, with a view to ascertaining the condition and formation of the bottom of the ocean lying between the shore of Eastern Australia and New Zealand. This will be done under the special direction of the hydrographical department of the Admiralty—the object of such a careful line of examination being to ascertain as far as possible what are likely to be the material difficulties to be surmounted in the laying down of the proposed New Zealand cable—one of

the last long desired connecting links between the mother country and the out ports of her wide spread colonial empire.

Miscellaneous.

EXPERIMENTS ON ELECTRICAL TRANSMISSION THROUGH WOOD.—M. du Moncel has recently been experimenting on electrical transmission through wood.

TOMMASI'S HYDRO-ELECTRIC CABLE.—M. Tommasi has been experimenting lately with his hydro-electric cable, with a view to its practical improvement.

NEW THERMO-ELECTRIC PILE.—M. Clamond, the author has been improving his apparatus. He found in it a considerable increase of resistance, and this was due to two causes—(1) Oxidation of the contacts of the polar plates with the crystalized bar under the influence of heat; and (2) splitting of the bar and separation of its different parts in planes perpendicular to its length.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF THE RECEIPT OF ONE ASSESSMENT SHOULD BE TAKEN AS A RECEIPT FOR ALL THE PREVIOUS ASSESSMENTS.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS No. 65, UP TO AND INCLUDING AUGUST 10TH, 1874.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ending July 7, 1874, and bearing that date.

REISSUE.

5,958.—ELECTRIC SIGNALING APPARATUS FOR RAILROADS.—Wm. Robinson, Brooklyn, N. Y.—Patent No. 130,661, dated Aug. 20, 1872. (Filed Apr. 24, 1874.)

Constantly closed circuit to signal magnets, preferably through rails of an insulated section of track. Car axles form a shunt circuit of low resistance, causing magnets to act by demagnetization.

- 1. The combination of a constant circuit, a magnet or magnets operated or controlled without actually opening the circuit of said magnets, and an electric railway signal or signals, substantially as described.
2. A visual or semaphoric signal, in combination with a constant circuit, composed in part of a rail or rails of a railroad track, substantially as set forth.
3. An alarm or audible signal, in combination with a constant circuit, composed in part of a rail or rails of the track, essentially as described.
4. An additional or secondary circuit, in combination with a primary circuit, composed in part of a rail or rails of the track, essentially as and for the purpose described.
5. A visual and an audible signal, in combination with each other and with a constant circuit, composed in part of rail or rails of the track, substantially as described.
6. The battery B and magnet M, so connected to the rails of a railroad track that when connection is established between the rails of said section by the wheels and axle of a car, or by other superior conductor, the electric circuit is partially changed and the signal operated through the demagnetization of the magnet M, substantially as specified.
7. A signal constructed partially of tubular material, for the purpose of securing lightness combined with strength, in the manner substantially as herein set forth.
8. The arrangement of the pivotal bearing of the lever e at a point midway between the horizontal lines of exposure and concealment of the signal banner, as shown and described, for the purpose set forth.
9. The combination of the elastic spring t, or its equivalent, with the levers L and e and signal banner S, substantially as set forth.
10. The battery B, in combination with the wires k k', rails a b of a railroad track, wires l l', and magnet M, substantially as and for the purpose herein described.
11. The additional or secondary circuit r, in combination with the magnet M, wires l' l' k k', battery B, and section of rails of a railroad track, essentially as described.
12. A railway signal or series of signals, in combination with a constant circuit, as described, charged in its normal condition, essentially as indicated.

For the week ended July 21, 1874, and bearing that date.

153,309.—ELECTRIC TELEGRAPH APPARATUS.—R. K. Boyle, Brooklyn, N. Y. (Filed June 27, 1874.)

Induced currents sent over line, operating an induction coil at receiving station, the current from the latter operating in turn another induction apparatus, in which the ordinary relation of fine and coarse wires is reversed—that is, the induction coil is the coarser. By this reduplication of induction coils a practically continuous current is obtained.

- 1. In an electric telegraphing instrument, the combination of one or two induction coils, C C', and their circuit breaking armature lever d with line wires 15 and 16, and with an induction coil E, the inner helix of which connects with a pen or other device for producing marks or signs, substantially as shown and described.
2. The combination of an original induction coil, D, with the induction coil E, line wires 15 and 16, and with the induction coils C C' and their circuit breaking armature levers d, substantially as and for the purpose set forth.

TRADE MARK.

1,889.—ELECTRIC AND GALVANIC APPARATUS.—Jerome Kidder, New York, N. Y. (Application filed July 14, 1874.)

"The representation of a sphere or globe surrounded by clouds, from which proceed and extend over or partially across the sphere representations of flashes of lightning or electricity."

41 THIRD AVENUE,

Chicago, Ill.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost. Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and **Labor at last Secured.**

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

F. L. POPE & CO.,

—:o:—

TELEGRAPH INSTRUMENTS,

splendidly finished, and mounted on highly polished Rosewood
Bases.

RELAYS unequalled for beauty and strength.
GIANT SOUNDERS, without a rival for clear, loud sound.
STRAIGHT and CURVED LEVER KEYS, warranted not to
stick.
REGISTER SPRING and WEIGHT, of approved patterns.
POCKET RELAYS, in Hard Rubber Cases; new style.
BOX RELAYS, with or without Keys on base, a specialty;
superior in all respects.
IMPROVED COMBINATION INSTRUMENTS for main line.
RELAY, SOUNDER and KEY on same base, making an ele-
gant set.
WILSON, HASKIN, WESTERN UNION and PLUG CUT-OUTS.
HASKIN'S AUTOMATIC REPEATERS, LIGHTNING ARREST-
ERS, GROUND, BATTERY and REPEATING SWITCHES.
WESTERN UNION (new style) SWITCH BOARDS.
ELECTRIC BELLS, single or vibrating stroke.
MEDICAL INSTRUMENTS, cheap and reliable.

Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THEIR CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER, 104 Centre Street, NEW YORK, TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,
BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
 American Compound Telegraph Wire Co.,
 ALANSON CARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
 E. HOWARD, & CO., Proprietors.
 J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.
 15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world. It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also, ELECTRIC AND CONTROLLED CLOCKS

of all kinds,
 CHRONOGRAPHS,
 ASTRONOMICAL CLOCKS,
 REGULATORS,
 ETC., ETC.,
 OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
 MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
 OF

L EWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR.

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

 General Agents.

RUSSELLS' AMERICAN
STEAM PRINTING HOUSE,
 17, 19, 21, 23 ROSE STREET, near FRANKFORT,
 NEW YORK,
 EXECUTES ALL DESCRIPTIONS OF
BOOK, JOB AND COMMERCIAL PRINTING.
TELEGRAPH PRINTING A SPECIALTY.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS
 for Students and Amateurs.
 The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
 Instrument with Office Outfit..... 7 50
 Two Instruments and Outfits..... 14 50

L. G. TILLOTSON & CO.,

THE AMATEUR'S TELEGRAPH APPARATUS.
 (Patented April 16th, 1872.)

ONE CUP BATTERY, CHEMICALS, WIRE AND MANUAL WITH EACH INSTRUMENT.
 Complete outfit for the Student or short line use.

Price, complete,
Seven Dollars.

Key and Sounder only..... \$6 00
 " " with Lightning Arrester..... 7 00
 Five per cent. discount for cash in advance.

GEO. H. BLISS & CO.,
 SOLE AGENTS,
 41 THIRD AVENUE,
 Chicago, Ill.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard. Brass or nickel plated always on hand.

No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
 WATTS & CO., Baltimore.

THE REASON WHY THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A HAND-BOOK

FOR

ELECTRICIANS AND OPERATORS.

By FRANK L. POPE.

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND

FULLY ILLUSTRATED.

THE BISHOP GUTTA PERCHA WORKS,
 422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
 ONLY MANUFACTURER
 OF
PURE GUTTA PERCHA GOODS
 IN THE
UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,
 FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
 SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,
 AND FOR
BLASTING AND MINING PURPOSES,
 In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable. Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia, has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

SARGENT & STUDLEY, 26 Park Place,
 RUBBER CLOTHING CO., 363 Broadway,
 D. HODGMAN & CO., 27 Maiden Lane,
 SHEPARD & DUDLEY, 150 William St.

How Two of the Boys got Taken in.

BY WEBFOOT.

At a church festival held in a certain Oregon town it was decided to engage the services of the two Knights of the Key that attended to the telegraph interests in the town aforementioned, and persuade them to construct a telegraph line from one end of the Opera House to the other, and transmit the amorous messages by telegraph from the masculine "filliciums" to their sweethearts at the moderate sum of a "hit," American gold coin, regardless of the number of words contained in the telegram.

At the desired time the line was ready for business and the two artists at their posts, and for a while everything went along swimmingly, and the managers were delighted with the amount of "tin" rolling in from messages sent; but in a short time the "filliciums" on the masculine side of the house sent something to the female "filliciums" that raised their "dander" to such a pitch that they absolutely refused to receive any more messages unless proper apologies were made. Of course this had a demoralizing effect on the business, and dividends failed to be returned. After waiting a while for business to resume, and concluding it was a complete "burst up," our two artists commenced chatting and expressing their opinions in regard to the young ladies present, and what was more impolite, in the opinions expressed they were more sincere and emphatic than elegant in the language used.

No. 1 artist commenced by remarking that "it was getting—monotonous sitting here; that we had better cut out and give it up."

No. 2 replied—"Yes, I'd be on it if it were not for a blame splendid looking girl here by my side, who looks as if she never saw the machine before; and if it were not for the daro old spindleshank, lantern jawed old buffer by her side, I'd strike up a 'gas' and have some fun. I'd like to give her one right on her mouth for luck."

No. 1—"The — you say! that's rich. My crowd here are all boys, and mad as thunder at the way the girls served 'em. Give that young 'greeny' a buss any way, and send old spindleshanks down here and I'll tap his sneller, so as to make the claret flow copiously."

No. 2—"Old buffer might get hot. He could clear both of us out with one hand. He's a son of a gun for size. Can't say I admire her choice in a gallant, taking a mummy like him. You ought to see him whispering to the gal, and he is actually laughing. Just think of him laughing!"

No. 1—"That's rich. He thinks he's got off something good. Tell him he'd better take a spin. Ask him if his mother knows he's out."

No. 2—"You don't suppose such an object ever had a mother. Why, he's the feller that Darwin lost. He belongs to that breed, and is a thoroughbred, too. I'm going to tell Darwin he's here, so he can catch him—by the tail."

No. 1—"Ha! ha! That's pretty good. Say—it's a—good thing the old spindleshanks don't understand what we are gassing about; he might get 'heated' just a little."

No. 2—"That's so; but no danger of that. But I tell you confidential he could just use us both up. I should like for him to know what we are saying, but if he should find I had a hand in it, I'd—take a walk."

No. 1—"I'll fix him. I'll get some one to—" (No. 2 breaking in). "Hold on; here comes old buffer. He's writing a message—now for fun! but he looks devilish hot over something—mad as a hornet! (Taking up message and reading it.) Holy Jehosaphat! thunder and lightning! (To No. 1.) "Here, just take this and get it through your wool. I'm going to skip out soon as old buffer will give me a show to run the 'blockade'—here goes."

"To the two simpletons, so called Oprs., in Opera House to-night:

"Old buffer is pretty good, 'fair to middling,' as we say on our grain reports, but darn you! I'll make you two idiots think it's better than good. Just come out-

side that door and if I don't wallop you so that you can't see for a month of Sundays. That 'young greeny' is my wife, and understands telegraphing—sight better than either of you do or ever will. I am stopping at the — Hotel, and if you don't come and offer a suitable apology before noon to-morrow I'll come down a'd clean out your darn old office—d—d if I don't! I'm on it but you ain't."

"Yours, in—a horn.

"JIM' BLACKBURN,
"Of 'Xs.'"

No. 1 got it correct, but it was amusing to watch his noble countenance while it was being received. After it was finished he remarked over the string that "That's H—alifax! We're in for it. I'm going. I'll see you in the morning—my head aches. G. N.," and he "vamoused the ranche," leaving "No. 2" at the mercy of "Jim;" but the latter, after laughing at him good, shook hands and introduced him to Mrs. B.; made him promise to "do so no more." In the morning "No. 1" was missing, but an envelope was found bearing the following: "My father was taken sick last night and I had to go out this morning. Be gone about a week. Get some one work for me."

The Honesty of Youthful Writers.

BY OWTON A FLYE.

I GET more confidence in human nature every day. I know it will average honest. You take young literary people, for instance, they never startle their readers with a great, overpowering, soul lifting passage of fervid eloquence, but that they debit themselves at once by hemming it in with quotation marks. Now, poliev doesn't prompt this but honesty dictates it, and I think I am right when I say that literary people, at least, will be honest, even at a sacrifice. This is especially true of the fledglings in letters, for you never saw an effusion yet that didn't have from one to a dozen quoted sentences, extending all the way from a hackneyed, over written and much abused maxim of ten words to the long outburst which often reaches half a column in length. The writer must understand that there is no real merit for himself in a batch of quotations from more original minds than his own; and, besides that, this charity which we all profess to have in our hearts should restrain us from making good sayings unpopular by causing them to become stale, even though the author be dead and gone.

I will engage to write the grandest passages the world has ever seen, both for depth of thought and sublimity of expression, with no other help than a Sanders' Fifth Reader.

For example: "When Freedom, from her mountain height," "saw Cassius' dagger fall" "mark how the blood of Cæsar followed it," "and while Olympian Jove" "frowned on the Numidian Lion," "Greece, with melting heart, paid homage to the gods," "And yet o'er all there crept the awful, all pervading gloom of oppressive tyranny, that never was uplifted until" "Freedom shrieked, and fought and won" "in bleeding Kansas," "and the American eagle smiled on all that woe."

Now, I submit whether there is anything in the above to prevent my being received as a genius, except the everlasting quotation marks, which take the laurels from my spotless brow and lays them on the graves of people who have been dead two thousand years, more or less. No! I'm opposed to this mock honesty, because minds are so alike in a great many respects that it would be quite natural for me to think of and express an idea something like what Pythagoras may have broached ages ago, and why should I credit him simply because he said it first? He don't need it and I do.

Let's go it alone. If I say something good, and you never heard it before, why, let your heart go out to me; and if you have heard the same thing by somebody else, be charitable.

The Latest Application of Electricity.—The Automatic (Fire) Signal Telegraph.

SINCE the time when Sir Walter Scott pronounced his eloquent eulogium upon James Watt, that "potent abridger of time and space," so marvellous has been the progress of invention in the improvement of the locomotive and the steamship, and particularly in the application of electricity through various stages of increasing serviceability, that its subject himself, hardly less than the "hard" who pronounced it, would be startled almost into incredulity by the audacious ingenuity which, in the most advanced nations, has completely transformed the aspect of their civilization. It is not our present purpose to yield to that fascinating temptation which would set us about stating in a detailed and sequential form what these developments and inventions are, but to call the attention of our readers to the latest, and, so far as we know, the most

interesting and surprising adaptation of human control over the electric fluid.

We are indebted to Mr. W. B. Watkins for this wonderful invention. This gentleman, originally a dry goods merchant in New York city, having for several years employed himself in the endeavor to discover some means of obviating the great damage done by water at fires, on account, chiefly, of the headway made before the possible arrival of appliances for extinguishing them, in the year 1870 procured his first patent for an invention by which a fire was itself made to give an alarm in its incipient stage, thus inducing the earliest possible use of the facilities already in employment for the purpose of putting out conflagrations. Between that date and April, 1873, he took out other patents for the protection of the several improvements he successively introduced, and during the following summer the Automatic (Fire) Signal Telegraph Company was formed, with the following officers and directors, who, by the way, all of them still hold their respective positions: President, John C. Beale; General Superintendent, J. E. Fenn; Directors—E. W. Crowell, David Solomon, J. Boorman Johnston, John C. Beale and Win. B. Watkins.

These gentlemen immediately entered into negotiations with the Committee on Fire Patrol of the New York Board of Fire Underwriters to secure a connection with that body, and arrangements were made whereby the Fire Insurance Patrol stations were constituted the terminal offices for the company's fire circuits, and since that time Mr. Watkins' invention has been employed as the most effective of recent accessions to the utility of this organization. The next few months were occupied in perfecting the system and apparatus of the company, and late in the fall of 1873 it commenced active operations.

Shortly after, the attention of the Board of Fire Underwriters being directed to this system, they, after careful investigation, became fully satisfied in regard to the benefits to be derived by the insurance interests from its general introduction, and accordingly adopted resolutions granting a reduction of insurance rates to all property protected by this company's apparatus.

Our readers are already aware that the Patrol is a body of firemen employed since 1839 by the Board of Fire Underwriters, and is an organization entirely independent of the city Fire Department. In case of fire they do their utmost to extinguish it, since the invention of Mr. Babcock's Extinguisher, by means of this contrivance; or, failing in this possibility, they protect, so far as they can, the endangered property by covering it with waterproof tarpaulins inside the building, or removing it into the street and protecting it there by the same means. It is plain that such an invention as Mr. Watkins' must be of incalculable value to this organization, and since its association with the Automatic (Fire) Signal Telegraph Company its usefulness has been greatly promoted.

An inspector in the service of the telegraph company is now to be found both night and day at every Fire Insurance Patrol, and his duties are to see to the instruments, and when a signal is given to communicate with the Patrol. He is anticipated in this latter duty, however, so far as indicating the necessity of the services of the Patrol goes, for the moment his bell commences to strike, the intelligent horses, who have stood ready harnessed, rush from their stalls, and the firemen have made ready to go out almost with the completion of the signal, which, as we shall presently see more particularly, gives not alone the street where the fire is located, but the number and which floor of the building is attacked. This is a great advance upon the capability of the Fire Department, which is yet dependent for signals altogether upon the old fashioned pole boxes, which merely indicate the district in which a fire has broken out.

But to explain more minutely by what means the wonderful results we have already indicated are brought about by the new Automatic Alarm: Let us suppose the case of a building in Broadway in connection with the Patrol in Murray street. It consists of five stories. Placed along the ceiling, at intervals of twenty-five feet in each of these stories, is a number of what are called thermostats. These are small instruments consisting of a brass tube, in which is placed a compound metallic coil, composed of two metals of unequal expansive and contractive power. By the action of heat upon this coil it expands until it touches an adjustable screw, which projects through the side of the tube. By this means a connection is formed with a galvanic battery through the wires by which the thermostat is connected with a larger instrument, called the transmitter, one of which is to be seen on every floor of the building. The electric current operating through a magnet in connection with the kind of clock work of which the transmitter partly consists, conveys a signal to the Patrol station. There slow beats of the bell indicate the street and number of the house from which the signal has come, and rapid strokes, immediately succeeding them, the floor. In short, all necessary particulars for the use of the Patrol are available in almost a flash from the time when the atmosphere of

any room in the building becomes heated to an abnormal degree. So sensitive, indeed, is the coil in the thermostat to heat that it can be adjusted to originate the signal at a temperature from 10 to 15 degrees F. higher than the average temperature of the room. Placing the thermostats in the ceiling, it is readily seen, is the best arrangement, not so much on account of the superior convenience as for the scientific reason that the heated air must ascend.

In addition to the leading advantages we have stated above, it is important to be remembered that no person can interfere with the wires in the slightest degree without giving an alarm at the Patrol station denoting the interference, not to speak of the impossibility of cutting or breaking them without detection. Any disturbance in the electric action, however occasioned, duly reports itself, and, if the cause is removable by human skill, is therefore promptly adjusted.

To practical men there can be no need of enlarging upon the eminent protection against fire afforded by the ingenious appliances furnished by the Automatic (Fire) Signal Telegraph Company. There are now in New York above two hundred and fifty business establishments in communication with their respective Insurance Patrol, and their number is being augmented at the rate of two or more per day. We are not intruding upon the province of the prophet in anticipating an (at present) incalculable use of the appliances we have treated, not alone in this city but in all great centres of population. It gives us much pleasure to make our readers in some degree acquainted with their nature and their use, and at this time it only remains for us to record our appreciation of the courtesy extended us by Mr. J. E. Fenn, Superintendent of the company whose name stands at the head of this article, in personally furnishing us with the materials necessary to its production.—*The New York Trade Reporter and Insurance Review.*

The Telegraph in Queensland, Australia.

FROM the report of Mr. W. J. Cracknell, Superintendent of Electric Telegraphs in Queensland, to the Postmaster General, made July 13, 1874, a copy of which has been forwarded to THE TELEGRAPHER, some instructive facts are derived relative to the progress of the telegraph in that colony.

He states that since the date of his last report the following extensions have been completed: From Maryborough, *via* Gin Gin, to Teneninging, a section of forty-eight miles of new line, and twenty-five miles of additional wire stretched on the existing poles between Maryborough and Gayndah.

A line from Gin Gin to Gladstone, 104 miles in length, was completed on the 27th of October last.

A line within the railway fences from Toowoomba to Dalba, fifty-two miles in length, was completed on the 24th of February last. This line consists of three wires. Iron poles are erected on the plains in order to secure the lines from the effects of atmospheric electricity, universally prevalent and destructive during the summer months on this portion of the Darling Downs.

A branch line from Gin Gin to Bundabug, 30½ miles long, was completed and opened for business on the 30th of last March.

A line from Springsine to Tambo, 144½ miles in length, was completed on May 27th.

A second wire, 177½ miles in length, has also been placed on the existing poles between Brisbane and Maryborough. This line was completed and opened on 24th of March.

All these lines are substantially built, in accordance with the usual specifications.

It will be seen from the above that the telegraph is making rapid and creditable progress in Queensland, as well as other Australian colonies. There are now in that colony 3,203 miles of line, 3,931 miles of wire, 74 stations in operation, and 181 officers permanently employed by the department. The first line erected in Queensland (25 miles in length), from Brisbane to Ipswich, was opened for public business on the 13th of April, 1861.

There are in course of construction the extension from Roma to Charleville, about 180 miles. A contract was entered into on the 4th of April for constructing a branch line of 120 miles from Roma, *via* Surat, to St. George, to be completed and handed over to the Government within eight months from the notification of the tender being accepted.

Arrangements were also entered into on the 16th of April for erecting a second wire on the line from Rockhampton to Burdekin, a distance of 493 miles. This wire is much required in order to relieve the overcrowded single line between these stations.

Other important extensions are proposed, for some of which provision has already been made and tenders for their construction invited.

The revenue of the Telegraph Department, from all sources, during the year 1873, was £27,143 11s. 1d. In this is included the value of messages on govern-

ment service, £6,386 12s. The expenditures, including refundments to other colonies of £1,811 15s. 6d., were £27,774 6s. 3d.—showing the expenditure in excess of revenue £630 15s. 2d.

156,608 messages were transmitted from the several stations during 1873, against 121,998 in the previous year—an increase of 34,610.

On the 1st of November, 1873, the tariff was reduced to a uniform rate of one shilling for ten words, exclusive of address and signature, and one penny for each additional word to and from all stations south of Bowen; press messages not to exceed half rates; and on the 10th of January last the reduced charges were extended to every station in the colony. A considerable reduction has also taken place in the intercolonial rates.

For the six months previous to the reduction of charges on the 1st of November last there were 58,542 paid messages transmitted, which produced a revenue at the rate of about £22,000 per annum. For the six months following the reduction in the charges the number of paid messages sent was 96,130—being an increase of 65 per cent. on the previous half year, for which the revenue received was at the rate of £20,000 per annum, thus showing that at present reduced charges have entailed a loss of revenue to the extent of £2,000 per annum. On the other hand, the expenditure necessary to provide for the increase of business at the principal stations is increased by about £3,400 per annum.

The Duplex Review Reviewed.

NEW YORK, August 19th.

TO THE EDITOR OF THE TELEGRAPHER.

AS A certain party seems to be airing himself and his patents through the medium of your paper at others' expense, will you, on the grounds of fair play, try to make room for a few words of defence by a "poor inventor," and allow me "to excite the curiosity of your many readers" by putting in type My Review—not "of this very recent and very unaccountable proceeding of our model Patent Office"—although I might explain how to do some things there which is simply on the principle that if you want anything done *do it*; if not, send—

But of the "Duplex Review" of one party, by name G. L., C. E.

It is no wonder he cannot understand "how they do some things," etc., as he seems to forget that at the U. S. Patent Office other inventors, as well as himself, are allowed patents for new combinations, improvements, devices, etc., etc.; but he must not forget that even if he has been "over twenty years in working out" a *failure*—that he does not own other people's brains, or that he cannot prevent other people from improving even *his* failures:

MY REVIEW OF THE DUPLEX REVIEW.

G. L. claims,	F. & R. claim,
Patent, April 9th, 1872:	July 14th, 1874:
"Dots and dashes may be indicated by a blank or a colored dot or dash."	"Dots and dashes distinguished by the space left."

In this same patent he says: "My invention, as distinguished from those that have preceded it, consists in an arrangement of shunt circuits in connection with the main line, whereby the circuit of the main line *always remains closed.*"

It will be plainly evident that Mr. L. simply divides into long or short breaks what would otherwise be, as he says, a continuous dark line, these breaks representing the dots and dashes of the Morse Alphabet. It is also evident that he does not use alternate negative and positive currents upon the line, but distinctly states, "whereby the circuit of the main line *always remains closed.*" Now, he says of F. & R.—and evidently he does not know what he is writing about—"dots and dashes distinguished by the space left."

Let us see if there is the least similarity. First, in L.'s patent, he alludes to the *receiving* paper, while F. & R. describe the fillet of paper specially perforated for *transmitting* the impulses of opposite polarities to operate a repeating instrument of special construction, and only claim just what they believe to be new, and never have been known to claim, knowingly, anything else. I think there is quite a difference between the two; and, besides, I find that L. says, in a patent of September 2, 1872, "This character of perforated paper is well known;" therefore, I cannot understand why he lays such great claim to it. Can you?

Patent, July 23, 1872.

"The recording device brought into action by means of perforations in one line, and the action arrested by the other line of perforations by currents of different polarity."

July 14, 1874.

"A fillet of paper perforated in two rows, each serving to transmit currents of opposite polarity."

In this same patent of July 23, 1872, he says: "Telegraph transmitting machines, such as Siemens' and Wheatstone's, have been used, in which two lines of perforations have been employed, and at the receiving station the recording device has been brought into action by means of the perforations in one line, and the action arrested by the other line of perforations."

I would say here that this alludes to the class of instruments known as ink writers, and it is evident that it is to this kind of apparatus that L.'s patent pertains and is adapted, too, and all that he had in view. And he further says he arranges the batteries and their connections so that their action is rendered more uniform; and, besides, in his "American fast telegraph system" he does not use electro-magnets to actuate *recording devices*, or, if he does, it cannot be *fast*; and, further, in quoting from F. & R.'s patent why does he not give it correctly, and add, "for the purpose specified?"

Now, can you tell me, Mr. Editor, why this party should garble the claims of F. & R. so that what we really do is not understood, and should seek to injure his neighbors by placing them in such a false position, in such a public manner, by pretending to show that they are claiming what he has done, when he admits, in his own patents, that what he is trying to show that F. & R. does does not belong to him?

Patent, Oct. 18, 1870.

The perforated paper itself, the means for operating the extra or "neutralizing circuit."

July 14, 1874.

A fillet of paper with two rows of holes. The extra row for the purpose of discharging or freeing a telegraph line or cable of "surplus electricity."

In this same patent he says: "Efforts have been made to introduce a reverse current to neutralize the remaining portion that makes the mark, thus rendering the mark sharp and distinct instead of attenuated." This is just exactly what L. tries to do, while F. & R. do not try to do this, and do not even once mention the neutralizing of the recording current. L. further says: "When the paper intervenes the two batteries act in opposition to each other and neutralize the action of that which sends the pulsation to make the mark at the distant station," clearly proving that he is simply patenting, in his judgment, an improved method of preventing tailing; and, in fact, he further says of his patent, in his duplex review:

Patent, Oct. 18, 1870.

"In a chemical telegraph to prevent tailings or blurs. Sets forth the use of the perforated paper itself, to effect this object immediately the paper intervenes to break the circuit."

July 14, 1874.

"In a chemical telegraph to prevent tailings or blurs showing upon the line, immediately upon each and every break in the circuit. A current of opposite polarity by the perforated paper fillet."

Still further, he says in his duplex review: "Automatic chemical telegraph—two currents act in opposition to each other and neutralize the action of that which makes the mark at the receiving end of the line. The perforated paper itself being the only means for operating the recording and the 'discharging or freeing circuit.'" Again falsely alluding to his patent—not quoting from it, as he does not even mention in his patent, much less describe the "discharging or freeing a line of surplus or unavailable electricity," or of the use of a discharging battery, but simply aims to neutralize the recording current to prevent tailings or blurs, as before set forth, and he only claims just what he does. Still later, in his patent of September 2, 1873, he says: "The coil, or condenser, absorbs the extra current, or tends to produce a reverse current upon the main line as the main line pulsation ceases, thus neutralizing the direct action of the extra current."

Now, Mr. Editor, if Mr. L. had achieved or invented what we have, or what he claims to have done in 1870, he never would have thrown away his money for such a patent as this of September 2d, 1873; but, even allowing that he did attempt to do what we have done, he simply tried to do it his way, and he did not try it our way, and I cannot see but that we have a right to patent a perfect, practical method or device if he has a right to patent an imperfect, impracticable one.

I might say much more on his review of F. & R.'s claims at this point, but I will pass on, as I have lengthened too much now, I fear, and still have two or three other points.

Feb. 26, 1873.

July 14, 1874.

"Plant's condenser, or secondary battery, is pre- ing battery at the receiv-

ferable for this purpose, or the condenser, or accumulator, as in application dated Oct. 1, 1872."

ing end of a line, for the purpose of freeing a line or cable of surplus electricity."

What astouishes me, Mr. Editor, in this reference, is that any person pretending to have been over twenty years experimenting, and pretending to such great knowledge, and to be one of the "scientific," should show such ignorance as to compare a condenser to the discharging battery, as described by F. & R.

The next points are where he alludes "to the combination of the receiving and transmitting drum—two or more styluses," and fails to show for what purpose they are—and his allusion to "two or more styluses insulated from each other, etc.," and inasmuch as their uses in both cases are widely different by the different parties. I think Mr. L. is far from just or honorable in "garbling" our claims in such a manner and putting F. & R. in such a false position, and I would repeat, for the benefit of Mr. L., that "those who live in glass houses must not throw stones;" for while I do not claim to be a "walking magazine," I do claim to know a "thing or two."

Now, Mr. Editor, while it may be "notoriously patent" that G. L. owns—nothing of any value, it has not been proved to F. & R. that their claims are owned by him.

CHARLES A. RANDALL,
35 Ann street, New York, N. Y.

One of my Electro-Chemical Problems.

TO THE EDITOR OF THE TELEGRAPHER.

In reference to my duplex review of the 10th inst., permit me to call attention to the following dates relating to a portion of my many specifications (some seventy) bearing fully upon the above subject, being one of several electro-chemical problems solved by myself—namely, the problem of how to neutralize a decomposing current in the chemically prepared paper of a chemical telegraph by the aid of the single row of perforations composing the telegram itself at the transmitting end of the line, or by one or more rows of perforations, and recorded in the archives of the various governments of Europe, Asia and America, and signed by me in the following order: August, 1870; August, 1871; November, 1871; May, 1872; June, 1872; September, 1872, and February, 1873.

The above specifications, involving the use, among many other salient features fully described and shown by models, as also by elaborate drawings, of a paper fillet having one or more rows of perforations and operating one or more insulated styluses, for the purpose of completing, breaking or neutralizing circuits in a chemical telegraph using a chemically prepared strip or fillet, or a sheet of chemically prepared paper.

This one of the somewhat "paradoxical problems" presented to my mind in the early part of 1869 consisted in how to open or close an extra circuit, or to transfer or throw upon a chemical telegraph line a neutralizing or opposing current by the use only of the same single row of perforations which go to make up the telegram itself. The (in this case) single transmitting stylus itself being made to perform that extra function controlled by the perforated row of symbols in the paper fillet by opening or closing an extra circuit, or by bringing into action an extra battery, so as to act in opposition to the battery used to make the mark in the chemically prepared fillet or sheet at the receiving end of the line wire.

The above problem was practically solved by me in the early part of 1870 between the cities of New York and Washington.

In my specifications of 1872 I also describe and show that if separate reverse currents are employed the paper is made with two rows of perforations. A portion of the instrument is shown adapted to receive a message. The pen may be used upon paper in place of the ordinary stylus to mark the pulsations by decomposition in the chemical paper. Two batteries are connected, so as to make the respective currents of equal force, or the force may be varied. Positive pulsations will be sent by one line of perforations and negative pulsations by the other line of perforations, and these will be alternated according to the position of the perforations in the paper, and these pulsations are to be of a character adapted to operate the receiving instrument at the distant station. The receiving pen or stylus may also be vibrated when chemical paper is used.

Geo. Little, C. E.

The Invention and Inventors of Automatic Telegraphy.

New York, Aug. 18.

TO THE EDITOR OF THE TELEGRAPHER.

I NOTICE in your issue of the 15th instant this question by "Peter Simple," "Can you tell me who the inventor of practical automatic telegraphy in this country really is?" I am led to ask if you or "Peter"

think that any one person can honestly claim to be the inventor of automatic telegraphy, even as it exists today? I am also led further to ask if there has yet been invented and developed a practical automatic chemical telegraph system?

I am well aware that G. L., who does not know "how some things are done," etc., as well as he ought to, at least, claims to have forty-three patents, and that it is "notoriously patent" to the whole scientific world (unfortunately that does not include your humble servant) that everything belongs to him; and also claims that, "under the guidance of a mysteriously beneficent Providence, he has been made a chosen instrument" in the discovery and development of telegraphy, "thereby rendering the same practically universal"—a statement that no one but G. L. believes, and which he has failed to demonstrate.

I am also aware that the great inventive humbug from Jersey—familiarily known at the Patent Office as a "model maker"—claims to have wasted a great many "consecutive nights" in perfecting automatic telegraphy, which resulted in accomplishing just what Mr. G. Grace had been doing for a year or two.

I am also aware that he has been reissuing other people's patents, but always to himself, and, as "Peter" says, "they are numerous, but their value is not so apparent."

I am also aware of the fact that the Automatic Telegraph Company, under the Lefferts, Little, Grace, Edison patents, manage to do very good and fast telegraphing on a circuit of about 300 miles, specially constructed for the purpose, and claimed to be the most perfect line in the country; but I am not aware of any system of practical automatic telegraphy by which could be done, for instance, the every day business of the W. U. Tel. Co., over its long lines and cables, branching to all parts of this country, at the same rate of speed that they do it, or even do it at all—and until this, at least, can be accomplished, automatic telegraphy is not practical to my mind.

If this has been or can be accomplished under any present automatic system, I should like very much to know it; and if you, Mr. Editor, or "Peter," or any of your many readers will enlighten me through your columns in regard to this, "I shall not feel hurt;" in fact, "there is nobody hurt," I hope, by such a proceeding.

INQUIRER.

Telegraphic Journalism Criticised.

CINCINNATI, OHIO, August 10th.

TO THE EDITOR OF THE TELEGRAPHER.

PERMIT one who is not accustomed to taking such steps as this to offer you a few words, which you may publish if you see proper.

Telegraph operators are emphatically a class. In comparison with the other trades and professions they are not less isolated than are engineers or printers, sailors or soldiers. Anything looking to the welfare, then, of the class—anything intended, even, for the improvement of their minds or the economizing of their money, should meet with the hearty support of every operator who desires his own improvement or wishes well for his fellows. A journal, ably edited by one in sympathy with those who are expected to be his patrons; one who knows the needs of "the boys," and who is able to provide for them; one possessing not only the power to manipulate the key, but who can also, from time to time, talk to his patrons intelligibly upon the science of his profession; one who can move among his fellows in the profession as a teacher, and who, in handling his pen, can make those to whom he talks feel that he is master of his subject—who, like Tyndall, knows of what he speaks; I say a journal ably edited by such a man, and devoted to sensible articles on scientific subjects and the standard literature of the day, should be and would be generously sustained.

It does not need any great amount of capital to carry on ward to success a really meritorious journal, no odds what its peculiar bias may be. In evidence I would point to a few examples: as a political newspaper, the *New York Tribune*; as a religious paper, the *New York Witness*; as a scientific paper, the *British Philosophical Magazine*. But, while it does not need much capital, it does need a large amount of brains, and of that penetration of judgment which will enable its conductor to understand, say, to anticipate the wants of his patrons, and that depth and breadth of solid acquirements and resources which will enable him to supply them all.

Now, as you will see by the enclosed clippings, the editors of the *Plug* (our new Cincinnati journal) (?) claim to have plenty of brain power, and that they expect to have plenty of capital the motto will abundantly testify: "In pocketo put nickelo." Its editors also recommend to "the boys," as a means of saving money, to subscribe for the *Plug*. What do you think of that for journalistic ability, in view of the merits of the paper, as they are apparent on its face?

Much of the space, you will see, is devoted to slurs upon operators who happen to make mistakes in send-

ing or receiving; a portion of the rest to innuendoes, intelligible, of course, only to the operators in this office, and an insult to them. We have several ladies in the way room, who are expected to read the paper. These claimed exemption from the personal column, but their names, also, are dragged into this issue in what I suppose the editor considers a delicate manner. You will find also an evidence of the classical erudition of one of the editors in the reference to the names of the ladies, under the caption, "Ohms." "Diana was a Goddess of War, Niobe was a Goddess of Notions," etc. (The capitals are his own.) How does that tally with your classical knowledge, Mr. Editor? Nearly on a par with the latinized motto: "In pocketo put nickelo;" is it not?

But enough. Pardon for the abuse of space in the review of such stuff. Please gird your loins in honest, scholarly journalism, and when the *Plug* shall have ceased to exist, may THE TELEGRAPHER be a thriving, robust journal.

NIHIL NAMELESS.

A Step in Civilization.

THE following despatch, dated at Buenos Ayres, was received last week at Washington from the President of the Argentine Republic:

"TO PRESIDENT GRANT.

There was general rejoicing in the United States when the first submarine cable was laid. At the close of my term of office I leave my country in communication with all nations. The Argentine Republic is now at the gates of the United States. I greet President Grant.

SARMIENTO,

President of the Argentine Republic."

The fact which is thus officially announced to the world is one of universal interest. It is a step in the progress of civilization on the American side of the Atlantic, and one which is well fitted to awaken the satisfaction and pride which President Sarmiento evidently feels in the accomplishment of so great a result. It is something to mark his administration and to make it famous in all future time. The Argentine Republic is brought into immediate communication with all nations. It is no longer an isolated and remote league of South American States stretching across the continent, but a member of the great family of civilized nations, and cemented by closer ties than ever before with the interests and the intelligence of the civilized world. All that may hereafter happen to the fortunes of mankind in any country will immediately be known there, and its people will be linked by new sympathies to every other people on the globe. "The Argentine Republic," as its President well says, "is at the gates of the United States." It is also at the gates of every other nation.

We are too apt to estimate events by the noise they make, or by the material changes they produce. No doubt many a battle in the recent war of the Argentine Republic has been thought to be of far greater consequence than this opening of telegraphic communication with other nations and with distant parts of the world. But, estimated by a true standard, this latter event rises to an importance which transcends almost any other in Argentine history. Its influences will last and continue to be felt in the condition and progress of the people when that of most others will have ceased. The telegraph is a great educator of a people, and when it is connected with the wider communications of the world, it does what no other agency is able to do for diffusing information, for quickening intelligence and for promoting civilization. Knowledge feeds and strengthens the desires which it gratifies. When thus brought to a country from any part of the world, it stimulates inquiry and leads to every kind of mental activity. So will it be with the people of the Argentine Republic. They will be brought under higher influences than they have known before, and will be forced into new sympathies with all human interests and concerns. Well, therefore, does President Sarmiento announce the event to the world with congratulations and rejoicings, as the crowning glory of his closing administration, and as marking an epoch in the history of the Argentine Republic.—*The Providence Journal*.

At a meeting of the Globe Telegraph and Trust Company the accounts were adopted and much satisfaction expressed at the progress the trust had already made in the estimation of investors—the market value of the trust shares being considerably higher than those of the companies of which it is composed. A resolution was passed requesting the board to take immediate steps for bringing in the Eastern, Eastern Extension and other companies to this amalgamation, in which companies the Globe has already a large and preponderating influence. Considering the large holding of the Globe in these companies, and the fact that the directors are practically the same in each undertaking, it would appear that considerable advantage would result to the shareholders from a complete absorption of these undertakings.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, AUGUST 22, 1874.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Back Numbers Wanted to Complete Files.

THE supply of the following numbers of THE TELEGRAPHER is exhausted, and we are desirous to obtain them to complete files of subscribers. Any one who may have either of them that can be spared will confer a great favor if they will forward the same to this office:

Vol. IX, No. 341.....	5 copies.
“ “ “ 342.....	4 “
“ “ “ 351.....	2 “
“ “ “ 352.....	1 “
“ X, “ 391.....	6 “

A Friendly Talk with our Readers and Correspondents.

We have devoted considerable space during the last three or four weeks to the discussion of certain so-called telegraphic inventions and inventors, and, we think, not unprofitably. Any supposed or pretended invention or inventor which, or who cannot stand discussion and investigation, is a fraud or an ignoramus, and the sooner effectually disposed of the better. In the cause of justice and equity it is not unfrequently the unpleasant duty of the conductor of a publication of the character and standing of THE TELEGRAPHER to expose and condemn pretensions which are not based upon a proper foundation. It is not always the case that such unfounded claims are made in bad faith, or with intention to deceive—the deceivers are very often self-deceived. For these we have sincere compassion, and, if we could properly do so, would shield them from the disappointment and mortification which must follow the demonstration of the baselessness of their claims and expectations. For those whose only aim is

to knowingly impose old and practically useless devices as new and valuable inventions, or who are guilty of the baseness of appropriating or attempting to appropriate and claim for their own the inventions and discoveries of others, we have only contempt, and experience pleasure in showing such up in their true colors. It is one of the objects of THE TELEGRAPHER to do this, and we flatter ourselves that the duty has of late been efficiently performed.

We trust that there may now for a time be a cessation of this kind of thing, and that we may be permitted to devote our columns to more pleasant if not as exciting themes. With the close of the summer season and the opening of the fall the general interest in telegraphic topics among the great body of the telegraphers of the country will revive, and we hope that our former correspondents and new ones will favor our readers with their contributions, to diversify and make more interesting the columns of the telegraphers' paper. All will be heartily welcomed, and their assistance and coöperation duly and gratefully acknowledged.

There are, undoubtedly, many topics and subjects of importance and interest, the discussion of which would add to the attractions of the paper. To develop these we must rely upon the assistance of our friends. Any suggestions in this direction will be cordially received. A contemporary thinks we devote too much space to "self-laudation." If this be so it is a grievous fault, undoubtedly, and one which we should be very happy to correct. Honest criticism of the paper we are glad to receive, and act upon, if convinced that it is correct. We have often derived benefit from such criticism, and would invite rather than repel it.

We should feel under special obligation if each of those of our readers engaged in practical telegraphy would inform us of anything occurring within their knowledge or circle of information which would be likely to interest, instruct or amuse the fraternity. It may be that more of this kind of information would increase the value and interest of the paper to the large number of telegraphers. If we do not give more space to it, it is for lack of available material. The active coöperation, in this respect, of the fraternity and others would be duly appreciated. We do not, however, regard the statement that "Tom Smith, of the Squedunk office, has dyed his moustache," or that "Peter Jenkins, of our staff, has become, by hook or by crook, the possessor of a new tile," or that "Billy Jones is a great fellow for the girls, and spends his time in cultivating his elegant side whiskery and soaping his locks for the benefit of the handsome daughter of his landlady," etc., etc., *ad nauseum*, as a style of literature calculated to either interest intelligent telegraphers or add to the dignity or influence of any publication—telegraphic or otherwise.

Those who are pleased with such trash must be too weak in their intellectual developments to appreciate anything of real value and importance; and, of course, we are not surprised when we are informed that they consider THE TELEGRAPHER too dull, and as giving too much space to scientific and other heavy reading to suit them. We regret to be obliged to recognize the fact that there are among those claiming to be telegraphers individuals so affected with lack of intellectual development or mental paralysis, as to prefer such a style of journalism, but, unfortunately, it is a fact. For this class we have no inducement to offer to secure their approbation or support. But for those who aspire to increase in knowledge and usefulness we have the vanity to believe that this paper is not published in vain, and we know that nothing would sooner cause them to fall away from and despise it than for us to permit its columns to be filled with such drivel and inanity. Innocent and harmless fun, wit and incident are always welcome, as the spice to the more solid and serious matter which must necessarily predominate; but these are essentially unlike what we have attempted to portray.

Without further extending the present friendly talk with our readers, we will conclude with a general invi-

tation to favor us with their criticism of the management of the paper, and with their coöperation with us in improving it in the future.

Telegraphic Journalism.

THE TELEGRAPHER some time since published an editorial on the subject of newspapers of the telegraphic persuasion, and after noting the demise of *The Switch*, gives a side rap and motherly note of warning to *The Operator* and *The Plug*. THE TELEGRAPHER very kindly goes on to show that in its estimation there can be but one paper, and that THE TELEGRAPHER. We don't exactly see it in that light. We do know that THE TELEGRAPHER has done and is doing a good deal of good. We have always felt kindly toward it and its success, but we do not deem it the *ne plus ultra* of telegraphic journalism. We think it has given too much of its space to advertisements and its own laudation, and consequently less consideration to other more interesting topics, when in justice to its readers it should have given more. It asserts that "it requires capital and journalistic abilities to run a newspaper." That's just it exactly. Now it strikes us that had there been any one in that office struck by the lightning of journalistic ability, and bloated with capital, so to speak, it would not have taken years to place the paper on a paying basis, and a national union to start it. We have capital—to get—from our subscribers, of which we have a goodly number. We are prepared for quite a siege, and if our friend of THE TELEGRAPHER will garnish his editorial columns with new matter, we will call things square, otherwise we shall apply to him for the stereotyped copy of his favorite theme, "The future success of THE TELEGRAPHER," and publish it once per month free of charge.

The above, from *The Plug* of August 1st, should have received attention sooner but that our exchange copy failed to reach this office, and we might never have known how severely we had been lectured had not a Cincinnati correspondent sent it to us as an illustration of his criticisms, which we print in our correspondence columns.

We regret very much that our remarks above referred to should have so greatly displeased our friends, the publishers and editors of *The Plug*. We had no intention of hurting their feelings or casting reflections upon their enterprise, which has our sincere good wishes for its success. We have shown our appreciation of *The Plug* by copying liberally from its columns, and *crediting* what we have copied.

We have never claimed for THE TELEGRAPHER that it was "the *ne plus ultra* of telegraphic journalism." On the contrary, we are quite as conscious of its defects as anybody else can be, and are striving to correct and remedy them as far and as fast as possible. We regret that our success in this respect has not been satisfactory to *The Plug*, but we are determined not to become weary of well doing, and shall continue our efforts at improvement.

That we have given a good deal of space to advertisements is true; and how long do our friends of *The Plug* suppose THE TELEGRAPHER, in its present size and form, and at its subscription price, could be otherwise maintained? The price received for THE TELEGRAPHER will not average four cents per copy, while our friends of *The Plug* charge ten cents for their small sheet, and, we presume, get it. The subscription price of THE TELEGRAPHER does not pay the actual cost of composition, press work and paper within fifty per cent., and we must either double the price or continue to offend *The Plug* by filling a portion of our space with advertisements. As for "self-laudation," it is perhaps more modest for us to say nothing; but we hope that what we have said in commendation and explanation of THE TELEGRAPHER is no more than is warranted by the facts, and that it may be forgiven us for the past and future, as we fear that we shall be compelled to repeat our offence occasionally.

But what seems to have particularly disagreed with *The Plug* is our remarks, which it misquotes: "Newspapers grow, seldom springing into immediate profitable existence, and require to insure permanence and success, capital, enterprise, energy, and, at least, some journalistic experience." We were not connected with THE TELEGRAPHER during the first four years of its publication, and, therefore, do not apply personally the sarcasm of our contemporary. We are not overburdened

with capital, as we are too painfully aware, and as for journalistic ability we leave to our readers to judge on that point; but had it not been for the capital furnished by the National Telegraphic Union the paper could never have been established, and it never paid the cost of publication until it came into the hands of its present publisher. We are willing to concede that it probably does not require a very large amount of capital to maintain *The Plug*, and as for journalistic ability, we have no doubt our friends, SELDEN and MATTOON, have sufficient for the purpose. Let us have peace.

The Conundrum Evidently too Difficult.

ANOTHER issue of the official organ has appeared, and still no attempt is made to answer the request for information in regard to the duplex invention of Mr. STEARNS, contained in a previous issue of THE TELEGRAPHER. It is evident that our editorial friend, who was so last in making the little raid upon THE TELEGRAPHER (the only one ventured upon for several years in that paper), regrets the temerity, and finds the conundrum propounded altogether too difficult to venture upon a response. The exhibition of so little knowledge of the duplex as to claim for our mutual friend STEARNS what he expressly disclaimed in his patent as the invention of SIEMENS and HALSKE, makes it appear less strange that there should be a wholesome disinclination to attempt anything further in connection with that subject. If, however, the writer has anything more to say we should be happy to hear it, and will try to give him any further information that may be required to enlighten him on the duplex inventions of Mr. STEARNS or others.

Too Many Telegraph Students Taught.

We are constantly in receipt of communications, the substance of which is a reiteration of the complaint that there are too many telegraphic learners for the benefit of those engaged in the business, and that these, as soon as they can manipulate a key or read telegraphic signals, are not only willing but eager to obtain situations at a rate of compensation which will exclude from the business those who are qualified to do credit to it by their superior ability and acquirements. There is undoubtedly a foundation for these complaints, but how the difficulty is to be remedied is not quite so easily to be ascertained. Most of our correspondents referred to have an indefinite idea that in some way a telegraphers' association will do the work, but exactly in what manner they fail to indicate. If such an association could be established, which should include a large majority of those already in the business, it would undoubtedly have an influence which would be felt in the determination of who and how many should engage in telegraphy. All attempts hitherto to establish such an organization have resulted in failure, and we do not recognize at present any such general interest in, and self-sacrificing disposition for the establishment of a new one as shall give assurance of success. The fact is, and it may as well be plainly stated, each one is waiting for some other to initiate the enterprise, and the number who would enroll themselves in the ranks, and bear the burden and encounter the personal disadvantages likely to result, is not very great. The mere ability to manipulate a telegraphic key and to read telegraphic signals is too easily acquired, and is too generally accepted as constituting an operator, to enable telegraphy to become a close corporation. Telegraph companies, railroads, and employers of telegraphic labor generally, believe that the larger the number of so-called telegraphers the more independent they are, and the more cheaply will the work be done. As an abstract proposition this is undoubtedly correct, but when we take into consideration the varied and important interests which are necessarily and unavoidably entrusted to the ability and fidelity of telegraph operators, we believe that the indiscriminate employment of low priced telegraphic labor is not really economical. In the push and hurry which characterizes the age and the American people, the

price and quantity, rather than the quality of the work done, is the chief consideration.

We agree with our correspondents mainly as to their premises, but must confess that we are as unable as they are to point out, any more than we have done heretofore, an effective remedy for the evils complained of. If any of our readers have or think they have solved this difficult problem, we should be pleased to hear from them, and to ventilate their plans and ideas through the columns of THE TELEGRAPHER, premising, however, that if merely *talking* of the advisability and feasibility of a telegraphic organization or association would have remedied the evil, it would not now have an existence. Let us then have something practical, not mere speculations as to what could, would or should be done.

Personals.

Mr. GEO. W. RAILTON, formerly of Meriton Junction, Ontario, Canada, has accepted the appointment of agent of the Great Western Railway at Buffalo, N. Y.

Mr. JOS. W. BURNHAM may still be found at his old established general railroad and steamboat ticket office, Fifth Avenue Hotel, New York. His long connection with the telegraph interests have made him well known to the telegraphic fraternity, and his deserved popularity with the travelling public generally insure him recognition and patronage, notwithstanding the efforts of the managers of the through transportation routes to prevent the sale of their tickets through private agencies.

Mr. J. D. LARCOMBE, formerly of the Syracuse, N. Y., Atlantic and Pacific office, has accepted a situation with the Western Union Company, at Washington, D. C.

Mr. GEO. C. HARPER, of Albert Lea, Freeborn County, Minnesota, desires to learn the present address of Mr. JOHN H. POWERS, formerly of Penfield, N. Y., and who, when last heard from, was in Iowa.

The Telegraph.

Congratulations.

THE President has sent the following telegrams to the Presidents of the Argentine Republic and of Uruguay, in response to their messages of congratulation on the completion of the cables between South America and other countries:

"EXECUTIVE MANSION,
WASHINGTON, August 10th, 1874. }
TO THE PRESIDENT OF THE ARGENTINE REPUBLIC.
I heartily congratulate your Republic upon the completion of the work which brings the South American nationalities into immediate communication with each other and the balance of the civilized world. It is an important step in the interests of commerce and of good fellowship between nations and peoples.

(Signed), U. S. GRANT."

"EXECUTIVE MANSION,
WASHINGTON, August 10, 1874. }
TO THE PRESIDENT OF URUGUAY.

I send the warmest congratulations on the completion of the telegraphic line that connects your country with not only the United States of North America but most of the civilized nations of the world. May this new means of communication cement the present cordial friendship into the most permanent form.

(Signed), U. S. GRANT."

Foreign Telegraphic Notes.

THE Great Eastern will next week leave the Medway for Newfoundland, with the object of laying a sixth cable from that coast to Ireland for the Anglo-American Cable Company. This will be the first occasion upon which the laying of the cable will have commenced from the American coast. Captain Halpin will again command the ship, and the chief of the electrical staff on board will be Mr. Law.

Reuter's Telegram Company announce that they are prepared to undertake the transmission of private telegrams for South America of one word and upwards at reduced rates.

After an ineffectual effort to take the first of the deep sea soundings for the Sydney and New Zealand cable the ship Challenger returned to Sydney, N. S. W., through stress of weather. Five days elapsed before she again resumed her work, the results of which were soon expected. The other cable route to which the credit of the colony is pledged has been already surveyed, and as soon as the contractors are ready to lay it from Banjowangie to the Gulf of Carpentaria they

will find the Queensland Government officials at the latter place ready to receive it and connect their land lines.

An official memorandum, dated July 27, from the Eastern Telegraph Company (Limited) states: "This company's direct cable to Lisbon is repaired, thus restoring submarine telegraphic communication with Portugal, Gibraltar, Malta, Egypt, India and the far East."

The Eastern Telegraph Company have notified that their Vigo-Lisbon cable, which was interrupted by the steamship Chimborazo last week off the river Tagus, is now repaired, so that the whole of the company's lines are in perfect working order.

The Western and Brazilian Telegraph Company (Limited) have received intimation that the land lines connecting Rio Grande do Sul with Montevideo will be open for traffic about the 30th inst. Through telegraphic communication will be thus effected between Europe, the River Plate and the west coast of South America. The anticipated delay to through messages for Montevideo, Chili, etc., occasioned by the loss of the steamship Gomas with the Rio Grande do Sul and Chuy cable will thus be obviated.

A new cable between Shetland and Orkney has been successfully laid by the steamer Caroline.

A news report from Kingston, Jamaica, of the 10th inst., states that the submarine telegraph cable between Cayenne and Demerara will not be completed before October. The cable steamship Hooper will return to London for an additional supply of cable to duplicate the line between Demerara and Jamaica.

The Telegraph in Japan.

IN a brief account of the progress of the telegraph in Japan, printed in THE TELEGRAPHER of May 30th last, it was stated that Mr. Thomas J. Larkin was the superintendent of telegraphs in that country. This was not exactly correct, as his actual position is that of assistant superintendent of telegraphs (of which class of officials there are five), with headquarters at Kobe. The position of superintendent-in-chief of Government telegraphs in Japan has been conferred upon Mr. E. Gilbert, of Glasgow, Scotland, telegraph engineer to the North British Railway Company. Mr. Gilbert, who is a practical telegrapher, is also known as the inventor of a system of electrical communication in trains, and other electrical inventions.

The Government telegraph lines of Japan extend or are being extended from Tokyo to the north of the island of Nippon, and will shortly be connected by a cable with Hakodadi, in the island of Yesso.

It was also erroneously stated in the paragraph referred to that the galvanized iron wire used was made in Japan, which is not the fact, it being imported.

Before the present telegraph staff was engaged for the Japanese lines (in 1871), Mr. Gilbert, a nephew of the gentleman who has now been appointed Superintendent-in-chief, was employed by the Government, and built the first telegraph in that country that connecting Yokohama with Tokyo, and Kobe with Osaka.

The Duplex System on Long Submarine Telegraph Cables.

IN THE TELEGRAPHER of July 18th was reprinted from *The Telegraphic Journal* the substance of a letter from Mr. C. V. De Sauty, claiming to have succeeded, after fourteen months of experiment, in solving successfully the problem of applying the duplex system to the working of long submarine telegraph cables. In the number of *The Telegraphic Journal* for August 1st, Mr. B. Smith, of the Eastern Telegraph Company, under date of Malta, July 10th, contests the impression conveyed by Mr. De Sauty's letter of priority in successfully applying the duplex to such cables. He says:

"Mr. De Sauty is to be congratulated on his success after so long a period as fourteen months of experiment. Permit me, however, to point out that Mr. De Sauty's is not the first solution of the problem of submarine 'duplex' telegraphy, as applied to long cables, as would seem to be claimed by his letter.

On my arrival at this station in June, of last year, I found Mr. De Sauty here experimenting on the matter. The instruments used at both ends were Thomson's 'recorders,' and Mr. De Sauty found, on charging and discharging the line, that a sudden jerk of the syphon took place at the home end, which he called the 'kick.' All his attempts to neutralize this having failed, on the 6th of July he returned to Gibraltar, expressing his fear that this difficulty would prove fatal to the success of the system.

After Mr. De Sauty's departure I selected one of the Company's Alexandria cables on which to experiment, as, having duplicate cables, the traffic would be less

interfered with than had the Gibraltar cable been chosen.

Foreseeing that the first subject to which attention should be directed was the 'kick,' my experiments were made with a view to ascertaining its cause and the means of removing it. This difficulty being overcome, I anticipated no obstacle to the practical application of the system to the company's lines. I eventually succeeded in readily producing or nullifying it at pleasure, and on the 22d July, 1873, I had the pleasure of informing our London Head Office that I had succeeded in working the 'duplex' system between our Malta and Alexandria stations—a distance of 911 nautical miles. As a test of the arrangement, the cable was kept connected up for the 'duplex' during the whole of the 21st of that month, for a considerable portion of which time the traffic was passing on the 'duplex' system.

Of course success on such a length of cable rendered success on any other line of approximately similar length—such as the Gibraltar-Malta cable—a mere matter of adjustment; but, in order to satisfy myself, I, at the commencement of September, transferred my arrangements to the Gibraltar cable, and had the satisfaction of reporting, on the 3d of September, that signals, as nearly perfect as possible, had been transmitted between here and Gibraltar on this system.

Nothing but lack of sufficient apparatus has prevented the system being established on the company's lines for months past.

As my experiments were made in the Eastern Telegraph Company's interests, solely at their expense, and with their cables and apparatus, I did not consider myself at liberty to make public, through your *Journal*, the means by which I had attained success; but I may incidentally mention that a full account, with a drawing of the *modus operandi*, was sent to Mr. De Sauty at the time.

I do not wish to impugn Mr. De Sauty's claims to originality, as I do not doubt his plan will be found different to mine. My object in writing is to correct the impression his letter is calculated to produce—that Mr. De Sauty was the first to successfully apply the 'duplex' system to long submarine cables."

The Pleasures of Telegraph Construction in Central America.

THE following extract from a letter just received will illustrate the comfortable pleasures of erecting telegraphic systems in Central America:

"I have just returned from a trip to Quesaltenango and Retalhuela. My nose got the worst of the journey, strongly resembling the starboard light of a passenger steamship; it was an object of remark until to-day, when it toned down about 50%, and now looks as if it had been frostbitten, or amongst fish, it is so scaly. I enjoyed the trip very much, with exception of about seven leagues of the road between Quesaltenango and Retalhuela, one half of which is a mountain pass or gorge and the other a mountain water course. My horse almost gave up the ghost in making the passage, and the mules seemed very much disgusted. Only a cat could thrive on such a road, and then, perhaps, not without a pack of bull dogs after it, to make her jump from rock to rock easily. I have the consolation of knowing that the force of the swearing which I indulged in while struggling amongst the rocks, and swimming the streams, was so great that the whole country has heard of the elegant language I gave birth to, and am in danger of being invited to do the 'cussing' for every bad road in the country. From this we started on the journey on land 4,500 feet above the sea, rising and diving each day by the thousands of feet. One day we travelled over 50 miles of pine clad hills, averaging 10,000 feet above the sea level. One of our stopping places, Los Escuentros, is a young Canada in winter time for these parts. I think the thermometer must average about 40° at night—a low temperature for people accustomed to 30 and 40 degrees higher. The country charmed me, much of it being under cultivation, and I saw plenty of wheat, potatoes and beans growing. Lake Atitlan is beautifully situated and quite attractive. I saw some of the *cafetales* (coffee estates) of the Costa Grande, but none of the celebrated *fincas* (farms). Those I saw, however, satisfied me of the extraordinary productiveness of the soil, most of the trees being actually borne down by the weight of the beans upon them. Many of these I saw must have had as much as six pounds."

RECENTLY a Michigan judge went to a neighboring town to see a man, and telegraphed back to his wife, "Have found Garland; won't be home in a week." When the despatch reached her it read, "Have found girl, and won't be home in a week." Here let us draw a veil.

It is only by the thorough study of details and their mastery that one can hope to attain eminence or position in any profession.—GRAHAM SMITH.

The Telegraphers' Mutual Benefit Association.

ASSESSMENT No. 66, ISSUED AUG. 14, 1874.

DEATH OF THOMAS A. ENGLISH AND ROBERT B. DILLON.

THOMAS A. ENGLISH (Certificate No. 1682, issued November 25, 1872) died at Covington, La., June 18, 1874, of consumption.

Robert B. Dillon (Certificate No. 2060, issued June 11, 1873) died at New Orleans, La., July 19, of consumption.

Members holding certificates numbered up to and including No. 2262 will remit for the above assessment.

By the policy adopted at the last annual meeting a balance appears in the hands of the treasurer sufficient to pay the assessment which would otherwise have been called for on one of the two deaths now announced. Only one assessment of one dollar, therefore, is called for, the other to be paid from the funds of the association. After payment of this latter claim there will be still in the hands of the treasurer, as the permanent fund of the association, about \$3,000.

ASPINWALL.—At Troy, N. Y., Aug. 11, 1874, to C. ASPINWALL, manager of the Atlantic and Pacific Telegraph, a son.

Married.

FAULCONER—HACKETT.—At Yorkville, S. C., August 12, 1874, Mr. W. E. FAULCONER, manager of the Atlanta, Georgia, office of the Southern and Atlantic Telegraph Company, to Miss ADA E. HACKETT, of Yorkville.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, a \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.
