INDEX TO VOLUME X.

EDITORIAL.

Appointment of H. H. Ward, Secretary and Treasurer of the Gold and Stock Telegraph Co.	11
An Old Friend in a New Dress	11
Arguments in Favor of and Against Telegraphic Monopoly, The	22
Another Atlantic Cable Telegraph Company Proposed	41
An Excellent Appointment—L. N. Jacobs	42
American Fire Alarm Telegraph, The	42, 95, 239
An Entertaining Firm	47
An Unwise Policy	52
An Excess of Telegraphic Labor	58
Annual Announcement of Packard's Business College	65
Automatic Signal Telegraph, The	77
Advertising Patronage of THE TELEGRAPHER	83
Another Atlantic Telegraph Cable Interruption	94
Alliance between the Western Union and American District Telegraph Co.'s	100
A Sad Affliction	106
Agents for THE TELEGRAPHER	107
Automatic Telegraph Company, The	125
Arrival of President Orton	130
A Liberal Response	130
An Error Corrected	130
Another Atlantic Cable Completed	167
Automatic Telegraphic Inventions	178
Automatic	196
American Electrical Society, The	233, 250, 256, 263
Automatic Telegraphy not Inimical to the Interests of the Telegraphic Fraternity	280
Atlantic and Pacific Telegraph Company, Executive Changes	287
Approaching Session of Congress, The	287
A Journalistic Nuisance	287
American District Telegraph Company Volunteers	287
Annales Telegraphiques	299
American Journal of Science and Arts	299
A Reform Needed in our Patent Laws	305
Active Telegraphic Competition Probable	310
Bliss, George H. & Co.'s Telegraphic Manual	53
Brooks' Insulators	65
Bliss, George H. & Co.	89
Business and Telegraphic Prospects	250
Consolidation and Telegraphic Competition	16
Congress and the Postmaster General	17
Chance for a Little Civil Service Reform	23
Conspiracy to Oppress Telegraph Employés. A Real Grievance	28
Chains of the Page Patent, The	42
Congress and the Patent Office	71
Correspondence of THE TELEGRAPHER, The	82, 88
Currency Inflation Question, The, and Telegraphic Prospects	106
Congress, Inflation and the Telegraph	130
Congress and the Telegraph	154
Completion of the Euro-Brazilian Cable	154
Cincinnati Industrial Exposition of 1874, The	166, 185
Chance for Inventors, A	167
Cable Telegraph Enterprises	208
Congress and the Postal Telegraph	221
Change of Location and Business	251
Chester's New and Superior Register and Relays	262
Champion Burglar Alarm and Annunciator	287
Close of the Tenth Volume of THE TELEGRAPHER	310
Comparative Cost of Telegraphic Systems	311
Death of Prof. De La Rive	11
Discouraging Experience of a Friend of THE TELEGRAPHER	23
Destructive Sleet Storm, A	23
Domino Telegraph Co., The	47
Deficiency in the Postal Revenues, The	53
Dull Business Season, A	76
Defective Postal Arrangements	137
Decision of Judge Drummond, The	184
Direct United States Cable, The	191, 269
Deserved Promotion and Excellent Appointment	239
Departure for California of Dr. L. Bradley	275
Direct United States Cable Fleet, The	287
Electric Watch, Clocks and Dials	42
Elementary Principles of Electrical Measurement	65
Editor and Telegrapher in Luck, A	142
Extension of the Telegraph in Central and South America	196
Encouraging Telegraph Prospects	220
Effective Way to Do It, The	220
Encouraging	226
Edison and Prescott Organs, The, and Past Systems of Telegraphy	232
Excellent and Successful Telegraphic Management and the Result	263
Eleventh Volume of THE TELEGRAPHER, The	305
Financial Utopia, The, How it is Likely to Affect Telegraphic Interests	88
Farce Played Out, The	136
Fourth of July, 1776 and 1874. Progress and Improvement since the U. S. became a Nation	160
Failures to Receive THE TELEGRAPHER Regularly	185
Friendly Talk with our Readers and Correspondents, A	302
Friendly and Complimentary	215
Fairy Electric Engine, The	269
Gray's Telephone	184
Gold and Stock Telegraph System to be Introduced in Canada	227
Getting Up a Newspaper Under Difficulties	256
Hubbard Telegraph Monopoly, The	28
Hubbard Bill, The, Reported in the Senate	88
Hale, Hon. Eugene, Declines the Office of Postmaster General	161
Holiday Season, The	286
International Free Exhibition of Arts and Manufactures	11
Impeccious Telegraphers	17
Industrial Monthly, The	23
International Review, The	61
Illustrated Annual of Phrenology and Physiognomy, The	65
Important to Telegraph Instrument Makers	65
Improvement in the Offices Provided for Telegraph Business, The	118

Illness of Mr. F. L. Pope	118
Interests of THE TELEGRAPHER, The	119
Improvement in Business and Telegraphic Prospects, The	148
Inducements to Engage In, and Objections to Telegraphic Service	242
Indications of Renewed Prosperity to Telegraph Interests	248
Justice to Military Telegraph Employés	246
Largest Piece and Largest Coil of Telegraph Wire in the World	53
Lightning and Thunder All Around	142
Lightning and Lightning Arresters	167
Lightning Rods and the Protection of Buildings from Lightning	214
Laying of the New Cable. Reports of Direct Cable being Sold to the Anglo-American Teleg. Co.	215
Liberal Contribution to Reserve Fund T. M. B. Association	287
Literature	311
Migratory Proclivities of Telegraphers, The	53
More Startling Inventions for Rapid Telegraphing	172
Marvelous Character and Achievements of the Electric Telegraph	226
Marine Telegraph Bill of Canada, The	227
Metallic or Lead Battery, The	290
New Year and the New Volume of THE TELEGRAPHER, The	4
New Volume of THE TELEGRAPHER, The	34
New Feature, A	53
New Style of Telegraphic Journalism, A	65
New Atlantic Cables, The	106, 113, 136, 185, 221
New Uniform of the A. and P. and Franklin Messengers	112
New Telegraph Cables in Progress and Proposed	124
New Compulsory Education Law, The, and the Telegraph Messengers	124
New Telegraphic Establishment, A	137
Necessity for a More Thorough Education of Telegraph Operators	190
New Telegraph Line to Sandy Hook, The	221
New Law in Regard to Postage on Newspapers, The	280
New Postmaster General and the Telegraphs, The	280
Not Exactly the Fair Thing	298
Operator The	71
One more Unfortunate	89
Our new Advertisements	280
Our Washington Correspondence	293
Postmaster General and the Western Union Telegraph Co., The	4
Postmaster General and Mr. Orton on Automatic Telegraphy, The	10
Patent Insulated Telegraph Wires	17
Public Ledger a manac, The	18
Page Patent Litigation, The	28, 47, 53, 262
Prospects for Telegraph Business, The	52
Present Condition of Telegraphs, Telegraphers and Telegraphic Service, The	64
Popularization of Cable Telegraphy	77
President Orton Gone Abroad	82
Presentation to Mr. S. C. Rice, of Albany, N. Y.	82
Proposition for a Society of Electricians and Telegraph Engineers, The	112
Personal Talk with our Readers, A	118
Progress of the New Lines of the A. and P. Telegraph Company	161
Pope, F. L. & Co., and their Specialties	161
Policy, Creed and Practice of THE TELEGRAPHER, The	238
Proposed New Electrical Association, The	244
Put Your Telegraph Lines in Order for the Winter	245
Phillips' Insulated Wires	251
Premium Awarded to the Brooks Insulator	251
President Orton's Annual Report to the W. U. Stockholders	262
President Orton's Reports to the Directors of the W. U. Telegraph Company	311
Quick Cable Telegraphing	41
Quiet Along the Lines	208
Railroad Telegraphers and THE TELEGRAPHER, The	5
Rumors of Future Telegraphic Combinations. How a Consolidated Opposition may be Profitably Managed	40
Recent Test of the Automatic Telegraph System, The	41
Rapid Increase and Extension of Cable Telegraph Lines	70
Railroad Telegraphs	82
Return of President Orton	125
Resignation of Mr. H. L. Hotchkiss	125
Resignation of Postmaster General	160
Resignation and Appointment of Superintendent N. Y. Fire Alarm Telegraph	173
Rumored Sale of rival Telegraph Lines to the W. U. Co.	226
Reminiscences	233
Resignation and Appointment of Albany, N. Y., Fire Alarm Telegraph	239
Resignation and Appointment of Superintendent American District Telegraph Co.	256
Resignation of a Popular Telegraph Superintendent	156
Social and Professional Status of Telegraph Operators in this Country and Europe	16
Success of THE TELEGRAPHER, The	53, 77
Speculation in Western Union Telegraph Stock	76
Seasonable Suggestions	77
Snapper Sounder, The	83
Some Reflections on the Different Characteristics of Telegraphers	91
Swindling Tricks of Telegraph Colleges and Certain Telegraphers	119
Section of the New Atlantic Cable Laid, A	142
Season and its Consequences, The	151
Suspension of the <i>Smitch</i>	166
Safety of the Cable Steamship Faraday	173
Summer Passing Away—Experience and Prospects	191
Seasonable Considerations	220
Steamer Faraday not heard from	233
Success and Failure in Telegraph Cable Laying	245
THE TELEGRAPHER in Canada	11
Telegraphic Positions on Central and South American Lines	17
True Worth	23
Telegraph Poles	23

Telegraph Invention and Inventors	34
Telegraph Messengers in Uniform	35
Telegraphic Projects at Home and Abroad	58
Telegraphers' Mutual Benefit Association	65
Tillotson and Co. on Hand	83
Telegraph Lines in Cities	100
The <i>Phog</i>	100
The Weather and the Telegraphs	106
Telegraph Instrument Manufacturing Business, The	112
Termination of the Contract between the U. P. R. R. and W. U. Teleg. Co.'s	113
Telegraphy and the Rensselaer Polytechnic Institute	113
Telegraphic Science in India	136

Toronto, Ont.

NOVELTY!

A **SOUNDER** of Entirely New Construction,
which gives with the usual amount of battery a very heavy and
clear sound.

SIZE FOR REGULAR OFFICES.....	\$5 00
SMALL SIZE.....	3 50
LEARNERS' OUTFITS, with small size Sounder, Key, Battery, Chemicals, Wire, Instruction Book, &c., all complete.....	7 50

Send for Circular.

TELEGRAPH SUPPLY AND M'FG CO.,
NO. 4 LEADER BUILDING,
CLEVELAND, O.

C HARLES WILLIAMS, JR.,
(ESTABLISHED 1856.)
109 Court Street, Boston,
has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

C OVERED WIRES,
Made from Lake Superior Copper, warranted strictly
pure, covered with Hemp, Flax, Linen, Cotton, Silk or other
material, for Telegraph Instruments, Electro-Magnetic Machines,
Philosophical Apparatus, and all kinds of Electrical Purposes.

Also, PLAIN, WOVEN, ENAMELLED, SHELLACED,
PARAFFINED, and all kinds of

TELEGRAPH OFFICE WIRES.

Also, Telegraph Switch Cords,
many Patterns, Plain, Woven and Braided. Parties being partial
to any particular kind need only enclose a small specimen in a
letter and it can be imitated in every particular.

CONDUCTING CORDS, POLE CORDS, TINSEL.

C. THOMPSON,
(SUCCESSOR TO JOSIAH B. THOMPSON,)
29 North 20th St., Phila., Pa.

J OSEPH MOORE & SONS,
(Established 1820.)
535 & 537 CHINA STREET,
(Below Green St.) PHILADELPHIA, Pa.,
MANUFACTURERS OF

INSULATED WIRES.

OFFICE WIRE—Plain, Braided, Prepared, &c.
INSTRUMENT WIRE—Cotton and Silk Covered, &c.
FLEXIBLE CORDS, all kinds, &c., &c.

We warrant all Wire to be of the highest conductivity, tested
by our Galvanometer, which compares with the tests of the
highest authority in this country.

E UGENE F. PHILLIPS,
MANUFACTURER OF
TELEGRAPH OFFICE WIRES
OF ALL DESCRIPTIONS,
Lock Box, 169. PROVIDENCE, R. I.

With improved facilities for the manufacture of BRAIDED
LINEN or COTTON COVERED OFFICE WIRE, either plain or
paraffined, I am now prepared to offer to purchasers a SUPERIOR
ARTICLE, in any quantity, on the most reasonable terms.

The Gold and Stock, and the American District Telegraph
Companies have been supplied from my works with the larger
part of the office wire used by them.

SEND FOR SAMPLE CARD.

For further information address as above, or

C ALLAUD BATTERY.
L. G. TILLOTSON & CO.
SOLE MANUFACTURERS in the EAST.
ORDERS SOLICITED.
No. 8 DEY STREET, NEW YORK.

A NEW GALVANIC BATTERY.
Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors.

One of these cells has been in use in this city for running a
sewing machine for weeks, without renewal, and is still in good
working condition. Price, \$2.25.

No. 2 is a round cell, designed for either locals or main line.
Price, \$2.

These batteries will be supplied, and further information
furnished by

F. L. POPE & CO.,
38 VESEY STREET,
SOLE AGENTS.

C ALLAUD BATTERIES
KEPT ON HAND, AND ORDERS FILLED BY
W. MITCHELL McALLISTER,
728 Chestnut Street, Philadelphia,
CHARLES WILLIAMS, JR.,
109 Court Street, Boston,
AND BY THE
WESTERN ELECTRIC MANUFACTURING CO.,
AGENTS FOR THE UNITED STATES,
220 East Kinzie Street, Chicago, Ill.

W ALLACE & SONS,
MANUFACTURERS OF
BRASS, COPPER & GERMAN SILVER WIRE.
Also, BRASS, COPPER and GERMAN SILVER,
in the Roll and Sheet.

We make the manufacture of Electric Wire a specialty—
especially the finer sizes of Copper for conduction, and German
Silver for resistance purposes—guaranteeing the conductivity of
the same in every instance to be superior to that of any other
manufacturer in the market.

WAREHOUSE,

A HAND-BOOK OF PRACTICAL TELE-
 GRAPHY.
 By R. S. CULLEY,
 ENGINEER TO THE
 ELECTRIC AND INTERNATIONAL
 TELEGRAPH COMPANY.

Published with the sanction of the Chairman and Directors of the Electric and International Telegraph Company, and adopted by the Department of Telegraphs for India.

FOURTH EDITION,
 REVISED AND ENLARGED.

vol. 8vo, cloth..... \$5 00.

Copies sent free by mail on receipt of price.
 My new Catalogue of American and Foreign Scientific Books,
 eighty pages, 8vo, sent to any address on receipt of ten cents.

D. VAN NOSTRAND, Publisher,
 23 MURRAY STREET, N. Y.

THE AMATEUR'S
 TELEGRAPH APPARATUS.
 (Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished
 ONE CUP OF BATTERY,
 TWO YARDS OFFICE WIRE,
 ONE PACKAGE BLUE VITRIOL,
 ONE PACKAGE SULPHATE ZINC,
 and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

A COMPLETE OUTFIT FOR A TELEGRAPH OFFICE,
Seven Dollars and Fifty Cents.

Two Sets, complete..... \$14 50
 Sounder and Key only..... 6 50
 " " with Cut-out and Lightning Arrester... 7 50

We will pay expressage on Amateur Outfits when price is remitted in Advance.

GEO. H. BLISS & CO.,
 SOLE AGENTS,
 41 THIRD AVENUE,
 Chicago, Ill.

SHAFFNER'S
 TELEGRAPH MANUAL.
 TO TELEGRAPHERS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
 78 and 80 Broadway,
 NEW YORK.

SOMETHING NEW.

"The Rattler" Telegraph Sounder.

(PATENT APPLIED FOR.)

This is a very simple and effective Instrument, and, as it does not require any spring to draw the lever back, is always adjusted.

PRICE, - - - - - \$3.50.

L. G. TILLOTSON & CO.,
 No. 8 DEY STREET, N. Y.

THE BISHOP GUTTA PERCHA WORKS,
 422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
 ONLY MANUFACTURER
 OF
 PURE GUTTA PERCHA GOODS
 IN THE
 UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,
 FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
 MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
 SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,
 AND FOR

BLASTING AND MINING PURPOSES,

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
 GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable, Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and de-
 livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
 any Telegraph Cable or Wire manufactured at the Works in New
 York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manu-
 factured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
 sale in New York by

SARGENT & STUDLEY, 26 Park Place,
 RUBBER CLOTHING CO., 363 Broadway,
 D. HODGMAN & CO., 27 Maiden Lane,
 SHEPARD & DUDLEY, 150 William St.

Original Articles.

The Elementary Principles of Electrical Measurement.

By F. L. POPE.

Introductory.

THE foundation of all exact knowledge rests primarily upon the comparison of one quantity with another, or, to speak perhaps more accurately, upon the comparison of unknown with known quantities. When experimental researches are conducted by single individuals, the absolute value of the quantities dealt with are usually immaterial, but if a number of persons are employed in investigating the same class of phenomena, it becomes necessary that they should have a mutual understanding of the units and methods of measurement to be employed. The object of the present treatise is to assist the student in obtaining a clear understanding of the principles and standards employed in making electrical measurements.

The electrical phenomena which admit of measurement are four in number, viz., *electro-motive force*, *resistance*, *quantity* and *current*. These four measurable properties necessarily exist in every electric circuit.

An electric circuit, in the most usual acceptation of the term, consists essentially of a voltaic battery and of a conductor, or series of conductors, connecting its positive and negative poles. This battery may consist of a single cell or element, or of many cells; and the conductor joining its poles may be of any length, from an inch or two to many hundreds of miles, but the essential features of the circuit in either case are precisely the same.

Before entering upon the subject of electrical measurement, it is necessary that the student should understand the precise meaning of the terms used to denote the four measurable qualities of the electric circuit.

Electro-motive Force.

This may be defined as the immediate force which produces an electric current, or, in other words, the power which a voltaic cell, or other generator of electricity, possesses of causing a transfer or flow of a certain quantity of electricity. It does not depend in the slightest degree upon the size or form of the cell, but principally upon the kind of metals of which the battery is composed, and to a less extent upon the nature of the exciting solution in which the metals are immersed.

This may be easily proved by the following interesting and instructive experiment: Procure a common toy tumbler an inch and a half high, and construct a miniature Daniell's cell with it by bending a piece of sheet zinc into a cylinder of such size as to just go within the tumbler. Make a porous cell of the bowl of a common clay tobacco pipe, with the stem broken off and the opening at the bottom closed by a bit of wax or tallow. Bend a piece of copper wire into a spiral, of such size as to go within the pipe bowl, which is to be filled with powdered sulphate of copper or blue vitriol. A wire soldered to the zinc cylinder forms the other pole of the battery. Fill the tumbler and the pipe bowl with warm water. Now connect this miniature cell in circuit with a full size Daniell's cell, so that the two batteries oppose each other. By placing a galvanometer in circuit it will be found that not the slightest current will pass, showing that the electro-motive force of the small cell is exactly equal to that of the large one.

The existence of an electro-motive force necessarily involves a certain electrical condition, which is termed by recent writers on the subject a *difference of potential*. Although the idea expressed by this term is a very simple one, it is nevertheless somewhat difficult to translate it into words so as to be easily understood. In fact, the terms *electro-motive force* and *difference of potential* are often employed indiscriminately by writers on electricity. They are not, strictly speaking, identical, although neither can exist without the other. Perhaps the matter may be rendered clearer by an illustration.

If plates of two different metals (as the copper C and zinc Z in fig. 1) be immersed in water contained in a glass vessel, and a copper wire, C', be joined to the zinc Z, C will become charged with *positive* and C' with

negative electricity, and the difference in the electrical condition of these poles, as they are termed, of the voltaic cell or element thus formed, is their *difference of potential*.

Now if C and C' were united by a wire, that wire would be traversed by an electric current, and the strength of this current would be strictly proportional to the difference of potential between the poles before they were joined. The electricity existing in C and C' before they are connected by the wire is said to be in a *static* condition. When traversing the wire it is said to be in a *dynamic* condition—that is, in motion. Now, as the strength of the dynamical current is always strictly proportional to the difference of potential existing between the two statically charged points, it follows that the static charge becomes a measure of the dynamical action. Electricity at rest bears a definite relation to electricity in motion. Similarly, the difference of potential existing between C and C' is always strictly in proportion to the electro-motive force of the cell or element, and, in fact, may be said to be caused thereby. The difference of potential, therefore, may be said to be that difference of electrical

(Fig. 1.)

condition between two points by virtue of which a current tends to flow from one to the other when they are united by a conductor. The existence or continuance of the flow of a current of electricity from one point to another consequently depends solely upon the difference of potential between the two points.

Probably it would not be incorrect to say that an electro-motive force causes a difference of potential between two points, and this difference of potential in turn gives rise to a current whenever the two points are connected by a conductor.

This may, perhaps, be rendered clearer by means of a certain analogy which exists between the action of electricity and that of water.

Suppose we have two vessels of equal size and capacity, A and B, fig. 2, connected by an horizontal pipe, C, provided with a closed stop-cock. Now let such a quantity of water be put into each vessel that the surface of the water in A shall be the same distance above the line X X that the surface of the water in B is below it. The difference between the level of the water in A and in B may be termed their difference in potential. The two bodies of water are in a condition corresponding to that of the electricity in the cell shown in figure 1. Now, if we open the stop-cock (which corresponds to the act of joining C and C' in fig. 1 by a wire), a current will flow through the pipe C. The greater the difference of level between A and B the more rapidly and forcibly will the water pass through C. When the water in both vessels has

(Fig. 2.)

reached the same level—that of the line X X—the flow will cease, because there is no longer any difference of potential. The line X X, therefore, may be termed the zero of potential, and the original level in A which was higher than this line represents a positive potential, while the lower level in B in the same way represents a negative potential.

Now let us suppose that an apparatus is set at work pumping water from B into A. This would tend to lower the water in B and at the same time raise it an equal amount in A, or, in other words, to maintain a difference in potential between the two vessels. This pumping apparatus corresponds to the electro-motive force and the difference in potential maintained between A and B, and consequently the amount of water that will thereby be caused to pass through C in a given time depends entirely upon the energy of its action, and is of course directly proportional thereto.

It will also be obvious that the amount of water flowing through C depends upon the *difference* of level between A and B, and not at all upon the absolute level, which may be arbitrarily assumed at pleasure. For instance, the zero line X X might be assumed as

the mean level of the sea. In precisely the same manner the potential of the earth is assumed as the zero of electrical potential, merely as a matter of convenience in electrical work, and therefore, when we say that a given point has a certain positive or negative potential, we mean that its potential is so much greater or less than that of the earth.

Resistance.

All known substances, whether solid or liquid, oppose a greater or less *resistance* to the passage of an electric current through them, when they form part of an electric circuit, by which it is to be understood that when two bodies having a different electrical potential are connected by any material whatever, the quantity of electricity produced occupies a certain *time* in passing between them. Thus, if a certain difference of potential between two points is maintained by means of a constant electro-motive force, and these two points are joined by a conductor, as before explained, it is found that, by modifying the form or the material of the conductor, the transfer of a given quantity of electricity may be made to take place in very different times. The quality of a conductor, by virtue of which it prevents the transfer of more than a certain quantity of electricity in a given time, is called its electrical *resistance*.

Returning to our illustration by means of the flow of water, as shown in fig. 2, if the pipe C were reduced to one half its original capacity, its resistance would be doubled. It would then take exactly twice as long as before (leaving friction out of the question) for a given quantity of water to be transferred from A to B, provided the other conditions remained unchanged.

Electrical resistance is a property that differs very widely in different substances. The best conductor known is probably pure silver. One of the worst is gutta serena, the resistance of which is no less than 850,000,000,000,000,000 times as great as that of pure silver. Substances usually termed insulators are merely those having a very great resistance. The terms conductor and insulator are, therefore, entirely relative and not absolute, and it would, perhaps, be as well for the student to consider all bodies in the light of conductors having a greater or a less resistance, as the case may be, which will materially assist him in forming a clear and distinct conception of the nature of electrical action.

The resistance of an electric circuit is partly within the battery itself, and partly in that portion of the circuit outside the battery.

Quantity.

Much confusion of ideas has arisen from the loose and indefinite sense in which the term quantity has been used by different writers on electricity. A certain quantity of electricity means exactly the same thing as a certain quantity of anything else, that is, a given amount of it. In the combination shown in fig. 1, it was explained that a current of electricity would flow between the poles C and C', when these were joined by a conductor. This current of electricity arises from the action of the electro-motive force, and is supposed to be maintained by the chemical combination of the zinc with the oxygen of the water, the zinc being consumed exactly in proportion to the amount of electricity developed. Therefore, we may, for the purposes of this explanation, regard the electricity as a component part of the zinc, which is set free when the latter combines with oxygen. We may conceive, then, that the zinc plate of a battery contains a certain definite *quantity* of electricity, the same as the reservoir or vessel A. Figure 2 contains a definite quantity of water above the line X X. Now, the less the resistance of the pipe C, the greater will be the quantity of water which will pass through it in a given time, and the sooner will the water in A be reduced to the level of X X. Similarly, in a voltaic battery, the greater the amount of current traversing the conductor joining its poles in *given time*, the sooner will the original quantity of electricity (which we may regard as having been stored up in the zinc) be exhausted.

Current.

From what has been said, it will readily be understood that current is simply the quantity of electricity that passes through a given conductor or circuit in a given time. To avoid circumlocution, the direction of a current is assumed to be from a higher to a lower potential, and is usually spoken of as if this were really the case. Actually it is the recombining of the two opposite or positive and negative electricities, which have been separated by an electro-motive force, and, therefore, strictly speaking, may be said to flow as much in one direction as in the other.

The strength of a constant current in any circuit—that is to say, the quantity of electricity that passes in a given time—is equal at every point in the circuit. This uniform current throughout the circuit is not influenced in the smallest degree, either by differences in the resistance of different parts, or by differences in the material of which the circuit is composed. The distinction of "quantity" and "intensity" currents, formerly in vogue among electricians, is entirely a fal-

lacious one. There is only one kind of current, and that is a current of greater or less magnitude or strength, by which we understood nothing more nor less than the simple fact that it conveys a certain definite quantity of electricity past a given point in a given time. Here, once again, we may refer to our illustration of the water flowing in the pipe C, fig. 2. Suppose this pipe to be replaced by a series of pipes of various diameters, all of course filled with water, the current of water from A to B will flow uniformly through all of them. Precisely the same quantity of water per second will flow through each section of the pipe, whatever its diameter may be. It is true that the velocity of the water varies in proportion to the diameter of the different sections, but the current is uniform throughout, in the sense that it is a current of so many gallons per second.

The Government and the Telegraphs.

We stated a short time since (Oct. 4th, 1873) that the railway companies had still some very large claims upon the Government, arising out of the purchase of the telegraphs by the State, and at that time not less than forty-one claims were unsettled. Twelve of the claims of the largest amounts have been submitted to arbitration, including the North-Eastern, Midland, Lancashire and Yorkshire, Great Eastern, London and South Western, Great Northern, North London, Ulster, Metropolitan, Metropolitan District, Metropolitan, Hammersmith and City, and Metropolitan and St. John's Wood. The latest returns to Parliament show that the sum paid for taking over the telegraphs was £5,847,347. It is probable that when the whole of the claims are disposed of, the cost to the country will not be far short of ten or twelve millions. With regard to the claim of the Lancashire and Yorkshire and other lines, we find the following in the *Western Morning News*:

"An error of enormous magnitude has been discovered in the Government telegraph accounts. Instead of purchasing, as was supposed, a freehold and absolute title, the Government finds that it purchased the leasehold only from the telegraph companies, whose rights were bought up in many instances. The telegraph lines were leased from the railway companies, and what they sold was merely a lease of them. The railway companies are represented as being now engaged in preparing their claims. Some of these, it appears, are uncomfortably large. The claim of the Lancashire and Yorkshire Railway for the telegraph, which the Government fondly imagined it had purchased from the Magnetic Company, amounts to £950,000. The matter is to be referred to two arbitrators—Mr. Weaver, secretary of one of the telegraph companies, on the part of the Government, and Sir John Hawkshaw, on the part of the Lancashire and Yorkshire Railway. Sir John Karslake is to be umpire. The approach of an arbitration of such public interest and importance, which is thus alluded to, can scarcely, however, be fairly called an error, nor is it possible that, in purchasing the rights of the telegraph companies, the Government imagined itself to be acquiring the whole of the privileges connected with telegraphs in the country. The Telegraph Act, 1868, after giving powers to purchase the undertakings of telegraph companies, goes on to recite that the railway companies on their part are either owners of telegraphs, or they have contracts with telegraph companies whose apparatus is placed in the stations and along the railways and canals of the railway companies. Powers are, therefore, given in this Act of 1868 to the Postmaster General to take the place of the telegraph companies in such contracts with the railway companies, and to pay the railway companies compensation, either to be agreed upon or to be fixed by arbitrators, for the loss of present and reversionary gains. The Lancashire and Yorkshire Company is mentioned by name in this Act as one of the railway companies with which arrangements will have to be made, and no agreement having been come to, although negotiations have been going on ever since the passing of the Act, the time has now come when a decision will have to be arrived at by arbitration, as provided in the Act, and before Sir John Karslake as umpire. Eminent counsel have been retained on both sides. The Marquis of Salisbury, as umpire, has already pronounced on a somewhat similar claim, involving, however, a much smaller amount than the sum to which, on the part of the Lancashire and Yorkshire Company, it will probably be contended that company is entitled. The Act of 1869 estimated £700,000 as a sufficient sum to cover the whole expenses of the Government in this part of the transfer of the telegraphs. The Lancashire and Yorkshire Company alone now demand a million or more. But it will be obvious that neither the Government nor the company is a fair judge of its own cause, and the public will look with interest for the decision of Sir John Karslake and his experienced assessors. The arbitration will involve difficult and intricate matters of account."—*The Railway News*.

West India and Panama Telegraph.

THE committee of shareholders appointed at the annual meeting of the shareholders of the company on the 17th November, 1873, report that their long deferred hope of the completion of the telegraph system of the company is now likely to be realized, the steamships *Minia* and *Kangaroo*, in the service of the Telegraph Construction and Maintenance Company, freighted with cables for duplicating the lines between Jamaica and Porto Rico, and Dominica and Martinique, having sailed on the 2d of December, and the Investigator, in the service of the same company, having sailed on the 8th of December, to repair the broken cable of the Cuba Telegraph Company. After referring at some length to the failures and shortcomings of the past, which have resulted in the unquestionable difficulties of the present, they state that they "cannot but express their regret that more decided action was not taken by the board immediately after the expiration of the eleven months named in the contract for the laying of the cables, and that, previously to the commencement of litigation, more vigorous efforts were not made to bring about an amicable adjustment or arbitration by commercial men. The committee have, as far as time would permit, looked through the voluminous proceedings in this unfortunate Chancery suit, and they came reluctantly to the opinion that it was unadvisable, in the interests of this company, to approach the defendants with a view to an amicable settlement; but, in saying this, they are not by any means without hope that, under a newly constructed board, negotiations may not be advantageously opened with a view to an amicable adjustment of differences. The committee cannot but suspect that, in the long continued discussions and correspondence which have taken place between the directors and officers of this company and the India Rubber Company, feelings have been excited not favorable to the amicable solution of the grave differences existing; and, entertaining this opinion, the committee have come to the conclusion that it is desirable that some members of the present board should retire, and that some gentlemen of larger practical experience in the management of existing submarine telegraph companies should be invited to take seats at the board."

Remarkable Operations.

B. FRANKLIN made his name famous when he flew his kite and brought down lightning from the clouds, which had been flying around without paying its way. Now we not only flash through on wires, but science has grappled with electricity and used it to perform miracles. Our readers will remember that when Gen. Kilpatrick returned from Chili, three years since, he had a remarkable operation performed by a physician in New York, who removed a large fleshy formation from the General's neck by filling it full of needles and then attaching a galvanic battery to it. Ten minutes after the current of electricity was let on the bunch had entirely disappeared. A remarkable operation was performed by a Whitehall physician a few days ago. A gentleman who had been suffering from a superabundance of adipose tissue consulted a physician, asking for relief from his burden. The gentleman consented, and, with the medical practitioner, entered the telegraph office at this place. The fat man was requested to remove his coat and vest, after which the physician surrounded him with wires, attaching the ends to a powerful galvanic battery. At a signal from the doctor, Manager W. B. Eddy let on the current. The patient writhed and twisted when he felt the current passing around him, but he stood it like a martyr. Presently he began to shrink; he grew smaller and smaller and smaller; his clothing hung in bags about his fast diminishing form. The doctor felt much pleased at the result of his experiment, while the formerly fat man's joy was very great, although he seemed to be suffering the worst pain. All of a sudden there was heard a loud clicking at the instrument, as if Pandemonium's great hall had been let loose. The operator sprang quickly to answer the call. He ascertained it was from the New York office. He quickly asked, "What's up?" An answer came back as if some demon was at the other end of the wire: "Cut off your wires quick—you are filling the New York office with soap grease!"

The Way the Cable Talks.

AN operator sits at a table in a room darkened by a curtain. On his left hand stands a little instrument, named the "reflecting galvanometer," the invention of Sir William Thompson, without which Atlantic telegraphy would be a slow process—not exceeding two or three words per minute, instead of eighteen or twenty, the present rate.

This delicate instrument consists of a tiny magnet, and a small mirror swinging on a silk thread, the two together weighing but a few grains. The electric current, passing along the wire from Valencia, deflects

the magnet to and fro. The mirror reflects a spot of light on to a scale, in a box placed at the operator's right hand, where, by its oscillation, the spot of light indicates the slight movements of the magnet, which are too slight to be directly seen.

This little swinging magnet follows every change in the received current, and every change, great or small, produces a corresponding oscillation of the spot of light on the scale. A code of signals is arranged by which the movement of the spot of light is made to indicate the letters of the alphabet.

When receiving a message from Valencia, the operator watches the movement of the little speck, which keeps dancing about over the scale on his right. To his practiced eye each movement of the spot of light represents a letter of the alphabet, and its seemingly fantastic motions are spelling out the intelligence which the pulsing of the electric current are transmitting between the two hemispheres. It is truly marvellous to note how rapidly the experienced operator disentangles the irregular oscillations of the little speck of light into the letters and words which they represent.

Christmas Greeting to a Telegraph Manager.

A LOOP extends from the main office of the Southern and Atlantic telegraph office at Charleston, S. C., to the sleeping room of the manager, Mr. L. E. C. Moore. At twelve o'clock, Christmas Eve, he heard his call, "Em," and, upon answering, received the following Christmas greeting, from the employés in the office:

"Main office, S. and A. Telegraph Co., Charleston, S. C., Christmas Eve, 1873. To L. E. C. Moore, manager.—The employés of your office extend to you and your family a happy Christmas greeting, and hope that the 'circuit' of your happiness may be long, and your course of life so 'adjusted' as to catch every 'dot' of pleasure; that the 'sympathy' that now exists between us may never be interrupted by any 'ground' of discord; that the strong 'battery' of friendship now existing may never lose its 'insulation'; that 'escape' of all trouble may ever be your fortune. May our, each and every 'manipulation' be 'conductive' of your popularity as our manager; may you and yours 'dash' through life smoothly and steadily; may the 'space' of time be long extended ere our 'connection' be severed, and may nothing ever 'stick' in the friendly intercourse existing between us, is the wish of your employés.

J. C. DUGGAN, Chief Operator.
A. L. HAYNES, Night Manager.
A. J. WRIGHT, Operator.
J. P. FINNIGAN, "
J. PHILLIP RIVERS, "
THOS. F. SEATERY, "
ALVA B. GREEN, Clerk.

Telegraphers Better than they are Represented.

TO THE EDITOR OF THE TELEGRAPHER.

I NOTICE that there is considerable said through the columns of THE TELEGRAPHER in regard to the morals of telegraphers, and how they are looked upon in social circles. Some of the writers are afraid that matters are growing worse instead of improving, and that operators are, as a general thing, a depraved and almost an abandoned class of men. Now I think these fears are not only unnecessary but groundless. Speaking of the fraternity at large, it is true that there are black sheep in all flocks. This is true in church and state, and always has been and always will be to the end of time. Our Saviour, when upon earth, chose twelve disciples, and Christ himself said, "Have I not chosen twelve, and one of them is a devil?" But Christ also said, "Let the wheat and the tares grow together, but while ye root up the tares ye also root up the wheat."

Now I have met a great many telegraphers, and formed their acquaintance, and been associated with them, and I must say that they are not the worst men; but, as a general rule, a more generous, whole souled class of men you cannot find. They are always ready to extend the helping hand whenever required. The only mystery to me is that telegraphers are not more dissipated and reckless than they are, for most of them have left home and home influence when quite young, and perhaps just at the very time they most

needed the kind admonitions of careful parents—who they were moulding a life character. They have left all this; and how many, many sweet influences are connected with a Christian home! God only knows the influence of a mother. What heart does not thrill with joy as they remember a kind and loving mother, who in their youth taught them their first prayer, and told them of heaven and a Saviour, who had gone to prepare a home for them, if good children? Then how that same gentle, loving mother would imprint the good night kiss upon the cheek. Oh! who can tell the influence of a Christian mother? I well remember, when I left the old homestead, how my mother bade me farewell with tears streaming down her cheeks, and bade me remember the advice and instruction received from her.

Now this is not all romance, as many a one who will read this can testify, and perhaps call to remembrance home, thinking of that gentle, loving mother who so often soothed their boyish sorrows. Perhaps she now sleeps in the silent churchyard, and her spirit has gone home to its eternal resting place. Now, who will not think it strange, upon reflection, when duly considering all the many privileges and home counsels that telegraphers are deprived of, that they are no worse than they are? And, as I think back on my own experience, I have great reason to thank God for a pious mother. Telegraphers are, to use a vulgar expression, kicked from pillar to post, and the public do not, in the way they should, appreciate the services rendered them by the fraternity. They look upon them as a kind of necessary evil, and generally treat them accordingly; but we can bear all this, for ours is a noble calling, and we have the consciousness of doing a noble work, and if our reward is not just upon earth, we are assured that we are seen by our Heavenly Father in secret, and shall be rewarded openly by him; and, if that be not until the great and final day, let us not despair, but perform well and faithfully our part in life.

Let some one else speak upon this matter. It can be made interesting. MELVILLE.

The Bible, and the Invention of the Telegraph.

TO THE EDITOR OF THE TELEGRAPHER.

SOME of your correspondents have been going back in the history of telegraphy for items of interest. Since they have started on the backward course, I would like to cite them to where we read in Nahum (ii. 4) of chariots seeming like torches, and that they should run like the lightning, with terrible collisions in the highways; and earlier still, by nearly a thousand years (Job xxxviii, 35), inquire if the lightning could be sent to convey intelligence? Three millenials pass away and Morse responds "it can;" and to-day thousands of operators throughout our land exclaim with Morse, "it can."

In the language of another, we can say, "God has shorn the lightning of its terror and laid it powerless in our hands." We should remember "we operators are the mediums of one of the noblest uses that science ever whispered into the ear of man." When we see how rapidly this art has developed we cannot help but admire its inventor. There is no name that the American people more deeply revere than that of Morse. Magically, by the wonderful power of telegraphy, months have been reduced to seconds, time ignored, space powerless, man speaks to man in words of living eloquence, though oceans separate them. High mountains and broad rivers constitute no obstacle in the path of this irresistible force. Everything yields to its potent sway, and still stands aghast with wonder, contemplating in amazement the mighty works of fellow men, and exclaiming, "all is possible." It is, indeed, the arteries through which beats the great pulse of humanity—the public highway of thought.

S. L. C.

Consolidation of Competing Telegraph Lines the Only Safety.

TO THE EDITOR OF THE TELEGRAPHER.

THE consolidation of the Pacific and Atlantic Telegraph lines with the Western Union, although not unexpected, should awaken the managers of the companies competing with the Western Union to the necessity which exists for taking measures to consolidate their interests and to protect themselves against a similar fate. Only in such a consolidation can there be safety, and it is imperatively demanded by their own interests and that of the public whom they serve. It is the policy of the Western Union Company to absorb competing companies one by one—and while they remain separated, and to a more or less extent divided in their interests, they cannot compete upon anything like equal terms with that organization.

The Atlantic and Pacific Company is the leading telegraph organization outside of the Western Union combination, and it would seem to be the part of wisdom for the managers of that company to take the lead in the movement towards such a consolidation.

The defection of the Pacific and Atlantic Company renders it necessary that the territory which it covered should be occupied by new competing lines with the least possible delay, and this can be done if the existing companies will unite their energies and resources in practically one organization.

This course has been urged for years in THE TELEGRAPHER, and its recommendations in the premises have met with general approval, but it has been understood that hitherto the Pacific and Atlantic Company has stood in the way of any advantageous arrangement. That obstacle is now removed, and it is to be hoped that we shall soon witness effective action towards a consummation which all who have the permanence of telegraphic competition at heart must desire. CONSOLIDATION.

How the Western Union Company Encourage Inventors.

TO THE EDITOR OF THE TELEGRAPHER.

THE last number of the official organ contains an elaborate illustrated description of the Milliken Repeater, filling two pages. This amount of space, however, was not sufficient to allow the writer room enough to state that although the Western Union Company are using between one and two hundred of these repeaters on their lines, yet, so far as heard from, Mr. Milliken has never received a dollar of compensation from that company for the use of his invention; yet the actual money value of it to them since its adoption must amount to a great many thousands of dollars. This is paralleled by the case of Cushman, the inventor of the well known switch-board, of which hundreds and hundreds have been used by the same company, and no compensation was ever made either to the inventor or his destitute widow. When they do attempt to reward an inventor, they seem to be equally unfortunate; for the considerable sum of money paid for the duplex patents, "\$19,258 on account" (vide Mr. Orton's report), to all appearances was paid to the wrong man, as almost every point about the latter invention of any practical value, and which was not free to public use, was anticipated in Farmer's patent of 1858, which has recently been extended for seven years. They are perfectly willing, however, to pay a large sum for a fraudulent patent like that of Page, not for legitimate business purposes, but as an engine of oppression, for the purpose of crushing any one who ventures to make use of electricity in any way without paying tribute to their monopoly. To hear some of their officials talk, one would think a man couldn't be killed by a stroke of lightning without liability of having a royalty collected from his heirs. This is the way wealthy corporations reward worthy inventors. JUSTITIA.

A Response to Nettie Bronson.

TO THE EDITOR OF THE TELEGRAPHER.

THAT spicy little note from "Nettie Bronson," in your last issue, was really so interesting that I shall have to ask of you a small space to express my admiration.

Although never taking any particular interest in the question as to the practicability of admitting ladies into the profession, I have never been able to see why, if they have the proper qualifications, those of the fair sex should not have the same privilege to the profession as we of the more unrefined persuasion. And "Nettie's" idea of our sitting with our feet on the table, etc., almost makes me believe that we are a sort of a clownish set; but I hope she does not have as poor an opinion of all of us as her description of the "gentleman" (I should say not a very dear friend) to whom she applied would seem to imply. If she does, farewell to all my hopes of reconciliation.

Not long since I was coworker in an office with a very nice young lady, and the pleasure of smoking, with all its attendant gratifications, had to be dispensed with; but if Nettie could have seen with what eagerness a pipe was grasped, as soon as the lady left the office, I think she would have admired my martyrdom in foregoing such a pleasure; yet, I assure her, I made no complaint, and, in fact, think I was quite cheerful.

I am afraid that Nettie felt a little "sour" when she wrote that letter; and, no doubt, if at that time any poor unfortunate "frite gerse" had come in her way, on his devoted ears would have fallen, with appalling distinctness, "You plug!" for I can say to her that I have seen those of our sister operators who were quite emphatic when their anger was aroused.

But as I should certainly expect to be withered at once by Nettie's sarcasm, I hereby disclaim any idea of criticism, and announce myself in perfect sympathy with her. Nettie presumes she should prefer a gentleman student. Allow me to say that this, strange as it may seem, strikes me as being her finest point, especially as she shows such a Christian spirit in her willingness to help others.

I hope, if she has not an office now, she soon will

have. Let him who dare say nay, and I shall immediately renounce all my knowledge of telegraphing and apply for a position as student. Will Nettie look with favor on the application? FRANKIE.

Exit of the Pacific and Atlantic Telegraph Company.

PITTSBURG, PA., December 28.

TO THE EDITOR OF THE TELEGRAPHER.

"THE king is dead, long live the king." Last night at 6 o'clock the wires were cut off from the office of the Pacific and Atlantic Telegraph Company in this city and transferred to the Western Union office. Everything had gone on in the usual way until the moment of closing, and as we rose from our tables as the wires were cut off at the switch-boards by Mr. Geo. Wynne, the veteran repairman, we all felt as though parting from old friends for the last time. For the last hour or so before six o'clock the wires were almost entirely occupied in farewell talks between the "boys" at the *termini*, and along the line of the several wires.

Messages expressive of mutual regret at parting, and wishes for future prosperity, were exchanged between chief operators Long, at Chicago, and Hamilton, at this place, on behalf of their respective forces.

We all felt sad, and the impressive "R. A." was observed to draw forth a huge red silk handkerchief and weep; he then jammed his hat down over his eyes and made for the door, fearful lest his emotion should be seen.

The force here consisted of Messrs. Geo. A. Hamilton, chief operator (day), M. M. Prescott, chief operator (night), R. W. Ledwith, assistant chief operator (day), and Messrs. Fetch, Myers, Pollock, Byrne, Muse, Barclay and Matthias, operators, all of whom, it is understood, are to be transferred, for the present at least, to the Western Union office. M. S.

Another Problem.

TO THE EDITOR OF THE TELEGRAPHER.

SUPPOSING four points, A, B, C and D, to be connected by telegraph lines, each being at an equal distance, say 10 miles from the point E, there being available only just enough material to construct 40 miles of single wire line, how can it be arranged so that each office can work direct with either of the others, without the use either of loops or of repeaters?

The diagram shows the arrangement of wires and stations above described. B.

Answer to Correspondent.

OCCASIONAL.—Your items of the 10th ult. were accidentally overlooked last week. Sorry, and will try not to have it occur again.

Personals.

Mr. FRANK N. DIAMANT has resigned his position of assistant agent and operator of the North Pennsylvania, and North East Penn. Railroad at Abington, Pa., and accepted a position with the Lehigh Valley Railroad at Tunkhannock, Pa.

Mr. J. B. SHUTE has accepted the position of agent and operator at Abington, Pa., resigned by Mr. DIAMANT. Mr. SHUTE was a former resident of California, and his many friends on the Pacific Coast will no doubt be pleased to hear from him.

Mr. JOHN MURPHY, operator in the general agent's office of the North Penn. R. R. at Philadelphia, Pa., has been absent on leave of absence to his home in Richmond, Va.

Mr. GEO. H. WILSON has been appointed agent and operator of the North Penn. R. R. at Hellertown, Pa.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended December 6, 1873, was 339,099—an increase on the corresponding week of 1872 of 53,453.

The total traffic receipts of the Great Northern Telegraph for the month of November amounted to 314,573 fr. (£12,583), and for the same month in 1872 to 229,187 fr. (£9,167), showing an increase of £3,416. The receipts on the European lines amounted to 166,563 fr., against 124,915 fr., and on the China and Japan lines to 143,010 fr., against 104,272 fr.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, JANUARY 3, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS OF THE

Telegraphic Fraternity and the Advancement of Electrical Science and the Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of THE TELEGRAPHER will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The New Year and the New Volume of The Telegrapher.

A NEW YEAR has dawned upon the world, and will be in its third day when these lines reach our readers. The Christmas and New Year festivities have nearly closed, and it is time to address ourselves once more to the serious every day business of life. The customary compliments and greetings have been exchanged, and the New Year is with us, with what of pleasure or pain, joy or sorrow, success or failure, will be duly solved by the swiftly passing days, weeks and months which, in due course, shall bring us to 1875.

With the New Year THE TELEGRAPHER commences its TENTH VOLUME, and will, we trust, continue to be a welcome weekly visitor to all of its old friends and subscribers and to many new ones. Its prospects for the future are apparently as good or better than ever before in its history, and its usefulness, we hope, will be even more marked than at any previous time since it was first established. The volume which has just been closed, although not in all respects what we had hoped to make it, still has been, we think, a decided improvement upon those which have preceded it. We are under obligation to many friends for their valuable contributions to its columns during the year, and are assured of the continuance of their favors, and of contributions from others which will have a tendency to increase the value and interest of the paper. We have no special promises to make in regard to THE TELEGRAPHER, further than that all its valuable and interesting features will be continued, and such improvements and additions made, from time to time, as additional experience and more ample facilities and means shall render possible and practicable.

The evidences that we are constantly receiving of fuller appreciation, and increasing and widening interest in THE TELEGRAPHER, are very gratifying, and stimulate us to renewed efforts to make it worthy of the high position which it has obtained as an authority in electrical science and telegraphic art, and as the only independent and reliable telegraphic journal in this country. Representing as it does the practical telegraphers of the country, wherever known and by whom employed, and not crippled by complication with any telegraph company, combination or clique, it can afford to be a really independent publication—and, as such, it is our especial pride to maintain it. It is for the telegraphers themselves, whom it represents, to say how long its present policy and character shall be maintained. If they continue to support it by their subscriptions and influence it shall not be found wanting. It has passed through some apparently dark days, but, we believe, has never forfeited or lost the confidence of the practical telegraphers of the country.

We had hoped to still further enlarge the paper with the commencement of the new volume, but have deemed it advisable not to do so at present. Such enlargement involves not only considerable increase of the cost of publication, but also of labor and care, which we are not in a condition to bestow just now. If the patronage received shall be sufficient to warrant it, and other things shall be favorable, we may make this enlargement during the present volume. We can truly say that the prospects of THE TELEGRAPHER were never more encouraging than at the present time. Notwithstanding the depression in business its circulation is increasing, and of advertising we have more offered than we can find room for. All things considered, we anticipate for the new volume a success which shall equal, if not excel that of any which has preceded it. To realize this anticipation, however, we must rely upon the continued active cooperation of our telegraphic friends, who have not heretofore failed us.

In conclusion, we would ask every telegrapher, who believes that it is important to the welfare, instruction and best interests of the fraternity, that THE TELEGRAPHER, as its organ and representative, should be maintained, to use his or her influence to add to its circulation and influence. With such an active and

easily afforded cooperation, its subscription list would soon be doubled and trebled—and with increase of circulation comes increase of influence and usefulness. With thanks to the kind friends who have by their generous efforts given the new volume encouragement in the way of additional patronage, and with the compliments of the season to one and all of our readers, we now start the TENTH VOLUME OF THE TELEGRAPHER with favoring winds upon its brief, but, we hope and believe, prosperous voyage through the coming year.

The Postmaster General and the Western Union Telegraph Company.

POSTMASTER GENERAL CRESSWELL, in his efforts to induce Congress to confide to his Department the management of the telegraphs of the country, seems to be peculiarly unfortunate. Actuated by an ambition rival the fame of Mr. SCUDAMORE in England, who succeeded in securing to the Post-office and himself the administration of the telegraphs of the United Kingdom, after a severe and protracted contest with the companies that owned them, Mr. CRESSWELL entered upon the task of obtaining a similar triumph here with great confidence, and a manifest disregard of the existing telegraph interests. He was not long in discovering, however, that the undertaking was a much more arduous one than he had calculated upon, and that Congress did not incline much to the course which he recommended, and which he had, by elaborately prepared, but, as it was found when analyzed, fallacious and unreliable statistics, endeavored to show would prove a popular and profitable one. President ORTON and the Western Union Telegraph Company entered the lists against the proposed confiscation of their property and interests zealously and successfully, and, as a consequence, our worthy Postmaster General lost his temper, and, in the report which he presented at the opening of the present session of Congress, he attacked both the Company and Mr. ORTON personally in a savage and most unusual manner. To this Mr. ORTON has just issued a reply, which caustically reviews Mr. CRESSWELL's report, and puts him in a most uncomfortable and unenviable position. The length of this reply, which fills a pamphlet of 38 pages, precludes its publication entire in our columns, but we will endeavor to give briefly the more important features of it.

The Postmaster General is unfortunate in his treatment of the subject. He is so evidently unreasonable, ill tempered, inconsistent and illogical, as to damage his own case, and prevent his suggestions and recommendations having the weight and influence desired. It is evident to him, as to everybody else, that the proposition for a Government telegraph monopoly, instead of gaining, loses ground, and that there is no reasonable prospect of success; but he apparently desires to do as much damage as possible to the party or parties whom he regards as largely responsible for his ill success.

Mr. ORTON's reply is in the form of a communication addressed to the Postmaster General personally. The communication gives the following explanation of the reasons which have impelled such an unusual course on the part of Mr. ORTON, who says:

"I have before me an official copy of the Report of the Postmaster General for the fiscal year ending June 30, 1873, which contains statements concerning the policy and management of the Western Union Telegraph Company, including allusions to myself, which are so erroneous, unjust and personal, that it seems incredible they should have been made by a Cabinet Minister in an official communication to the President for transmission to the Congress of the United States.

"That it is an unusual proceeding for a private citizen to publicly address a communication to a Cabinet Minister upon the subject of an official report, is admitted. On the other hand, I believe it is equally unprecedented for a Cabinet officer, in a public report to the President, to select for official animadversion a business lawfully prosecuted, or a citizen who has infringed no law; and, therefore, if any justification is needed, it will be found in the extraordinary character of the paper to which this is a reply. It seems due to the owners of property whose value may be impaired by official misrepresentation, to the public, who are largely interested in the proper conduct of the telegraph business,

and also to the managers of a corporation who have been held up to public reprobation by the head of one of the most important Executive Departments of the Government, that his errors should be plainly pointed out, and the facts fully and fairly stated."

He then proceeds to give a brief history of what the Government has done for the telegraph, its whole assistance to this important interest having been comprized in an appropriation of \$30,000 to build the experimental line from Washington to Baltimore, and a subsidy of \$40,000 per year, for ten years, to the first line to California, which latter was more than repaid by the transmission of Government despatches over it without other charge. He then contrasts the munificent liberality of the Government to railroads with its niggardliness to the telegraph, showing "Hundreds of Millions of Government aid to Railroads and but thirty thousand to the Telegraph!"

He then considers the Act of 1866, which conferred certain privileges upon telegraph companies, but n return extorted from them an agreement to sell their lines to the Government, at its option, upon appraisal, at any time after five years; a contract which the telegraph companies have never repudiated, but which the Postmaster General—neither Congress nor the people giving any indication of intension of enforcing—desires repudiated, and a partial Government competition established, to depreciate and destroy the value of the property which Congress may desire hereafter to purchase.

He then proceeds to review the proposed legislation in Congress, looking to a postal telegraph. He quotes from the Report of the Postmaster General in 1872 the following paragraph:

"I am decidedly of opinion that if the people interested require a postal telegraph, it should be entirely in the hands of the Government. If, on the contrary, a postal telegraph is not so demanded, then the Government should not favor one private company to the exclusion of another, nor should it in any wise enter into competition with private enterprise."

The Report of the Postmaster General, in 1872, fixed the value of the existing telegraph property in the country at \$11,880,000, while the only estimate submitted in his report, from an expert, was that the lines could be duplicated for \$18,250,000, if the material could be imported free of duty—while Mr. ORTON asserts that the property was worth in the market not less than \$50,000,000. The Postmaster General, in the report under consideration, expresses "full confidence" in the correctness of the estimates in his previous report. The communication says:

"The Government has the right to buy the property of the Company thus assailed, and the utterance of official opinions calculated to prejudice the public mind as to its value, looks like an attempt to forestall the award of the arbitrators, and to compel the owners to accept a sum less than that to which they consider themselves entitled, rather than take the risk of inciting greater official hostility. The injustice of such a proceeding will be apparent to any one who will examine the facts."

In his report the Postmaster-General asserts that "the opposition to the postal telegraph comes almost entirely from the telegraph companies and those directly interested with them in sustaining their monopoly," and that "every intelligent, disinterested observer, who has seen the workings of the Government system abroad, gives them the decided preference."

Mr. ORTON briefly but effectually refutes both of these statements. "The press," he says, "are almost unanimously opposed to it, and there is no evidence that even a respectable minority of the people desire its assumption by the Government." These facts are evident to everybody outside of the Postmaster General's office, and it is difficult to believe that he makes the statements with an intelligent faith in their correctness.

The assertions of the Postmaster General that "under the present management the use of the telegraph by the masses of the people is almost prohibited by reason of arbitrary rates, unnecessarily high charges and a want of facilities," and that "it may, however, be regarded as settled, that while under the control of pri-

vate companies, whose chief object is to make a profit for their stockholders, and whose skill and labor are expended in efforts to advance the price of their stock, and to enforce the highest rates to which the people can be made to submit, the telegraph will never become a general medium of correspondence," are discussed at considerable length by Mr. ORTON, and their fallacy shown by statistics of the telegraph service in this country and in Europe—by which it appears that the telegraph is more generally used here than in any country in Europe, and that the rates of charges are no higher, relatively, than in countries where the telegraph is a Government system. Statistics are also given which show that, with the exception of Russia, the Government telegraphs are worked at an absolute loss; and in Russia, which made a profit of 4,000,000 francs out of its telegraph service in 1872, the average charge per message was about 5½ francs, while the present average tariff for messages in the United States is but fifty cents—about 2½ francs for a message of ten words—date, address and signature being free.

The following will no doubt be endorsed by every person familiar with the telegraph business:

"It is strictly true that the chief object of the companies is to make profit for their stockholders. It is for that purpose alone that private parties have invested capital in the telegraph business; and there is no good reason why the investors in such property, and those to whom they have entrusted its management, should be subjected to the invidious rhetoric of a Cabinet officer, more than citizens engaged in other legitimate industries; neither should their efforts to make the business remunerative and the property valuable, by lawful means, be made the subject of official condemnation. The present telegraphic facilities are adequate to meet all the demands upon them. In no other country have telegraphic facilities increased so largely, during the last few years, as in the United States. This increase has not only kept pace with the public demand, but in many sections has anticipated it. While in other countries the cost of telegraphic extension, and in some of them a part of the cost of its operation, has been paid from the public treasury with moneys raised by taxation upon the people, in the United States the extensions have been made entirely by private capital, furnished by private citizens."

The review of the Postmaster General's statements in regard to the automatic system we have not space to consider in this article, but will consider specially hereafter. Mr. ORTON endeavors to show that the automatic system is really slower and more expensive than the Morse, but the facts do not bear out the assumptions made, as will be shown in a future article.

The Postmaster General states that "there are now but two parties in the controversy over the postal telegraph—on the one side the people, on the other the Western Union Telegraph Company."

To this special pleading Mr. ORTON says:

"It was stated early in the report that the opposition to the postal telegraph came from the telegraph companies (in the plural) and those directly interested with them in sustaining their monopoly. Further reflection appears to have induced the Postmaster General to modify this opinion—to suspend sentence upon all parties except the Western Union, and to concentrate upon that company and its officers the entire weight of his condemnation."

It might very properly have been said that in the postal telegraph scheme there are but two parties—the Postmaster General and a very limited following—and in active opposition or indifferent to it nearly the entire press of the country and almost the whole body of the people.

The Postmaster General having made serious charges against the Western Union Company and its efforts to destroy rivals, Mr. ORTON replies to these at some length and defends the company, and asserts that if its rivals have been vanquished it was "either because they did not possess the facilities requisite for doing sufficient business to enable them to pay its expenses, or because the rates they insisted upon establishing proved to be unremunerative, or because they failed to conduct their business to the satisfaction of the public."

"The charge that the Western Union Company have not scrupled to use any device which the power-

ful can employ against the weak, and failing in the open field of fair competition, have resorted to artifice, and have triumphed by making gold their weapon," is absolutely groundless, and if uttered by one less distinguished than the Postmaster General, would deserve to be characterized as a pompous slander. If published by one private individual in respect to another, it would make its author liable to an action for damages. * * It has the right to acquire a monopoly of the telegraph business by serving the public better and cheaper than any other parties are able or willing to serve it; but if it be true, as stated in the report, that its competitors have been 'vanquished' by the reduction of rates, does not that fact destroy the chief support on which the postal telegraph scheme rests? If private companies cannot pay expenses at present rates, how is it expected that the Government can make a profit at still lower rates?"

In conclusion, Mr. ORTON says:

"There only remains to be considered the recommendation of the Postmaster General, that Congress authorize the construction of lines required for the immediate establishment of the postal telegraph. Can it be that the Postmaster General expected a proposition to be seriously considered which contemplates employing public moneys, collected from the people by taxation, to set up the Government in business as the competitor of private citizens? Coming from an executive officer of a Republican Government, whose powers are defined and limited by a constitution and laws, the proposal is simply monstrous. If there were no such prohibition in the Constitution, the common sense of an intelligent people would revolt at the suggestion that private property should be taken for public use without just compensation. But to use public moneys to destroy private property by Governmental competition, would be more unjust than to take it without compensation. In the latter case its owners would lose only its value, while in the former they would make the same loss, and, in addition thereto, be obliged to contribute in taxes their *pro rata* share of the cost of its destruction. The owners of telegraph property, startled as they may well be at this extraordinary proposal, need have no apprehension of its being carried into effect. The people of the United States are intelligent and just, and the Congress they have chosen, faithfully representing them, will require the Government to show the same respect for private property and private rights that the common law requires each citizen to show to every other."

We have been obliged to pass over many points in this communication which we should be pleased to consider, and merely refer to others which deserve more extended notice. We will only add, in conclusion, that the argument is all against the Postmaster General, and that, before he again enters the lists, he had better regain his good temper, devote some further time to the consideration of the subject, and then display his acquired wisdom by letting it severely alone.

The Railroad Telegraph Operators and The Telegrapher.

WHEN, two or three years since, recognizing the importance which railroad telegraphy had assumed, we devoted special attention to railroad telegraphy and telegraphers, we did so because we considered that it was due to both. Before that time little attention had been paid to this important interest, and it had been regarded as rather a reproach than otherwise to be ranked as a "railroad telegrapher." All this has been measurably changed now, and many of the ablest electricians and practical telegraphers are engaged in the railroad telegraph service. Certainly there is no branch of telegraphy which requires more ability and reliability upon the part of the operators than that connected with the railroads of the country. Upon the ability and reliability of these persons not unfrequently depend the safety of lives and property, and they seldom fail at the critical moment. Although not generally as well paid as commercial operators, their duties are usually more arduous and their responsibilities much greater. We think that their condition is gradually improving, and if THE TELEGRAPHER can in any way aid in such improvement, its influence shall not be lacking.

The railroad telegraphers of the country have not been slow to recognize and appreciate the position taken by THE TELEGRAPHER in relation to them, and some of our most valued contributors, and no inconsiderable number of our subscribers are connected with the railroad telegraph service. We hope that both

will be increased during the coming year, and that they may be fully satisfied that THE TELEGRAPHER not only desires but intends to do them justice, and that it is not without influence in their behalf.

A Valuable Contribution.

WE would direct the special attention of our scientific readers to the valuable and instructive series of papers on The Elementary Principles of Electrical Measurement, the first of which appears in the present issue. As a complete exposition of the very latest discoveries and theories in electricity, it will be found to be a contribution of great and permanent value to the literature of the subject.

Special Notice.

THE present number of THE TELEGRAPHER—the first of Vol. X—will be sent to subscribers whose subscriptions expired with the last number of Vol. IX, whose renewal of their subscriptions has not been received. It is hoped that all who have not yet sent their renewal will do so at once, if not the paper will be discontinued after the present issue.

Back Numbers of the Telegrapher Wanted.

OUR supply of the following numbers of Volume IX of THE TELEGRAPHER is exhausted:

Numbers 342, 351 and 354.

We would be obliged to any of our friends who may have either of them to spare if they will forward them to us to complete files.

The Telegraph.

Election of Officers of the Southern and Atlantic Telegraph Company.

AT the adjourned annual meeting of the Southern and Atlantic Telegraph Company, held in this city on Wednesday, December 17, 1873, Mr. James R. Crenshaw was reelected President of the company for the ensuing year. At a meeting of the directors of the company (whose election was noted in THE TELEGRAPHER of December 20th last) the following elections were made: Mr. Charles W. Blossom, Vice-President; Mr. W. R. Gardner, Secretary and Treasurer; Mr. George H. Grace, General Superintendent.

The following gentlemen were elected Executive Committee: Messrs. Francis Morris, H. Hentz, C. W. Blossom and Henry Morgan.

The President is ex officio a member and chairman of the Board of Directors, and of the Executive Committee.

The lines of the company now extend to Selma, Alabama, and will soon be constructed to New Orleans, La.

Annual Meeting of Stockholders of the Atlantic and Pacific Telegraph Company.

THE annual meeting of the stockholders of the Atlantic and Pacific Telegraph Company will be held at the executive offices of the company, 102 Broadway, in this city, January 28th.

Exit the Pacific and Atlantic Telegraph Company.

THE wires of the Pacific and Atlantic Telegraph Company have been turned over to the Western Union Telegraph Company, and the former, as a practical telegraph organization, has ceased to exist.

THE receipts of the Submarine Telegraph Company for the month of November, 1873, amounted to £8,851, against £3,485 for the corresponding month of the previous year.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended December 2, 1873, and bearing that date.

145,064.—TELEGRAPH CUT-OUT. William G. Linn, Bloomfield, Iowa. Application filed April 21, 1873.

Central revolving disk, with a metallic raised rim divided into two equal parts by insulating spaces. Disk revolved in one

direction connects B to B and B' to B', cutting the office out; reversing connects B to B' and B to B'.

The movable disk, with its separated conducting strips, combined with the conducting arms B B' B', substantially as described.

145,123.—TELEGRAPH REGISTER. William H. Sawyer, New York, N. Y., assignor to the American District Telegraph Company, same place. Application filed October 17, 1873.

Employs principle of screw thread unison of printers to arrest clock work of registers, preventing running down and waste of paper when not in use.

1. The combination, with the pen lever of a telegraphic registering or recording apparatus, of a shaft, Y, provided with a screw, S, and stop piece X, a pivoted lever, L, carrying a pin, U, a supporting arm, R, and a retracting spring, O, substantially as and for the purposes herein specified.

2. The combination, with the screw S and pin U, of the pivoted lever L, the latter being made flexible for the whole or a portion of its length, substantially as and for the purposes herein specified.

3. The combination, with the arms R and L, of the adjustable stop V, substantially as and for the purposes herein set forth.

145,143.—NON-FREEZING BATTERY. Edward H. Ashcroft, Boston, Mass. Application filed October 30, 1873.

A number of battery cups are arranged upon shelves in a subterranean casing, containing a lamp and having ventilating pipes.

The out door battery, composed of cells C, enclosed in a subterranean close chamber, and provided with lamp D, pipe E for supplying fresh air, and vent F, for escape of the battery fumes and products of combustion.

Born.

LARKIN.—At Kobé, Japan, the wife of Mr. THOS. J. LARKIN, Superintendent of the Imperial Telegraph Department, of a daughter.

SPARKS.—At Abington, Pa., Nov. 30, 1873, to Mr. GEORGE L. SPARKS, Agent of the North Pennsylvania and Northeast Pennsylvania Railroads, a male son.

Married.

FINKS—BROWN.—At Waco, Texas, Dec. 17th, 1873, Mr. J. H. FINKS, Manager of the Western Union Telegraph, to Miss FANNIE BROWN, of that place.

Died.

UPSON.—At his residence in Burlington, Vt., at 3 o'clock on the morning of December 22d, 1873, of consumption, HENRY S. UPSON, aged 31 years.

Mr. Upson had been in the telegraphic service for about fifteen years, being employed most of the time at 145 Broadway, New York, and Burlington, Vt. He leaves a wife and one child.

W. HOCHHAUSEN, Manufacturer of ELECTRICAL INSTRUMENTS, 132 WILLIAM STREET (rear), Between Fulton and John Streets, NEW YORK.

One half of actual size PATENT SELF-CLOSING KEY, (Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

- The Platina Points are large and hard. Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight. \$50 00 Sounders, from..... \$ 50 to \$6 50 Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00 Relays, from..... 9 50 to 16 00 Improved Switch Keys, from..... 3 00 to 5 50 Send for Illustrated Circulars.

The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

ANSON STAGER, Pres't. ELISHA GRAY, Sup't. ENOS M. BARTON, Sec'y.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE,

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SULLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.
 Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.
 Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.
 For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. BOX 6865.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.

15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS

of all kinds,

CHRONOGRAPHS,

ASTRONOMICAL CLOCKS,

REGULATORS,

ETC., ETC.,

OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

GEO. W. STOCKLY,
Sec'y and Treas.,
No. 4 LEADER BUILDING,
CLEVELAND, O.

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS

for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

NEW YORK, Oct., 1873.

We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

SOLE MANUFACTURERS OF THE

PATENT CIRCUIT-CLOSER KEY,

Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK, }
Sept. 22d, 1873. }

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,

A. S. BROWN, Manager.

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it: "We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year."

"We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.

Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR, for Hotels and Residences.

PARTRICK, BUNNELL & CO.'S

GIANT SOUNDER.

They are offered as being unequalled, and giving louder and better sound, with

ONE CELL OF DANIELLS OR CALLAUD BATTERY, than is usually produced from other Sounders worked by two cells of the same batteries.

A NEW GALVANIC BATTERY.
Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for the
manufacture and sale of the

EAGLES METALLIC BATTERY,
now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.
The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.
These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.
Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.
On Locals, one No. 1 cell is used in place of two Daniells, at a
saying of nearly one half in cost.
No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

THE AMATEUR'S TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.
 The Battery used is **HILL'S** Patent Gravity Battery, the most constant and economical in use.
 With each Instrument is furnished

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
 and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.
 In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

A COMPLETE OUTFIT FOR A TELEGRAPH OFFICE, Seven Dollars and Fifty Cents.

Two Sets, complete.....\$14 50
 Sounder and Key only.....6 50
 " " with Cut-out and Lightning Arrester... 7 50

We will pay expressage on Amateur Outfits when price is remitted in Advance.

SHAFFNER'S TELEGRAPH MANUAL.

TO TELEGRAPHERS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,
TAL. P. SHAFFNER,
 78 and 80 **Broadway,**
NEW YORK.

SOMETHING NEW.
"The Rattler" Telegraph Sounder.

(PATENT APPLIED FOR.)
 This is a very simple and effective Instrument, and, as it does not require any spring to draw the lever back, is always adjusted.

PRICE, - - - - \$3.50.

 No. 8 **DEY STREET, N. Y.**

THE BISHOP GUTTA PERCHA WORKS,
 422, 424, 426 **EAST 25th ST., N. Y.**

S. BISHOP, Proprietor,
 ONLY MANUFACTURER
 OF
PURE GUTTA PERCHA GOODS
 IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fine Wires, Leading and Connecting Wires for **SUBMARINE** and **MINING PURPOSES.**

Also, a **NEW COMPOUND** (thoroughly tested) for underground and out-door use.
 Cotton, Linen, Silk and Fibre covered Wires for **MAGNET AND OFFICE USE,**
 of any pattern or style.

OFFICE WIRES,
 Cotton and Gutta Percha covered, with any number of conductors required.
 Gutta Percha and Cotton covered Wires for **HOTEL ANNUNCIATORS, ELECTRIC BELLS** and **BURGLAR ALARMS.**

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE,
 AND FOR
BLASTING AND MINING PURPOSES,
 In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors **GUTTA PERCHA** has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.
ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 **DEY STREET, NEW YORK,**
 have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.
 Any Goods manufactured (except Telegraph Goods) are for sale in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway,
D. HODGMAN & CO., 27 Maiden Lane,
SHEPARD & DUDLEY, 150 William St.
Address all Communications to
S. BISHOP,
 OFFICE AT FACTORY.

A Great Telegraphic Suit in Prospect.

THE litigation which has recently been commenced between the Gold and Stock and Western Union Telegraph Companies on one hand, and the Manhattan Quotation Company on the other, from the nature and amount of the interests involved, seems likely to create as great an excitement in telegraphic circles, before it is finished, as did any of the celebrated suits between the Morse, House and Bain interests, which most of our older readers doubtless well remember. As appearances indicate that active hostilities are about to be commenced, it will probably interest our readers to know something of the origin and causes of the dispute.

The Gold and Stock Telegraph Company first commenced, in 1867, the then novel undertaking of furnishing printed telegraphic quotations of the transactions of the gold and stock markets to subscribers in the neighborhood of Wall and Broad streets, having purchased for this purpose the patents of E. A. Calahan. The Calahan printing instrument employed three line wires, and was capable of transmitting at the rate of perhaps six or eight words per minute; but, in spite of this apparently slow rate of speed, it served an excellent purpose, and the system very soon became an established institution. Within two years a large number of instruments were put in operation, and the profits of the company speedily became very large in proportion to the capital invested. During the year 1869 Mr. S. S. Laws, who was in reality the originator of the system of simultaneous reporting by telegraphic apparatus, also appeared in the field with a printing instrument of his own invention, and established a rival system. The Laws instrument required three line wires, and was not, in any essential particular, an especial improvement upon the Calahan instrument. Upon investigation the patents of the rival concerns were found to conflict, and there was at one time a prospect of a contest between them, which, however, terminated in the purchase by the Gold and Stock Company of Laws' patents and his entire system of reporting telegraphs, including his system of gold indicators, which has proved a notable success. This arrangement was consummated in the fall of 1869, and greatly strengthened the position of the Gold and Stock Company. The next attempt at competition in this business was made by Pope & Edison, who established a system of printing instruments for reporting gold quotations during the winter of 1869-70. Their instrument required but one wire, and was made simpler than any of its predecessors. The enterprise was quite successful, but was eventually purchased in the spring of 1870 by the Gold and Stock Company, together with a number of valuable patents. Meantime the progress of the Gold and Stock Company had been jealously watched by the officers of the Western Union, who were greatly chagrined at the spectacle of such a powerful organization growing up under their very noses, and reaping a golden harvest in a field which they had possessed neither the foresight to discover nor the administrative skill to cultivate; so they at length determined to enter the arena themselves with a new system, intending to employ an elegant and rapid printer, which had been invented by Mr. G. M. Phelps, superintendent of the company's manufactory, and which required but two line wires, although it was capable of doing three or four times as much work as any of the previous instruments in use.

By the latter part of the year 1871 Mr. Phelps had perfected his invention, and had built a large number of the machines, and it seemed probable that there would be a vigorous campaign opened against the Gold and Stock Company. Almost the sole advantage of the Western Union, as far as the business of New York city was concerned, consisted in the superior working qualities of their instrument. The Gold and Stock, on the other hand, already occupied the field, which advantage, together with their energetic management, and more especially their experienced, skilful and well trained employes, weighed heavily in their favor. Besides this they were owners of patents, on the basis of which instruments even more rapid and effective than that of the Western Union might have easily been constructed; but the threatened contest terminated in a compromise and the union of the two adverse interests. The Gold and Stock Company maintained its separate

organization, but a controlling interest in the stock passed into the hands of the Western Union Company. Scarcely had this arrangement been effected when still another competitor appeared upon the scene, in the shape of the Manhattan Quotation Company, which was destined to become the most formidable and successful antagonist of the whole series. The instrument employed by them was devised by J. E. Smith, and required but one line wire, while its effective speed was considerably greater than that of the old instruments—a consideration which the growth of business in the exchange had rendered a very important one. The new concern pushed matters very energetically, and within a year of the time they first opened for business they had put in a large number of instruments.

The old organization, naturally, were not disposed to share their large and lucrative business with a rival without a vigorous contest. Accordingly, several months ago the Gold and Stock Company commenced legal proceedings in the United States District Court against the Manhattan Company, alleging an infringement of a number of patents of which they were sole owners. Three distinct suits were instituted—one against the Manhattan Quotation Company, another against certain of its chief officers, engaged in promoting the enterprise, and a third against Mr. C. T. Chester, the manufacturer of the instruments employed. In addition to these, other suits have been commenced against the same parties by the Western Union Company for an alleged infringement of the notorious Page patent, and which are no doubt intended to test the validity of this somewhat questionable monopoly. Furthermore, notice was issued to all the subscribers of the Manhattan Quotation Company that they would be held liable for damages for using the instruments of that company. The Manhattan Quotation Company thereupon promptly issued a circular to their patrons, containing opinions signed by two eminent patent lawyers of this city, to the effect that the instruments used by the Manhattan Quotation Company did not "infringe any patent or patent rights under patents issued to any parties other than those owned by the said company." On the 30th of December the Gold and Stock Company came out with another *pronunciamento*, announcing a reduction of terms from six dollars per week to ten dollars per month, to take effect on the first of January. But perhaps the most important feature of this circular was a copy of certain correspondence between the attorneys of the Western Union Company and the two eminent attorneys whose opinions appeared in the previous circular of the Manhattan Company, and was quoted in substance above. One of them says, in his reply: "I have recently examined several of the telegraph printing machines put up and in use by the Manhattan Quotation Telegraph Company in this city, and find that they embrace devices that were not in the machine previously examined by me, and upon which my opinion referred to was based." In conclusion, he pronounces the machine actually in use "An infringement of the 11th, 12th and 13th claims of Page's reissued patent."

In reply to this, the Manhattan Quotation Company came out with another circular on the 2d inst., addressed to the bankers and brokers of the city, setting forth that the Gold and Stock Company—especially since their alliance with the Western Union—had become "arrogant and unreasonable in their treatment of customers, slow and careless in furnishing quotations and financial news, and impatient of just complaints," and claiming that they (the Manhattan Company) had furnished a vastly superior instrument; had abolished the former charge of \$100 for the introduction of instruments; had reduced the charge for all kinds of service to the sum of \$6 per week, and, finally, had contributed to the payment to the Stock Exchange of a rental of from \$20,000 to \$30,000.

In regard to the heavy reduction of rates by the Gold and Stock Company, above referred to, the circular contains the following: "And now, practically admitting that a fair competition on the merits of the instruments is too much for them, and that they have no hope of succeeding in their suits for a pretended infringement of their patents, this powerful monopoly has lately announced, by their circular of the 30th of December ult., that they will reduce the price of their stock instrument to \$10 a month—thus resorting to the policy of crushing out this company by reducing the charges for similar service below a living rate." The circular also denies that any deception has been resorted to, as charged by the Gold and Stock Company.

The fight is likely to prove a lengthy and obstinately contested one, especially so far as the question of the validity of the Page patent is involved therein—and, judging from universal experience, it seems probable that the contest will end in a consolidation of the opposing interests in some shape, whatever may be the final result of the litigation. Meanwhile, the prospect is that the host of eminent counsel who have been engaged will reap a rich harvest. Nothing like so cheering a prospect, telegraphically, for these gentlemen has turned up since the days when "Fog" Smith,

Henry O'Reilly and Amos Kendall, "fought, bled, and paid" on many a well contested field.

A Reply to Mr. William Orton, in regard to Automatic Telegraphy.

AUTOMATIC TELEGRAPH COMPANY,
80 Broadway, Room 28,
New York, Jan. 3d, 1874.

WM. ORTON, ESQ.,
President Western Union Telegraph Co.

SIR: Referring to your letter, published in the New York Tribune of December 27, 1872, criticising the Annual Report of the Postmaster General, so far as he discusses the possibility of cheaper telegraphy, you are pleased to task him, by implication, with using his office to further private interests, because he is awake to current developments, and states a few facts which will not be gainsaid by any one capable of seeing and judging, and cannot be refuted by mere assertion.

We had no idea that Mr. Cresswell would make any reference to the Automatic system in his report, much less mention it with even qualified approval. If Automatic telegraphy be the utterly worthless thing you would have your stockholders and the public believe it, why indulge in such a labored attack upon it? It has been in operation, between New York and Washington, during the past year, for general business, which would seem to be the best evidence of its practical working. To ignore facts, simply because they are unpleasant, is not the part of wisdom.

In 1869, after the "Duplex" had been in practical operation between New York and Boston for several years, you said, concerning it, "The double transmitter—an apparatus for working both ways over one wire at the same time—has long occupied a prominent place among speculative telegraphers, and has recently been extensively advertised by the promoters of the various competing lines. During the past 20 years there has been several inventions for accomplishing this result, the first being that of Dr. Gintl, of Germany; but, while it is possible, under certain exceptional circumstances, to transmit messages both ways at the same time over one wire, the conditions under which this result is obtained are such as to render the general use of the system impossible. If there were, however, any practical value in this apparatus, its use, like that of the Morse telegraph, is freely open to all."

In 1873, after circumstances allowed you to secure it at a nominal sum, you characterize it as "the most important and valuable of all the improvements which have been made since the Morse telegraph was first established," and excite the imagination of your stockholders, over prospective dividends and the obliteration of further competition, in the following eulogistic passage—

"The Duplex apparatus, the patents for which are owned by the Western Union Company, is capable of rendering more valuable service than the Automatic, even if the graver defects of the latter are successfully overcome. The Duplex works equally well single or double, thus obviating the necessity for duplicating instruments. It doubles the capacity of a wire by enabling messages to be transmitted over it in opposite directions at the same time, without any perceptible diminution of speed. It does more than save the cost of providing and keeping in repair additional wires. It gives the carrying capacity of two wires, when, by accidental interruptions, there is but one in working order, and when no amount of money previously invested in wires would have provided another."

Meantime the world moves—Automatic telegraphy is developed, and you would again treat it with the same contempt as you formerly regarded the now much vaunted Duplex.

It is unnecessary to comment on your assertions that the Automatic system has been for years seeking a market. Enough to say that no one has ever yet been authorized to offer it for sale, and its present owners are still content with their investment: nor is it necessary to reply in detail to the extravagant statements made as to the cost and character of machinery and equipment, the large number of operators needed, and the comparative capacity of the various systems.

The fact exists, notwithstanding, that we perforated the President's late message at the rate of 25 words per minute per man, transmitted it in 34 minutes over one wire from Washington to Pottsville, Penn., and there copied it at the rate of 32 words per minute per copyist—the perforating, transmission and copying, of course, proceeding simultaneously, as in the case of the Western Union.

We shall have the pleasure of doing that or better in a further demonstration within a few days, and shall be pleased not only to have you present, but also to present you with affidavits of responsible gentlemen, which will be eminently more convincing and satisfactory to the public patrons of the telegraph than any mere statements.

You will recall a conversation with the writer last winter, in Washington, when, in the discussion of this

subject, you raised numerous theoretical objections, to which he replied that it did not rest on his statement, as that might prove nothing; nor would your simple refutation change the matter. The question the writer put was: "Is the work done?" Our daily experience then and since is the answer.

Regarding your positive statement that press matter cannot be hauled automatically in the day time, we simply reply that all offered us is being transmitted between Washington and New York for a half cent per word—which is at least 50 per cent. less than the present charge of the Western Union Company—and this is done in conjunction with our ordinary commercial business.

Be patient and you shall hear from us again. The President of the Western Union Telegraph Co. should know what is going on in the telegraphic world. If he does not, we will endeavor practically and kindly to inform him.

J. C. REIFF.

Action of the Cleveland, Ohio, Western Union Operators on the Death of Mr.

George D. Phillip.

MR. GEORGE D. PHILLIP, who had been employed as an operator in the Cleveland, Ohio, Western Union office for several years, died recently of small pox, after a brief illness.

The following letter and resolutions, expressing the sentiments of his late associates, were prepared and forwarded to his family, and are published by request in THE TELEGRAPHER:

"To the family of the late George D. Phillip.

"DEAR FRIENDS: Enclosed you will find resolutions deploring the untimely death of our late beloved friend and associate, George D. Phillip. They contain our heartfelt sentiments. His departure upon the great unknown sea comes home to us like a personal bereavement, and impressively teaches us that "he who builds beneath the skies builds too low." He was one of the fortunate few who possess the happy faculty of conciliating and pleasing every one, and his accommodating and winsome ways have left an indelible impression upon us, and we sympathize very deeply with you in your irreparable loss.

"Please accept these resolutions as a sincere expression of friendship for our departed friend, and cherish them for memory's sake.

"At a meeting of the telegraph operators of Cleveland, Ohio, held Sunday, December 23, 1873, at the Western Union telegraph office, for the purpose of taking fitting action in regard to the death of their late fellow operator, George D. Phillip, the following resolutions were adopted:

"Whereas, We deem it proper to tender to those he held so dear our sympathy, and to express our regrets at the loss of our esteemed friend and associate, George D. Phillip—

"Resolved, That by his death the profession has lost one of its most accomplished members, the telegraph company a valuable servant, and his fellow operators a kind companion and a true friend.

"Resolved, That we tender to the family of the deceased our heartfelt sympathies in their great bereavement.

"Resolved, That a copy of these resolutions be presented to the family of the deceased, and that they be published in the papers of this city and in the journals of the country devoted to the interests of telegraphy.

V. D. GREENE,
J. T. HANFORD, } Committee.
R. W. WILLIAMS,

"O. A. GURLEY, Secretary."

The Society of Telegraph Engineers.

THE annual general meeting of the London Society of Telegraph Engineers took place on the 10th of December last. The annual report was read by the chairman, Mr. W. H. Preece, and showed that the affairs of the society were in a very prosperous condition. The total number of members, including honorary, associate and foreign members, at the date of the report, was 512. The society has lost several of its most prominent members by death during the past year, among whom may be mentioned Sir Francis Ronalds, the very father of telegraphy; Mr. Lendi, of Berne, and Mr. George Seward, of Atlantic cable celebrity. The balance of funds on hand at the close of the fiscal year was over £500. Three honorary members have been added to the rolls of the society during the year, viz., Professor G. B. Airy, the Astronomer Royal; General Edward Sabine, and Professor William Weber, of Gottingen. A number of changes and modifications have been made in the rules and regulations of the society. Any foreign member can now become a life member upon the payment of ten pounds. The following officers were elected for the ensuing year: President—Sir William Thompson. Vice Presidents—Lord Lindsay, Latimer Clark, R. S. Cully and Professor G. C. Foster. Other members of Council—Professor

Abel, Major Malcolm, W. H. Preece, Robert Sabine, Carl Siemens, Lieutenant Colonel Stothard, Major Webber, Wildman Whitehouse, C. F. Varley, C. E. Spagnoletti, C. V. Walker, Professor Williamson. Associates—A. Bell, Dr. A. Muirhead, Lieutenant Watson. Auditors—J. Wagstaff Blundell, Fred. C. Danvers. Treasurer—Major Webber, 101 Cannon street, E. C. Hon. Secretary—Major Frank Bolton. Secretary—George E. Preece. The society have recently secured commodious and convenient rooms for a library, office and meeting room at No. 4 Broad Sanctuary, which are being prepared for occupancy, and will be opened early this year.

Correspondence.

Automatic and Morse Telegraphy.—Reply to the Official "Journal."

NEW YORK, Jan. 6th.

TO THE EDITOR OF THE TELEGRAPHER.

SIR: As the Western Union Company furnish the money to pay for printing and editing their official *Journal*, it is, of course, natural that the company should wish to exclude from its columns matter detrimental to its own interests; but, as the *Journal* affects to be "up" in all the scientific and practical departments of telegraphy, it could not well avoid alluding to automatic telegraphy, and here is the way the editor does it:

"Now, we claim that if it takes as long to prepare a message for transmission by one process (Automatic) as to transmit it by another (Morse), the latter process, in all but exceptional circumstances, must have the advantage."

In the first place, it is well known to every person who knows anything about Automatic telegraphy (and to none better than to the editor of the *Journal* and his employers), that the average speed of Morse operators, in large and small offices, does not exceed 6,000 words per day of ten hours. The leading officers of the Western Union Company, including the editor of the *Journal*, know, from their own eyesight, that the perforators of the Automatic Company have been accurately worked up to 135 words per minute, and to such expert operators 3,000 words per hour would be a very easy task; and, to the slowest operators of the perforators, 1,500 words per hour would be as easy as 500 words per hour to the average Morse operator.

In the very outset, therefore, of the *Journal's* allusion to automatic telegraphy, the editor deliberately robs the system of more than TWO THIRDS of what actually belongs to it, and then complacently assumes that its absurdly untrue premises are correct, and, of course, finds it easy to deduce conclusions satisfactory to the managers of the Western Union Company.

But it is easy to show the absurdity of the *Journal's* conclusions, even if we concede to it all it claims; and, for illustration, let us take two lines, of one wire each, say 100 miles in length, with twenty offices on each—one Morse and one Automatic.

The twenty Morse offices take in an average of thirty words each per hour, which, with the addresses and signatures, would aggregate over 1,000 words per hour, which, of course, any disinterested Morse telegrapher would unhesitatingly say was twice as many words as are ordinarily transmitted over way or side lines. Now, then, obviously, eighteen of the twenty Morse operators must be standing still—utterly unable to advance the work of the line in any degree—as only two can work the line at the same time.

At the end of ten hours, the wire having been constantly occupied, it has conveyed 10,000 words, and eighteen of the twenty operators have been waiting their turn at the wire, which they have individually obtained once in every hour—so their messages have been delayed only an average of sixty minutes.

Now, turn to the Automatic line of twenty offices, each averaging a business of 500 words per hour. As fast as the messages are handed in, each of the twenty operators finds steady employment in perforating or copying the messages or in transmitting them—no one office holding possession of the wire over one minute. In each hour, therefore, the Automatic wire will have been in actual use but twenty minutes, but yet the twenty operators have been able to so employ their time that they have served the public with 10,000 words as easily as the twenty Morse operators have served them with 1,000, and the day's business foots up 10,000 words for twenty Morse operators and 100,000 for twenty Automatic operators.

Here are legitimate advantages of nine to one in favor of Automatic telegraphy, and it is not in the power of the editor of the *Journal*, nor of any of his

employers, to imagine a probable combination of circumstances wherein Automatic telegraphy will not show actual advantages over the Morse system, varying from at least fifty to ninety per cent.—always, of course, on the supposition that the public will transact a very large business over the wires, if they can do so at a very small charge. D. H. C.

More Reminiscences.

TO THE EDITOR OF THE TELEGRAPHER.

THE contributions from the veterans appear to be well received, and, even if they do tell tales out of school occasionally, there is little harm done. Charley Jones rather goes for a fellow about my size, but I forgive him.

But what I wanted to put on record is the story of one of the early day mysteries, which never was explained before, and which will not meet the eye of the injured party in all human probability. During the "early days" opposition lines were extended rapidly Westward, and the town on any great thoroughfare was small indeed that could not boast of two offices. In a little place that shall be nameless, the spirit of competition was made a personal matter between the operators, and all sorts of devices were concocted to curry favor with customers, and decry the ability and injure the facilities of the opposition. Little jokes were played, and matters were worked up to a fever heat. One line opened late in the fall with a brand new office and instruments, a glittering sign, and other appurtenances of an equally attractive nature, and business flocked to the standard of the Speed man. The O'Rielly man became thoughtful and almost despondent. Saturday night all was lovely with the Speeds, but Monday morning the Speed man was in trouble. His circuit came and went like the "milk sick" in Indiana, and all his communications were fractional; but there was no trouble elsewhere on the line. His office was in a loop, so he hunted for it there. He climbed every pole in the town—a mile of poles—without climbers, but found nothing, and still the current came and went irregularly, and apparently without cause. Oh! how he turned and twisted the screws of his instruments and fussed with his local! His hooks filled, his customers grumbled, then left him and returned to their first love. Then the repairer came and sweat, and quoted from the book of common prayer, and went home again. Things went on in this way several days, until one morning the trouble disappeared as mysteriously as it came and was heard of no more. By some means or other two fine wires had made connections between two separated sheets of zinc under his stove, which stood on bricks, and the wires on either side of his instrument, and as they lay in the grooves of the floor they had been overlooked, and somehow or other the tongs, every now and then, and occasionally a wet boot, completed the cut-out. The uncertain action of the unfortunate arrangement was what made it difficult to find, and it was accounted for, in a sort of Dundreary style, "As one of those things no feller can find out."

Between Queenston and Lockport the line ran through an Indian village. When lines would not work in those days you would find on the office door a notice something like this:

"Gone out on line. Be back soon as I find the break."—OPERATOR.

One terribly cold day in January my office was decorated as above, and I was footing it between the two points named. I met a noble red man and made inquiry as to the *status* of the line, and the noble red caromed on the white as follows:

"Me show where broke. All right now. Me fix 'em. Indian wan't pail handle; rope no good for pail."

The breechless Modoc supposed a fair exchange was no robbery, and so he had traded, giving string for wire, and had put up an extra pole, in the shape of a slanting fence rail, into the bargain, to keep the line from the ground. I thought, "pretty well for Ingin." Come again, somebody. C. C. H.

The Western Union Company vs. The Poor Inventor.

TO THE EDITOR OF THE TELEGRAPHER.

A CORRESPONDENT in your last number has something to say on the subject of the treatment of inventors by the Western Union Company. If he had stopped to think a little it might have occurred to him that there is another aspect of the subject. Take for instance the case of the Milliken repeater. There was certainly nothing to prevent Mr. Milliken from taking out a patent (provided the invention was really his, which I assume to be the fact) any time within two years of the date when his invention was perfected and put in practical operation. Failing to do this the invention became public property, in accordance with the Act of Congress. As Mr. Milliken held a position as manager of one of the largest telegraph offices in the country, it is hardly reasonable to suppose that he failed to apply for a patent on account of lack of funds, as the expense of

so doing certainly would not have exceeded \$100. Having made no effort whatever to secure his invention, and having allowed it to become public property, I think it is hardly worth while to raise a howl because the Western Union Company have seen fit to equip their lines with it, as they had a most undoubted right to do. In fact, it is very likely that this was done with the permission of the inventor, as he has made no protest against it, "so far as heard from."

I know nothing about the case of Culgan, but as the switch never was patented (or patentable either, for that matter, in my opinion), it is fair to presume that it was substantially a similar one to that of Milliken.

In regard to the Duplex patent, if it is true—as your correspondent asserts—that "almost every point about the latter invention of any practical value, and which was not free to public use, was anticipated in Farmer's patent of 1858"—I would like to ask where Farmer has been all this time? If his invention was a practical one, why was it never used? I think, when the matter is sifted, that we shall find that, as is often the case, his invention fell just short of success, and that Stearns added some apparently trifling but really essential modification, that just bridged the narrow gap between success and failure. Most great inventions are made in just that way, and the man who puts on the finishing touch gets credit for the whole. It seems unjust to his predecessors, who have borne the burden and the heat of the day; but is it? The question is: Are we not indebted to the man who gives the invention to the public in an available form, for the benefits we actually derive from it, and for which we pay our money? It is obviously impracticable to divide up the credit and the compensation in due proportion among the thousand and one inventors, each of whom contributed more or less towards the development of almost every great invention that could be named.

Furthermore, I would ask if it seems likely that the Western Union Company, having in their employ some of the ablest patent counsel to be found in the country, would be so supremely foolish as to pay out such a large sum of money for a patent of this kind, if, as your correspondent says, it was anticipated by Farmer's patent, which, of course, was readily accessible to any one who chose to look for it? The very idea is a manifest absurdity. Lastly, by what authority does your correspondent assert that the Page patent is fraudulent? Congress authorized the Commissioner to grant Page a patent for whatever he might be able to prove himself the original inventor of. His claims were examined in the Patent Office, and passed upon precisely the same as those of any other inventor, and are, therefore, presumably valid. If the Western Union Company thought enough of the patent to do so, I cannot see wherein they did wrong to buy it. The company was probably established for the purpose of making money. If the patent is worthless there should be no particular difficulty in proving it; if, on the other hand, it is good, the company would finally have been obliged to buy it in any event, for their own protection, and if they were convinced of its validity, they were very wise in getting hold of it in good season. I have heard a great deal said about the Page patent being used as an "engine of oppression," but from the fact that nobody has been molested by any attempted enforcement of it, although the Western Union Company have owned it for more than two years, it would seem that they bought it principally for self-protection. Some of your correspondents are always ready to raise a hue and cry at the Western Union Company, but I fancy the officers of it generally do just about the same as any one else would place in their position. INVENTOR.

A Response to Nettie Bronson.—"Plugs," not Female Operators, Objectionable.

FALLS CITY, NEB., Dec. 31.

TO THE EDITOR OF THE TELEGRAPHER.

NETTIE BRONSON takes me severely to task for my strictures on the superfluous number of "plugs" throughout the country, and, as she does injustice to the motives which prompted that article, "I rise to explain."

Without the remotest idea of assailing your sex, Nettie, that protest was made purely against the too early employment of students, before they could lay any claim to being capable of managing an instrument. In self-vindication, and to further explain the injustice of your observations and conjectures, I will add that I have instructed ladies to become expert operators, but they did not take charge of an office until their competency was quite manifest.

About that "dollar bet"—you cause a manly blush to overspread my physiognomy.—I suspect you would lose. I am pronounced the quittance of modesty. I made so many "bulls" while learning the art, half a decade of years ago, that it took all the conceit out of me. You did not give the geographical location of those "soft" operators, but we don't have any of that class out here.

The encouragement of ladies to become operators is very generally and highly commended, and by few

more so than this scribe. They are admirably adapted to this peculiar employment, and the deference shown a poor operator on the lines is the strongest evidence of sympathy and consideration for her that can be produced, and a like inefficiency in a man would hardly be tolerated.

The avenues for ladies to find suitable, and the chances of remunerative employment, are too few, and no obstacle would be willingly thrown in the way to their preferment in the telegraph ranks. The most common and formidable objection raised is the likelihood of their abandoning the calling in a few years, from various causes, and therefore start in the business with such a contingency in view.

A person starting out to learn operating should be made acquainted with the qualifications requisite to become successful. Many illiterate persons attend these institutes month after month, and actually demand recognition in the profession for their trouble, without any other evidence of merit or sympathy than an exhausted purse and wasted time.

But, Nettie, you make a sweeping accusation against us operators for what would seem our lack of magnanimity. You probably never realized what a vast amount of patience it requires to transact business over the wires with a "plug," especially when one has little time to squander coaxing messages to such.

It is an over-zealousness in students to become managers or operators, before they have attained reasonable proficiency, that robs them of their real merits. Personal experience indicates to my mind the importance of these considerations. I had, while learning, the usual zeal to take an office, and was, at the same time, very doubtful about being able to hold a place when I got it, and have since thanked the operator by whom I was instructed for restraints on such impetuosity.

The opportunities for learning the first rudiments of the art are innumerable, and this kind of employment to young persons is fascinating, hence a great number of persons attempt to learn, encouraged by a mistaken belief that no personal adaptation is essential.

It is with no "dog in the manger" spirit that the generality of managers repel the students, by any means. There are few operators that outgrow their remembrance of having belonged to that class themselves, but the constant demands on managers to "finish learning," or, to practice, or, by more courageous ones, for a job, brings the class into bad odor with managers.

This will account for the ill success of so many students who venture among strangers, and expect sympathy and assistance. AARON AROUND.

Telegraphers' Unions Impracticable and Why.—The Moral, Social and Professional Status of Telegraphers.—Reduction of Salaries, and Official Christmas and New Year's Greetings.

TO THE EDITOR OF THE TELEGRAPHER.

If I remember rightly, I have expressed myself on the subject of Telegraphers' Unions before, but I might add a reason or two more why I believe them to be impracticable:

First. There are two distinct and separate classes of telegraph operators, which are removed as far from each other as though they were of different vocations. I refer to the railroad operators and those employed upon commercial lines. There is no harmony of feeling and action, no sentiment of sympathy existing between them. The generality of railroad operators have been reared, so to speak, on railroad lines, and know nothing of the workings of commercial lines; and railroad wires and the mysteries of train orders, etc., are as foreign to the commercial operator as water to the fowls of the air.

Second. The great difference in the capacity of operators and its consequent result—the wide range of salaries—is a serious obstacle.

Third. There is, as I have said before, no one to act. It is all well enough to write anonymous communications for THE TELEGRAPHER, or assume some *nom de plume* and express one's self, but I really have very serious doubts whether there is actually a man in the fraternity who is bold enough to assert himself sufficiently to accomplish anything.

Regarding our standing socially and morally, of which some few of your correspondents have spoken, I have noticed a *something* wrong myself—but it does not seem to me that it is because we are so very immoral. Indeed, the telegraphers of my acquaintance are, with a few exceptions, inoffensive, good-for-nothing fellows, who would do no one a wrong. I am one of the same class—am not smart enough to do a mean or dishonest thing—and yet I have observed that in social circles the telegrapher is not respected as I think he ought to be. He is considered an insignificant sort of fellow, instead of the representative of the greatest of art sciences.

For this I am unable to account. I have sometimes

wondered if it were not on account of the imperfect knowledge of the art and our inferior qualifications. But I hardly think this is so much the trouble as is the fact that we stand divided against ourselves. There is not enough of harmony between us and unity of action. If we wish to gain the esteem of others we must first learn to esteem ourselves.

Although, taken as a class, I do not believe we are so very immoral; yet, the term "press operator" is always associated in my mind with unlimited and untold quantities of whiskey. My first inward exclamation, on reading the article of your correspondent the other day, who told us of the great feats he had performed, was: "Ah! how the 'benzine' must have suffered." A man who is really a *first class* operator, and can show himself to be such, ought not to apply for work in this section of the country; it is hardly worth his while. They are said to be *unreliable*.

As your correspondent, Nettie Bronson, says, "the telegrapher is surely a very conceited mortal." One glance at your correspondents' columns justifies this belief; and I claim no exception to the general rule. There is scarcely a day but I see how much more I admire and appreciate myself than others do. How unwilling would a single one of your correspondents be to acknowledge the limited number of years of experience they have had at telegraphing; and in the four years I have worked at it, I have got this principle so thoroughly inculcated in my mind, that not for worlds would I have one of your readers mistrust that I am a minute less than twenty years at the business!

The salaries on many of the lines in this section have been reduced ten per cent. Our lines are included in the number. And now comes the meanest part of the story. I have read of the man who whipped his oldest boy when his wife found tobacco in his own pocket—whipped him, he said, because the tobacco belonged to the boy, and the boy had put it there to escape detection—I have read of this, and how the depraved old vagabond afterwards laughed, and told his bar-room friends how it made his old heart glad to think he had a boy that could be relied upon in case of emergency; but it strikes me this is not a comparison in meanness to the keeping in of operators, upon legal and national holidays, to send Christmas and New Year's greetings from the officials to "all employes!!" And, methinks, if those who favored the reduction knew how strangely those smoothly worded greetings sounded—how harshly they grated on our ears—if they knew of the little some of us had to make our Christmas merry or the New Year happy, they would refrain from sending them.

But, for the life of me, I cannot begin to imagine what we are going to do about it, even though we do not like it. But we will hope for better times, and hope in dead earnest, too. In the spring, we are told, they will come; and until then we will patiently submit to that which we cannot now remedy. J. H.

A Telegraphic Union the One Thing Needed.

BUFFALO, N. Y., Dec. 29th.

TO THE EDITOR OF THE TELEGRAPHER.

SIR: In your last number I saw an article signed "Rover," and as he agrees with me in his idea of a Telegraphic Union, I wish to give my views on this subject:

In the first place, I contend that there is no trade or occupation in this country (requiring the same amount of education and ability to master it) that receives so low salary as telegraphers in general. Take any of the trades—gas fitters, plumbers, engineers, etc.—are those men superior in either education or ability to telegraphers? Emphatically, no; and yet either of them can command as much or more than a first class telegrapher, and the situation is growing worse each year. Now, let us have a Union, as Rover says, "built on a firm basis." Admit none but first class men; put them through the mill first, and then, with a ticket signed by the officers of the Union, the holder would be respected, and could always be sure of a position, and I am sure that in a short time the Union men would be in demand, and the plugs be where nature intended them, *i. e.*, chopping wood. Speaking of plugs reminds me that the operating department is not the only place to find plugs in. I mean plug linemen or repairers—and from my observations I think the percentage is very large, and no wonder. It is the same story with them as with operators—no standard of ability. Now is the time to form a Union, for delays are dangerous, and unity is strength, and if it is ever wanted now is the time.

As I am not an operator, I will not attempt to describe how the Union should be constructed, but will leave that to older heads than mine. Start the Union, brothers, and I will lend a helping hand. S. G.

Answer to Correspondent.

G. E. C.—Do not know where the articles mentioned can be obtained, or that any one manufactures them now.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JANUARY 10, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Communications must be addressed to

(P. O. Box 5503.) 38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS

OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE
AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Postmaster-General and Mr. Orton on Automatic or Fast Telegraphy.

In considering last week the reply of Mr. ORTON to the Postmaster-General's report on the subject of telegraphy, and his attacks on the Western Union Telegraph Company and that gentleman personally, we proposed to make that portion of both the subject of a separate article.

In reference to the Automatic system of telegraphy, the Postmaster-General, in his report, says:

"For years past the attention of inventors and scientists has been attracted to the necessity for a more rapid and less expensive mode of transmission than the Morse, which requires the message to be spelled out by a slow and tedious process, at about the speed of an ordinary writer. One of the results of their investigations is the 'Automatic, or Fast System,' now in operation between New York and Washington. This system is capable of a speed of from 500 to 800 words per minute. The average of an expert MORSE operator is not over 25 words per minute. Therefore, it is evident that if the Automatic method can be made to accomplish what its advocates confidently predict for it, the capacity of a single wire for business will be increased nearly or quite thirty times. This increased capacity may again be doubled, or, perhaps, quadrupled, if the Duplex apparatus, now used every day by established companies for sending messages simultaneously in different directions on the same wire, can be successfully combined with the Automatic machine. There can be no doubt of the ultimate success of the Automatic principle. Its battle with an incredulous public is almost won. As soon as it shall be thoroughly developed and applied in practice, the problem of cheap telegraphy will be definitively solved."

To this Mr. ORTON responds:

"The next notable statement in the report relates to what is therein styled the 'Automatic, or Fast System.' It is certainly an unusual instance of good fortune when the owners of patents, who have been for years unsuccessful in their efforts to make a satisfactory sale, are enabled to secure so valuable an advertising medium as the Annual Report of a Postmaster-General. The inference to be drawn from the statements in the report concerning this wonderful 'system' is that it is a budding novelty, just ready to burst into the full bloom of triumphant success. I would not blast its promise by even the breath of an unkind word, but a few plain and simple truths concerning it must be told:

"First.—It is not a novelty. There lies beside me as I write a pamphlet, bearing date December 1, 1869, throughout whose twenty-two pages the praises of what it had then achieved are glowingly set forth.

"Second.—It is not a success. Four years of constant trial, during which large sums have been expended in practical experiments, and in endeavoring, by new devices, to overcome constantly developed defects, have failed to demonstrate its superiority over existing modes, or even its ability to compete successfully with them.

"Automatic telegraphy, as a separate system, has never been attempted in any country. It has been in use in England for several years, but only as an aid to the Morse system, or as a substitute for others greatly inferior to the Morse, and which were either never introduced into this country or were long since discarded. Its chief defects are—

"1. More time is required to prepare a message for transmission by the Automatic than to send it by the Morse. By the latter the receiving operator writes out the message as fast as the sending operator transmits it, so that when the sending is finished the copying is completed, and the message ready for delivery.

"2. By the Automatic system the message is received in the dots and dashes of the Morse alphabet. More time is then required to translate and copy than is occupied in both sending and copying in the ordinary way. No matter, then, what the rate of speed at which the signals are made to pass over the wire—if it takes as much time to prepare for transmission, and again as much time to translate and copy, after the message is received, as to transmit and copy by the Morse system—it is plain that twice as much is consumed in respect to any single message by the Automatic process as by the ordinary Morse.

"But there are other grave practical difficulties. The Automatic apparatus, as compared with the Morse, is cumbersome, intricate and costly. It gets out of repair easily, and the cost of providing duplicates for use in case of accident, and of shipments over long distances for repairs, constitute a serious objection.

"Again, it is evident that in the separate processes of perforating, transmitting, translating and copying by the Automatic system, more operators are required than in the regular Morse. The testimony of those connected with the Government telegraph in England is, that it takes five times as many operators to successfully work the former process as the latter.

The cost of operating is the chief expense of carrying on the telegraph business. It would be much cheaper to provide additional wires, and to apply the Duplex to them, than to double the cost of operating; but if it be necessary to multiply this cost by five, that fact alone constitutes a fatal objection."

In an appendix to his letter Mr. ORTON elaborates his argument, and, by assuming certain conditions, endeavors to prove the inferiority of the Automatic over the Morse system as regards speed and relative cost. The argument and assumptions are certainly ingenious, but an analysis shows both to be fallacious.

It might be supposed that his experience in decyphering the Duplex system and apparatus as utterly impracticable, and subsequently purchasing the same at a large price for the Western Union Company, and vaunting it, as he has done in his last Annual Report to the Stockholders of that company, as the greatest and most valuable telegraphic invention of recent years, would have induced more modesty and caution in his treatment of the Automatic system. If he remains in the telegraph service for any considerable time he will undoubtedly change his tone as entirely, in regard to the Automatic, as he has already done in regard to the Duplex.

As the readers of THE TELEGRAPHER will bear witness, we have never been extravagant (its friends think us hardly just) in our statements in regard to what the Automatic system has accomplished or is capable of. We have given space to nothing in favor of that system which we have not had good reason to believe was fully substantiated by actual performance. We do not now regard it as likely to supersede the Morse, but believe that it has proved of great value and advantage, and will become more so as it is more generally introduced.

Mr. ORTON bases his arguments entirely upon what has been accomplished by the WHEATSTONE Automatic in England. We willingly concede his statements in regard to that system to be correct, so far as they go, but the WHEATSTONE is much slower, relatively to the American (or LITTLE) Automatic, than the Morse, as practiced there, is slower than the same system in this country and with American operators.

The Western Union officials are making progress on the Automatic system, evidently. In the fall of 1870 Mr. GEORGE B. PRESCOTT, the electrician of the Western Union Company then as now, stated, in a communication published in the *Scientific American*, that after an exhaustive series of costly experiments, (instituted on behalf of that company), he had proved the utter impossibility of attaining by any known means a greater speed than fifty to sixty words per minute automatically on 100 miles of line. Mr. ORTON now concedes that nearly 12,000 words can be and have been transmitted in distinct legible signals, in one instance in thirty-four and in another in twenty-two minutes, on about 300 miles of line!

In 1872 Mr. ORTON asserted, before a Congressional Committee at Washington, that the wires and operators of the Western Union Company were capable of telegraphing upon an average only about 600 words per hour. Conceding that by the Duplex the capacity of the wires and operators is doubled (which it is not), would give an average of only 1,200 words per hour, against a conceded performance of the Automatic equal to about 36,000 words per hour! It must be borne in mind that the statement in regard to the performance of the Morse operators is Mr. ORTON's, not ours.

The Automatic Telegraph Company, for a year or more, has had its lines opened for public business between this city and Washington. During that time the capacity and practicability of the system has been pretty thoroughly tested, and has not been found wanting. The capability of the system of transmitting telegraphic signals as rapidly as is claimed for it having been conceded, the question remains as to the relative speed of perforation and copying the despatches. The President's message, to the transmission of which reference has been made, was actually perforated at the rate of twenty-five words a minute per man. Conse-

quently, eight perforators could prepare the despatch for transmission in one hour. It was copied at the rate of thirty-two words a minute per copyist. Six copyists, therefore, would be required to copy it in an hour. Upon Mr. ORTON'S own statement it required sixteen operators and eight wires to accomplish what could have been done by the same number of operators, *i. e.*, eight perforators, one sender, one receiver and six copyists by the Automatic system, in the same space of time, on *one* wire. This speed was by no means exceptional, and can be largely increased with practice.

This simple statement of *facts* disposes of Mr. ORTON'S *assumption* that it will require at least double, and, judging from English experience, five times the number of operators by the Automatic system to accomplish the same amount of work as by the Morse system.

Mr. ORTON entirely ignores one of the greatest advantages of the Automatic system. If, as is not unfrequently the case, all but one or two wires on a main route, like that between New York and Washington, or between New York and Boston, for instance, are incapacitated for a time, the automatic system would enable one wire to do all the actual transmission required; or where all the wires are prostrated and business accumulates, as it does in these days of almost unlimited use of the telegraph, the messages can be perforated, and as soon as a single wire is restored, they can all be forwarded to the receiving stations in a very brief space of time, whereas by the Morse system, even with the valuable assistance of the Duplex, hours would be required to clear the files.

The length to which this article has extended, and the pressure upon our columns of other matters, compels us to be brief in our allusions to other points in Mr. ORTON'S remarks upon the Automatic system. In the appendix to his communication he asserts positively that, "whatever else the Automatic may be able to do satisfactorily, it is very certain that it cannot handle press matter in the day time." To this it is sufficient to say that it *does* handle press matter in the day time, and, we are informed, is prepared to contract for the satisfactory transmission of press despatches on the route covered by its wires to any desired extent.

The umbersomeness and costliness of the apparatus, even if true, is a minor consideration, and one not difficult to obviate. Its liability to get out of repair we have not investigated, but think it safe to assume that this assertion has no better basis than the other, whose fallacy we have shown.

It is true that the Automatic system is no novelty, and it is also true that a sanguine advocate did, in 1869, publish a pamphlet or pamphlets glowingly setting forth what it had accomplished. We believed and stated then that we considered such publications premature and unadvisable, but that fact did not and does not lessen the real merits of the system. The idea of Automatic telegraphy outdates by many years Mr. ORTON'S accession to the telegraphic service, but until the development of the American system its capabilities and practicability had not by any means been demonstrated. It required the application of the rheostat and condenser, made by Mr. GEORGE LITTLE, to make it practical and reliable for long lines of telegraph.

As to the paragraph in the Postmaster-General's report being a "valuable advertisement," we are assured that the fact that it was to be mentioned by him was unknown to the officials of the Automatic Telegraph Company, and that the system has not been offered for sale or a purchaser been sought.

There are other points which we should be pleased to notice more at length, but we cannot now afford more space therefor. What we have stated we can substantiate at any time. At the same time, it should be understood, that, while conceding the advantages of Automatic telegraphy, and firmly believing that it is to become a most valuable part of the telegraph system of this country and the world, we are not yet convinced that it will either supersede the Morse, or that it affords any argument in favor of a postal telegraph,

such as the Postmaster-General seeks, with so slight prospect of success, to have imposed upon the country. If, by increasing the development of the practical capacity of the wires for business, the cost of telegraphic service can be materially cheapened, private enterprise will not be slow to recognize so important a fact, and private competition will assure to the public the advantage to be derived therefrom.

Death of Professor De la Rive.

THE distinguished Swiss scientist and electrician, Prof. AUG. DE LA RIVE, of Geneva, died on the 27th of November. He was formerly Professor of Natural Philosophy in the Academy of Geneva, and is best known to Americans by his great work on electricity, the first volume of which was published in 1852 and the last in 1858, and which has been translated into English, German and Italian. This work may truthfully be said to have embodied almost everything that was known in relation to electricity up to the time of its publication, and for many years was the standard text-book on this branch of natural science in all the countries of Europe. Some of the later writers on the same subject—in this country especially—have published works whose most valuable portions have been compiled almost literally from DE LA RIVE'S treatise. Prof. DE LA RIVE was several times visited by DAVY and FARADAY, and was an almost constant correspondent of these eminent men. At the time of the annexation of Savoy to France he was sent to England by the Federal Council of Switzerland on an important and delicate political mission. He was a foreign member of the Royal Society of London, a corresponding member of the Academy of Sciences of Paris, and of a large number of other learned societies in the different capitals of Europe.

An Old Friend in a New Dress.

WITH the opening of the New Year our esteemed contemporary, the *American Artisan*, comes to us in a new form and a new dress. Hereafter it is to be published monthly instead of weekly. The January number, the first of the new series, is a large quarto of 32 pages, cut, stitched, and enclosed in a tasteful and elegant cover. It is profusely illustrated, and in typographical appearance is certainly superior to any journal of the kind ever issued in this country. It is filled with useful scientific information of all kinds, and contains many articles of marked ability, written in an interesting and popular manner. The high reputation of its conductors, Messrs. BROWN & ALLEN, is a sufficient guarantee that no pains or expense will be spared to maintain the utmost degree of excellence in the future numbers of the *Artisan*, and we trust that they may meet with the success which they so well deserve. The terms of the *Artisan* are two dollars per year, in advance. Specimens will be sent free, on application to the publishers, at No. 258 Broadway, New York.

The Telegrapher in Canada.

THE telegraphic fraternity in Canada have appreciated THE TELEGRAPHER, and are very generally represented on its subscription list. For this we are largely indebted to the kindness of our friends who have acted as agents and canvassers, bringing the paper to the notice of the fraternity generally.

Mr. JOHN TRENAMAN train despatcher of the Grand Trunk Railway at Kingston, Ontario, has been very efficient in securing the support of the operators employed on the line of the road, and we are under obligations to him for past favors, and commend him to the telegraphic fraternity as an agent of the paper, which we hope he will continue to be for years to come.

We are also under obligation to MESSRS. HUGH NELSON, of the Dominion Telegraph Company, of Toronto, GEO. BLACK, of the Montreal Telegraph Company, Hamilton, J. ATKINSON, of Port Hope, A. B. MUNSON, of Fergus, GEO. W. RAILTON, of Merriton, and others who have rendered valuable service in adding to the circulation of the paper in the Provinces.

We would solicit the continued coöperation of all the old friends of an independent telegraphic journal in not only maintaining but increasing the circulation of THE TELEGRAPHER, and many new ones which we hope to secure from time to time.

International Free Exhibition of Arts and Manufactures.

Mr. GEORGE BLACK, for several years manager of the Montreal Telegraph Company's Hamilton, Ontario, office, has, with Mr. WALTER W. SIMS, agent of the Toronto *Globe*, engaged in a new and novel enterprise, which is likely to prove of much value—it is entitled an International Free Exhibition of Arts and Manufactures. They propose the establishment of a permanent free exhibition and general sample and advertising agency in the City of Hamilton, and all the cities of the Dominion, for introducing, exhibiting and advertising the manufactures, wares, etc., of the Dominion, Great Britain and the United States. Premises have been secured at No. 73 James street (North), Hamilton, Ontario, and other agencies will be opened as rapidly as possible.

This enterprise should meet with encouragement and success. Mr. BLACK'S experience and ability as a telegrapher will enable him to deal intelligently and successfully with telegraphic and electrical instruments, inventions and apparatus, and we have no doubt but that our American manufacturers will find it for their interest to communicate with and patronize him.

Circulars and all required information may be obtained by addressing BLACK, SIMS & Co., drawer 49, Post-office, Hamilton, Ontario.

Appointment of Secretary and Treasurer of the Gold and Stock Telegraph Company.

ON the 1st inst. the office of the Atlantic Telegraph (Cable) Co. in this city was closed, and Mr. HENRY H. WARD, who has for several years filled the position of Supt. of the New York, Newfoundland and London Telegraph Company, which has been merged in the Cable Company, retired from the service. He has been appointed Secretary and Treasurer of the Gold and Stock Telegraph Company, of this city, and assumed the duties of his new position on the 1st of January.

Mr. WARD has filled several important telegraphic positions during the many years of his connection with the business, all of which he has filled with much ability and credit to himself. His services to the Gold and Stock Company will be very important and valuable, and his duties will be discharged with the ability, faithfulness and courtesy which are characteristic.

Titlepage and Index to Vol. IX.

THE Titlepage and Index to Vol. IX of THE TELEGRAPHER will be furnished with this week's number. Should any one who desires fail to receive them, copies can be had on application to this office.

Personals.

Mr. W. N. McCORMICK has accepted a position in train despatcher's office at Fort Wayne, Ind., on the P., Ft. W. and C. Railroad.

Mr. J. A. PATTERSON has resigned the position of train master and superintendent of telegraph of the Cairo and Vincennes Railroad, and Mr. T. E. CLARKE has been appointed to fill the vacancy.

Mr. J. H. POWERS has resigned his situation with the Western Union Company at Chicago, Ill., and accepted a situation with the Pennsylvania Railroad Company at Elizabeth, N. J.

Mr. C. M. GREENE has been appointed division operator of the Minnesota Division of the Northern Pacific Railroad, with headquarters at Brainard, Minn.

Information is desired, and, if possible, the present address of Mr. WILLIAM J. COWAN, formerly telegraph operator at Crook Haven, Ireland. Any person who can give such information is requested to address Mr. PHIL. P. HAUFF, Atlantic and Pacific Telegraph Company, 198 Broadway, N. Y.

Mr. CHARLES R. HOSMER, who has ably filled the position of manager for the Dominion Telegraph Company at Buffalo, N. Y., for two years past, has been

promoted to be Superintendent of the Eastern Division of that company, with headquarters at Montreal, Ca.

Mr. CHARLES A. TINKER, general train despatcher, has been appointed Superintendent of Telegraph for the Central Vermont Railroad Co., and all telegraph lines belonging to or connected with the interests of that company are placed under his charge.

The Telegraph.

Foreign Telegraphic Notes.

Messrs. HAMBRO & SON, of London, England, have announced the payment, on the 1st of January, of interest at the rate of five per cent. per annum, on the shares of the Great Northern Telegraph Company.

We are told by the *London Times* that it may be some time before the nation learns the total cost of the purchase of the telegraphs by the State. The materials for calculation are, at present, £5,847,347 returned as paid to "Telegraph Companies;" £865,559 returned as paid, or due to "Railway Companies," up to the 15th of July, 1873; and such proportion of the £5,000,000 said to be the amount of claims outstanding as may be eventually ascertained, by arbitration or otherwise, to be due.

The total number of messages forwarded from postal telegraph stations in the United Kingdom, during the week ended the 13th of December, 1873, was 338,742—an increase over the corresponding week of the previous year of 47,625.

The Eastern Telegraph Company's traffic receipts for the month of November, 1873, amounted to £35,096, against £33,667 in the corresponding period of 1872.

The Eastern Extension, etc., Telegraph Company state that the receipts of their lines for the month of November, 1873, amounted to £17,454, against £15,991 for the corresponding period of 1872 of the four separate lines, viz: British-India Extension, China Submarine, British-Australian, and Tasmanian Submarine Telegraph.

Telegraphic and Electrical Brevities.

The new telegraph line for the United States Signal Bureau, between Norfolk, Va., and Cape Hatteras, reached a point, on the 7th inst., twelve miles below Cape Henry, and is being pushed rapidly to the dangerous coast of Hatteras.

A severe sleet storm, on Wednesday last, prostrated all the telegraph wires west of Pittsburgh, Pa., and suspended telegraphic communication with the West. The wires were badly damaged in all directions west.

Promoted.

It is with pleasure that we note the promotion of Mr. James J. Riegel from the position of station agent at Bingen, North Pennsylvania Railroad, to the charge of Old York Road Station, on the same road, about seven miles from Philadelphia. In his new position Mr. Riegel will take charge of the ticket and telegraph offices, also will act as freight agent and agent for the Central Express Company. Mr. W. W. Sell, assistant station agent at Doylestown, will succeed Mr. Riegel in charge at Bingen. These promotions will go into effect to-day, and are as deserved as they are gratifying to us to publish them.—*The Morning Progress*, South Bethlehem, Pa.

SHOULD men be indulged in ungentlemanly, profane or obscene language over telegraph lines?

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended December 9, 1873, and bearing that date.

145,303.—ELECTRIC SIGNALING APPARATUS FOR RAILROADS. Frank L. Pope, Elizabeth, N. J. Application filed April 2, 1873.

For use at tunnels, drawbridges, etc., one line of rails divided into insulated sections, the other in connection with earth. System of repeaters at each end of, say, tunnel. Train going in one end sets a primary signal at far end, which signal repeats back and sets a secondary signal at entrance. Train on its exit closes certain circuits, reversing the signals.

1. The combination of the electro-magnet C', electro-magnets B B', circuit breaking levers b b', and circuit closing devices a1 and a2, substantially as and for the purpose herein specified.

2. The combination of the magnet C' for operating a primary signal, the magnet D for operating a secondary signal and a circuit closer, a1, the latter arranged to be actuated by the passage of a train, substantially as herein described.

3. The combination and arrangement of the electro-magnets B and B' and armature levers b and b', so arranged that the closing of the circuit through one magnet will break the circuit of the other, substantially as herein specified.

4. The arrangement of a primary signal magnet and a secondary signal magnet at each end of a section of railroad track, each secondary signal magnet being controlled by the action of the primary signal magnet at the opposite end, substantially as and for the purpose herein specified.

ELECTRICAL INSTRUMENTS,
132 WILLIAM STREET (rear),
Between Fulton and John Streets, NEW YORK.

One half of actual size

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard.
Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight, \$50 00
Sounders, from..... 4 50 to \$6 50
Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00
Relays, from..... 9 50 to 16 00
Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars.

Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System
OF
FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE,

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. BOX 496.

A MERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

J. HAMBLET, Electrician.

GEO. W. STOCKLY,

Sec'y and Treas.,

No. 4 LEADER BUILDING,
CLEVELAND, O.

DR. L. BRADLEY,
No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60. Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraph and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any attention whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

L. G. TILLOTSON & CO.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.80.

Agents for towns, and counties wanted.

GEO. H. BLISS & CO., Gen'l Agents,
41 Third ave., Chicago, Ill.

WATTS & COMPANY,
47 Holliday Street,
BALTIMORE,
MANUFACTURERS OF
ELECTRICAL AND TELEGRAPH INSTRUMENTS
AND
Material of Every Description,
RELAYS, KEYS, SOUNDERS, COMBINATION SETS, &c., &c.
Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,

Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK, }
Sept. 23d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,

A. S. BROWN, Manager.

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.

Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

PARTRICK, BUNNELL & CO.'S
CHAMPION LEARNERS
AND
SHORT LINE TELEGRAPH APPARATUS.
A GREAT IMPROVEMENT

over all Instruments of the kind ever offered for this purpose, consisting of a

No. 1 SOUNDER AND KEY COMBINATION SET,

AN EXCELLENT BOOK OF PRACTICAL INSTRUCTION IN
TELEGRAPHY,

OFFICE WIRE, CHEMICALS, ETC.,

making a complete arrangement for one office.

The Instruments are full sized, complete in every respect. The Battery is a full sized first class Callaud cell, and the entire outfit has nothing about it which in any way resembles the many wretched affairs which have been extensively sold as Learners' Apparatus.

Great numbers of our "Champion Instruments" are in use upon short private lines, and upon City wires of Telegraph Companies, where they are giving the greatest satisfaction, on account of their very substantial make and excellent working qualities.

We guarantee them to be in every respect better than any form of Learners' Apparatus or Short Line Instruments ever offered to the public.

Price of Apparatus, complete, with Book of Instructions, Battery, Wire, and all necessary materials for one complete office outfit, ready for shipment, sent C. O. D., \$10—or, if money order sent for the amount, \$9.50. The latter plan will additionally save the purchaser the express charges for the return of money.

Price of Single Instrument, good for one mile or less, without Battery..... \$8 50

Ornamental style ditto, with rubber covered coils, without Battery..... 10 00

Single Instrument, good for working a line from one to twelve miles..... 9 50

Ditto, ornamental, with rubber covered coils..... 11 00

Battery, per cell..... 1 50

CHARLES WILLIAMS, JR.,
 (ESTABLISHED 1856.)
 109 Court Street, Boston,
 has for sale the various kinds of Office and Magnet Wires, in-
 cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

COVERED WIRES,
 Made from Lake Superior Copper, warranted strictly
 pure, covered with Hemp, Flax, Linen, Cotton, Silk or other
 material, for Telegraph Instruments, Electro-Magnetic Machines,
 Philosophical Apparatus, and all kinds of Electrical Purposes.
 Also, PLAIN, WOVEN, ENAMELLED, SHELLACED,
 PARAFFINED, and all kinds of
TELEGRAPH OFFICE WIRES.
 Also, Telegraph Switch Cords,
 many Patterus, Plain, Woven and Braided. Parties being partial
 to any particular kind need only enclose a small specimen in a
 letter and it can be imitated in every particular.
 CONDUCTING CORDS, POLE CORDS, TINSEL.

SITUATION DESIRED.
 A Situation is desired by the subscriber as a Telegraph Operator.
 She has had nine years' experience, and has filled responsible
 positions in Commercial and Railroad offices satisfactorily, but
 is at present without an engagement. Would prefer a situation
 in an office in some city, or place of moderate size, where she
 could have an office by herself—either in a Commercial or Rail-
 road office.
 Any person knowing of such a situation, or desirous of engag-
 ing her services, will please address
 Miss A. NIXON,
 Hobart, Lake County, Indiana.

A NEW GALVANIC BATTERY.
Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
 PATENT APPLIED FOR.
 The undersigned having secured the exclusive Agency for the
 manufacture and sale of the
EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.
 The Battery cell is made of lead, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.
 These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.
 Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.
 On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.
 No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished

- ONE CUP OF BATTERY,
- TWO YARDS OFFICE WIRE,
- ONE PACKAGE BLUE VITRIOL,
- ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

A COMPLETE OUTFIT FOR A TELEGRAPH OFFICE,
Seven Dollars and Fifty Cents.

Two Sets, complete.....\$14 50
Sounder and Key only..... 6 50
" " with Cut-out and Lightning Arrester... 7 50

We will pay expressage on Amateur Outfits when price is remitted in Advance.

SHAFFNER'S
TELEGRAPH MANUAL.

TO TELEGRAPHERS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
78 and 80 Broadway,
NEW YORK.

THE BISHOP GUTTA PERCHA WORKS,
422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
ONLY MANUFACTURER
OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,
Cotton and Gutta Percha covered, with any number of conductors
required.
Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS,
ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES.
In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with increasing
superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered
at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
any Telegraph Cable or Wire manufactured at the Works in New
York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods manufactured
by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
sale in New York by

The Elementary Principles of Electrical Measurement.

BY FRANK L. POPE.

(Continued from page 2.)

Ohm's Law.

EACH one of the four electrical phenomena that have been described is susceptible of being measured with great accuracy. The essential properties of an electric circuit may be said to be: First, the electro-motive force included or contained in it; second, its resistance to the passage of the current; and third, the magnitude of the current so passing. When any two of these three properties have a known value the value of the third may readily be ascertained.

This is done by means of Ohm's law, upon which all electrical measurements are founded—the importance of which is only equalled by its simplicity. From the fact that it is expressed in most books by algebraic formulæ, students are apt to be very much afraid of it, but there need really be no difficulty in understanding it. Unless he does understand it, the student can make but little progress towards a thorough knowledge of the phenomena of the electric current.

Ohm's law may be briefly stated as follows:

- 1. The current in any circuit is found by dividing its electro-motive force by its resistance.
2. The resistance in any circuit is found by dividing its electro-motive force by its current.
3. The electro-motive force in any circuit is found by multiplying its resistance by its current.
4. The quantity of electricity produced in any circuit is found by multiplying the current by the time during which it flows.

The algebraic formulæ referred to are nothing more than a short way of writing down the same thing, thus:

Let Q denote the total quantity of electricity generated in any circuit.

Let E denote the electro-motive force in the circuit.

Let R denote its resistance.

Let C denote the current flowing in the circuit.

Let T denote the time during which the current flows.

We may then write down the above statements, thus:

(1) C = E/R. (2) R = E/C. (3) E = RC. (4) Q = CT.

For the benefit of those not familiar with algebraic formulæ, it may be well to state that, when two letters standing for numerical quantities are placed one above another in the form of a common fraction, it signifies that the quantity above the line is to be divided by the quantity below the line.

Thus E/R signifies E divided by R.

The sign = denotes equality; or that the quantities on one side of the sign are equal to those on the other side.

When two or more letters standing for numerical quantities are written together, one after the other, it signifies that they are to be multiplied together. Thus, in the above case, the expression E = RC means that E is equal to the product of R multiplied by C, or, in other words, that the electro-motive force (E) is equal to the resistance (R) multiplied by the strength of current (C), which is exactly what was stated above in the third paragraph of Ohm's law—only in the former case it required 78 letters to explain it, and in the latter case we express precisely the same thing by means of four letters and one arbitrary sign, which, perhaps, may serve to give the student some idea of the reason why persons who understand algebra prefer to use it whenever circumstances permit.

Units of Electrical Measurement.

In order to measure anything we must first provide ourselves with suitable known standards or units of measurement with which the unknown quantities may be compared. Thus, in measures of space, we have the inch, in measures of time, the second, and in measures of force or weight, the pound.

The first well defined and accurate unit of electrical measurement proposed, which met with much general acceptance in practical work, was the resistance unit of Dr. Werner Siemens, of Berlin, Prussia, which he constructed in 1860.

The Siemens unit is defined as being equal to the resistance of a column of chemically pure mercury, one metre in length and one square millimetre in sectional area, maintained at a temperature of 0° Centigrade or 32° Fahrenheit. No definite standards of electro-motive force or of quantity have ever been authoritatively established in connection with the Siemens resistance unit. The ordinary Daniell cell furnishes a unit of electro-motive force of sufficient uniformity and constancy for ordinary purposes, and one which is used in this way very generally by practical electricians.

A complete system of electrical units has more recently been established by the British Association for the advancement of science, which are usually known as the B A units. They are as follows:

The Volt is the unit of electro-motive force. It does not differ greatly from the electro-motive force of a single sulphate of copper cell, and for many purposes may be considered equivalent to it. According to Mr. Farmer's determination, the sulphate of copper battery generally used in telegraph work has an electro-motive force equal to 0.93, or 93/100 of a volt.

The Ohm is the unit of resistance. It is equal to the resistance of a round wire of pure copper 1/100 of an inch in diameter and 408 feet 4 inches in length, at a temperature of 60° Fahrenheit. This is the size generally known as No. 16 wire, Birmingham gauge. Roughly, it is about equivalent to the resistance of 330 feet of ordinary No. 8 galvanized wire, such as that used in the construction of telegraph lines. The ohm and the Siemens resistance unit before referred to do not differ greatly from each other. According to the most trustworthy determination 1 ohm is equal to 1.0486 Siemens units, and 1 Siemens unit is equal to 0.9537 ohms.

The Farad is the unit of quantity and of electro-

static capacity. It is equal to the quantity of electricity that will pass through a circuit having a resistance of 1 ohm during 1 second, with an electro-motive force of 1 volt. The use of the same unit for quantity and capacity is a matter that seems somewhat puzzling at first sight, but if we refer to our former illustration in figure 2, the propriety of it becomes apparent. The capacity of the vessel A above the line xx may be for one gallon, and, in that case, the quantity of liquid contained in it when it is full, will also be one gallon.

The Weber has been proposed, by some writers on the subject, as a unit of current, and is defined by them as equal to the quantity of electricity that will pass per second in a circuit having an electro-motive force of 1 volt and a resistance of 1 ohm. The necessity of a distinctive name for a unit of this description is not very apparent, and would seem rather liable to create confusion of ideas than otherwise. Fleeming Jenkin, who is probably the best authority on the subject, gives one farad per second as the unit of current, and it is probable that his definition will be the one ultimately adopted. It has the merit of being capable of comprehension, at all events, and when we speak of a current of so many farads per second, the idea conveyed is as distinct as it would be if we spoke of a current of water of so many gallons per second.

The ordinary Callaud cell usually has about 3 ohms resistance. If such a cell were placed on "short circuit," that is, having its poles connected by a wire so thick as to offer no appreciable resistance, the current traversing the circuit would be equal to one third of a farad per second. One sixtieth of a farad per second is sufficient to operate the relays in the main circuit of a telegraph line. A local circuit for actuating a sounder or register usually has a current of from one fourth to one sixth of a farad per second. When a

1 So named from the Italian philosopher, Volta, the discoverer of the Voltaic battery.

2 According to the same authority the mean electro-motive forces of some of the cells in common use are as follows: Bi-Chromate Carbon... 1.75 Volts. Grove... 1.63 " Bunsen... 1.59 " Smee... .62 "

3 So called in honor of Dr. G. S. Ohm, who was the first to discover and lay down the true laws of electrical action.

4 So called in honor of the English philosopher, Michael Faraday, distinguished for his researches and discoveries in electrical science.

current of a certain number of farads is spoken of, the words per second are, of course, understood.

The wide variation in magnitude of the different quantities dealt with by electricians—such for example as the ratio of resistance between silver and gutta serena, before alluded to—renders the use of multiples and submultiples of the above units very convenient in practice. The names and values of these are as follows:

- 1 megavolt = 1,000,000 volts.
1 megohm = 1,000,000 ohms.
1 megafarad = 1,000,000 farads.

Similarly—

- 1 microvolt = 1/1,000,000 of a volt.
1 microhm = 1/1,000,000 of an ohm.
1 microfarad = 1/1,000,000 of a farad.

(To be continued.)

"The Ghost."

VERY likely it is not generally known outside of New York that the Western Union office at No. 145 Broadway is haunted—but such is the mournful fact—the apparition, however, taking the most unostentatious and frugal form of a blank hook, of godly dimensions, and the cover of which appears the following announcement:

"TELEGRAPHICA'S GHOST." Vol. 1.

A manuscript chronicle of events occurring in and in connection with the general office of the W. U. Telegraph Co., New York, and a medium of communication between operators in quest of "subs" or "subbing," edited by W. P. PHILLIPS,

and engrossed by the best penman that can be induced to engage in the work.

New York, Jan. 1st., 1874.

On the fly leaf appears the appended lines, which explain themselves:

When Telegraphica's spark expired, In bonny, blossoming June, Many kind voices hastened to say, "Its being has closed too soon."

And though it never has returned Through all the months now fled, It has staid away, with reason, And now sends its ghost instead.

As its founder sat pondering, Christmas night— The season when spirits hold full sway— This ghost came down through the chimney pot And in hurried accents went on to say:

"Haste—oh! haste thee, and bring me a dress From some neighboring blank book store, That I may remain, for a time at least, And breathe the earth's air once more."

These were the words of the spirit, And this is the dress that was got; May it prove a cheerful kind of a ghost, This sprite of the dash and dot.

P. S.—The phantom requests, in blindest tones, It be asked of the "powers that be" That it be allowed to "lay around here," That all may its pages see.

Below are given a variety of extracts, calculated to show the field in which the "Ghost" is calmly stalking, and the way it "chins" the boys about matters and things in general:

"The glad New Year—the great, the important day to New Yorkers, big with the fate of calls, of cake and wine—is here once more. Last night we telegraphic knights nocturnal listened and heard old Trinity ring out the chimes of requiem for dead '73, and felt with gladness that the new horn year was ushering in. How easy to look back across the short expanse when last year's infant note was pealed upon the air! How easy to peruse the page on which the events of the past twelve months are written! The leaf is scattered o'er with marks awakening sad memories, vain regrets and sweet remembrances. But we peer into the future to no purpose; the wee bairn tells us naught of what's to come. In its cycle it will surely bring marriage, births and death; failure and success; defeat and victory; which, and to whom, we may not know as yet. And still a little further on new chimes will ring out on the midnight air; the calls, the cake and wine again will be in order, and our familiarity with the finished page of '74 will make us marvel that its great events were but so shortly enshrouded in mystery and gloom!"

"The force list for New Year's day, which has been tastefully drawn up by Mr. Dolan, is embellished with three significant etchings by Mr. J. J. Callahan. The first represents a day man astride a horseshoe magnet, the speed of which is evidently retarded by a 'home resistance,' composed of the smell of poultry in the pan, the smiles of wife and children, and a natural longing to gather round the hearth on New Year's day. The anxious fellow is slowly bearing down on 'No. 145,' though his eyes are eagerly turned towards the clock which looms up on Trinity, and as he notes the fact that its hands point to precisely eight o'clock, he sinks his imaginary spurs into his

flankless steed and gasps: 'I wonder if I'm on the reserve?' The next depicts an office scene, in which the operators seem to have taken several steps backward in the direction of primitive man, as Darwin pictures him. Bills and web feet, as well as claws, are noticeable, suggesting that a diet somewhat poultryish has had a queer effect. There is a great effort making to clear the hooks, in order to assist at a discussion of a monster 'phoni,' which a sable seignor is bringing in, indicating that primitive man or nothing is the object to be achieved. The last of the group is a picture of an 'owl,' on whose front—it can hardly be called a face—despair is visibly imprinted, as he spasmodically ejaculates, after the manner of Mr. Jingle, 'no pens—can't draw on the 10th—broke!' It may be well to state, for the benefit of a benighted posterity, that with the close of 1873 the system of paying salaries on the first, tenth and twentieth instants, so long in vogue, is abandoned, and hereafter the first and fifteenth instants will be the only days on which the telegraphic mind will generally contemplate the purchase of the Windsor Hotel, the completion of our gorgeous Court House, or indulge in meditating an expenditure in other ways of accumulated shakels."

"Our genial friend, Mr. Op. St. Mq. Weller, seems to flourish with his wonted luxuriance since entering the state connubial. Indeed, he is unusually majestic since he became one of the day force. We have no information to the effect that he meditates becoming one of the Brooklyn Board of Aldermen, but, even in the absence of such information, we cannot refrain from saying that he is rapidly building up a *physique* which would do honor to a representative from Gowanus."

"The current number of *Harper's Magazine* has an interesting article on the manner in which press business is conducted among the Washington correspondents. There are several illustrations, one of which represents 'Newspaper row,' with the Western Union Telegraph and Associated Press offices, which are in the same building, occupying a conspicuous place. There is also a cut entitled 'Rushing for the Wires,' in which our 'C. W.' Washington office is well depicted. Likenesses of Ben. Perley Poore, the famous correspondent, L. A. Gobright and J. W. Simonton, lend the article peculiar attractions to the telegraphic eye."

"We hereby make Mr. Thomas R. Taltavall one of our most gracious bows. It is to him we are indebted for all the ornamental work that has entered thus far into this remarkable history, including the tasteful lettering on the cover and the careful execution of the verses. When we contemplate the finish, the grace and the symmetry of Mr. Taltavall's work, and compare it with our original copy of the same, which was about as shaggy as a buffalo robe, we realize how competent he is to change chaos into order, and removing our cap reverentially, we pretend to blow our proboscis while we really shed a 'briny' over our shortcomings."

The engrossing is neatly and skilfully done by Mr. Thomas J. Bishop, and the "Ghost," naturally enough, has been an object of great interest since its advent. The management, it is hoped by those interested, will not manifest a disposition to deny it the coveted privilege to

"——— 'lay around here,'
That all may its pages see."

The New Central Telegraph Office in London.

THE *Telegraphic Journal* of Dec. 15th contains an engraving of the magnificent new building, now nearly completed, which is to be occupied as the central station of the Postal Telegraph system in London. The exterior is very handsome, being ornamented with columns, and cornices, and mouldings, in the *renaissance* style, executed in sufficiently bold relief to break up the front, so as to produce a pleasing effect. In style the building forms as strong a contrast to the new office of the Western Union Company in this city as could possibly be imagined, though, to our fancy, the latter is the most effective of the two. We copy a portion of the *Journal's* description of the new building:

"The material used is granite as high as the ground floor, and above that Portland stone. The building is 300 feet long by 90 feet wide, and forms a parallelogram pierced with two central courts, which are the secret of the plentiful supply of light. The ground, first and second floors are taken up by the different offices of the departmental staff, from the Postmaster General's rooms downward. The ledger room on the ground floor is of fine proportions, and very handsome with its pillars and mouldings of white stone, but the principal feature of the building is the great telegraph room, by far the largest in the world, occupying the whole of the upper floor. Its area is 20,000 square feet, and there are two thirds of a mile of mahogany instrument tables. The wires are already laid from the main lines into the room, which is at present a sort of electric siding to the telegraph system of the country.

When all is ready the telegraph street wires will be cut, and the stream of messages turned into the new office. The countless ends of wires growing through the mahogany tables will each be connected with an instrument, and beside each instrument a card fixed in a stand will give the number of the "circuit." These will be, as far as possible, distributed geographically, Scotland and Ireland being in one corner together, so that the room will be a sort of telegraphic map. All the wires are gathered together at the "test box," a neat array of "terminals." To these terminals the 440 wires are led from out of doors, and then on the instruments at the tables—the object of having all the wires together at one point in the building being to enable the engineer to alter the service, as may be necessary. Each terminal being numbered, the route of the wire is known, and it can be used when wanted in making up a fresh circuit, or line of direct communication. Every evening the telegraph service of the country is altered for press purposes—ordinary wires, no longer wanted for private messages, being joined together to make lines of direct communication with towns in need of newspaper matter. There is, for instance, no direct communication with Darlington during the day, public messages being repeated from one place to another till they reach it; but at six o'clock the Darlington *Echo* begins to want its news, and the direct line or "circuit" necessary for the quick and economical transmission of the long press messages is made up for the benefit of the *Echo* by joining a London and Sheffield, a Sheffield and Leeds, and a Leeds and Darlington wire. A Darlington and Newcastle wire is also joined on, so that the same information may at the same time reach another journal. When Mr. Bright delivered his recent speech at Birmingham a similar arrangement and diversion of wires enabled his speech to be telegraphed simultaneously by 12 automatic and 17 Morse instruments—one of the former being equal to two of the latter. Altogether, 150,000 words, or matter equivalent to more than 90 large print columns of *The Times*, was telegraphed from Birmingham that night between 9 P. M. and 2 A. M. The numbers on the brass finials of the test box in the telegraph room of St. Martin's-le-Grand indicate the route as well as the destination of each wire. Thus Liverpool has in all no less than 17 wires, of which eight go by the London and Northwestern Railway, six by the Great Western, and three by the Grand Junction Canal. Of the thin green paper tape, dotted with telegraphic strokes, no less than 10,000 miles a month are used throughout the kingdom. The color is chosen as being less trying to the clerks' eyes. Even these 10,000 monthly miles of telegrams are not nearly all, for they do not represent the messages of the sight and sound instruments, of which there are 6,000 in use, as against 1,500 automatic or reording instruments.

All along one side of the great telegraph room are ranged the curved leaden tubes and brass fittings of the pneumatic delivery apparatus. Eighteen miles' length of this pneumatic tubing are laid to twenty-five telegraph stations in the city and Westminster, which can thus deliver their telegrams at the Central Office in parcel form faster than the messages could be sent by wire. The messages are enclosed, twelve or sixteen at a time, in despatch tubes, which are shot along the exhausted pipe to the counter of the Central Office. From the counter they are carried to the check table, whence they are distributed, partly by messengers and partly by travelling tapes, to the clerks at the instruments. The Post-offices being the only collectors and distributors of messages, telegrams for the cables and lines of private companies come to this central office, and are sent thence to the offices of the companies by pneumatic despatch. The 440 wires working directly from the telegraph room are in communication with upwards of 1,000 stations. The battery room on the basement will have 25,000 battery cells, and here, again, the wires are collected together at a test box studded with innumerable brass finials. There is 300 miles, length of gutta percha covered copper wire within the building.

Leaving the spacious and handsome instrument room (the telegraphic workshop and executive are lodged on the same floor), we notice through the windows the great chimney rising from the boiler house built in the floor of the south court. Descending a staircase under a handsome skylight, we pass the departmental offices of the lower floors, and turning along corridors, always well lighted, descend to the engine house, on the floor of the north court. Here there will be three engines of 50 horse power each, for the pumping work of the pneumatic tubes, and two of 10 horse power, to draw water from the well of 400 feet deep which is being sunk on the premises. This well will soon repay its cost, and even the 50 horse power engine on Telegraph street spends close upon £600 a year in drink. The new offices will have cost altogether when complete about £450,000, of which £300,000 has been swallowed up by the site. We rejoice that the administration at the Post-office of so distinguished a man as Dr. Lyon Playfair commenced at the time of the opening of this, the greatest telegraphic centre in the world.

[From the *Telegraphic Journal*.]

Mathematics for Non-Mathematicians.

BY W. PAGET HIGGS, LL. D.

DIVISION I.—THE ALGEBRA OF CONSTANT QUANTITIES.

(Continued from p. 313, Vol. IX.)

Limit of Series.

THE powers of a quantity greater than unity increase without limit. Thus, there is no power of 2 but that the next higher power is greater. Improper fractions follow, of course, the same law; thus, $1\frac{1}{2}$ raised to the second power, or $1\frac{1}{2} \times 1\frac{1}{2}$, as it contains the half of one and a half more than one and a half, is greater than the first power. The powers of unity only never increase; but the powers of a proper fraction, or of a quantity less than unity, always decrease. Thus, the powers of $\frac{1}{2}$, viz., $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \frac{1}{16}, \frac{1}{32}$, etc., constantly diminish. Representing an integral quantity by x , and a fractional quantity by $\frac{1}{x}$, the powers of the first, or x^2, x^3 , etc., continually increase, while the powers of $\frac{1}{x}$, viz., $\frac{1}{x^2}, \frac{1}{x^3}$, etc., diminish in value. Thus, with the series

- x, x^2, x^3, \dots, x^n , etc., we have the following conditions:
- I. An increasing series, if x is greater than unity.
 - II. A decreasing series, if x is less than unity.
 - III. A series whose terms are all of the same value, when $x = 1$.

In the first and third cases, the sum of the series may evidently be made as great as we please by the addition of more terms. But where x is less than unity this may or may not be possible.

If we take the decreasing series,
 $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32}$, etc., the sum of this series will constantly approach 2, but will never attain that value. It will always be necessary to add the last term to obtain the value 2. Thus,

$$(1 + \frac{1}{2}) + \frac{1}{2} = 2.$$

$$(1 + \frac{1}{2} + \frac{1}{4}) + \frac{1}{4} = 2.$$

$$(1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \frac{1}{32}) + \frac{1}{32} = 2.$$

2 is then the *limit* towards which the series constantly approaches.*

Such a series as $1, r, r^2, r^3, \dots, r^n$, has, then, *always* a limit when x is less than unity. The powers of r are constantly decreasing in value, and the higher the name of the power the lower its value. Let n be a very distant term; $\frac{1}{1-r}$ will be the sum. But

$$\frac{1-n}{1-r} = \frac{1}{1-r} - \frac{n}{1-r};$$

whence we see that the more distant is the term n (or, rather, the smaller the fraction, $\frac{n}{1-r}$) the less is $\frac{1}{1-r}$ affected by the subtraction.

$\frac{1}{1-r}$ is then the *limit* towards which the series $1 + r + r^2$, etc., approaches.

The formula given in our last section for the summation of an infinite series was

$$\Sigma = \frac{a}{1-r}$$

where a is the first term. Substitute 1 for a , and we have as well by this method the expression

$$\frac{1}{1-r} = 1 + r + r^2 + \dots + r^n,$$

where $n = \infty$. Whence we perceive that "the sum of an infinite series is the limit toward which we approximate by continually adding more and more of its terms."

GERMAN troopers are now exercised in climbing up telegraph poles, and furnished with instruments to cut the wires. This is, of course, intended for service in an enemy's country, and the work is executed under cover of a dark night. The men are despatched across the country in couples; whilst one of the troopers dismounts, climbs up the pole and cuts the wires, the other holds his comrade's horse, and keeps a look out for any indication of interruption on the part of the enemy.

* But we are not therefore to conclude that every decreasing series has a limit. It is possible to arrange a series (for instance, the reciprocals of the integer numbers in lots, each containing half as many terms as there are units in the denominator of its last term) having no limit.

Telegraphic Progress in Northern Michigan.

BAY CITY, MICH., Jan. 7th.

TO THE EDITOR OF THE TELEGRAPHER.

PERHAPS a brief account of the progress made by the Western Union Telegraph Company, relative to the extension of their lines within the past three years in this woody country, will not be uninteresting to some of your readers.

The excellent manner in which the majority of your correspondents contribute to your columns, tends to throw my efforts in the shade, and almost discourage me from making any attempt to follow their example; however, I will go as far as my abilities will permit. Three years and a half ago (so I am informed by Mr. Cooper, our efficient manager here) there was no such thing as a telegraph line north of Bay City. During the year 1871 the Western Union Company built a line to Au Sable, a distance of 75 miles from here. In 1872 they added 165 miles to this, extending to Mackinaw City. During the year just closed the same line has been increased by an additional 245 miles of wire, together with five miles of cable, which crosses the straits of Mackinaw (and which cost the company \$10,000); thence by overland route to Sault Ste. Marie, Mich., and Marquette, L. S., making a complete circuit, from this point to Marquette, of 490 miles. There are 24 offices along the route, the most important of which are Tawas, Au Sable, Alpena, Cheboygan, Mackinaw, Sault Ste. Marie, White Fish Point and Marquette, which places are all more or less engaged in an extensive lumber business. The line is equipped with five batteries, their respective situations being at Marquette, Sault Ste. Marie, Cheboygan, Alpena and Bay City. It is also well supplied with repairers, there being about half a dozen stationed at various points, at a respectable distance from each other. It should be borne in mind that this line traverses no civilized country—three fourths of it running through woods, and, for 25 miles, between Sault Ste. Marie and White Fish Point especially, where it finds its way through the thick and gloomy forest, devoid of any road save a narrow pathway cut out by the builders when engaged in constructing it. During fine and dry weather we can work through to Marquette (without repeaters) like a charm, and on the same adjustment as if we were working with a neighboring office. Manager Cooper thought he would try an experiment, by connecting this line with one of our Detroit wires. This being accomplished, to our great surprise we had the satisfaction of hearing messages passing through from Detroit to Marquette, and *vice versa*—a circuit of 600 miles without repeaters. This lengthy circuit would only permit of slow and firm manipulation. During this extended circuit a message was sent from Marquette to Chicago, it being repeated at Detroit only, and an answer received at Marquette in precisely eight minutes from the time the first message left the office. I might also state that, to receive an answer to a letter by mail, would require six weeks. As a general rule, the wire is out at Sault Ste. Marie, that office repeating for Marquette; this will necessarily have to be the case during the busy season of navigation.

From the above you will see that Bay City is an important telegraphic centre, inasmuch as it is the repeating office for this extraordinary long wire. Four years ago Bay City was only afforded two wires, one to Detroit and the other to Jackson, Mich., the entire business being conducted by our present able manager, Mr. Cooper. Now we have four wires, two of which connect us with Detroit, one from Saginaw City to Otsego Lake, which is a railroad wire on the line of the J. L. & S. R. R., the other to Jackson, Mich., as before stated. Our force consists of four operators, one of whom, Mr. F. S. Hogan, is entirely devoted to press reports, and is, without any exception, a first class operator. The company also employ a book-keeper and two messengers here, but in the summer we are blessed with three.

Without any exception our office is one of the cosiest and best fitted up in the State. We have a place for everything, and everything is in its place; and, as regards our manager, the only deprecation we can find him guilty of is that he is too lenient with us. Take us on the whole, we are a happy fraternity of telegraphic artists. We are also considerably high toned, inasmuch as that we indulge in the fragrant smoke of Havanas; but should the company deem it advisable to reduce the salaries of their employes ten or fifteen per cent., we would necessarily and very reluctantly (with a sour expression overhanging our pleasant countenances) have to fall back on our brier root

pipes—which would be exceedingly degrading in our own estimation, after the progress we have heretofore attained.

I will close, hoping ere long to say something relative to some further extensions and improvements in telegraphy which will be made in the spring in the northern part of the State.

So far so good for progress, enterprise and perseverance. Q.

The Duplex Telegraph.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE noticed some discussion in the last two numbers of THE TELEGRAPHER in regard to the invention of the duplex telegraph apparatus, and being somewhat familiar with the subject, it is possible that I may be able to throw some light on it. "Inventor" suggests that Mr. Farmer's apparatus, patented in 1858, may have lacked some essential element, by the addition of which, at a later date, the invention was rendered complete and practical.

I have before me a copy of Farmer's patent of 1858. The arrangement figured in the drawings is very much like the "differential duplex" now in use on the Western Union lines. The transmitting circuit breaker is arranged so as to make contact between the battery and line before breaking it between the ground and the line, and is shown in another figure, worked by a local circuit and key. The relay is wound with two distinct wires. In fact, the only essential difference is in the connections, for the same identical apparatus shown in the drawings—the differential relay, circuit preserving key and adjustable rheostat—might be worked either on Farmer's plan or on Stearns', merely by changing the connections. Farmer's drawings also show a duplex repeater, and a differential relay having two magnets opposite to each other, acting on a single armature lever.

It is quite possible that Stearns' arrangement may work better than Farmer's ever did, but it is certain that the latter was worked successfully on lines 300 or 350 miles long at least fifteen years ago. I remember its having been shown to me the first time I was ever in the Boston office, which was in the latter part of 1859. It was a very wet day, but the apparatus was working to Portland as well as could be desired. It was also worked between Cincinnati and Indianapolis (I think) about the same time. Mr. W. Wiley Smith, now of Indianapolis, would probably know all about that experiment. In fact, if I recollect rightly, there was quite a serious effort made to introduce the invention at that time, but there were several reasons why such an effort could not have proved successful. One reason was the wretched character of the lines in those days, not so much from bad insulation—though that was bad enough—as from rusty and imperfect connections, which caused wide and sudden fluctuations in resistance—a condition of things fatal to the satisfactory operation of any duplex system whatever. There was also the fact that such an invention was much less needed then than now. The wires were comparatively few in number and not overburdened with business at that. Then again, there was that old, inveterate prejudice against new inventions, which was considerably more formidable then than now, though even yet it is very far from being extinct. If Mr. Stearns had not himself been President of a telegraph company I have not the slightest idea that he would have been able to introduce his invention into practical use for many years to come, if at all. The manner in which it was derided and ridiculed by the officers of the Western Union Company, even after it had been in daily use on the Franklin line for more than two years, is well known, and affords an excellent example of this.

In reference to the interference between the patents to which your correspondent alludes, I have only to say that it is a simple question of fact, and can only be decided after a very careful investigation of the whole subject by competent persons. In any event it concerns nobody but the owners of the respective patents, who are doubtless abundantly able to look after their own interests. F. L. P.

Elizabeth, N. J., Jan. 13th, 1874.

Congress and the Telegraph.

WASHINGTON, D. C., January 14.

TO THE EDITOR OF THE TELEGRAPHER.

SINCE the reassembling of Congress telegraph matters have scarcely been thought of either in or out of the Capitol.

The House Committee on Appropriations, to which the subject was referred, have had no time, and apparently little disposition to bother themselves with the matter. It came up, however, yesterday in the Committee, and was postponed until next Tuesday, when it is proposed to dispose of it in one sitting. The sentiment of the Committee is known, however, to be very much opposed to the scheme of buying existing lines, and the proposition contained in Mr. Cresswell's report,

that the Government shall ignore existing telegraph interests and build new lines, to compete with those now in operation, is not regarded seriously by anybody, except possibly by Mr. Cresswell himself.

As has been before stated, there is no prospect of anything being done in regard to telegraph matters at this session. The absence of any popular demand for a Government ownership or management of the telegraphs, would prevent its favorable consideration by Congress, even if other conditions were favorable to it, which is not the case.

Even the Postmaster General has abandoned any expectation of accomplishing anything in the furtherance of his pet project at present, and, from the indications at this time, Congress and the telegraph is likely to prove a barren subject, so far as any special interest is concerned. CAPITOL.

Setting up the Gravity Battery.

TO THE EDITOR OF THE TELEGRAPHER.

IS IT the rule (I do not find it anywhere), in setting up Calland cells, to put all in position, water included, and close on short circuit before supplying sulphate of copper? My observation is that this is the very best way. Circuit being closed, the first trace of acid reaching the zinc causes current, and consequent consumption of sulphate of copper, keeping the strong solution away from zinc, when it is not desired to use sulphate of zinc to start with. S.

[This method of setting up a battery is recommended by most writers on the subject, except that they do not give any specific directions as to whether the circuit is to be closed before or after the sulphate of copper is dropped in. Our correspondent's suggestion is a good one.—ED. TELEGRAPHER.]

Solution of Problem.

TO THE EDITOR OF THE TELEGRAPHER.

I OFFER the following as a solution of B.'s problem on page 3 of THE TELEGRAPHER of January 3d:

Any one of the stations can work simultaneously to the three others, provided the wires are connected at the intersection, by using his own battery, the other stations being connected to ground without battery. According to Ohm's law the current will divide into three parts at E; and, for that reason, the sending station should be supplied with a battery affording a sufficient quantity of electricity. An ordinary sulphate of copper battery, in the above case, would suffice.

The same arrangement should be adopted at each station. When at rest, every station should have the extremity of its branch line connected through its relay with the ground, to be ready for any coming message, and, before sending, the receiving station is called as usual, as they receive all together. An open circuit key, as on European lines, would be advantageous in that case, although not necessary.

GEO. D'INFREVILLE,
Consulting Electrician and Engineer.

TO THE EDITOR OF THE TELEGRAPHER.

"B." ASKS how offices A, B C and D, connected by lines joined at E, may work with each other.

There are two ways.

First. Let him try the old open circuit plan, or what is nearly the same, double pointed keys, front to battery, back to ground, lever to line, without circuit closer.

Second. Let him increase his capital stock and sell enough to pay for wire to build it as it should be, and to also pay two or three semi-annual dividends, after which, when the stock can be bought in at from twenty-five to thirty cents, secure all within reach, then sell a control to the Western Union at fifty cents, and close out the whole concern by lease at four per cent. on the whole capital. PERKINS.

[We have also received solutions to this problem from J. L. W., C. H. H. and R. J. H., which are correct, but the above will be sufficient. Our correspondents have solved this problem apparently with little difficulty].

How the Difficulty of "A Sticking Key" may be Avoided.

NEW YORK, January 6th.

TO THE EDITOR OF THE TELEGRAPHER.

STICKING KEYS are the bugbear of fast telegraphing. I had one that bothered me terribly, and the following simple device saved me all trouble and avoided all difficulty. I inserted a little oil between the platinum points, which is then held in suspension by the attraction of the metal, and does not have to be renewed more than once or twice a month. My key has never stuck since, and I do not think it will, though I work it very close. The oil should be pure; watch oil will do; and, very probably, some other non-conducting substance, such as glycerine, could be used with advantage. E. M. D.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JANUARY 17, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT
No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The Tenth VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME OR EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE
AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2.00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

Consolidation and Telegraphic Competition.

THE absorption of the lines of the Pacific and Atlantic Telegraph Company into the Western Union system, although anticipated for more than a year past, naturally creates some uneasiness on the part of telegraphers and the public as to the permanence and stability of other competing telegraph organizations. It is not to be denied that there is a fear that these may one by one be forced to succumb, and that in the end the assertion, so confidently made by Mr. ORTON in his late report to the stockholders of his company, that at an early day there would be practically no competition in the telegraph business of this country, may prove to have a better basis than has generally been supposed.

We do not regard these fears and anticipations as well founded. The fate of the Pacific and Atlantic Company, from its management, was inevitable, if not actually intended by Mr. THURSTON, its late President, and those associated with him in the actual control of the company. It has long been known that it was in a moribund condition, and that the period of its existence as a telegraph organization was dependent upon the will of its former rival. The only cause for surprise is that it existed so long—not that it has at last been exhibited in its true colors.

As we have before stated, that company is much less damaging to the competing interests in its present condition than it was while dragging out a miserable imppecunious existence. It has removed an obstacle to the progress and enterprise of other companies, which are honestly engaged in maintaining telegraphic competition. It throws open to occupancy an important section of the country, and there is no doubt but that at an early day the routes which it covered will be made available for the establishment of new lines, which it is to be hoped will be managed more efficiently and honestly than those which preceded them. It is essential, however, to the safety and permanence of any telegraphic system competing with the Western Union, that it should be practically one in interest and management. It will not do to continue an attempt at a guerilla contest, and operate in comparatively small and feeble organizations. There is telegraph business enough for two national organizations, and it would be the part of wisdom for the existing telegraph organizations not in the Western Union combination to unite their forces, and act vigorously and effectively for the best interests of all concerned. Until this is done they are liable one by one to meet the fate which has overtaken so many similar organizations, and which has so recently befallen the Pacific and Atlantic Company.

The railroad telegraph system of the country has become of great extent and importance, and it is for the interest of the railroad companies generally that they be enabled to control and operate their own lines. It seems to us that they are deeply concerned in the maintenance of an effective and powerful telegraphic competition. If any telegraphic organization shall succeed in establishing a practical telegraph monopoly, it will not be content until it brings the railroad telegraph lines into subjection to it, either through the notorious PAGE patent or some similar outrageous monopolizing device. The railroad companies of the country should not be compelled to pay tribute to or submit to the exactions of any telegraphic monopoly. It seems to us that they are vitally interested in this matter, and should not be slow to combine their forces with those of a competing organization such as we have indicated. In fact, one or more of the great railroad companies might very properly take the lead in bringing about such a combination and consolidation of the telegraphs and telegraph organizations outside of the Western Union.

The telegraphic field is ripe for this harvest, and to secure it it is only necessary that the proper parties should, without unavoidable delay, proceed to do the work. If this opportunity should be neglected, it is hardly probable that so excellent an one will soon be again presented. Such an organization as might thus be brought about would be national in its character,

and by availing itself of the best telegraphic systems, with the pecuniary resources which it would possess, could maintain itself against any efforts possible to be made against it. Such an extended telegraph system, properly and economically managed, would undoubtedly prove profitable also, and serve the interests of investors, the fraternity and the public alike.

It is evident that there is not the slightest probability of Congress interfering with the telegraphs of the country—it could not if it would in the present condition of the public finances—and past experience has demonstrated that it would not if it could, so long as the public is properly served at reasonable rates—and there is no popular demand that, in addition to its other multifarious duties, the Government shall undertake the telegraph business of the country. As long as there is any effective competition in the telegraph business there will be no popular or general demand for a Government telegraph. The only condition which would create this demand, in our judgment, would be such a telegraph monopoly as Mr. ORTON and his associates in the management of the Western Union Company have labored for years to establish, and which that gentleman assures his stockholders will be established in the near future. We are satisfied that in his case the wish is father to the thought, and that there is yet too much good sense on the part of those intrusted with the management of the competing companies to allow them to go to the wall, when they can so easily be not only preserved but strengthened, and their value and importance increased.

The interests of the public and of the telegraphic fraternity require that there shall be telegraphic competition. It will, indeed, be an unfortunate day for the telegraphers generally when the Western Union or any other telegraph organization, through a monopoly, shall have them at its mercy. The great body of employes of the Western Union Company are to-day benefited by the existence of its competitors. The result to the fraternity of the establishment of a telegraphic monopoly must be too evident to every intelligent telegrapher to require detailed elucidation from us. It is in their interest and in that of the public that we urge such action on the part of managers of existing competing telegraph organizations, and on the part of railroad managers, as shall assure the creation and permanence of a united, powerful and successful competitor of the Western Union Telegraph Company.

The Social and Professional Status of Telegraph Operators in this Country and Europe.

AMERICAN operators, generally, have but little idea of the different social and professional status of practical telegraphers in this country and Europe. Indifferent as many of them regard their position and compensation, they are in every respect in advance of the similar class there. To some extent here a good operator is expected to have some knowledge of electrical science, and to be able in an emergency to assume the management of the wires and business. In Europe a telegraph operator or clerk (as they are termed) is merely an operator, and is expected to know nothing more than how to send and receive messages. The arrangement of circuits, management of batteries, testing, removal of difficulties, etc., are intrusted to officials specially assigned and instructed in such duties, and it would be regarded as presumptuous and absurd for a mere operator to interfere in the higher branches of the business. As a natural sequence to this they are paid proportionately, and the salaries received by them would be scouted by even second rate American operators. They are in fact barely sufficient to enable them to live in a very humble and unpretentious manner—and the discipline in which they are held is of the most stringent and strict character. Their social position is but little, if any, above that of other laborers, and not so good as that of the better class of merchants and storekeepers' clerks and assistants. The business being a Government monopoly, they are compelled to accept such positions and salaries as are offered them, and cannot vary their employment at will, as is the

case here. As an offset to the small amount paid for their services, it must be acknowledged that two or three are employed to do the work that any competent operator is expected to do in this country, so that the advantage peculiarly to the system is not so great as would at first sight appear.

We do not think that the telegraphers in this country would be pleased if placed under similar conditions as to professional and social position, and certainly not as regards the scale of salaries, as their European brethren. They enjoy advantages and have prospects in life which the latter would never dream of, and this ought to be some compensation for the evils of which they not unfrequently complain.

Naturally, in the increase of the telegraph business in extent and importance, the duties have been subdivided to a considerable degree, even in this country, and in the larger offices especially, the operators, as a general thing, are not expected to be as familiar with the whole routine of duties as formerly—but almost every telegraph operator here looks forward to the time when he shall become chief operator and manager, and every manager has in view the higher position of superintendent, and this incites the better class to become acquainted with electrical science to some extent, and its application to practical telegraphy.

Socially, the American telegrapher is as good as anybody else, and it is his or her own fault if they occupy a lower social position than others of the community.

The successful publication of *THE TELEGRAPHER* is an illustration of the different *status* of the American telegraphers from that of any European country. In no other country would it be possible to maintain a publication which should be devoted to the interests and the organ of the telegraph operators themselves. This idea would be regarded as absurd, and not the least so by the operators themselves.

We hope that our telegraphic friends will think of these things, and that they will strive by all means in their power to improve their social and professional *status*. They can do this most effectually by seeking to obtain a more thorough scientific and practical knowledge of their profession. Every telegraph operator who designs to make the business a permanent occupation, should, seek by study and application to become fitted to discharge creditably and satisfactorily any position in the telegraph service. They should not be satisfied with a knowledge of the merely mechanical duties of manipulating a key and reading telegraph signals as they are transmitted. However expert they may be in these, they are but the lower rounds in the professional ladder, and those who would go higher must be content to study and investigate, instead of idling away their time in material pleasures and temporary personal gratification. There is a brilliant telegraphic future before us, and let it be the ambition of one and all that the telegraphic fraternity shall be worthy of the highest respect and honor, and not, as in other countries, mere servants, for whom there is little chance of professional or social elevation.

Impecunious Telegraphers.

Not a few telegraphers, when solicited to subscribe for *THE TELEGRAPHER*, excuse themselves on the ground that they are too poor, and cannot afford the small amount required to secure its weekly visits. There may be a few who make this excuse in good faith, but in most cases it will not bear examination.

How many are there who have made this excuse that do not every month waste in useless or hurtful expenditures more than the subscription price of the paper for a year? If a telegrapher does not desire to receive the paper, or does not consider it of sufficient value to repay the investment, he or she may very properly decline to subscribe for it. We can in such cases only regret their lack of appreciation, but have no reason to question their honesty.

The amount of information and instruction contained in a volume of *THE TELEGRAPHER* makes it of far more

value to any person interested in telegraphy than many times the amount of the subscription price. In fact, we do not think that any such person can really afford to be without it. This is not our opinion alone, by any means. We are almost daily in receipt of letters of the most flattering character, and, if we may credit the statements of our correspondents, *THE TELEGRAPHER* is constantly improving, and becoming more valuable from week to week. We hope that telegraphers will seriously consider whether they can properly and advantageously dispense with the paper, and whether in reality, if it is necessary to economize, economy cannot be better exercised in some other direction. The recent additions to our subscription list indicate that our views in this matter are by no means ours alone. There is still room on our books for many more subscribers, and we hope the good work that has been so excellently commenced will be continued, until every telegrapher who desires to be advanced in the profession, and who especially seeks to become better qualified for the discharge of telegraphic duties, shall be enrolled on its subscription list.

Congress and the Postmaster General.

POSTMASTER GENERAL CRESSWELL evidently is not in favor with the members of Congress. His urgent pleadings with that body to establish a Government telegraph system, and to entrust to his department its control and management, fall on unheeding ears; and now his recommendation to establish a postal savings bank system is understood to meet with no favor in the committee to which it was referred. The transmission of public documents free through the mails is likely to be restored, and the expensive foolery of printing stamps, to be sold to the other Government departments and officials, for use on official communications, instead of their being franked as heretofore, will probably be abandoned. The deficit in the revenues of the Post-office department the last fiscal year was over \$6,000,000, and is increasing, notwithstanding the abolishing of the franking privilege. We are afraid that he will be forced to the conclusion that Congress is a very intractable and altogether obnoxious assemblage, and managing the Post-office affairs of the country a by no means desirable job. However, he can console himself with the idea that if he is inclined to give it up there will be no difficulty in finding a suitable person to take it off his hands, and, possibly, one with fewer crochets in his head and somewhat less ambition may find it easier to get along with.

A Very Pretty Project.

As many of our readers know, the speculation in Western Union Telegraph shares has been very active since the monetary stringency has been relaxed, and the price which, during the panic, was depressed to the neighborhood of fifty, has recently advanced rapidly, and is quoted at 76 to 79, and has even touched 80—some 4,000 shares having been sold at that figure on the Stock Exchange one day last week. This rapid advance has been stimulated by reports that it was intended to declare a large dividend shortly, and that the Executive Committee of the company had the matter under consideration. Last week some parties engaged on the bull side of this speculation got up a petition addressed to the management of the company, which was circulated in the Exchange, proposing that, in addition to the \$7,000,000 of the stock which was held by the company on the first of July last, enough more should be purchased by the company to reduce the Capital stock to \$30,000,000; and that then \$15,000,000 of 7 per cent. income bonds should be created and divided among the stockholders *pro rata*, as representing the net earnings of the company since 1869. This would be in effect preferred stock, and the capital of the company would then be represented by \$30,000,000 of common stock, and \$15,000,000 of these income bonds, or preferred stock, in addition to its other indebtedness. Undoubtedly this would be a very good arrangement for the speculators, and the circulation of

the petition had the immediate effect of advancing the prices of the stock, which was probably all that was designed by the enterprising genius who devised the scheme.

It has not generally been supposed the nominal capital of the Western Union Company required any additional inflation. The plan which was originated by President ORTON, and in the carrying out of which the late HORACE F. CLARK was engaged, was to reduce the capital and bonded debt to \$30,000,000, by investing the net earnings of the company in its own shares until the amount had been thus reduced. This plan, the legality of which at best was exceedingly doubtful, came to grief when Mr. CLARK died, and as is well understood, has been abandoned; but it is not reasonable to suppose that the present managers will not only undo what has been accomplished in that direction, but actually dilute still further the already excessive nominal capital of the company.

It is understood to be the policy of the present managers in the future to distribute in dividends the net earnings of the company, and it is not improbable that a dividend of some as yet undetermined amount will be declared by or before the first of July next.

Watts & Co.'s New Catalogue.

WE have received from WATTS & Co., of Baltimore, a catalogue of telegraph material and electrical apparatus manufactured and sold by them, which is very carefully and handsomely got up. It is illustrated with engravings of nearly all the different articles kept on hand, including several specialties of this firm which have already become widely known. Among these may be mentioned the main line sounder, or "wreck instrument," very useful and convenient in railroad work; keys with Davis' patent circuit closer—an excellent device; a cheap, simple and effective dial instrument, which only costs forty dollars; Scott's patent hotel annunciator, and the well known Baltimore battery. The catalogue will be found of much intrinsic value merely as a book of reference, as it contains all the formulæ and tables for size, weight and resistance of iron and copper wires, and a very full and explicit series of instructions for the use of students and amateurs, in which we think we recognize the handiwork of our old friend, Mr. J. B. YEAKLE, who is now associated with WATTS & Co., and attends principally to the electrical work of the establishment. Copies of the catalogue may be had on application to WATTS & Co., 47 N. Holliday street, Baltimore.

Patent Insulated Telegraph Wires.

THE use of Insulated Telegraph Wires has very largely increased during the last few years, and the quality of such wires has been greatly improved. The new advertisement of Mr. EUGENE F. PHILLIPS, of Providence, R. I., which appears in this number of *THE TELEGRAPHER*, will be found of interest to all who may have occasion to use such wires. The wires manufactured by Mr. PHILLIPS are of a very superior quality, and the demand for them has been so large, and is increasing so rapidly as to require an enlargement of his factory, which is now completed, and in future he will be able to fill all orders promptly and satisfactorily. We have no hesitation in recommending these wires, as we know them to be all that is claimed for them.

Telegraphic Positions on Central and South American Lines.

WE are occasionally in receipt of letters from telegraphers, who desire to obtain situations on telegraph lines in the Central and South American States, asking for information as to rates of compensation, chances of obtaining situations, how to make applications, etc.

From such information as we have of these lines we do not feel at liberty to encourage any telegrapher, who has employment in this country, in seeking to better his fortune by emigrating to those countries, as we understand the rates of compensation of telegraphers there are much less than in this country. The climate is

unhealthy for foreigners, and the mode of living not agreeable to those who have been used to living here.

In no country in the world are telegraph operators so well paid, or as pleasantly situated, notwithstanding the disadvantages which undoubtedly exist, as here;

The "Public Ledger" Almanac.

We have received from Mr. GEORGE W. CHILDS, of Philadelphia, the Public Ledger Almanac for 1874.

Personals.

Mr. GEORGE CLARK, late Train Despatcher on the Pennsylvania Central and St. Louis Railroad at Pittsburg, and formerly of the Philadelphia and Erie Railroad, has been appointed Special Agent for Mr. GEORGE WEBB, Assistant General Manager of the Pennsylvania and St. Louis Railroad.

Messrs. GEORGE H. BOWKER, and M. F. SMITH, have accepted positions with the Atlantic and Pacific Telegraph Company at Albany, N. Y.

Mr. C. E. LAKE, of Poughkeepsie, N. Y., has accepted a situation with the Atlantic and Pacific Telegraph Company at Troy, N. Y.

The Telegraph.

Telegraphic and Electrical Brevities.

THE Atlantic and Pacific Telegraph Company have opened offices at 44 Pine street, 122 Front street, New York City, and 18 Exchange Place, in Jersey City, N. J.

The Atlantic and Pacific Telegraph Company have opened an office in the Delevan House, Albany, N. Y., with Mr. E. A. GAY as operator.

The Atlantic and Pacific and Franklin Companies have secured some of the best offices recently occupied by the Pacific and Atlantic Company in the principal cities where the lines of these companies extended, and opened offices for their lines in them.

The bill before the Legislature of New Zealand, authorizing a cable to Australia, has become a law.

It is suggested that, in the laying of ocean cables, communication between the deep sea line and floating buoys, all along the route, be arranged.

The West India and Panama Telegraph Company.

A MOVEMENT is on foot among the shareholders of the West India and Panama Telegraph Company to call an extraordinary meeting of the company, for the purpose of taking into consideration the report of the committee, and reconstituting the present board.

A more remarkable abuse of the privilege of using proxies has seldom been attempted than that which appears to have been the case at the recent meeting of the shareholders.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

For the week ended December 16, 1873, and bearing that date.

No. 145,532—ELECTRO-PNEUMATIC ACTION FOR MUSICAL INSTRUMENTS. William F. Schmoele and Henry Schmoele, Jr., Philadelphia, Pa., assignors of one third their right to Charles Schmoele. Application filed March 7.

A small wind pocket, operated by an electro-magnet, is used as a trip to operate the valve of a wind instrument.

1. The use or application of an electro-magnet to operate a wind pocket or pockets employed to work the valve, substantially as set forth.

2. The form of pocket and valves employed, admitting the wind by a groove with double aperture, controlled by two valves or nuts opposed to each other on a screw threaded wire, substantially as set forth.

3. The small or primary pocket with diminutive valve, to control the large or secondary pocket, which operates the pallet or other resistance, substantially as described and set forth.

THE custodian of many secrets—the telegraph operator.

WANTED.

Wanted to know the whereabouts of ROBERT McCALLUM. Was operating on the B. and M. R. R. when last heard from.

TELEGRAPH POLES.

Parties who are in want of good

CEDAR TELEGRAPH POLES,

can obtain them on favorable terms, and have them delivered at any Lake Port between Oswego and Chicago, on the opening of Navigation, by applying to

A. A. COLBY,

MANUFACTURER OF

REED & PHILLIPS'

PATENT INSULATED TELEGRAPH WIRES,

(PATENTED, NOVEMBER 18TH, 1873.)

Lock Box 169.

PROVIDENCE, R. I.

Having recently enlarged our factory, we are now prepared to furnish at short notice any style and quantity of

BRAIDED LINEN or COTTON COVERED WIRE,

saturated and finished with our Patent Compound, which makes the most durable, handsome and best insulated Braided Wire manufactured.

PAINTED, PARAFFINE or SHELLAC WIRES

also furnished at the lowest prices. Iron or Compound Wires covered upon reasonable terms.

We are also prepared to furnish a new style of

ELECTRIC CORDAGE,

which has been pronounced by all superior to any in the market.

The American District and Gold and Stock Telegraph Companies have been supplied from my works with a greater portion of the office wire used by them.

Sample Card and Price List furnished when requested.

Phillips' Wire can be had of

Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The **Electro-Mechanical Gong Striker**,
for home and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System
OF
FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the
original *FARMER & CHANNING PATENTS*, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THREE**
CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its in-
troduction into their localities is cordially invited, and
their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**,
with Patent **Platina Connection**, introduced by us eight years
since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that
will work practically with a single **DANIELL** cell, a **BATTERY**
that does not require to be taken down but once a year, and the
very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employés, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. BOX 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON GARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.

15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS

of all kinds,

CHRONOGRAPHS,

ASTRONOMICAL CLOCKS,

REGULATORS,

ETC., ETC.,

OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

GEO. W. STOCKLY,
Sec'y and Treas.,
No. 4 LEADER BUILDING,
CLEVELAND, O.

DR. L. BRADLEY,
 No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalent of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1/800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1/150th to the 1/300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

WATTS & COMPANY,
47 Holliday Street,
BALTIMORE,
MANUFACTURERS OF
ELECTRICAL AND TELEGRAPH INSTRUMENTS
AND
Material of Every Description,
RELAYS, KEYS, SOUNDERS, COMBINATION SETS, &c., &c.
Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,
Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK,
Sept. 22d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,
A. S. BROWN, Manager.

The Best Form of Battery Insulator Offered.
SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.

Designs for Switch Boards for special service furnished.
SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

PARTRICK, BUNNELL & CO.'S
CHAMPION LEARNERS
AND
SHORT LINE TELEGRAPH APPARATUS.
A GREAT IMPROVEMENT

over all Instruments of the kind ever offered for this purpose, consisting of a

No. 1 SOUNDER AND KEY COMBINATION SET,
AN EXCELLENT BOOK OF PRACTICAL INSTRUCTION IN
TELEGRAPHY,

OFFICE WIRE, CHEMICALS, ETC.,

making a complete arrangement for one office.

The Instruments are full sized, complete in every respect. The Battery is a full sized first class Callaud cell, and the entire outfit has nothing about it which in any way resembles the many wretched affairs which have been extensively sold as Learners' Apparatus.

Great numbers of our "Champion Instruments" are in use upon short private lines, and upon City wires of Telegraph Companies, where they are giving the greatest satisfaction, on account of their very substantial make and excellent working qualities.

We guarantee them to be in every respect better than any form of Learners' Apparatus or Short Line Instruments ever offered to the public.

Price of Apparatus, complete, with Book of Instructions, Battery, Wire, and all necessary materials for one complete office outfit, ready for shipment, sent C. O. D., \$10—or, if money order sent for the amount, \$9.50. The latter plan will additionally save the purchaser the express charges for the return of money.

Price of Single Instrument, good for one mile or less, without Battery.....	\$8 50
Ornamental style ditto, with rubber covered coils, without Battery.....	10 00
Single Instrument, good for working a line from one to twelve miles.....	9 50
Ditto, ornamental, with rubber covered coils.....	11 00

A NEW GALVANIC BATTERY.
Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for the
manufacture and sale of the

EAGLES METALLIC BATTERY,
now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.
The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.
Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.
On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.
No. 2 is a round cell, designed for main line. Price, \$2.

THE AMATEUR'S
 TELEGRAPH APPARATUS.

(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Truncheon Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished

ONE CUP OF BATTERY,

TWO YARDS OFFICE WIRE,

ONE PACKAGE BLUE VITRIOL,

ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

A COMPLETE OUTFIT FOR A TELEGRAPH OFFICE,
 Seven Dollars and Fifty Cents.

Two Sets, complete.....\$14 50

SHAFFNER'S
 TELEGRAPH MANUAL.

TO TELEGRAPHISTS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,

78 and 80 Broadway,

NEW YORK.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, JANUARY 24, 1874.

VOL. X. WHOLE No. 393.

Dedication of the New General Post-office, London.

THE London newspapers of the 2d instant contain very full reports of the dedication of the new General Post-office, which occurred on New Year's night, and which seems to have been quite a brilliant affair. The following is condensed from the report published in the *London Times*:

"Last evening this edifice, erected in St. Martin's-Grand, immediately in front of the old General Post-office, and which has been devised and constructed with a careful regard to the large and still growing wants of postal communication, as understood in the present day, and especially telegraphic communication, may be said to have been dedicated to the public service. The ceremony of last night assumed the modest form of a *conversazione* in commemoration of the reopening of the Post-office Library, and a large and influential company, some hundreds in number, many of whom were ladies, had been invited to witness it, the new Postmaster General, Mr. Lyon Playfair, M. P., taking the leading part, as became his official position, and the central, northeast, and southeast galleries of the building having been thrown open for their accommodation. All the heads of departments in the General Post-office were also present, and vied with each other in consulting the comfort and convenience of the audience.

In the southwest gallery, which was brilliantly lighted and tastefully decorated with banners lent for the occasion by many of the civic companies, there was a museum of early telegraphic instruments and appliances. The mode of transmitting news to and receiving it from nineteen large towns simultaneously was also shown there. The system of the Exchange Telegraph Company, by means of which identical information as to the prices of stocks, shares, etc., is sent to the offices of stock brokers, was likewise exhibited. There was a direct communication during the evening between this gallery and the postal telegraph offices in Dublin, Edinburgh, Glasgow, Jersey, Penzance, Manchester, Southampton, and several London stations. In the same gallery, too, communication by means of the Hughes type printing instrument was established between London and Southampton, and messages printed in Roman type were sent simultaneously in opposite directions on one wire, through the instrumentality of Mr. Stearns' invention. The chronofor, by means of which Greenwich time is transmitted simultaneously to the principal towns in the kingdom, was also exemplified there. In the northwest gallery the process of 'testing for faults' was shown. There was direct communication during the evening between this gallery and Australia, India, Teheran, America, St. Petersburg, Paris and Berlin. On tables, microscopes, stereoscopes, graphoscopes and electrical apparatus of various kinds were exhibited, as was also the working of the pneumatic tubes which connect the Central Telegraph Station with the principal offices for the collection and delivery of messages in the metropolis.

A raised dais had been erected in the central gallery, and from it, after the company had assembled, Mr. Lyon Playfair opened the proceedings by delivering an address. He said: 'We are met to-night in the new great telegraphic room which, in a few days, will be the active centre of the whole kingdom for sending out with the speed of lightning and by the same agency the thoughts of people who require immediate inter-communication. All our improvements of postal communication become dwarfed by this mighty invention. Most of you are much more familiar with postal history than myself, but still let us recall to our memory one or two facts, which may serve to impress us with our present position. You all recollect that post messengers arose out of State necessities, and that their survivals are still seen in the Queen's messengers of the present day. They were originally men who travelled on foot or on horse with State despatches, but did nothing for the service of the general public. As they grew more numerous they required a supervisor, who was the ancestor of the Postmaster General. The Universities were among the first bodies who established running postmen of their own to carry the communications of professors and students. Some towns, also, had their own separate postmen. The far north City of Aberdeen, during the reign of Elizabeth, had

the bravery to appoint a postman with a blue cloth dress, emblazoned with the city arms, to go leisurely up to London with the letters of the enterprising Aberdeens, and to bring back those addressed to them. Intercommunication with Scotland was very imperfect until the Scotch King James VI sat upon the English throne as James I. Recollect how he learnt the death of Elizabeth, and the difference between his time and our own will be very apparent. It is related that Robert Carey, having received a ring taken off the Queen's finger when she died, at three o'clock on Thursday morning, galloped off to Edinburgh, which he reached in the middle of the Saturday night. That was a wonderful feat in those days; but now such a message, put into the hands of Mr. Scudamore, would find its way to Edinburgh in less time than Carey could have saddled his first horse. The electric agency which is to be used in this room for sending messages has been known since the world began. Every flash of lightning in the sky revealed its existence. When the savage African rubs his furkaron electric sparks appear, but they light up an eye as intellectually dull as the eye of an ox, and no science is developed from such untutored observations. The clever wife of an Italian physician was the first who noticed a fact which led to our possession of electricity in quantity sufficient for our present purposes. Madame Galvani was the daughter of the celebrated physician, Galeazzi, and she observed that frogs' legs became convulsed under electrical excitement—the popular version being while she was making soup for her husband, but the truer version, that they were convulsed while near an electric machine. Out of her acute observation her husband ultimately discovered the galvanic battery and laid the foundation for telegraphy. But great discoveries do not startle an astonished world by a sudden apparition. It is only in mythology that Minerva, full grown and panoplied in complete armor, starts out of the brain of Jupiter. Science and its practical applications are of slow growth; the seed being put in favorable ground the young plant appears after a time, but requires much care before it comes to maturity. And so Galvani's discovery, supplemented by many intermediate discoveries, required nearly a century to mature it before my friend Sir Charles Wheatstone, whose presence we expect to-night, gave us that form of telegraph which now bridges over space and time from this office to the whole kingdom.

This is not the occasion to give you a scientific lecture, but I would ask you to remember how slowly this Post-office has received its wonderful organization. The inventive genius of Wheatstone, and the bold conceptions of Rowland Hill have aided us powerfully to attain our present position, but both of these men, whose friendship I am proud to claim, would tell you that after all they were mainly exponents of a knowledge which had descended to them by inheritance from their forefathers. Wheatstone could not have achieved his triumphs if Oersted, and Faraday, and many other philosophers had not largely developed the original discovery of Galvani. Rowland Hill could have done nothing in introducing or in carrying into effect the penny post, had there not been large developments in the means of intercommunication, by good roads, coaches and railways. Withering, by his postal organization of 1635; Palmer's mail coach system of 1784; Dockwra, by his London penny post, and Stephenson by his railways, were as much the postal progenitors of Rowland Hill as Galvani, Oersted and Faraday were the scientific forerunners of Wheatstone.

* * * * *

In this great establishment there are many men of thoughtful minds who desire to benefit by the accumulated intelligence of those who have preceded them. They can only acquire this through books. There are few men worked more hardly than our officers; but the nature of the service gives intervals of leisure without which the work could not be performed. In those intervals access to a library and a reading room is of great importance to them, and a lending library to the numerous clerks, both male and female, of this office, offers resources which cannot be too highly valued, either intellectually or morally. I do not intend to weary you with empty platitudes as to the benefits of knowledge. Our work here is of the most varied character. Our postal system, our packet service, our telegraphs, our money order office, and our savings banks—all involve even technical knowledge of geography, science and political economy, which would give ample scope to those who wish to carry on their duties, not by a mere blind empiricism, but with that intellectual understanding which distinguishes man from a mere machine in activity. But we do not desire to confine readers to mere technical books bearing on their occupations. You have the glorious records and learning of antiquity, the literature of more modern times, and the recreative books which amuse as well as instruct. The library is created by yourselves and managed by yourselves, so that it will be adapted for your several needs and desires. I am only here among you to-night by your own favor to wish you continued

prosperity in an undertaking which gets fresh life by the enlarged accommodation afforded to it in a new building. I offer to it no patronage, for that would be unworthy of its object and of the committee who manage it; but I ask you to accept my warmest wishes for the prosperity of the new reading room and library, and to assure you that, while I remain in office the Committee of Management will always find in me a warm friend.'

The address of the Postmaster General throughout was listened to with marked attention, and at its conclusion the company signified their interest and approval by an enthusiastic cheer.

The company then, on the invitation of the Postmaster General, and accompanied by Mr. Scudamore, C. B., and other of the principal officers of the department, made a tour of the several galleries, inspecting the various objects of interest, and had opportunities of witnessing the telegraphic arrangements and operations. The occasion was rendered still more agreeable by a choice selection of vocal and instrumental music. Altogether, the occasion was replete with interest, and the company lingered in the building until far towards midnight."

[From the *Telegraphic Journal*.]

Method of Determining the Actual Resistance of Old Telegraph Line Wires.

To the Editor of the *Telegraphic Journal*.

SIR—In your journal of the 15th inst. I am accused, by J. W. Hagers, Inspector of the Government Telegraphs in the Netherlands, of reproducing a formula of his and publishing it as my own.

The article, "Method of Determining the Actual Resistance of Old Telegraph Line Wires," published in your journal of 15th May, is not written by me, nor is my name mentioned in connection with the article.

I am referred in Mr. Hager's note to an article by Mr. Ayrton, in the journal of the 1st inst. Mr. Ayrton's note had escaped my notice until now.

I desire to say to Mr. Ayrton that the object of my article on "Economical Line Construction," was to show the advantages of perfect insulation, or insulation that is not affected by dampness. In this case a heavy and expensive conducting wire is not essential.

My business is the manufacture of insulators. I guarantee their performance. One of these guarantees is that they shall not be affected by rain or damp weather. I undertake to insulate a wire weighing, say two hundred pounds per mile, and thereby make the capacity of that wire equal to another wire weighing four hundred pounds per mile; this latter wire being insulated with common insulators—such, for instance, as are used in the British East Indies, the Netherlands, or England. I do it and maintain this degree of insulation for a moderate charge—less than is usually expended for such purposes, asking no pay unless these conditions are fulfilled.

To Mr. Ayrton I beg to say I have not had the good fortune to read "Instructions for Testing Overland Lines," compiled by Mr. Schwendler, nor "The Instructions for Testing Telegraph Lines, and the Technical Arrangements in Offices." I have no doubt that I would be interested and profited by doing so.

I and others in this country have applied Mr. Schwendler's formula to correct the apparent or observed resistance of old telegraph lines. I refer to the formula as published by Clark and Sabine. We have been unsuccessful, however, in getting at anything like an approximation to its actual resistance for these reasons: (1.) The resistance of the insulators is seldom if ever uniform for the entire length of line, but constantly changing. (2.) Conductivity of old wires is more reduced by bad joints than by loss of actual weight of metal. The resistance of defective joints is reduced by dampness, in some instances sufficient to make a difference in the apparent resistance of the wire of more than one hundred per cent.

In measuring the resistance of old wires to determine the loss in conductivity from use and exposure, it is perfectly useless to attempt it except in clear or cold weather. In one instance the resistance of an old wire reinsulated was reduced over three hundred per cent. by rain, as compared to a measurement in clear weather. In dry weather in this country the resistance of the insulators is too great to enter into or affect the result. It is beyond the scope or range of the Siemens's universal galvanometer. *It is so in rain* where my insulation is used. Rain or dampness does not affect this insulation. We can then observe and realize the effect of dampness upon the bad joints.

My knowledge of the telegraphs in the British East Indies is derived chiefly from the London journals. If there is improvement I am glad to hear of it. I have, in my business of reinsulating telegraph lines, distributed over thirty of Siemens's universal galvanometers, nearly all of them to railway companies. In the manufacture of these insulators I employ the most sensitive galvanometers, using those made especially for the purpose by Ruhmkorff, Dr. Werner Siemens and Mr. Becker. If we do not keep pace "in the application

of scientific laws to practical questions," we are determined not to be so far behind the rest of the world as to lose sight of those that win the race. I am, etc.,
DAVID BROOKS.

The Postmaster General's Report.

THE annual report of the Postmaster General has been very extensively circulated, and has deservedly attracted considerable attention. The evils which attend our present system, and which we have frequently pointed out, seem at last to have received some consideration, but to any intelligent person that has had much experience in transmitting matters by mail, it is very evident that Mr. Creswell's ideas in regard to the best method of removing the defects which are now a subject of general complaint are by no means clear and practical. And we would earnestly suggest to him that a thorough revision and reform in the practical workings of our present postal operations is far more necessary than any advance in the direction of postal savings banks or postal telegraphs. "One thing at a time" is a good rule, and if Mr. Creswell will only devote his energies to the perfecting of our present system of sending letters, papers, books, etc., he will not only find his time and talents fully occupied, but if he succeeds in giving satisfaction to the reasonable portion of the community, he will have achieved a title to the gratitude of every man and woman in the country, and this is more than he can hope to attain even by his pet scheme of a Government telegraph.—*Industrial Monthly.*

Congress and the Telegraph.

WASHINGTON, D. C., January 12.

TO THE EDITOR OF THE TELEGRAPHER.

THE inevitable scheme of Mr. Gardner G. Hubbard, which has been before Congress for several years, has come to the surface once more. This scheme, as the readers of THE TELEGRAPHER are aware, proposes that a Postal Telegraph Company, so called, shall be chartered by Congress, and be worked in connection with the Post-office Department. It is a scheme to establish a gigantic telegraph monopoly for the benefit of the proposed corporation, under the auspices of and fostered by the Government. It is neither a private enterprise, relying upon its patronage for its profit, or a Government institution, the benefits of which are to inure to the public, although it will be maintained largely at the expense of the Treasury. The Postmaster General does not favor this proposed enterprise, but desires, if any change be made, that a *bona fide* Government telegraph shall be established.

The bill was reintroduced by Senator Ramsay in the Senate early in the session, as has already been stated in this correspondence, and referred to the Post-office Committee, of which he is Chairman. It is similar to the bills which have heretofore been introduced in previous Congresses, and offers no new features of importance.

On Thursday and Friday of last week the committee had the subject before them, and Mr. Hubbard was afforded an opportunity to repeat his oft told tale, and restate his arguments in favor of his pet project, which are now quite threadbare from such frequent repetitions. The scheme has all the disadvantages of the Government telegraph schemes, and none which will compensate for such an extraordinary grant from Congress.

President Orton and Mr. George B. Prescott, electrician of the Western Union Telegraph Company, were also before the committee in opposition to the scheme, and are to be heard further in opposition to it this week.

Mr. T. T. Eckert, of the Western Union New York office, also put in an appearance here on Monday night.

Large numbers of the pamphlets, containing Mr. Orton's reply to the report of the Postmaster General, have been circulated among the members of Congress and others here.

In reply to a resolution of the House, the Postmaster General has prepared a statement in regard to the additional numbers of employés of the Post-office Department which would be required in case the telegraph was added to the other business of the department. His statement is too long to be included in full in this letter, but, in conclusion, he reaffirms the estimates given in his report of 1872, that an aggregate telegraph force of 7,500, including all grades, at an annual cost of \$4,500,000, would be ample to work

the postal telegraph up to 30,000,000 of messages per annum, which, he says, is about double the number transmitted by all the companies operated one year ago.

If our Postmaster General is great in anything it is in statistics. It may be said for him that, having once made his statistics, no amount of demonstration will induce him to retract or vary them. The baselessness and unreliability of his telegraph statistics have been repeatedly and conclusively shown, but he still adheres to and repeats them with a confidence which, if not convincing, is, at least, courageous and obstinate, and is only paralleled by Mr. Hubbard's persistent urging of his scheme for a telegraph monopoly sanctioned by Congress and largely supported by the public treasury.

If Mr. Creswell could reduce the deficiency of six to seven millions in the postal business of the country, Congress and the people might, perhaps, have more confidence in his statistics, and his ability to conduct the telegraph business successfully and satisfactorily. But so long as this deficit annually increases under his administration, they will, on economical grounds, hesitate to confide to him additional business, the cost of which he so greatly underestimates. An effort will be made to have a special committee appointed in each House to take charge of the postal telegraph matter, although the most sanguine friends of the scheme concede that there isn't the ghost of a chance for it this session. The new representatives appear to take more interest in the matter than the older members, and some of them have commenced to cram, to display their intimacy with the subject for the enlightenment of their fellow members and the country when the opportunity is afforded.

A bill was introduced in the House yesterday by Mr. Negley, of Pennsylvania, "to promote telegraphic communication with foreign countries." This bill provides for the incorporation of the Submarine Cable Printing Telegraph Company, which is said to be composed of Boston and New York capitalists, to lay and operate one or more lines of Atlantic cable. The enterprise is based upon new methods of ocean telegraphing—the invention of Mr. W. S. Sawyer, of this city, who was formerly a correspondent here of several newspapers. The promoters of this enterprise are confident that Mr. Sawyer has made an important and valuable invention, which will greatly increase the rate of transmission of telegraphic signals over long cable lines. Section 4 of the act provides "That the tolls for governmental, commercial and private messages over the line or lines of the said company shall not exceed fifty cents per word, and for press despatches shall not exceed twenty-five cents per word."

The weather reports of the Signal Bureau, which were formerly sent over the Pacific and Atlantic lines, are now forwarded by the Western Union, and it is said that arrangements have been concluded between the Signal Bureau and the Western Union Company under which the latter is to resume the service in full, as was the case originally. CAPITOL.

Quantity and Intensity.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE read Mr. Pope's introductory article with interest and profit, and am especially pleased with his happy illustration of the term *potential*. Pardon me, but I do not quite see the drift of his assertion that the electric current cannot be distinguished by the terms "quantity" and "intensity." I am no expert in these matters, and ask only for information. Suppose we have three cells of precisely the same electro-motive force. How are we to distinguish the currents in the two methods of connection, viz., in a single series, or with all the zines joined to one pole and all the carbons to another? G.

Reply.—One objection to the use of the terms "quantity" and "intensity" is, that they have not a well understood and well defined meaning. It is customary to speak of quantity and intensity currents, but a so-called quantity current must have some degree of intensity, and an intensity current must also have more or less quantity. Then we have all shades of currents between the two extremes of quantity and intensity, and nobody can agree what to call them. In fact, the use of these terms for so many years has involved the whole subject in such confusion and obscurity, that I doubt if anybody ever clearly understood it until they had first got rid of the idea inevitably suggested by them, viz., that there are two kinds of electro-currents, of very different qualities and producing very different effects. But when we have once grasped the idea that there is only one kind of current, which, as I have before said, is a current of greater or less quantity—meaning by this that a greater or less amount of electricity passes through the circuit per second—our difficulties and perplexities vanish.

Suppose we take four carbon cells, such as our correspondent speaks of, and connect them to an electro-magnet, first "for quantity" and then "for intensity"—or, as I should term it, first parallel and then in series—and see what the result will be. We will try

it first with an electro-magnet having a resistance of 4 ohms, and let the cells have an internal resistance of 1 ohm each. Connecting them parallel, we have a total electro-motive force equal to one cell only, or say 1.75 volts. The resistance of 4 cells connected parallel is only one fourth that of a single cell, or 0.25 ohms; add to this the resistance of the magnet, and the total resistance in circuit is 4.25 ohms. Therefore, 1.75 (volts) divided by 4.25 (ohms) gives us a current of 0.41 (farads per second).

Now connect them in series and we have $1.75 \times 4 = 6$ (volts), which, divided by $4 \times 1 = 4$ (battery resistance) + 4 (magnet resistance) = 8, gives us a quotient of 0.75 (farads per second), nearly twice as much current as in the first case, showing that for the particular magnet in question we get the best result by connecting in series.

Now take another magnet having a resistance of 0.5 ohms. Connected parallel the current would be 1.75 (volts) divided by 0.75 (ohms), or 2.3 (farads per second). Connected in series we would have 6 (volts) divided by 4.5 (ohms), or only 1.3 (farads per second). Thus the effective force of any current may be precisely determined without the least vagueness. Thus we find that the difference between a current of 100 cells, connected parallel with a very short exterior circuit, and that of the same in series with 500 miles of telegraph wire in circuit, is merely one of degree, and not of kind or quality. F. L. P.

Elizabeth, N. J., Jan. 20, 1874.

Indifference of Telegraph Operators to their own Interests.

TO THE EDITOR OF THE TELEGRAPHER.

THE TELEGRAPHER seems to be working earnestly for the elevation of the profession. I wish you success, but must confess it appears to be almost a hopeless undertaking. The field for such labor is large, but it seems to be almost like "casting pearls before swine."

On a railroad division upon which there are twenty-five telegraph offices, I have personally solicited subscriptions for THE TELEGRAPHER at each office, and obtained four. In three city offices, in places of 4,000 to 8,000 inhabitants, I was even less successful!—obtaining none. Two years ago many of these operators knew nothing of THE TELEGRAPHER, but I think I obtained two subscribers, last year three or four, and this year, after circulating nearly all my numbers of Vol. IX, I obtained four subscribers.

The following scene will illustrate the discouraging indifference and evasions which are encountered by those who appreciate the value of the paper, and desire to benefit telegraphers by inducing them to take and read it:

Scene: A Telegraph office.—Operator wearing silk hat, which cost \$6; brilliant neck-tie, \$1.25, etc. Salary \$40 dollars per month. Enter solicitor for subscriptions to THE TELEGRAPHER.

Solicitor. "Have you read the papers I sent you?"

Operator. "Oh, yes! Read most of them."

Solicitor. "Where are they? I want to preserve them."

Operator looks around and finds one behind the ticket case; another, which has fallen down behind the safe, and thinks he must have used the other to kindle the fire.

Solicitor. "Well, I suppose you will subscribe for the coming year?"

Operator. "No, I can't do it! Two dollars is too much for that kind of a paper. Times are too hard now. My pay is not very much, and, besides, am owing for a box of segars!"

Another, who has two students at present, and from whose office have graduated six *first class* (?) operators within the past two years, all now holding *responsible positions*, at salaries of from \$35 to \$50 per month. Enter agent, to solicit subscription to THE TELEGRAPHER.

Operator. "O, we get that regular; they send it to us; we don't have to pay for that, we don't."

Solicitor explains to best of his ability the difference between THE TELEGRAPHER and the *Journal*—that the object of the latter is to circulate W. U. Tariff circulars, corrections, etc., but that THE TELEGRAPHER is the organ of the fraternity in general; only one in the world with a large fund of scientific and general telegraphic information, chiefly devoted to elevating the profession, etc., etc.

Operator. "Oh, we don't care anything about that; we get the *Journal*, that's good enough for us. We ain't going to pay for a paper when we are getting one of same kind dead head!"

Another, whose orders I have to obey, although he makes me many miles of travel and weary hours of work during a heavy rain, on a glass insulated line of 100 miles, because he got a slight current, with key open at the further end, and did not see how there could be any escape, unless insulators were broken, or trees or limbs on wire; and when I suggested replac-

ing the old Bradley relay (resistance from 300 to 600 ohms), with uniform style, say 150 ohms, didn't see what difference it made; an instrument was an instrument, any way; if they would answer calls, it was all he wanted—when solicited to subscribe, says, "It don't amount to shucks! I wouldn't read it if you would give it to me. Some high toned stuff cant, nobody understands, and rest damn nonsense," etc.

Another, who has a short line from his office to the room of a *Telegraph Institute*, with a capacity of about ten plugs per month, when solicited, says, "O yes; I want that paper, that is a pretty good thing; I am going to have that paper; but, by George, I ain't prepared to send just now. What is the address?" Copies address, saying, "I am going to send for that just as soon as I can." He did the same last year, and probably will as often as asked, never intending to subscribe.

Now, what can be done to elevate such telegraphers as these? I have but little faith in their elevation. If there is such a thing as total depravity, I think they have not far to get there. T.

The Transmission of the President's Message.

AUDUBON, MINN., Jan. 14.

TO THE EDITOR OF THE TELEGRAPHER.

It is claimed that the following statement—

"QUICK TELEGRAPHING.—The President's message, Spanish protocol and synopsis of the Treasury report, in all 12,325 words, were, on the 2d inst., transmitted from Washington, D. C., to New York, over eight wires, by the Western Union Telegraph Company, in one hour. This is the shortest time in which the message was ever received, and under the disadvantage of unfavorable weather—a steady rain falling at the time along the whole length of the lines. The report passed through the Associated Press office in one hour and twenty minutes"—refers to transmission by the Automatic system. I claim that it was sent by the Morse system, making 26 words per minute for each wire—it being transmitted at the same time over eight different wires. Will you inform us through THE TELEGRAPHER which is right? TEN.

[You are right. The despatch referred to was transmitted by the Morse. The Western Union Company do not operate the Automatic system—which President Orton states, as he formerly did in regard to the Duplex, to be inferior to the Morse, as regards speed, and practically valueless. He will, doubtless, in process of time see his error, and retract his present assertions as completely as he already has done in regard to the latter, which, in his last annual report to the stockholders of the Western Union Company, he claims to be (Mr. Stearns' patents having since been purchased by his company) the "most important and valuable of all the improvements which have been made since the Morse telegraph was first established."—[EDITOR OF THE TELEGRAPHER.]

The Character, Disposition and Ability of Many Telegraph and Railroad Officials.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE often thought this world of ours would be a very pleasant and delightful place to live in if the human race were not disposed to be so selfish and exacting one of another. But man too often forgets the golden rule, and instead thereof acts upon what is sometimes called the silver rule—that is, do unto others as others do unto you, and by his selfish ways, and the harsh and unfeeling manner in which he treats his fellow man, he not only makes himself miserable, but also all with whom he comes in contact. In the language of the poet, "Man's inhumanity to man makes countless thousands mourn." Kindness costs nothing, and what a magic power there is in it who can tell? It will reach the heart and compel us to respect the one who exhibits it toward us. Who would not do all in his or her power to please one who thus treats them kindly and encourages them? I refer particularly to employer and employé, and in order to make the matter still plainer, say railroad and telegraph officials and their employés. There are so many of these so-called officials who are in some way placed in positions of honor and trust, that are as undeserving and unqualified for the positions, they command as a child, and these are not exceptional cases, but very common; and, instead of matters improving in this direction, they are constantly growing worse and more unbearable, and in nine cases out of ten of such officials, who rise from some humble position in life to hold one of any importance at all, they entirely forget how very low down they themselves once were, and they seem to think they are fully licensed to abuse their fellow man who has the misfortune to be under their authority. They want everybody to know who they are and that they wear the brass collar. They very forcibly remind me of a story my grandfather used to tell of a man of his

acquaintance residing in Connecticut, who was elected captain of militia in his native town, and was so elated over the matter, and wanted to be known by the name of Captain —, that he used to go out to his barn, and stick his head in a barrel, and call out, "Captain —." Now this man's qualifications and vanity fully illustrates the one half of our so-called officials who assume the management of railways and telegraph lines. How such men ever command these positions has always been a query to my mind, but how they manage to keep them is a greater query. They are undoubtedly a great detriment to the business. Now the kind of men we want for superintendents and other important offices are generous, whole souled and kind hearted men. Let such men as are referred to in the commencement of this communication study the life and character of our Saviour if they would learn a lesson of humbleness and self-sacrifice. He was never known to turn any away without giving them satisfaction, and if the Great Teacher could condescend to always speak kindly and encourage all who applied to Him, then I think men ought to be heartily ashamed of their way of treating those under them. I am glad we, as a fraternity have just such a paper as THE TELEGRAPHER, through whose columns we may express our views and defend our rights; and as THE TELEGRAPHER is not the organ of any monopoly, and is not kept up by any mammoth telegraph company, we may expect to see our cause fearlessly defended. I wish the whole fraternity would give THE TELEGRAPHER their support and encourage the editor in his work. MELVILLE.

The Character and Habits of Telegraph Operators.

TO THE EDITOR OF THE TELEGRAPHER.

IN reply to "Frankie's" note, I would say that there was a time when I thought that operators were indeed a "clownish set." I don't think I ever met with one but what he smoked, chewed and drank, and, in fact, some of them, after they have eaten their dinner, must have a little game of billiards before going back to their office. But in THE TELEGRAPHER of late I have seen some very nice and interesting communications from those who, I trust, are perfect gentlemen and true Christians. There was one over the signature of "H," if I mistake not, which I admired exceedingly. It showed a mother's careful training, and it made me feel glad to see his courage in saying "No," when asked by a friend to take a drink or a smoke. Oh, I wish there were more young men like him. May he always have strength to resist temptation.

You think, "Frankie," that he was not a very dear friend. At that time we were, and I use to enjoy going to his office, but since then we meet as strangers, but I trust we are friends. A reconciliation is indeed without hope.

I do not think I felt "sour," but am afraid I had a few hard feelings against "Aaron Around," for I do hate selfishness. No, I have not an office, and often feel discouraged, but still "I'll wait a while longer before I despair." I thank "Frankie" for his sympathy, and would certainly receive him as a student, but think he would make a great sacrifice, for he would be obliged to give up smoking and all the rest of his bad habits (which, I trust, are few). I will bid the readers of this paper a kindly farewell, for I think this is the last time you will hear from me at present, as I cannot afford to take THE TELEGRAPHER any more, at least not until I get an office, when I hope to have a few more "stamps" than I have at present. I have taken great interest in the correspondent's column, and regret that I am unable to unite with you to help along this interesting paper. Should "Frankie" like to hear from me personally (that is if he is unmarried) I will give the editor of THE TELEGRAPHER liberty to give him my address. NETTIE BRONSON.

Country vs. City Telegraph Operators.

CALIFORNIA, January 7.

TO THE EDITOR OF THE TELEGRAPHER.

IN your issue of the 27th ult. my attention has been called to the remarks of "Rover," who seems to look down upon we "country plugs" having country offices, as though he thought it was a disgrace to be the manager of a country office; and, also, his remarks for the placing of boys in the San Francisco office. Now, it is my fortune to have been connected with the Western Union lines for something like six years, and in that time have gained considerable knowledge of the "ticking of the instrument, and understand its "ling," at a moderate rate of speed, although not a first class man in my own estimation, as some of our young men are apt to think themselves, when actually they are only passable.

The reason why boys are employed in San Francisco is because the boys can send and receive what is given them to do as though it were a school, while we "country plugs" are holding responsible transfer offices—

money to the extent of \$1,000 to \$2,000 a month—doing as though it were a banking business, requiring a clear head and a knowledge of figures, facts and faces. We "country plugs" supply the San Francisco daily papers with all the interesting matter of our several country precincts, and our reports are published as sent, provided the San Francisco "first class operators" do not make a "cow's brother" of our dispatches. We "country plugs," in case of disturbance or breaking of lines, must mount our country plugs (horses or mustangs, as called here) and away with our blocks and tackle. Eighty-five to one hundred miles is not thought of by us. I have ridden one hundred and sixty miles in three days to repair a ground which another man had passed unnoticed. Do the first class operators of San Francisco know anything of making a splice, climbing a pole, riding broncos, or testing for grounds outside of the key? The sum and substance of "Rover's" remarks is that he has been superseded by the boys in San Francisco, and very likely would like now to take a back seat and become a "country plug." INDIGNANT COUNTRY PLUG.

Telegraphers Unjustly Accused and Characterized.

TO THE EDITOR OF THE TELEGRAPHER.

IT is a good time to think to-day, for the lines are all down, and I have only heard a faint click on my instruments once or twice during the day. I have sat here alone so long with no company or business, listening to the driving winds and rain as it rushes through the icy tree tops, that I feel (how shall I express it; blues don't begin) as though I would like to be at home, sitting in the little corner hack of the stove, with the old cat on my knee. (I'll warrant he don't get much petting now). How cosy it looks. I think most any one would appreciate the picture if they could only look with me out of my little window and see nothing but trees, with not even the smoke from some straggling chimney in sight. Having nothing much to do I have been reading THE TELEGRAPHER, and since laying it aside I have been wondering whether anything I could say would entertain or give any one as pleasant thoughts as the communication over the signature "Melville," in your first issue of the New Year, has given me. It seems good to hear once in awhile that there are some who think there is still some chance of operators escaping from the charge of total depravity. I should think, from some of the communications in the last four or five numbers of our paper, that the writers had been getting in very bad company by the way they depreciate the whole fraternity. (I have heard it said that "birds of a feather will flock together.") Let us have a rest on the moral and social standing question, and if some one must be abused, take some other profession, by all means. If we don't respect ourselves the public won't, surely. N. R.

Practical Suggestions.

MICHIGAN, January 14.

TO THE EDITOR OF THE TELEGRAPHER.

HEARING my brother operators around me making suggestions, and good ones, too, I think I will make at least one. It is this: That we be more careful in future, in sending messages, to put in the periods, and when necessary, even the commas. I have received not a few messages which could be read two ways; either way with equally as much sense as the other. Now, by inserting the period, the message would be made to read with a definite meaning. The party receiving may be expecting the message, and thus be able to read it with the true meaning, while again it may be an enigma to him, and possibly cause serious trouble, all from the omission of that little period. Let us hear your opinion upon the subject. SENTINEL.

Phenomena of Induced Currents.

THE induction current is very generally employed, as is well known, in the stimulation of nerves and muscles. A new fact in this connection has been pointed out by Mr. Onimus, and is worth noting by physiologists. It is that the physiological effects differ according to the material of which the wire is formed. He made exactly similar coils of copper, lead and German silver wire, of 210 metres in length and of equal diameter. They were submitted in the same way to the action of the inducing current. It is stated generally, that when the wire for the induced current is of a metal that conducts electricity badly, the contractions are much stronger, and the impressions on the cutaneous nerves less vivid than with good conducting wires, such as copper. The current induced in the badly conducting wires has much greater tension than that in good conductors. Various experiments are described, which appear to show that German silver may with advantage be substituted for copper wire in certain cases.—*English Mechanic.*

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, JANUARY 24, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS OF THE

Telegraphic Fraternity and the Advancement of Electrical Science and the Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of THE TELEGRAPHER will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME OR EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Arguments in Favor of and Against a Telegraphic Monopoly.

EVER since, in the progress of events, it became evident that comparatively short telegraph lines and small telegraph companies must be superseded by systems which should practically be national in their character, there has been a persistent effort to establish and maintain a monopoly of the telegraph business of the country. The Western Union Telegraph Company is the outgrowth and result of this effort. The policy of absorption and consolidation of opposing and competing telegraph lines and companies has been steadfastly pursued, and line after line, and company after company has been brought into that organization, until it has become the largest and most powerful telegraph organization in the world. The purpose of its managers past and present to make it practically a monopoly has neither been disguised nor denied.

It cannot be denied that the arguments in favor of such a monopoly have much weight, and that certain important advantages may be secured thereby. It is claimed that one organization can conduct the business more economically than if it be as now and heretofore carried on, by two or more organizations, covering the same territory, with opposing interests and duplicate offices, employes and officials. This is undoubtedly true, and if the interests of stockholders were alone to be consulted the argument must be decided in favor of the monopoly. But besides the interests of proprietors those of the public who are not owners of telegraph shares, and who patronize the lines, and of the employes who depend upon telegraph employment, are to be considered. The advantages to be derived are, in our opinion, more than offset by the disadvantages to the two classes above mentioned. While the business would perhaps be more profitable, experience has shown that the public would find in an established telegraphic monopoly less regard for the interests and convenience of its patrons than when these have the option of employing its facilities, and, if dissatisfied with the manner in which its business is conducted, of transferring their patronage to a competing line. The important reductions of charges for telegraphic service are unquestionably due in great part to the existence of rival organizations. These may and probably have been of late more or less influenced by the urgent attempts which have been made to transfer the entire business to Government ownership and administration, but this has had less effect than the other cause mentioned.

As regards the employes, there can be no doubt but that their condition and compensation is influenced favorably by the existence of telegraphic competition, and the fact that they have to some extent a choice of employers. It creates a rivalry for the service of the better qualified among the employes, and enables them to secure far better terms than if there were but one organization to which they could apply for employment.

Another argument which the monopolists urge is, that one organization being more wealthy and powerful than if subject to competition, it would be enabled to afford more complete and extensive facilities, and better provide for the expansion and growth of the business. This argument, too, is not without force, abstractly considered, and if we had reached that millennial period when men, and aggregations of men into corporations, should seek not merely their own but their neighbors' profit as well, would have much more force than under existing circumstances and conditions. The object for which telegraph as well as other corporations are established is primarily to make a profit from the business transacted. These will extend and expand only so fast and so far as may be necessary to secure a profit on their business. Monopolies are seldom as energetically managed as when they are subject to the spur of active competition, and, provided the balance sheet is all right, and the dividends satisfactory, there will be but little effort to provide facilities which involve the investment of additional capital, perhaps not immediately remunerative. A telegraphic mo-

nopoly once assured, there would be a hesitancy about extending lines and increasing facilities which does not now exist.

The foregoing are the arguments which are principally relied upon to justify the establishment of a monopoly of the telegraphic business of this country in the hands of the Western Union Telegraph Company. That they are plausible is admitted—that they are fallacious we think has been demonstrated. It is not for the interests of either the public or the employes that the efforts which are made to establish such a monopoly shall succeed, and we do not believe that they will succeed. The genius and character of the American people is opposed to monopolies, and especially to a telegraphic monopoly, and there is no doubt but that if every existing competing telegraph line and company should be absorbed into the Western Union organization, the means would be speedily furnished to establish new ones.

We have just seen one of the leading competing telegraph organizations consolidated with the Western Union, and already plans are being perfected to cover the routes formerly occupied by that company, on which there are now no competing lines. So would it be if the others were to follow the Pacific and Atlantic into that mausoleum of telegraph organizations—the Western Union Telegraph Company.

The true policy of the companies outside of the Western Union combination we have pointed out time and again, and the opportunity is now presented for the adoption of this policy. It is the only safe one, and the only one by which an organization capable of competing effectively and successfully can be established. It is to follow the example of their adversary and consolidate the several companies into one organization, under one management, and then extend the system until, like the Western Union, it becomes general and national. The interests of investors, the public and the telegraph employes demand this, and if it is not done, those who are responsible therefor will be very much to blame. We believe that it only requires that some responsible parties should take the lead, and it can and will be effected, now that the principal obstacle, the Pacific and Atlantic Company, is out of the way.

The railroad companies, to whom the telegraph under their own control and management has become almost indispensable, are deeply interested in the matter, and may very well take the lead in such a consolidation. Any telegraphic monopoly is adverse to their interests, and would inevitably subject them, once established and assured, to burdens and restrictions of which they have had during the continuance of the Morse patents some experience. So much greater as their telegraphic interests are now than they were then, so much more onerous would they find the reestablishment of the control of a telegraphic monopoly. They should be wise in time, and at once move in this matter of such great importance to them.

Discouraging Experience of a Friend of The Telegrapher.

A COMMUNICATION from a friend of THE TELEGRAPHER, which we print this week, details some rather discouraging experience in soliciting subscriptions for this paper. This is but a sample of many such statements which we receive on this subject, and we print this to show the frivolous character of many telegraphers, and of the excuses and evasions resorted to for the purpose of avoiding contributions to the support of the organ of the telegraphic fraternity.

It is true, as stated by our correspondent, that we are endeavoring earnestly to secure the elevation of the character and standing of the telegraphic fraternity. It is also true that the progress made in that direction is slow, and our experience somewhat discouraging. Yet we believe that the influence of THE TELEGRAPHER is beneficial, and that the information and instruction which it is constantly imparting is of much value, and increasing the efficiency and professional ability of its

readers. Were it not for this the labor and responsibility imposed would indeed be poorly compensated.

In the last issue of THE TELEGRAPHER we briefly referred to this subject, and do not know that there is much to add to what was then said. There are but few telegraphers who cannot, if they desire to do so, afford the small sum of two dollars per annum for the weekly visits of the paper, and, without intending to be egotistical, we think we may properly claim that they receive many times the value of their investment during the year. The excuses and evasions made are not creditable to those who make them, and show either gross ignorance and incapacity, or that they are more inclined to devote their money to sensual gratifications than to that which will improve them in the profession through which they seek to obtain a living.

There is another view of the matter which is worthy the consideration of such persons. The better qualified they become, and the more intelligence they exhibit, the better will be their chances for promotion and compensation. The complaints of insufficient compensation are, in many instances, not just. Probably a majority of those who thus complain actually receive fully as much compensation as their ability and acquirements entitle them to, and in many instances much more than they could receive in any other capacity. We desire that all telegraphers should be properly compensated, and it is to be regretted that the evil effect of the employment of incapable and insufficiently instructed operators is not limited to themselves. They not only injure themselves, but they give to the fraternity, generally, a low standing, and too often the whole are judged by these inferior members. This is not just, perhaps, but it is unavoidable. If the business was relieved from the incubus of their presence it would be greatly to the advantage of all who are worthy the name of practical telegraphers.

We do not make these remarks so much in the interest of THE TELEGRAPHER as in that of the fraternity. As we have before stated, it is the right of any person whose support for this paper is solicited to decline it, but let them put it on the true ground, and not pretend that impecuniosity is the cause, while they weekly or monthly squander much more than the amount of the subscription in things not only of no benefit, but most frequently of actual damage to them.

True Worth.

SOME excellent and timely remarks upon the above subject appeared in the last number of our official contemporary, after reading which we feel compelled to say that, while no well informed person for a moment supposes they can have any practical application under such a perfectly organized system of civil service as that now in force at the Western Union headquarters, yet there is, nevertheless, much reason to fear that the injudicious publication of articles of this kind may afford opportunities for evil minded persons to insinuate that some deeper signification is intended than is at first sight apparent, which would, to say the least, be a very unfortunate circumstance, and one eminently calculated to make the judicious grieve. At the same time, there is so much sound philosophy and undeniable truth in the observations of our contemporary that we feel that it would be an injustice to our readers not to reproduce them. They are as follows:

"A really modest and meritorious person will never make pretensions of any kind. His manner and expressions will always have a tendency to underrate his real ability, not because he will pretend to be less capable than he really is, but as so many men have become pretentious in their manners and expressions, he fears he may be considered as such. We are, in consequence, too apt to consider the extent of the capacity of those whom we meet a little below the standard indicated by their acts and expressions. Therefore, true merit is seldom properly appreciated, and its cultivation is never greatly encouraged. On the contrary, pretence is almost always successful. He who is pretentious affects the interests of society in a similar manner as the swindler. He induces men to doubt the capacity of others, and often refuse aid and employment, because they measure the merits of all by those

of the pretentious fop and the conceited ignoramus. Many an honest and skilful man, and many a valuable improvement, has been refused support and adoption because the pretentious swindler has previously misled the people and imposed upon them outrageously. Pretensions of every kind are the true indications of a weak mind or a would-be swindler."

A Destructive Sleet Storm.

THE recent storm was very severe in Central and Southern Ohio, and the telegraph lines suffered greatly. Ice formed on the wires nearly two inches in diameter, with icicles depending therefrom from two to six inches in length. Immense numbers of poles were broken off, and where the poles withstood the strain the arms and brackets were stripped off by wholesale. On the Marietta and Cincinnati R. R. not one of the three wires was left in working condition for half a mile in any one place, for a distance of fifty miles. The oldest wire of the three was broken, as a correspondent remarks, "in 1,000,000,000 places by actual count," and is to be replaced by a new one. Such storms often do good service by annihilating a great many lines that have outlived their usefulness, but are in the disheartening condition of not being good enough to work, and a little too good to throw away. From the accounts of the storm which have reached us, we think it probable that there are not many of that sort of lines left in southwestern Ohio at this writing.

A Chance for a Little Civil Service Reform.

THE inventors of the country are under the greatest obligations to Commissioner LEGGETT for the many reforms and improvements he has introduced into the patent office, and especially for the tasteful and convenient manner in which not only the patents themselves, but the official reports and decisions are gotten up, and the means provided for obtaining them with the utmost promptness and the smallest amount of trouble and expense. But "if not inconsistent with public interests," as they say in Congress, we do wish that the Commissioner would try and get a person who has at least had an introduction to Webster's elementary spelling book in place of the present official who prints the titles of the inventions on the photo-lithographic drawings attached to the patents. According to his orthography the Page patent is for "Indiction Coil Apparatus and Curcuit-Breakers," and we also observe that Mr. Farmer has a patent upon "Electro-Magnetic Telegraphs." Give him a cold potato and let him go.

The January Magazines.

THE INDUSTRIAL MONTHLY.

THE January number of this handsomely printed and well conducted publication has reached us, and is one of the most valuable of all our exchanges. We reproduced some of its articles in another part of this paper. The present number is illustrated with two handsome chromo-lithographs of machinery. One excellent feature of the *Industrial Monthly* is the publication of a list of all the articles of any importance appearing in the current industrial literature of the world, by means of which any one who is only interested specially in one particular branch of science may ascertain whether any one of the scientific periodicals of the month contain anything of value to him without being obliged to take them all. For our own part we consider this feature alone worth the price of the whole work which is only \$1.50 per year. The publication office is at 176 Broadway, New York City.

Telegraph Poles.

THE great and increasing demand for telegraph poles in this country, and the constant and rapid decrease of available timber has made them difficult to obtain and increased their cost. With the opening of spring telegraph construction will be resumed, and we therefore render a service in calling attention to the advertisement of Mr. COLBY, of Toronto, Canada, who offers to

furnish first rate cedar poles at reasonable prices, delivered at the Lake ports.

We know Mr. COLBY, and have no hesitation in recommending him to the consideration of those who may need telegraph poles, who can deal with him with confidence that he will furnish a good article, and that what he contracts to deliver they may rely upon obtaining.

History of Postal Telegraph Schemes.

ATTENTION of parties interested is called to the advertisement of the documents published by the government, telegraph companies and others during the last six years in connection with the schemes for a postal or government telegraph. This offers a rare opportunity to obtain a complete copy of all these documents.

Numbers of Volume IX wanted.

WE are very much in want of a few copies of Nos. 342 and 351 of Vol. IX of THE TELEGRAPHER, to complete files. Any person who may have either of these numbers to spare will confer a great favor by sending them to this office.

Personals.

Mr. HENRY VAN HOEVENBERGH has been appointed Assistant Superintendent of the Gold and Stock Telegraph Co., in charge of all printing instruments and wires connected with the New York Commercial News Department.

Mr. W. W. BURHANS, lately in the employ of the Pacific and Atlantic Telegraph Company, New York, has accepted the position of night manager of the Washington, D. C., office of the Southern and Atlantic Company.

Mr. C. R. DART has resigned his position with the Atlantic and Pacific Telegraph Co. at Troy, N. Y., and gone to California for his health.

Mr. E. P. MCMANUS has resigned his position with the Franklin Telegraph Co. at Washington, D. C., and retired from the business.

Mr. WM. GARLAND has accepted a position with the Atlantic and Pacific Telegraph Co. at 198 Broadway, New York.

Mr. M. C. GROSS formerly with the Pacific and Atlantic Co., Chicago, Ill., has accepted a situation with the Atlantic and Pacific Co. in that city.

The Telegraph.

Telegraphic and Electrical Brevities.

THE Western Union and Arizona Military Telegraph offices were yesterday opened in their new quarters in Josse's brick building, corner D and Fifth streets. Under the competent direction of Manager Smith the rooms have been conveniently fitted up, and there is no neater telegraph office in the country than that of San Diego. The public will be perfectly accommodated, while the operating room, battery room, etc., afford ample space for the business of the lines. The location is a very fine one, and is generally satisfactory. —*San Diego (Cal.) Union.*

The unfortunate Spanish frigate *Arapiles*, which has been detained so long at the Brooklyn Navy Yard, and which has met with a series of misfortunes somewhat discouraging to her officers and crew, while passing down the East river, dragged her anchor and tore up and damaged the seven wire cable of the Gold and Stock Telegraph Company, which is laid from the foot of Jackson street to Brooklyn.

Hooper's Telegraph Works have received the following message from Mr. France, their engineer in chief, announcing the successful laying of the Pernambuco-Bahia section of the Western and Brazilian Company's cables: "Cable successfully laid on the 11th of December. Insulation superb. Start from Rio about the 25th."

The Quotation and District Telegraphs in England.

THE managing director of the Exchange Telegraph Company in London gives notice that the company will give daily at about 4 P. M. the "opening prices" on the New York Stock Exchange of a few of the leading stocks and shares, the rate of exchange, price of gold, and the general tone of the market; as also special extra messages, should circumstances render such necessary. He also announces that, "among

other things, we are introducing the 'call system,' as now worked at New York, by which householders can call a messenger, cab, medical man, police, or give the alarm of fire, and so soon as the system is worked out, it will be started in the metropolis; in the meantime we are giving it free to our subscribers on the Stock Exchange, for the purpose of calling members from the House to their offices."

The Concession for a Telegraph Cable between Peru and Chili.

THE Lima, Peru, correspondent of the *Panama Star and Herald* writes, under date of Dec. 20th, 1873, that on the 18th instant a decree was made public by the Minister of Public Works granting permission to Mr. Charles Scott for the construction of a submarine cable between Callao and some port to be named in Chili. Mr. Scott is the representative of the India Rubber, Gutta Percha and Telegraph Works Company of London, and offers to lay the cable without special privilege or guarantee of any description, within the term of eighteen months from date. The port to be selected in Chili will probably be Caldera, from whence a land line runs to Valparaiso and thence across the Cordilleras to the Argentine Confederation. When we have Mr. Scott's cable and that between Payta and Panama in operation, it will be an easy matter for the inhabitants of Buenos Ayres and Montevideo to wire their greetings *via* Santiago de Chili and Lima to friends in the old world. Owing to the malevolence of a discharged employe, the wires were cut between Payta and this city, and the first intelligence of the attitude assumed by the United States towards Spain in the Virginius question, reached us with the steamer Lima on the 17th instant.

Irregularities of the West India and Panama Cable.

MANY complaints have reached us lately of the great delay in the transmission of messages by West India cable. We have heard of three instances within the past week in which messages from the United States were so long delayed as to be completely worthless when received. Some with business orders for return steamer from Aspinwall were not delivered till long after the steamer had sailed thence. We have similar complaints of messages from this coast to New York. Such management on the part of the company or companies is inexcusable. When the cable is broken, or not in working order, the fact should be made public immediately; and when delay is deemed unavoidable, the time of delay likely to occur should be given, otherwise the companies should be obliged to refund the cost of all messages kept back beyond a due time. The management of the cables between Jamaica and the United States has ever been such as to render them an annoyance more than a benefit to those patronizing them. It is high time some steps were taken to remedy the evil.—*The (Panama) Star and Herald.*

The Patent Congress.

A CONVENTION of patentees and persons interested in patents and patent inventions was held in Washington, D. C., last week, which was numerously attended. This Convention was in response to the recommendation of the International Patent Convention, held at Vienna during the International Exposition. The difficulties and disadvantages experienced by American inventors in foreign countries in their efforts to secure protection were discussed, and it was resolved to hold a grand International Patent Congress at Philadelphia during the Centennial Celebration in 1876.

Resolutions were adopted declaring that the production of inventions should be guaranteed by the laws of all civilized nations, and that a patent should be granted for a term of 17 years, with a privilege of extension for the benefit of the inventor or his heirs for a further term of at least seven years. A resolution was submitted recommending that Congress make use of the surplus fund of the Patent Office now in the United States Treasury for the erection of a suitable building in Judiciary Square, for the exhibition of the models of inventors. This fund is over \$1,000,000.

A permanent organization was formed, and it was recommended that State associations be organized. The following officers were elected: John S. Perry, of Albany, President; Dr. C. F. Stansbury, of Washington, Secretary; Hon. J. M. Thatcher, of Washington, Treasurer. Directors: T. A. Dodge, Massachusetts; C. P. Kimball, Minnesota; G. H. Christy, Pennsylvania; N. R. Graham, Illinois; N. C. Stiles, Connecticut; C. E. McDonald, Indiana; J. S. Boyle, Ohio; H. G. Bulkley, New York.

In one of the county schools in England the art of telegraphing is taught to the children with much success. The Postmaster General approves of the scheme, and is highly pleased at its adoption.

A telegraph messenger boy got his despatches mixed the other day, and handed a jockey a telegram which read, "Can you supply our pulpit next Sunday?" And to a well known clergyman a despatch which read, "The race is postponed till Monday. Can't you come down and spend Sunday?"

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended December 30, 1873, and bearing that date.

No. 145,997.—TELEGRAPH INSULATOR. Christian Fox and Elisha G. Heston, Gap, Pa. Application filed August 20, 1873.

An annular glass insulator, slotted in its upper face for the wire, fits over a stud and rests upon a shoulder on the supporting bars. A shed cap screws down upon the stud.

The combination of the nut-like cap C with its sheltering base to cover, clamp and protect the annular slotted insulator G B, when the latter rests upon the shoulder a, and the former receives the screw end D of a vertical shaft or support, A, the whole arranged in the manner shown, for the purpose set forth.

HISTORY OF POSTAL TELEGRAPH SCHEMES.

The important documents on this subject published by the Government, the telegraph companies and others, during the last six years; well bound; in one volume, of over 1,000 pages. One copy for sale.

Price, \$10.

Address, "THE TELEGRAPHER."

WANTED.

Wanted to know the whereabouts of ROBERT McCALLUM. Was operating on the B. and M. R. R. when last heard from. Any one knowing him, or having seen him during the past three years, will please communicate with his brother, ALEXANDER McCALLUM, Mendocine City, California, and by so doing will confer a great favor.

EUGENE F. PHILLIPS,

MANUFACTURER OF

REED & PHILLIPS'

PATENT INSULATED TELEGRAPH WIRES,

(PATENTED, NOVEMBER 18TH, 1873.)

Lock Box 169. PROVIDENCE, R. I.

Having recently enlarged our factory, we are now prepared to furnish at short notice any style and quantity of

BRAIDED LINEN or COTTON COVERED WIRE,

saturated and finished with our Patent Compound, which makes the most durable, handsome and best insulated Braided Wire manufactured.

PAINTED, PARAFFINE or SHELLAC WIRES

also furnished at the lowest prices. Iron or Compound Wires covered upon reasonable terms.

We are also prepared to furnish a new style of

ELECTRIC CORDAGE,

which has been pronounced by all superior to any in the market.

The American District and Gold and Stock Telegraph Companies have been supplied from my works with a greater portion of the office wire used by them.

Sample Card and Price List furnished when requested.

Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The Electro-Mechanical Gong Striker,
for house and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the
original FARMER & CHANNING PATENTS, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, THREE
CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its in-
troduction into their localities is cordially invited, and
their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that
will work practically with a single DANIELL cell, a BATTERY
that does not require to be taken down but once a year, and the
very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.
Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. BOX 496.

American Compound TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
 No. 434 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR

GEO. W. STOCKLY,

Sec'y and Treas.,

No. 4 LEADER BUILDING,
CLEVELAND, O.

DR. L. BRADLEY,
 No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1/800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1/150th to the 1/300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,

PATENTED APRIL 8, 1873,

L. G. TILLOTSON & CO., Sole Agents,
No. 8 DRY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS

for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any attention whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

L. G. TILLOTSON & CO.

8 DRY STREET, NEW YORK,

SOLE AGENTS.

BALTIMORE,
MANUFACTURERS OF
ELECTRICAL AND TELEGRAPH INSTRUMENTS

AND

Material of Every Description,

RELAYS, KEYS, SOUNDERS, COMBINATION SETS, &c., &c.

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,

Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK, }
Sept. 22d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,

A. S. BROWN, Manager.

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.

Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

PARTRICK, BUNNELL & CO.'S
CHAMPION LEARNERS
AND
SHORT LINE TELEGRAPH APPARATUS.

A GREAT IMPROVEMENT

over all Instruments of the kind ever offered for this purpose, consisting of a

No. 1 SOUNDER AND KEY COMBINATION SET,
AN EXCELLENT BOOK OF PRACTICAL INSTRUCTION IN
TELEGRAPHY,

OFFICE WIRE, CHEMICALS, ETC.,

making a complete arrangement for one office.

The Instruments are full sized, complete in every respect. The Battery is a full sized first class Callaud cell, and the entire outfit has nothing about it which in any way resembles the many wretched affairs which have been extensively sold as Learners' Apparatus.

Great numbers of our "Champion Instruments" are in use upon short private lines, and upon City wires of Telegraph Companies, where they are giving the greatest satisfaction, on account of their very substantial make and excellent working qualities.

We guarantee them to be in every respect better than any form of Learners' Apparatus or Short Line Instruments ever offered to the public.

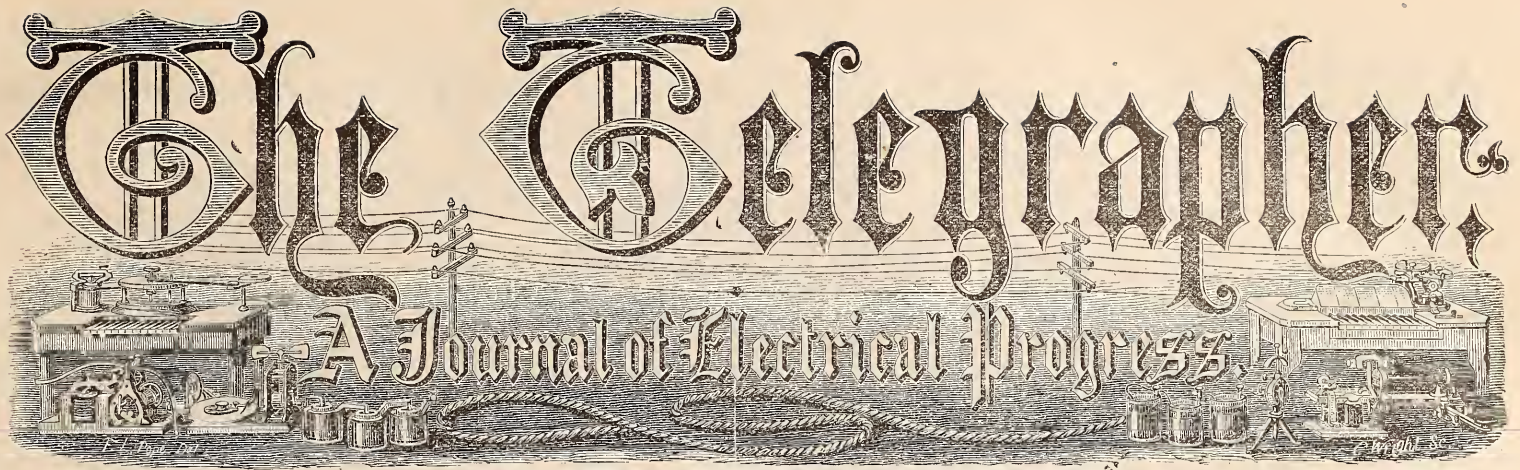

Price of Apparatus, complete, with Book of Instructions, Battery, Wire, and all necessary materials for one complete office outfit, ready for shipment, sent C. O. D., \$10—or, if money order sent for the amount, \$9.50. The latter plan will additionally save the purchaser the express charges for the return of money.

Price of Single Instrument, good for one mile or less, without Battery.....	\$8 50
Ornamental style ditto, with rubber covered coils, without Battery.....	10 00
Single Instrument, good for working a line from one to twelve miles.....	9 50
Ditto, ornamental, with rubber covered coils.....	11 00
Battery, per cell.....	1 50

TELEGRAPH SUPPLY AND M'FG CO.,
 No. 4 LEADER BUILDING,
CLEVELAND, O.

CHARLES WILLIAMS, JR.,
 (ESTABLISHED 1856.)
 109 Court Street, Boston,
 has for sale the various kinds of Office and Magnet Wires, in-
 cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

COVERED WIRES,
 Made from Lake Superior Copper, warranted strictly
 pure, covered with Hemp, Flax, Linen, Cotton, Silk or other
 material, for Telegraph Instruments, Electro-Magnetic Machines,
 Philosophical Apparatus, and all kinds of Electrical Purposes.
 Also, **PLAIN, WOVEN, ENAMELLED, SHELLACED,**
PARAFFINED, and all kinds of

TELEGRAPH OFFICE WIRES.
 Also, **Telegraph Switch Cords,**
 many Patterns, Plain, Woven and Braided. Parties being partial
 to any particular kind need only enclose a small specimen in a
 letter and it can be imitated in every particular.
CONDUCTING CORDS, POLE CORDS, TINSEL.
C. THOMPSON,
 (SUCCESSOR TO JOSIAH B. THOMPSON.)
 29 North 20th St., Phila., Pa.

JOSEPH MOORE & SONS,
 (Established 1820.)
535 & 537 CHINA STREET,
 (Below Green St.) **PHILADELPHIA, Pa.,**
 MANUFACTURERS OF
INSULATED WIRES.
 OFFICE WIRE—Plain, Braided, Prepared, &c.
 INSTRUMENT WIRE—Cotton and Silk Covered, &c.
 FLEXIBLE CORDS, all kinds, &c., &c.

We warrant all Wire to be of the highest conductivity, tested
 by our Galvanometer, which compares with the tests of the
 highest authority in this country.

REDUCTION OF PRICES.
POPULAR, EXCELLENT and ECONOMICAL.
THE NONPAREIL
TELEGRAPH APPARATUS,
 For **AMATEURS, STUDENTS and SHORT LINES.**

Since the introduction of this *Pioneer Low Priced Telegraph In-*
strument, a little over a year and a half since, nearly 2,000
 have been sold, and they are constantly more and more sought
 after.
 Hereafter we shall furnish them at the following popular rates:
 Single Instruments, including Three Cells Battery, Con-
 necting Wire, Chemicals and Instruction Book..... \$6 50
 Two sets of Instruments, etc..... 12 00

SEND FOR CIRCULAR.

TELEGRAPH POLES.
 Parties who are in want of good
CEDAR TELEGRAPH POLES,
 can obtain them on favorable terms, and have them delivered
 at any Lake Port between Oswego and Chicago, on the
 opening of Navigation, by applying to
A. A. COLBY,
 P. O. Box 1,376. TORONTO, ONTARIO,
 CANADA.

A NEW GALVANIC BATTERY.
Durability, Efficiency, and Economy of Expense
and Labor at last Secured.
THE EAGLES METALLIC BATTERY.
 PATENT APPLIED FOR.
 The undersigned having secured the exclusive Agency for the
 manufacture and sale of the

EAGLES METALLIC BATTERY,
 now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.
 The Battery cell is made of lead, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.
 These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.
 Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.
 On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.
 No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to

THE AMATEUR'S
 TELEGRAPH APPARATUS.
 (Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished
ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
 and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

**A COMPLETE OUTFIT FOR A TELEGRAPH OFFICE,
 Seven Dollars and Fifty Cents.**

Two Sets, complete.....\$14 50
 Sounder and Key only.....6 50
 " " with Cut-out and Lightning Arrester... 7 50

We will pay expressage on Amateur Outfits when price is remitted in Advance.

SHAFFNER'S
 TELEGRAPH MANUAL.

TO TELEGRAPHERS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
 78 and 80 Broadway,
 NEW YORK.

MODERN PRACTICE OF THE ELEC-
 TRIC TELEGRAPH.

A HAND-BOOK
 FOR
ELECTRICIANS AND OPERATORS.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
 ONLY MANUFACTURER
 OF
PURE GUTTA PERCHA GOODS
 IN THE
UNITED STATES.

Has also on hand, and makes to order,
**SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,**

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fuse Wires, Leading and Connecting Wires for **SUBMARINE
 AND MINING PURPOSES.**

Also, a **NEW COMPOUND** (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.
 Gutta Percha and Cotton covered Wires for **HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.**

Has on hand and makes to order
**SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,**
 AND FOR
BLASTING AND MINING PURPOSES.
 In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors **GUTTA PERCHA** has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
 to make and deliver at his Factory any style of Cable. Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

**SARGENT & STUDLEY, 26 Park Place,
 RUBBER CLOTHING CO., 363 Broadway,
 D. HODGMAN & CO., 27 Maiden Lane,
 SHEPARD & DUDLEY, 150 William St.**

The Elementary Principles of Electrical Measurement.

BY FRANK L. POPE.

(Continued from page 13.)

Geometrical representation of the Phenomena of the Voltaic Circuit.

THE mathematical relations which have been shown to exist between the electro-motive force, resistance and current in a voltaic circuit, and which are expressed by Ohm's law, may also be graphically represented to the eye by geometrical projection—a process which often materially assists the student in forming a correct conception of a subject.

Let the resistances in any given circuit be laid off on a horizontal line, A B, figure 3, by means of a scale of equal parts. In the same manner let the electro-motive forces be laid off on the line A C, drawn perpendicular to A B, and let the latter line also indicate the zero of potential. A battery of 5 Daniell cells is represented in figure 3, the zinc and copper plates *z* and *c* being represented at such a distance apart as to correspond to an internal resistance of 2 ohms per cell. Let the total resistance of the circuit be 20 ohms, which will be represented by the length of the line between A and B. The total resistance within the battery is shown by the length of the line A D, and the resistance exterior to the battery by the length of B D.

Each of the five divisions of the line A C represents an electro-motive force of 1 volt, which, in this case, we will assume to be exactly equal to that of 1 cell, the total electro-motive force included in the circuit being 5 volts.

We have then in figure 3 a battery of 5 cells, each cell having a resistance of 2 ohms and an electro-motive force of 1 volt, and the copper pole of this battery is connected to an insulated conductor, B D, having a resistance of 10 ohms.

Now, let us suppose that the zinc or negative pole of the battery is connected to the earth at A, and that the opposite end of the conductor at B is insulated, or, in telegraphic parlance, "left open." In order to represent the difference of potential at every point of an open circuit, such as that under consideration, we must construct a line which may be termed the *line of potential*. The perpendicular height of such a line above the line A B, at any point, will indicate a corresponding difference of potential between that point and the line. In the present case this will be a positive potential.

As the first zinc plate at A is connected directly with the earth, which is assumed to be the zero of potential, as we have already explained, its potential must also be zero. But the first cell contains an electro-motive force equal to 1 volt, which we will, for convenience, assume to be situated at the junction between the zinc plate and the solution in which it is immersed. As will be seen by the dotted line in the figure, at each junction of the zinc with the liquid the potential rises 1 volt, attaining in the fifth cell a potential of 5 volts. But the whole of a perfectly insulated conductor, whatever may be its length, acquires the same potential as the pole of the battery to which it is attached, and, therefore, the potential of the line B D is equal throughout.

Next, let us take the same battery and conductor, and connect the end of the conductor B to the earth also, the latter, of course, having no appreciable resistance. The distribution of potentials throughout the whole system is now changed, and becomes as shown in figure 4.

Both ends of the circuit have now a potential of zero, and the potential decreases regularly from the last cell of battery at D to the earth connection at B. It will be seen that the potential line falls or decreases within the cells of the battery just as it does on the line. The steepness of this line represents what Ohm termed the *electric fall*. The degree of steepness represents accurately the strength of current in the circuit. If the units of resistance in A B, and of electro-motive force in A C, are laid off to the same scale, as is the

case in the above diagrams, a current of 1 farad per second would be represented by a line of potential leaving an inclination of 45°. It really has an inclination of just one fourth this, or 11¼°, showing that the current in such a circuit would be one fourth of a farad per second, which we find by Ohm's law to be the case, for

$$E = 5 \text{ (volts.)}$$

$$R = 20 \text{ (ohms.)}$$

$$\text{and } \frac{E}{R} = \frac{5}{20} = \frac{1}{4} \text{ farad (per second).}$$

Figure 5 shows the same battery placed on short circuit—its poles being connected together by the earth, a conductor of infinitely small resistance. In this case the potential rises 1 volt in each cell, as in the two previous examples, and the maximum potential is found at the junction of the zinc plate and the solution. In this case the line of potentials is much steeper, indicating that a much stronger current flows through the circuit. The inclination is in fact 22½°, or twice as great as before, corresponding to a current of one half

FIG. 3.

a farad per second. As before, we find by Ohm's law that this ought to be the case, for, we now have

$$E = 5 \text{ (volts.)}$$

$$R = 10 \text{ (ohms.)}$$

$$\text{and } \frac{E}{R} = \frac{5}{10} = \frac{1}{2} \text{ farad (per second).}$$

It is proper to state that the best authorities now consider that the change of potential which denotes the existence of an electro-motive force, does not actually take place at the junction of the zinc plate with the solution, as has usually been supposed, but at the junction of the *metals*, between two cells of the

FIG. 4.

battery. This is in accordance with what is called the *contact theory of galvanism*, the truth of which appears to have been verified by experiments of a most convincing character.*

Phenomena produced by the Voltaic Circuit.

Having now defined our units of measurement, we will next consider how they are to be used. We can only perform electrical measurements by observing the effects of the electric current itself. These are exhibited in three different forms, viz., *heat, chemical action and magnetism*.

1. *Heat*.—When the two poles of a voltaic battery are connected by a thick wire having no sensible resistance, through which the current passes, the wire is

FIG. 5.

not perceptibly heated. Heat is actually developed by the oxidation of the zinc, but in this case it is confined to the battery itself. If, however, we substitute for the thick wire one which offers considerable resistance to the current, the wire will be heated, and if properly selected with reference to the quantity of electricity generated in the battery, may be raised even to a white heat.

* Fleeming Jenkin's *Electricity and Magnetism*, pp. 43 to 48.

The total amount of heat generated by the oxidation of a given weight of zinc is always absolutely the same, and is, therefore, strictly proportional to the current, or rather the square of the current or quantity of electricity which traverses the circuit, but it may be distributed in various proportions between the battery and the external circuit. These facts were established by Joule, who carefully collected and measured the amount of heat developed in a circuit under known conditions. This method of electrical measurement is seldom if ever used in practice, as others, hereafter to be explained, are vastly more convenient.

2. *Chemical Decomposition*.—When the voltaic current traverses a compound liquid conductor instead of a metallic one, the liquid is in many cases decomposed. This fact was discovered by Nicholson and Carlisle in 1800. Faraday devised an apparatus called a *voltmeter*, by means of which he proved that the quantity of liquid decomposed in a given time is absolutely in proportion to the quantity of electricity traversing the circuit. The voltmeter consists of a graduated tube, by means of which the quantity of gas generated in a given time is collected and measured. This instrument is found very useful in certain classes of measurements.

3. *Magnetism*.—When the voltaic current traverses a conductor, passing immediately in the vicinity of, and parallel to a freely suspended magnetized needle, as of an ordinary compass, the needle will be deflected, and will tend to assume a position at right angles to the direction of the current. This fact was discovered by Oersted in 1820. The greater the magnitude of the current the more nearly will the needle approach a position at right angles to the conductor. It is found, when proper precautions are observed, that the angles of deflection of the needle, under the influence of a voltaic current, are strictly proportional to the quantity of electricity passing, and such a needle, therefore, becomes the most convenient instrument for measuring or comparing the strength of different currents.

As the methods of measuring a current by its magnetic effects are by far the most generally available for practical use, the remainder of this treatise will be confined entirely to their consideration.

[To be continued.]

[From *The Ghost*.]

All About Us.

It is a common grievance, among men of all classes and conditions, all trades and professions, that, periodically, some one who has no personal knowledge of the matter, casts about him for information concerning their business, and then proceeds to print, with an amplification depending altogether upon the fertility of the writer's imagination, his second hand facts and first hand fancies. Meddling with tools of which one does not know the proper use, and skating on thin ice, are perilous pastimes. When the Rev. T. De Witt Talmage, not content with writing a book, saw fit to pretend to a knowledge he did not possess, he consequently came to be thought an ass by a large class of very intelligent men. We allude to the printers, who were offended at his implied familiarity with their business. He indulged in the hope, in the preface to his work, that some erring sister, some faltering brother, etc., might be, through its influence, won back to a purer life, for then he should not regret that his *manuscript had been caught up on the sharp teeth of the type*. Whether Mr. Talmage thought, because 'types are sometimes placed in a way that bites, that they have a full set of incisors, bicusps and molars, or whether he fancied that there was something thrilling in the idea of his manuscript being "chawed up," as there was in reality about his book being so disposed of on its appearance, we cannot state, but in any event there is no denying that the remark was silly and the figure as outrageous as could possibly have been introduced. And so it often occurs in treating of other subjects. Our own business is not often "written up," as the phrase is, and for that we may be thankful, but when it is we find ourselves glaringly misrepresented, and our manner of filling our place in the business economy of the country provokingly disturbed, the same as those of other professions whose cases are taken in hand and disposed of by that regular patron of free lunches—whose prejudice against clean linen is only equalled by his predilection for gin cocktails—the "penny-a-liner." In a New York Sunday paper of Jan. 8th the appended *brochure* occupies a conspicuous place. It will not be difficult for the reader to see where the writer reproduces what he has been told, for that is tolerably correct; but there is no doubt in our mind that he is wholly responsible for the flattering information that the average telegrapher cannot, for the life of him, explain how the sound of an instrument conveys intelligence. To him, moreover, is certainly attributable the

cheering statement to those aspiring to take "a first class position in an office," that one year's practice will fit them therefor; or, still better, that "plenty of operators have acquired proficiency in six months;" proficiency in swinging open the brass gate, unquestionably; proficiency in the "cust," "it don't come," "write Gerse," etc., phrases; certainly not in working a wire with care and judgment. We have not patience to allude to half the inaccuracies that appear in the course of the article; but we must not close without referring to the capers of the lightning as it goes flashing from the switch board and caroms on the different instruments, causing the operators to do the "demon's dance" fit to grace the most spectacular play. How familiar that scene has become to us! How often we have all tripped the light fantastic under those circumstances, and what a hit most of us would make in the spectacular line! Listen to the magpie, and see how you like it:

TELEGRAPHY.—WHERE OPERATORS COME FROM.—
UNNECESSARY DELAYS CAUSED BY THEIR
MULISHNESS, ETC., ETC., ETC.

Telegraphy is a mysterious art to a great majority of people. Introduce a stranger to the operating room of an office and the confused rattling of the instruments strikes upon his untutored ear as a miniature Bahel. It seems to him an impossibility for any one to distinguish aught of order in the general din, and yet on every side he can see the operators, with pen or pencil in hand, tracing letters, syllables, words and sentences upon the paper before them with the utmost rapidity of movement. If he becomes inquisitive, and asks questions, he will receive little satisfaction, for the average telegrapher simply knows the fact that the sound of an instrument conveys intelligence of some description to him, but for the life of him he cannot explain how the result is achieved.

To become proficient in the business of telegraphy requires constant, laborious practice for about three or four hours a day during the period of about one year. At the end of that time a candidate who has followed this course may be considered capable of taking a first class position in an office. This is the case with most men, but of course there are exceptions, and often disappointment attends every effort of individuals to master the art. Then, again, plenty of operators have acquired proficiency in six months' hard work, but such cases are rare.

As a rule, telegraph operators are either village bred or have graduated from the ranks of the messenger boys who are employed in every large city office, in numbers ranging from ten to a hundred. Operators are, in general, young men, and if their ages were averaged and compared with those of other professional men, they would undoubtedly be found to be the most youthful class. The reason for this can be easily explained. A boy can become a messenger in a telegraph office at the age of twelve years, and after spending from one to three or four years in this branch of the business the way is open to promotion. If the boy is smart, and shows it, he will be taken from the corps of messengers to fill a vacancy in the operating room. His duty there is to wait on the operators, remove messages as they are received, and take them from the dummy box as they are sent up from the receiving room to be sent to other cities. The work is light, and throws the youngster into the very heart of the business he is destined to follow. It would be impossible for an average youth to remain long in such a position without having his curiosity aroused, and he soon begins to tinker with the instruments.

At first he is sly about it, and hates to acknowledge before operators that he is making any effort to learn the business. They find this out, however, without being told so, and then furnish the tyro with a copy of the alphabet, with the significance of each letter in telegraphy, marked by dots . . . or dashes — — —, alongside. When the "check boy," as he is called, gets this far along he is bound to progress, and it is a proud moment to him when he discovers that he is able to make the letter "A" in a manner pronounced correct by the operator who is his particular patron. In three or four days, or, at the outside, a week, the alphabet is mastered. Nearly every new beginner has his particularly hard letter to overcome. Over that one letter he will work and puzzle for hours before he is able to sound it, and when he does so intelligibly, he has to keep practicing on it to train his fingers to make it correctly.

From learning the alphabet the boy begins to form conjunctions of letters and words, and with every advance he makes his interest increases, until finally he neglects no moment of spare time, and, after his working hours are over, remains in the office rattling away on a "way wire" instrument, and using up column after column of newspaper matter. In a very few weeks his finger joints seem to relax, and he can do anything with the key, from writing a single paragraph to playing the "Dead March in Saul." As a rule, beginners can send at the rate of twenty to thirty words

a minute before they can read a letter of the messages that come over the wires.

To acquire the knack of distinguishing between the confusion of noise made by an instrument at work requires long practice. It is by far easier to learn to send a message than to receive one. Generally, beginners entering upon the second and hardest stage of the study, practice together. Both students sit at the same table. No. 1 has one hand on the key and a newspaper in the other. No. 2 has his ear inclined toward the "sounder." No. 1 writes the alphabet slowly, letter by letter. No. 2, if he can catch the letters, repeats them. If he cannot, at the first attempt, they are repeated over and over again until he can read them. He first attempts to read the letters in regular rotation. After he succeeds in this they are written by the sender in every way. He writes the alphabet backward, or begins in the middle. In this way the listener learns to tell the sound of the letters in themselves, without reference to other letters. He can tell the sound of "K" without having "J" sounded before it.

From learning the letters the student soon becomes able to place them in words. Words become sentences, and, after a few weeks longer practice, he can read the messages that come over the wires with great distinctness. After this result is gained about half the work is accomplished. Then follows the task of conveying to paper the words that he reads in the ticking of the instrument. This part of the task is the hardest, and patience and constant practice are absolutely necessary to success.

Operators' salaries range from \$30 to \$40 a month up to \$120. The inferior class are never up to the standard of men fit to fill positions in city offices, and their employment is obtained in the service of railroad companies, or as holders of branch offices in hotels, etc., where business is very slack. In "main" offices, the hours of labor range at from 8 A. M. to 6 P. M. for day men, and 6:30 P. M. to the hour of closing for night men. Night operators are sometimes through work by eleven or twelve o'clock, but when storms prostrate the wires, or on occasions when the President's message is to be transmitted, they may be kept at work until six or seven o'clock in the morning.

It is very exciting to be in an operating room during a thunder storm. The lightning flashes over the wires, strikes the "switch board," caroms on the different instruments in the room, and causes the men to do a "demon's dance" fit to grace the most sensational spectacular play. Balls of fire play about the room, and the flash is accompanied with snapping noises of the most startling character. On such occasions the boldest of operators grow alarmed, and often business is entirely suspended during the prevalence of the storm.

Telegraph operators learn to cultivate a certain degree of worldliness, or it might be called callousness, that is born of the business they follow—messages affecting the most vital interests of the sender; messages to save life or to cause death, to enrich or to bankrupt, pass through their hands by the score every day. They know a great deal of the secret life of hundreds of men in this way, and it would be thought that this very experience would teach them the necessity of attending strictly to their business. That they do this is true of some, but there are scores of them who do not regard one message that may come into their hands of a whit more consequence than another. Often messages will be left in the counting room of a telegraph office, with instructions to the clerk to "rush it." The message is sent up stairs, the clerk whistles to the check boy, "rush this." The check boy tells the operator to do so, and the operator hangs it on a hook to rest until he shall have finished the particular chapter of the novel he is perusing. When he does turn his attention to it, lazily enough, the delay may have rendered it useless in achieving the object desired by the sender, and yet the operator does not feel that he has violated his duty in any particular.

Suits against telegraph companies for delay in the transmission of messages have often been brought, and sometimes successfully. The more of them that are instituted the better for the general public.

Can Electricity be Profitably Employed as a
Motive Power?

A New Answer to this Question.

THERE was recently on exhibition in one of our industrial expositions a series of pumps, worked by exhaust steam, over which was placed the startling announcement that, by means of them, water might be raised to a given height in quantity sufficient to drive a water wheel which would give out more power than the steam engine itself! The placard was well calculated to attract attention, but then nobody believed the statement printed on it, for the simple reason that no engine, far less the exhaust steam from one, could ever pump up water enough to drive a wheel which would give out half the amount of power of the original motor. The waste in pumping and the loss caused by

want of efficiency in the water wheel would be sure to consume the other half. Now, it happens curiously enough, that there are in common use two methods for producing dynamic electricity—one being the voltaic battery and the other any form of mechanical power. In regard to the latter, it is evident that the same principle holds true in regard to it that is true when applied to the water wheel and steam engine above mentioned. If electricity, which has been produced by the agency of mechanical power, be applied to the driving of an electro-motor, the latter can never be made to give out as much power as has been exerted by the engine employed to produce that electricity. In other words, no one could be found so foolish as to employ a steam engine to produce electricity for the purpose of operating an electro-motor intended to drive machinery. It would evidently be vastly more economical to drive the machinery by means of the engine itself, without the intervention of any complicated apparatus.

This proposition is so self-evident that it requires no elaborate demonstration; but from it follows the very obvious conclusion that, if by means of the steam engine we can produce electricity more cheaply than we can by the voltaic battery, then it is evident that the battery cannot compete with the engine as a source of power, no matter how perfect may be the electro-motor through which the energy derived from the battery is applied. Hitherto it has been claimed that the only difficulty in the way of applying electricity as a motive power, consists in the absence of a properly constructed electro-motor; but if it can be proved that electricity can be produced more cheaply by means of steam than by the consumption of zinc, then it is clear that even a perfect motor—that is to say, one that utilizes all the electrical energy, and converts it into mechanical power—cannot enable the battery to compete with steam.

Here, then, is a crucial test which is easily applied. And we believe that the results already attained do not leave the question in any doubt. In the case of the electro-deposition of metals, as well as the production of the electric light—two instances in which the comparison between the engine and the battery may be made with great accuracy—it has been found that the engine is the most economical. *A fortiori*, it should be far more economical as a source of mechanical power.—*Industrial Monthly*.

The Asiatic Cable.—Cruise of the Tuscarora to
Locate a Route for the New Cable.—Inter-
view with Commander Belknap.

THE United States steamer Tuscarora yesterday sailed from this port for the Sandwich Islands and Japan, with the purpose of sounding *en route* for a location for the proposed telegraph cable between Asia and the Pacific coast of the United States.

An interview with Commander Geo. E. Belknap yesterday morning elicited some interesting information in connection with the Asiatic cable enterprise and the cruise of the Tuscarora, which we here lay before the readers of *The Union*. The Tuscarora was detailed for her present expedition at the suggestion of Cyrus W. Field, the projector and conductor of the great Atlantic cable enterprise, who is at the head of the Asiatic cable scheme. The steamer was first ordered to survey northward for a route through Puget Sound and *via* the Aleutian Islands, and proceeded to carry out the instructions. Becoming short of coal she returned to San Francisco, where orders were received to go southward and survey the route from San Diego to the Sandwich Islands and Japan, returning by the northern route, if possible.

Commander Belknap thinks that the southern route, with a landing for the cable at San Diego, is by far the most feasible, and believes that it will in all probability be adopted.

The northern route to Japan *via* Aleutian Islands is beset with difficulties. It would be impossible to repair any break during the largest part of the year, there being but four months in which those northern waters are open to navigation.

A route from San Francisco has apparently not been thought of. It would be well nigh impracticable to land a cable in that vicinity on account of the rocky nature of the bottom at that part of the coast.

A line from San Diego *via* Japan to the Sandwich Islands is the most practicable; first, because it would lie in the "calm belt of the Pacific," and the cable could be laid down and repaired at any time during the year; second, as a connection with the Sandwich Islands is the evident purpose of the scheme, this line is geographically the best, the branches to Japan and Australia being short and of easy access; third, the cable should connect with an overland wire not subject to interruption, and by the time the submarine line would be laid there would be a southern overland line between San Diego and the east which could be constantly operated. It is a well known fact that communication by the existing overland line is constantly interrupted

hy storms; this would never be the case with a line running eastward *via* the thirty-second parallel. In every point of view the advantages of taking the southern route, and making the landing at San Diego, are so great that they can hardly be overlooked.

Commander Belknap hopes that he will not find over three thousand fathoms depth on the survey across. If a satisfactory result in this respect is reached, he thinks it will not fail to give the route from San Diego the preference—everything else being very greatly in favor of its adoption.

He will suggest that the cable be laid on the south side of the channel, landing on the Peninsula, from which point a land line would be built down the Peninsula around by way of La Punta and up the bay shore to San Diego. The shore from the Peninsula slides off very gradually to deep sea water; the bottom being soft and smooth, in which a cable would imbed itself by its own weight very readily.—*The San Diego Union.*

Congress and the Telegraph.

WASHINGTON, D. C., Jan. 28.

TO THE EDITOR OF THE TELEGRAPHER.

THE discussion before the Senate Committee on Post-offices and Post-roads of the Hubbard postal telegraph scheme, so called, was continued on Wednesday, Thursday and Friday of last week. President Orton, of the Western Union Telegraph Company, appearing and arguing at length in opposition thereto.

Mr. Orton concluded his argument on Friday, in which he maintained the proposition that Congress has not the right to pass a bill of this character, for the reason that it would indirectly take private property for telegraph purposes without just compensation, and that the passage of the bill would in fact be a violation of the contract between the Government and the telegraph companies now existing under the provisions of the Telegraph Act of 1866.

He further argued that if there were no constitutional objections, or violation of contract, the adoption of the Hubbard scheme, as contemplated by this bill, would be impolitic, because it constitutes a partnership between the Government and a private corporation, to be conducted by both official and private agencies operating at the same time, under which there is to be a division of expenses between the Government and the company, while any profits that may be realized will go exclusively to the latter.

It was further contended that, whatever the faults of the existing telegraph system of this country may be, the proposed scheme affords for them no adequate relief. It was shown from official documents and statistics that the present average rate for messages in this country is lower than in Europe for like despatches, and that here the business is conducted without any expense to the Government, while the annual deficiency arising from the telegraph service in Europe, raised by taxation upon the people, whether they used the telegraph or not, amounted to several millions of dollars.

Mr. Orton, in reply to the arguments of Mr. Hubbard, asserted that there was in fact no combination between the Western Union Company and the Associated Press, and that all other press combinations are offered by his company the same terms as the Associated Press, and that the establishment of a postal telegraph could not affect the Associated Press combination in any way.

The discussion has not attracted much public attention, it being conceded that there is no probability that Congress will take any definite action in regard to telegraph matters at this session, and that the Hubbard scheme especially, in any event, has no possible chance of success.

It is understood that Mr. Hubbard is to have a further hearing, in reply to Mr. Orton's arguments, by the Committee.

Aside from this matter nothing of telegraphic interest has occurred. CAPITOL.

Telegraph Matters in Oregon.

ALBANY, OREGON, Jan. 10.

TO THE EDITOR OF THE TELEGRAPHER.

ON Jan. 5th, 1874, Mr. F. H. Lamb, who for years past has been Sup't of the Fourth District, Pacific Division of the W. U. Tel. Co., from Portland, Oregon, to Victoria, B. C., turned the same over to Dr. O. P. S. Plummer, Sup't of the Third District from Marysville, Cal., to Portland, Oregon. Dr. Plummer will in future have both Districts under his supervision. Mr. Lamb started East on a visit to the Atlantic States on the

morning of the 6th inst., to be absent a few weeks, when he will return and take a District (we understand) with headquarters at Sacramento, Cal.

Dr. Plummer's headquarters have been moved from Albany, Oregon, to Portland, Oregon.

Mr. F. H. Lamb having resigned, Mr. J. W. Sweeney has been appointed Sup't of the Puget Sound Telegraph Company.

The following are trustees of this company, who are to serve this year, Messrs. O. F. Gerrish, D. C. H. Rothschild, Marshal Blinn, Cyrus Walker and M. Renton. The Trustees organized by electing O. F. Gerrish, President; Cyrus Walker, Treasurer; and James G. Swan, Secretary. This is a local line, built between and connecting all the ports on Puget Sound, and is doing a very good business. Headquarters are at Seattle, W. T. WEBFOOT.

Importance of the Telegraph to Railroads, and Insufficient Compensation to Railroad Telegraph Operators.

TO THE EDITOR OF THE TELEGRAPHER.

THE late ice deluge gave us a good opportunity to test the value of the telegraph department in the management of a great railway. The five wires which extend along the line of the Pittsburgh, Fort Wayne and Chicago Road were almost entirely prostrated for a distance of seventy miles east from Crestline, and the railway company was deprived of their use thereby during two days. During those two days the trains became most hopelessly mixed up and delayed, so that it required freight trains to put in about twenty-four hours on fifty miles of road as they joggled along from one jumble into another. The strike of the locomotive engineers a few days previously was decidedly mild in comparison with the trouble caused by the exit of the telegraph. Everybody was in a tub at sea, without compass or rudder, simply because the faithful little clickers were deprived of the power of giving forth their joyful sound. And yet, while the telegraph is proven to be a most valuable and indispensable part of the management of a large railway, and the telegraphers the most faithful and attentive in the discharge of their duties, their pay is kept at a rate but slightly in advance of the track repairers and coal heavers, who need not know a letter of the alphabet, or have any of the great responsibility which is attached to him who receives a train order from a rabid despatcher, the least error in which might consign to an untimely death scores of valuable lives and cause the destruction of property worth many thousands of dollars.

This, and much more fully demonstrates that the telegraphers, as a class, have just cause to cry out against the universal oppression with which they are burdened. Their invaluable services to the public, and especially to railway companies, coupled with the enormous load of responsibility under which they continually labor, and the large number of masters they are obliged to serve, demands double the compensation that any of them receive.

A closer union, honorable protection, and a firm demand for just rights, should be the watchword of the craft everywhere. MAGNETO.

The Remedy for a Sticking Key.

MEAFORD, CAN., Jan. 23d.

TO THE EDITOR OF THE TELEGRAPHER.

IN your issue of the 17th inst. I noticed a remedy for a sticking key, signed E. M. D., which I have tried, and am glad to say it has proved a success. I have been hithered terribly with a sticking key, and can say, for one, that this remedy alone is worth the amount paid you for THE TELEGRAPHER for one year.

A. GAULT, Operator.

Supply and Demand.

TO THE EDITOR OF THE TELEGRAPHER.

IN opposition to the theory of protection against the encroachments of capital, which is the corner stone of most trades unions, it is usually asserted that the law of supply and demand will regulate the rates of wages, and I believe you have editorially endorsed this argument. I wish to call your attention to the fact that a combination already exists in certain quarters, the object of which is to obstruct the natural demand for operators, by interposing official influence to prevent their securing more desirable positions. Among the young operators who are continually coming upon the stage, there are many who remain in situations where they neither have encouragement nor opportunity to rise, and who toil incessantly year after year, twelve or fourteen hours per day, at a very moderate compensation. If, perchance, a more agreeable position is tendered them, the machinery of the combination I refer to is immediately put in operation.

It is not to be expected that operators, so situated, can voluntarily secure a better place under the same

superintendent or the same company, but it is well known that some of these picayune officials have made arrangements with each other, and with railroad telegraph superintendents, under which they mutually refuse to hire operators who leave the service within the territory under their immediate control. Should a man, through some oversight, obtain a position within this hallowed precinct, it is probable he would be discharged immediately upon the fact becoming known to his late employer. Such contemptible scheming as this shows the calibre of the superintendent of the period, and if any of your readers have had any personal experience of this kind, I hope they will avail themselves of your columns to smoke 'em out.

CENTRIPETAL.

The Peculiar Characteristics of Different Operators.

BRISTOL, PA., January 22.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR correspondent, "Jo." in his remarks on telegraphers' unions or associations, classifies operators as railroad and commercial operators. I desire to make a further designation, and will distinguish them as resident and travelling operators.

The resident operator, whether railroad or commercial, is what is termed steady and reliable. Generally he is old foggyish, precise, contented, hangs to old fashioned ways of doing his work, don't put his five words per line, or count as he goes. If he gets it down, "nuff sed." Usually is not addicted to the use of tobacco, and is very apt to be married.

Now for the other genus: He has a knowing look, is smart, with a moustache agonizingly undeveloped. Sports a tall hat, fashionable tights, a big ring and a girl. Don't care a cent whether school keeps or not; affects the traveller and is posted. Knows every Superintendent in the States and suburbs, and has worked for 'em all. Been discharged for every misdemeanor under the sun, and glories in it. Always financially busted. "By the way, Jones, can you spare a couple dollars till next week; it's all right, you know, ole feller, av coorse!" He does a nice gilt edged copy, puts on all the extras, and is generous to a fault when he has the means. Never saves a cent, and is never contented with his job. His monomania is to write to Superintendents for a "sit," and, if he is successful, leaves the one he is in for it. His morals are of the convenient type; is not naturally bad, but his principles are that the world owes him a living, and he acts accordingly. Is full of fun, telegraphic jokes, and the boys all like him. Girls ditto. This is a different race from the *old report operator*, thirty years at the business, who takes forty-five words Spencerian, can copy three messages at a time while sending with his left hand, diverting himself while so doing by Mazonkaing to other side of room to borrow a chew and talking to the boys. He can also strack a set of Hicks. His eyes resemble a pickled mackerel's from long practice on fourth proof, and can't stay sober long enough to get a job. You've seen him, eh? SPORTS.

The Western and Brazilian Telegraph Company.

AN EXTRAORDINARY general meeting of the Western and Brazilian Telegraph Company (Limited) was held on the 17th December at the Carman Street Hotel, London. The Chairman said the object of the meeting was to approve an agreement, made on the 8th inst., between this company and the liquidators of the Great Western Telegraph Company, relative to the cancellation of the shares issued to the shareholders of the latter company, and the allotment and issue of other shares of this company in exchange for said shares, credited with the like sum as paid up thereon. His colleagues at the Board, however, had requested him to state the present position of the company. The line from Para to Pernambuco was laid and at work. The ship Hooper was now on the coast, laying the southern portion of the line from Rio. The further lines between Rio and the River Plate had been purchased by the company and the deposit money paid. A repairing ship had been bought by the directors to sail along the coast and look after the cables. As soon as the ship Hooper returned home she would take out the West India cable, and he hoped the whole of their system would be completed and at work in a short time. Another satisfactory matter was that all moneys due to the contractors had been paid, and the company was absolutely out of debt. The resolutions approving the agreements, etc., were unanimously adopted.

THE Eastern Extension, etc., Telegraph Company's traffic receipts for the month of December, 1873, amounted to £20,400, against £14,797 for the corresponding period of 1872 for the four separate lines, viz., the British Indian Extension, the China Submarine, the British Australian and the Tasmanian Submarine Telegraph Companies.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, JANUARY 31, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS OF THE

Telegraphic Fraternity and the Advancement of Electrical Science and the Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of THE TELEGRAPHER will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

Conspiracy to Oppress Telegraph Employees.— A Real Grievance.

WHEN some years ago it was found that a portion of the telegraph employes of the country had combined and established a League for mutual support and protection, great was the outcry against it on the part of Western Union officials, and most earnest the determination, at any cost, to defeat and destroy it. In this the company was successful, and, since then, except that at times the spectre of the League has seemed to trouble and terrify them, all has been serene, and with the exception of some grumbling and complaining through THE TELEGRAPHER, and spasmodic agitations of the Telegraphers' Association question, there has been little, so far as the employes were concerned, to disquiet them.

It is not our purpose to find fault with this or to agitate disturbing elements, but it seems to us that if combination on the part of the employes which may prove adverse to the interests of employers is so wicked and discreditable, combination on the part of the higher officials of telegraph companies and liars, avowedly adverse to the interests of the employes, is a wrong and outrage, and constitutes a real grievance which should be exposed and made public.

Our correspondent CENTRIPETAL, whose communication will be found in this paper, partially reveals such a combination on the part of Western Union and certain railroad telegraph officials, which is made avowedly to prevent, so far as may be in their power, any chance for the subordinate employes bettering their condition, or availing themselves of opportunities for exercising the liberty of selecting their places of service, or exchanging from one location to another, except as these officials shall be graciously pleased to permit. That this is wrong and an outrage there can be no question. In this country every person is supposed to be at liberty to select employment and employers, and, if an opportunity offers, to change both or either if it shall appear desirable or for their interest to do so. It is of course but right that in making such a change proper notice should be given of the intention to do so, and a suitable opportunity afforded to supply the service which is about to be withdrawn.

This is all that can in justice or equity be required, but this is not sufficient to satisfy some telegraph officials.

It has recently come to our knowledge that an arrangement exists, as before stated, between Western Union officials and certain railroad and other telegraph superintendents, by which an employe of either will not be given positions under the other without the permission of his former superior; or, if inadvertently an appointment be made, upon its being made known that the employe is a fugitive from the thralldom exercised by one of these officials, or has abandoned one for the other for a better position, easier labor or increase of compensation, the employe is at once discharged, and can either humble himself or herself, and, if graciously permitted so to do, return to his or her former, or a lower position under the old Superintendent, abandon the business, or starve.

As will at once be supposed this arrangement has grown up on the division which is under the management of T. T. ECKERT, and exists in all its force in the large district which is under the sway of D. H. BATES. Whether it exists on other sections of the Western Union and connecting lines we are not as yet informed. It may be so, but we doubt whether such an arrangement could exist elsewhere. If it does, the fact should be made known and the subject agitated until the injustice is corrected.

We concede the right of telegraph companies and officials to manage their business as they shall deem most advantageous, and to employ such persons as they shall deem most likely to serve them satisfactorily. We deny their moral and equitable right to combine to keep in subjection the employes, or to prevent them from exercising freedom of selection of employers and employment, and especially to prevent them from obtaining better compensation than they may have

previously been receiving. This is a conspiracy to oppress, and a real grievance, which should be agitated until it is removed.

We do not approve of telegraph employes constantly and capriciously changing from one line to another, for insufficient reason or for no reason at all, but if they can obtain situations it is their right to do so. How much stronger then is the right of steady, reliable employes, who after months and years of faithful service, seeing no probable reason to anticipate any improvement where they are, when the opportunity is afforded to secure such improvement by a change to avail themselves thereof? But just here the old employer says, "No, you must continue in my service whether you will or not. By an arrangement between your proposed employer and myself, only with my consent can your service be transferred!" If this is not slavery we are at a loss to understand the word. If the power of such men as we have mentioned was only equal to their desires, they would be despots whose tyranny and oppression would equal any that has ever before been experienced.

It is inevitable that combination will be met by combination, and if telegraph companies and officials do not desire that their employes should engage in such, they must not attempt on their own part to combine against them. We may have something more to say on this subject hereafter if the above should continue, and in the meantime desire the fraternity throughout the country to inform us whether such a combination exists in their respective localities,

The Hubbard Telegraph Monopoly.

AS HAS been stated by our Washington correspondent, CAPITOL, the proposed HUBBARD telegraph monopoly has been discussed for several days before the Senate Post-office Committee, by Messrs. HUBBARD, ORTON, PRESCOTT and others, for and against. The arguments adduced on either side were of the stereotyped character, and are too familiar to our readers to make it worth while to reproduce them at any length in our columns.

There is so little really to be said in favor of Mr. HUBBARD's proposed telegraphic monstrosity that it is difficult to understand how it is that a committee of the Senate should need lengthy argument in opposition to it, or should give it serious consideration even; but they do, and not only so, but once or twice at least have reported favorably upon it. It has the advantages neither of a private enterprise or of a Government telegraph, and is to be established, if at all, only upon the ruin of existing telegraph interests, and with the certainty that it must eventually, and that at no distant day, be taken over by the Government, and at a largely increased cost to that which would attend the purchase of the lines and the establishment in the first place of the proposed Postal Telegraph.

The Postmaster General, rabid as he is on the subject of a Postal Telegraph, sees through the HUBBARD scheme and very sensibly opposes it. It should be effectually disposed of in some way, and not return Congress after Congress and session after session, to bother legislators and telegraphic officials uselessly and needlessly. How it can be done is beyond our knowledge, but that it ought to be there can be no doubt. That it will ever succeed we suppose no one besides Mr. HUBBARD and Senator RAMSAY seriously believes, and the two gentlemen named rely upon persistent worrying to effect the object, if it is possible to do it in any way. It has become a legislative nuisance and ought to be abated, but how?

The Page Patent Litigation.

THERE seems to be a probability that the validity of the PAGE patent will be thoroughly and legally tested. We have before mentioned in THE TELEGRAPHER the fact that suits had been commenced in the United States Courts against the Manhattan Quotation Company and Mr. CHARLES T. CHESTER, of this city, for infringement of this patent, and they are to be contested to the end, and its validity as affecting telegraph

instruments and apparatus, either established or denied judicially.

Our readers are fully aware of our opinion in this matter, and we have shown, as we think, conclusively, that Prof. PAGE was not the original inventor of the devices for which a patent has been granted to him, and that in fact the patent is an outrage on the public, who have paid largely for these same devices to other patentees, whose patents have expired and become public property. So well convinced was the Western Union Company of the invalidity of the patent that, when first offered to them for purchase, after an investigation by experts and eminent patent lawyers, it was rejected. It was subsequently purchased by that company for good and sufficient reasons, no doubt, not connected with its validity, and has for the last three years been held *in terrorem*, over the telegraph interests of the country, not connected with the Western Union—no serious attempt having heretofore been made to enforce it.

It should, by all means, be disposed of as early a day as possible. If properly contested that it can ever be maintained legally we regard as an impossibility.

The resources of the Western Union Company will enable them to press the matter, and the contest will be protracted and expensive. All who are interested in defeating it should at once join hands with the defendants and make common cause with them, sharing the expenses as they will the benefit of success. The railroad companies are especially and vitally interested in this matter, for if the PAGE patent be once established, they are at the mercy of the Western Union Telegraph Company, so far as their telegraph facilities are concerned, and will be made to pay roundly for the exemption from such control during the last few years, since the MORSE patents expired. They should be wise in time, and cooperate with those who are engaged in supporting the independence of the telegraphs of the country.

The Western Electric Manufacturing Co.

THE Western Electric Manufacturing Co., of Chicago, Ill., seems to be in a sound and prosperous condition, considering the hard times. They have kept a full force at work at full time during the fall and winter, and have met all their engagements promptly, and we are pleased to learn that they find a good demand for the products of their shop.

The company, instead of decreasing its production, is branching out and adding an entirely new department to their manufactory, in the shape of apparatus for insulating all descriptions of office and magnet wire. They have purchased of Messrs. OLMSTEAD, MEAD & Co., of Providence, R. I., their machinery for this purpose, and are setting it up in Chicago, adding new apparatus for the winding of silk and cotton magnet and resistance wire.

This company does business on its own capital, and its business is not limited to any one branch of electrical work, and all branches do not fail at the same time. Again, its workmen and employes are stockholders, and are thus working for themselves, and remain permanently in a shop where they have an interest in the profits, in addition to their wages. This naturally secures good workmen, interested in making a superior article, and who do their work economically, wasting neither labor or material.

Those having occasion to use insulated wire of any description will do well to patronize the Western Electric Company.

Personals.

Mr. O. K. TOMPKINS, recently of the Dubuque, Iowa, Pacific and Atlantic office, has been appointed Day Assistant of the Northwestern and Western Union office at McGregor, Iowa—the great increase of business at that point necessitating an increase of the force.

Mr. E. A. DENNIS has been transferred from the Augusta, Ga., to the Charlotte, N. C., office of the Southern and Atlantic Telegraph Company.

Mr. C. D. CASE has resigned the position of Ticket Agent and Telegraph Operator at the Broadway ticket office of the Midland R. R. at Paterson, N. J., and returned to his home in New York State.

Mr. F. M. HUNTINGTON has been transferred from the Train Despatcher's office at Jersey City, N. J., of the New Jersey Midland R. R. to the Broadway Ticket Office at Paterson, N. J.; the despatchers doubling up on their work at Jersey City.

The W. U. Company have established an office at Congress Hall, Albany, N. Y., which is in charge of Mr. J. F. McAULIFFE, transferred from the main office.

The W. U. office at the State Capitol, Albany, N. Y., has been reopened for the Legislative season. Mr. J. A. OSBORN, late of Hartford, Conn., is the operator in charge.

Mr. W. F. SMITH, late of the W. U. and P. and A. Co., has accepted the position of signal operator at the Dudley Observatory, Albany, N. Y.

Mr. H. C. WINELAND, formerly in the Kansas Pacific R. R. office, State line, Kansas City, Mo., is now extra operator on the Pittsburg Division of the P. R. R.

Mr. CHARLES RUSHMORE, Secretary and Treasurer of the American District Telegraph Company, of Brooklyn, N. Y., has resigned.

Mr. H. L. HUES, Manager of the Western Union Telegraph Co., Brooklyn, N. Y., has been appointed Secretary and Treasurer *pro tem.* of the American District Telegraph Co., to fill the vacancy from the resignation of Mr. CHARLES RUSHMORE.

The Telegraph.

By Cable.

KINGSTON, JAMAICA, Jan. 24.—The Telegraph Construction and Maintenance Company have (17th inst.) succeeded in submerging a new cable between Jamaica and Porto Rico. It is laid to Ponce, on the south coast of Porto Rico. Everything is working well, but the line is not open to the public. The former cable was laid along the north side of Porto Rico to St. John, but in consequence of strong currents to the east of Porto Rico, the change of route has been considered necessary.

The Brazilian Telegraph.—Celebration of the Completion of the Line.

By the mail steamer South America, which arrived at New York on the 22d inst., advices from Rio Janeiro to Dec. 26th, and Bahia to Dec. 30th, have been received.

The Hooper Telegraph Company had completed their cable from Bahia to Rio—the steamer Hooper arrived at Rio with the final end on December 25th, and now there is complete communication from Para to Pernambuco, Bahia and Rio. The completion of the line was celebrated by a grand banquet and dinner at each of the above named ports on Jan. 1st. The Emperor of Brazil, present at Rio, held communication with those ports, and, after an interchange of congratulations with the presidents and officials of the several provinces, by a signal from the Rio headquarters all parties simultaneously sat to dine and toasted the success of the greatest enterprise that to-day exists in all Brazil. Other vessels of the company are now preparing to lay the remainder of the cable between St. Thomas, West Indies, and Para, which, it is expected, will be completed by May 7th, 1874, when there will be complete telegraphic communication with the United States, and thence to all parts of the world. Another line is projected and expected to be laid between Lisbon and Pernambuco within the year, thus opening direct communication with Europe.

Annual Meeting of the Atlantic and Pacific Telegraph Company.

THE Annual meeting of the Atlantic and Pacific Telegraph Company was held on Wednesday, the 26th inst., at the Executive offices of the Company in this City, and the following gentlemen were elected Trustees of the Company for the ensuing year. Messrs. Oliver Ames and John R. Duff, of Boston, Mass.; S. L. M. Barlow, George S. Bowdoin, George Bliss, Geo. H. Brown, H. G. Chapman, W. H. Clay, Sidney Dillon, John Duff, R. R. Graves, W. H. Guion, J. B. Hodgskin, C. P. Huntington, L. P. Morton, John H. Mortimer, G. G. Sampson, William W. Sherman, W. J. Syms, Henry M. Tabor, William R. Travers, John G. Vose, A. F. Wilmarth, New York; John Barker, Brooklyn, N. Y.; James Hendrick, Albany, N. Y.; N. C. Simons, Buffalo, N. Y.; Cheney Ames, Oswego, N. Y.; H. G. Hamilton, Rochester, N. Y.; Russell Wheeler, Utica, N. Y.; S. H. Marks, Lockport, N. Y.; W. W. Shippen, Hoboken, N. J.; C. S. Bushnell, New Haven,

Conn.; Herman D. Walbridge, Toledo, O.; R. M. Shoemaker, Cincinnati, O.; J. A. Devereaux, H. M. Flagler, Waldemar Otis, Cleveland, O.; C. B. Hammond, A. B. Meeker, Chicago, Ill.; and Emory Wendell, Detroit, Mich.

Foreign Telegraphic Notes.

THE directors of the Eastern Telegraph Company have announced an interim dividend of 2s. 6d. per share for the quarter ended September 30, 1873.

An interim dividend has been declared by the directors of the Eastern Extension Australasian and China Telegraph Company for the quarter ended September 30, 1873, at the rate of 6 per cent. per annum, or 3s. per share.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended January 3, 1874, was 284,788, an increase of 28,753 on the corresponding week of last year.

A dividend at the rate of 6 per cent. on the shares of the Anglo-American Telegraph Company is announced.

The *Evening Standard* says there is no truth in a recent report that the Telegraph Construction and Maintenance Company (Limited) are about to manufacture a light cable for the Anglo-American Telegraph Company for submersion between Great Britain and America. It is, however, probable that the 1,000 miles of cable owned by the latter company, and now on board the Great Eastern, will be utilized during the present year, with the addition of about 700 miles of new cable of the heaviest type—experience having demonstrated that this description of cable is the best and most durable.

Gibraltar has been for more than eighteen months connected with the telegraph system of Europe by means of the line between that city and San Roque. Up to the present time, however, the Spanish Government has permitted this line to be used only for telegraphing to places in Spain itself, objecting to the transmission of messages to other countries, on the ground that it would accept no responsibility except for messages deposited in its own telegraph offices. It is notified, however, that from the first of January the service of the Gibraltar telegraph, heretofore limited to Spain alone, will be extended to all parts of the world.

Admiral Sherard Osborn, C.B., F.R.S., has resigned the managing directorship of the Telegraph Construction and Maintenance Company in order to place himself at the disposal of the Admiralty, and is succeeded by Admiral Richards, C.B., F.R.S., who has filled the position of Hydrographer to the Navy for the last ten years. Admiral Osborn joined the Telegraph Construction Company in 1864, previous to the first contract for an Atlantic cable, and during his tenure of the managing directorship has successfully carried out contracts for upwards of 30,000 miles of cable, extending from Falmouth to Australia and America, and constituting a complete system of submarine telegraphy. He will still retain a seat at the board of the company, to whose utility and prosperity he has thus so long contributed.

The Eastern Telegraph Company's traffic receipts for the month of December, 1873, amounted to £35,238, and for the corresponding month of 1872 to £32,250, showing an increase of £2,988.

The Board of Supervision of the German Union Telegraph Company of Berlin have resolved to pay an interim dividend on account of the dividend due 1st May next, with 10s. 4d. per share of 100 thalers, or £15, at the German Bank of Berlin, London agency, 50 Old Broad street.

The West Indian Telegraphs.

THE Kingston, Jamaica, correspondent of the *New York Herald*, under date of Jan. 10th, writes:

"It has long been a scheme to connect the entire group of West India Islands by telegraph, and the British Government, through the Colonial Office, offered to grant some kind of subsidy or concession to any enterprising capitalists who should undertake to carry out the idea. The West Indian and Panama Company had at one time so far completed it that it was possible to telegraph to almost any part of Europe from these islands, and while they were about demanding their reward from the Government the cable between Colon and Jamaica was broken, thus severing the connection and shutting off communication. No sooner was the Colon cable repaired than the cable laid to the north end of Porto Rico became useless, thus again destroying the communication between here and St. Thomas. And, lastly, the Spanish authorities in Cuba have so far crippled the operations of the cable to Santiago and Batabano that it has been purely a waste of time to attempt to use it for transmitting messages *via* New York—five days being the time required for a single

word to reach your city. Notwithstanding all the accidents of the deep, and the unjust and untimely interference of the Dons, the Panama Company have determined to try again to make the circuit complete. A few days ago two large steamers, chartered by the Telegraph Construction and Maintenance Company, arrived at this port, having on board the material for the new Porto Rico cable. One of them, the Minia, had on board 648 miles of five eighths six strand wire. The Kangaroo carried fifteen miles of main cable, eighteen miles of intermediate and fourteen miles of shore end—the intermediate being about one inch and the shore end about one inch and three eighths in circumference.

The Minia, after having laid the present cable, will attempt to grapple and repair the wire now broken at some distance from Porto Rico, while the Kangaroo has to proceed to Martinique for the purpose of mending the Dominica wire, which has been sundered in about 1,000 fathoms of water.

The shore end of the new line will be laid, by about Tuesday next, the 13th inst., from Holland Bay, on the eastern extremity of Jamaica, to Ponce, on the south side of Porto Rico. The bottom, according to the soundings on the chart, appears to be uneven; in some places it is only about 600 fathoms, while only a short distance further on the leads went tumbling down the sides of immense hills to the depth of over 2,000 fathoms, showing that the bottom is mountainous and difficult to lay a wire on.

The wires, on being tested before leaving, were found to be in splendid condition, so that in all probability the enterprise will prove successful. The supervision of the work on behalf of the Panama Company has been entrusted to Mr. Theophilus Smith and a staff of three other electricians from the office of Sir Samuel Canning, while the contractors—the Construction Company—are represented by Mr F. Lucas and a special staff. Some little difficulties are expected in laying the shore end, for, though the British Government seems so anxious to have the West Indies connected by wires to the United States and Europe, their representative here declined to aid in the work by loaning a small steamer. Should the shore end be successfully laid by Tuesday, however, and the weather remain fine, the other end will have been laid at Ponce by about the 20th of January.

Ball at Tucson, A. T., to Celebrate Completion of the Military Telegraph Line to San Diego, Cal.

On Saturday, Dec. 5, 1873, a ball took place at Tucson, Arizona Territory, to celebrate the completion of the military telegraph line connecting Arizona with the telegraph system of the country at San Diego, California. The *Arizona Citizen*, which is published at Tucson, gives the following account of the affair:

"This affair was well attended and as well enjoyed. The evening was fine and the spirits of all present seemed finer. The dance opened about half past eight and continued to near twelve, when a fine supper was partaken of at Neugasa's restaurant. After eating and some drinking of coffee, champagne and other joy inspiring fluids, some remarks were made. Gov. Safford gave a concise and interesting history of the rise and progress of telegraphing, and commented on the mysterious wonder which it surely is to the mass of people even to this day. He paid proper tribute to Gen. Crook, and those under him, in its construction, and especially to Capt. G. F. Price, whose absence was regretted by all present, for to his energy and business tact the people of Arizona are much indebted for the entire completion of the line as contemplated with the small appropriation made by Congress; and the Governor very fitly referred to delegate McCormick's prompt action in securing the appropriation for the work. It is true that others high in authority recommended it, but for the opportune motion of delegate McCormick, and enforced by his excellent arguments in committee of the whole House of Representatives in Congress, there would have been no appropriation made. This is a little history in this connection which the people of Arizona should properly remember. After the Governor's remarks the proprietor of the *Citizen* informed those present of the contents of a news despatch just received from San Diego, which set forth that the administration of President Grant had wisely averted war with Spain upon honorable terms, which were briefly stated; the President's views on the postal telegraph and postal savings banks were also given as contained in the despatch fresh from Washington. Such late news was never before enjoyed at a supper in Tucson. Gen. E. A. Carr, of Camp Lowell, was called out, and he responded in some remarks complimentary to the citizens in general.

So far as we can learn, all present still feel that it was good to have been there, and rejoice that a large step towards removing our feeling of isolation from the hives of population and thronged business centres of our country had just been taken."

The Correspondence of "The Telegrapher."

Now that the prospect of the location of the American terminus of the Asiatic Telegraph Cable at this place begins to look like certainty, it is not out of place to mention the fact that the first public statement of the advantages of San Diego in that connection appeared in the columns of THE TELEGRAPHER, over the *nom de plume* of "Clix," and was from the pen of Mr. Wm. E. Smith, the manager of the Western Union Company's office in this city. The article was very extensively copied in the Eastern press at the time of its appearance.—*San Diego (Cal.) Union.*

WESTERN ELECTRIC MANUFACTURING COMPANY

FURNISH ALL DESCRIPTIONS OF

Copper Office and Magnet Wire,

OF OUR OWN MANUFACTURE,

WITH

EVERY VARIETY OF INSULATION,

FINE RESISTANCE WIRE and DOUBLE and SINGLE CONNECTING CORD.

Western Electric Manufacturing Company, CHICAGO.

VOLUMES OF THE TELEGRAPHER FOR SALE.

The subscriber has had placed in his hands, to dispose of to the best advantage, complete sets of Vols. 4, 5, 6 and 7 of the THE TELEGRAPHER, unbound. They are in perfect condition and may be had at a bargain.

EUGENE F. PHILLIPS,

MANUFACTURER OF

REED & PHILLIPS'

PATENT INSULATED TELEGRAPH WIRES,

(PATENTED, NOVEMBER 18TH, 1873.)

Lock Box 169. PROVIDENCE, R. I.

Having recently enlarged our factory, we are now prepared to furnish at short notice any style and quantity of

BRAIDED LINEN or COTTON COVERED WIRE,

saturated and finished with our Patent Compound, which makes the most durable, handsome and best insulated Braided Wire manufactured.

PAINTED, PARAFFINE or SHELLAC WIRES

also furnished at the lowest prices. Iron or Compound Wires covered upon reasonable terms.

We are also prepared to furnish a new style of

ELECTRIC CORDAGE,

which has been pronounced by all superior to any in the market.

The American District and Gold and Stock Telegraph Companies have been supplied from my works with a greater portion of the office wire used by them.

Sample Card and Price List furnished when requested.

Phillips' Wire can be had of

- L. G. TILLOTSON & Co.....New York.
- CHARLES T. CHESTER....."
- F. L. POPE & Co....."
- W. HOCKHAUSEN....."
- PATRICK BUNNELL & Co.....Philadelphia.
- WATTS & Co.....Baltimore.

Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. BOX 496.

A MERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON GARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.

15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS

of all kinds,

CHRONOGRAPHS,

ASTRONOMICAL CLOCKS,

REGULATORS,

ETC., ETC.,

OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

GEO. W. STOCKLY,
Sec'y and Treas.,
No. 4 LEADER BUILDING,
CLEVELAND, O.

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,

BALTIMORE,
MANUFACTURERS OF
ELECTRICAL AND TELEGRAPH INSTRUMENTS
AND
Material of Every Description,
RELAYS, KEYS, SOUNDERS, COMBINATION SETS, &c., &c.
Nickel Plated Goods a Speciality.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,
Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK, }
Sept. 22d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,
A. S. BROWN, Manager.

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.

Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

PARTRICK, BUNNELL & CO.'S
CHAMPION LEARNERS
AND
SHORT LINE TELEGRAPH APPARATUS.

A GREAT IMPROVEMENT

over all Instruments of the kind ever offered for this purpose, consisting of a

No. 1 SOUNDER AND KEY COMBINATION SET,

AN EXCELLENT BOOK OF PRACTICAL INSTRUCTION IN TELEGRAPHY,

OFFICE WIRE, CHEMICALS, ETC.,

making a complete arrangement for one office.

The Instruments are full sized, complete in every respect. The Battery is a full sized first class Callaud cell, and the entire outfit has nothing about it which in any way resembles the many wretched affairs which have been extensively sold as Learners' Apparatus.

Great numbers of our "Champion Instruments" are in use upon short private lines, and upon City wires of Telegraph Companies, where they are giving the greatest satisfaction, on account of their very substantial make and excellent working qualities.

We guarantee them to be in every respect better than any form of Learners' Apparatus or Short Line Instruments ever offered to the public.

Price of Apparatus, complete, with Book of Instructions, Battery, Wire, and all necessary materials for one complete office outfit, ready for shipment, sent C. O. D., \$10— or, if money order sent for the amount, \$9.50. The latter plan will additionally save the purchaser the express charges for the return of money.

Price of Single Instrument, good for one mile or less, without Battery..... \$8 50

Ornamental style ditto, with rubber covered coils, without Battery..... 10 00

Single Instrument, good for working a line from one to twelve miles..... 9 50

Ditto, ornamental, with rubber covered coils..... 11 00

Battery, per cell..... 1 50

CANADA.

A NEW GALVANIC BATTERY.
Durability, Efficiency, and Economy of Expense
and Labor at last Secured.
THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for the
manufacture and sale of the
EAGLES METALLIC BATTERY,
now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.
The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.
These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.
Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.
On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.
No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished

ONE CUP OF BATTERY,

TWO YARDS OFFICE WIRE,

ONE PACKAGE BLUE VITRIOL,

ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

[From *The Ghost*.]

Telegraphic Lays.

It was thought some years ago, when a celebrated blacking house in the City of London advertised "We keeps a poet," that blacking was tending upward, and that the makers of that convenient compound were enterprising who could afford to make a raid into the realm of the Muses, and keep up unflinching chase of the Parnassian heights, until a full fledged singer was overtaken and brought to London to chant the praise of prosaic blacking. But in this enlightened day every blacking establishment might employ a versifier, without the trouble even of invading the enchanted enclosure of the Nine, for their name is legion who slip astride their Pegasus, and cavort about the arena of questionable verse in a manner as wayward and free as that which characterized Mr. Wegg, who, as all will remember, professionally "declined and fell, and, in a friendly way, dropped into poetry" for the edification of good Mr. and Mrs. Boffin. The editor of this veracious chronicle finds that in our own midst we have a number who write lines of considerable merit, but so numerous are his friends who have

"Sighed o'er Delphi's long deserted shrine,"

that he will not attempt to give the names of these "celebrated composers," lest he may make some errors in fixing the authorship. In a little book which lies before us we find the following:

In theory the city line
May be considered very fine;
But to be gobbled every day,
And from my post be sent away,
And shifted till I'm tired, I vow,
A victim of caprice, I "swow,"
Is not so fine, you'll all allow;
But to imperious Fate I bow.

Though my young years do count but few,
It seems as if the Wandering Jew
Had in me found his modern mate—
For ever has it been my fate,
Not only eight days out of nine
To wander 'bout the city line,
But on the ninth to wander back,
And at "En" to take a crack.

Now Downer orders me on six—
'Tis always in a fearful mix—
And then I'm sent on fifty-one,
A place I love to rest upon;
But Fate conspires, and soon I pine
Again upon the city line.

And so it's been "from childhood's hour,"
"I never loved a tree or flower"
But off I wandered like a star,
Always "so near and yet so far."

A night man, who worked on the "Eries" before Mr. Smith went on the "South," tells his experience in the following manner:

"SUBBING" ON THE WEST.

When you work upon the "West,"
Oh! minions of the night,
Have a care for Smith, the chief.
If you tend to biz, however,
You are sure to be all right;
But don't go prowling round,
Or you'll surely come to grief.

One dingy afternoon I engaged myself to serve
For one Harris, who with Erie No. 7 had to do;
And I strolled about the room my spirits to preserve,
And passed my time away in "chinning" one or two.

But no matter where I went I met Gerrit everywhere;
And he smiled a funny way, and propounded me this query,
Till I "tumbled to myself," as our friend Melotte would say,
"Let's see, how's this, ain't you working 7 Erie?"

Yes, ye minions of the night,
When you "scoop" in the broad day,
Skin your orb for Smith, the chief.
If you tend to biz, however,
You are sure to be all right,
But don't go prowling round,
Else "Ain't you—Erie"—grief.

From the "Line Men's Book" for last year we take the following:

When men are sent out on the wires
Armed with a coll, and spurs and pliers,
With care the chiefs will, in this tone,
Note when they start, and when come home.

If'er they should o'erstay their time,
And make their claims they had to climb
The largest pole within the town,
The chiefs will also note this down.

But if the fragrance of the cup
Should spoil their tale of climbing up,
The same will on this record go,
That Captain McIntosh may know.

A branch office man amused himself on New Year's Day, which he put in at "No. 145," evolving the appended, which was found on the back of a blank on the table where he had been put down "to do his working."

This winsome, gladsome, gay New Year,
Sans whiskey, brandy, wine or beer,
Is quickly passing while we're here
Hard working.

I know this life is one of woe—
At least I've always found it so—
But yet I cannot blame the Co.
For working.

For if I had in seventy-three
Saved spondulix sufficiently,
I could have hired a sub, you see,
To do my working.

But this is but a vain regret:
Yet during seventy-four, you bet,
I'll steadily keep out of debt
And save my money.

In parting with his desk diary an operator waxes sentimental, and, with a lingering, longing look, he relinquishes it with the following very creditable verse:

Adieu, old book! thy work is done!
Thy record of this busy wire
Is all complete, and on my lyre
A parting song I sing. Adieu!
Adieu forever that long, endless day
Which brings no hope! Away! away!
And now again farewell;
"And if forever, then forever
Fare thee well."

Here is a little one for a cent, which was floating around at Christmas:

To add to the joy of your Christmas bliss
I hereby send you an electric kiss.
May it gladden your heart and brighten your eye
Till I exchange it for a real one bye-and-bye.

[From the *Iron Age*.]

Automatic Semaphore R. R. Signals.

To the Editor of the *Iron Age*.

THE article describing Robinson's Electric Railroad Signals, in your paper of January 8th, contains some statements calculated to convey an erroneous impression in regard to the origin of the system of operating automatic semaphoric signals, by making use of the ordinary rails of the track as electric conductors. After giving three distinct and very excellent reasons why the so-called wire systems previously in use "are extremely limited in their functions, and may, under certain circumstances, show a safety signal when the danger actually exists which they are designed to avert," you add: "Mr. Robinson early recognized the above serious objections as inseparable from the wire system of signaling, and his efforts to overcome them have resulted in the present rail system."

In reply to this statement I would say that in February, 1870, I was employed by Mr. A. E. Beach, of the *Scientific American*, to arrange an electric signaling apparatus for the Broadway Pneumatic Railroad. The car was driven by a stationary blowing engine, and it was necessary to automatically give a signal to the engineer when the car reached the remote end of the tunnel, so that he might reverse the blower. I connected the battery to the rails in such a manner that the wheels of the car would complete the circuit and operate an electric bell during its passage over a certain section of the track. This apparatus was in operation for some months, and was seen by hundreds of people. It subsequently occurred to me that the same principle might be applied to ordinary railroads, and I found by calculation that it ought to be practical to convey an electric current through a line of fish-jointed rails for at least two or three miles, even in wet weather. I tested this idea in the summer of 1870, on the line of the New Jersey Railroad, for a distance of between one and two miles, and proved by actual experiment that a strong current could be conveyed at least that distance, and a magnet operated without serious difficulty. Having satisfied myself in regard to this fundamental point, the arranging of a signal to be controlled by the magnet was obviously a matter of no great difficulty. I was then actively engaged in other business, which I disposed of in May, 1871, in order to develop my proposed system of signaling. I worked out the details of my plan, and, on the 19th of September, 1871, I filed an application for a U. S. patent, in which I proposed to use the rails in sections of a mile or more in length—of the practicability of which my earlier experiments had satisfied me. By November I had made a successful experiment on a New England railroad, where the apparatus remained for some months, and was examined by a considerable number of people. In

this experiment I employed the rail circuit in combination with both a stationary alarm and a semaphoric signal, and, so far as I can ascertain, I was the first to do this.

It seems quite certain that up to about this time Mr. Robinson had not the slightest conception even of the possibility of operating signals successfully by rail circuit; for, in an article published over his own signature in the *American Artisan* of September 6, 1871, he says: "Albert Horwood received a patent in 1861 for a device in which he used three insulated rails, about as long as ordinary rails; these he placed longitudinally between the rails of the track. Two upright bars on the engine came in contact with these rails, closed the circuit, and operated the instruments at the station. It was only necessary that a careless laborer should connect two of the insulated rails by a shovel full of moist earth, or that a mischievous boy should place a wet stick across them, in order to operate the instruments at the station. This, of course, is an insurmountable difficulty in this invention."

If Mr. Robinson at this time supposed that a single wet stick laid across the rails would operate the instrument, it is reasonable to suppose that the idea of operating a signal through a mile of rails, connected together by 2,640 "wet sticks"—which is actually the case in the rail system on a rainy day—must have appeared to him so wildly absurd as to be utterly unworthy of consideration! Even so late as November, 1871, Mr. Robinson was still at work endeavoring to perfect his wire system and lever circuit closers, after my application for a patent on the rail circuit had been before the office for nearly two months. But on the 6th of December, 1871, after accounts of my experiments had been published, and had become a matter of common report in railroad circles, Mr. Robinson also applied for a patent on the rail circuit, differing from mine only in the arrangement of the connections, so that the magnet would be unmade instead of made by the passage of the train. My patent was granted July 16, 1872, and reissued October 21, 1873, and covers broadly the combinations above referred to. I certainly have no desire to detract from any credit that may be justly due Mr. Robinson; but, as a matter of justice to myself, it seems proper to make public the above statement of facts.

Very truly yours,
FRANK L. POPE,
Engineer Electric R. R. Signal Co.,
38 Vesey street, N. Y.

January, 23, 1874.

A Noble Opportunity Lost.

We have now in progress, in the City of New York and elsewhere, several massive and imposing structures, which, though belonging to private individuals or corporations, may, nevertheless, from their position and the objects for which they are intended, be justly regarded as public buildings. Prominent amongst these is the building which is now being erected at the corner of Dey street and Broadway, in this city, for the use of the Western Union Telegraph Company. In its proportions and the massiveness which characterizes every part, it promises to be one of the finest structures in the city. There is no sham work about the materials or the mode in which they are put together. Some idea may be formed of its size when we say that it is very nearly one half larger than the well known building of the Equitable Life Insurance Company; that there are ten stories, the height to the top of the pavilion roof being 174 feet, while the top of the clock tower, which, by the way, is to be accessible, is 216 feet above the level of the sidewalk. As a means of comparison, we may also state that the height of the spire of Trinity Church is 286 feet. The material is granite, brick and iron; and, from the well known wealth and liberality of the company, it is to be presumed that the architect has been untrammelled by any considerations of mere cost. The object was to produce a structure in which might be transacted the business of one of the richest and most important corporations in this country or in the world—a corporation whose relations to the public are as intimate and as extended as those of the post-office itself; and whose functions, whether under Government control or in private hands, can never be dispensed with. It does not require any elaborate argument, therefore, to show that a building suited practically and aesthetically to the purposes of such a corporation should present a massive and imposing appearance; that it should depend for its effect rather upon a grand simplicity than upon intricate tracery, and that the colors should be quiet and subdued. And now what has the architect given us? Something which can be compared to no other object so well as to a gigantic barber's pole, with horizontal instead of diagonal stripes! Every passer by who possesses the slightest degree of correct taste, must be disgusted with the bizarre appearance presented by this structure, and must regret beyond measure the loss of the fine opportunity that was there presented for the erection of a building that would have done us credit.—*Industrial Monthly*.

Decision of the Postmaster General Regarding Government Messages.

POST-OFFICE DEPARTMENT,
WASHINGTON, D. C., January 16, 1874.

SIR: Your letter of the 13th instant states that in consequence of a difference in construction of the rules established by this department, relative to the computation of distances, your accounts for Government messages have in some cases been subject to reduction; that messages between St. Paul and points on the Plains have to go by way of Chicago, and thence to Omaha and destination, involving repetitions, while the post route may be nearly direct; that all messages for the Pacific Coast have been sent to San Francisco, and re- sent from that point; that you charge from Washington to San Francisco 3,123 miles, and from San Francisco to San Diego 517 miles, making 3,640 miles or 15 circuits, while you are allowed only for the direct distance from Washington to San Diego, 3,199 miles, or 13 circuits; and inquires whether it was the design of the Department to limit the compensation of telegraph companies to air-line distances.

In section second of the act approved July 24th, 1866, being the act under which the rates of telegraphing are fixed by the department, it is enacted that telegraphic communications between the several departments of the Government and its officers and agents, shall "in their transmission over the lines of said companies" have priority, etc. This language itself defines the route; that is, that it is to be "over the lines of the companies;" and, consequently, excludes the idea of air line distances or routes over which there are no telegraph lines. I consider, therefore, that the companies may properly charge for the distance actually traversed by the message, although the mail route may be more direct. While the direct distance from Washington to San Diego is less than that by way of San Francisco, the latter route is the usual course of the mail, for the reason that it is the most convenient and expeditious in point of time. While I think it is right that the companies should charge for the distance over their lines, I hold that where there are two lines between the same points they are not to be allowed to subject the Government to unnecessary expense by charging for the greater distance.

Very respectfully,
Your ob't servant,
(Signed), JNO. A. J. CRESWELL,
Postmaster General.

LEONARD WHITNEY, Esq.,
Manager Western Union Telegraph Co.,
Washington, D. C.

The Western Union Chicago Office.

THE City of Chicago has 75 miles of poles and 700 miles of wire (of Western Union proper) within the metropolitan limits, with 68 branch offices—28 regular Western Union and 40 Metropolitan. The main offices occupy a large portion of the block on the southwest corner of Washington and La Salle streets. In the basement are the District Superintendent's offices and the receiving department; on the second floor the General Superintendent's office and the office of the Associated Press; and the entire fifth floor, one hundred feet square, is occupied by the operating department. The wires are brought into the building on a new plan—being carried from the poles above the neighboring blocks to a central tower, through which they drop down in a circular cluster to the operating room. They already number 250, and the tower has a capacity for 750 wires. The wires are for the most part steel covered with copper. On entering the tower they strike the "lightning arrester," by which the atmospheric electricity is carried off to the ground. The wires are exposed in their whole length after entering the building, facilitating changes and repairs. Attached to each wire is a metallic tag, corresponding to another on the corner poles, giving the title of the wire. There are connected with the operating department two battery rooms, which the wires enter in a cluster. In the local battery room there are two jars to each instrument worked, giving increased force and louder sound, enabling the operator to read by ear. In the main battery room are five separate batteries—the largest of 60 cups, the smallest of 25—from which all the wires are worked. The transition from the quiet of the battery department to the din of the great operating room is no more striking to the ear than impressive to the imagination. This room is never closed; every moment, all the year round, and from year to year, the scores of instruments are vocal with their sign language, and the tones of each are lost in the incessant hum of all. Here are ninety-five employes, busy day and night—about fifty constituting the operating day force—these little instruments, making audible the omnipresence of this electric potency; through them day uttereth speech unto day, and night unto night showeth forth knowledge, until now there is no language or land where their voice is not heard.

The "ends of the earth" are here literally brought together, and here meet and mingle the thoughts and purposes of men separated by all the oceans and continents of the earth.—*Chicago Railway Review.*

The Electric Telegraph on the Gold Coast, Africa.

A LARGE number of men, of all colors, castes and creeds, are employed under the Royal Engineers in the construction of the land telegraph lines on the Gold Coast. Wherever it is practicable trees are substituted for telegraph posts without cutting them down. By means of the light wire and small insulators sent out from Henley's Telegraph Factory at North Woolwich, these men, with no other tools than a light ladder, large gimlet, a handsaw and axe, can complete six miles of line per day when the way is tolerably clear through the bush. The number of insulators and tree posts per mile varies according to the nature of the ground. The average on level ground is eighteen intermediate and three straining posts per mile, which makes a span of eighty-four yards, and on hilly and difficult ground there are as many as twenty-six posts to the mile, and, in exceptional instances, there are spans of two hundred yards. The telegraph apparatus employed in the Gold Coast expedition against the Ashantees is the invention of Sir Charles Wheatstone, and is contained in a compact box, thirteen inches long, eight inches broad and seven inches deep, the weight of the whole being under twenty-five pounds. The electric power is derived from a permanent magnet within the instrument, a constant series of currents from which is obtained by a rotation of a small iron armature placed before its poles and turned by a handle in front. The signals are made by successive depressions of lettered finger keys arranged round the dial plate. By means of these instruments camp and field messages can be transmitted, at the rate of twenty words per minute, a distance of one hundred or two hundred miles. The object in erecting the field telegraph is that of making known the enemy's position or numerical strength, to order arms and reinforcements from distant stations, and to control any military and strategic movements found necessary in the war on the Gold Coast with the Ashantees. It is the first time field telegraphy has been employed by the English in actual warfare.

No notice will be taken of anonymous communications.

Congress and the Telegraph.

WASHINGTON, D. C., Feb. 4.

TO THE EDITOR OF THE TELEGRAPHER.

OUR friend Mr. Gardner T. Hubbard was afforded an opportunity to reply to the arguments of Mr. Orton before the Senate Post-office Committee last week, and repeated his arguments and statistics in favor of his scheme for establishing a private telegraph monopoly in company with the Government, with which the "constant reader" of THE TELEGRAPHER is so familiar. It is hardly worth while to reproduce them at this time. The committees of Congress and the public are so thoroughly weary of the subject that the recent discussion has attracted very little attention here, as is manifest from the fact that although the hearings before the Senate Committee were public, the newspaper correspondents and reporters did not honor them with their presence, and they have been accorded the briefest possible notice in the reports of the Associated Press.

Our amiable friend Gohright, the manager of the Associated Press bureau here, despite his desire to accommodate all who have "items" to communicate, looks glum when Hubbard or the postal telegraph are mentioned, and would, no doubt, with characteristic piety, were it not for his repugnance to saying or doing anything that could give offence, pray "Good Lord deliver me" from any further knowledge or mention of this threadbare subject. As for the other correspondents and reporters, they quietly ignore the whole matter, and if it is brought to their notice, are compelled at once to leave in pursuit of an item or an "interview" which cannot be neglected for a moment. It must be confessed that your correspondent, and, I doubt not, most of your readers, have a similar feeling, but THE TELEGRAPHER, as a telegraphic journal, must be kept informed on all matters pertaining to the art or business.

The Senate yesterday adopted a resolution authorizing the presiding officer to appoint an operator for the Senate wing of the Capitol for the departmental telegraph line.

In my communication of January 12th it was stated that arrangements had been made for the transfer to the Western Union Telegraph Company of all the weather reports, etc., of the Signal Bureau. This arrangement has been consummated, and from and after last evening this business, which has heretofore been divided between the Western Union and competing lines, will all be done over the former. The consolidation of the Pacific and Atlantic lines broke up some of the circuits as previously established, and made it very inconvenient for the bureau to transact its business, and interfered with the prompt transmission of some of the reports, so that the change was rather forced upon the chief signal officer. This is another demonstration of the necessity for a consolidation of the lines and interests competing with the Western Union into one organization, and the extension of the system until it becomes really national, and able to compete effectively for the telegraph business of the country. CAPITOL.

An Oregon Telegrapher's Trip.

ALBANY, OREGON, January 16.

TO THE EDITOR OF THE TELEGRAPHER.

"A LONG time I no see you," as our Mongolian neighbors say.

Since our last we have been off on a "trip for our health," over the Puget Sound country, and if the items enclosed are of any interest to the readers of our paper, they are welcome to them.

January 1st we left Albany and struck down the R. R. to Portland, thence down the mighty "River of the West" for Kalem, W. T., the headquarters of the Pacific Division of the Northern Pacific R. R.

Arriving there in company with Mr. Sheridan, W. U operator, we found friend Fagan in charge of the R. R. office. We gently intimated that we were not averse to accepting a pass to Tacoma (the terminus) and return. He opened his heart, and in a short time we were in possession of two pieces of paper that are a "g-o-o-d thing to travel on."

Leaving Kalem we started down the bank of the Columbia River, and thence up the Cowlitz through a country that could with the greatest of propriety be called well wooded, watered, and very "billy." The road is a splendid piece of work, but how it is to be supported from the country around and adjoining is more than we can imagine.

A sixty mile ride brought us out into the first prairie we had seen since leaving Kalem, and six miles more to Tenino, the point we "lit out" at, as we wanted to visit Olympia, the capital of the Territory.

Horror! At Tenino we found that to reach Olympia a stage ride of sixteen miles awaited us. We started out in the most awful snow storm I have ever seen on this coast, and, to make it worse, it was freezing hard. This was nice for Oregonians who knew little or nothing about snow and ice!

Olympia was finally reached after four hours' ride over a terrible mountain road. This is a very pretty little town of 2,500 inhabitants. It is situated at Budd's Inlet, an arm of Puget Sound, one and a half miles below the extreme head of tide water. There is a great deal of business done here. Stepping into a telegraph office we found Mr. H. H. Pitts, a pleasant gentleman and first class telegrapher, in charge.

Sunday morning at 8 o'clock, by the steamer Zephyr we started down the Sound—giving up our proposed trip to Victoria and British Columbia on account of severe weather. After visiting Steilacoom, the oldest town in the territory, we reached Tacoma, the "terminus" of the N. P. R., so much talked about, where we take the first through passenger train from Puget Sound to the Columbia River.

Here on Puget Sound is to be found some of the largest saw mills in the world, cutting from 60,000 to 150,000 feet of lumber each day. Ships are continually loading here for all parts of the world. The Tacoma mills keep in active operation, for their own use, a line of telegraph from Tacoma to Steilacoom, where it connects with the through wire. The Puget Sound Telegraph Company was organized for the purpose of connecting all the different mills on the Sound and local business, and is doing well.

There is bound to be a big city somewhere on this Sound, as the water is very deep, averaging from 60 to 200 feet up to within 20 or 30 feet of the shore; and, as it is protected by hills from high winds, it makes the finest harbor known; and, for size, all the ships that sail the seas could be put inside this harbor. If any of our eastern operators want to "invest," let them watch the progress of things, and put their money in the *to be* city of the United States—so the Puget Sound people say.

At Tacoma the Railroad Company have built a large depot, buildings, offices and hotel. I understand that in the spring the headquarters will be moved to Tacoma from Kalem.

Our old friend, J. B. Whittlesey, is manager, and is managing to exist on a "hundred a month." "Whit" is an old timer, and looks just as he did years ago.

when he used to give "Webfoot" H—lifax for breaking in on press, when the aforesaid "Webfoot" was "beginning" on the old string from Portland to San Francisco.

A splendid double wire line has been thoroughly built from Kalemo to Tacoma, under the supervision of Mr. F. W. Lamb, formerly Superintendent of the fourth district of the W. U. Telegraph Company.

The following are the operators on the N. P. R. R.: Kalemo—C. E. Fagan, chief operator and Superintendent, *pro tem.*—no train despatcher or Superintendent having been appointed as yet. Cowlitz, Edward Valiere, agent and operator; Oleque, Edward Stevens, agent and operator; Tenino, Chas. C. Hogue, agent and operator; and last, but not least in size or ability, J. B. Whittlesey, Tacoma.

For favors received on this little run we desire to return our sincere and heartfelt thanks to Chas. D. Faling, Superintendent Telegraph, O. & C. R. R., Portland, Oregon; C. E. Fagan, chief operator, and Gen'l J. W. Sprague, Gen'l Supt. N. P. R. R.; C. C. Hogue, Tenino, and J. B. Whittlesey, Tacoma.

Boys, as ye have done unto me so shall it be done unto you if you ever come my way; and the remembrance of your kindness will ever be fresh in the memory of

WEBFOOT.

Inspection of the Arizona Military Telegraph Line.—A New Consolidated Office.

SAN DIEGO, CAL., Jan. 10.

TO THE EDITOR OF THE TELEGRAPHER.

THE pressure of business has been so great lately as to interfere with my purpose of keeping THE TELEGRAPHER posted in regard to telegraph matters in this section of the country. At length I have been able to find a few moments of leisure which I can devote to you.

Capt. George F. Price, of the fifth Cavalry, U. S. A., is now on a tour of inspection of the new military line connecting Arizona with San Diego.

The offices of the Western Union and United States military telegraphs here have been consolidated, and placed under the management of Mr. W. E. Smith. A handsome office has been fitted up for their joint occupancy. The receiving and operating room, are all in one, with a sleeping room in the rear, and another room for the battery, near the latter.

The operating room is fitted up with Boston tables, with the wires run under the floor, so as to be out of the way and out of sight. Upon one wall of the operating room there is a splendid chromo (thirty-six by thirty inches) of Stanley's Indian Telegraph, which represents a scene near Gila Bend, Arizona Territory. On a high pedestal of rocks on the eastern bank of the river two Apache chiefs are seen—one signaling with a flaming, smoking torch, while the other watches for the reply seen curling up in the dim distance. The air in Arizona is so clear that these signals can be seen for a long distance; in fact, one of the main causes of defeat of the United States soldiers operating against the Apaches has been the information of their coming conveyed by this system of visual telegraphy. The new Morse telegraph line has rendered this system of little use to the Indians in the future. With the aid of the telegraph we will be able to keep peace in the rich but Apache cursed territory of Arizona.

Upon another wall is exhibited a handsome lithograph of the new Western Union New York office, now in course of construction, surmounted by a bracket supporting the bust of Prof. Morse. Upon the other walls are displayed a view of the San Francisco Western Union office, several locomotives of Eastern railroads, etc., pleasant reminiscences of old times to the employés and others.

Altogether it is the neatest and most completely fitted up telegraph office I ever saw—combining the conveniences and improvements which have been from time to time introduced into different offices. It is a comfortable and attractive office for the employés as well as the public, and calculated to make the former contented, and willing to remain permanently where they are so well situated.

The citizens generally are greatly pleased with the improvement, and consider it a credit to their young but important and growing city. More anon.

CLIX.

How Two R. R. Telegraph Supt's Conspired to Fleece a Victim.

NEWARK, N. J., Jan. 31.

TO THE EDITOR OF THE TELEGRAPHER.

THE communication from "Centripetal," in your last issue, and your editorial comments upon the "Conspiracy to Oppress Telegraph Employés," brings to mind a sample of the policy pursued by the Superintendent of an important railroad telegraph line in this vicinity.

At the junction of the Central Railroad of New Jersey

with the Delaware, Lackawanna and Western R. R. an operator was employed who performed joint duties for both companies, and drew a portion of his salary from each. The Central R. R. paid him \$25 per month, and the D. L. & W. \$35, making a grand total of \$60 for thirty days, of twelve hours each. The former operator retired from this lucrative position after saving up a sufficient competency to provide against want in his old age. But his successor being in more of a hurry to get rich, endeavored to secure an advance of \$10 per month from the Central R. R. His avarice hastened his downfall, for it brought to the immediate attention of the Superintendent the fact that his salary was even then \$10 above the standard adopted for men in his position. In order to restore the equilibrium his monthly stipend was reduced to \$20 per month on the part of the Central R. R., and the Supt's doubtless thought that he could easily induce the Supt of the D. L. and W. to cut away a corresponding slice from the salary paid by that Company. In this he was for a time unsuccessful, but by continued perseverance, worthy of a better cause, he eventually succeeded beyond his expectations, the D. L. and W. Co. reducing his pay to \$25, leaving him the munificent sum of \$45 per month. It is a source of gratification to be able to state that the young man shortly after secured a position on another line, and has thus escaped from the combination which endeavored to swindle him out of \$15 per month.

I hope you will not overlook the fact that in this instance it was only through the connivance of the officials of two different companies that this result was accomplished. One of these worthies acts also as an assistant to D. H. Bates, and hereafter, when you have occasion to work out a problem of meanness, you can adopt as your formula, Eckert, Bates, Fuller—mean, meaner, meanest.

REDLIGHT.

Topics of General Telegraphic Interest Discussed.

TO THE EDITOR OF THE TELEGRAPHER.

THE correspondence columns of THE TELEGRAPHER are read by myself, and probably by most of those who receive the paper, with great interest, and although the ideas of some of the writers are crude and not well considered, they are all valuable as reflecting the opinions and sentiments of those practically engaged in telegraphic pursuits. The policy of the paper in giving to all an opportunity to be heard, and to make known their views and sentiments, is undoubtedly the true one, and is one of the reasons for its popularity among the practical telegraphers of the country.

It must be confessed that lately I have not taken as much interest as formerly in the discussion of the Telegraphers' Association question, as there seems to be little that is new to be said, and no indication of any real purpose or determination to establish a new organization. Until some flagrant and general system of oppression of the fraternity is developed, it is not probable that any effective movement in that direction can be successfully made. On the abstract proposition that such an organization or association, carefully and intelligently devised, would be advantageous to the employés and employers, there is, probably, among the practical thinking members of the fraternity, little diversity of opinion; but this seems not likely, for the present at least, to take practical shape. So long as no one is prepared to take the lead in such an organization, I, for one, cannot see any prospect of its being established.

The matter of insufficient and inadequate compensation of telegraphic employés has occupied, I would be afraid to estimate how many columns of THE TELEGRAPHER.

It seems to me, however, that most of those who write upon this subject take a very partial and limited view of it, and do not usually generalize upon it at all. They seem to look at and consider only individual cases, and that usually their own, and do not take into account the fact that in averaging compensation of employés telegraph managers have many things to consider. While it is true that in many cases telegraph employés are insufficiently compensated, in more the individuals concerned receive much more than they could obtain in other employments. Telegraphy, of late years at least, has not apparently proved very remunerative to the investors in telegraph property, and it is a question whether commercial telegraph companies can afford to pay higher salaries than they do. The trouble, it appears to me, is not that the amount expended in telegraphic salaries is inadequate, but that it is not properly apportioned, some receiving more than their ability and proficiency entitle them to, while others are underpaid. One of the principal advantages to be derived from a telegraphic association would be, by cooperation between employés and managers, to classify situations, operators and salaries, so that they should be more properly arranged than at present.

There are other subjects which have been and are being discussed in the columns of THE TELEGRAPHER and among operators which I should like to consider, but probably sufficient space has been occupied for the

present. If this communication is favorably received, I may hereafter offer you some further considerations on topics of general telegraphic interest for publication.

PRACTICAL TELEGRAPHER.

Telegraphers Not so Bad as Represented.

TO THE EDITOR OF THE TELEGRAPHER.

AS I HAVE just finished reading THE TELEGRAPHER, and turn back the leaves, my eye falls upon the communication with the signature of "Nettie Bronson," and of course, I have to read it again. I heard it said by a brother operator last night that he should not be much surprised if that was a fictitious name for some young operator that wanted to be a girl, but could not, so he assumes a girl's name. Now, if the writer of these communications is truly a girl, I look upon them with admiration, and have no doubt but what I would also admire the bearer of that name if I could see her. If the writer is some male operator with that signature, he is very low, in my estimation, and is unworthy of being recognized by his brother operators; but I trust and hope no person so frivolous ever learned the art of telegraphy. What Nettie says about drinking, chewing and smoking is perhaps true in her case, as far as she knows, but I do not think she is acquainted with telegraph operators very extensively, for I know several that neither smoke, chew nor drink, and I think can all say *No* with courage equal to that of — myself, for instance. I neither smoke, chew nor drink, and, in fact, never was the possessor of any of those filthy articles which, when used by man, make him a beast. If I have been asked to drink and smoke once I have been asked the same question a thousand times, and, thank God, I have the courage to say no unflinchingly, and without the least hesitation, and always have had that courage, and trust and hope I always will. Our friend "Frankie" would feel taken down a little if Nettie should happen to be an old maid of about thirty-five, for she must be getting pretty well along in years, and wants to get married pretty badly, or she would not be so particular about his being married. I am sorry to hear that Miss Nettie talks of bidding us farewell on account of financial troubles. If she cannot really afford to take THE TELEGRAPHER, I will be one of eight persons to send it to her for a year, for the sake of hearing from her occasionally. I believe that hers is the only lady's signature that I have noticed lately in THE TELEGRAPHER, and would be very sorry to lose the pleasure of reading her articles (if a lady she is) for the small sum of twenty-five cents. If any brother operator is willing to help send her this noble paper, let him respond through its columns, and I will be on hand.

ELIAS.

Bounty Land Warrants to Army Telegraph Operators.

TO THE EDITOR OF THE TELEGRAPHER.

ABOUT a year since, during a session of Congress, we saw many communications printed in THE TELEGRAPHER and *Journal* in relation to the subject of a Government grant to military operators who served during the late civil war. The correspondence suddenly ceased, since when not a word has been published or spoken of the matter. Was the subject definitely disposed of at that time, and the verdict rendered that army operators were not entitled to any Government recognition? Why are all the army boys so silent?

There are hundreds scattered all over the country, who served the Government faithfully, and endangered their health and lives by exposure, and many who not only nobly faced hardship and exposure, but so gallantly stood at their posts of duty amid the whistling bullets on many fields of battle. Are not these men, who so faithfully served their country, and whose services were, in many instances, greater than whole regiments, entitled to a hundred and sixty acres of land?

I would like to hear from my former companions-in-arms upon this subject, and ascertain if a petition cannot be successfully circulated.

We have good friends at Washington, who would do their utmost in our behalf.

AGITATOR.

The Northwestern and Northern Pacific Telegraph.—Bulls.—An Incredulous Wife.

NORTHERN PACIFIC R. R., Jan. 27.

TO THE EDITOR OF THE TELEGRAPHER.

NOT seeing anything in THE TELEGRAPHER of late from this part of the universe, perhaps it would be as well to let the fraternity know that we have 225 miles of wire, well put up, and scientifically repaired when necessary, "by one H. S. Lyle." Mr. O. C. Green is Superintendent for the N. W. Telegraph Co., and has charge of over 600 miles of wire. He is a kind, gentlemanly fellow, and highly esteemed by all of the N. P. operators and his numerous friends outside of the lightning department.

(Continued on page 35.)

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, FEBRUARY 7, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will commence with the number for SATURDAY, JANUARY 30, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The New Volume of The Telegrapher.

IT may be of interest to the many friends of THE TELEGRAPHER scattered throughout the country and the Dominion of Canada, to learn how the new volume has been received, and what its prospects are. It gives us pleasure to be able to state that its reception has been all that could reasonably be desired, and that the prospects of the paper were never better than at the present time. The new subscriptions have more than made good those which expired at the close of the last volume, and we are daily receiving assurances, which are most gratifying, that the paper is appreciated and its general course approved by those in whose interest it is published.

The series of articles commenced by Mr. F. L. POPE, in the first number of the present volume, on the "Elementary Principles of Electrical Measurement," have met with very general and warm approbation. These will be continued for some months to come, and will afford instruction and information which will be of great value to every telegrapher.

We have also made arrangements for contributions from other able writers, scientists and expert telegraphers, of series of articles on practical telegraphic subjects, which will be not less valuable than Mr. POPE's, and will add to the (we think we may say without egotism) high reputation of THE TELEGRAPHER as a scientific and practical telegraphic organ.

Of course, all these cost money, but we rely confidently upon the support which has never yet failed us, from those interested in telegraphic pursuits, to bear us out in any reasonable amount of expenditure in maintaining a first class telegraphic journal, which shall be a credit to the telegraphic fraternity of the United States and Canada, whose organ and representative it is.

We shall publish next week a carefully prepared article, discussing the comparative advantages of the differential and bridge systems of duplex telegraphy. This is a matter of much importance, and has of late given rise to a great deal of discussion among practical telegraphers throughout the country. This will be found of much value and interest.

These articles will be illustrated by all the necessary cuts and diagrams, to enable them to be readily understood, even by telegraphers who have not been so fortunate as to obtain any special scientific education.

We would ask that our friends will call the attention of their associates and others to the character of THE TELEGRAPHER, and continue to aid us in securing for it a constantly and rapidly increasing circulation.

Telegraph Inventions and Inventors.

THE litigation of the extraordinary patent granted to the late Prof. PAGE under the special Act of Congress, which by no means contemplated anything of the sort, is likely to reopen the discussion and investigation of the claims not only of the patentee but of others who have occupied a prominent position as telegraphic inventors. Hitherto these investigations have only been pursued so far as was required to serve the purposes and interests of the contestants, and until the expiration of the earlier patents it was not deemed advisable to invalidate them—which would result in making the telegraph business free and unrestricted to everybody. It is, perhaps, needless to remark that this reason does not now exist, and therefore, in the present litigation, the whole subject will be necessarily most thoroughly and exhaustively considered, who ever may suffer therefrom.

It is the purpose of the present owners of the PAGE patent to reestablish a monopoly in telegraphing in this country, which will assuredly be accomplished if the validity of that patent, as reissued, should be judicially sustained. It was supposed that, with the expiration of the patents granted to Prof. MORSE, there no longer existed a possibility of restricting or making tributary any telegraphic interest. Those patents, or the more essential and important of them, had expired by regular limitation—had been extended and renewed, and having reached the utmost term which could be granted to them, except by special legislation, had become public property. Whether rightfully granted or not, they had been acquiesced in and tribute paid under them to the patentee, and those holding through or under him, to a very large amount. The effort to enforce them against the Bain Chemical and House Printing Telegraph Systems had, it is true, failed, but neither of them ultimately proved very formidable rivals, and the value of the patents had proved to be very great. As before remarked, they had become public property, and there seemed to be no longer any obstacle to their actual realization as such by the people.

The desire of Congress to do honor to Prof. PAGE, as a scientific and worthy American citizen, who had, it was contended, been unjustly deprived of the credit which was due him as the real inventor of what is known as the Rhumkorff coil, and of certain other inventions in magneto-electrical devices, led to the passage of the act under which the patent which is now attempted to be enforced was issued. There is abundant evidence in the act as passed, and in the discussion in both the House of Representatives and the Senate, on its passage in those bodies respectively, that at that time there was not the slightest intimation, suspicion or intention that it should apply to telegraphy in any way. There is no evidence that even up to the time of his death Prof. PAGE had any idea or intention of making the telegraph interests of the country tributary under his patent. As a matter of fact he died in pecuniarily straitened circumstances, and his last days were troubled because he had been unable to make suitable and adequate provision for his family. Subsequently to his death an attempt was made to dispose of the patent for a valuable consideration, the price asked for it being a half million of dollars, but no purchaser could be found at any price. It was offered to its present owners, the Western Union Telegraph Company, who had it carefully investigated by experts and by the best legal talent, and rejected it as worthless and valueless. How it was subsequently purchased by that company, and for what purpose, the readers of THE TELEGRAPHER are tolerably familiar with.

It has since been reissued so as to cover essential telegraphic devices more completely—the Patent Office officials apparently deeming it incumbent upon them to grant anything that is asked in the name of their late associate, and the attempt is being made to establish judicially its validity.

The effect of the success of this attempt we have already pointed out, but it cannot be kept too prominently in view of those interested. It renders all telegraph interests in the country tributary to the owners of the patent for years to come, and it would in that event undoubtedly prove the best investment which has been made in patents for a very long time. This would be no argument against it if its claims, or those made under it, were legal, just and equitable; but they are not, and if contested, as they must be, they can never be so declared by any court.

As was stated at the beginning of this article, this litigation will lead to a thorough and exhaustive investigation of telegraphic inventions and patents during the last forty or more years, and will be likely to alter materially the assignment of honor and credit for such inventions from what they now are. It will undoubtedly prove that to Prof. JOSEPH HENRY, of the Smithsonian Institute, more than to any other single person, living or dead, belongs the honor and credit of the discoveries, and inventions which have made the American

system of telegraph practical and successful. The principal devices described in the PAGE patent were known, demonstrated and described, some of them years before Prof. PAGE, as those who hold under him claim that he discovered and invented them.

To no one man or nation belongs the honor of inventing the electric telegraph. As was better stated in a "Condensed History of the Electric Telegraph," prepared by Prof. VAN DER WEYD for and published in the *Manufacturer and Builder*, which was reprinted in THE TELEGRAPHER for March 8th, 1873, than we can do it:

"The electric telegraph is a forcible illustration of the power of accumulated human intellect. During several centuries scores of the most ingenious men have, by assiduous investigation, discovered facts upon facts—succeeding generations standing mentally on the shoulders of their ancestors, till, finally, one century ago the first real electric telegraph was born in that centre of political liberty and inventive genius, Switzerland.

One of the first duties in science is to 'give honor to whom honor is due;' as latter brilliant inventions tend to eclipse former more valuable discoveries on which they are based, and as even the names of former great investigators and laborers in the field of scientific progress become forgotten, we think it highly useful to give here a kind of chronology of the discoveries on which our knowledge of electricity, and the subsequent series of inventions which culminated in the modern electric telegraph, are based. It will show the reason why Switzerland, Germany, France, England, America and even Russia claim this invention—while the fact is that they all had their share in it, and that no single nation, and much less no single individual can lay any other claim than having taken advantage of the investigations of others, and perhaps sometimes added some novelty, very trifling when compared with the knowledge inherited from predecessors. It also illustrates the truth of one of Prof. Tyndall's sayings in one of his recent lectures here, that the scientific investigators are the real workers, discoverers and inventors, of which patent applicants take advantage. In this respect we cannot omit calling attention to the historical fact that Prof. Joseph Henry stands foremost in preparing the way for the realization of the invention in question, which, after his labors were finished, required scarcely a single step forward."

As experience for many years past has shown, and as all who have to deal with telegraphic interests are aware, there is practically no end to the inventions and discoveries, or what are supposed to be such, that are constantly being brought forward. Enthusiasts are constantly deluded with the idea that they have made remarkable and valuable discoveries and inventions (and not unfrequently succeed in deluding others into a similar belief) which, upon investigation, turn out to be either old, or, at the best, merely rediscoveries, or else practically worthless. There has been such an active and exhaustive investigation into electrical science and telegraphic inventions that the field has been pretty well cultivated. We do not mean to say, or wish to be understood as intending that there is no possibility of any further valuable and novel discoveries and inventions in this department, but that the chances are that what is claimed and believed to be new is not so, and that proper investigation will generally save useless expenditure of time and money, and, perhaps, cruel disappointment in the end. As an instance of a very numerous class of such supposed inventions, we might cite a case which recently came to our knowledge, where a callow scientist and telegrapher wrote to an electrical expert of an invention which he had made, which must come into general use and prove very valuable, and proposing that he should take an interest in it, and get the patent for the invention for him. A description and sketch of the invention was included in the letter, which proved to be nothing more than a *common electrical bell!* of which thousands are probably made and sold every year. We have no doubt but that the same is true of almost every important or unimportant department of art and industry, but our attention has naturally been particularly attracted to electrical and telegraphic inventions and patents.

It is not our purpose to trace the invention of the telegraph, or to show how it was slowly developed until it has reached its present state of perfection. We merely desire to attract attention to this subject of tele-

graphic inventions and inventors that our readers may fully understand the litigation which is going on in regard to the PAGE patent, to which, it is probable, we may be obliged to refer frequently for some time to come.

Telegraph Messengers in Uniform.

WITH the commencement of the present month the messengers employed in connection with the delivery department of the Western Union Telegraph Company in this city, numbering about 130, appeared in a new uniform, neat and comfortable in appearance. This regulation is a very good one, and should have been adopted, and has been attempted to be introduced once or twice before, but was abandoned on account of the opposition of the messengers themselves to it.

The uniform adopted consists of a cap of the Prussian undress service, edged with scarlet, and a button or metallic rosette with the name of the company on the front. The clothing is of dark blue pilot cloth, well made and warm, the surtout buttoning close up to the neck, with a leather belt round the waist, bearing the name of the company. On the belt is attached a long leather pouch, in which to place the messenger's book and messages.

The public will soon become familiar with this uniform and its advantages will be apparent, while we can see no reason why any messenger should object to its use while on duty.

It would be well for each company doing business here to adopt a distinctive uniform for its messengers, so that persons who may receive despatches may be assured, when a message is received, of the office or line from which it comes, and that the person presenting it is duly authorized to receive replies, if any be required, and that they will be promptly returned to the office. We could suggest an addition which we think would prove of service in many cases—that each messenger have conspicuously displayed a number by which he may be identified, if it should become necessary or desirable.

(Correspondence continued from page 33.)

Mr. C. M. Greene is our Division operator. Clem is a fine fellow, kind and accommodating, and yet withal a good disciplinarian. We are a happy lot of boys out west, and highly fortunate in having such able and gentlemanly officers.

Here is a telegraphic bull, related to me by the victim: S telegraphs from Z to his son at — to send him his two horse collars. Judge of his amazement on the arrival of the train to find his two horse colts on board instead of the "collars." The telegraph boys paid the freight both ways, and told him to say no more about it. Another operator at J— takes a message to Mrs. R—. She inquires who the message is from? "Why," says J—, "from your husband." "No, it can't be," says she "because I know his writing, and it don't look like that; you are trying to fool me." All of J—'s arguments seemed to be of no avail, until he told her that her husband would certainly be on the train, and expecting to see her. That closed the affair. She went, found her better half, and has often wondered why J— should try to make her believe it to be from her better half, when she "knew his handwriting well enough." N. P.

A Defence of the Telegraphic Fraternity.

TO THE EDITOR OF THE TELEGRAPHER.

I FEEL it my duty to say a word in defence of telegraphers as a class, after reading such terrible assertions as some of your correspondents have made in regard to their moral character. One of the laws of nature is that "Water always finds its level." So it is with individuals; they take their position in society just where they belong, as naturally as water finds its level, whether telegraphers or others. Now, if there is in some locality some telegraphers who do not bear a good character, must that necessarily place an indelible stamp on the whole fraternity, as consisting only of such characters? I am happy to say that on *this* line the telegraph operators, as a class, are respectable, intelligent and influential men, who are at the head of all good enterprises in society. Some have even said it was useless to try to elevate the moral standing of this fraternity. We are truly thankful all are not of that opinion. (Our worthy editor, for one, is not.) If I was to gratify my passions, I would say these are the very ones to start with, and the best method of elevating

them would be to set them up in the *boot and shoe business*, which, at least, would have a strong tendency to elevate them. S. L. C.

Personals.

Mr. C. O. MCGREW has been appointed operator of the United States Military Telegraph, at Mountain Springs, Cal.

Mr. JOHN GIFFORD has been appointed operator U. S. Military Telegraph at Stanwix Station, Arizona Territory.

Mr. JOHN W. STRAUCHEN has been appointed operator of the U. S. Military Telegraph at Wickenburg, Arizona Territory.

Mr. C. W. GEARHEART has been appointed operator of the U. S. Military Telegraph at Maricopa Wells, Arizona Territory.

Mr. R. H. HOWE has been appointed operator of the U. S. Military Telegraph at Tucson, Arizona Territory.

Mr. MAURICE GOLDWATER has been appointed operator of the U. S. Military Telegraph at Phoenix, Arizona Territory.

Mr. THOS. E. ATKINSON has been appointed operator of the U. S. Military Telegraph at Yuma, Arizona Territory.

Mr. WM. B. ELLISON has been appointed chief operator of the U. S. Military Telegraph, with headquarters at Prescott, Arizona Territory.

Mr. C. P. ADAMS, telegraph operator and station agent of the Grand Trunk Railroad, at Gotham, N. H., has resigned, and accepted a similar position with the Central Pacific R. R. at Corinne, Utah.

Mr. J. WILLSON UTT, formerly extra telegraph operator on the Lehigh Valley Railroad, has been tendered and accepted the office of chief operator in the office of the North Pennsylvania Railroad Company, at Front and Willow streets, Philadelphia. This is a good appointment, as Mr. UTT is an excellent operator and intelligent gentleman. No appointment has yet been made to the position on the L. V. Railroad vacated by Mr. UTT.

The Telegraph.

A Practical Test of the Automatic Telegraph System.

ON the evening of January 27th last the Automatic Telegraph Company made a demonstration of the actual working of their system, in answer to the criticisms and statements of President William Orton, of the Western Union Company, in his letter to Postmaster General Creswell of December 27, 1873. There were present from the Western Union Telegraph Company Mr. Geo. B. Prescott, the electrician of the company in New York, and Mr. Leonard Whitney, manager of the Western Union office in Washington. Several other gentlemen, not connected with either company, were also present in the New York and Washington offices.

The matter transmitted was the President's Message and the Spanish Protocol attached, numbering 11,130 words.

The operation of punching the matter on the strips for transmission was commenced in Washington at 5:39 P. M., and the document was copied complete in New York at 6:48 P. M., occupying in all but 69 minutes—against 70 minutes—the time occupied by the Western Union Company in its transmission. The average time was 55½ minutes—against 59 by the Western Union.

But one wire was used by the Automatic process, while the Western Union used eight.

The persons employed were ten perforators, thirteen copyists and two Morse operators, while the Western Union Company employed sixteen expert Morse operators on their eight wires. The average pay of perforators and copyists is stated to be \$40 per month.

This is claimed to be a complete refutation of the statements made by Mr. Orton, and especially the assertion that it would require seventy-eight persons to do this work automatically in the time employed by the Western Union Company.

West India and Panama Telegraph.

A SPECIAL general meeting of the shareholders of the West India and Panama Telegraph Company was held in London on the 14th of January, at which the directors of the company resigned, and a new board, comprising Sir James Anderson, Mr. H. Weaver, Mr. C. W. Earl, Mr. W. Ford and Mr. H. Holmes, was unanimously elected.

This company has been unfortunate, and the shareholders believe, badly managed, which created much dissatisfaction, which was manifested by the fact that the number of proxies placed in the hands of the com-

mittee of shareholders, who have been endeavoring to effect a change in the management, were six to one, placed in the hands of the old board of directors.

The meeting adjourned till the Wednesday following, at the office of the company to complete the election.

Foreign Telegraphic Notes.

The directors of the Globe Telegraph and Trust Company have declared a dividend of 3s. per share—being at the rate of 6 per cent. per annum upon the preference shares of the Company.

The Anglo-American Telegraph Company has declared a balance dividend of 2 per cent.—being, with that previously paid, at the rate of 6 per cent. per annum for the eight months ended the 31st of December, 1873. The Company, after the payment of this dividend, will remain with a cash balance of about £250,000, besides about 900 miles of spare cable. The annual general meeting will be held at the Loudon Tavern, on Friday, February 13th.

The total number of messages forwarded from postal telegraph stations in the United Kingdom, during the week ending January 10th, 1874, was 313,696, an increase on the corresponding week of the previous year, of 38,355.

The Eastern Telegraph Company have announced the opening of their new lines from Otranto, Italy, to Zante, Greece, and from Zante to the Island of Candia. Messages should be marked, "Via Zante direct;" and the rates to Greece will be the same as by the old route via Volo. This company also announce that they are prepared to accept messages for Para, Bahia and Rio Janeiro, to be posted from Lisbon to Pernambuco, and telegraphed thence to their destination.

The traffic receipts of the Submarine Telegraph Company for December, 1873, amounted to £7,798 against £7,466 for the corresponding month of the previous year.

The total traffic receipts of the Great Northern Telegraph Company, during the month of December last, amounted to 287,137f. (£11,485), and for the month of December, 1872, to 204,752f. (£8,190). The receipts on the European lines amounted to 142,938f., against 106,294f. in December, 1872; and on the China and Japan lines, to 144,198f., against 98,458f. in the month of December, 1872.

Reuter's Telegraph Company has announced that telegraphic communication is restored between Shanghai and Hong Kong.

Telegraph wires now extend from Copiapo to the Arancaian frontiers of Chili.

The government of Salvador has had to pass laws, with severe penalties, against those who destroy the telegraph wires. It has been found that the people are apt to cut off long pieces of the wire, and use them as strings to dry clothes on.

The Bishop of Pampaluna, in Sautander, Bogota, has given his blessing to the Electric Telegraph there, and, in his address to the people, begged them to respect the invention as being necessary for the progress of society.

The telegraphic line lately constructed and connecting Valparaiso, Chili, with Malvoa, Angol, Nacimiento, Chiguaihue, Callipulli and Mulchen, has been in working order.

Telegraphic and Electrical Brevities.

SCIENTIFIC TELEGRAMS.—Last year Professor Henry, of the Smithsonian Institute, secured the privilege of a free exchange of scientific information—such as the discovery of new planets or comets—over the Atlantic cable. The Western Union Telegraph Company has agreed to send such despatches free of charge over all parts of the United States. The French telegraph companies have offered the same privileges, and recently the Director of the Russian Imperial Telegraph consented to the same arrangement.

The Western Union Telegraph Company have obtained an injunction against the Manhattan Telegraph Company, restraining them—the directors, etc.—"from in any manner molesting, injuring, obstructing, or interfering with any telegraph pole, line or wire owned or used by the plaintiff, and from erecting or constructing any telegraph pole, line or wire at or between any point or points on any side of any street, avenue, square or public place in the city, at or between which point or points any telegraph pole, line or wire is now or shall hereafter be erected or constructed by or for the plaintiff."

The cable laid in 1869 across the straits at Cape Canso was fouled in December by the anchor of a vessel, and parted. The difficulty of laying a cable there in the winter season is very great—the current running

eight knots an hour, and huge masses of ice sometimes wedging up in a night the whole passage. However, Mr. George Robinson, who has charge of repairs there, gathered up a number of spare pieces of cable at Plaster Cove, joined them carefully, and on the night of January 25th succeeded, after much toil, in laying it and restoring communication.

Mr. F. A. ABBOTT, a witness for the defence in the case of John J. Kiernan vs. the Manhattan Quotation Company, of this city—which is being heard before Rufus F. Andrews, Referee, being charged with stealing the plaintiff's news—refused to answer the question as to how he obtained news for defendant, and was sent before Judge Lawrence for contempt.

The shares of the Atlantic and Pacific Telegraph Co., and of the American District Telegraph Co. have been placed on the list of the New York Stock Exchange, and there is already considerable dealing in them.

Gov. Straw, of New Hampshire, has conveyed to the United States Direct Cable Co. the right to use 4,000 feet of land at Straw's Point, near Rye Beach, N. H., for the use of the ocean telegraph cable now being manufactured in England for that company. The grantees are to erect and maintain substantial and comely buildings, and the land to be used only for the purposes indicated in the deed of conveyance.

A Telegraphic Defaulter.

MR. BYRON W. BARNARD, who, under the name of William Bernard, was at the time employed in the Cincinnati, Ohio, Western Union office, volunteered during the pestilence which raged so fearfully at Shreveport, La., last summer for service in the Western Union office there, which offer was promptly accepted. He was given the management of the office, and escaped the pestilence, only to prove a defaulter and swindler. In two months he had squandered all the company's funds in his possession, swindled his assistants by obtaining their receipts for salaries which had not been paid, and nearly sacrificed his life in a fit of *delirium tremens*. This is not the first of his swindling transactions, and, however commendable may have been his conduct in volunteering for what may be called a forlorn hope, he is not entitled to pity or commiseration.

Buchanan and Saville, who also volunteered for this service, fell victims to the disease, and sad as must their fate be regarded, it was far preferable to that of Barnard, who has thus recklessly wrecked the chance which was afforded him for redemption.

The Postal Telegraph Debate.

THE Gardiner Hubbard and William Orton Debating Society has been revived at Washington, and held meetings before the Senate Post-office Committee yesterday and the day before. Their theme was the novel one of the Postal Telegraph. The subject will be continued indefinitely for some years.—*Springfield Republican*.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended January 13, 1874, and bearing that date.

No. 146,421.—ELECTRIC SHIP ALARM. James B. Andrews, New York, N. Y. Application filed November 6, 1873.

Deviation of compass operates a circuit closer controlling an alarm.

In combination with a magnetic needle or bar, suitable means adapted to be influenced by any change in the relative position of said needle with the ship, and an alarm device for denoting such change, substantially as hereinbefore set forth.

No. 146,444.—ELECTRO-MAGNET. Hippolyte Fontaine, Paris, France. Application filed, October 2, 1873.

A magnet formed of a series of thin flexible metallic blades, strips, or their equivalent, assembled and bound together by pieces of copper, soft iron, or malleable cast iron, substantially as shown and described.

No. 146,463.—TELEGRAPH RELAY. Sandford Howard Lombard, Winona, Minn. Application filed November 28, 1873.

Movement of armature invariably shunts one coil entirely, and a determined portion of the other out of circuit.

1. In combination with a relay a shunt circuit to a portion of its coil, brought automatically into action by the movement of the armature to the magnet, and an additional shunt adjustably connected thereto by a switch, substantially as set forth.

2. In combination with the shunt circuit *h*, the switch *D*, and connections *e e'*, substantially as described.

3. The combination of the contact point *a'*, conductor *a*, post *C*, switch *D*, points *e e'*, conductor *h*, and armature lever *b*, constructed and arranged substantially as described.

No. 146,490.—ELECTRICAL APPARATUS FOR SHIPS' REGISTERS. Niles H. Thompson, Albion, Mich. Application filed December 24, 1873.

Register chart moved to correspond with deflections of needle through electrical apparatus controlled by a circuit made and broken by needle.

1. The combination, with a magnetic needle, of an electrical circuit and circuit closers (the circuit closers being arranged to

indicate any deflection of the needle), and devices operating to remove the circuit closers from contact with the needle.

2. The combination with a registering apparatus, of a magnetic needle, and an electric circuit controlled by said needle operating to convey any deflections of the needle to the registering apparatus, substantially as set forth.

Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

One Distinctive Feature of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDER made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. BOX 496.

American Compound TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time ensuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

GEO. W. STOCKLY,

Sec'y and Treas.,

No. 4 LEADER BUILDING, CLEVELAND, O.

DR. L. BRADLEY,

No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter with a huddled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1/800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1/150th to the 1/300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

NEW YORK, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.

BALTIMORE,
MANUFACTURERS OF
ELECTRICAL AND TELEGRAPH INSTRUMENTS
AND
Material of Every Description,
RELAYS, KEYS, SOUNDERS, COMBINATION SETS, &c., &c.
Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,

Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK,
Sept. 22d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,
A. S. BROWN, Manager

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.
Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

THE BEST TELEGRAPH MATERIAL

INSTRUMENTS furnished Nickel Plated at 20 per cent. advance on List Price.

OFFICE WIRES, from 80c. to \$1.25 per pound.
GUTTA-PERCHA COVERED WIRES, all sizes.

BISHOP'S NEW COMPOUND COVERED WIRE, for running into offices, 4c. per foot.

MAGNET WIRES, in Silk and Cotton, at Factory prices.
INSULATED WIRES for special purposes made to order.

SILK COVERED SWITCH CORD, one, two or more conductors.
PATENT MESSAGE HOOKS, the best ever introduced, prices 65c. and 75c. per dozen.

MANIFOLD PAPER and AGATE STYLUS at bottom prices.
CABLES AND SUBMARINE WIRES.

REPAIRERS' TOOLS and TOOL BAGS.
GLASS AND RUBBER WINDOW TUBES.

KENOSHA AND OTHER INSULATORS OF EVERY DESCRIPTION.

BRACKETS, PINS and SPIKES.

HILL, CALLAUD, GROVE, BUNSEN, CARBON, DANIELLS, LECLANCHÉ, NITRO-CHROMIC AND OTHER

STYLES OF BATTERY in ANY QUANTITIES.

PURE CHEMICALS AT LOWEST PRICES.
SULPHATE OF COPPER A SPECIALTY, AND PRICES VERY LOW.

CARBON PLATES made to order for Grenil, Smee, Stohrer and other Batteries.

OFFICE FIXTURES and BATTERY UTENSILS OF EVERY DESCRIPTION.

"Smith's Manual of Telegraphy," - - - 30 cents.

ALL STANDARD WORKS on ELECTRICITY & TELEGRAPHY.
SOLE AGENTS FOR

RICHARD JOHNSON & NEPHEW'S CELEBRATED LINE WIRE.

Catalogue and Price List furnished upon application.

C HARLES WILLIAMS, JR.,
109 COURT STREET, BOSTON, MASS.,
MANUFACTURER OF
TELEGRAPH INSTRUMENTS
OF ALL KINDS,
GALVANIC BATTERIES,
JONES' PATENT LOCK SWITCH,
PATENT ELECTRIC GONGS,
PRINTING TELEGRAPH INSTRUMENTS.
ALSO, ON HAND AND FOR SALE,
D. W. PUTT & CO.'S Mechanical Telegraph
Instruments,
"Pope's Modern Practice of the Electric Telegraph,"
AND A FULL ASSORTMENT OF
TELEGRAPH MATERIALS AND SUPPLIES.
AT THE LOWEST PRICES.

C ANADIAN TELEGRAPH SUPPLY
MANUFACTURING COMPANY,
MANUFACTURERS OF
All kinds of Electrical Instruments
AND
TELEGRAPH SUPPLIES.
All orders promptly filled, at reasonable prices.
Office and Factory,
352 and 354 KING STREET, WEST,
Toronto, Ont.

W ESTERN ELECTRIC
MANUFACTURING COMPANY
FURNISH ALL DESCRIPTIONS OF
Copper Office and Magnet Wire,
OF OUR OWN MANUFACTURE,
WITH
EVERY VARIETY OF INSULATION,
FINE RESISTANCE WIRE and DOUBLE and
SINGLE CONNECTING CORD.
Western Electric Manufacturing Company,
CHICAGO.

C HARLES WILLIAMS, JR.,
(ESTABLISHED 1856.)
109 Court Street, Boston,
has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

E UGENE F. PHILLIPS,
MANUFACTURER OF
REED & PHILLIPS'
PATENT INSULATED TELEGRAPH WIRES,
(PATENTED, NOVEMBER 18TH, 1873.)
Lock Box 169. PROVIDENCE, R. I.
Having recently enlarged our factory, we are now prepared
furnish at short notice any style and quantity of
BRAIDED LINEN or COTTON COVERED WIRE,
saturated and finished with our Patent Compound, which makes
the most durable, handsome and best insulated Braided Wire
manufactured.
PAINTED, PARAFFINE or SHELLAC WIRES
also furnished at the lowest prices. Iron or Compound Wires
covered upon reasonable terms.
- We are also prepared to furnish a new style of
ELECTRIC CORDAGE,
which has been pronounced by all superior to any in the market.
The American District and Gold and Stock Telegraph Compa-
nies have been supplied from my works with a greater
portion of the office wire used by them.

Sample Card and Price List furnished when requested.
Phillips' Wire can be had of
L. G. TILLOTSON & Co. New York.
CHARLES T. CHESTER "
F. L. POPE & Co. "

GEORGE H. BLISS & Co. Chicago.
General Superintendent's Office,
AMERICAN DISTRICT TELEGRAPH CO.,
NEW YORK, January 1st, 1874.

E. F. PHILLIPS, Esq.
Dear Sir: Your office wire is a decided success. We have
used it exclusively for two years and consider it the best in the
market.
Respectfully,
W. H. SAWYER, Gen'l Sup't.

J OSEPH MOORE & SONS,
(Established 1820.)
535 & 537 CHINA STREET,
(Below Green St.,) PHILADELPHIA, Pa.,
MANUFACTURERS OF
INSULATED WIRES.
OFFICE WIRE—Plain, Braided, Prepared, &c.
INSTRUMENT WIRE—Cotton and Silk Covered, &c.
FLEXIBLE CORDS, all kinds, &c., &c.
We warrant all Wire to be of the highest conductivity, tested
by our Galvanometer, which compares with the tests of the
highest authority in this country.

T ILLOTSON'S EXCELSIOR
TELEGRAPH INSTRUMENT.

(PATENTED JUNE 24, 1873.)
This apparatus is constructed of the best material, and finished
equal to any Telegraph Instrument, and is warranted first class
in every particular. It is especially adapted to the require-
ments of Students of Telegraphy and the operation of Private
Telegraph Lines.
Price, complete, Sounder and Key mounted on finely
finished Mahogany Base, with one Cell Hill's Patent
Battery, with Chemicals, eight feet of Office Wire, and
"Smith's Manual of Telegraphy" \$7 50
Two sets 14 50
Price of Sounder and Key only 6 50
" " " with Cut Out and Lightning
Arrester attached 7 50
SEND FOR CIRCULAR.

23 MURRAY STREET, N. Y.

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a bona fide Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished
ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

A COMPLETE OUTFIT FOR A TELEGRAPH OFFICE,
Seven Dollars and Fifty Cents.

Two Sets, complete..... \$14 50
Sounder and Key only..... 6 50
" " with Cut-out and Lightning Arrester... 7 50

We will pay expressage on Amateur Outfits when price is remitted in Advance.

SHAFFNER'S
TELEGRAPH MANUAL.
TO TELEGRAPHERS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some Six Hundred and Twenty-five Illustrations in the Edition of 1859, and the present coming Edition will contain at least One Thousand, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
78 and 80 Broadway,
NEW YORK.

MODERN PRACTICE OF THE ELEC-
TRIC TELEGRAPH.

A HAND-BOOK

FOR

ELECTRICIANS AND OPERATORS.

By FRANK L. POPE.

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND

FULLY ILLUSTRATED.

THE BISHOP GUTTA PERCHA WORKS,
422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
ONLY MANUFACTURER
OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,
Cotton and Gutta Percha covered, with any number of conductors
required.
Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR
BLASTING AND MINING PURPOSES.
In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable. Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.
CABLES OF ONE MILE OR LESS manufactured and de-
livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.
Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
any Telegraph Cable or Wire manufactured at the Works in New
York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods manu-
factured by me, at Factory Prices, delivered in New York.
Any Goods manufactured (except Telegraph Goods) are for
sale in New York by

SARGENT & STUDLEY, 26 Park Place,

THE TELEGRAPHER

A JOURNAL OF ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, FEBRUARY 14, 1874.

VOL. X. WHOLE No. 396.

Written for THE TELEGRAPHER.

A Psalm of (the Telegrapher's) Life.

BY J. H.

Tell me not, in mournful numbers,
Telegraphing is a dream;
For the "plug" should die that slumbers,
Or reads by the tape machine."

For 'tis real, ditto earnest—
Imperfection's not its goal;
Plug thou art, and plug remaineth,
Was not spoken of us all.

Others writing should remind us
We can make our writing fair;
And our breaks be no more numerous
Than a good receiver's share.

Let us, then, begin to practice,
Making each our sphere in life;
Still achieving, still pursuing,
Shun contention, wrangling, strife.

MAUCH CHUNK, Pa., February 9.

* The Morse recording apparatus is referred to.

Original Articles.

The Bridge vs. the Differential Duplex.

BY F. L. POPE.

IN THE TELEGRAPHER of July 12, 1873, was published a description of the Stearns Duplex Telegraph, arranged on the differential plan, which had at that time been in successful operation for more than four years, first on the lines of the Franklin, and more recently upon those of the Western Union Telegraph Company. Within a year past another form of duplex apparatus, upon a different principle, also invented by Mr. Stearns, has been largely introduced upon the Western Union lines. The patent for this latter system, which is known as the "bridge duplex," was granted November 12, 1872. It involves the principle of the well known electrical balance, or Wheatstone bridge, the respective resistances being so adjusted as shunt the outgoing current around the receiving relay, leaving the latter in a neutral condition, ready to be affected solely by the current arriving from the distant station.

Although the "bridge duplex" has always been a great favorite with the electricians and managers of the Western Union Company, judging from the number of them that have been placed on the lines, the opinion of the practical telegraphers who actually do the work has almost uniformly been strongly in favor of the differential system, the general impression being that the latter worked much better than the bridge instrument under unfavorable conditions of insulation. As this is a matter of a good deal of practical importance, a short discussion and comparison of the principles involved in the question will be of interest to the readers of this journal.

The accompanying diagram will serve to illustrate the arrangement of circuits in the bridge system. Only one terminal station is shown, the opposite station being its exact counterpart in every particular.

One pole of the main battery, E, is connected with the ground, and the other with the lever of the key K. A supplementary lever, K', is so arranged at the back of the key lever that when the latter is depressed contact is made between K and K' before it is broken between K' and P—the effect of which is to keep the latter connected direct to the ground, except when the battery E is inserted by depressing the key. When a current is thus sent from the battery E it divides at H, one portion going through A to the line L, and the other going through B and the rheostat X to the ground. The relay R—which is of the ordinary kind—is placed in a circuit between F and G, called the "bridge wire."

The circuits being thus arranged, it will be obvious to any one familiar with the principle of the bridge, that when the various resistances are arranged in the following proportion:

$$A : B :: L : X,$$

no current will flow through the bridge wire F G, and consequently the relay R will not be in the least affected by the outgoing current.

On the other hand, if the line current be increased by the closing of the key at the opposite end, the addi-

tional current arriving at F will divide—part going by A to H, and part going through the relay R to G and thence through B to H, where it joins the first mentioned portion, and the reunited currents go through K' to the ground. A portion also diverges at G and passes to the ground through X.

Now, if we carefully examine the diagram, we shall find that, in order to send the greatest possible portion of the current into the line, the resistances of B and X should be as large as possible in comparison with the resistances of A and L. Again, the most favorable proportion of resistances for receiving is the one that will cause the greatest proportion of the current to pass through the bridge wire F G and relay R. In order to do this we must make A as great as possible in comparison with R and B.

It will, therefore, be evident that the best arrangement for transmitting is the most unfavorable for receiving, and vice versa, and that in practice it is necessary to find the most advantageous compromise between these antagonistic conditions.

A series of experiments, made by inserting a tangent galvanometer in the bridge wire instead of a receiving relay, have shown that the best results are attained when the proportion between the various resistances corresponds with the figures given in the diagram, or A = 1,000, B = 500, L = 4,000, X = 2,000, R = 500.

These figures are the same as those given in an article describing this system published in the *Journal of the Telegraph*, Sept. 1, 1873.

Taking these, therefore, for our basis of calculation, let us ascertain how much current can be made to pass through the relay in order to record the incoming signal.

The joint resistance of the two routes from G via X and B is $\frac{2000 \times 500}{2000 + 500} = 400$. Add the relay resistance,

500, and we have 900 as the total resistance of the relay route between F and the ground. The resist-

ance of the branch A is 1000; therefore the current dividing at F will give the relay 1/3, or .526—only a little more than one half of the current received from the line at F. But the current has already been divided at the sending station and two thirds sent to ground through B and X, leaving only one third to go to line, which, upon reaching F at the receiving station, is again divided, the relay getting but one half of this, or only about 16 per cent. of the entire current leaving the battery at the sending station, even under the most favorable circumstances.

It is not practicable to increase the sensitiveness of the receiving relay by substituting one of lighter resistance, because by so doing a greater proportion of the current is forced through the branch A, and the amount passing through the relay correspondingly diminished. On the other hand, if an attempt be made to lessen the resistance of the relay, the current passing through it is indeed increased, but the number of convolutions in the helices is lessened, and the magnetic effect diminished in the same ratio.

The proportion of the current arriving at the receiving station, which is given in the above calculation, will ordinarily be still further diminished by leakages on the line, and it has been found in practice that the bridge system can scarcely be worked at all on a long line in wet weather. Efforts have been made to increase its efficiency by "piling on more battery"—the usual panacea for badly working lines—with substantially the usual result—that of increasing the escape and adding to the general misery.

When we compare the results of the two duplex systems, we find that they may be summed up as follows: In Mr. Stearns' first system—the differential—50 per cent. of the current leaving the battery at the sending station reaches the receiving relay; while in his second system—the bridge—only 16 per cent. reaches the same point. One of our leading electricians thinks that "it would be difficult for any one to devise a more beautiful and ingenious and at the same time utterly useless improvement, than Mr. Stearns has given us in his bridge duplex." The great intrinsic merits of the differential system have

enabled it to triumph over the numerous obstacles that beset it, and its success has now become an established fact. It is certainly somewhat singular that such a persistent effort should have been made on the Western Union lines to supersede it by a system so radically inferior in every respect as that which has just been described.

The Telegraphs and Telegraphers of a Quarter of a Century Ago.

BY OLD TELEGRAPHER.

THE telegraphic reminiscences which appeared in THE TELEGRAPHER some months since, prepared by the writer, called forth some very interesting communications from telegraphers relating their early experience. The subject is by no means exhausted, and it is to be hoped that we shall have more of them. Those who have engaged in the telegraph business within comparatively a few years past, have but little appreciation of the difficulties and disadvantages which their predecessors experienced when the telegraphic art was comparatively novel, and electrical science but imperfectly understood. The practical operation of telegraphs then was, to a considerable extent, a groping in the dark, and even the best qualified for their duties but imperfectly comprehended the nature of the problems which were daily presented to them for solution.

The theories which were from time to time propounded, and the efforts which were made to demonstrate practically their correctness, involved the sacrifice of a considerable amount of the capital invested, and retarded rather than promoted telegraphic progress and success.

The surface theory, so called—that is, the theory that electricity was propagated on the surface of the conductor rather than through the mass—at one time had many adherents, and the old New York and Boston House line (as was stated in THE TELEGRAPHER of March 15, 1873), was constructed on this theory. Instead of a single conducting wire, seven small wires were mechanically twisted together, and the twisted iron cord was stretched between the two cities. When new this did not materially interfere with the transmission of electric signals, as the three wires in effect formed a single conductor. In a short time, however, these small wires became oxidized, and the resistance to the passage of the signal must have been something enormous. As galvanometers for testing resistance were then but little known, the amount of this resistance cannot now be stated, but that it sadly interfered with successful telegraphy those who were then required to operate the lines very sensibly appreciated. The actual cause of the difficulty experienced was not understood at the time, but that it existed was painfully evident to everybody concerned. Another difficulty, arising from this peculiar construction of the conductor, was, that it became so thoroughly oxidized and consequently weakened that it was constantly being broken; and one of the most important qualifications of an operator was to be an expert line repairer. The line was built upon the highway, and every office had in its monthly accounts a heavy outlay for horse hire and for teams engaged to transport the operators in the search for "breaks." The number of operators employed, especially in the way offices, was very limited; and it was customary, when a break occurred between any two offices, for the operator in each to close his office and "go out on the line." It was a very common thing for customers desirous of forwarding messages to find, upon going to the office for that purpose, that it was closed, and a paper stuck upon the door announcing the fact that the operator had gone out to repair the line; or, perhaps, a messenger in charge, who coolly informed them that the line was down and the operator would "probably be back to-morrow." How much business would a telegraph line be likely to obtain, or retain, if a similar policy were now pursued?

The advantage to the company of such a policy was twofold. First, the expense of this system of repairs; and, secondly, the loss of business from the time the line was repaired until the return of the operator from a tour of from twenty to forty miles by team. This system of line repairing was continued for several years, and until the business became more extensive and more thoroughly systematized. The printed instructions issued to the managers and operators of a line upon which the writer was employed as late as 1855-56, among other things directed them, when the line was "down," to take the fastest horse that could be obtained and proceed to repair the difficulty and return to their offices with all possible speed, so as to be ready for business.

Telegraphers were not averse to this system, although it at all times imposed upon them severe labor. They used to have certain points of meeting, and made their excursions occasions of very pleasant remissions, which otherwise would have been of rare occurrence.

Another fallacy, which was almost universal, was when there was any difficulty in working the lines, that did not amount to a total interruption of conductivity, to pile on battery in order to force the sig-

nals through the wire. The Grove battery was considered the only one suitable for telegraphic purposes, and every operator was expected to know how to set up and take care of the battery. In none but the largest offices was there a person whose special duty it was to take charge of the battery, and every office was expected to have on hand an extra battery, to be added to the regular battery whenever there was an increase of the ordinary escape, which at all times, except in very dry or very cold weather, was considerable. The writer has frequently, when in charge of a large office, directed the battery man to add fifty to seventy-five cells of Grove battery to the very large batteries always used, in order to work through escape. Although even now making but small pretension to scientific knowledge, he would know that in such cases a reduction rather than an increase of battery would be likely to prove advantageous. At that time, however, even those who made considerable pretension to electrical knowledge, believed that adding to the battery power was the proper thing to do when troubled with escape of the electric current. The increase of the capacity of the conductor, and more careful insulation, have so largely decreased the necessity for battery that a large saving in this item of expenditure has been made. That this is capable of being still further economized there can be no doubt, and when, as in course of time must inevitably be the case, telegraph lines are more thoroughly insulated than they are even now, the waste of battery will be reduced to the minimum, as it is now on some lines.

The characteristics of the old time telegraphs have already been touched upon in previous articles by the present writer, and by others who have supplemented them by their interesting communications, which have appeared in the columns of THE TELEGRAPHER.

But few of them remain connected with the business. Many of them have said their last "good night," and have gone to their final account, where crosses, breaks and had insulation shall trouble them no more. Nearly the ordinary lifetime of a generation has passed since the time to which reference is here made, and naturally death has greatly depleted the number of those who, with high hopes and anticipations of what the telegraph was to become (which it may be truthfully said have already been more than realized), engaged in a business which possessed for them no ordinary fascination. They were mainly young men, and generally intelligent and enterprising, and, if their Bohemian style of existence had a tendency to somewhat demoralize them, they were usually faithful employes, and labored earnestly for the interests of the lines with which they were connected. That they had their faults it would be folly to deny, but their virtues also were great, and their love for their business and devotion to it was exceptional and commendable. There were undoubtedly some black sheep among them, but their failings and errors generally injured themselves more than others.

Those of them who are still connected with telegraphy generally occupy responsible positions, to which their long experience fully entitles them. Those by whom these lines may be read will recognize their truthfulness, and it is hoped will add their own experience and observation to the general fund, for the instruction and amusement of the generation which now manipulate the instruments, and has taken the positions as employes which they once held.

The writer looks back with interest and affection to the many years past, when he was one of the then limited band of telegraph operators, and to those with whom he was then associated. Nothing gives him more pleasure than to meet these old time friends, and again revive the memories of the past; and, as he recalls those who have gone from the joys, and sorrows, the successes and pleasures, and the troubles and tribulations of earth, he is saddened at the thought that he shall meet them no more in this life.

"After life's fitful fever they sleep well,"

and in a few days we too shall become but a memory of the past, and shall

"Take our places in the silent hall of death."

It is for us that remain that regret and sorrow should be felt. For those who have gone before us we should rather rejoice, because their warfare is ended. They have fought life's battle, and for them there is no further need of apprehension, of disappointment, suffering or trouble.

The telegraphs and telegraphers of the present day are unlike those which have been briefly and imperfectly depicted in these articles. In many respects there has been very marked improvement, but, in the ability and good qualities of the persons engaged in the business, the old time telegraphers will compare favorably with the generation which has succeeded them.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended January 17, 1874, was 328,946; an increase over the corresponding week last year of 45,267.

Resignation of and Presentation to Mr. Charles P. Hoag.

MR. CHARLES P. HOAG, chief operator of the Western Union Telegraph Company, of this city, having tendered his resignation, which was to take effect yesterday, as he was about to leave the office yesterday was called over to Mr. Urquhart's desk, where Mr. C. S. Cunningham, on behalf of the operators, addressed him as follows:

"Mr. Hoag—We were surprised when we heard of your determination to surrender the profession in which you have so brilliantly distinguished yourself, and grieved because we know and feel that we are losing a kind friend, and the company a most worthy chief operator. I wish my brother operators had selected one who could in words give you an adequate idea of their appreciation of you as a gentleman and an operator. During our association with you, your kind and gentlemanly deportment, your attention to your arduous duties, and your readiness at all times to consult the wishes and desires of those under you, have secured for you our love and confidence. Your even and cheerful disposition had a tendency to lighten our labors and create that harmony so essential in our profession; and we feel that when you depart we have lost a valued friend and a most agreeable associate. As a slight proof of our esteem we beg your acceptance of this chain and locket. Our only regret is that circumstances prevent us from tendering you something more valuable and worthy of the feeling which animates us. We hope you will wear it in remembrance of the happy days we have spent together—and that in your new and more responsible duties you will be equally successful in meriting public confidence and esteem. We wish you, your amiable wife and children, a long, happy and prosperous life."

Mr. Hoag, in a few well chosen remarks, thanked the operators, and concluded by saying that he had worked a long time for the company, but he would admit that this was the best "receiving" he ever did. Mr. Hoag is about to embark with his brother in the wind-mill business, an invention of their own, for which they have received a patent.—*Alta California.*

Suit Against the Western Union Telegraph Company.

THE Indianapolis *Journal* gives the following in reference to a suit for \$50,000 damages brought against the Western Union Telegraph Company by a man named Ericsson, a theatrical manager, the injury being received, as alleged, through an operator's divulging the contents of a message: "The theatre troupe over which Ericsson presided was playing an engagement at North Vernon, Ind., and became somewhat pressed for money. He telegraphed his brother for funds. The brother responded as follows: 'No money here. Hold fast to all you get. Come home. Be sure and bring my dog.' One of the company, having his suspicions aroused from some cause, came to the telegraph operator, and by representing himself as Ericsson's partner, succeeded in getting a copy of the despatch, on the strength of which he caused the manager's arrest and incarceration in the jail, where he remained for a brief interval of time. The complaint alleges that the plaintiff had in his employ a large number of 'stars,' secured at an enormous expense, was making money rapidly on account of the excellence of his company, and that upon his arrest the company disbanded, greatly to his detriment, financially and otherwise. His anguish of soul, during his stay in jail, he thought could be assuaged by the payment of a few thousands. Every item was set out with the most excruciating exactness in detail. Desirous of settling some questions of importance involved the suit in the highest courts. Mr. Wallick, the manager of the Western Division of the telegraph company, has succeeded in having the case transferred to the United States Courts of this district, where it will be decided, probably next term."

The Opposition to the Western Union Company.

THE New York correspondent of the *Daily Evening Traveller*, of Boston, Mass., writes to that paper in regard to the opposition to the Western Union Telegraph Company as follows:

"I don't believe you will be afraid to publish the fact, in this connection, that the Western Union is really menaced now by the most serious opposition it has ever encountered. A few years since this company had the Atlantic and Pacific and Franklin in its grasp, but in some way it has lost it. I think I could tell you how, but it is unnecessary. Now there is to be a struggle which will be far more serious to the Western Union than any it has yet encountered. In anticipation of this, the Western Union had already monopolized the Gold and Stock Telegraph Company, but have since almost lost that advantage by persisting in charges which brought the Manhattan Company into life, and now the American District Telegraph Company becomes an object of competition. This is a distribution telegraph by

messengers, which, I presume, your readers know all about, as you have it in Boston; but, in brief, it is the quickest and most convenient method of sending messages or packages ever invented, and, consequently, it is universally popular. The telegraph company which secures this will have an advantage in city distribution which can hardly be appreciated, except by those who have tried city despatches. The American District Telegraph Company, of New York, is the parent concern, and the District Telegraph Company, of Boston, Philadelphia, Chicago, St. Louis, etc., are offshoots. It is probable that the Western Union, from its great influence, will secure these lines, and finally incorporate them, and they are now negotiating; hence the advance of American District Telegraph stock lately."

Electricity.

WE stated, a short time since, that arrangements of an important character were pending, having for their object the development of electricity as a lighting and motive power. That this mysterious power is capable of being applied to many purposes of art, science and industry, has been already fully established, and there are yet many other purposes, at present only indicated, to which it may doubtless be applied with a success not less complete than that which has been achieved in the electric telegraph. For purposes of lighting our thoroughfares and public buildings, for lighthouses and ship lights, electricity has already shown itself to be thoroughly well adapted; and all that is required for its extended application to these purposes is that the matter should be taken up in a practical and business-like manner. In the departments of art and manufacturing industry a wide and at present comparatively unoccupied field exists for the application of this invaluable agent. In connection with the working of our railway system, with which we are more particularly interested, there would appear to be no reason why a very general economy might not be effected by the substitution of the electric light for the present expensive mode of lighting by gas. Night signals might be given by the electric light in the place of the oil and gas at present employed. Electricity is successfully employed, and may be still further extended in the communication, and for keeping accurate time on all the railway clocks; in railway trains it may be applied for purposes of railway breaks; and we believe the day is not far distant when even steam itself shall be superseded by electricity as a motive power.

Hitherto electric science has been treated too much in the nature of a philosophical toy, and its most eminent professors have been content to keep to themselves many of the brilliant results which they have obtained, and frequently overlooking, in the ardor of their scientific researches, the practical value of results which have been reached. One thing, at all events, in connection with electricity, has been fully demonstrated, which is, that it affords a cheap and efficient motive power. Enterprise has but to apply it to the many purposes to which it is adapted; but enterprise itself requires the motive power of capital. We are in a position to state that this essential has been provided. A company has been registered for the purpose of taking over the manufacture of all Sir Charles Wheatstone's inventions in electro-magnetic telegraphs, electro-magnetic clocks, mechanical clocks, with all the improvements connected with the patents. The company also take over the good will and stock in trade, and will apply the capital to be raised generally in "assisting and promoting the economic application and development of electrical power." The capital consists of the small sum of £30,000, the whole of which has been already privately subscribed. The subscribers to the capital signing the articles of association are Sir Charles Wheatstone, 19 Park Crescent, Regent's Park, W.; R. Sahne, Esq., 172 Great Portland street, W.; H. Kimber, 79 Lombard street, London; F. Braby, Mount Henley, Sydenham; Sir S. Canning, 7 Great Winchester street Buildings, W.; T. H. Puleston, 41 Lombard street, and W. Abbot, 10 Tokenhouse yard.—*The Railway News.*

Congress and the Telegraph.

WASHINGTON, D. C., Feb. 11th.

TO THE EDITOR OF THE TELEGRAPHER.

THERE has been no mention of telegraph matters in either house of Congress since my last week's letter was written. What the *Springfield Republican* humorously styles "the William Orton and Gardner Hubbard debating society," before the Senate Post-office Committee, seems to have substantially ended for the pres-

ent with Mr. Hubbard's reply to Mr. Orton's last speeches before the committee. Postmaster Burt, of Boston, Mass., favored the committee with his opinion that the messages could be delivered by the postmen as promptly as letters are now delivered, which it is to be presumed even Mr. Orton would not undertake to dispute, and this seems to have brought the performance to a close for the present. The committee has agreed to print the arguments and evidence on the subject, which will be a good thing, as private enterprise certainly would not undertake the job. Fortunately, although the committee may print, but few are compelled to read them, and so no great harm will be done. It cannot be denied that, however able and convincing these arguments and the evidence accompanying them may be, they lack the elements of freshness and novelty which would insure them a general perusal and consideration. Besides, as it is a foregone conclusion that the Hubbard scheme and Mr. Creswell's postal telegraph have neither of them any chance of favorable consideration from this Congress, there is a plentiful lack of interest in anything relating thereto. We have other fish to fry in Congress, and can't waste time upon any impracticable telegraph propositions now. Having got their arguments before the Senate Committee and printed, Mr. Hubbard and Mr. Orton can retire with the consciousness that their duty has been discharged, and that a grateful constituency will hold them in remembrance until the next session.

Mr. Orton's prestige has been rather damaged by the demonstration of the Automatic Telegraph System recently made, the details in regard to which have been printed in circular form and generally distributed here, and were also printed in the *Republican* yesterday morning. The inaccuracy of his statements and assertions in regard to the Automatic System, in his letter to the Postmaster General, were so completely and practically demonstrated on this occasion, and that, too, in the very presence of his friend and electrical guide and councillor, Mr. G. B. Prescott, that he must feel rather chagrined at having been led to make them in so positive a manner. As he must realize, from the mortifying position in which he has been placed, first in regard to the Duplex and now in regard to the Automatic, it isn't safe to decry and denounce telegraphic and electrical inventions and systems because they do not exactly accord with your interests and prejudices for the time being.

Mr. William L. Ives, of Seneca Falls, N. Y., has been appointed by the President of the Senate operator in the Senate wing of the Capitol, on the line connecting the Capitol and the several Government Departments.

The Secretary of War has transmitted to the House of Representatives, with a request that it may receive early attention, a communication from the Chief Quartermaster of the Military Department of Arizona, which states that, "In view of the fact that there is no law, national or territorial, affixing a penalty beyond that for a misdemeanor, for tampering with the military telegraph lines, and in view of the fact that the territorial legislature will not convene for over a year, the propriety of requesting the action of the proper authority, looking to the necessary legislation on the subject by the present Congress, is respectfully suggested for the consideration of the commanding General."

This is approved and forwarded by General Crook, commanding the Department, who adds a recommendation that Congress be requested to pass an act affixing penalties equal to the severest imposed by any of the State Legislatures for this offence, and offering suitable pecuniary rewards as an inducement to all parties to discover and deliver up any persons who tamper with the wires in the territory.

The communication was referred to the Military Committee and ordered printed. CAPITOL.

The Claims of the Page Patent.

NEW YORK, February 9.

TO THE EDITOR OF THE TELEGRAPHER.

WILL you please enlighten me as to what is claimed by the Page Patent, mentioned so frequently in your very interesting columns. Having been "disconnected" from telegraphy for upwards of eighteen years, is my only excuse for making an inquiry that may seem ridiculous to most of your readers, but the patent was certainly not well known when I had the pleasure of being an operator. NI.

Answer.—The following are the claims of Prof. Page, as contained in the patent issued to him under date of April 14, 1868:

1. An induction coil apparatus, consisting of a primary and secondary circuit, when said secondary circuit is many times (that is to say, two, three or more times) the length of the primary circuit, having the connections so arranged that shocks, sparks, and electro-static results may be obtained from the secondary circuit alone, or from the combined primary and secondary circuits, or from the primary alone, or from portions of either circuit, substantially as set forth.
2. The combination of an automatic circuit breaker with either a primary coil alone, or a primary and secondary coil combined, substantially as set forth.

3. The combination of a mechanical circuit breaker with a primary and secondary coil combined, substantially as set forth.
4. The combination of both a mechanical and automatic circuit breaker with a primary and secondary coil combined, substantially as set forth.
5. The combination of a primary and secondary coil, enclosing an electro-magnet, with an automatic circuit breaker, substantially as set forth.
6. The combination of a primary and secondary coil, enclosing a compound or divided electro-magnet, with an adjustable automatic circuit breaker, substantially as set forth.
7. The combination of a primary and secondary coil, enclosing a compound electro-magnet, with an attached hammer circuit breaker, substantially as set forth.
8. The spark arresting circuit breaker, whether used with a primary coil alone or a primary and secondary combined, substantially as set forth.
9. The spark arresting circuit breaker, whether used with a coil or coils enclosing an electro-magnet, substantially as set forth.
10. The spark arresting circuit breaker, whether attached to or independent of the primary or primary and secondary coils, substantially as set forth.
11. The adjustment of the retractile force of an automatic circuit breaker, substantially as set forth.
12. In combination with such adjustment, I claim adjusting the distance of the hammer, or the armature, from the pole or poles of the electro-magnet which actuates them, as set forth.
13. Adjusting or regulating the length of vibration of the circuit breaking bar by means of a set screw, or any mechanical equivalent for substantially the same purpose, substantially as herein set forth.
14. The employment of one electro-magnetic instrument to open and close the circuit of another electro-magnetic instrument, using either one battery for both or separate batteries for each, substantially as set forth.
15. The employment of separate and independent batteries to operate an electro-magnetic circuit breaker, and the circuit which is broken by it, substantially as set forth.

These claims were reviewed and examined in THE TELEGRAPHER of February 25th and March 4th, 1871. On the 10th of October, 1871, the patent was reissued to Mrs. Priscilla Webster Page, administratrix of the estate of Charles Grafton Page, deceased, assignor to the Western Union Telegraph Company, New York. The first ten claims of the reissue are identical with those in the original patent. The remaining and important claims of the reissued patent are as follows:

11. The adjustment of the retractile force of an automatic circuit breaker, substantially as set forth.
12. The combination of an electro-magnet, armature and adjustable retractor.
13. Adjusting or regulating the length of vibration of the armature of an electro-magnet by means of a set screw, or any mechanical equivalent for substantially the same purpose, substantially as herein set forth.
14. The employment of one electro-magnet to open and close the circuit of another electro-magnet, using either one battery for both or separate batteries for each, substantially as set forth.
15. The employment of separate and independent batteries to operate an electro-magnetic circuit breaker, and the circuit which is broken by it, substantially as specified.

These claims of the reissued patent, as above, were printed in THE TELEGRAPHER of October 14, 1871.—[EDITOR OF THE TELEGRAPHER.]

Death of Mr. Charles F. Simmons.

SAN FRANCISCO, CAL., February 1.

TO THE EDITOR OF THE TELEGRAPHER.

FOR two or three weeks past I have looked for some notice in your paper of the death of an old telegrapher, hoping that some one of his numerous friends would send some word to you, but as none seem to take sufficient interest, I, who have been associated with him for a number of years, venture to do so.

Mr. Charles F. Simmons, a native of Poughkeepsie, N. Y., died December 22d, 1873, of aneurism of the heart, after an illness of four days.

Mr. Simmons came to this city in 1859 with Mr. Wm. Blanchard, under an engagement with Messrs. Lovett, for the purpose of introducing the combination printing telegraph instrument.

He was subsequently employed in the Western Union office for several years, and in 1865, upon the organization of the San Francisco Fire Alarm Telegraph, he was appointed operator, where he remained up to the time of his death.

F. G. WOOD,

Operator Fire Alarm and Police Telegraph.

A Presentation.

TO THE EDITOR OF THE TELEGRAPHER.

MR. E. P. ADAMS, who for fifteen years has served the Grand Trunk Railroad and Montreal Telegraph Company at Gorham, N. H., has been offered and has accepted the position of Agent on the Central Pacific Railroad, at Corinne, Utah. On the eve of his departure, December 24th, a goodly number of his friends, employés of the Grand Trunk Railroad and citizens of Gorham, surprised him at his office, where he was presented with a magnificent Swiss gold watch, valued at \$160, by Thomas Giffard, Esq., for the donors. The closing lines of his very appropriate speech we will insert:

"MR. ADAMS.

"We are sorry to hear that you are about to leave us for the distant West. Yet, as we hope the change may be for the benefit, physically, of yourself and dear companion, and also your financial benefit, we will not

bid you remain, and shall always be glad to hear of your prosperity; but should you ever return, we will be ready to welcome you with warm hearts and open hands.

"As a token of our friendship please accept this watch—not for its intrinsic value, but rather as some tangible expression of the esteem in which you are held by these your friends. As you look upon it day after day, to remind you how time is passing, may it remind you of the many happy days we have spent in your society, and that among the old Granite Hills, and those other places here represented, you have left behind many true and admiring friends.

"Let me also assure you, sir, that we will miss you. Yes, we will miss you when you cease from our society, as if a calm familiar star shot suddenly and brightly from our vision; we will gaze wistfully down the path where you have vanished, and in the long after-time *our hearts*, which you have helped to make happy, will recall your memory with gratitude and tears."

Mr. Adams then responded in a few terse and pertinent remarks, followed by several speeches of regret that he was about to leave them, and all united in wishing him prosperity and happiness in his new home. W.

A Bullock.

DIXIE, February 4.

TO THE EDITOR OF THE TELEGRAPHER.

THE following office messages passed through my hands to-day. I believe they will explain themselves to the intelligent telegrapher:

"To Vicksburg, Miss., Ofs.

"Give better address, yours 3d to Capt. H. H. Broadstearnes, signed Cooper. Can't find party.

"Selma, Ala., Ofs."

"To Selma, Ala. Ofs.

"Destroy it. The message goes to Capt. H. H. Broad, steamer Selma, at New Orleans.

"Vicksburg, Miss., Ofs."

The message was originally sent to New Orleans direct. Q. CLUCKS.

Answers to Correspondents.

SILVER STATE.—Your favor of January 31st received, and amount appropriated as directed. There is no doubt about the writer being a female.

Personals.

MR. HARRY I. TALLEY, telegraph operator, Germantown Junction, Philadelphia, Pa., desires to learn the present address of Mr. FRANK B. SCHALL, telegraph operator, who left New York last June. Any one who can give the desire information is requested to address as above.

MR. CHARLES P. HOAG has resigned the situation of chief operator of the San Francisco, California, Western Union office, to engage in other business.

MR. JOHN R. YONTZ has been appointed chief operator of the San Francisco, California, Western Union office, in place of CHARLES P. HOAG, resigned.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended January 20, 1874, and bearing that date.

No. 146,603.—ELECTRIC BELL STRIKING APPARATUS.—Lewis H. McCullough, Richmond, Ind., assignor of two thirds his right to Elwood Patterson and Isaac G. Dougan, same place. Application filed September 4, 1873.

Hammer held suspended against force of one spring by action of another spring or weight, exerted through a train of gearing held by the armature of a magnet taking against a detent. The train released, the hammer is instantaneously thrown against the gong by the one spring, and then raised by the other through a sectional gear and a rack pinion.

1. A bell, hammer and detent, in combination with a prime mover for raising the hammer, and a spring for discharging it, the opposing forces being nearly balanced when the hammer is held suspended, so as to reduce the pressure on the detent to a minimum.

2. An alarm bell in which the hammer is lifted against the force of a spring, and thus held suspended by clock work, ready to deliver the blow.

3. An alarm bell in which, during each beat of the work, the hammer delivers a blow, and is also again lifted and held suspended for another discharge.

4. The combination of the segmental pinion B of suitable clock work, rack A² on the stem of the hammer, spring C, revolving stop pin f and armature G of an electro-magnet, substantially as and for the purpose specified.

5. The combination of the rack A² on the stem of the hammer, spring C, pinion B, revolving stop pins f and f', and armature G, provided with a notched lug, g g', substantially as and for the purpose set forth.

6. The spring cushion E, in combination with the shouldered stem A¹ a² of the hammer, substantially as and for the purpose specified.

7. The loose fly wheel K, in combination with the segmental pinion B of the clock work, and rack A² of the hammer, substantially as and for the purpose specified.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) NEW YORK.

Rumors of Future Telegraphic Combinations.— How a Consolidated Opposition may be Profitably Managed.

ALTHOUGH there is for the time apparent quiet and stagnation in telegraphic matters, there is a rather instinctive feeling that this condition of affairs is not to continue for a very long time. Foreign capitalists are said to be looking with considerable interest into the telegraphic situation, and to be ready to invest their surplus capital in acquiring an interest in and extending the telegraphic system of this country. It was understood and reported at one time that it was intended, and steps had been taken towards acquiring a controlling interest in the Western Union Company, but this, it was subsequently admitted, had been abandoned, and it is since confidently believed in certain quarters that they are making arrangements, in connection with the United States direct cable scheme, to consolidate and extend the existing telegraph lines outside of the Western Union combination, as has been advocated and urged for years, as the only safe policy for the opposition. We are not prepared just yet to state how far matters have been arranged, but we shall be disappointed if something does not come out of this more than mere talk and buncombe.

The extract from the New York correspondence of the *Evening Traveller* of Boston points to this new combination to advance telegraphic competition, and indicates that the scheme is beginning to be made public. That there is an excellent field here for such an enterprise there can be no doubt, and the time is fully ripe for it. The first step, of course, must be the consolidation under one management of the companies and lines now competing with the Western Union, and then the extension of the system, so as to enable it to compete on something like equal terms for the telegraph business of the country. The amount of capital that would be required to obtain a controlling interest in the existing opposition companies, if judiciously invested, would not be very large, comparatively speaking, and with such pecuniary results as may be obtained by the extension of the system, and an energetic and liberal, and at the same time economical management, we know of none which would be more likely to attract the attention of intelligent and enterprising capitalists.

The prediction of Mr. ORTON, in his report to the stockholders of the Western Union Company, that at an early day there would be practically no competition with that company, is not likely to prove as correct as it was gratifying to those of them who were inclined to credit it. Competition there will be, unquestionably, the only query being whether it shall be an active, vigorous and aggressive one, with the means to meet its competitor on at least equal terms, or a comparatively feeble and half exhausted affair, which shall just manage to exist, as has been the case for much of the time during the past few years. This question is, we believe, to be practically decided very soon, and we think, from what we can gather in regard to the situation, that it is likely to prove the former.

That it is now intended to lay the new cable which is being manufactured in England we think there is conclusive evidence. That it will, if laid and worked direct, prove a formidable rival to the Anglo-American Company, we do not believe, as the amount of business which can be transmitted over so long a circuit, and by a single cable, must be very limited. Still, if it is laid, it will need a more complete telegraphic system than there is at present to collect and distribute business for it. Naturally the question arises, on the part of those engaged in this enterprise, how such a system may be provided, and there can be but one solution to the problem, and that the one we have so often pointed out.

We should prefer that the ownership and control of the competing lines should remain in the hands of our own people, but if it has been demonstrated that foreign capital must be called upon to supplement that already invested to complete the work, we must submit as gracefully and cheerfully as possible to the inevitable.

The consolidation of the existing companies and interests into one organization, and the extension of the system so as to make it really national in its character, will afford an opportunity, which we hope will be improved, to thoroughly revise the existing system of management, and introduce an improved system, which shall be more in accordance with common sense, and benefit by the lessons which the past and present experience of all telegraph companies and lines in this country teach. There should be a thorough and systematic organization of the whole machinery of the consolidated company, such as is calculated to insure efficiency, economy, and a proper administration of every branch of the business. The electrical and engineering portion of the business should be assigned here, as it is in Europe, to persons who are properly qualified to administer them intelligently and properly. The General and District Superintendents have all that they can attend to properly in managing their operating and business departments—and, even if qualified to supervise or direct the electrical and scientific branch, which they seldom are, have not the time to attend to them properly.

There should be a chief electrician and engineer, who should have charge of all matters which properly belong to that department. He should be carefully selected, and appointed only upon his ability and fitness for the position, and should have an assistant in each division, who should be accountable to him and report to him. These should not be interfered with by or accountable to the Superintendents, who properly are only the business managers of the lines and offices, and who can always find abundant and profitable employment in the discharge of their legitimate duties. Being relieved from other duties, these electricians and engineers would be able to devote their time to devising and determining upon the best and most advantageous methods of construction and insulation of lines, the proper and most efficient and economical arrangement of circuits and batteries, decide upon any improvements which may be made or proposed in telegraphic instruments and apparatus—in short, perform all the duties which in Europe are considered as especially belonging to that position which it is proposed to create, and which has never heretofore been fully established upon any American line. This is a most important matter, and one which should receive careful consideration if it is desired to avoid the errors and profit by the experience of the past.

To the District Superintendents should be given the entire business management of their respective districts. They should have the appointment of all managers of offices, who should be directly responsible to them, and they in their turn should be responsible to the General Superintendent, whose responsibility would be, of course, to the Executive of the company. A simple and easily comprehended system of business and accounts should be established, doing away with as much of the complicated machinery of the Western Union organization as possible. While it is desirable that a certain amount of statistics in regard to the business shall be obtained and preserved, there is danger that this may be carried to excess, and that more time, labor and expense may be invested in this direction than is profitable. This should be carefully guarded against, and at the same time care be taken that all the necessary statistical information is obtained and properly tabulated for information and use.

With such an organization as we have hastily sketched there can be no doubt but that the new organization would prove practically and pecuniarily successful. Much money is constantly squandered on the telegraphs which could be saved with a little knowledge and care—and by a judicious and liberal outlay in directions where it is sadly needed, the chances and percentage of profit would be largely increased.

If there is to be a new deal, and a reorganization of the lines outside of the Western Union combination, we hope that it will be thorough and practical, and that the errors and follies which have in the past, time and again, wrecked promising telegraphic enterprises, may be avoided, and that, profiting by the lessons of

experience, we may see for once telegraphic enterprises organized, managed and conducted on honest, sensible and practical business principles. That an enterprise so organized and conducted would prove advantageous and remunerative to all concerned—the investors as well as the public and the employes—there can be no doubt. The time and opportunity for it has come; now let us have it as speedily as possible.

Another Atlantic Cable Telegraph Company Proposed.

By a despatch to the Associated Press from London, which we print in another column, we learn that a prospectus has been issued in that city for a new telegraph cable, to be laid from the English coast to Halifax, N. S., via the Azores Islands. The cable proposed to be laid is a light one, and if it is to be provided and put down for the amount of capital stated in the despatch, we should judge that it must be a very light one indeed. This new company makes a bid for public favor by stating its intention to transmit messages on its cable for one shilling per word. While this would undoubtedly, when laid and in operation, secure the line an abundance of business, it will not be very likely to induce very liberal subscriptions to its capital.

No names are mentioned in connection with this new project, so that we are unable as yet to state by whom it is engineered, or upon what ground it expects to be able to do the business at 25 per cent. of the amount now charged by the Anglo-American Company for similar service. We shall have to wait the slower communication of the mails to learn the particulars of this new enterprise, which seems to have been sprung upon the public.

The *Railway News*, of London, of the 24th ult., in an article on the pecuniary condition of the company and the quotations of Anglo-American shares, which, notwithstanding the increased receipts of the company on its business, which for 1873 were £64,000 in excess of those of the previous year, had been depressed, says: "The only cause operating to depreciate quotations appears to be the circulation of rumors, to which we alluded last week, as to the formation of competitive schemes for laying light cables—a bugbear constantly raised by speculators."

The *Railway News* makes some statements in regard to these proposed light or hemp cables, which do not indicate much probability of any continued success, even if the necessary capital could be obtained to manufacture and lay them. Our contemporary, the *New York Commercial Advertiser*, which is usually conspicuously sound and sensible upon telegraph matters, leads off in a glorification of this new scheme, and an anticipation of the advantages which are likely to be derived from it, which we cannot but regard as rather premature. We would commend to its editor, and others of the fraternity who may think they perceive in this enterprise the approach of the ocean telegraphic millennium, the following extract from the article of the *Railway News* referred to above:

"As bearing upon this question of the proposed hemp cables, it may be useful to inform those who consider that there may be some probability of their being laid and worked with success, to state that a cable of this description was laid some time since between Cornwall and the Scilly Islands, and its existence was limited to a few short hours. On another occasion a similar cable was laid between England and Ireland. Its span of life, too, was short—not more, we believe, than three days. Both of these cables have been replaced by heavy ones, and they are now in as perfect a condition as when they were first laid, and without having been interrupted, or required the outlay upon them of a single shilling. If there were really any merit in these so-called light cables, it would have been to the interest of the Telegraph Construction Company to have manufactured and laid them; and if taken in hand by such a company, the public would at least have the guarantee, which cannot be provided elsewhere, that the work would be efficiently done, and the cable manufactured under the supervision of really practical men."

We believe there is no instance on record where light ocean telegraph cables have remained in condition to be worked for more than a few days at a time, while

the heavily armored cables have proved efficient, reliable and remunerative.

We shall await with some curiosity the further developments in regard to this latest proposed cable telegraph enterprise, and, until they are received, will not express an opinion as to its character or the purposes for which it is initiated.

The Recent Test of the Automatic Telegraph System.

WE published last week a brief statement of the test of the demonstration made on Tuesday evening, January 27th, of the Automatic System of Telegraphy, on the line of the Automatic Telegraph Company between New York and Washington. As a matter of record we print this week the report of the General Manager of the company to the Hon. GEORGE HARRINGTON, its President, giving the details of the demonstration in full, with the certificates of a number of gentlemen present at either end of the line, of the correctness of these details.

The occasion of this demonstration was to show the inaccuracy of the statements made by President ORTON, of the Western Union Telegraph Company, in his letter to the Postmaster-General under date of Dec. 27, 1874, which were, that

First. The Automatic System is practically slower than the Morse.

Second. It requires at least five times as many operators to do the same amount of work within a given time.

Third. That, consequently, it is more expensive.

Mr. GEO. B. PRESCOTT, the electrician of the Western Union Company, was present on behalf of that company in the New York office, and Mr. LEONARD WHITNEY, Manager of the Western Union Company in that city, in the Washington office.

The matter selected was the same as that previously transmitted over eight Western Union wires, against a single Automatic wire between the two cities.

The following are the documents referred to:

General Office of the Automatic Telegraph Co., }
66 Broadway, New York, }
January 28th, 1874. }

Hon. GEORGE HARRINGTON, President.

SIR—I respectfully submit the following report of the work done in the demonstration made on Tuesday evening, January 27th, as per your instructions of prior date. The matter selected for the purpose was the President's late message and the Spanish protocol:

<i>Statement.</i>	
Matter transmitted,.....	11,130 words.
Length of Circuit,.....	281 miles.
Conductors used,.....	1 wire.
Labor.—New York.....	{ Morse operator,..... 1
	{ Copying operatives, . . . 13
“ Washington... }	{ Morse operator 1
	{ Perforating operatives, 10
Total, 25 operatives.	
Time.—	P. M. Mins.
Washington. { Perforating commenced, 5.39 }	45½
	{ Perforating completed, 6.24½ }
New York. { Copying commenced, . . . 5.42 }	66
	{ Copying completed, . . . 6.48 }
Total time, 69 minutes.	
Cost.—Morse operators,.....	\$100 per month.
“ Automatic operators,.....	40 “ “

The characters were perfectly legible and well defined, and were copied with great facility.

The average time during which the perforating operatives were actually at work was forty-five and a half minutes—making an average per operative, per minute, of twenty-five words.

The average time of copyists was fifty minutes, making an average per copyist, per minute, of seventeen words.

Unlike the Western Union Company, we had no large corps of operators from which to select our working force, but were compelled to utilize all—good, bad and indifferent, which makes it proper to call special attention to the above averages made.

The whole time consumed was sixty-nine minutes, as against the published record of seventy minutes by the Western Union in their late effort.

The average time occupied by Automatic was fifty-five and a half minutes.

The average time occupied by Western Union (as reported) was fifty-nine minutes.

An unfortunate defect in the paper caused much de-

lay in the transmission, otherwise still less time would have been consumed. No attempt, however, was made to attain a high speed of transmission on this occasion, as that point had already been yielded, and incontestably proved in the presence of the Hon. Jno. A. Creswell, Postmaster General, and numerous other gentlemen, including Senators and Representatives in Congress, on the evening of December 11th, 1873, when we transmitted some 12,000 words over our one wire from Washington to New York in twenty-two and a half minutes.

Our operatives were congregated at Washington and New York on Monday, January 26th, and were tested for the first time on the evening of that day. I call attention to this, in anticipation of the charge that the time which has elapsed since the publishing of the message, has been improved by our operatives in practising upon it.

With the experience gained in this demonstration, I am confident that in another we could readily dispense with at least two perforators and three copyists, and yet perform a like amount of work.

Respectfully,
E. H. JOHNSON,
General Manager.

New York, January 28, 1874.

We were present in the office of the Automatic Telegraph Company last evening, whilst they were receiving the President's message and the Spanish protocol from Washington.

At 5.39 P. M., Washington signaled that the perforating had commenced.

At 5.43 the first portion of the message was received and handed to the copyists.

At 6.42 the last portion was received.

At 6.48 the copying was finished; the whole time occupied being 69 minutes.

There were 13 copyists in the room; but we noticed that two or three were unemployed a portion of the time, so that, had all been constantly employed, there would have been several minutes saved in the aggregate.

The writing was perfectly legible, and the copyists translated with great facility. (Signed),

JAS. G. SMITH, A. G. Supt. A. & P. & F. In Tel. Cos.
H. G. PEARSON, Assistant Postmaster, N. Y.
EDWARD W. SERRELL, C. E.
JAMES H. WILSON (of Winslow & Wilson).
HIRAM BARNEY.

Office Automatic Telegraph Co., }
Washington, D. C. }

E. H. JOHNSON, Esq., General Manager.

At the test which took place on Tuesday evening, January, 27th, the late annual message of the President, together with the Spanish protocol, amounting in all to eleven thousand one hundred and thirty (11,130) words, was perforated by ten perforators, and transmitted automatically, by one Morse operator in the following time:

Perforating commenced, 5.36 P. M.	
“ completed, 6.21½ “	
Time, 45½ minutes.	
Transmission commenced, 5.40.	
“ completed, 6.39.	
Time, 59 minutes.	

The above is New York time, as computed by Washington Observatory time.

Respectfully,
P. B. DELANY, Manager.

Having witnessed this test throughout, we can certify to the correctness of the above statement.

(Signed),
ROBERT D. LINES (of Post Office Department).
D. J. GIBSON, U. S. A., Acting Signal Officer.
H. W. HOWGATE, U. S. A.
J. H. LATHROP.

Quick Cable Telegraphing.

THE perfection to which the cable telegraph service has been brought is shown by the following facts, which can be proved to be such:

In December last a message was sent from New York to London, and in *thirty minutes*, actual time, the answer was received in New York. On Thursday the 5th instant, another despatch was sent to London, to which a reply was received in *thirty-five minutes*, actual time. In neither of these cases was any especial effort made to hurry the answers, but the party addressed sent the reply to the London office by the messenger delivering the original message.

To fully appreciate the wonderful achievement we must consider that the distance from New York by the land lines, from New York to the cable station at Heart's Content, N. F., is about 1,300 miles, the length of the cable about 2,000 miles, and the land lines and cable from Valencia to London about 300 miles. Each message, therefore, was transmitted about

3,600 miles, and passed through the hands of eighteen persons, all told; consequently, the message and reply, in each case, passed through the hands of thirty-six persons, and travelled over 7,000 miles in thirty to thirty-five minutes. We do not think that this can easily be beaten, and the progress made within the last fifteen years, in the facilities for communication between countries so widely separated, is truly marvellous.

An Excellent Appointment.

By the recent death of Mr. JOHN FOLEY, Manager of the Atlantic and Pacific, San Francisco, California, office, a vacancy was created, which, we are much pleased to learn, has been filled by the promotion of Mr. L. N. JACOBS to the position. This is an excellent appointment, and one which we have no doubt will prove advantageous to the telegraph company and the public, as well as gratifying to the many friends of Mr. JACOBS. This gentleman is no stranger to the readers of THE TELEGRAPHER, who will be pleased to know that his ability is being appreciated and rewarded.

Electric Watch Clocks and Dials.

The Howard Watch and Clock Company, of Boston and New York, whose advertisement will be found in our advertising columns, are doing an extensive business in magneto-electrical telegraph instruments, and in electro-magnetic watch clocks, chronographs, astronomical clocks, etc.

Mr. JAMES HAMBLET, the electrician of the company, is well known as an able and experienced scientific and practical inventor, and gives his personal attention to all the electrical work of the company. This company have just finished and delivered to the United States Observatory at Washington eight astronomical clocks, to be used by the scientific expeditions sent out by the United States Government to observe the great astronomical event, the coming transit of Venus.

In this city they have recently put up in the Hoffman House an electro-magnetic watch clock, with twenty stations; also a similar clock in Mr. J. U. BRIGGS & Co.'s extensive stables, with five stations. They have also just finished putting into the new depot of the Boston and Lowell Railroad a watch clock with two stations, and a standard clock which actuates seven electric dials in different parts of the building.

The American Fire Alarm Telegraph.

Messrs. GAMEWELL & Co. have just completed the fire alarm telegraph for Harrisburgh, Pa., and are now engaged in putting up their system under contract with the municipal authorities at Halifax, Nova Scotia. Their system has distanced all competitors, and they are now practically without opposition in the business which has been created by their enterprise, liberality, and fair dealing.

The Claims of the Page Patent.

At the request of a correspondent we reprint in another column the claims of the original and reissued patents of Prof. PAGE, which will be of interest at the present time, when an attempt is being made to establish judicially the validity of the patent, which, as will be seen, in effect covers almost every description of electrical and telegraphic apparatus.

The Telegraph.

Progress of the Southern and Atlantic Telegraph Line.

THE Southern and Atlantic Telegraph Company have actively recommenced the extension and construction of its lines. The section between Selma and Mobile, Ala., upon which the poles have been set and the insulators put on, is being wired, and will shortly be completed and in operation to the latter important point. It is understood that this company is meeting with very encouraging success, and that the extension of its lines south is watched with interest and cordially welcomed by the people of that section, who have hitherto been entirely dependent upon the Western Union Company for telegraphic facilities.

By Cable.

A CABLE STEAMER ADRIPT.

LONDON, Feb. 7.—The steamship Ambassador, laden with a section of the Brazilian cable, broke from her moorings at Woolwich yesterday, and was carried some distance up the Thames before the crew succeeded in securely anchoring her. While the steamer was adrift she fouled thirty-two colliers, sinking two of them and damaging others. Several of the men on the colliers were severely injured.

PROJECT FOR A NEW TELEGRAPH CABLE FROM EUROPE TO AMERICA.

LONDON, Feb. 9.—The organization of a new company to lay a light cable from the coast of Great Britain to Halifax, via the Azores Islands, is announced.

The capital is \$380,000, and the prospectus, which was brought out on Saturday, says it is the intention of the company to convey messages over its cable at the rate of one shilling per word.

The American District Telegraph.

THE rapidity with which the American District Telegraph Company has increased in popular favor is certainly astonishing.

Scarcely two years ago the company started off with every prospect of success, but laboring under the disadvantage of unprofitable rates, and the imperative necessity of keeping a large force, the company for a time seemed to linger between life and death. Through the influence, ability and indefatigable perseverance of Mr. E. B. Grant, the present Vice-President, and the hearty cooperation and incessant labors of the Superintendents the company has gradually risen to its present sphere of usefulness. Its prospects at the present time could hardly be more favorable, and with a liberal policy the company will meet with a success in the future hardly anticipated. Satisfactory arrangements have been completed with the City Fire Alarm Telegraph Department, that enables the company's subscribers' signals for fires to be transmitted to the Department without repetition, should the fire prove to be of such magnitude as not to be conquered by the extinguisher carriages of the company. Fortunately all fires thus far have been subdued without the aid of the Department, although several have necessitated the calling of help from the adjacent districts.

The understanding with the Police Department is also quite satisfactory, and arrangements will undoubtedly be consummated within a short time that will largely increase the efficiency of both the city's and the company's forces.

The patrol force of the company is to be extensively increased. In the Fifteenth District, 397 Broadway, over one hundred new subscribers were added last week.

Patrol boxes are being placed in position as fast as possible, from which the night patrolmen will send signals every hour. The patrol force in this district is to be immediately increased by the addition of eight or ten men. This same system is to be carried into every district. To a certain number of districts will be assigned a roundsman. This officer, in connection with the boxes and other safeguards which will be brought out in the establishment of this system, will insure a perfect and reliable patrol force. The company have in circuit 2,300 instruments, paying a monthly rental of \$2.50. The earnings of these instruments additional to the rental is—Messenger Police and Fire Service, average \$250 per day, including Sundays. The receipts for service have reached as high as \$500 in a single day. The number of signals or "calls" average about 1,100 per day. The expenses of the company are necessarily large. To perform the service in a satisfactory manner requires a regiment of uniformed and disciplined boys, an extensive police force, efficient apparatus for extinguishing fires, a large construction and maintenance force, etc. It should be understood, however, that the increase of subscribers does not increase the operating expenses in the least, excepting in the matter of messengers, the present force being sufficient for treble the number of subscribers.

Foreign Telegraphic Notes.

THE report of the directors of the Eastern Telegraph Company states that they have at length concluded a joint purse traffic arrangement with the Indo-European Telegraph Company. The net revenue for the six months ended the 30th of September, amounted to £122,826, and an interim dividend of 1½ per cent. on the 14th of October, and a further interim dividend of 1½ per cent. declared on the 7th inst., amounting, together with interest on new shares, to £99,932, leaves a balance of £22,893 to be carried forward.

At an adjourned meeting of the shareholders of the West India and Panama Telegraph Company, at the

offices in London, the following gentlemen were elected directors in place of the old board, which had resigned: Sir James Anderson, Messrs. H. Weaver, C. W. Earle, W. Ford, Cyrus W. Field and H. Holmes. The chairman stated to the meeting that he had received a letter from the Telegraph Construction Company, which conveyed the intelligence that the cable at Porto Rico was about being buoyed.

The Telegraph in China.

THE Great Northern Telegraphic Company has recently established a line between Woosung and Shanghai. Twenty words are sent for a dollar. This is the first successful attempt to introduce the telegraph through the main portion of the empire, as previous efforts have been met with violent opposition from the people, who cut the wires and destroyed the poles.

Telegraphic and Electrical Brevities.

THE Government of the United States has given permission to the Mexican Government to extend its telegraph lines across the Rio Grande to Brownsville, Tex., and to establish an office there. When this is accomplished there will be direct telegraphic communication established between all points in the United States and the City of Mexico.

The annual meeting of the Dominion Telegraph Company of Canada was held at Toronto on Wednesday last, the 11th inst.

What all telegraphers should do—subscribe for and read THE TELEGRAPHER.

Married.

MEYER—PFEIFFER.—At the residence of the bride's parents, February 1st, 1874, by the Rev. Father BOSCO, A. LEONARD MEYER, agent and operator of the Southern Pacific R. R. at Santa Clara, Cal., to Miss LIZZIE PFEIFFER, of that place.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY. PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System
OF
FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. BOX 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL
DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.

15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS

of all kinds,

CHRONOGRAPHS,

ASTRONOMICAL CLOCKS,

REGULATORS,

ETC., ETC.,

OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES

OF

EVERY DESCRIPTION,

38 VESEY STREET, New York.

NEW AND SUPERIOR PATTERNS OF

STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

RELAYS,

SOUNDERS,

REGISTERS and

KEYS.

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,

For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.

Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.

BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for

HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

Descriptive Circulars and Price List forwarded upon application to

F. L. POPE & CO.,

GIANT SOUNDERS,

Improved Curved Keys,

Batteries and Supplies of every Description.

Send for Circulars and Catalogue.

DR. L. BRADLEY,
No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

New York, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.80.

Agents for towns, and counties wanted.

ELECTRICAL AND TELEGRAPH INSTRUMENTS
AND
Material of Every Description,
RELAYS, KEYS, SOUNDERS, COMBINATION SETS, &c., &c.
Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,

Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK, }
Sept. 22d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,
A. S. BROWN, Manager

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.
Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.
The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.
With each Instrument is furnished

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,
Cotton and Gutta Percha covered, with any number of conductors
required.
Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES,
In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deli-
vered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

VOL. X. WHOLE No. 397.

An Operator's Musings.

By J. A.

The other night, 'twas dark and dreary,
An operator, tired and weary,
Sitting within his office gloomy,
With sullen look on his "visnomy."

The rain beat fast on pane and shutter,
The wind swept round with dreadful clutter;
And he, poor soul, felt quite forlorn,
As o'er the wire these words were borne:

"Poor baby died at half past seven;
Buried to-morrow at eleven;"
He spoke aloud, in tones of sorrow,
"Alive to-day and dead to-morrow."

The mystic words set him a thinking
Of thousands who are daily sinking
Into the grave. Death shoots the arrow—
Alive to-day and dead to-morrow.

Such were his thoughts. A gentle tapping
Aroused him from his solemn napping;
He looked around in silent wonder—
The sound appeared like distant thunder.

"It cannot be; I've not been sleeping,
The clock strikes three; how time is fleeting;
But hark! there goes another message,
On wings as swift as birds of passage:"

"A child was born this morning early,
And such a boy is seen but rarely;"
This was the substance of the letter
Or telegram—the name is better.

Yet so it is, while time doth linger,
Or cruel Death doth point its finger;
Or souls come forth to worldly sorrow,
Some born to-day and die to-morrow.

Ah, what! still, still there goes another,
The deepest grief and gloom to smother;
"Married this morning—Sister Pearly
Arrive by train to-morrow early."

Two loving hearts have been united,
Their futures bright, their paths unblighted
By dire misfortune—Death will sever,
They live to-day, but not forever.

Yet such is life, its joys, its troubles;
Still it is naught but glistening bubbles;
For time will pierce the heart with sorrow
Wedded to-day, and die to-morrow.

The Elementary Principles of Electrical Measurement.

By F. L. POPE.

(Continued from page 25.)

The Galvanometer.

A MAGNETIC needle, freely suspended in such a manner as to be at liberty to place itself in the magnetic meridian, and provided with a conducting wire so arranged as to convey an electric current parallel to and in the immediate vicinity of itself, constitutes a *galvanometer*. A scale divided into degrees is usually added, by means of which the angle through which the needle is deflected from the magnetic meridian may be conveniently ascertained. As the galvanometer in some form is almost an indispensable requisite in every class of electrical measurements, it is desirable to become acquainted with its different modifications before taking up the subject of electrical measurements in detail.

Galvanometers may be conveniently divided into two classes. In instruments of the first class the angles of the deflections are not proportional to the strength of current by which they are produced, except to a limited extent, while in those of the second class the deflections bear a fixed and definite mathematical relation to the strength or quantity of the currents by which they are produced, throughout the whole extent of the scale.

The simplest form of the galvanometer consists of a carefully balanced magnetic needle, capable of turning freely in a horizontal plane, and a conductor consisting of a metallic wire or band passing close to the needle, either above or beneath it, in a direction parallel to the magnetic meridian. This arrangement is illustrated in Fig. 6. NS is the magnetic needle, and RW a wire passing directly over and parallel to it. The direction of this wire must necessarily be north and south, as the needle will always assume that position

under the influence of the earth's magnetism. If now the extremities of the wire RW are connected with the poles of a voltaic battery, so as to cause an electric current to pass through it, the needle NS will be deflected from its normal position, and will assume the position *a b* or *c d*, according to the direction of the current passing through the wire RW. If the wire be placed

Fig. 6.

in the same direction, but below the needle the deflections will be the reverse of those produced by the same current when passing above the needle. For example, if the copper or positive pole of the battery is attached to W, and the zinc or negative pole to R, the north seeking pole of the needle will turn to the west if the latter is below the wire, and to the east if above it.

Fig. 7.

The tendency of the force exercised upon the needle by the current is to place it in a position at right angles to the conducting wire, and consequently to the magnetic meridian. But it is not possible for even the most powerful current to deflect a needle sufficiently to cause it to assume a position exactly at right angles

Fig. 8.

to the conductor, because of the influence of the earth's magnetism, which still acts upon the needle and tends to draw it back to its original position.

If the conductor be carried entirely around the needle, so as to pass once above and once beneath it,

Fig. 9.

the influence of the current upon the needle will be doubled, and the resulting deflection considerably increased. It will be evident, upon reflection, that as the current passes in one direction above the needle, and in the other direction below it, the tendency of both will be to deflect the needle in the same direction. This

operation of carrying the wire around the needle may be repeated any required number of times, and in this manner the effect of a very feeble current upon a needle may be multiplied until it manifests itself by causing a deflection. Hence, a needle surrounded by a number of turns or convolutions of wire is called a *multiplier*. The writer has employed in some of his experiments an instrument of this kind, having 40,000 convolutions of fine wire surrounding the needle.

The most sensitive galvanometers or multipliers are those provided with what is termed an *astatic* system of needles. This consists of two separate needles, coupled together in the manner shown in Fig. 7. Both needles are placed in the same perpendicular planes, one directly over the other, but with their north and south poles opposite to each other. If the magnetism of the two needles were exactly equal, and they were also exactly parallel to each other, the action of the earth's magnetism upon each of them would be equal and opposite, and consequently they would remain at rest in any position indifferently. But in practice one needle always slightly overpowers the other, and by this excess determines the position of equilibrium. This position is never in the magnetic meridian, and is often nearly at right angles to it.

In the astatic system, represented in Fig. 7, the directive force of the earth's magnetism is nearly neutralized by the influence of the two needles upon each other, while on the other hand the magnetic effect of the current upon the system is doubled. This is accomplished by arranging the conducting wire in such a manner that it will tend to deflect both needles in the same direction, as will readily be understood by a careful inspection of the figure. A light pointer or index, AB, is placed upon the axis above the upper coil, which traverses a scale divided into degrees, and serves to indicate the angle of deflection of the needles.

In some instruments the lower needle only is surrounded by the conducting wire, and in this case the upper needle may serve as a pointer. Of course, this combination is less sensitive to the action of feeble currents than the preceding one.

A system of astatic needles is usually suspended by a minute filament of silk, and is therefore capable of being deflected by an exceedingly feeble current.

A galvanometer or multiplier, constructed upon the plan which has just been described, is principally useful as a means of detecting the presence of an electric current. As a measure of the actual magnitude of a current it is deficient, inasmuch as its deflections are not proportional to the currents by which they are produced beyond 14° or 15° of the scale. The reason of this will be apparent hereafter.

Thomson's Reflecting Galvanometer.

This beautiful apparatus, invented by Sir William Thomson of Glasgow University, is the most sensitive and probably the most generally useful instrument of the kind ever devised. Strictly speaking it is one of the class above referred to, the deflections of which are not, beyond a certain point, proportional to the currents producing them. It is, however, so arranged that in practice the actual deflections of the needle which are observed, are never required to exceed a very few degrees on each side of the meridian, and, therefore, the values indicated by them are in reality strictly proportional to the currents by which they are produced.

The principle of the reflecting galvanometer is well shown in Fig. 8, which is taken from Jenkin's *Electricity and Magnetism*.

A copper wire, insulated by being overspun with silk, is wound upon a hollow cylindrical bobbin of brass, A, provided with deep flanges, B B', and having feet at C by which it is supported upon a base of wood or hard rubber. Inside of A a small brass plug, D, is fitted, having at one end a hollow chamber about 0.6 inches in diameter, which is closed by the lens E. The latter should have a focal distance of about 48 inches. Within the little chamber the mirror and magnet are suspended by a single fibre of silk—such as may be drawn out of a silk ribbon—and which should be so thin as to be almost invisible. The mirror itself is formed of microscope glass as truly plane in surface and as thin as possible. The length of the magnet is equal to the diameter of the mirror—about half an inch—and is attached to the latter by means of a little shellac dissolved in alcohol. The magnet is often made of a piece of watch spring. Care should be taken that the mirror is not drawn out of shape when the magnet is attached to it. The silk fibre is also secured to the mirror by means of the shellac varnish, and then threaded through a small hole in the top of the chamber, by means of a needle with a little varnish on it, and secured by means of the same material.

When thus arranged, the plug D and its contents may be introduced into or withdrawn from A at pleasure. The outside diameter of the flanges B B' is about 2.5 inches, and of the length from B to B' about 1.7 inches.

The diameter of the wire with which the space inside the flanges B B' is wound, depends upon the purpose for which the instrument is to be used, as will

be hereafter explained. The two ends of the galvanometer wire T and T' are connected to two binding-screws, a and b, Fig. 9, insulated by means of hard rubber, and to which other wires may be attached. The instrument is completed by a common kerosene lamp, L, placed behind a screen having a slit M in it, in front of the mirror, and being also provided with a horizontal white paper scale N, about twenty inches in length. When the apparatus is arranged as shown in Fig. 9, a narrow pencil of light from the lamp L passes through the opening M, and thence through the lens to the little mirror, and is reflected back by the latter through the lens, which forms a sharp image of the flame of the lamp upon the scale. The zero point is in the centre of the scale, exactly opposite the mirror, and when no current is passing the spot of light which serves as an index remains at zero.

The operator reads the indications from a point just in the rear of the magnet and coil, the light of the lamp being cut off by the screen, so that he only sees the small luminous opening through which the light passes to the mirror, and a brilliantly defined image of the flame upon the white scale just above, which is kept in shadow by the screen. If by the passage of a current through the coil the magnet is deflected to the right or left, the spot of light moves to the right or left along the scale. The angle formed by the reflected rays being twice the angle through which the magnet and mirror are deflected, a very small angle causes a comparatively great displacement of the image. It will at once be seen that we virtually have in this instrument an index arm four or five feet long, absolutely without either weight or inertia.

With an instrument of the above proportions the indicated deflections are, as has been explained, almost strictly in proportion to the strength of current producing them, the range of the magnet itself being considerably less than 14° on each side of zero. It is a good plan to have the scale curved to form part of a circle having its centre at the point of suspension of the magnet.

An adjustable permanent magnet, S, is usually placed in the magnetic meridian above the coil; by raising or lowering this magnet the action of the directive force of the earth upon the suspended magnet may be increased or weakened at pleasure. If the south pole of S is placed to the south it may be put in such a position as to render the needle nearly astatic. The instrument is then in its most sensitive position, but the spot of light will never remain quite stationary. The zero adjustment may then be controlled by a second small magnet, T, placed at right angles to the magnetic meridian.

A galvanometer of this kind might be constructed by an ingenious student without much difficulty, and would be a very useful and instructive instrument.

(To be continued.)

[From *The Ghost.*]

Death!

It is with sincere sorrow that we announce the death, on the 11th inst., of the eldest son of Mr. J. T. Olmstead, of this office. There are others among us who have stood over the agonized form of our first born and best beloved of all, and seen the little face on which we have looked so proudly lose the tinge of life, the little limbs grow cold, and felt, alas! how sure is death. All who have met this sad experience will sympathize to-day with our fellow laborer in his bereavement heartily and sincerely. No one else can sympathize completely. Such losses as these cast a shadow into a man's heart, that good fortune, good health, a swarm of smiling children—everything the world may give—can never quite light up. It is a grief which, coming but once, outweighs all other sorrows, and leaves a scar which none can comprehend but those who number it among their woes.

Gilbert M. Simmons, formerly a printing operator in this office, died on the 12th inst., at his home in Williamsburgh. His death resulted from a paralytic shock sustained in May last, hastened somewhat, perhaps, by a dropsical tendency. Mr. Simmons belonged in Poughkeepsie, N. Y., but had worked here for ten years or more, and was quite well known among printing operators generally. He recovered partially from his paralysis during the fall, and resumed his place for a few weeks, but when cold weather came on he again withdrew and he never returned. His death, while it was not unlooked for by those who knew of his critical condition, will take many by surprise, as it seems but yesterday that he was here. He and Charles F. Simmons, who died in San Francisco on the 22d of last December, were brothers.

At Springfield, Mass., on the 11th inst., F. E. Curtis, better known among the profession as "the Major," died suddenly at his home, where he had been confined several days with a slight indisposition. He was thought to be recovering, but in the early part of the day he was seized with apoplexy and died almost instantly. "Major" Curtis was in his twenty-ninth

year, and had been identified with No. 4 East for ten years or more. He was a dwarf in stature, but mentally he stood among the most intelligent members of the profession. Naturally of a smart, quick temperament, he was sufficiently educated and travelled to be a most genial companion, and on postprandial occasions he was ever happy, comical and interesting in his remarks. He had his peculiarities, like the rest of us, but his *bonhomie* served as an ample mantle to hide his faults, and his friends were those who knew him long and intimately.

[From *The Ghost.*]

Odds and Ends.

On St. Valentine's day there passed through this office the following poet's appeal, supposed from its tenor to be going from a father to his absent dear:

An empty chair is by my side;
An empty void is gaping wide,
No call for pickles greets my ear;
No cry for augur do I hear.

The girl who at my right hand sat
Has donned her jacket and her hat,
And off to Bristol she has gone,
And left her Popsey all alone.

Oh, do come back, and once more shine,
And be your dove's valentine!

Here is a short one of a similar shade, which comes to us on what compositors would call "snake copy," and is, presumedly, the work of one of the printing operators:

Well, Jake and George, my honest blades, I'm sorry for to say
My heart is sad, my mem'ry fades; forgot 'twas Cupid's day.
So, not to let the custom fall, I'll simply drop a line;
I'm yours—body, boots and all—your mouldy valentine.

A young man, who lamented in these columns his disgust at having to work on New Year's day, and optically resolved that

"During seventy-four, you bet,
I'll steadily keep out of debt," etc.,

has split upon another rock thus early in the year, and tells his story after this fashion:

I love her yet, that sweet brunette,
Although she has deceived me.
Her cruel ways did nearly craze,
And have quite sorely grieved me.

She wrote bad Morse, but yet, of course,
I never dared to break her.
She was so proud, she'd tell the crowd
How fast and well I'd take her.

But oh! alas! it came to pass
I made a horrid blunder,
Which raised her ire, and o'er the wire
Said she, "You go to thunder!"

PERSONAL AND GENERAL.

John F. Riley, of Hartford, whose numerous messages—"Get me a 'sub' to night," "You know how I am," "I am on my way up town"—made him famous while here, is sojourning in New York for awhile, and he looks as if the world was using him pretty well, too.

The *Baltimore American* announces that the proprietors of that journal have purchased the building corner of Baltimore and South streets, Baltimore, now occupied by the Western Union Telegraph Company, on the site of which they intend to erect a \$125,000 shanty, known as the *Baltimore American* Building.

Mr. A. D. Taylor, a day operator heretofore, succeeds F. E. Curtis, deceased, as night report operator at Springfield, Mass. Mr. Taylor is one of the finest operators of our acquaintance, and those who manipulate No. 4 East at this end will be glad to learn of his permanent appointment.

On the 4th instant Mr. William H. Hargrave, of this office, was united in wedlock, at White Plains, N. Y., to Miss Ella L. Esler—the Rev. Mr. Van Kleeck officiating. It seems an empty thing to say "we congratulate," etc.; but, perhaps, the unusual sincerity with which we wish this newly married pair a happy voyage over life's dangerous waters, may render our congratulations acceptable.

Dr. Fowler Bradnac has returned to New York and will commence the practice of medicine here. He comes from Detroit, where he has relinquished a large and lucrative business—the social attractions of this metropolis and the facilities afforded for a professional man to perfect himself in his studies, having done the business for this genial disciple of Esculapius, as it has for the disciples of Bacchus, Momus and numerous other old parties who did some time back. The doctor will, perhaps, combine physic with electrical science, and agitate the brass occasionally.

The Switch is the title of a diminutive journal published in the Western Union Chicago office. It is edited by the well known "Billy" Wallace, and is replete with local hits and happenings. It must be keenly relished by the Chicagoans, to whom every line tells a tale—the fine point involved in which is not so readily seen by outsiders. However, there are lots of things in *The Switch* which are enjoyable to all, though we

lay it down rather sorry that we have not a better acquaintance with our Chicago brethren, so we might know more accurately on whom *The Switch* is laid, and whose foibles are so pleasantly lashed in its columns.

We again beg to acknowledge our indebtedness to Mr. J. J. Calahan for his efforts to the end of making *The Ghost* lively and entertaining. His caricatures, always funny without being personal, are laughed over by everybody and admired by all. "The twenty-seventh man off," as he appeared at the South Ferry," and the thirsty trio of telegraphic "bums," who, having accidentally met in New York, penniless, of course, are "snuffing the bottle from afar off," are worthy of a place in any humorous journal in existence; but, unfortunately, the subjects are not to be appreciated by those of the common clay, and so Mr. Calahan, like many another genius before him, continues to hide his light under a bushel.

Dr. J. C. Graham, of No. 145, has been made the recipient of a very handsome Russia leather cigar case, the donors being Messrs. O'Brien and Clarke, night operators at Scranton and Wilkesbarre, respectively. The gift is tendered, as a note which accompanies it explains, in token of their appreciation of his patience and judgment in sending "State Press." Courtesies of this kind are so very rare—the receiving operators on a press wire having an affection for the sender very similar to that which his satanic majesty is supposed to entertain for holy water—that this one should go on record by all means. The "regular practitioner," we believe, will not advertise, but we hope Dr. Graham will not "kick" at this publicity. In the words of inky Othello:

"It is the cause—it is the cause, my soul."

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

The Closing Services of the P. and A. Chicago Office.—Location of the late Employees.

NORTHWEST, February 7.

TO THE EDITOR OF THE TELEGRAPHER.

As the Pacific and Atlantic Company is permanently defunct, and the employes scattered here and there, it is desired by those of us in this section of the country to learn through the columns of THE TELEGRAPHER what has become of them, and how they have fared since the last "Good night" was said on the P. and A. wires, and they passed to and became a part of the Western Union system?

That memorable Saturday evening, December 27, 1873, is one long to be remembered by the officers and employes of the Chicago offices.

Among the greetings exchanged, the following to Circuit Manager Long will show what kindly feelings existed between the operators as a class:

"PITTSBURG, PA., Dec. 27, 1873.

"To W. C. LONG, Chicago, Ill.

"In behalf of the operators in this office, allow me to thank you for your courtesy toward us. May you live long and prosper is the wish of each one of us. Present our compliments to your force. Our wires are being cut and switched into Western Union now. Farewell. (Signed), RA."

As "Ra" was the operator who generally worked Chicago circuit the above gave us all the more pleasure, because it came from one who knew all our failings as well as our good points.

A little before six o'clock Supt. Wilson, of the Western Union, entered the office, and, with Circuit Manager Long at the switch board, disconnected the wires. As fast as opened by the closing of a key in the Western Union office the transfer was made, so complete were the arrangements in W. U. for the transfer.

Messrs. Pearson and Stevely accepted positions in the operators' ranks in the W. U. office. Messrs. Long, Fortier, and Hall were put on the W. U. day force, and Mr. Dennis on the night force. Mr. Gross accepted a position as operator and clerk with the A. and P. Co., Chicago, Ill. Garner has accepted a position with the Chicago and Northwestern Railway Co. as operator and signal man at Tunnel No. 3, Summit, Wis.

Messrs. Harris and Iredale, "Branch Office men," continue in their respective offices, which are maintained as Western Union offices. The "Indomitable Louderback," who established an office on commission with the three opposition lines, P. and A., A. and P. and Great Western, at No. 86 Madison street, continues there for the Western Union Company. The balance of the branch offices were closed.

Communications from others as to whereabouts and positions of the Israelites will be acceptable and highly appreciated.

A word in regard to subscriptions. I am sorry to see so much indifference manifested towards THE TELEGRAPHER, and hope operators will wake up to their interests by rolling in a liberal subscription from all quarters. I must say that my success in soliciting subscribers has been the same sad experience as that of my fellow laborer over the signature of "T," in issue of January 24th. Ex. P. AND A.

A Matrimonial Failing.

ALBANY, OREGON, Jan. 30th.

TO THE EDITOR OF THE TELEGRAPHER.

FAILING to keep THE TELEGRAPHER posted as to what is going on is something I very seldom do. Everybody, of course, have their failings, but we of the Oregon and California Railroad Telegraph have one we think a good deal of—i. e., Chas. D. Faling, Superintendent of Telegraph and Train Despatcher, but we must say we were very much surprised last Wednesday to learn that, failing to find true enjoyment in the life of a bachelor, he had taken unto himself a wife. Yesterday the following telegram of congratulation was prepared and sent over the wire to Mr. Faling by Assistant Chief Operator Rice, of Albany office. After Mr. Rice had finished sending it Mr. Kenny, Chief Operator, signed it, then each operator in routine all over the wire. The following is the message:

"CHAS. D. FALING,

Superintendent Telegraph O. and C. Railroad.

We tender to you, Mr. Faling, our sincere congratulations upon the annexation of an accomplished and excellent partner to your markedly failing firm. Our failure to more promptly learn of the failing alliance is our apology for failing sooner to proffer our open expression of that never failing good will which unfailingly possesses our several breasts. May the circuit of your perfect happiness long remain unbroken, being clear of escapes and free from resistance. May your relays never fail you, a proper adjustment being unfailingly maintained. May you, never failing in the full enjoyment of life's pleasures, as you go dotting and dashing along her lightning pathway, find no grounds of discord to mar your harmonious working; and should crosses annoy, may they ever be sympathetic. May Time, as he rapidly clicks the hours away, ever adding something new, also add many lesser failings to your already failing household; and when the final good night is given, may your *i* be the signal for that triumphant promotion which is the merit of an unfailingly faithful discharge of life's every duty. Such are the wishes of your employes. (Signed),

- | | |
|--------------------------|-----------------------------|
| JNO. J. KENNY, Chf. Opr. | W. B. RICE, Asst. Chf. Opr. |
| W. W. SKINNER. | G. A. TAYLOR. |
| J. E. TIBBETTS. | O. A. TIBBETTS. |
| C. E. PARKS. | W. A. WILLIAMS. |
| J. H. REID. | C. R. WHEELER. |
| GEO. F. CROW. | J. M. FISH. |
| J. H. WOODROW. | J. L. WILLIAMS. |
| S. B. HENDEE. | H. C. STEVENS. |

W. T. BRADLEY."

Mr. Faling was nonplussed for awhile, but shortly recovering from his surprise, telegraphed the following reply:

"Operators O. and C. Railroad.

GENTLEMEN: Allow me to return you my sincere thanks for your kind wishes and hearty congratulations. I assure you they are deeply and truly appreciated. Hoping that the bonds of friendship which have existed between us may never be severed, and that fraternally our harmonious relations may continue as heretofore, I remain very truly yours,

CHAS. D. FALING."

As lottery gent remarks—"Who's the next lucky man?" This looks discouraging to us five (5) poor lonely old fellows—all that are left out of a band of fifteen gay bachelors a year or so ago. But we will try and bear the burden yet a little longer, and there will, we trust, be further rejoicing in ——— WEBFOOT.

Good Counsel to the Telegraphic Fraternity.

TO THE EDITOR OF THE TELEGRAPHER.

FOR some time I have desired to respond to the communications and remarks of "Nettie Bronson," and to let her know that I sympathize with and feel for her. It occurred to me to try to obtain her real name and address, and open a personal correspondence with her, to tell her my experience, and how I fought my way until I obtained the position and office that I finally secured here; but, on further consideration, I was doubtful whether she would appreciate it, or be willing to correspond with an operator of her own sex, and so abandoned the idea.

In THE TELEGRAPHER of February 7th I noticed communications over the signatures of "Elias" and "S. L. C.," which have again brought the subject to my mind, and I have decided to respond, if room can be accorded for my communication in your columns. "Elias" has expressed my opinion in regard to "Nettie

Bronson" exactly. I should like to hear from her occasionally through THE TELEGRAPHER, and learn how she prospers in what I know by experience to be an arduous undertaking for a woman—getting a living by telegraphy.

I am thankful that opportunity is given in your columns for a discussion of the morals and conduct of the fraternity, which has changed my views concerning them somewhat, as set forth in my communication of Aug. 9th, 1873, over the signature of "Female Operator," when I made public my grievances.

I am sorry to say that since then, as far as my acquaintance has gone with them on this circuit, I have met but three or four (certainly not more) who may properly be called gentlemen in every respect—never meeting these in person and not knowing their bad habits, if they have any, but judge that they have none. I have found, however, that as a general thing those who were coarse and ungentlemanly over the line were drinkers, smokers, billiard players, etc.—slaves to habits which sink men below the brutes. Thank God that they are not all alike! and may he bless those who can say No to every temptation. Their reward is and will be great.

Brothers, continue in well doing. I would request you to remember this fraternity in your daily devotions, as I have done ever since I became connected with telegraphy. We who can and do resist temptation should let our light so shine that others may see that we are walking with Christ.

To the young, careless and reckless, I would say, "It is not all of life to live here." No, we are only pilgrims and strangers here, journeying, it is to be hoped, towards a better land. Let us so live that we may all meet there. Good bye all. God bless you and keep you, and give you strength to overcome all evil. JENNIE.

A Heavy Sleet Storm.—A Telegraph Line Man Freed by a Mule.

CHARLESTON, S. C., Feb. 11.

TO THE EDITOR OF THE TELEGRAPHER.

SEEING nothing in your columns from our section, I have concluded to let the world know that we still live, though one of the heaviest sleet storms that has ever visited this country stopped all direct communication with the north for five days. The breaks between Charlotte, N. C., and Danville, Va., were about forty to the mile, and it will take several weeks to restore wires to their original condition. We got Washington Sunday on temporary wires and work well to New York now. During the break the Western Union kept their northern business moving via Nashville, with, of course, some delay, but the Southern and Atlantic having no other outlet, had to refuse everything and grin and bear it patiently, waiting anxiously for a clik from Washington. The weather here during the storm was cold and wet, and so very disagreeable that half the usual number of drinks were sufficient to retain the high polish and beautiful coloring on the tips of the natives' noses.

Charleston has a natural curiosity in the person of a nobby huanan, who hails from Virginia, and is the happy possessor of 1,500 acres of highly cultivated land in that State. He is one of those lucky chaps always finding knives and money in the street cars. When he sees a quarter on the floor he don't put his foot on it and await an opportunity of sliding it in his pocket, like the rest of us, but picks it up and offers it to every passenger in the car, and if no one claims it tries to force it into the conductor's or driver's hands. He is always purchasing canaries and mocking birds for his friends; but, unluckily, is kept so busy that the birds take wing and fly away just before he has time to go for them. Every time he goes out in the country repairing he purchases chickens, eggs, etc., in abundance for the married men in the office, but it always happens that there is company at the seller's house just before he calls for them, and chicks, eggs and everything have been cooked for said company, but he can have more next week.

He is now feeling very blue because an amateur minstrel troupe organizing here won't allow him to buy instruments for them, and start them out in true Virginia style, with diamond rings, pins, swallow tailed brass button coats, paper bosoms, etc. He offered to do it, and thinks hard of them for refusing the offer.

He was out repairing during the late cold snap, and was up a rather decayed pole putting on an insulator. Whilst busy at work a man rode up, dismounted, and hitched his mule, a very vicious one, to this pole. Jim's fingers getting benumbed he starts down to warm them; but imagine his dismay when he beheld the mule with his fore feet up the pole, trying to reach him with his teeth. There is no doubt of his bravery, as three years' honorable service in the army will testify, but here was a dilemma. If he remained up the pole he would freeze on it. If he descended the mule would freeze on him, or even if he could scare him off he might pull the pole down in his endeavors to get away,

in which event he was liable to be severely injured by the fall. He concluded to risk the freeze rather than the teeth, so mounted higher and got astride a cross arm, where he sat whistling "Thou art so near and yet so far," and singing psalms till the shades of night brought the owner of the mule back, who unhitched him and rode off into the darkness, releasing the half frozen telegrapher from his airy perch.

I hear that one of the boys passing along saw him when he first discovered the mule and had him photographed. If so I will send you a copy.

He is now throwing money around among the politicians endeavoring to have an ordinance passed prohibiting hitching rabid mules to telegraph poles.

We all look forward impatiently for your paper day, and it is a most welcome sheet. Why it is not subscribed for by every one in the business is beyond my comprehension, containing as it does so much valuable information, besides being the well known champion of the fraternity. QUILP.

Justice to Military Telegraph Operators.

TO THE EDITOR OF THE TELEGRAPHER.

I NOTICE in THE TELEGRAPHER of February 7 a communication signed "Agitator," in regard to a land bounty for telegraph operators who served the Government during the war of the rebellion. As one of the many operators interested in this question, I should very much like to know what, if anything, has at any time been done to bring our claims before Congress. Certainly it cannot be denied that our services were quite as valuable to the Government as were those of the brave soldier boys who so gallantly ran the risk of becoming "food for powder," and are now enjoying their country's bounty. Although we did not bear arms, we were constantly exposed to danger and sickness; and many of our number standing faithfully at their posts at points inadequately guarded, were captured by the enemy and suffered all the horrors of their prison pens; others languished on cots (not beds) of sickness, and many laid down their lives as nobly as did their brethren on the battle field. By our aid many calamities were averted, and many advantages gained which could not have been gained without the help of our little "clickers," insignificant as they might seem among the mighty "engines of war" by which they were surrounded. And wherever our army corps were found there also were seen our field lines, and our brave boys of the "key and quill," doing as effectual service as they of the "sword and epaulette;" while in the rear, along the railway lines of communication and supply, their brethren stood sentinel night and day, watching with untiring fidelity the progress and safety of the trains bearing to the front the necessaries of life for those in the field. None were more trusted, or more implicitly relied upon by the President and the generals in command, and none more fully proved themselves worthy of such confidence. Why, then, should Congress be unwilling to recognize our services by according to us a land bounty? Few of us are so "well to do" in this world's gear that such a bounty would not seem, and in reality be, a godsend. It seems to me that it only requires concerted action on our part to set the ball in motion and carry our cause to a successful issue. Surely we shall find advocates among those in power who are cognizant of the justice of our claims. Compared with the hosts of arms bearers our numbers are small, even insignificant; but our services cannot be estimated on a basis of "one man power." As your correspondent, "Agitator," truly says, "The services of one operator were often of greater value than those of whole regiments."

I am not an organizer, and feel incompetent to suggest a course to be pursued in this matter; but I hope others who are interested, and would be benefited by an Act of Congress in favor of Military Telegraph Operators, will give us their views through your columns. "Agitator's" suggestion that a petition be circulated, may be a solution of the question as to how we shall get our claim before Congress. Let the matter not be dropped again until some end is arrived at, either favorable or otherwise. We believe our claim to be just. Let us prosecute it with determination, and why shall we not succeed? ONE OF THE BOYS.

A Correction.

TO THE EDITOR OF THE TELEGRAPHER.

In my article last week, on the "Bridge Duplex," I attempted to say, "It is not practicable to increase the sensitiveness of the receiving relay by substituting one of higher resistance." The printer made it read lighter resistance, which inverted the sense of the passage. As usual. F. L. POPE.

Answer to Correspondent.

TRIP.—The message received properly contains eight words only, but what the latest Western Union official ruling may be we don't know.

Justice to Military Telegraph Employees.

We print this week a communication from another telegrapher, who, during the war, was employed in the military service of the United States, in regard to an appropriation by Congress of a land bounty to such as served faithfully in that capacity.

An act was introduced in the last Congress by Mr. RICHIE, who was a member of the House from Maryland, and the subject was considerably discussed in THE TELEGRAPHER at the time, but finally the Congress expired and nothing was done with it. Our correspondent "Agitator," in a recent number of this paper again called attention to the matter, and it is beginning to attract the notice of the parties interested.

We are aware that the present is not a very favorable time to present claims for bounty or recognition of past services to Congress, but in this case the justice of the claim is so clear and indisputable that it seems to us a proper presentation of it would secure attention even now.

In commenting on this matter in THE TELEGRAPHER of May 11, 1872, we said "If any persons who were in the United States military service during the war are entitled to recognition, and a grant of land from Congress, those who were in the telegraph service of the army should not be neglected or overlooked. Many of the telegraphers who were engaged in the military telegraph service were exposed to greater hardships and dangers than their associates in other departments, and performed services of incalculable value and importance. The safety of armies and the success of most important military operations frequently depended upon the courage and fidelity of the military telegraphers, and they were never found wanting in zeal or devotion to the national interests." We do not know that we can add anything to this presentation of the case. The statements made are indisputable and never have been disputed, to our knowledge. We have heard of no special opposition to Mr. RICHIE'S act having been made, but our recollection of the matter is that it failed for want of time, or from not having been urged with sufficient energy by those who were interested.

We have no doubt but that a proper presentation of the claims of the military telegraphers would secure recognition, and ultimately justice being done to them. To effect this, however, there must be an organized effort made; if possible some influential member should be induced to take the matter up and present it properly to Congress, and his efforts should be supplemented by the petitions and personal exertions of as many of the parties interested as can be reached at this time.

Congress will remain in session at least until the latter part of next June, and perhaps longer, and if a move is made within the next month or six weeks it is possible that something may be accomplished even at the present session. To do this, however, will require immediate personal effort on the part of those who are concerned.

Believing the claims of the military telegraphers to be just and equitable, THE TELEGRAPHER will hereafter, as heretofore, support them to the extent of its ability and influence, but without such effort as we have indicated all that we may say or that our correspondents may say on the subject will have but little effect.

The Work of the Patent Office for 1873.—Proposed Reforms in its Organization.

THE Annual Report of the Commissioner of Patents for the year 1873 has just been published, and is in many respects a document of great interest, especially to inventors. The gross receipts of the Patent Office from all sources during the year was \$703,199.77, and the expenditures \$691,178.98. The total number of patents issued was 12,864. The greatest number of patents (2,826) was granted to citizens of New York State, and the least number to Idaho and New Mexico, each 1. Of course we are not surprised to find the inventive faculty proportionately more active in Connecticut than elsewhere, being in the ratio of 1 patent to

every 864 inhabitants. New Mexico is at the other extreme, the ratio there being 1 to every 91,874 inhabitants. The total number of patents issued has varied but little one way or the other from 13,000 per year for the last seven years. The proportion of electrical patents to the whole number during 1873 is a little under 1 per cent.

Commissioner Leggett recommends a number of amendments to the patent law of 1870, which experience has shown to be seriously defective in many particulars, as many inventors have good reason to know. One of the most important of the suggested amendments is one making the duration of an American patent entirely independent of the duration of any foreign patent to the same person. Another is the repeal of an absurd provision in the law of 1870, by which the assignee of the entire interest in a patent, in order to secure a re-issue, must first secure the signature and oath of the inventor, if he be living. The only purpose served by this provision is to place a means of extortion in the hands of unprincipled assignors.

For the third time Commissioner Leggett called the attention of Congress to the necessity of a reorganization of the Patent Office. There is no doubt whatever of the substantial truth of the Commissioner's statement that fully nine-tenths of all the capital invested in manufacturing in this country is thus invested because of the security afforded to it by patents. Hence the importance of ascertaining correctly what is new and useful in each application, and then limiting the applicant's claims to precisely that of which he is really the first inventor. While we consider that the Patent Office, on the whole, has succeeded admirably in doing its work in a creditable and satisfactory manner, in spite of its defective organization, yet it is no less true, as the Commissioner himself says, "that very many applications are hastily and carelessly examined; very many patents are issued every year for subject matter not patentable; and applications are rejected upon which patents should be granted." We also emphatically agree with him when he says: "It is well known that complaints from many sections of the country against our whole patent system arise almost exclusively from patents that have been improperly granted, because of the want of proper supervision in their examination"—a supervision which it is utterly impossible to secure under the system now in vogue in the office.

The plan recommended by the Commissioner is that of grouping the 145 classes in the office into nine divisions, each division to be presided over by a competent official, to review the work of his subordinates. "Such an organization," he says, "would relieve the country of a large number of very annoying patents, which should never be granted, and will secure to real inventors the products of their brain work with much greater certainty than is now done."

It is proposed to meet the somewhat greater expense of the new system by a tax of perhaps twenty dollars, to be paid in by the holders of all patents, at the expiration of six or even seven years from their date. This would probably sweep away a great proportion of the worthless and disused patents, amounting to perhaps 25 per cent. of the whole. The Commissioner says that "this tax would not be onerous upon the holders of patents possessing in themselves any real merit, and would be beneficial in exterminating such as are without merit and stand in the way of substantial and practical improvement."

We heartily endorse every one of the above recommendations, as well as the concluding one, which is in many respects the most important of all, that of establishing at Washington "a Court exclusively for the trial of patent cases, to be composed of men eminent for their legal and judicial talents, and also distinguished for their expert knowledge of the subjects presented in the trial of causes growing out of patents. This Court should be easy of access, always in session, and the pleadings simple and direct. Its findings of fact should be final; its rulings on law

"points might be reviewed, upon proper application 'by the United States Supreme Court.' The great value to inventors and manufacturers of such a Court is so obvious as to need no argument. It would greatly enhance the actual money value of all meritorious patents, and inventors would receive much greater encouragement, also, and remuneration than under the present extremely defective system.

We hope Congress may be induced at length to pay some attention to the very common sense recommendations of the Commissioner. The reforms urged by him are imperatively necessary, and, if carried out, would be worth millions of dollars to the manufacturing and commercial interests of the country. But as the interests of the country are apparently the very last matters that this body of worthies are at all likely to attend to, the prospect of an immediate reform is not particularly encouraging. Still, it may be some satisfaction to Gen. LEGGETT to know that his efforts are appreciated by the large and worthy class whose interests he so ably advocates, and we hope he may continue to hammer away at the honorable members till he accomplishes the desired result.

The Page Patent Litigation.

WE have repeatedly referred to the litigation which is in progress for the purpose of judicially determining the validity or otherwise of the notorious Page patent which practically covers nearly every method of telegraphy, except the Automatic, now used. The defendants in the suits which have been brought by the Western Union Telegraph Company against the Manhattan Quotation Company and Mr. CHARLES T. CHESTER, to enforce this patent, have just filed their reply to the complainants, in which the priority of invention claimed by Prof. PAGE is very thoroughly examined, and shown to be untenable.

We know of nothing which is of more importance to the telegraph interests of the country than the attempt which is being made to reestablish a telegraph monopoly under this patent, and all parties should, without delay, unite with the contestants in defeating this attempt. The contest will, no doubt, be long and expensive, and as an adverse decision will be of general and great value, it is but just that those who are to be benefited should contribute to secure it.

The Dominion Telegraph Company.

WE publish this week the fifth annual report of the Dominion Telegraph Company of Canada, from which it will be seen that this company is proving highly successful. It is proposed during the coming season to largely extend its lines and increase its facilities, which is imperatively demanded by the rapid increase of its business. We believe this company to be well and honestly managed in the interests of its stockholders and the public, and are gratified to learn of its continued and increasing success and prosperity.

An Enterprising Firm.

THE attention of those who may have occasion to purchase telegraph instruments and apparatus, is called to the advertisements of Messrs. PATRICK BUNNELL & Co., of Philadelphia, which will be found in this number of THE TELEGRAPHER. This enterprising firm, we are pleased to learn, are doing a very good business. They deserve to succeed—the firm being composed of practical telegraphers, well and favorably known to the fraternity and the business public. They have recently enlarged their premises and increased their facilities, and are now prepared to fill all orders promptly and satisfactorily.

Personals.

THE address of Mr. CHARLES MAYNE is desired. When last heard of he was in Illinois. Any one who knows his present address is requested to address "Manager, Western Union Telegraph, Cromwell, Iowa."

Mr. J. J. FREY, heretofore Superintendent of the Sedalia Division, has been appointed Superintendent of

Telegraph on the Missouri, Kansas and Texas Railway, with office at Parsons, Kansas.

Mr. E. O. MARTIN has been transferred from the day to the night force in the W. U. Chicago office.

Messrs. WM. C. LONG, CHARLES FORTIER and GEORGE HALL, of the Pacific and Atlantic Chicago, Ill., office, were, upon the consolidation of the lines with the Western Union, transferred to the day force of the latter in the Chicago office.

Mr. ED. DENNIS, formerly P. & A. night manager, Chicago, Ill., was transferred to the night force of the W. U. office in that city.

Mr. H. GARNER, formerly of the Chicago P. A. office, has accepted a position as operator with the C. & N. W. Railway, Madison Division, at Tunnel No. 3, North End, Summit, Wisconsin.

Mr. N. B. WALKER has accepted a position as operator with the C. & N. W. Railway Co., Madison Division, at Tunnel No. 3, South End, Summit, Wisconsin.

Mr. J. H. F. SCHOLL, formerly in the Train Despatcher's office of the Central Railroad of N. J., L. & S. Division, at Mauch Chunk, Pa., has accepted the position of agent and operator for the U. P. Railroad, at Ogalalla, Nebraska.

The Telegraph.

The Dominion Telegraph Company.

THE annual meeting of the Dominion Telegraph Company, of Canada, was held at the executive office of the company in Toronto, Canada, on Wednesday, February 11.

The Hon. John McMurrich, President, presided.

The Chairman said that the directors and officers of the company had passed through another hard year's work, but with much less anxiety than on former occasions, as they had received more encouragement. He felt that the shareholders would be satisfied with the progress the company had made.

The fifth annual report of the directors was then read by the Secretary, Mr. Small. They congratulated the shareholders on the steady increase of business and profitable returns which the accounts exhibit, and the fair prospects for the coming year.

"The company was organized, and the first Board of Directors appointed in August, 1868. Seventeen months after, at the close of 1869, the company had been enabled to construct but 147 miles of single wire line, and to open six offices in that period; its growth has been steady and most satisfactory. In the course of the following year, 1870, the company had increased their mileage to a total of 629 miles of pole line and 1,116 miles of wire, with 35 offices. At the close of 1871 the company, including the purchase of the Quebec line, possessed 1,510 miles of pole line, 2,933 of wire, and 106 offices. During the course of the following year, the pole line mileage had been increased to 2,177 1/2 miles, the wire to 3,942 miles, with 164 offices.

"The new lines constructed during the year just closed consist of the following: From Sarnia to Kent Bridge, intersecting the London and Chatham line, over 59 miles; from Collingwood to Owen Sound, 39 miles; from Trenton to Picton, 32 miles; from Whitby, through Port Perry, to Little Britain, 36 miles; from Clinton, on the Goderich line, to Kincardine, 56 miles; from Brantford to the town of Simcoe and Port Dover, 33 miles; from Mount Forest, through Durham and Walkerton, to Kincardine, 50 miles; from Mount Forest to Harriston, 10 miles; and a short connection between Ottawa and Aylmer, making in all about 400 miles of new extension, with 633 miles of wire. These additions bring up the addition of the company's pole mileage to 2,585 miles, with 4,574 miles of wire and 251 offices.

"A portion of this increase of wire mileage has arisen from the addition of extra wire on lines already constructed, rendered necessary by the increased business of the company; and still further provision will have to be made in this direction, partly by additional wires on existing lines, and partly by new lines on fresh routes, not only to increase the scope of the company's business by embracing fresh districts where these lines are called for, but also to add to the facilities of existing communications between the business portions of the Provinces of Ontario and Quebec. The general manager has prepared with great care a sketch of the extensions referred to above, which it is most desirable should be provided for with as little delay as possible while the season is favorable for getting out poles.

"To make provision for these contemplated extensions a fresh issue of stock will be necessary, and the directors recommend that authority for this purpose be granted to the extent not exceeding \$100,000 for the year 1874, to be floated from time to time as the new works are proceeded with."

In conclusion, the directors express their satisfaction at the manner in which the General Manager, Mr. J. D. Purkis, continues to discharge the important duties of his position, and with the zeal and energy of the Secretary, Mr. Small.

The report of the General Manager, Mr. J. D. Purkis, was then read. He calls attention to the fact that, at least 500 miles of poles and 1,000 miles of wire will be required to be put up the coming season to meet the growing business, as well as to open up new routes and new offices in the Provinces of Ontario and Quebec.

He continues:

"You are aware that greater facilities are becoming more necessary every year to meet the steadily increasing requirements of the mercantile community and the press; and, in order to provide for these and to advance our own interests, we must continue our extensions and increase our wires. You are aware that the more extended our lines are the less will be the ratio of working expenses, and I have no hesitation in saying that the sooner your lines are extended, not only through Ontario and Quebec, but the Lower Provinces, the greater will be your success; but it has not been my aim to advise larger extensions during any season than I have felt we could place in proper working order.

"In order that the contractor may avail himself of the winter season to procure the poles, and to give time to import the necessary wire, it is most desirable that arrangements should be come to at once, or with as little delay as possible.

"So far, our success has been such that I feel confident you will cheerfully accede to my request, and provide the necessary means to carry it out."

With the exception of the interruption caused by the almost unprecedented storm of Dec. 23, 1873, and the sleet storm of Jan. 7th and 8th last, which did a great deal of temporary damage, but was repaired with all possible energy and despatch, the wires have worked during the past year with great regularity, and the lines are now throughout in good condition.

He closes his report with a graceful and deserved compliment to his assistants and the employes and agents of the company generally, who have, he says, "worked heartily and faithfully for the interests of the company."

A comparative statement of the number of messages sent during the years 1872 and 1873, showing an increase of 83,579 messages for the latter over the previous year.

The report of the directors was accepted after some remarks of satisfaction on the part of gentlemen present at its favorable character, and a motion "That the directors are hereby authorized to make a fresh issue of stock, not to exceed \$100,000, as asked for in the report," was carried.

Mr. Mackenzie, in commenting upon the report, said there was no difficulty which he could not see his way out of. By contracts between the railroads and the Montreal Telegraph Company the latter had secured exclusive right of way over their routes. It was very desirable and almost essential that this company should, especially when its lines were extended into the Maritime Provinces, have a similar privilege. He thought that the law of the country ought to give an equal right to all to construct telegraph lines along the railways. "The honorable Treasurer of Ontario has at present an amendment to the railways act before the local Legislature, and he thought the directorate of this company ought to consult with the Government upon this subject. He had no doubt but that, in justice to the country, they would give the amendment asked for. The importance of the subject would justify their approaching all the provincial governments with a similar request. He did not see why one telegraph company should be given a monopoly over another, or why two foreign express companies should be privileged to the virtual exclusion of companies which we could organize ourselves."

After further debate a motion was made by Mr. Mackenzie, which was carried, "That the Board of Directors be requested to enter into immediate communication with the Dominion and Provincial Governments for the purpose of securing to all telegraph companies in the Dominion the privilege of laying down their lines upon the different railways in the Dominion, and having the same facilities afforded to all on equal terms."

Sheriff Waddell moved a hearty vote of thanks to the President, Vice-President, Treasurer and Directors, for their attention to the interests of the company during the past year, which was carried.

The following gentlemen were then declared unanimously elected Directors for the present year:

Hon. John McMurrich, John J. Mackenzie, James Michie, Hon. Wm. Cayley, Lewis Moffat, Hon. T. N. Gibbs, S. Neelon, A. Copp and Wm. F. McMaster.

At a subsequent meeting of the new Board the Hon. John McMurrich was reelected President; Mr. John J. Mackenzie, of Hamilton, Vice-President; Mr. James Michie, Treasurer, and Messrs. M. H. Gault, of Montreal, and A. Joseph, of Quebec, were reappointed local Directors for the Province of Quebec.

AN ELECTRIC BELLE.—A female telegraph operator.

The best investment for a telegrapher.—Two dollars for a subscription to THE TELEGRAPHER.

Enlargement and Improvement of the Indianapolis, Ind., Western Union Telegraph Office.

The Western Union Company in this city has recently doubled the space occupied by the operating, receiving and Superintendent's departments. The operators have been removed to the fourth floor, corner room, which is well lighted, cheerful, and a great improvement over the old one. Calland batteries have taken the place of the Grove, some eight hundred cells being in use, divided into eight main batteries. Including duplex and repeaters there are about forty instruments in the operating room, the whole in charge of Mr. Winder, as chief, with Messrs Langhorne and Fuller as assistants.

The work of changing operating and battery rooms was done under the supervision of Mr. C. H. Summers, the company's electrician.

Mr. Whitney remains as right bower to Sup't Wallace, assisted by Hinsdale and Moulton, both big trumps.

Manager Butler is happy with Thomas at the books; Barnard as receiver, and Swain in charge of delivery. Brisbane bosses batteries, and John Hasty keeps the spurs of his climbers bright, and things straight generally.

Bold Forgery of an Official Announcement of Increase of Western Union Stock.

ON Tuesday afternoon an intense excitement was created on the floor of the New York Stock Exchange by the announcement of a proposed increase of the stock of the Western Union Telegraph Company to \$50,000,000—an addition to the existing capital of \$9,000,000.

A few minutes before one o'clock P. M. a messenger boy—one of the regular uniformed messengers of the Stock Exchange—handed a letter to Vice-President Wheelock, who read out the announcement that the Western Union Telegraph Company had increased their capital stock from \$41,073,410 to \$50,000,000.

The letter was as follows:

"WESTERN UNION TELEGRAPH COMPANY, }
New York, Feb. 17, 1874. }

MOSES H. WHELOCK, Esq., Vice-President New York Stock Exchange:

As required by the rules of the New York Stock Exchange, you are hereby informed that the Directors of this company, after mature deliberation, and acting, as they believe, in accordance with the ultimate best interests of the company, have decided to increase the capital stock of this company from \$41,073,410 to \$50,000,000. The proceeds of the sale of the additional stock, together with the proceeds of the sale of \$7,295,235 of stock lately in the possession of the company, will be expended in the repairs and improvement of the present lines, and the extension of the lines of the company to nearly all the post-offices in the United States, and for the establishment of a line to California and Mexico. The Directors beg to state that while the establishment of new lines may delay for a little the expected dividends to stockholders, they express a confident hope that by thus taking possession of the whole field, and effectually thwarting the establishment of a rival company, the ultimate value of the stock will be in no way diminished, and that reasonable dividends can be paid at no distant day. Yours truly,

WILLIAM ORTON, President."

This letter was written on the official paper of the Western Union Company. Directly after the reading of the above by Mr. Wheelock a second letter was handed to him, purporting to be from the President of the Toledo, Wabash and Western Railway Company, also announcing an increase of \$10,000,000 of the common stock of that company. This letter, like the first, was written on the official paper of the company.

The reading of these letters at once created intense excitement, and there was a tremendous pressure to sell stocks, especially of the two companies affected.

Two or three brokers, who were not carried away by the excitement, carefully examined the letters and at once pronounced them forgeries. The officers of the Exchange sent letters to the officers of the two companies, and soon obtained the following from President Orton, of the Western Union Company:

"NEW YORK, Feb. 17, 1874.

H. G. CHAPMAN, Esq., President New York Stock Exchange:

I have just learned an announcement has been made in the Stock Exchange that the Directors of the Western Union Telegraph Company have recently voted to increase the capital stock to \$50,000,000. This announcement has no foundation in fact. No meeting of the Directors has been held for several months, nor has the matter of the increase of the capital stock of the company been a subject of consideration at any meeting of the Executive Committee. Respectfully,

WILLIAM ORTON, President."

Information was also received from the transfer clerk

of the T. W. and W. Railway that the notification of increase of capital of that company was a forgery, and the excitement subsided.

In the meantime the shares of the Western Union Telegraph Company had declined nearly four per cent.; and, doubtless, the rascals who had concocted and carried out the nefarious scheme had managed to profit largely by the successful trick.

The Governing Committee of the Stock Exchange have taken measures to ferret out the villains, who, if detected, will be made to suffer for their villany.

President Orton stated to a reporter who interviewed him on the subject, after the excitement was over, that the company had no intention of increasing its capital stock, and has not had.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended Jan. 24, 1874, was 324,600—an increase of 35,427, on the corresponding week last year.

The West India and Panama Telegraph Company have been informed by Sir Samuel Canning, their engineer, of the successful completion by the Telegraph Construction and Maintenance Company of their duplicate cable between Jamaica and Porto Rico, and they state that the interruption on the Cuba Company's cable—the repair of which they hope to see announced in a few days—is now the only obstacle to direct telegraphic communication with the West Indies.

The Eastern Telegraph Company announce that their direct cable between Cornwall and Lisbon is interrupted, but messages are sent as usual by the duplicate line between these points *via* Vigo.

The final meeting of the United Kingdom Telegraph Company, for the purpose of receiving the report of the liquidator, and for winding up the company—its lines having been taken over by the Government as part of the postal telegraph system—was held at the London Tavern on the 26th of January. The balance sheet was unanimously accepted, and the chairman declared the company completely wound up.

Married.

CADMUS—BARKALOW.—On Tuesday, Feb. 17, 1874, at the residence of the bride's father, by Rev. H. M. Taylor, CHARLES A. CADMUS, of the Western Union Telegraph Co., Cleveland, Ohio, to ANNIE E. BARKALOW, daughter of Moses V. and Cornelia Barkalow, of Franklin, Warren Co., Ohio.

FALING—BARRETT.—In the City of Portland, Oregon, at the residence of the officiating clergyman, Rev. T. L. Elliott, Mr. CHARLES D. FALING, Supt. Telegraph O. & C. R. L., to Miss XARIFA J. BARRETT, all of Portland.

It is evident that the bridegroom's name is indication of his disposition; but who can blame him for having a "failing," as regards the young lady who has favored him with a "permanent connection," and, no doubt, he will be able to "barrett" not only with equanimity but pleasure. A solitary life must certainly, under the circumstances, have proved an unpardonable "failing" on his part had he continued it longer. May they live long and happily together with few "crosses" and no "breaks" to trouble them.

JONES—DIKE.—Mr. F. W. JONES, Asst. Chief Operator Western Union office, Chicago, Ill., to Miss ELIZA DIKE, operator in the same office.

STEWART—SCWALKA.—At Yreka, California, January 28, 1874, Mr. GRANVILLE Q. STEWART, of Yreka office, of the Western Union Telegraph Co., to Miss JENNIE SCWALKA, all of Yreka.

The matrimonial epidemic among the Pacific Coast telegraphers seems to be spreading. They evidently realize the fact that "It is not meet that man should live alone," and it is certainly an act of kindness on the part of the lady to take compassion on the loneliness of a telegraphic artist. May others find sufficient provocation to do likewise for such members of the fraternity as have not yet been provided with matrimonial engagements.

Died.

HARRIS.—At St. Paul, Minnesota, January 31, 1874, in the 24th year of his age, of hemorrhage of the lungs, GEORGE HARRIS, formerly Manager of the Pacific and Atlantic Telegraph Company in that city.

I thought my cup of grief was full,
But now it's running o'er,
Though I know my children are not dead,
But only gone before.

Three little ones were called away
To join the angel throng,
And now another loved one's gone
To swell the heavenly song.

My noble son gave up his life
To God, the just and right;
He did not live to suffer long—
God took him from our sight.

His MOTHER.

Obituary.

GEORGE HARRIS.

THE deceased, although but in his twenty-fourth year when he died, had been engaged in the telegraph business from his fifteenth year. He was a very excellent young man and a good telegrapher. His last telegraphic position was as manager of the St. Paul, Minn., office of the Pacific and Atlantic Telegraph Company, which position he filled acceptably and creditably to himself and the company.

In April of last year he was taken with hemorrhage of the lungs, for which he could not succeed in obtaining relief, and in

September last, by advice of physicians, went to California, but not apparently receiving much benefit, he returned to St. Paul. After his return for a time he seemed somewhat better, but gradually declined, and for the last four weeks of his life was unable to leave his bed.

He was beloved by those who were associated with him in business, and, so far as is known, he had no enemies. His funeral took place Feb. 3, from St. Mary's Church, St. Paul, and an affecting general sermon was preached by Rev. L. Caillet.

The deceased always felt much interested in THE TELEGRAPHER, urging it upon the attention and support of those with whom he was associated, and occasionally contributing to its columns.

He leaves a kind and affectionate mother, who is greatly afflicted at his death, and who has the sympathy of all who knew her son.

[From the N. Y. Tribune and N. Y. Evening Post.]

THE AMERICAN AUTOMATIC TELEGRAPH.

TO WHOM IT MAY CONCERN.

THE AMERICAN AUTOMATIC TELEGRAPH SYSTEM is now being operated in the United States of America by the AUTOMATIC TELEGRAPH COMPANY, under an agreement with a temporary license granted by me, the undersigned (on record in United States Patent Office, Liber J, 17, page 73, Oct. 21, 1873). I am ready to assign (conditionally) to responsible parties one undivided fourth part of all the foreign patents (including Canada) now in my possession. GEORGE LITTLE, C. E., Assignee and Sole Patentee, Bloomfield ave., Passaic City, N. J., U. S. of America.

TO TELEGRAPH SUPERINTENDENTS.

If you are fitting up SHORT LINES or CITY WIRES get PARTRICK, BUNNELL & CO.'S

CHAMPION SETS.

They are complete, full sized, work beautifully, don't get out of order, are substantial, pretty, and very low priced. Send for circular.

WILLIAM BROWNLEE,

Dealer in

CEDAR TELEGRAPH POLES,
DETROIT, MICHIGAN.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

(P. O. Box 5603.)

Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
 Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. BOX 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
 American Compound Telegraph Wire Co.,
 ALANSON GARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,

DR. L. BRADLEY,
 No. 9 Exchange Place,
 JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60. Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-800th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any attention whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,

Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

145 BROADWAY, NEW YORK, }
Sept. 22d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,
A. S. Brown, Manager.

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order. Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

WESTERN ELECTRIC
MANUFACTURING COMPANY
FURNISH ALL DESCRIPTIONS OF
Copper Office and Magnet Wire,
OF OUR OWN MANUFACTURE,
WITH
EVERY VARIETY OF INSULATION,
FINE RESISTANCE WIRE and DOUBLE and
SINGLE CONNECTING CORD.
Western Electric Manufacturing Company,
CHICAGO.

CHARLES WILLIAMS, JR.,
(ESTABLISHED 1856.)
109 Court Street, Boston,
has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
MANUFACTURER OF
REED & PHILLIPS'
PATENT INSULATED TELEGRAPH WIRES,
(PATENTED, NOVEMBER 18TH, 1873.)
Lock Box 169. PROVIDENCE, R. I.
Having recently enlarged our factory, we are now prepared
to furnish at short notice any style and quantity of
BRAIDED LINEN or COTTON COVERED WIRE,
saturated and finished with our Patent Compound, which makes
the most durable, handsome and best insulated Braided Wire
manufactured.
PAINTED, PARAFFINE or SHELLAC WIRES
also furnished at the lowest prices. Iron or Compound Wires
covered upon reasonable terms.
We are also prepared to furnish a new style of
ELECTRIC CORDAGE,
which has been pronounced by all superior to any in the market.
The American District and Gold and Stock Telegraph Com-
panies have been supplied from my works with a greater
portion of the office wire used by them.
Sample Card and Price List furnished when requested.
Phillips' Wire can be had of

MANUFACTURERS OF

INSULATED WIRES.
OFFICE WIRE—Plain, Braided, Prepared, &c.
INSTRUMENT WIRE—Cotton and Silk Covered, &c.
FLEXIBLE CORDS, all kinds, &c., &c.
We warrant all Wire to be of the highest conductivity, tested
by our Galvanometer, which compares with the tests of the
highest authority in this country.

TILLOTSON'S EXCELSIOR
TELEGRAPH INSTRUMENT.

(PATENTED JUNE 24, 1873.)
This apparatus is constructed of the best material, and finished
equal to any Telegraph Instrument, and is warranted first class
in every particular. It is especially adapted to the require-
ments of Students of Telegraphy and the operation of Private
Telegraph Lines.
Price, complete, Sounder and Key mounted on finely
finished Mahogany Base, with one Cell Hill's Patent
Battery, with Chemicals, eight feet of Office Wire, and
"Smith's Manual of Telegraphy"..... \$7 50
Two sets..... 14 50

THE AMATEUR'S
TELEGRAPH APPARATUS.

(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized
Trunnion Lever Key, with Friction Circuit Closer and a Pony
Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most
constant and economical in use.

With each Instrument is furnished

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
and a "Manual of the Telegraph," for the instruction of be-
ginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in
addition to the above, more cups of battery, according to the
length of line.

COMPLETE OUTFIT, WITH BATTERY, CHEMICALS
AND MANUAL,
Seven Dollars.

Sounder and Key only..... 6 00

SHAFFNER'S
TELEGRAPH MANUAL.

TO TELEGRAPHISTS.

I am now revising my "TELEGRAPH MANUAL," and desire
to make the work complete in its description of the present
state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustra-
tions in the Edition of 1859, and the present coming Edition will
contain at least *One Thousand*, descriptive of the latest
improvements.

At present it is my design to issue two Volumes, containing
about 600 pages each, separating the Historical from the Oper-
ative.

I will thank any one for information suitable for such a work.
Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
78 and 80 Broadway,
NEW YORK.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable. Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and de-
livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,

SATURDAY, FEBRUARY 28, 1874.

VOL. X. WHOLE No. 398.

The Page Patent Litigation.—Answer of the Manhattan Quotation Company.

The answer of the Manhattan Quotation Company to the complaint in the suit of Priscilla Page, administratrix, etc., and the Western Union Telegraph Company, which suit is intended to establish the validity of the patent granted to Charles Grafton Page, and subsequently, on the 10th day of October, 1872, reissued to the plaintiffs, has been filed in the Circuit Court of the United States for the Southern District of New York.

The answer admits the Act of Congress under which the application of Prof. Page was made, and letters patent issued to him, but denies that said Act of Congress conferred any power, right or authority for issuing said letters patent as issued, or that Page then, or at any time thereafter, was the original and first inventor of certain new and useful improvements in induction coil apparatus and circuit breakers, being the same inventions and improvements which are more particularly described in the said letters patent, or that the same had not been known or in use by others at or prior to the time of the alleged invention claimed to have been made by Prof. Page, or that, by virtue of granting and issuing of said letters patent, he became the owner of said inventions and improvements, or thereby acquired any exclusive rights and privileges, as set forth in the complaint; but that, on the contrary, said inventions and improvements were previously known and described by divers and sundry persons in one or more printed publications and otherwise, and were described, claimed and held by divers and sundry persons under letters patent in this country and Great Britain; for which reasons defendant claims and insists that the said letters patent, so issued to said Charles Grafton Page, are null and void, and ask the Court to so declare.

It is also denied that, by the assignment and transfer by the said Priscilla W. Page, the Western Union Telegraph Company became the owner of or acquired any interest in the improvements and inventions enumerated and described in said letters patent.

The defendant avers and will insist that the surrender of the original patent was not for any sufficient, lawful or valid cause, nor for the reason that the specification attached to said first mentioned letters patent, and forming a part thereof, was so defective or insufficient as to render them inoperative and invalid under the statute in such case made and provided; and that the Commissioner of Patents had no lawful jurisdiction or authority to receive and cancel the said letters patent under said alleged surrender, nor to issue the said reissued letters patent, dated October 10, 1871; and denies that the said amended specification attached to the said reissued letters patent is more full, clear or exact than the original specification attached to the original letters patent. *And the defendant states and insists that the said amended specification, and the said reissued letters patent, include and contain more and other matters than the improvements and inventions described in the said surrendered letters patent, or in the application of Prof. Page, on file in the Patent Office on the 19th day of March, 1868, and include new and additional matters, improvements and inventions, more and other than was ever claimed to have been discovered or invented by the said Page, and that said amendments of said specifications were not confined to remedying the defects therein, within the meaning of the statute in such case made and provided, and do not conform with the description, specification or claims of inventions, improvements or discovery (claimed to have been made) of said Page, in his application on file in the United States Patent Office, March 19, 1868, and in the said letters patent of April 14, 1868, but, on the contrary, important parts of said descriptions and specifications, original, of said Charles Grafton Page, are amended, modified and suppressed, with intent to mislead, deceive and defraud, against the statute in such cases made and provided; for which good and sufficient reasons the defendant claims that said reissued letters patent are and were null and void, ab initio.*

The answer specifically denies the statements of the complaint of the plaintiffs of wrongful infringement of the letters patent, and loss and damage arising therefrom.

And for a further and separate answer and defence to the allegations of the complainants, the defendant answers, upon information and belief, "That prior to the 19th day of March, 1868, and on the 2d day of February, 1854, the said Charles Grafton Page, claiming to have invented and made discovery of certain new and useful improvements in induction coil apparatus and in circuit breakers, made application for letters patent therefor to the Commissioners of Patents of the United States Patent Office, and which said application was on February 23d, 1854, rejected and denied by said Commissioner of Patents, upon the ground and for the reason assigned, that said Charles Grafton Page was then an Examiner of Patents in the United States Patent Office, and thereby, under the law in such cases made and provided, disqualified of the right of receiving and obtaining letters patent of the United States; and also for the further reason assigned, that said Charles Grafton Page, prior to holding such position of Examiner of Patents, and a long time subsequent to the time of the alleged inventions for which he then made application for letters patent, had made known and abandoned to public use the said improvements and inventions by him claimed to have been made as aforesaid, and that the same or material parts thereof had been long known and in public use with his knowledge and consent."

The defendant further states that, under the Act of Congress by which the disabilities of said Page were removed, and he was authorized to apply for and received a patent, he did renew his said application "for letters patent for his induction apparatus and circuit breakers," then "on file in the United States Patent Office, including therewith his circuit breakers described by him prior to said application," and that subsequently said Page amended his application, then on file as aforesaid, as follows:

WASHINGTON, March 31, 1868.

HON. A. M. STOUT,
Acting Commissioner of Patents.

SIR—I desire to amend my application for letters patent for the induction coil and circuit breakers, now pending before the Patent Office, as follows, to wit:

Before claim first insert as follows:

The spark arresting circuit breakers may all be used as independent or detached circuit breakers, and these, and likewise all the independent electro-magnetic instruments hitherto used and described by me, for opening and closing circuit with other instruments, may be operated by batteries separate and independent from the batteries which operate the circuits to be opened and closed. In fact, this often becomes necessary when the circuits of the two instruments are largely disproportioned in length.

In using, for instance, the electro-magnetic circuit breaker called Barlow's spur-wheel, described by me in Volume XXXI, page 141 of Silliman's Journal, it becomes much more efficient when used with a separate battery.

Insert, after claim 13, as follows:

The employment of one electro-magnetic instrument to open and close the circuit of another electro-magnetic instrument, using either one battery for both or separate batteries for each, substantially as set forth.

The employment of separate and independent batteries to operate an electro-magnetic circuit breaker and the circuit which is broken by it, substantially as set forth.

CHARLES G. PAGE.

That subsequently the Commissioner of Patents issued to the said Page the letters patent of the United States, numbered 76,654, bearing date April 14, 1868, and which said letters patent were not issued upon the said application, on file at the date of approval of said Act of Congress (as required by said Act), but upon the amended application, made as aforesaid, as are fully made to appear by reference to the specifications and claims in said letters patent, and the said application on file March 19, 1868, and that the said amended specifications and claims were made with intent to deceive and mislead, and in fraud of the rights of other parties, and that they did and do embrace improvements and inventions not of the said Charles Grafton Page, and for which the said Page could not lawfully obtain letters patent of the United States, and for issuing of which no right, power, or authority was conferred under said Act of Congress, and for which letters patent of the United States had been theretofore issued to Samuel F. B. Morse, to wit, reissued Letters Patent No. 117, dated June 13, 1848, and which said improvements and inventions, or substantial and material parts thereof, were known and described by the said Samuel F. B. Morse in said last mentioned letters patent; that said amendments, added as specifications and claims under said instrument, dated March 31, 1868, were not intended, nor do they describe or refer to induction apparatus in circuit breakers described by the said Page, prior to his said application theretofore made, and then on file as aforesaid, but were interpolated as an attempt to obtain rights and privileges other than these defined by

or contemplated by said Act of Congress, and that said Act of Congress defined and limited the rights thereby intended to be conferred upon the said Charles Grafton Page to the removal of existing disabilities for the specific and special purpose therein designated and the Commissioner of Patents having exceeded the authority therein conferred and granted in issuing said letters patent, the defendant claims that they are null and void.

And for further and separate answer and defence to the allegations of the said complainants in their said bill of complaint contained, said defendant answers, and upon information and belief states and avers the facts to be, that prior to the date of said letters patent of the said Charles Grafton Page, No. 76,654, dated April 14, 1868, and prior to his alleged making or discovering any of the said improvements and inventions so patented to him as aforesaid in said letters patent, and as well also as in the said reissued letters patent made known, described and claimed, to wit:

The opening and closing of one circuit by another—the employment of separate and independent batteries in combination with an electro-magnetic circuit breaker, and the circuit broken by it—the combination of a set screw with the armature of an electro-magnet—the combination of an electro-magnet, armature, and adjustable retractor—a self-acting circuit breaker combined with a primary coil alone, or with a primary and a secondary coil combined—a mechanical circuit interrupter in combination with a primary and a secondary coil combined—an induction coil, the secondary circuit of which is two or more times the length of the primary circuit, and with several connections so made that the shocks or sparks produced by said coil may be regulated—a coil composed of a primary and a secondary circuit, in combination with both a mechanical and an automatic circuit breaker—a self-acting circuit interrupter in combination with two helices enclosing an electro-magnet—an adjustable self-operating circuit interrupter combined with a primary and a secondary circuit enclosing a compound electro-magnet—an attached vibrating circuit interrupter combined with two helices or circuits enclosing a compound electro-magnet—a self-acting circuit breaker with an adjustable retractor, and many other useful inventions, improvements and devices connected with the art of telegraphy—and claimed by the complainants as secured to them under and described in their said reissued letters patent—and substantial and material parts severally thereof, and the application of principles, mechanism and devices therewith essentially connected, were severally well known, in use, and were described in one or more printed publications, in this country and in foreign countries, as well also as in caveats and letters patent of the United States, and to which the defendant prays that examination and reference may be had, viz:

In the caveat filed in the U. S. Patent Office on or about Oct. 6, 1837, by Samuel F. B. Morse.

In U. S. patent dated June 20, 1840, granted to Samuel F. B. Morse.

In English patent No. 7,390, dated June 12th, 1837, granted to William Fothergill Cooke and Charles Wheatstone.

" " " " 20, 1831, p. 340.

" " " " 22, 1832, pp. 403-408.

Lectures of Professor Joseph Henry (now Secretary of the Smithsonian Institution, Washington, D.C.), in Princeton College, New Jersey, about the year 1834.

The defendant prays that these may be produced in Court, and proper proofs thereof may be made, to wit: The several applications by the said Charles Grafton Page filed and made to and with the Commissioner of Patents, and in the United States Patent Office in Washington, and the specifications and claims by the said Charles Grafton Page therein made and signed—the said Act of Congress of March 19, 1868—the said Letters Patent issued to Charles Grafton Page, dated April 14, 1868—the said assignment, executed by Priscilla W. Page, administratrix, dated January 9, 1871—the instrument of (alleged) surrender, executed by the said Priscilla W. Page, as administratrix, dated September 21, 1871—the application thereafter made and signed by the said Priscilla W. Page, as administratrix, or by her attorney, for reissued letters patent—and the reissued letters patent issued to complainants, dated October 10, 1871, and copies of the file wrappers and contents severally with each filed, as by said reference and proofs, when so made, will more fully

appear, whereby this defendant alleges and avers that sufficient facts are shown to render and make null and void, both for irregularity and want of proper and legal authority in any one acting or claiming to act as Commissioner of Patents, the right to accept a surrender of said letters patent, or the right to issue said reissued letters patent, for which reasons, good and sufficient, said defendant claims and will insist that said reissued letters patent, dated October 10, 1871, were unlawfully issued and without lawful warrant or authority, and are and were null and void ab initio, and ask your Honors to so decree.

Reply to Prest. Orton's Statements in regard to Relative Expense of Constructing and Operating Automatic and Morse Telegraph lines.

OFFICE OF THE AUTOMATIC TELEGRAPH CO.,
80 BROADWAY,
New York, February 8th, 1874.

To the HON. JNO. A. J. CRESWELL,
Postmaster General.

SIR: In a communication addressed to the Postmaster General, hearing date the 6th of December last, and published in the daily journals on the 27th, the President of the Western Union Telegraph Company used the following language in relation to the Automatic System of Telegraphy:

"It would require 24 perforators, 48 copyists, and at least three more to attend the transmitting and receiving instruments and the perforators, making a force of 75 (which he subsequently enlarged to 80) to accomplish in an hour the work performed with 16 operators, on 8 wires, by the Western Union in the same time.

* It would be decidedly cheaper for the W. U. to provide and maintain seven additional wires between Washington and New York, than to maintain such a force at both places as would render it possible to transmit and deliver, by the Automatic process, 12,000 words within an hour of the time of filing."

These statements are clear, concise and unqualified, and, emanating from the President of the W. U. Co., are invested with an authority which otherwise would not attach to them.

If they can be sustained—that is, if the assumption is correct that the well known defects and deficiencies of the English or Wheatstone Automatic system, so clearly and succinctly set forth by him, are applicable to the American Automatic system—I shall be forced to admit that the last "four years of constant trial, during which large sums of money have been expended in practical experiments," with which he so unkindly reproaches us, and to which we plead guilty, have been expended in vain.

He admits that the transmission, by the American system, has been increased from comparatively few words per minute to 12,000 words, in 20 minutes, over a single wire. Is it not barely possible that "four years of time and large sums of money" may have developed other improvements, whereby the fatal defect of five Automatic operators to one Morse may have been overcome, and even have gone so far as to justify the assertion that, with a like number of equally skilled operators, much more may be accomplished in any given time by Automatic than by Morse, and at a largely reduced cost?

It would be a waste of words to meet assertion merely by counter assertion. The only effectual mode of testing the question was by a public demonstration in presence of disinterested and unimpeachable witnesses, who should note the time and number of operators engaged in the work.

The transmission of the President's last annual message by the Western Union in 80 minutes, as reported by some of their employés—in 70 minutes, as announced in the *Tribune* on the morning after the performance—and in 59 minutes, average time, was pronounced "a feat unparalleled in the annals of telegraphy," which he declared to be impossible of performance by the Automatic system with less than 75 or 80 operators.

To accomplish this masterpiece the Western Union used the Morse system, 8 wires and 16 of their most accomplished operators.

It must be admitted that, to fully and fairly demonstrate the merits of the two systems of Morse and Automatic, the manipulators of each should be equal in experience and practice.

The Western Union has a corps of 5,000 operators, more or less, from which to select, many of whom, from long years of practice and experience, have attained a degree of professional skill and ability unequalled in any other country.

The whole corps of automatic operators, including the Morse operators who manipulate the wires, and the perforators and copyists, distributed in their several offices in New York, Philadelphia, Baltimore and Washington, aggregate but twenty-one persons. The first are excelled by none; the latter class comprises various degrees of efficiency, though none with sufficient practice to be classed as experts.

To enter the lists under these disadvantageous conditions, in competition with the Western Union, with their accumulation of wires, their consummate skill, long experience and thorough organization, with our twenty-one comparatively inexpert operators and our single wire, was a step which required consideration and justified hesitation on our part, the more especially as any other or less standard than that "unparalleled feat" was not permitted us.

The Automatic Company, however, after due deliberation, determined upon a trial, notwithstanding it would subject our daily business to much inconvenience and delay, and thereupon the requisite number of perforating instruments were sent to Washington, and on Monday, the 26th January, a sufficient number of operators were congregated in the respective offices at Washington and New York, and, to meet our supposed necessities, we were obliged to impress into service, as copyist, an office lad, and four unaccustomed outside temporary assistants.

They numbered, one transmitter, one receiver, ten perforators, and thirteen copyists—an aggregate of twenty-five operators.

The trial took place on the following day, and the result, as per report of our manager, copy of which I have the honor to enclose, together with the certificates of the gentlemen who kindly noted the operations, shows the whole time occupied from beginning to conclusion, to have been sixty-nine minutes, as against their seventy minutes; and the average time fifty-five and a half minutes, as against their average of fifty-nine minutes; with a declaration that, "with the experience gained in this demonstration, I am confident that we could readily dispense with at least two perforators and three copyists, and yet perform a like amount of work," and he might have safely added that, with the experts practice and experience are sure to develop, a like amount of work may be accomplished with about one half the number used on this occasion.

Thus is his charge of numbers disposed of. In regard to cost of operating force, I estimate their sixteen operators

At \$100 per month.....	\$1,600	\$19,200 per annum.
Automatic transmitter and receiver (Morse operators)		
2 at \$100.....	200	
23 perforators and copyists at \$40.....	920	
	\$1,120, or \$13,440	

Difference in favor of Automatic... \$5,760, or 30 pr. et. which favorable difference will be materially increased with thorough experts.

That there may be no misapprehension on the point of numbers or operating cost, let it be borne in mind that an Automatic operator can, with equal facility, perforate or copy, as the exigencies of business may require, thereby rendering it unnecessary to maintain a double force.

As a commentary upon this overwhelming result as to time, number of operators and relative cost, I place in juxtaposition his assertion, that "It would be decidedly cheaper for the Western Union to provide and maintain seven additional wires between Washington and New York than to maintain such a force at both places as would render it possible to transmit and deliver 12,000 within an hour of time of filing."

I present to you a statement, based upon Western Union data, of the cost of providing and maintaining additional Morse wires, except that I have stated the cost of wire \$25 per mile below their usual estimates.

On the 12th December last, as you are aware, in presence of yourself and other gentlemen, we transmitted from Washington to New York, over our one wire, about 12,000 words in twenty-two and a half minutes; by no means, let me assure you, an "unparalleled feat" with us.

The Western Union required eight wires and one hour for like service. Therefore, our Automatic wire was thus shown equal in capacity to twenty Morse wires.

If, therefore, there is sufficient business to require twenty Morse wires (and the W. U. has, I believe, more than forty leading from New York south), we can do a like amount of business on one wire.

From New York to Washington, by direct line, the circuit is, say, 250 miles.

Extra Morse wires to supply a capacity equal to one Automatic wire, 19.
250 miles : 19 : 4,750, at \$75.... \$356,250 00 add'l. cap.

7 per cent. annual interest	24,937 50
His last annual report states the annual cost of maintenance and repairs at \$8.66 per mile of wire.	
Accepting his own data,	
4,750 miles additional wires,	
\$8.66.....	\$41,135 00

Annual cost of providing and maintaining additional Morse wires, equal in capacity to one Automatic wire..... \$66,072 50 which would be more than 50 per cent. on the whole Automatic investment.

With but seven additional wires, which will be fully occupied while our one wire will be occupied but one half the time:

250 : 7 : 1,750 miles, \$75.....	\$131,250 00	add'l cap.
7 per cent. interest.....	\$9,187 50	
Annual maintenance and repairs, 1,750 miles, \$8.66.....	15,155 00	

Annual excess over Automatic, exclusive of economies in operating..... \$24,342 50 or more than 20 per cent. on the whole Automatic investment. Extend this over the United States and estimate the result; comment thereon is unnecessary.

The President of the Western Union Company in his last annual report, declared:

1st. That at times all their wires between principal points were fully occupied.

2d. That telegraphic business in the United States "is still in its infancy."

3d. That the number of messages was rapidly increasing; thus, the number sent in 1866-7 was 5,800,000, and in 1872-3, 14,456,832; to which latter should be added the large number sent by the independent companies organized since 1867.

In his argument before the Washburn Committee he stated that an increase of business, assuming existing wires to be occupied, would necessitate a corresponding increase in the number of wires (of course, with the Morse system).

A growing business which, with the Morse system, would be constantly demanding more wire, might swell a thousand per cent. before the necessity for an additional wire would be created, if operated upon with the Automatic system. And when it is considered that each additional wire, say to Chicago, costs from sixty to seventy-five thousand dollars, or to New Orleans double that sum, the enormous economy of the Automatic system demonstrates itself.

In relation to current expenses of operating, we shall employ the highest Morse skill in manipulating our wires; but I beg you to bear in mind that each operator will accomplish from ten to twenty-fold more with the Automatic than with the Morse.

To attain expertness as a Morse operator requires several years of close application and constant practice, and but few of those who attempt it reach the highest class. Such are entitled to high compensation.

To attain expertness as a perforator and copyist is within reach of the many in a comparatively short time, and, therefore, such may be had at a much less average compensation, while the product will exceed the average attained by the Morse operator; and, lest the question should be raised, I assert that we can drop copies in any number of offices at will.

This demonstration was simply to determine whether the criticisms to which the English system of Automatic telegraphy may be obnoxious are applicable to the American system. I contend that the result justifies me in asserting that they are not; and furthermore, that "the four years of constant trial and large sums of money" which have been expended to accomplish cheap telegraphy, acknowledged to be beyond the reach of the Western Union Co., have not been expended in vain.

The overwhelming advantage of the Automatic over the Morse system, in the comparatively small amount of capital required—say one fifth; its economy in operating—say a clear saving of one third; in the enormous difference in the maintenance and repairs—say as two wires are to thirty; in interest, etc., etc., will be demonstrated, in due time, by uniformly low tariffs, which we believe will be satisfactory to the public, and meet all just demands for cheaper telegraphy.

In view of the opinions expressed in your annual report, that, "as soon as it (the Automatic system) shall be thoroughly developed and applied in practice, the problem of cheap telegraphy will be definitely solved," I have taken the liberty to thus submit for your consideration this evidence of the actual practical condition of that system which, in my judgment, shows that the problem of cheap telegraphy has already been solved; and, permit me to add, that its practical application to circuits between the principal commercial centres of the country had been definitely arranged.

With great respect,
I have the honor to be,
GEORGE HARRINGTON,
President of the Aut. Tel. Co.

Past hope—the possibility of a Government telegraph system in the United States.

The Claims of Military Operators to Bounty Land. —How not to Effect their Recognition, and How it can be Secured.

WASHINGTON, D. C., Feb. 21.

TO THE EDITOR OF THE TELEGRAPHER.

"AGITATOR," in THE TELEGRAPHER of this date, expresses a desire to know "what has been done to bring the claims of military operators before Congress," and frequent inquiries on this subject evince a general feeling on the part of those interested to have the matter pressed to a final decision by the proper authorities. Last session an ex-military operator—whom no one in this city ever heard of before (or since)—came down upon Congress with a flourish of trumpets and an avowed determination to immediately secure a farm for every one of the telegraphers who had served the government during the war. A bill to effect this object was introduced in the House, and referred to the Military Committee, before which the diplomatic stranger agreed to appear and make such explanations as might be required. When the time for the meeting came he was "doing" the city in a hired hack, and the committee never saw him. The bill was referred to a sub-committee of one. Before Congress met again the sub-committee and the bill were both dead. While the bill was pending somebody suggested, through THE TELEGRAPHER, that military operators should each write a letter to the member of the committee having it in charge, and, accordingly, numerous heroic effusions found their way into the government waste baskets. A repetition of this performance now seems probable, and will doubtless result in just as little good. Congress is not apt to vote away money or lands without knowing how much is required, and who is to get it, and any legislator, in considering a bill for the relief of the military telegraphers, will at once ask "how many of these men are there?" "Were they soldiers or civilians?" "When and where did they serve, and what compensation did they receive?" and other questions of a similar nature. Until the members of the old military corps can send some one here who can explicitly state all the facts relating to the service, any attempts to get bounties will be a waste of time. The work of collecting and arranging the necessary data can be best executed by a committee composed of men who served in various divisions of the army, who are familiar with the work performed, and know where to find the records. If the men in different localities will consult together, and select members of such a committee, the matter can speedily be set going. As a representative of the operators of the Army of the Potomac, no better man than A. B. Chandler can be found.

MILITARY.

Causes Tending to Control Compensation to Operators.

TO THE EDITOR OF THE TELEGRAPHER.

In attempting to explain the reasons producing the effects in this most preguant subject I shall only deal with facts which have presented themselves to me during my eight years' experience of actual practice as an operator. The causes are so diversified that it will be impossible to give more than the leading ones—supply and demand, generally, and locality. Taking present salaries as effect, cause is the point I will discuss. The supply of operators is always in advance of the demand. This gives the employer the power to regulate salaries to his own advantage, because if the operator won't work for the remuneration, others can easily be found who will. All subordinates, as a rule, are bound to run the cost of their department to the lowest figure in order to hold their own position. The Superintendent who can reduce the working expenses of his department, while performing the same or necessary amount of actual work, is sure to stand high in the estimation of his superiors. To such an extent is this carried that the proper handling of business is seriously impaired on numerous lines. That salaries are gradually being lowered I have no doubt. In numerous instances, when a change has been made in operators, the office has paid from five to ten dollars less than previous to the change, and that my assertion is true the frequency of these cases confirm. Operators usually learn their business while young—from 15 to 20 years of age. The principal reason of the number of learners is, that there are few occupations which, with so short time of preparation, will enable them to earn as high wages as telegraphy—taking into consideration their youth and qualifications. I find that eight out of ten operators I meet learned with the intention of following it the few years that most young men are prac-

tically a nonentity, as a pleasant and, to them, very lucrative business, and, when 22 or 23 years of age, engaging in other more steady and profitable occupation. Very few persons entertain a correct idea of the immense number of students there are being turned out monthly. I have no hesitation in asserting that there are two operators (without reference to qualification) in this country for every situation. You will say yes, but not good operators. Exactly; and the reason is this: on account of the unlimited supply of operators, salaries are kept at a rate which offers little inducement for a man to remain an operator after he has arrived at an age at which he can bend his energies to a more profitable (not respectable) business. In the Eastern and Middle States, railroad telegraph operators, with no other duties, are paid at an average of \$45 nights; \$50 days Western States, \$50 nights; \$55 days; and in the Far West, \$65 to \$80 and \$90. Locality has little to do with the salaries of commercial operators, who receive \$60 to \$80 as good operators, experts receiving from that up to \$125. Salaries in the extreme East are usually below the average. In regard to the student question I will make a suggestion. Frequently we hear complaints of the College nuisance. I claim that there are ten students turned out by the operators themselves to one by schools. As an example: On the wires I am on, I can count nine learners inside of forty miles. Will the operators never realize that by taking students for friendship or a "consideration," they are keeping their own salaries down to board and clothes? Each one says, oh! my student will make no difference. But hundreds are doing this. Take my advice—have no more students, and discountenance it in every possible way. It may make no perceptible difference for a time, but will show in two years to your advantage.

I will elose with a few remarks on a Telegraphers' National Association. Such a body must and will be organized in a short time. It will prove a benefit to employer and employé in many ways. It will bring the telegraphers into more intimate relation with each other; induce more pride in their occupation; be a medium of interchange of ideas, good will, useful information; and last, but not least, a means of protection in case of any aggravated oppression by employers. I discountenance strikes, believing them useless, and that desired results may be reached by far easier ways than through their agency. A thorough organization, with unanimity of action, is itself power, and every operator should be brought in. To do this we must have a means of exchange of ideas, plans and discussion, which should be THE TELEGRAPHER, and to produce the most beneficial results the largest circulation possible is necessary. Let every operator who reads this endeavor to secure one, two or three new subscribers, and if one out of five succeed it will be an important help and aid to us. Let us agitate this association in an earnest manner. I have an idea, or plan of one, which, at some other time, I may feel justified in bringing forward. Now, wake up! let the experienced operators, old hands, and others as well, send us their "Tel." As Mae says: "If it were done, when 'tis done, then 't were well it were done quickly."

DON JUAN.

The Fate of the Pittsburg P. & A. Employes.

PITTSBURG, PA., Feb. 23.

TO THE EDITOR OF THE TELEGRAPHER.

THE article in your last issue relative to the exit of the P. & A., prompts a reply from this "Smoky City," the hub of the defunct company, and where the "melancholy days" fell with a leaden weight upon many poor "artists," likewise the "plugs." And it seemed a fitting time that the miserable corporation should perish. A continuous rain had rendered the wires incapable of carrying the last "Good night" to the East. Eastward the heavens frowned, as if to indicate the fitting termination, while to the West all was clear and cheerful, plainly indicating the wisdom of the late Horace Greeley's advice. Thus we were enabled to manifest a feeling of sincere regret, because of the apparent separation of friends, but with no regrets that the company, as a company, had ceased to be. Speculative quarrels among the officials pronounced the company's doom, and were it not for the employés, it was well it died when it did. And, Mr. Editor, this consideration for the employés reminds me of a grievous injustice done "the boys" by Mr. Orton, which, if I mistake not, was premeditated. I was privileged to see a letter from that gentleman to Mr. McCargo, wherein was this emphatic assurance: "You can assure all your employés a continuance of employment." There was no discrimination. This assurance was, to my mind, calculated to prevent desertion from the ranks prior to the consolidation, and to my certain knowledge it served the contemptible end. Many were content to await the time when "a continuance of employment" would be proffered them, who, had they displayed more discretion than confidence, would not be found to-day asking for the charity of their more fortunate associates. That is, there were men who had positions prof-

ferred them by men who anticipated the speedy consolidation, and who were willing to aid them. But the operators in this city knew of Mr. Orton's emphatic assertion, and placed implicit confidence in it; therefore, preferring positions with the Western Union to almost any other company, the men declined the proffered assistance of their true friends, and the dire misfortunes that hang, pall like, over them to-day, is a lesson from which words of profitable instruction may be gleaned. And yet Mr. Orton is an honorable man. There are many other facts of a similar character known to the writer, but as none of those who directly feel the results are prone to ventilate a just indignation and condemnation, I am content to "let the dead past bury its dead," and in a spirit of cheerful submission proceed to exume the loved and lost from the graveyard of the past.

Our Ex-General Superintendent may be seen perambulating our streets in the role of Macawber. Mr. Hamilton, the Chief Operator, and Mr. Ledwith, Assistant Chief Operator, have each in turn renounced telegraphing—the former going to Boston and the latter to the rural districts, to engage in commercial life. Mr. Prescott, Night Manager, has taken his "Q," and with his accustomed vigor is wrestling with "Old Prob.'s" in the Western Union. Mr. Fiteb, the inimitable "Ra," with Mr. Byrnes, "B," and Mr. Myers, "Ku," are "toiling knights." Miss Bunnell, "N," and Mr. Marshall, "M," are a part of the bright concatenation of day artists, for which "G" has long been noted.

Those who may exclaim with Othello, "my occupation is gone," are Mr. Mathias, "M S." (who deserved a better fate); Mr. Pollock, "P;" Mr. McBratney, "Mc;" Mr. Barelay, "Mr.," and Mr. Walters, "Mgr." Mr. Editor, having briefly noted the whereabouts, without specifying the condition of "the boys" of the late P. & A., in this city, I shall decline into obscurity until a spirit of manly independence shall animate their dormant sensibilities. Then, and not until then, will the telegrapher in his individual capacity be what God has created him—a man—and not what the miserable interrogatory of the petty officials have made him—"What are you but the willing tributary to the accomplishment of our desires?"

RODERIC DHU.

The Resignation of Mr. Joseph F. Hibbard.

MAUCH CHUNK PA., Feb. 21.

TO THE EDITOR OF THE TELEGRAPHER.

WE regret to announce to the readers of THE TELEGRAPHER that Mr. Joseph F. Hibbard, who so well and creditably to himself filled the office of Chief Operator for the Lehigh Valley Railroad Company, Mauch Chunk, Pa., has, on account of ill health, resigned his position and gone to his home. During his sojourn with us he had, by his many acts of kindness, won for himself many true and admiring friends, who will miss him as he now ceases from our society, and in his absence the company will lose one of their very best men—a man who was well calculated to fill the position he held. Yes, we will miss him, but we cannot bid him remain in detriment to his health.

We hope for his speedy recovery, and when he is again called to fill another field of usefulness our best wishes shall be with him for his success. We can never forget the many happy days spent in his society, and in the long, long years that are to come our hearts will recall his memory with tears of sorrow.

J. W.

The "Snapper" Sounder.

NEW YORK, Feb. 24.

TO THE EDITOR OF THE TELEGRAPHER.

TEN years ago, while in the employ of the American Company in a New England city, I dropped in at a printing office to deliver "Good night." Sauntering about the office, in company with Fred Fairchild, I picked up a printer's rule which lay upon the imposing table, and noticing that it was worn very thin, I bent it slightly, when a familiar "click" was heard—a perfect down and back stroke. I wrote a few words in Morse with it to my companion, and we agreed that it was a pity that such a novelty should remain hidden in the rubbish of a printing office, so I slipped it into my pocket. A vigorous search for it was made after our departure, but the next day when the owner learned what a treasure it was in the heart of every operator who saw or heard it, he kindly relinquished his claim to it. I showed it to Mr. Lundberg, an instrument maker, in San Francisco, who made a number of them, but they were not equal to the original. Mr. Martin Wessman has now completed an improvement, by which a complete mechanical sounder is being manufactured, embodying the principle of the original "snapper," which I have made arrangements to mail to my address for thirty cents, as advertised in another column of THE TELEGRAPHER.

R. W. POPE.

An electric shock—a refusal of a matrimonial proposal by telegraph.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, FEBRUARY 28, 1874.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.
TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION
Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The Tenth VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL
UPON THE
AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00
SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

An Unwise Policy.

It is always an unwise policy to underrate a competitor. A very striking illustration of this is shown in the attempt made by the President of the Western Union Telegraph Company, in his letter to the Postmaster General, to demonstrate the inadequacy of the Automatic to compete with the Morse telegraph system. The statements in regard to the relative expense of performing a like amount of telegraph service by the two systems afforded the managers of the Automatic Telegraph Company an opportunity to exhibit by actual performance, in the presence of numerous persons, Western Union officials and others, the advantage of their system, of which they promptly and very properly availed themselves. The letter addressed by the president of that company in his turn to the Postmaster General, which we print in our columns this week, contains facts and figures which will, no doubt, prove interesting if not satisfactory to Mr. ORTON and his associates. They refute in the most complete manner the suppositions, and utterly unfounded data by which the latter endeavored to prove that the Automatic was in fact more expensive, and possessed no compensating advantages over the Morse. We do not propose to repeat here the data by which Mr. HARRINGTON has so completely and effectually demolished the arguments and assertions of his antagonist. They will, no doubt, receive proper attention and consideration from our readers

Mr. ORTON has again placed himself in a most mortifying position. His previous experience in regard to the Duplex should have taught him more caution, and have caused him to take counsel not alone from his wishes, and what he supposed to be the immediate interests of the great telegraphic corporation, of which he is the executive. In the case of the Automatic system that demonstration has followed more quickly than in that of the Duplex, but, if possible, it is even more complete and effectual than in the latter. If in the course of time it should become possible and practicable for the Western Union Company to adopt the Automatic system, we presume that we shall find Mr. ORTON as positive and enthusiastic, if not even more so, in proclaiming the importance and paramount value of the latter as of the former.

Mr. ORTON does not, so far as we are informed, claim to be either a scientific or practical telegraphic expert, and of course depends upon others to advise him in such matters. We should suppose that he must be satisfied that he has been badly advised, and led into giving his authority to statements and assertions which, as the representative of the great telegraphic organization of the country, place him in a very unpleasant predicament. It must be evident to him, as it is to everybody else, that he has stated as demonstrated and demonstratable that which is neither. It seems to us that he cannot afford to let the matter rest in its present shape. The Western Union Company has an organ which is supposed to represent the views and sentiments of the managers of the company. These statements and assertions have been made in its columns, and circulated wherever that paper is read. That Mr. ORTON is now satisfied that they were incorrect we presume will not be disputed. It would seem, then, that in all fairness that fact should be acknowledged through the same channel. Unpleasant as it may be to do this, it would be far more manly and honorable than to persist in what is privately admitted to be, to put it in the mildest form, an error.

We are not the special advocates of the Automatic system or of the Automatic Telegraph Company, but we endeavor, in these columns, to treat all electrical and telegraphic matters with equal and exact justice and fairness. We knew the statements made by Mr. ORTON to be erroneous, and therefore, as the conductor of a telegraphic and scientific journal, considered it our duty to put the matter in its proper light, without reference to the parties concerned or to their relative telegraphic positions. For Mr. ORTON personally, and for the Western Union Company, we have no unkind

or antagonistic feeling or prejudice. All telegraph companies and systems are alike to us. It is not our province to exalt or extol one above another, or to seek to advance unduly the policy and interests of one over another. THE TELEGRAPHER is, and always has been an independent telegraphic journal. Whatever there may be to commend in the Western Union or any other telegraphic organization and system, it gives us pleasure to commend. Whenever criticism and condemnation is necessary, as regards any telegraph company or system, we fearlessly and impartially criticize and condemn. This is in no sense the organ of any telegraph company. So far as it may be regarded as an organ at all, it is that of the practical telegraphers, whether employed by the Western Union or any other telegraph company. We can therefore speak freely and with all possible kindly feelings in regard to this matter, and while we do not presume to advise Mr. ORTON, we would say to him that it is due to himself that he should acknowledge the error into which he has been led, and manfully and honestly undo, so far as possible, the injustice which he has attempted to do to the Automatic telegraph system. The facts are now generally well known, and silence on his part must unavoidably be construed as practical acknowledgment of error, and as exhibiting a desire to avoid a more open and manly course. The interests of his company cannot be advanced thereby.

The Prospects for Telegraph Business.

THE winter of 1873-74 is about over, and the spring business should now be fairly under way. We hear, however, that the telegraph business is unusually dull, and the prospect for an active business during the season does not as yet promise very fairly.

This has been a hard winter, and telegraph as well as other business has suffered from the rude shock which the panic of last fall inflicted. It was hoped that before this time the worst effects of it would have been over, and business have resumed its wonted activity. Such is not the case, however, and we must confess that the indications are that the business of the season upon which we have just entered is likely to be very much restricted. The telegraph business, of course, sympathizes very intimately with the other business of the country, and until there is a general revival of that, it cannot expect to be as active and remunerative as otherwise. The restriction on general business is shown by the accumulation of unemployed capital at the financial centres, and the low rates of interest at which this can be obtained on call or short time. The uncertainty which exists as to the policy which will be adopted by Congress in regard to financial matters, is one cause of the hesitancy to engage in extensive business transactions. The financial question appears to be a very perplexing one to our Congressional Solons, and a great contest is going on at Washington between the inflationists and those who desire to limit and contract the irredeemable paper currency of the country, with a view to a return to a sound financial system. If further inflation should be decided upon it would undoubtedly make things lively for a time, and the telegraph as well as other business would experience a temporary renewal of activity, but it would be but temporary, and followed by another financial crisis, much more severe than the one we have just passed through. It is better to make haste slowly in this matter, and unpleasant as may be the present situation, to work out of it by degrees, and recuperate on a sounder basis than that upon which we have been doing business during the past ten years. It will, no doubt, take longer to get things into a satisfactory shape, and important telegraphic projects may be delayed, but in the end it will be much more beneficial for all concerned. The resources and productive capacity of this country are too great to allow of any protracted business prostration, and it is a question of but comparatively brief time when with a proper system of finance we shall again be busy and prosperous. Let us all have patience, be economical in our expenditures, and careful and conservative in our business

projects and arrangements, and the good time coming will not long be delayed. Telegraphic enterprises will again be pushed forward, and telegraph business be active and remunerative.

The Deficiency in the Postal Revenues.

THE estimated deficiency in the revenues of the Post-office Department for the next fiscal year will be not less than seven millions of dollars, and this notwithstanding the franking privilege is abolished, and everything that passes through the mails is ostensibly paid for by stamps, even to the official communications on the business of the department itself. The express business, in which the department has engaged, has proved unprofitable, and has enormously increased the bulk of the mails without a corresponding and compensating increase of its revenues. The post-office should pay its way, but instead of approximating towards it, the deficiency in revenue in proportion to expenses annually increases. In his desire to bring under his control as much of the business of the country as possible, Mr. CRESWELL went in for the light express matter and got Congress to authorize its transmission at nominal rates. It is a losing business, of course, and an effort is now being made in Congress to get rid of it again. Whether it will be successful remains to be seen. The rates of postage have been reduced to unremunerative figures, in the effort to introduce in this country, and under such vastly different conditions, the policy which naturally has resulted more favorably in the smaller and more densely peopled countries of Europe.

It only remains now, to complete the matter, to add the telegraphs of the country to the postal establishment, and everything would be lovely and satisfactory. Even in Great Britain it has been found impracticable to make the telegraphs, as a Government institution, pay. In this country the pecuniary result would be even more unfavorable. Mr. CRESWELL, or his successor, would have to meet Congress with a deficiency of fifteen to twenty millions of dollars annually, instead of six or seven, and incur besides the curses loud, deep and constant from the public, whom it would be impossible to satisfy with any red tape administration of the telegraph. Fortunately for the people, the Postmaster General and the Government, we are to be spared this additional infliction. Postal or Government telegraphy is dead, for some years to come at least, and though it may give an occasional spasmodic struggle, it is incapable of any vigorous demonstration. It may be and probably will be brought up as a peg to hang a speech on occasionally, or to cut the spite of some newspaper against an offending telegraph company, but it is essentially moribund, so far as this country is concerned. So note it be.

The Migratory Proclivities of Telegraphers.

It's perhaps but natural that telegraphers should desire to travel and see the world. That they do so desire there is constant evidence. A private letter, received from one of our correspondents in a far eastern country informs us that the publication of his name in THE TELEGRAPHER, as holding a responsible telegraphic position, has overwhelmed him with letters from telegraphers in this country, seeking to obtain positions on his lines. To these, of course, he cannot reply individually, but his advice to one and all is to stay at home. The experience of others who have been prominently connected with telegraphs in Central and South American countries, is similar.

We also frequently receive letters from telegraphers, asking for information as to how they shall proceed to obtain situations on foreign lines and in foreign countries.

To all who may be afflicted with this migratory fever, we would repeat the advice which we have heretofore given in these columns, to get rid of it at once. Whatever may be the disadvantages under which telegraphers labor here, they are better off in every respect than they would be in any other country.

They are better paid and more comfortably situated, and not one in twenty of them, if their desire for a change could be gratified, but that would bitterly regret it in a very short time. Under the most favorable circumstances but few telegraphers are fitted or calculated to succeed on foreign lines, and they would find that their condition would be much worse than in this country. Stay at home and try to improve your condition here, and in the end you will be in every respect much better off than if you became wanderers in strange lands and among alien people.

The Success of The Telegrapher.

THE TELEGRAPHER is the only paper published in the world which depends upon the telegraphic fraternity directly for its support, and which specially represents the interests of practical telegraphic workers. As such it has special claims to their personal interest and support, and appeals to them to take an active personal interest in maintaining and increasing its circulation. Its columns from week to week afford indisputable evidence of progress and improvement, and we think it may be said without egotism that it is creditable to the telegraphers of the country. Its prospects never were so good as at the present time; but, notwithstanding this, it does not have so extensive and general a support as it should. Its circulation should be at least 5,000 weekly, and we do not propose to be satisfied until it reaches at least this figure.

We would ask every telegrapher into whose hands it may come, to take a personal interest in extending and increasing its circulation. With a little effort on their part its circulation can easily and speedily be doubled. Will our friends take these suggestions into consideration and act promptly and energetically, as canvassers and agents?

The Page Patent Litigation.

WE print this week a synopsis of the answer of the Manhattan Quotation Company to the complaint of the Western Union Telegraph Company, in the suit instituted to establish the validity of, and enforce the Page Patent. This synopsis covers the important points, and exhibits the grounds upon which that patent is resisted. It clearly demonstrates the utter worthlessness of that patent, and the outrage which its enforcement would be upon the public. It will be found of much interest to all who are concerned in the matter, as who, whether telegraphers, owners of telegraph property, or patrons of telegraph lines, is not?

Crowded Out.

SEVERAL articles, communications, etc., intended for publication this week have been unavoidably postponed on account of the space occupied by the synopsis of the defendant's answer in the Page Patent litigation, and the letter of President HARRINGTON, of the Automatic Telegraph Company, to Postmaster General CRESWELL. Our friends must have patience with us, and they shall all have a chance to be heard as speedily as possible. The interest which is manifested in THE TELEGRAPHER of late is highly encouraging, and there is abundant evidence that it is generally regarded not only as increasingly influential, but as the recognized authority in telegraphic matters and electrical science in this country.

Geo. H. Bliss & Co.'s Telegraphic Manual.

WE have received from GEORGE H. BLISS & Co., of Chicago, a copy of the excellent little *Telegraphic Manual* furnished by them with their telegraphic apparatus, especially that designed for students and amateurs. Within a small compass it imparts a large amount of telegraphic instruction, which will be found valuable and interesting.

In it will be found a new alphabet, prepared by Dr. E. A. HILL, the electrician of the company, whose ability and proficiency are well known, which is very simple, and can be easily acquired by novices. The condensed manual, prepared by Mr. GEORGE H. BLISS,

in a series of short exercises instructs the student from the beginning in the telegraphic art, and carries him along by familiar illustrations and examples to the regular business of sending and receiving commercial and railroad despatches. This manual is not printed for sale, but will be furnished on application to GEORGE H. BLISS & Co., 41 Third avenue, Chicago, Ill.

The Longest Piece and Largest Coil of Telegraph Wire in the World!

Messrs. L. G. TILLOTSON & Co. have on exhibition at their salesrooms, No. 8 Dey street, a single piece of No. 8 galvanized iron wire, without joint or weld, which measures nine thousand nine hundred feet (nearly two miles).

This piece of wire was manufactured by Messrs. RICHARD JOHNSON & NEPHEW, from a bar of their iron which was awarded the prize medal at the Vienna Exposition. The JOHNSON wire has attained a world wide reputation for its long lengths, tensile strength and high conductivity, and is now the standard wire in every country using the telegraph.

A New Feature.

WE shall next week commence the weekly publication in THE TELEGRAPHER of the highest and lowest daily quotations of the shares of such telegraph companies as are dealt in at the New York Stock Exchange. This will prove a new and valuable feature, and we have no doubt will be appreciated by our readers throughout the country.

[From *The Ghost*.]

Old Jim Lawless.

Poor old boy! the western pines wave over his grave now. He has been dead some time. I don't remember just what took him from us, but as he was "Jim" to everybody, and prone to go on "jams" in spite of all opposition, I have a suspicion that it was a combination of the two. He didn't work at the business for several years prior to his decease; certain disturbances with telegraph managers and railroad superintendents had rendered him unpopular with employers, and he had officiated in a Cheyenne restaurant—with bar attached—up to within a short time previous to his death. But neither in this field of enterprise was he entirely successful. On the Chicago, Burlington and Quincy, an attempt, while train despatcher, to pass two trains on the same track, had worked his ruin. Dropping into a beery slumber, which lasted until daybreak, while he was attending a button repeater at Corinne, had resulted in a similar disaster. His troubles with trains and repeaters ended, however, when he quitted the service, and he thought he had gravitated to his level in the "hash and jig water business," as he facetiously termed it, and he confidently looked forward to less turbulent scenes and experiences. But one day the proprietor, who had just refitted the saloon in gorgeous shape, went to Omaha to see about a new mirror, and left Jim "chief in charge." The next day several kegs of new ale arrived, and Jim was busy all day getting them in. In the evening his friends found him unusually genial and generous, and they unanimously responded in person to his cherry invitation to "Drinkwymeboys, whasserods." In attempting to tap one of the new arrivals the bung flew out of the keg, and for a moment the air was fragrant with its contents. All that new paper, the mirror and its drapery of brocade and tassels, the pictures over the bar, everything around wept tears of hops and malt. Jim gave the newly garished room one sorrowful look, and it sobered him instantly. Then turning to his friends, he said: "Good-bye, boys, there goes another situation," and, like the "Tall Alcalde,"

"He strode him out of the adobe door,
And ne'er was seen or heard of more."

by Cheyenne eyes or ears, at least. There was a legend floating about Red Buttes in 1870, which assigned him to the position of a water drawer for the railroad at a station near there; I can't vouch for the truth of it, but certain it is he dropped out of telegraphing some years ago and died engaged in some lowlier pursuit than ours.

But Jim Lawless was the biggest kind of a telegrapher. I've seen the whole of them work; know them all by heart, and there never was a man who snatched brass that could touch him. I'll tell you what he did in Savannah, Ga. Old "Dad" Sullivan was in Charleston, and in those times "Dad" could average about eighty-three words a minute. He got Jim the first night Lawless struck the town, and Jim had been

around the block, and was so drunk the boys had to prop him up in his chair; but he sat there and took three hundred and eleven messages without a "break," besides a short "special" for the *Savannah News*. Sullivan did his level best. And the copy Jim took! gilt edged, copperplate; couldn't be "rushed" out of it any how. And talk about copying behind! Why, that night when "Dad" said, "N. M.—ur no slouch. G. N.," old man Jim was three social messages, a government "cypher" and the short "special" behind. The boys all stood around and watched him, and after he gave "O. K." and signed, he went right on and copied out all that stuff he had laid back in his head. Jim used to take "State Press" at Albany a long time ago, when they sent it abbreviated—E for "of the," "tt" for "that," "ts" for "this," etc. Most of the men took it by registers, but Jim just took it by sound, and wrote it out in full. The editors never saw such copy, and the proprietors of the paper offered him \$3,000 a year to take charge of their subscription books. One night when he was taking "State," Syracuse called up and wanted to know if he could deliver a message to the Chief of Police. Jim told him "yes," and took it, and told New York to go ahead. Then he jumped up and walked over to the Police Station, stopped into a little "dive" there is right there by the Delavan House, got a "schooner" and two "ponies" of beer, and came back to the office, and he "sat in" and went to copying, and caught up with New York before he got "30," though he got four hundred words behind while he was gone. These are only a few of the stories I can tell you about Jim Lawless, but these ought to suffice. I never encounter a crowd of operators but what some one will tune up about "Hank" Somebody, "Sandy" This, or "Nick" That, and their appalling achievements, and as I know for a positive certainty that Jim Lawless was the best operator that ever struck a key, I couldn't refrain from giving one or two of his feats publicity. JOHN OAKUM.

Personals.

Mr. E. V. ELLIOTT, of the Superintendent's office, Central R. R. of N. J., has accepted a position in the Superintendent's office, American District Telegraph Co., 516 Broadway.

Mr. H. MCGONEGAL has been transferred from the 19th district, 516 Broadway, to the managership of the 41st and 44th districts, A. D. T. Co., Sixth avenue.

The Telegraph.

By Cable.

LAUNCH OF A NEW CABLE STEAMER.

LONDON, Feb. 20.—The *Faraday*, a steamship of 5,000 tons burthen, built for Siemens Brothers, for the purpose of laying telegraph cables, and especially the new Atlantic Telegraph Cable for the United States Direct Co., now being manufactured by them, was launched at Newcastle to-day.

BRAZILIAN NAVAL AID TO CABLE ENTERPRISE.

HAVANA, Feb. 23.—Advices from St. Thomas report the arrival there of the Brazilian man-of-war *Vital Olivia*, to take soundings for the St. Thomas and Rio Janeiro telegraph cable.

American District Telegraph Company.

THE American District Company have just purchased of Messrs. Ferris & Brown, 164 Fulton street, for the use of Mr. Pope's department, six volumes of insurance maps of New York city, at a cost of 350 dollars. These maps are drawn on a very large scale, bound in atlas form, and comprise all that portion of the city south of 72d street. By means of a geographical index, any house in any portion of the city can be instantly referred to, and its complete description obtained. The maps show location and number of skylights, kind of buildings, height, location of hydrants, fire alarm boxes, and, in fact, everything that is useful and necessary in a business so full of details.

The Babcock Manufacturing Company are building a sample extinguisher carriage. If satisfactory, a number will be ordered.

Officers Brownlow and Mulvaney, of the 41st District, captured two burglars, at 2 A. M., Washington's birthday.

The Sixth District office, 31 Nassau st., has been opened for night service, and a sufficient number of policemen have been detailed to that district for duty.

A DESPATCH has been received by the District Attorney of New York, stating that forged Western Union Telegraph bonds to the amount of \$100,000 have been passed on the London market. It is reported that Walter Sheridan, alias Ralston, was the negotiator.

Foreign Telegraphic Notes.

It is proposed to establish a telegraphic line between the port of Corinto and that of San Juan del Sur, Nicaragua.

The receipts on the Eastern telegraph Company's lines for the month of January last amounted to £37,037, and for the same month in 1873 to £33,287.

The receipts on the Eastern Extension, Australasia, and China Telegraph Companies' four separate lines amounted for the month of January last to £20,717, against £16,523 in the month of January, 1873.

The directors of the Anglo-American Telegraph Company have decided not to renew the attempt to recover the 1865 cable until next year, when they expect to be able to fit out an expedition comprising the most efficient staff, and the ships best adapted for the purpose, neither of which can be had this season.

Anglo-American Telegraph.

THE report of the directors just issued shows that the total receipts for the eight months since the amalgamation of the company to December 31 last were £547,900. The working expenses, including income tax, were £218,810, leaving a net revenue of £329,090. This sum enables the directors to pay a dividend at the rate of 6 per cent. for the eight months, and carry forward a balance of £9,030. The reserve fund of the company now amounts to £251,940. The company also possess 900 miles of deep sea cable, forming a portion of the length manufactured for the cable laid last year, and which, by change of the route from Halifax, as originally intended, to Newfoundland, has been saved to the company, and will be available for completing a fifth cable, at no distant day. The company have also 126 miles of core in stock, capable of being made into a cable. This new fifth cable has already been taken in hand, a contract having been entered into with the Telegraph Construction Company to manufacture and lay 1,100 miles of new cable for the sum of £475,000, the greater portion of which will be paid from the working reserve fund and surplus profits, and the balance will be provided for without any permanent increase of the capital of the company.

This action on the part of the company will further add to the risk to be run by the competing schemes which, from time to time, are attempted to be forced upon the public. The "light cable" project, of which so much use has been made of late, will, it is rumored, be definitely brought forward during the ensuing week. Considering that the experiment is wholly untried, while all the experience of the past is against its success, and considering the vast losses already incurred by investors in similar competing schemes, it is to be hoped that the public will not be led into embarking capital in an enterprise so full of risk.—*The Railway News*.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended January 27, 1874, and bearing that date.

No. 146,641.—BURGLAR AND HOUSE ALARM. Richard M. Billings, Townsend, Pa. Application filed June 27, 1873.

Battery and alarm connected to three circuits, viz: Burglar, connected to doors and windows; day, to bell pull; and one to a clock for an alarm at a determined time. Gong and hammer both adjustable.

1. The combination, in an electric alarm, of a gong adjustable upon a vertical standard, and a horizontal and adjustable lever for striking this gong, all substantially as and for the purposes herein set forth.

2. The combination with a single battery and alarm apparatus of a circuit and circuit closing devices for a burglar alarm, and a circuit and circuit closing devices for a day or door alarm, and a switch for throwing one system in and the other out of connection with the battery and alarm, substantially as and for the purposes herein set forth.

3. The combination, with an electric alarm, of a clock connected to said alarm, and provided with perforations on its face, within which a pin is inserted, and against which pin one of the clock hands comes in contact, and thereby closes the circuit and causes the electric gong to sound, substantially as and for the purposes herein set forth.

No. 146,695.—UNDERGROUND TELEGRAPH LINE.—William Mackintosh, New York, N. Y. Application filed February 27, 1873.

The wires are attached to drawheads, by which they are drawn from reels and through underground troughs extending between vaults, which are open to the surface of the ground. The ends of the troughs extend within the vaults, and are made flaring and provided with side openings or doors, the ends being closed by plates of insulating material. The wires are supported at suitable distances in the troughs by notched bars, laid one upon another—one for each layer of wires—and are connected to tension screws passing through the insulating plates, the outer ends of these screws being connected with those of succeeding sections by wires in the vaults.

1. The combination of the insulating guide plates G, the insulating supporting bars g, the drawhead M, and the reels E, with the hollow trunk sections, and the working vaults C, all constructed in laying underground telegraph wires, substantially as described.

2. The drawhead M, in combination with a series of separate

and distinct layers of telegraph line wires, and an insulating entering plate G, whereby all the wires are drawn and laid in the trunk simultaneously as described.

3. In underground telegraph line wires, in which the trunk A is combined with working vaults C, wit in which the trunk projects, the combination therewith of the entering guide insulating plates G for the wires, essentially as described.

4. In combination with this entering guide insulating plates G, arranged within the trunk terminus D, as described, the tension adjusting screws F, supported by said plates, substantially as described.

5. The ends D of the trunk sections within the vault made flaring, to afford working room between the wires, substantially as herein described.

6. In combination with the flaring projecting ends D of the trunk sections within the vault, the working openings f within said sections, to effect the union of the line wires with the interior ends of the tightening screws F, as described.

Born.

BERRYMAN.—At St. Catharines, Ontario, Canada, to Mr. John BERRYMAN, Jr., station master and operator Allanburg Junction, Great Western Railroad, a son—an eight pound *souder*.

A SOUNDER FOR 30 CENTS.

THE "SNAPPER,"

a Mechanical Sounder and Key combined—giving a remarkably sharp and clear sound—weighs but half an ounce, and can be carried in the vest pocket.

EVERY OPERATOR, EVERY AMATEUR, EVERY STUDENT wants one. Sent post paid on receipt of THIRTY CENTS.

R. W. POPE,

GOLD AND STOCK TELEGRAPH COMPANY, 61 Broadway, N. Y.

TO TELEGRAPH SUPERINTENDENTS.

If you are fitting up SHORT LINES or CITY WIRES get PARTRICK, BUNNELL & CO'S

CHAMPION SETS.

They are complete, full sized, work beautifully, don't get out of order, are substantial, pretty, and very low priced. Sent for circular.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in **Fire Alarm and Police Telegraphy**, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. BOX 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL
DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.

OFFICES:
114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,
which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS
of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

Send for Circulars and Catalogue.

DR. L. BRADLEY,
No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60. Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

NEW YORK, Oct., 1873.

We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.

Nickel Plated Goods a Specialty.

A VERY SUPERIOR MAIN LINE SOUNDER,
ENTIRELY NEW.

SOLE MANUFACTURERS OF THE
PATENT CIRCUIT-CLOSER KEY,

Which has met with marked success.

Price, \$5.50 plain; \$7 nickel plated.

The following is from a competent judge, written after some weeks' trial.

154 BROADWAY, NEW YORK, }
Sept. 22d, 1873.

DEAR SIR—Your circuit-closing attachment on the key, left with me for trial, is pronounced by all who have used it a decided and much needed improvement on the common form.

Respectfully,
A. S. BROWN, Manager.

The Best Form of Battery Insulator Offered.

SIMPLE AND PERFECT.

Made of porcelain, handsome in appearance. Occupies little more space than the cell it supports. Each cell of battery completely isolated. Leakage is reduced to the minimum by the use of it.

General Superintendent Van Horn, Southern Division W. U. Tel. Co., writes of it:

"We have now in use a thousand or fifteen hundred of your battery insulators, and expect to order many more before the close of the year.

We have never used any battery insulator that equals it in any respect. In fact, it appears to be as near perfect as we can reasonably expect, in a contrivance for that purpose."

Price 40 Cents.

We offer a very excellent article of Galvanized Wire, superior to any in the market. The linemen on Baltimore and Ohio R. R. say they have never seen its equal for toughness and flexibility.

Special attention given to building. Estimates given for any amount of material for telegraph construction or extension.

SWITCHES, GALVANOMETERS, RESISTANCE COILS, &c., to order.
Designs for Switch Boards for special service furnished.

SCOTT'S PATENT ANNUNCIATOR,
for Hotels and Residences.

THE AMATEUR'S
TELEGRAPH APPARATUS.

(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

COMPLETE OUTFIT, WITH BATTERY, CHEMICALS
AND MANUAL,

SHAFFNER'S
TELEGRAPH MANUAL.
TO TELEGRAPHISTS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
78 and 80 Broadway,
NEW YORK.

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
ONLY MANUFACTURER
OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,
FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,
Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES.
In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing,
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and de-
livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,
have been appointed by me GENERAL AGENTS for the sale of
any Telegraph Cable or Wire manufactured at the Works in New
York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods manu-
factured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
sale in New York by

SATURDAY, MARCH 7, 1874.

VOL. X. WHOLE No. 399.

[From *The Telegraphic Journal.*]

The Historical Department of the German Telegraph Exhibition at Vienna in 1873.*

THE Annexé of the Gallery of the German Empire (viii. a) contains a treasure which must have a peculiar charm for any one who has marked the significance of telegraphy for the various departments of public and private life; while for physicists and telegraph engineers in particular it will have an irresistible attraction, exhibiting, as it does, though in limited space, so much that is instructive. This treasure is the historical department of the German telegraph exhibition, which places before the visitor's eye the development of telegraphy in Germany, from the earliest times to the present. It is impossible to pass through this little room without a feeling of gratitude to the authorities, learned societies, and private individuals, whose ready aid has rendered this historical collection possible. And yet how much more valuable might the collection be were the original idea of the man, who, as having been the leading organizer of this exhibition, has added another to his many services in the theoretical and practical development of telegraphy to be carried out, that of an *international* telegraph exhibition! The more reasonable is the wish that the collection here made may, as much as possible, remain unbroken, and that active efforts may be made to fill up any deficiencies. The development of telegraphy does not cover a long space of time, and several gaps in the collection might be filled without much difficulty; after which, the whole would be invaluable as material for a future History of Telegraphy.

In the following lines we propose to give some idea of this historical collection; to explain its significance to those who may be imperfectly acquainted with the history of telegraphy; to bridge over some gaps in the early history of the science; and with some side views to objects which are, or might be shown in other parts of the great exhibition, bring down the history to the most recent times. Commencing, then, with what is earliest, we will make a few remarks on the venerable original telegraphic apparatus, which, previous to the Vienna Exhibition, had been seen by but few persons now living.

In vain were efforts made, from the middle of the last century till towards the end of it, to utilize friction electricity for telegraphing. A pretty apparatus for lecture experiments might here and there be found in use, but any further practical application seemed impossible. The end of the century brought a knowledge of galvanic electricity; and in the beginning of July, 1809, M. Samuel Thomas von Sömmering (born in 1755 at Thorn, and a member of the Munich Academy since 1805) constructed the first galvanic telegraph, in which he utilized the phenomenon first observed by Carlisle (in 1800), that the galvanic current decomposes water into its elementary constituents, oxygen and hydrogen. Sömmering covered 27 wires with silk, so as to insulate them, formed them into a rope, and brought the gold point ends of the wires, each of which represented an alphabet letter, into a glass trough filled with water; while, at the other end of the rope, two of the wires could be connected with the poles of a voltaic battery; whereupon gas bubbles began to rise in the trough, at the two wire ends—oxygen at one, and hydrogen, in greater quantity, at the other. Sömmering thus always telegraphed two letters at once, the letter of the hydrogen wire being regarded as the first. To announce the commencement of the process an alarm was added, and it appears in the apparatus belonging to the Sömmering family here exhibited.

The possibility of telegraphing with such apparatus is undoubted; and, as afterwards improved by Schweigger, who reduced the number of wires to two, the telegraph would have been practically available; but as the demand for good telegraph quickly increased, better means were found of satisfying it. So that the Sömmering telegraph had as little practical development as the proposal made by Prof. Coxe, of Philadelphia, in 1810, to utilize the decomposing action of the galvanic current on various salts for telegraphic signaling.

The development of telegraphy took a new direction when Prof. Oersted, of Copenhagen, in the end of 1819, made the observation that an electric current deflects a magnetic needle, when passing near it, out of its normal direction north and south. Already, in 1820, the French Academician Ampère proposed to employ the deflection of (30) magnetic needles (with 60 conducting wires) in telegraphing; but, owing to the number of wires required, the proposal, like some later ones, dropped. Next, in 1832, the Russian Councillor Schilling, of Canstadt (of German descent), sketched a telegraph with only five needles; later, he used only one. A drawing of his apparatus, preserved by the St. Petersburg Academy of Sciences, is exhibited. Schilling died in 1837, before his telegraph was fully completed. In 1836, however, William Fothergill Cooke saw one of Schilling's telegraphs in Heidelberg, and was induced to apply himself to the construction of telegraphs.

A telegraph on a larger scale was constructed, in 1833, by Profs. Gauss and Weber, in Göttingen, and it continued in use till 1838. At first galvanic currents were used; later, magneto-induction currents. The exhibited telegraph is the property of the Physical Laboratory in Göttingen. The needle in the receiver is a large magnetic bar, 1.21 metres long, 0.075 broad, and 0.015 thick; and the surrounding multiplier coil is enclosed by a bobbin of strong copper wire, with few turns, which acts as deadener. The needle's oscillations are shared by a small mirror, which is observed through a telescope. The sending instrument includes an induction coil enclosing a strong magnetic bar, and, by one or other of two levers, this can be moved over the bar; the connecting piece of the two levers is capable of turning about a horizontal axis, and forms part of a mercury commutator, which sends the current sometimes in the one, sometimes in the other direction, through the multiplier coil, and deflects the needle within it to the left or to the right.

The next progress in construction of needle telegraphs, viz., their transformation into writing or printing telegraphs, we owe to Prof. Steinheil, of Munich. He constructed the line (three quarters of a mile in length) from Munich to the Bogenhausen Observatory, and telegraphed, in July, 1837 (to the latter), with the apparatus exhibited, which includes, as transmitting instrument, a magnetic inductor, capable of turning about a vertical axis, and a mercury commutator, and, as a receiving instrument, two small steel magnets turning about a vertical axis within a multiplier bobbin traversed by the induction current. Each of these magnets is furnished at one end with a small vessel of coloring matter, at the other with a metallic tongue; and they are so arranged that a current in one direction causes one of them to press with the ink vessel against a strip of paper carried along in front of it, a current in the opposite direction the other, or makes the tongues of the magnets strike on two different toned bells. The Steinheil telegraphic writing consisted of points in two different lines, these points being so grouped as to denote letters and figures. An essential advantage in the use of such writing, especially for deep sea telegraphy, lies in the fact that, for producing it, merely currents of equal length can be used. A further service was wrought by Steinheil, in 1838, in discovering the possibility of return conduction of the electric current through the earth; thenceforth only one line was required for each telegraph.

In England, Cooke, who, after his return from Germany, in 1836, had made a needle telegraph with 3 needles and 6 wires, and a pointer telegraph, united with Professor Wheatstone, and they took out a patent for a telegraph with 5 needles and 5 or 6 wires. On the 25th of July, 1837, the first trial experiments were made with it on the North Western Railway in London. In 1840 they furnished 39 miles of the Great Western Railway with their lines; but on account of its great costliness (£250 to £300 per mile), the telegraph was not further extended. The needle telegraphs, constructed by Cooke and Wheatstone, with 1 and 2 needles, have continued in use up to the present. Though these telegraphs do not give an enduring signal, they yet commend themselves for many purposes, on account of their simplicity and convenient handling. Siemens's double needle telegraph (with electro-magnet) of the year 1849, is exhibited in the historical department; and one of the most recent double needle telegraphs of Siemens Brothers in London, is to be found in the English department of the exhibition.

The first pointer telegraph, in which the letter to be telegraphed is indicated by a pointer, which moves over a lettered disc, stopping opposite it, was constructed by Cooke, in 1836; and in 1840 Wheatstone greatly improved this system of telegraphy. Among the German pointer telegraphs exhibited, the latest is that made by Leonhard, in Berlin, in 1845; in the receiver of which, the electric current, by means of an escapement, sets the scape wheel (on the pointer axis) in step by step rotation, while the closing and interruption of the current in the receiver is done with the aid of clockwork. The telegraph of Drescher, in Cassel

(not exhibited), had a similar arrangement. Essentially different is the pointer telegraph patented in Prussia, in 1846, by Siemens, of Berlin. This telegraph works with automatic interruption of the current, and the pointer is caused by rapidly successive making and breaking of the current to pass on to the letter to be telegraphed. This telegraph is, at the same time, the oldest exhibited printing telegraph; for it has a peculiar arrangement for printing the telegraphed letter on a strip of paper. The first type printing telegraphs were, indeed, previously constructed, in 1837, by Vail, in North America, and Wheatstone in England; also, in Germany, in 1844, the type printing telegraph transformed out of a pointer telegraph by Fardely came into use on the Taunus Railway. Of the older pointer telegraphs the historical collection only contains the pendulum which served Dr. Kramer, of Nordhausen, as relay, but unfortunately the rest of the apparatus is wanting. Copying telegraphs there are none in the historical department, but in the French Telegraphic Department may be seen two recent copying telegraphs, those of Meyer and of Gyt d'Arincourt.

To about the same time as the needle and pointer telegraphs reach back also those of the Morse system. Prof. Morse (who died in 1872) has told us that it was in October, 1832, on his return voyage to America, the idea occurred to him of making electricity give durable and audible signals at a distance; and he also then sketched out an electro-magnetic telegraph, and a telegraphic dictionary for the signals, which were formed of dots. It was in November, 1835, he showed his friends in New York a model, differing essentially from the later Morse apparatus, and in which a zig-zag line was drawn by a pencil on a strip of paper passing before it.

The Morse writing now used consists of groups of dots and dashes, either embossed with a style, or written with colour. The electro-chemical writing, through decomposition of metallic salts in strips of paper impregnated with them, has, notwithstanding many years' experiments by Morse, Davey, Bain and others not come extensively into use; in the present collection are shown Gintl's chemical telegraph, and the double style apparatus of Stöhrer.

The oldest apparatus for embossed writing exhibited is Siemens's style or relief writer, dating from 1849, and so from the earliest time of introduction of the Morse telegraphs into Germany. The electro-magnet stands upright, and the lever of the armature has an arm directed downwards to which the separating spring is attached. The next oldest style writer was made by Siemens, in 1853, and came into use on the Russian lines. The lever is here connected with one core of the electro-magnet, and this core, oscillating about a horizontal axis, is prolonged, in shoe form, to the other core; thus the working of the electro-magnet is rendered quicker than that of ordinary electro-magnets. The same arrangement is seen in the electro-magnet of Frischen's style writer, 1856, for closed circuit (*Ruhestrom*). In the relief writer of Lewert, of Berlin (1865), the spring barrel of the driving gear is removable, and the driving gear itself is fitted in a case, at the side of which passes the paper strip.

There is a greater variety in the construction of ink writers (black or blue). The first of these was made by Thomas John, of Prague, in 1854. In the original here exhibited, the writing wheel (fed with coloring matter from a saturated roll of felt) is fitted to a spring lever, which shares the movements of the armature lever of the electro-magnet, being connected with it by a small bar. The writing wheel is set in rotation by a cord passing from the cylinder of the paper strip. There is further exhibited a polarized ink writer, in the apparatus for submarine lines which Siemens constructed, in 1857, for the Red Sea cable; also the first construction of polarized ink writer (patented in England in 1862), in which a small writing wheel, fitted to a slowly rotating axis with universal joint, and pressed by a lever against the paper strip, dips in an ink-holder, the level of which may be altered. The ink writer of Lewert, of Berlin (1865), with removable spring barrel, has the arrangement preferred by Digner, in Paris; the writing wheel is fixedly fitted to the stand, and is slowly turned by the ink roller, which is in contact with it, while the knife edge extremity of the writing lever presses the paper strip against the wheel whenever the armature is attracted. Lewert, however, has added above the ink roller, an ink holder with valve. The other ink writer of Lewert (1868) is furnished with automatic ratchet wheel, and (as also one exhibited by Moller, of Cologne) has Brabender's arrangement of lever (1868) which is suitable either for the working current or the closed circuit system. The older arrangements of the kind by Wiehl and Dehm's one misses in the historical department; the most recent have been exhibited by M. Schäffer, in Vienna, in the Pavilium of Commerce and Palace of Industry. The polarized quick ink writer of Siemens (1868), lastly, is characterized by an arrangement which permits of varying, within wide limits, the rate of paying out the strip of paper. The department does not contain any ink writer of the kind devised by

*Abstract of a paper by Dr. Zetzche in the *Internationale Ausstellungs-Zeitung*.

G. Wernicke, in Berlin, in which the ink passes through a capillary tube to the paper from a holder fixed to the lever, unless we here reckon the ink writer exhibited by the Bavarian telegraph authorities, in which the paper strip is moved by the lever against a fine orifice at the lower end of the ink holder. Another Bavarian ink writer, again, with knife edge on armature lever, presents a new mode of transmitting rotatory motion to the little wheel. We may here refer to the peculiar ink holders, serving at the same time as writing wheels, that are exhibited in the French department.

There have not been wanting, also, experiments to group dashes and dots distributed in two lines according to a telegraphic code. The electro-magnetic double style apparatus devised by Stöhrer, of Leipsic, came into use in Saxony, in Bavaria (1849-58), and experiment-wise, in Austria, but, notwithstanding its simple and short writing, had to give way to the Morse apparatus. The department exhibits one of Stöhrer's double style apparatus of the oldest construction (with polarized relay belonging to it), and there is another quite similar in the Bavarian department; also, in the latter, a new double style writer, with four different relays (with movable plates, with two constant steel magnets, with two horse shoe magnets, with six bar magnets); in the general department, on the other hand, we find Siemens's alterations—a double style relief writer (1850) with the oldest form of polarized relay (without steel magnets); the armature magnetized inductively from the core of an electro-magnet, with branch current from local battery circulating round it, and a key board with 30 keys, as also a polarized double style relay with steel magnets (1852).

It has lately been proposed (1872) to return to the Steuheil writing, which consists only of dots distributed in two lines, but with this difference, that with a suitable punching arrangement the points be punched in the paper. Apparatus of this kind are exhibited by Jaite and Gurl, of Berlin.

There are no copying telegraphs in the German exhibitions, for no German has made such a telegraph.

Of type printing telegraphs, the historical department contains, besides that of Siemens's already referred to, only Hughes's apparatus as made in Germany, and an insertion for Hughes's end and translation stations; the French exhibition, on the other hand, shows the type printing telegraphs of d'Arlincourt and Dujardin, of Lille, each of which is fitted with two type wheels. The newest type-printing telegraph, that of Siemens, only arrived in Vienna about the middle of August. The Börsen telegraphs, finally, of O. Schäffler and A. Bauer (in the Austrian department of the Palace of Industry) are also type printing telegraphs, but they require two or three lines.

Alarm apparatus for railways is only represented, unfortunately, by one of the oldest, that of Siemens's (1847), in which a hammer is raised and falls back of itself. The importance of bell apparatus for railways appears in other parts of the exhibition.

Of the efforts which have been made to utilize the same telegraph line for the simultaneous transmission of several telegrams (duplex telegraphy), we are reminded, in the historical department, only by Frischen and Siemens's relay with double coils, and oscillating magnet, for duplex signalling (patented in Prussia in 1834), and a relay with double coils by Borggreve. In this respect, therefore, the collection is very deficient; for most of the proposals in this direction have been made by Germans. It is also to be regretted that the recent successful experiment in duplex telegraphy by Preece in England has not been exhibited, and that of telegraph apparatus in England, generally only those of Siemens Brothers are shown. From Hungary we have the duplex system of Franz Kosmata, in Pesth (1869). And we may here lastly notice the method (closely related to double telegraphy proper), first brought out in 1851, in which, on one and the same line several telegrams are transmitted alternately in fragments (that is, the signals of the two telegrams alternating). The most suitable of apparatus for this purpose is that recently constructed by B. Meyer, in Paris, which was practically tested from 18th July to the 10th August, on a half-mile line from the Palace of Industry (French department) to the central telegraph office, and with good results, which allow of the hope that it may be practically serviceable on longer lines. Another experiment towards solution of the same problem was made by A. Bauer, in Vienna, whose apparatus (*Illimit Apparat*), not quite completed, unfortunately, and by no means simple or readily intelligible, appears in the Pavilion of Commerce. Both apparatus require, of course, synchronism between the two stations.

The total traffic receipts of the Great Northern Telegraph Company, have been, during January, 1874, 332,471 francs, and in the corresponding period of 1873, 150,847 francs. On the European lines, in 1874, 166,040 francs; in 1873, 121,377 francs. On the China and Japan lines, in 1874, 156,431 francs; in 1873, 38,470 francs.

Appropriate Presentation to Superintendent W. A. Graves, of the N. Y. C. and H. R. R. Telegraph.

THE telegraphers connected with the line of the New York Central and Hudson River Railroad Telegraph have presented to their chief, Mr. W. A. Graves, a magnificent frame, containing photographs of all the present and former operators on the line under his charge. The testimony is an appropriate and valuable one, and is most worthily bestowed, and is highly prized by Mr. Graves as an indication of the warm personal friendship of the telegraph employes under his charge.

The following is the correspondence exchanged upon the occasion:

"ALBANY, N. Y., Feb. 18, 1874.

W. A. GRAVES, Esq.

Dear Sir—The undersigned telegraphers desire you to accept the accompanying picture as a slight testimonial of their respect and regard; hoping the receipt of the same may afford you as much pleasure as its presentation does us, and that the friendship and good will now existing may continue long after our business relations shall have been severed.

We remain, respectfully and truly yours,

J. H. Covert, W. H. Whyland, O. E. Stafford, J. Wetterau, Jr., R. Davis, J. Q. Wires, W. S. Dunbergh, J. Pembroke, G. H. Cooke, H. W. Denuington, A. Seely, L. Wadsworth, J. H. Eylebergh, W. S. Paddock, A. E. Clark, A. Marvin, J. F. Trenchard, J. J. Fitzgerald, W. E. Feno, W. J. Warren, C. V. Parker, F. Gould, Geo. Woodworth, Ira S. Kiuch."

"ALBANY, N. Y., Feb. 19, 1874.

GENTLEMEN—I should wrong both you and myself if I failed to express my pleasure and very agreeable surprise in being the recipient of your very beautiful and valuable present. I thank you for it, containing as it does that which will always remind me of those with whom I have worked and grown up.

I cannot, however, prevent myself from saying that I have always felt a delicacy in accepting any testimonial from my associates during the existence of such relations as you and I occupy. We are servants of an institution that demands from us in common severe labor and rigid discipline, and should do nothing that would have a tendency to weaken or embarrass those relations. I know you will all agree with me in this respect, and while I earnestly desire your comfort and success, I also do not forget the inexorable duty we owe the company in whose employ we are.

You will not misunderstand me; regard me as your friend; command me when I can aid you; and know that I shall always be pleased to see each and all of you prosper and succeed in life; and prosperity is certain if you are faithful in every duty you undertake to perform.

I do not feel ashamed of the condition of the division on which we are located, and know it will compare favorably with any other circuit of this or any other company's telegraph department. I often feel proud when I think over the improvement plainly visible since I first came on the line, and thank you, each and all, for it; without your aid and coöperation no success could be reached in this direction. I only request the same cheerful compliance in future as you have shown in the past, which, I assure you, has been and will be appreciated. To those represented, who have left our circuit, I can only say, thanks; their faces take me back to the past, and I can say only I am glad to be remembered by them, even though our business relations of intimacy are broken.

Again assuring you of my hearty thanks for your very kind present and the delicate way it has come to me, I am yours truly,

W. A. GRAVES.

To Messrs. Covert, Whyland, Kiuch, Woodworth, and all others represented.

P. S.—The picture hangs in my home in Schenectady, where I shall be pleased to see you, one and all, at any time. W. A. G."

The Panama Cable Service.

THE West India Cable Service continues to be a source of great annoyance to business men on the Isthmus and the Coast who used to use it. We have complaints by last mail from Lima of two messages sent to a firm in London that have never been delivered, and innumerable growls are constantly being made of prolonged delay in transmission, so much as to render a message of no value. In reply, we may say that the cable service between Santiago de Cuba and Havana is still carried on by steamer, the voyage occupying three to four days, for which a heavy extra charge is made. A message from Panama to New York or London may get through in six or seven days, and may take twelve to fifteen. Those interested must therefore use their judgment as to whether mail or cable is the quickest, most reliable, and most profitable to patronize.—*Panama Star and Herald*.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Congress and the Telegraph.

WASHINGTON, D. C., March 4.

TO THE EDITOR OF THE TELEGRAPHER.

THERE has been such an entire lack of interest in telegraphic matters here that material has been wanting for my communications for some weeks, and, therefore, I have not troubled you. There is even now but little to be said that will be likely to interest your readers.

The Senate Post-office Committee have continued to tinker at the Hubbard bill at intervals. It is understood now that the bill is practically completed, and it has been published in the shape in which it will probably be reported sometime during the present session. As there is no material alteration in the bill, and as it has not the slightest prospect of success, it is not necessary to burden the columns of THE TELEGRAPHER with a synopsis of it. It is the same old bill, and, no doubt, in deference to Senator Ramsey, its chairman, who is its Senatorial champion, the committee will report the bill as often as may be desired.

The following, from the *Chronicle* newspaper of this city, states the actual condition of the postal telegraph matter succinctly and correctly:

"The recommendations of the Postmaster General for adopting a system of postal telegraphy have not been presented to either House of Congress in the shape of a bill. Advocates of a project like that proposed by the Postmaster General have not been found in Congress since the retirement of E. B. and C. C. Washburn. There appears to be a lack of enthusiasm in Congressional circles upon the subject, and it will not likely be agitated this session. The Postmaster General feels content at being put on record as an advocate of postal telegraphy, and beyond this he will make no further effort in behalf of the plan. In the meantime the Senate Committee on Post-offices and Post Roads are tinkering away at the Hubbard bill, and it will probably come before the Senate in some shape shortly; but there is not the least chance of its success, as the disposition of Congress is to avoid the consideration of such an important question at this time, and there are but few who would give it the attention it demands."

As the *Chronicle* is a strong advocate of the postal telegraph scheme of the Postmaster General, this statement is the more noticeable.

The invention of Mr. W. E. Sawyer, for increasing the speed of transmission of signals over cable telegraph lines, has attracted considerable attention, and it is understood that Mr. Sawyer is constantly in the receipt of letters inquiring about it. The following is Mr. Sawyer's description of his invention, contained in a statement which was referred to the Committee on Foreign Affairs of the House of Representatives, before whom the application for a charter for a corporation to lay and operate telegraph cables on this system is pending. It is printed in Miscellaneous Document No. 115.

"The endeavor of the inventor of the methods which form a portion of the present subject, was to reduce the four impulses now requisite to transmit a letter to a single impulse. It was believed at first, and experiment has proved the correctness of the assumption, that eight different kinds of signals could be obtained from the mirror-galvanometer instead of but two, viz., a slight and a more marked movement of the mirror to the right and left; or four, and the same movement in connection with a quick return to the initial points, by means of the introduction of the opposite currents, or four more.

The next idea was to transfer to a synchronously revolving local cylinder, through the human intelligence, the impulse manifested by the mirror, thus obtaining any desired electro-magnetic power without static or retarding effects. The transmitting instruments consist of a cylinder revolved in synchronism, and a duplex lettered key board, namely: 26 keys, representing the 26 letters of the alphabet, and 26 secondary keys, representing the same letters with a letter or two letters in combination, thus: primary key A, secondary key A T; primary I, secondary I N G. The primary keys introduce upon the cable the simple positive and negative currents; the secondary keys introduce combination currents, as negative-positive, and positive-negative, to form the combined mirror movements above noted. The receiving instruments consist of the mirror-galvanometer, a quadrisectional cylinder revolving in synchronism, two combination local circuit keys, and a printing apparatus. Now, if we were to have in England a cylinder containing connecting points, and a key board representing the alphabet, and in America a type wheel revolving in synchronism with the cylinder in England, both in-

struments being in adjustment, and if the operator in England were to depress a key representing, we will say the letter A, when the proper point on the cylinder in England should come round it would make a connection with the depressed key, and, electrifying the cable, would occasion a movement of the mirror in America; and if the moment the operator in America should perceive the mirror move he should depress a local key and form a local circuit, which should stop the type-wheel, and perform the function of printing, the letter A would obviously be printed in America. This is the operation of the printing telegraph in use on land lines, with the exception that the electrical impulse is communicated directly to the type wheel; instead of through the depression, by the receiving operator, of a local circuit key to transfer it to the type wheel. The type wheel, however, could be divided into twenty-six sections, each containing a letter, and to attain a high rate of speed it would have to be revolved as many as 250 or 300 times a minute, carrying by a given point in a minute's time some 7,800 letters, which would be a rapidity too great for safety. But by using four sections of a cylinder, each the equivalent of a type wheel, because electrically connected with a printing apparatus, the alphabet is so combined, with reference to the occurrence of letters in words, merely by using four different movements of the mirror, that with but 15 letter-equivalents upon the periphery of the quadrisectional cylinder $4\frac{2}{3}$ letters are obtained at a revolution, and by combining this with the duplex and triplex letters, 9 letters are obtained for each revolution of the cylinder.

Thus, by giving the cylinder 25 revolutions per minute, which is but one tenth the rate of speed required to attain the same result in the printing telegraph used on land lines, a printed record is had of 45 words per minute, and the capacity of the cable is trebled. Two operators are required at the receiving instruments, one to operate the combination key for recording the short movements of the mirror, and the other the long movements. The apparatus for keeping the transmitting and receiving instruments in synchronism is of the simplest character, and consists, first, of the ordinary face governor clockwork at each end of the cable, which, when motion is imparted by the same weight, say 45 pounds, run nearly the same. When a message is coming, the weight at the receiving station is increased to, say 50 pounds, when the receiving clockwork, moving from a heavier weight than the transmitting clockwork, is constantly gaining upon the latter. A wheel carrying, fixed upon its periphery, crosswise and equidistant, fifteen armatures, is attached to the shaft, which carries the quadrisectional receiving cylinder. Placed so as to just escape the armatures, so as, when magnetized, to attract them in the direction contrary to that in which the cylinder is revolving, is an electro-magnet, and whenever the quadrisectional receiving cylinder has gained upon the transmitting cylinder the one twentieth part of its periphery, the same operation which performs the printing sends a current through the electro-magnet, and the cylinder is again brought into position."

CAPITOL.

Telegraphic Colleges Again.—What They are Doing, and What Practical Operators Should Do.

TO THE EDITOR OF THE TELEGRAPHER.

In a late issue of the *Journal of the Telegraph*, an editorial appears in which telegraphic colleges are strongly recommended as proper places for young men and women to learn the art.

Can it be possible that the editor of the *Journal* is paid for such puffing? or does he write in ignorance? He should have the benefit of any doubts, and we will assume that the latter supposition is correct.

For his especial benefit it may be well to chronicle a little historic event which occurred a short time since, and which, by the way, is a fair illustration of frequent occurrences of like nature in all our large cities.

After reading the following, if the editor of the *Journal* can, consistently with his ideas of honesty, truth, and justice, recommend these swindling institutions, let him do so; but we will have the satisfaction of knowing that he does not do it in ignorance.

At stated intervals, for many years, a manager of one of our large city offices has been annoyed by the proprietors of a commercial college making applications for situations in behalf of their graduating dupes.

The students themselves also make personal applications, with flowery diplomas in their pockets, certifying that they are *first class operators*, capable of receiving *twenty-five* or *thirty* words per minute, making good copy, etc.

The manager, a true gentleman, knowing the shallowness of their telegraphic knowledge, usually returns a civil answer, that "the company are not just now in want of any operators."

The poor victims approach with an air of great confidence, having been told that first class positions could

be obtained only for the asking; but they go out a little wiser and a little less confident.

Not long since, a poor, hard working German came in with his daughter, a girl some fourteen or fifteen years of age, who was a graduate of the telegraphic department of the commercial college, had a splendid diploma, stating that she was capable of receiving thirty words per minute. The manager having learned from one of the professors that this girl was the "distinguished scholar" of the department, concluded to give her a fair trial.

Escorting her to the operating room, he switched a way wire upon an instrument the most remote from the clatter of the other machines, and asked her if she could read the writing.

"Oh, yes; I read it all," she replied.

Messages were passing at the rate of twelve or fifteen words per minute, when the manager, giving the young lady a pencil, seated her at the desk, requesting that she copy the messages as they passed. He then very considerably stepped away from the desk, that she might not be confused by overlooking eyes.

She appeared very self-possessed; and as she sat down and commenced writing a distant observer was confident she was acquitting herself creditably. At the end of a minute or two the business on the wire was suspended, and the manager requested the operator seated at the regular instrument of the wire, to write something. About thirty words were then manipulated slowly and plainly, on an average of about fifteen words per minute.

The manager then signified that this was sufficient, and taking the copy which was on a number one blank examined it carefully. He then politely escorted the maiden to her father, who had remained in waiting, and told them that he had all the operators he wished at present. Out of regard to the feelings of the poor man and his victimized daughter the truth was not spoken, and they departed in ignorance of the great imposition by which they were the sufferers.

The beautiful copy at the rate of thirty words per minute was passed around for inspection, when lo, behold! there was not *one* intelligible word written upon the blank. Out of about one hundred words which the young lady had endeavored to copy, there was not *one* whole word written disconnectedly. She had caught one or two letters of one word and one or two of another, placing them down in order as they were distinguishable to her, and so on a letter or two from each word through the whole, until there appeared a conglomeration of letters—a perfect mass of unintelligible words.

A despatch written in Spanish, such as we are sometimes called upon to handle, could not be more unintelligible to the American operator than this girl's copy.

She is no more capable of working in a telegraph office as an operator than a Feejee islander, who never heard of a telegraph.

What is the meaning of the word swindle if it does not express to us the character of this diploma?

Is there not a law in the land which, if enforced, metes out justice to a person or persons obtaining money under false pretences?

This poor German had undoubtedly read the neatly worded advertisements of this commercial college, wherein they agree to fit male or female students for first class telegraphic positions in three, four or six months, and which assert that such positions can readily be obtained, etc. He had disbursed his hard earned dollars to give his daughter such an education—dollars, perhaps, which were necessary to insure his own comfort during the hard winter. He had denied himself for the time, under the delusion that the money would soon be replaced when his child would be earning a good salary.

Do the *Journal* people approve of such infamous doings as this?

A bogus medical college was broke up in Philadelphia not many months since, where, for a consideration, certificates were ground out and distributed to persons wholly incompetent to practice. The practicing physicians, who had obtained their papers by years of hard study, cried out against the swindle, and brought the law in its majesty upon it. Precisely the same thing is being enacted right under our noses, and the telegraph operators of the country rise not in their own defence.

AGITATOR.

Obligations of Telegraph Companies and their Employes.

PITTSYLVANIA C. H., VA., Feb. 26.

TO THE EDITOR OF THE TELEGRAPHER.

A MESSAGE was received at this office, signed "A Friend," to a young man in this place, warning him of a certain danger impending over him. The young man naturally was alarmed, and immediately started in the night, through a storm of hail and snow, travelling a distance of 25 miles on horseback, in consequence of receiving the message. He found, on his arrival, that the information was false, and on his return the next

day that the warning message was sent by *some friend* as a *hoax*. The young man then sends a message to the operator at the office from which the message was sent, demanding the real name of the person from whom the message originated, but the operator refused to give him the desired information without the consent of the party sending the despatch.

Under these circumstances can the operator be compelled to give the name of the author of the despatch, if he knows it; and are telegraph companies liable for damages for transmitting such messages? By answering this in your next issue you will greatly oblige me.

Q.

ANSWER.—Telegraph companies and their employes are bound to use ordinary care and diligence that their facilities shall not be employed for fraudulent or illegal purposes. They have no right to transmit anonymous messages of the character referred to, and there can be no doubt but that they are under legal obligation to give the desired information, if in their possession, or are responsible in damages for knowingly permitting such improper and fraudulent use of the wires.—EDITOR OF THE TELEGRAPHER.

The Franklin Line Telegrapher at the Capital.

WASHINGTON, D. C., Feb. 22.

TO THE EDITOR OF THE TELEGRAPHER

THE 22d of February, and the lines down North! Ought not this to be a good time to write up for your journal, and contribute our mite to unite all operators in closer bonds of friendship?

I think we have as many characters and as many "boys" in this office as any other south of New York. First, our manager, "K. D.," is a study. If you especially wish to see or speak to him you will find he is in Baltimore, for, as he is manager both here and at Baltimore, he spends about a fourth of his time "on the wing." If we could only send him by telegraph he would be the happiest man in the world.

Next come our two chief operators, "X" and "Da," who are just the opposite in everything. "Da" has the hot French blood flowing through his veins, and is fiery and quick tempered, but very polite and excessively careful about his "rig." If his imperial was not twisted to the fineness of a needle, and his shirt bosom spotless white, he would die of misery. He is a great man at the Capitol office, especially among the ladies, and is by far the finest looking man in the office. He was married a short time ago, and favored us by bringing around his wife, that we might see what kind of an eye he had for beauty.

"X" is going to make a fine man, if he does not hurt himself by over work. It does me good to see him rush in the office when everything is in a jumble, and knock things right and left. I would not like to receive from him as a steady thing, for he never catches hold of a key without making it rattle and spin. He timed himself and ran up to fifty-one words a minute, which we all felt proud of, and if any W. U. man wants to beat it, just let him come round and try it. "X" is the friend of every student and "plug" on the lines, as he is not so small and mean as to be afraid of competition, and is too much of a gentleman to ever lord it over any one beneath him.

It is whispered that "X" is engaged, but I suppose it is only the wind whistling around the corner. If it is so, I would advise her to most positively insist, for his good as well as her own, that he should never work twenty hours in one day—as he did not long since.

About the queerest character about the office is "Ga." He always comes down with a great lounge cloak, which reaches nearly to his feet, and which he wears in the true Greek style. As soon as he opens the door there is always a breeze among the operators. Always lively and as quick as lightning at repartee, and will never lose a joke whether it is against himself or not. Although he is a great student, I am afraid he has not much genius for writing with lightning.

A VOICE FROM THE CAPITAL.

An Imperial Telegraph Operator.

BUFFALO, Feb. 25.

TO THE EDITOR OF THE TELEGRAPHER.

The following is from an article printed in the *Berlin National Gazette* respecting the daily life and habits of the Emperor Joseph of Austria. Many of your readers will no doubt be gratified to learn that our royal brother is a first class sound operator:

"He next hastens back to his cabinet, and those who could watch him there would undoubtedly be greatly interested. There is a telegraph instrument in the cabinet, and the emperor, who is a remarkably good operator, having learned this as his trade, listens with close attention to the clicking of the wires, and sends every now and then a telegram himself—this being his favorite mode of corresponding with his personal friends and favorites."

OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will
commence with the number for SATURDAY, JANUARY 3d,
1874, and will close with the year.

All the popular features of the paper will be continued, and it
will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits,
and without patronage or support, other than that derived from
its legitimate business, for the past five years. (Previous to that
time it was partially maintained by the National Telegraphic
Union.)

The TENTH VOLUME commences under favorable auspices,
and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COM-
BINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the
patronage received, will be spared to improve its character, and
add to its interest, and to sustain its reputation as the ONLY
FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE
AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for
Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtain-
ing subscriptions, and will be allowed TWENTY PER CENT. COM-
MISSIONS in lieu of Premiums or Club rates upon the amount of
such subscriptions, which may be deducted from remittances
when made.

Any person sending the names and money for FOUR subscri-
bers, at the regular price of subscription, two dollars per year,
will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A
CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS
WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-
office order or registered letter, at the risk of the Publisher, but
no responsibility will be assumed for money sent without such
precaution. On remittances of not less than FIVE DOLLARS the
cost of the order or registration may be deducted from the
amount.

Advertisements are solicited, and will be inserted at reasonable
rates; but no Advertisement will be inserted for less than ONE
DOLLAR per insertion.

All communications relating to or intended for THE TELE-
GRAPHER must be addressed to

Telegraphic Projects at Home and Abroad.

THE sudden withdrawal of the scheme for a light
cable between England and Halifax, Nova Scotia via
the Azores Islands, which was recently announced
with quite a flourish as to what was to be accomplished
by the laying of a cable which could be manufactured
and put down at a comparatively small cost, and a pro-
posed reduction of charges for cable service to one
shilling per word, naturally suggests the consideration
of telegraphic projects which are proposed at home
and in foreign countries. We are not surprised at the
withdrawal of this scheme, though it has come some-
what more speedily than was anticipated. The alleged
cause is the lack of countenance and pecuniary support
which it has met with. The real cause we think is of
a different character, and that the scheme actually
received fully as much countenance and encourage-
ment as its projectors anticipated. In fact we do not
believe that, on the part of those who undertook to
engineer the proposed company, there was ever any ex-
pectation or intention of laying the cable.

The reasons for the belief, we think, are convincing.
For some time previous to bringing out the prospectus
it was very generally given out that such a company
was to be inaugurated, and that a cheap cable was to
be laid at so small a cost as to enable the service to
be performed at a fraction of the rate charged by the
Anglo-American Company, and that the effect would
be exceedingly damaging to the interests of that com-
pany, who had such an amount of capital invested in
their cables as to render it impossible to work them
profitably at anything near the rates on which the new
company could live and make money. The effect of
these disquieting reports was to materially depress the
market value of the shares of the Anglo-American
Company, notwithstanding that company was doing a
better and more profitable business than ever before.
This suited admirably the speculators who were thus
enabled to purchase more cheaply the shares of the
company which timid holders threw upon the market,
in anticipation of the time when the cheap cables
should render them valueless. The prospectus was
finally brought out a few weeks since, and we think
that at one time the shares of the new company were
nominally quoted at 1/2 per cent. premium. The desired
effect having been produced, and it being evident
that Anglo-American shares could not longer be un-
favorably affected or cheapened by a project which
there was nothing to indicate would prove practically
successful, it has been quietly dropped, and Mr.
HIGHTON and others, who honestly believe that there is
a merit and superiority in light telegraph cables, are
coolly informed that the public won't invest their
money in a scheme which has so little probability of
practical success and permanence.

Whether the Anglo-American Company has offered
any additional inducement to the manipulators of this
enterprise to remove it from the path, of course we
cannot be expected to know. It was understood, how-
ever, that it had been decided by that company that
for the future its purpose was to contest instead of
buying off competing schemes.

As has already been stated, the Anglo-American
Company have contracted with the Telegraph Con-
struction and Maintenance Company to utilize the sur-
plus cable on hand by manufacturing sufficient addi-
tional cable and putting down another cable to Heart's
Content during the coming summer. This cable is not
now needed for the business of the company, but it
has been its policy from the start, and an excellent
policy it is, too, to increase its facilities in advance
of their probable requirement. It is not improbable that
when this cable is laid that there may be a reduction
of the existing rate of charges for Atlantic telegraph
service.

The United States Direct Cable Company seems to
be progressing with its new cable, and it is confidently
anticipated that it will be laid during the coming
season. We have not, it must be confessed, had until
recently much faith in the actual laying of this cable.
We did have faith in the Great Western Telegraph

Company, which had made nearly as much progress
towards the completion of its cable and its laying as
the United States Direct Cable Company has had, when
all of a sudden the project was abandoned, and the
cable transferred to the Western and Brazilian Com-
pany. We are assured, however, by those who ought
to know, that the enterprise is undertaken in good
faith, and the cable will be laid during the coming
summer. A contract for a connection has been made
with the Atlantic and Pacific and Franklin Companies.
The line of the Franklin Company is, we understand,
to be extended to Rye Beach, N. H., where the cable
is to be landed to meet and form the connection with
it on this side. In this country there appears to be at
present a very quiet condition of telegraphic affairs,
and nothing can, as yet, be definitely stated as to
future telegraphic movements and extensions. It is
understood that the Atlantic and Pacific Company
have in view some extension and increase of its lines
and facilities during the coming season, but how
radical and extensive these may be cannot now be
stated.

It is also understood that the Automatic Telegraph
Company have nearly completed negotiations for the
extension and development of a system of lines upon
the automatic principle of telegraphy, but as yet the
public are in the dark in regard to what is to be done.

With these exceptions we do not learn of any very
important telegraphic projects in this country in the
immediate future. The general dullness of business
with which the telegraph sympathises of course has
for the time checked development in this direction, and
until there is a revival of the general business of the
country we do not look for any special or very im-
portant advance in telegraphic development.

As we stated recently, it is understood that there is
a considerable amount of foreign capital ready to be
invested in American telegraphs, whenever matters
get into such shape as to promise favorable results.
Those who control this capital, however, will not invest
it until there is a reasonable prospect that the senseless
division into separate companies of the organizations
competing with the Western Union Company shall be
abandoned, and a consolidated competing organization
take their place.

The Southern and Atlantic Company is the only one
outside of the Western Union that is at this time
actively engaged in extending its lines. The wires of
this company are being advanced towards New Orleans,
which, until they reach it, is, since the consolidation of
the Pacific and Atlantic with the Western Union lines,
without telegraphic competition. This company has
met with many obstacles and hindrances, but its lines
are steadily if not rapidly advancing, and the company
seems to be on a very fair and solid basis.

An Excess of Telegraphic Labor.

THE fact is patent to all who are familiar with tele-
graphy in this country, that at the present time the
supply of operators, good, bad and indifferent, is in
excess of the demand. We do not mean to be under-
stood that there is an excess of really first class opera-
tors, of such there is never an over supply. But, tak-
ing the fraternity as a whole, there are too many of
them seeking employment. Any check to telegraphic
development and extension, such as has been ex-
perienced during the last year, of course limits the
demand for telegraphers. Besides this, there has been
for two or three years past a very constant and numer-
ous addition to the ranks. In addition to those who
are constantly being inducted into the business through
the thousands of telegraph offices throughout the coun-
try, the so-called telegraph institutes, schools and col-
leges, through their specious and lying circulars, are
constantly attracting a large number who are led to
believe that a few weeks' or months' practice and train-
ing, such as they afford, will enable any person to at
once secure pleasant, easy and lucrative telegraphic
situations.

A correspondent in Philadelphia, whose communica-
tion we print this week, instances one such establish-

ment there which is doing a large business and proposes to turn out 200 plugs per annum. There are many others in different parts of the country, and although but a small proportion of their so-called graduates succeed in permanently obtaining situations, yet they and to the pressure upon the market for such labor, and have an influence in depressing the compensation of those who are more competent.

We must confess that it is much easier to indicate the existing condition of things than to suggest a remedy. It is evident that no amount of exposure of these so-called telegraph schools has any appreciable effect in diminishing the number of their victims. The fact is that those who patronize them do not see THE TELEGRAPHER, and as a general thing have but little acquaintance with telegraphers. They credit the lying statements in the circulars, invest their money and time before investigating the actual conditions. A "Professorship" in a telegraph college is the resource of many incompetent and broken down telegraphers who have failed to obtain an honest livelihood by the practice of the art.

As to the number who are constantly being learned in the telegraph offices, we see no way to limit them either. Almost every manager or operator has his friends whom he proceeds to induct into the profession, or takes a student to relieve him of a portion of his duties and labors. Human nature is the same all the world over.

In addition to the other supposed inducements for engaging in telegraphic pursuits, there is a fascination about it for many young people which powerfully attracts them towards it. This fascination it is true is generally cured when it is found that the business is a laborious and not excessively remunerated one, but by that time the late enthusiast has become one of the fraternity and has come to regard it as his means of livelihood.

It is true that the ranks are constantly being depleted by the abandonment of the business by telegraphers for other employments, but unfortunately a majority of those who thus transfer their services are of the better class of operators of whom it has been stated there is no surplus. They are driven out by the pressure of the crowd who are constantly seeking employment, and who can usually obtain better compensation as telegraphers than their ability and efficiency would secure them in any other line of business. As an inferior will invariably and inevitably drive out of circulation a superior currency, so too often is it the case, that the less competent so reduce the standard of telegraphic compensation, as to drive out of the business many of those of more ability and better qualified to discharge its duties.

The above we consider to be a fair statement of the present conditions. Can any of our correspondents suggest a practical and effective remedy?

Personals.

THE address of Mr. CHARLES MAYNE is desired. When last heard of he was in Illinois. Any one who knows his present address is requested to communicate it to Mr. CLIFF E. MAYNE, Western Union Telegraph, Cromwell, Iowa.

Mr. VIC. ALBITZ has been appointed night operator in the superintendent's office, Clarksville division, L. & N. & G. S. R. R., vice Mr. F. H. BRITTON, removed.

Mr. W. L. WILLIAMS has been transferred from Stewart, Tenn., to Tenn. River, Tenn., L. & N. & G. S. R. R., vice Mr. L. L. CRIDER, removed.

Mr. C. H. HALL has been appointed operator at Stewart, Tenn., L. & N. & G. S. R. R.

Mr. FRANK KING, operator at Guthrie, Ky., and Mr. G. E. BREED, operator at Paris, Tenn., L. & N. & G. S. R. R., have exchanged places.

Mr. C. O. PIERSON has been appointed night operator at Paris, Tenn., L. & N. & G. S. R. R.

Mr. CHARLES J. BARCLAY, formerly with the Pacific and Atlantic Telegraph Company at Pittsburg, Pa., has accepted a position with the Central R. R. of N. J., at Elizabeth, N. J.

Mr. H. C. HOPE, formerly with the P. & A. Tel. at Minneapolis, Minn., has accepted a position with the St. P. & S. C. and S. C. & St. P. R. Rds. at St. Paul, Minn.

Mr. D. D. KENNEDY, formerly report operator at Milwaukee, Wis., has just returned from Texas, where he has been for his health. He leaves next week on his way East.

The Telegraph.

By Cable.

UNTIMELY DEMISE OF THE LIGHT CABLE COMPANY.

LONDON, February 27.—The company which issued proposals a few weeks ago for laying a light telegraph cable between England and America has abandoned the enterprise, because of scanty support, and gives notice that the money deposited by subscribers to its stock will be returned on demand.

A New and More Commodious Western Union Office at Cincinnati.

THE Western Union Company have secured the large and well known building, corner of 4th and Vine streets, Cincinnati, Ohio, possession to be given May 1st. This is one of the most prominent locations in the city, and this move will, no doubt, give general satisfaction to the public, while the employees of the company are delighted with the prospects of the more commodious quarters promised. The building will not be occupied by the telegraph company before late in the summer, owing to the time required to make the necessary alterations and fitting up of so large an office.

Cable Communication between Jamaica and Porto Rico.

ADVICES from Kingston, Jamaica, of February 21st, state that the West India and Panama Telegraph Company have laid a second telegraph cable to Porto Rico from Jamaica; but this time by the south side to Ponce. There is no land line belonging to the company, and the Government refuses the use of the new line to the company. Messages, therefore, between Ponce and St. Juan travel in the mail bags, and cause a delay of thirty-six hours in the passage.

Foreign Telegraphic Notes.

ACCORDING to the official return of exports, the value of telegraphic wires and apparatus forwarded from the United Kingdom, for 1873, had increased from £405,318 in the previous year to £2,359,563.

The report of Hooper's Telegraph Works shows an available total of £35,519, and recommends a dividend of £1 per share, making 17½ per cent. for the year, and leaving £10,519 to be added to the reserve, thus raised to £26,214. The company are about to carry out a contract for a cable from the Cape via Natal and Mauritius to Aden.

The directors of the Telegraph Construction and Maintenance Company propose paying a dividend of 20 per cent. (£2 8s. per share), in addition to the interim dividend of 5 per cent. already paid, carrying forward about £19,000. At the corresponding period of last year the dividend was 24s. per share.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended February 7, was 293,990; an increase on the corresponding week of last year of 73,186.

Telegraphic and Electrical Brevities.

SUPERINTENDENT WALLICK, of W. U. Co. at Indianapolis, Indiana, has recently supplied Terre Haute office with a Calland main battery of 100 cells, and will shortly place a still larger one of the same kind at Evansville, Ind.

Coleman Wilson, the blonde of the Union Depot office at Indianapolis, has gone to Chicago to settle a difficulty with Mr. Summers, the electrician, but as Coleman had his hair cut just before starting, his friends need not be alarmed for his safety.

Annual Report of the Atlantic and Pacific Telegraph Company for 1873.

THE annual report to the stockholders of the Atlantic and Pacific Telegraph Co. for the year 1873 has been issued. The following is the report of the General Manager, Mr. E. D. L. Sweet, and the financial statement which is appended. It will be noticed that only the gross receipts of the company for 1873, are given, the accounts for that year not having been completed at the time of the annual meeting January 28, last:

ANNUAL REPORT OF THE EXECUTIVE MANAGER FOR YEAR ENDING DEC. 31ST, 1873.

To the President of the Atlantic and Pacific Telegraph Company.

SIR:—In accordance with the requirements of the Company, I beg to submit a brief report of what has been done in my department during the past year, with such information and explanations as seems to be desirable for your consideration at this time.

During the past year connection has been made with Oil City, Pa., by the erection of a wire upon our present poles from Cleveland to Oil City (139 miles). Ten miles of wire has been strung on our present poles from Sandusky to connect with a line to Put-in-Bay Island, Lake Erie. Further construction has been done at different points—principally at Albany (to avoid the necessity of a cable across the river); at Buffalo, Toledo and Detroit (for the purpose of connecting with the wires of Railway Companies); and at Chicago and other offices to enable the establishment of branch offices and connections with other companies; also, 403 miles of poles and wire line agreed to be purchased, which will give the Company 3,199½ miles of pole line and 7,680½ miles of wire.

The total receipts of the Company for the year, as you will see by the Treasurer's report, amount to \$372,627.81, being an increase over last year of \$32,504.49.

The number of messages sent and received during the year, exclusive of press and signal business, 933,850. This business, if done at the same tariff rates obtained on the business of last year (51 cents), would have yielded \$476,263.50. The total number of messages sent and received during the year, including press and signal business (25 words to each message), 1,093,350.

On the 1st day of February the tariff to California was reduced from \$5.00 for a message of ten words to \$2.50. The effect of this reduction, though large, was overcome during the first six months of the year, and the business showed an increase of net earnings over the same months in last year.

On the 1st day of July a further and general reduction of rates was made. It is believed, however, that this reduction would have been overcome, during the last six months of the year, by an increase of business but for the financial crisis in September, which almost wholly stopped the movement of produce at the time of the year when our receipts are usually the largest from that source, and no substantial relief was felt until very near the close of navigation.

Considering the reduction of rates in February and July, and for a time the almost total suspension of business, so far as transactions in stocks and produce were concerned, in the latter part of September and during the month of October, I think the company has every reason to be satisfied with the net results of the year as compared with that of 1872.

On the 1st of January the Pacific and Atlantic Telegraph Company ceased to do business as an independent company. Although the business interchanged with that company has amounted to a considerable sum per month, it is believed that the benefits derived from that connection will be almost wholly overcome by the increase of business coming to us between competing points which was previously divided, and when the value of territory opened to independent companies, by the extinction of the Pacific and Atlantic as a competing company is considered, it is believed that its loss to the independent system will ultimately prove a benefit.

The relations between the Atlantic and Pacific and Franklin Companies have been finally and fully settled, and the like harmonious relations with the Southern and Atlantic Company leaves the present independent companies unembarrassed, and with every encouragement to go on in the extension of their lines, until such an amount of territory is covered as will insure a complete success to the independent system of lines. In order to secure this success, however, the central portion and prominent objective points of the country must be covered. This is necessary for the enjoyment of a general business, as also for the establishment of a press service which may be relied upon for a large amount of business.

To complete such a system it will be necessary to reach New Orleans, Galveston, Louisville, Memphis, Nashville and St. Louis, which, with additional cross and lateral lines to be acquired generally without monied expense to the companies, will enable us to build up a business which cannot fail to yield a handsome profit.

Negotiations are in progress which it is believed will secure not only harmony and concert of action, so far as the erection of new lines are concerned, but also secure to the present companies' lines all the benefits of new and improved systems of telegraphing.

Since the last annual meeting of the company an Atlantic Cable Company has been organized in this country and in England. The requisite money has been obtained, and contracts with a responsible party, having ample facilities for its manufacture and for lay-

ing the same have been made, and it is expected that by the first of August next that the independent lines of this country will have a direct exclusive connection with Europe.

The text of a contract for exclusive connection and interchange of business between the Atlantic and Pacific and Franklin and the Cable Company has been written and substantially agreed upon between the negotiating parties, and is now the subject of executive consideration.

The want of such a connection with Europe has been one of the most serious drawbacks to the independent companies, both as regards general business and press service.

Taking everything into consideration, I feel warranted in saying that the promise of success in building up an independent system in this country has never been so flattering as at this moment.

Both of the companies under your charge are free from debt, with a surplus of capital in the treasury. Both have earned satisfactory profits during the past year, notwithstanding the embarrassments encountered.

Such a state of things has never existed in the history of any previous attempts to build up a competing telegraph system.

We have passed the point where all other attempts have failed, and it only remains to go forward with the same careful management that has characterized the past history of the companies during your official connection with them.

Very respectfully,

E. D. L. SWEET, Executive Manager.

January 27th, 1874.

200 offices with all necessary furniture, instruments and fixtures. The Company owns sufficient instruments, batteries, office wire, &c., to equip 250 offices. Stationery and general supplies sufficient for two months' use. Rights of Way and franchises in principal Cities and Towns in and from New York via Albany, Buffalo, Cleveland, Chicago, Omaha and on line of Union Pacific Railroad. A majority (5,100) of the shares of Capital Stock, and a controlling interest in the Franklin Telegraph Company.

FINANCES.

No notes, bonds, or floating debt. In 1872 the company declared a stock dividend, but has not paid any cash dividend, the surplus over all expenses earned each month for over two years past having been expended for additions to lines.

Gross receipts for year ending December 31st, 1872, consisting of	
Gross receipts for business.....	\$336,895 34
Premium on Gold...	3,054 33
Interest on deposits,	174 65
	<u>\$340,123 33</u>

Gross expenses for same term, consisting of Rents, Salaries, Messengers, Battery, Stationery, Repairs, and all classes of expense,	<u>292,720 55</u>
--	-------------------

Net Profit, 1872.....	\$47,402 77
-----------------------	-------------

NOTE.—The interest in Franklin Telegraph Company was acquired during the year 1873, and none of the profits accruing from the ownership of such interest appear in the foregoing exhibits of A. & P. Co.'s business.

The accounts of 1873 are not yet complete, but each month of the year shows a net profit over all expenses, notwithstanding that in February, 1873, the tariff from New York to San Francisco was reduced from \$5 to \$2.50 for ten words, and in July, 1873, large reductions in tariff were made over the entire lines of the company east of Chicago.

THE magnetic telegraph, whose early advocates were ridiculed as impracticables and visionaries, has achieved a success unparalleled in the world's history. Electricity and the telegraphic art are revolutionizing society, and are yet destined to a further development which will surprise even those most sanguine in regard to their future.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended January 20, 1874, and bearing that date.

No. 146,638.—FIRE ALARM TELEGRAPH. Lewis H. McCullough, Richmond, Ind., assignor of two thirds his right to Elwood Patterson and Isaac G. Dougan, same place. Application filed June 21, 1873.

Circuit ordinarily closed through main line and all the signal boxes. Starting any box breaks main line, cutting out all boxes beyond such box and establishing a short ground circuit.

1. In a fire alarm telegraph the combination of an earth for each signal box with an earth of the battery at the main station, substantially as and for the purposes set forth.
2. In a fire alarm telegraph the combination of the main line alarms, which when brought into action break the continuity of the main line, an earth for every alarm box, and an earth of the battery at the main station, substantially as specified.
3. The line wire metallicly connected with one end to the alarm, and with the other end to an insulated metallic plate *c*¹, in combination with the circuit breaker *c*² on the sliding rack *E*, which winds up the motor ground wire *k*, and a mechanism for closing and breaking the connection between the line wire and the ground wire.
4. The combination of the line wire connected to the alarm, as described, the sliding winding rack *E*, carrying the circuit breaker *c*², circuit disk *F* *f*¹, ground wire *k*, and spring *h* with or without the insulated disk *G*, substantially as set forth.

For the week ending January 27, 1874, and bearing that date.

No. 146,812.—TELEGRAPH SIGNAL BOX.—Thomas A. Edison, Newark, N. J., assignor to American District Telegraph Company, New York, N. Y. Application filed December 3, 1872.

Improvement on patent 129,526, for district alarm telegraphs. Contact springs made adjustable; sounding magnet unconfined.

1. The circuit springs *l n*, attached by slots and screws, so as to be adjustable in their length and power, as set forth in combination with the wheels *d e*, as specified.
2. The combination of the electro-magnet *m* beneath the clock-work, the adjusting armature-lever, screws 13 14 outside the clock-work, and the shaft 16, for adjusting the spring 15 above the lever and through the clock-plates *c c*, all arranged as and for the purposes set forth.

No. 146,953.—APPARATUS FOR LIGHTING GAS BY ELECTRICITY.—Adolph Theodor Smith, New York, N. Y. Application filed December 13, 1873.

Key making and breaking battery-circuit over gas tip is vibrated by a toothed segment attached to a hand-operated cock.

1. The toothed segment *b* and cam *g*, in combination with the gas-cock *D*, vibrating key *E*, dog *h*, tip *e*, gas-burner *A*, and point *a*, all combined and operating substantially in the manner herein shown and described.
2. The combination of a toothed segment, *b*, with a gas-cock *D*, key *E*, tip *e*, gas-burner *A*, and point *a*, substantially as set forth.

Died.

FIRMAN.—At Chicago, Ill., February 26, 1874, HORACE L. FIRMAN, aged 12 years, the eldest son of Mr. L. B. Firman, General manager of the American District Telegraph Company of that city.

PORTER.—On Sunday, February 22, 1873, at Albion, N. Y., after a protracted illness, SAMUEL PORTER, one of the early pioneers in telegraphy in this country, aged 55 years.

Obituary.

SAMUEL PORTER.

The death of Mr. SAMUEL PORTER, which occurred at Albion, N. Y., February 22, again impresses upon us the fact that, one by one, the early pioneers in telegraphy in this country are rapidly passing away, and that a new generation is taking their places. We have known Mr. Porter for many years, and well recollect the time when he was as well and generally known in telegraphic circles, as those who are to-day recognized as leading telegraphic managers.

The introduction of the deceased into the telegraph business occurred originally from his association with the late Professor Morse, with whom he became acquainted from having been employed as a clerk in the office of the New York Observer. Through this acquaintance he became very much interested in the invention of the magnetic telegraph, then being perfected, often assisting Prof. Morse in his investigations and experiments. Naturally, from the interest thus awakened, he engaged in telegraphy as a business immediately after the experimental line between Baltimore and Washington was constructed in 1844. In 1845 this line was extended to New York, and it was not long before the telegraph wires were extended to Albany and Buffalo, N. Y. After assisting in constructing and operating the line through the State, Mr. PORTER engaged in the construction of the Buffalo and Toronto line, he being the first to stretch a telegraphic wire across the Niagara river, which was done in 1846. He also was engaged in extending the wires across the St. Lawrence river into Montreal.

We have not the space to follow him through his telegraphic career in detail, but, as will be known to many of our older telegraphic readers, he was subsequently prominently engaged in the construction, opening, and management of telegraph lines in the Northern and Western States. Becoming interested in the Printing Telegraph invention and improvement of Professor ROYAL E. HOUSE, he for some time held the position of Superintendent and Manager of the New York, Albany and Buffalo House line. Subsequently, in 1852, he originated the project of a marine line between this city and Sandy Hook.

He was engaged also in the construction of the first competing telegraph line, under the United States Telegraph Company, from Chicago to Omaha, St. Paul, and other important points in the West.

During the later years of his life Mr. PORTER's health was evidently giving way, and two years ago, after opening telegraph offices along the Buffalo, New York, and Philadelphia Railroad, and getting the line into successful operation, he was obliged to resign his position, and from that time has been gradually failing, and unable to attend to business.

Mr. PORTER had many friends among the telegraphic fraternity, with whom for so many years he was intimately associated, and although of late years not prominently connected with telegraphic enterprises, he will long be remembered as one of those by whose personal exertions, talent and enterprise, the magnetic telegraph in this country became an established institution, and entered upon that process of development, the end and extent of which cannot even now be foreseen.

At length his earthly labors and trials are over, and he sleeps quietly and peacefully in the grave, which is to us all, sooner or later, the final termination, however earnestly and faithfully we may strive during the brief years which are granted to us here. His mortal remains were taken to Geneva, N. Y., and deposited with those of his kindred.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for sale by

WATTS & CO.,

47 HOLLIDAY ST., BALTIMORE.

OUR ILLUSTRATED CATALOGUE NOW READY.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.
Acknowledged to be a decided improvement.
Price, same as the ordinary key.
Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25. On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System
OF
FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

C **CHARLES T. CHESTER,**
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.

For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,

No. 50 BROAD STREET (Rooms 12, 13 & 14).

P. O. BOX 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, steel, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time insuring

EFFICIENCY AND RELIABILITY.

Address—

American Compound Telegraph Wire Co.,

ALANSON GARY, Treasurer,

No. 234 West 29th St.,

New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
 RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

DR. L. BRADLEY,

No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch. The layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873:

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.

CAUTION.

All persons are hereby notified that Batteries infringing upon our patents are in the market (some of them nearly worthless). The public are warned against using any such infringements, as in every case the guilty parties will be prosecuted to the fullest extent of the law. The genuine Batteries have the words "Pile Leclanché" on the carbons and glasses. Any information concerning such infringements will be thankfully received by the

LECLANCHÉ BATTERY CO.,

No. 40 West 18th Street.

New York, October 11, 1873.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE AMATEUR'S
TELEGRAPH APPARATUS.

(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is Hill's Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished

- ONE CUP OF BATTERY,
 - TWO YARDS OFFICE WIRE,
 - ONE PACKAGE BLUE VITRIOL,
 - ONE PACKAGE SULPHATE ZINC,
- and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

COMPLETE OUTFIT, WITH BATTERY, CHEMICALS
AND MANUAL,
Seven Dollars.

Sounder and Key only..... 6 00
" " with Cut-out and Lightning Arrester... 7 00

SHAFFNER'S
TELEGRAPH MANUAL.

TO TELEGRAPHISTS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1869, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
78 and 80 Broadway,
NEW YORK.

(From *The Ghost*.)

Little Tip McClosky.

"You remember little old Tip McClosky? He passed through here yesterday *en route* to Mexico. He has grown old since I saw him before, and they tell me he is a 'little off' on his working, and that the nice copy he used to put up has got to be a trifle snid. Gin has been playing fast and loose with his nerves, I fancy, and his palmist days, telegraphically speaking, are over."

I extract the above from a private letter bearing the date of New Orleans, March 6th, 1874. So little Tip has come to the surface again, after all these months in which his friends have been wondering if he was alive! Of course I remember him. Everybody remembers him. Ten years ago it was no small affront to the telegraphic profession in general not to know Tip McClosky. Long before I had carried my last message and been promoted to the position of operator in a way office, I had learned the history of his achievements by heart. I should be almost ashamed to-day to tell you how much I revered that man long before I had ever seen him. No rapt listener to the enchanting stories of "Sinbad," "Aladdin," or any of the others with which Scherezade beguiled the Arabic ruler and his attendants through the fleeting hours of those one thousand and one nights, ever paid more faithful attention to the clever wife than I to those who made little Tip's the burden of their song. I installed him in my boyish heart as a man fit to rank with Aramis or Athos, with Porthos or D'Artagnan, and the genius of Dumas has not clothed the "Three Guardsmen" and their Gascon mate with braver laurels than those with which I crowned my hero, or attributed to them greater or more numerous virtues than those with which I formed a halo to crown Tip's curly head.

The worthy Mr. Tip was generally known as a man who never "broke," and he travelled, got trusted, borrowed money, and obtained new situations in spite of frequent dismissals, on this reputation. It was he who received Buchanan's message at Worcester, Mass. It came through a button repeater at Providence. Tip afterwards made his boast that he was the only man in the New England States who took the whole message without a "break," and I think he was. The auburn haired operator who copied the message at Providence said that Worcester was accidentally cut off in the middle of that official document for fifteen minutes, and if Tip got the whole message he of the carrotty scone was a clam, that's all. I will not discuss the merits of this difference of opinion; it is a trivial matter. In Atlanta, Ga., Tip made a wager that he could walk from his instrument to the outside door, where he was to be met by a boy from a neighboring restaurant with a gin sour on a waiter, drink the "medicine" and resume his work without interrupting the sender—and he did it. The Atlanta paper said, in an editorial paragraph, two days later: "Our article of yesterday on the indiscretions of J. C. Lamont would have been characterized by less spirit had we known him to be a relative of the late Henry Clay. The Associated Press despatch, on which our article was based, stated distinctly that Lamont was a nephew of old Dan Webster, of Massachusetts." The other papers in that locality, whose "press" was taken on the same wire, had it Henry Clay, but Tip's reputation saved him. There is no doubt in my mind that the rest of the men on that wire were a set of unmitigated plugs and guessers. Tip worked the old National wire at New York in 1863. This was a great circuit in its day, and the amount of business sent *via* Pittsburg was enormous. Owing to an inordinate appetite for dramatic performances, he whiled the most of his evenings away at the Bowery Theatre, and because of this, and a habit of indulging in "revelry by night," after the entertainment, it was usually late before he sought his couch. As sleepiness is a natural sequence of unrest, and as ten or fifteen "horns" of beer a day do not conduce to wakefulness under these circumstances, Tip was generally drowsy, and whenever he was "clear" he laid his head upon the table and went to sleep. The office boys, by whom he was regarded as a sort of demigod, manifested their interest in his welfare by always being on the alert for calls. When they heard Pittsburg calling they aroused Tip from his slumber.

He would open the key, stare about sleepily for a moment, and then command his friend at "G" to "let 'em come and cut 'em all to bits." Then, to the admiration of all about, he would sit and copy message after message in a beautifully flowing chirography, oftentimes carrying on a lively conversation with his companions. And he *didn't* "break" in *seventeen months*. But there were bigoted citizens of New York who conspired against him. One illustration will suffice:

Dr. Janvier received a message from his wife stating that "Mr. Sage has caved and is satisfied." Now, I maintain that if Mr. Sage had caved he *ought* to have been satisfied. But not so with Janvier. He demanded a repetition, and the telegram read "Message received and is satisfactory." I have no patience with your modern Galens, and I never doubted for a moment that Janvier was prejudiced. The occasion of the memorable Army of the Republic celebration in Boston, in 1868, found Tip a night report operator at Titusville, Pa. It was on that night he demonstrated to a coterie of friends the feasibility of reciting "Casabianca" and receiving "press" simultaneously. The next morning the *Journal* announced in its telegraphic columns that "Post No. 1 was commanded by an Irishman from New Bedford;" and the New Bedford *Standard* hastened, a day or two later, to copy the despatch, and explain that Post No. 1 was really commanded by A. N. Cushman, from New Bedford. It added, moreover, that Mr. Cushman was less of a Milesian than the telegrapher. This was evidently a fling at Tip's nationality, and I have never ceased to despise the carping nature of a newspaper that would make such an observation.

When the Pacific Railroad was opened Tip and Jim Lawless joined the numerous company who, pinning their faith on the star of empire, followed it across the Missouri, through the land of sage brush and alkali, and beyond the snow capped heights of the Sierras. I never heard of McClosky but twice during his whole Western tour, and his sojourning on the Pacific coast. He was put off a train, and came sauntering into the office at Wasatch, in Utah, one morning, and depositing an old enamelled cloth satchel, tied up with a piece of line wire, on the counter, he said to the operator: "Just you keep your eye skinned for that trunk, George, and I'll go out and lie down." The satchel was empty; that was obvious on the first glance. The operator tossed it on an adjacent shelf and went about his business. The budding season ripened into glorious summer, those delicious days when the sun is up early and goes not down till late, came and went, but Tip came not. One afternoon, however, when the grain and fruits were bending with their wealth, and all nature had grown magnificent in her abundant harvest, he swaggered jauntily from an eastern bound train, and called for his satchel with an air indicating that his absence had merely extended over an hour or two. He had not improved in personal appearance in the interval. A red shirt, a pair of jean pantaloons, an old felt hat and a suspender, long separated from its mate, constituted what

"Pledges of our fallen state"

adorned his person. He had been "down to Frisco," he said, "and had seen trouble." Slowly he unwound the line wire from his unique trunk, cautiously he opened its widely gaping mouth, then plunging in his hand and feeling all around, he observed with considerable emphasis: "I should like to know the name of the black hearted Mormon who went through me for that red velvet vest." It was not without difficulty that he was persuaded to quit Wasatch; and when he did shake the dust of that polygamous section from his honest skirts, he mentioned privately to the train despatcher, as the train glided haughtily away, "that probably he would find that 'cylinder escapement' vest in Omaha." But my correspondent makes no mention of his wearing in New Orleans a garment resembling the ruby wine, so I fear he never found it. Perhaps he goes now to seek it in the laud of the Montezumas.

JOHN OAKUM.

Launch of the Cable Ship Faraday.

THE new cable steamship *Faraday*, which has been built by Messrs. C. Mitchell & Co., Newcastle, for the Messrs. Siemens Brothers, for the purpose of laying their Atlantic cable, was launched on the 17th of February last. The occasion seemed to be one of considerable interest. There was a large concourse of spectators, and lady and gentlemen visitors were present from all parts of the district. The launch was of the most successful character, everything passing off without a hitch. Half past three o'clock was the time fixed, and shortly after that hour the signal was given. Imperceptibly, almost, the vessel began to slip from the ways, and as her bow left the gangway occupied by Mrs. Siemens, of London, and a party of friends, she was named the "*Faraday*" by that lady, who completed the ceremony by sacrificing the customary bottle of wine. The giant structure slid gently down the incline, and dipped easily into the water amidst the cheers of the sightseers. By means of an immense ca-

ble chain, attached to anchors firmly embedded in the ground, she was brought up in midchannel, and was quickly taken in hand by a number of active little tugs and towed up the river. The vessel has been built to the order of Messrs. Siemens Brothers, London, for the purpose of laying their Atlantic cables, and in every requisite the ship is certainly one of the most perfect of its kind. The steamer is 360 feet long, 52 feet beam and 36 feet deep. Her gross register tonnage is about 5,000, and her dead carrying weight about 6,000 tons. The iron hull, built under the inspection of Lloyds' agents, will be accorded the highest certificate of classification. From her peculiar structure the vessel receives enormous strength, in addition to the usual requirements of Lloyds' rules. Supporting the sides of the vessel are three enormous cable tanks, constructed of plate iron, and forming a series of double arches. These are united together, and attached to the general fabric of the vessel by five iron decks. For the comfort and convenience of those on board, the upper and main decks are supplemented by the usual decks of wood. The *Faraday* is double bottomed, and in the space below the two bottoms is a network of iron girders for carrying the cable tanks, and these give also a longitudinal strength to that portion of the hull. Water ballast is also carried in this space, by which the ship may be trimmed as the paying out of the cable is carried on. This arrangement has likewise the advantage of dispensing with cargo or other dead weight beyond fuel. For the purpose of filling and emptying any single compartment of the double bottom, or for flooding any one of the cable tanks, a complete and well devised system of valves, cocks, pipes, and auxiliary engine power has been introduced, and the "system," which is worked from the engine room, is under the control of the engineers. The bow and stern of the vessel is of the same form, and in this respect she is unlike other vessels in outward appearance. Rudders are provided at each end, and she can thus be navigated ahead or astern, as may be desired, when "paying out" or picking up a cable. Each rudder, to provide against accident, is supplied with strong screw steering gear, worked in the usual manner by manual power, and the steering is accomplished by means of a steam engine placed amidships. Harfield's steam windlass works the anchors and cable chains, and steam apparatus, placed in various positions along the deck, performs all the heavy labor about the vessel. The rigging is after the most approved manner of ocean steamers, and the accommodation provided is of the most complete nature for the large staff of officers, electricians and crew, numbering about 150 persons. In addition to the multifarious appliances of a cable ship, the vessel will be fitted up with all the cabins and appliances of a large passenger steamer, and will be propelled by machinery of the compound surface condensing principle, which has been constructed by Messrs. T. Clark and Co., of Newcastle. To obtain increased steering or manœuvring power—an important condition in cable laying—the steamer will be provided with two propellers, commonly termed "twin screws," which will be worked by two separate sets of engines, placed vertically over the shaft, with two cylinders, one at high and the other at low pressure. By this means great regularity of motion will be obtained, and by a high degree of "expansion" in working the "system," fuel will be greatly economized, to an extent that would have been considered impracticable a few years ago. The deck machinery for the "paying out" of the cable is being manufactured by the Vulcau Foundry Company, who are experienced in this branch of work. It is needless to say that the *Faraday* has been called after the great English chemist and natural philosopher of that name.

The first employment of this new steamship will be to lay the United States cable for the Direct United States Cable Company. The launch was celebrated by a dinner in the evening, which was very elegantly served in the Assembly Rooms. A brilliant company sat down to the repast.

The Eastern Telegraph Company.

THE ordinary half yearly meeting of the Eastern Telegraph Company was held at the Causton Street Hotel, London, on Tuesday, January 26th. In moving the adoption of the directors' report of the accounts, the chairman, Mr. John Pender, M. P., referred to the negotiations with the Indo-European Telegraph Company for the bringing about of a joint purse arrangement (which would save the expense of duplicating the Red Sea line), he said that the Indo-European Company had met this company in a very fair spirit; but the Governments of Russia and Prussia were largely interested in that company, and, through the exertions of one of the principal shareholders in the Indo-European Company, and the contractors for maintaining the line, he was afraid that, for the moment, the negotiations were not likely to be brought to a successful conclusion. The directors hoped that eventually some arrangement would be carried out. The Levant system had been completed. There was only one hitch

at the present moment; this company had got a cable laying expedition at Alexandria, which was sealed up by the Egyptian Government until the settlement of some little misunderstanding which existed between the Egyptian Government and this company, with respect to the reading of a certain concession from the Egyptian Government. He was hopeful that in a very short time that misunderstanding would be settled. He could only repeat what he had stated on former occasions, namely, that telegraphy once commenced must grow. Telegraphy was still in its infancy. He pointed out that every day would increase the value of telegraphic property, inasmuch as science had now found the means of sending a much larger number of words in the same time; and he also mentioned the important fact that in submarine cables they were now able to telegraph messages from both ends simultaneously.

A Bewildered Father.

GILLINGHAM was in Williamsport the other day, and while attending to his business there he had a strong premonition that something was the matter at home; so, in order to satisfy himself, he determined to run down to Philadelphia in the next train. In the meantime his mother-in-law sent him a despatch to this effect: "Another daughter has just arrived. Hannah is poorly. Come home at once."

The lines were down, however, and the despatch was held over, and meanwhile Gillingham arrived home and found his wife doing pretty well, and the nurse fumbling around with an infant a day old. After staying twenty-four hours, and finding that everybody was tolerably comfortable, he returned to Williamsport without anything being said about the despatch, his mother-in-law supposing, of course, that he had received it. The day after his arrival the lines were fixed, and that night he received a despatch from the telegraph office dated that very day, and conveying the following intelligence:

"Another daughter has just arrived. Hannah is poorly. Come home at once." Gillingham was amazed and bewildered. He could not understand it. Daughters appeared to him to be getting entirely too thick. He walked the floor of his room all night trying to get the hang of the thing, and the more he considered the subject the more he became alarmed at the extraordinary occurrence. He took the early train for the city, and during the journey was in a condition of frantic bewilderment.

When he arrived he jumped into a cab, drove furiously to the house, and scared his mother-in-law into convulsions by rushing in in a frenzy and demanding what on earth had happened. He was greatly relieved to find that there were no twins in the nursery, and to learn how the mistake occurred; but he is looking now for the telegraph operator who changed the date of that despatch. Gillingham is anxious to meet him. He wants to see him about something.—*Max Adeler.*

The Chicago Western Union Female Operators.

UNDER the heading of "Meanderings Among the Maidens," *The Fraternity*, the new telegraphic journal published in Chicago, thus pleasantly discourses of the female operators employed in the Western Union service in that city:

"Not last (and by no means least) in our mention of Chicago operators should be that of the ladies. Of this class of talent we have at present some ten or twelve representatives, and they alone constitute no small portion of the attractions of the office. Although graduates from no particular school of telegraphy, they are, for the most part, masters (?) of the art; the majority of them working city wires, over which, at the lowest calculation, one half of the local business of the company passes *en route* to its destination.

"Strolling through the office in the discharge of our reportorial duties, we notice on the St. Louis circuit Miss Lizzie Veazey. Two years ago this lady was comparatively an inferior operator; to-day she works a wire the standing of which (excepting, of course, the heavier Eastern circuits) is second to none in the office. Some conception of the amount of business passing over this line may be formed from the statement that very frequently the total on both sides of the St. Louis 'slip' exceeds five hundred; and this business is all transacted in a style unattainable by many of her collaborators of the masculine gender."

"On the South Water street wire we find Miss Alice C. Nute. This wire is undoubtedly one of the heaviest in the office transacting metropolitan business; and here the work is done in a manner at which none need complain.

"Miss Ida Snell presides gracefully over Metropolitan No. 2; a wire doing business chiefly with the American District Company's offices, of which there are quite a number on this circuit. At the key Miss S. is *au fait*.

"Miss Jennie Harding, on Lake Shore No. 4, gives complete satisfaction. There is considerable business

transacted on this line, and the skill with which it is handled reflects great credit upon the lady above mentioned.

"In the assignment of Miss M. L. Russell to the Clinton wire the company must have studied their own interests, as well as the comfort of the numerous offices on this circuit.

"Michigan Central No. 2 we find in charge of Miss J. E. Phelps, an accomplished operator of some years' experience. To find business on these hooks when the wire is in working order is a thing of rare occurrence.

"On Illinois Central No. 1 we observe Mrs. Tillotson, a lady of long experience in telegraphing, and one to whom the fatigue connected therewith is very slight.

"The appointment of Mrs. A. O'Connor to the Dauphin wire was undoubtedly a wise one. The business here is considerable, and is executed in the highest style.

"Miss A. J. Fox and Miss Susie Musgrove, on Metropolitan Nos. 1 and 7, respectively, give the most complete satisfaction. Their duties are somewhat arduous, yet performed as only good lady operators can perform them.

"The business on Metropolitan No. 6 has the rare good fortune to be under the immediate supervision of Miss Lillie Smithells. She certainly knows how to do it, and do it as it should be done.

"Among the number recently added to the operating force it gives us pleasure to notice Miss Annie F. Veazey. Notwithstanding her youth she is by no means a novice in telegraphing; and, if our prognostications prove themselves correct, she is destined, at no distant future day, to occupy an enviable position."

A Cable Company in Chancery.

A REMARKABLE instance has been afforded during the week of the ruinous cost of the process of winding up joint stock companies. One of the many schemes which have been put forward from time to time, for providing independent telegraphic communication with America, was "The British and American Telegraph Company." At the time for the order for the winding up of the company, six years since, the whole of the debts, including £7,000 to the promoter, were £10,500. The liquidation costs had been £2,900, and of the solicitor engaged in the winding up £3,850. The Vice-Chancellor remarked upon these facts that he was perfectly astonished to hear that the winding up of this company—the *bona fide* subscribed capital of which was only £4,500, and the legitimate debts of which were under £4,000—had cost no less than £6,750.

Apart from the costly process of winding up joint stock companies, it is not encouraging to promoters of new telegraph lines to find that, with scarcely an exception, shareholders of every new company that has been promoted for Atlantic cables, have had either to pass through this ordeal, or to endure the mortification of finding their shares unsaleable, or at a very heavy discount. The application made to the Vice-Chancellor in the case of the British United American Telegraph Company, was to compel the directors to refund to the shareholders the sum of about £25,000, alleged to have been lost to the company through a breach of trust committed by them in entering into fictitious transactions, for the purpose of obtaining a settling day for the shares of the company. The promoter of the company, it appears, claimed £7,000 for his services in connection with floating the concern. This claim has been compromised; but the Vice-Chancellor expressed his opinion that, under the circumstances, "the claim was an improper one, and ought never to have been sanctioned."

With respect to the light cable, the prospectus of which was referred to by us in our last, some further correspondence has taken place during the week. Sir James Anderson, who has had practical experience in laying and in fishing up cables in the Atlantic, states that he is in communication with the most distinguished electricians, who state that the proposed cable offers no advantages in signaling which the existing cables do not possess. He states that several light cables have already been laid and failed, and adds:

"Fifteen million pounds sterling at least have been expended by the British public to test this question; and it ought not to be expected that the same public will now be eager to offer more money to the same men, who have hitherto advised the existing type of cables, for the purpose of making an experiment for which they give no reasons. It is no longer a scientific speculation, but a matter of observation and actual handling of results."—*The Railway News.*

Why term the girls the "weaker sex?"
(A foul aspersion, foully made.)
Wait till they work the Stearns' Duplex;
We'll call them then the "sterner grade."

THE SWITCH.

Of all animals we dread a *bull* the most.

The Closing Days of The Pacific and Atlantic Company at Pittsburg, Pa.

NEW YORK, March 3.

TO THE EDITOR OF THE TELEGRAPHER.

I NOTICE a communication in your last issue in regard to the P. and A. "boys" of Pittsburg. I am not surprised to learn some of the "boys" got no work with the Western Union Company, knowing the way business was managed. When we heard the P. and A. Company was going where the "Woodbine twineth," and knew our "goose" was cooked, desiring to give the office a grand farewell, about one week before the office closed we decorated it with pine branches, and piled the chairs up so they touched the ceiling. Mr. Waters, manager, wishing to show his authority, etc., undertook to pull them down, when they all came on his head, lowering the crown of his high hat so that it cost him one dollar to have it repaired. The chairs falling on him held him in irons until he attracted the attention of people on the street, and they came in and relieved him from his "perilous" position. The "boys" raised a collection to have his hat repaired, but it was refused by Mr. Waters. I must say it was well the "boys" did get out of that old office when they did, or the "rats" would have carried some of them off, or they would have starved to death as they (the rats) took their lunches first every night. The night artists were allowed no extra time after two o'clock, and at twelve we would notify the different offices and make a march on the rats—get the heads of them and hang them on the "old man's desk," putting a notice on that we wished extra time for their heads. He only took it as a joke.

At Christmas we (the night artists) procured fire crackers, divided the force into sides and shot at each other until we had bought all the fire crackers that could be procured on Fifth Avenue. Some of the "boys" were absent the next day, giving as an excuse that they were sick. We were defeated the last night, as they moved the office a day earlier than we had expected, and we did not have the fun anticipated. While I was in the employ of that company I had a grand time. The managers, Mr. Hamilton and Mr. Prescott—the former day, latter night manager—were liked by all who worked in the office. I must now close with a few words to the men who were thrown out of work by Mr. Orton's letter, in which it was stated that we would all continue working for the Western Union Company, and then they only gave those that were thrown out a day's notice. I ask them never to enter into the service of the Western Union Company, as they treated them all too mean to ever have a favor done by any for them. H.

A Telegraphic Organization Essential to the Welfare of the Fraternity.

PHILADELPHIA, March 2.

TO THE EDITOR OF THE TELEGRAPHER.

THE article in your last issue signed "Don Juan" calls forth, for nearly the first time, a few feeble remarks from this section. The views entertained and the ideas expressed with reference to a Telegraphers' National Association, are so near in accordance with my own that I cannot refrain from giving vent to my feelings. That something of the kind at this present day is quite essential to the interests of telegraphers cannot be questioned. Not only will it serve to bring the operators into closer and more intimate relation with each other, but will (as "Don Juan" has so wisely remarked) protect them against the aggravated oppressions of petty employers. We do not wish to convey the idea that we would agitate and carry on strikes and all that sort of thing. No, we do not favor such moves, for we have learned by observation that in nine cases out of ten naught but evil results from them. We would have an easier and safer channel through which to protect ourselves than this. At the present time it seems to me that operators are working against each other instead of uniting together as we should. Had we an organization with unanimity of action, by which all could respond as the voice of one man, and each be brought to feel an interest in the welfare of his fellow operator as well as his own, we could go forth into the world with more pride in our occupation, and the insults and oppressions we are now compelled to endure would soon, and quite soon, be lessened.

I wish to disclose a few facts as they appear in their true light, by which the readers of THE TELEGRAPHER can form a faint idea how business is conducted on railroad telegraph lines. It should be, and I think is, as far as my experience has taught me, a rule with rail-

road companies to place operators in a line of promotion, and let them receive the same as soon as entitled to it, and as far as their qualification and merit will warrant; but on the line of some railroads there seems to be an entirely different system. Some time ago a man representing himself as E. S. H., *alias* something else, made application to the Superintendent of an important railroad line for a situation, and, to the certain knowledge of every one on the line, there was not a single vacancy of any kind; but he was one of those jolly, good natured sort of fellows—more so at certain times, perhaps, than others. One of those men that had been around considerable, and scoured more than twenty-nine different States in the Union, and a man that could hold more tanglefoot whiskey without spilling it than any one perhaps you ever saw. But a short sojourn in some of the Western States, where the women's temperance movement was being pretty vigorously pushed, had changed his views somewhat in regard to using it any more as a beverage; and having made this fact known, the Superintendent resolved to employ him, providing he was just as good as when they worked together in New York. A few moments in the operator's chair, and those gilt edged copies he turned out removed all doubt as to his ability. So he was employed to do nothing, at a salary of sixty dollars per month, and the Superintendent thought in a short time he could give him the general office as chief operator. Now all this time there were men on the line who had proven by their merit to be worthy and reliable, and who were kept working at salaries from thirty-five to fifty-five dollars per month. This star of the East continued to shine out brightly for a while, but at last it disappeared suddenly from our vision and was seen no more.

Another instance of a similar character occurred only a week or so ago.

The general office on this line became vacant, and, instead of promoting one of his own men to it, an entire stranger was employed—a man, perhaps, who had never heard of or knew there was such a line.

This will give a pretty correct idea of the manner in which business is conducted on that and some other roads. And yet with all this the Superintendent is an honorable man (?). When will such evils as this have an end?

Brothers, it remains for us to decide whether we will remain under bondage any longer or not. Let us arise from our lethargy and burst the bonds which so oppressingly bind us. To effect this we must work—work and faint not. Here is the point upon which our interests chiefly depend. The question now remains for us to answer, will we take such steps as are necessary to defend them or not? CROTZER.

The Telegraphs and Telegraphers of Washington Territory.

TENINO, WASHINGTON TERRITORY, Feb. 2.

TO THE EDITOR OF THE TELEGRAPHER.

THIS distant section of Uncle Sam's territory is connected by the wires of the Western Union Telegraph Company with Portland, Oregon, *via* Kalama and Tacoma, to Seattle, Washington Territory. At Seattle, the repeating is done for the Western Union line to Victoria, British Columbia, and also for the Puget Sound line. A branch line extends from Tenino to Olympia and Steilacoom, and a railroad telegraph line belonging to the Northern Pacific Railroad, extends from Kalama to Tacoma.

The timber generally is very dense, and tree falls and troublesome "grounds" are very frequent. The winter season is almost a continued drizzling rain—not cold nor very unpleasant, but "rough" on the wires.

As business does not keep the lines very busy we have plenty of time and opportunity to chat with each other over the wires, and nearly all the operators are personally acquainted, and all are on the best of terms with each other. The operators are a jolly, though very gentlemanly set of fellows; a force which any superintendent might feel honored to have under his charge.

The hard times affect us out here somewhat, but salaries on the railroad have not been reduced any as yet. Those, however, who were anticipating an advance now look upon such a thing as improbable. Mr. F. H. Lamb has been our Superintendent, but recently started for the East. Of courteous address and pleasant manners, he is a true gentleman, whom we disliked to part with. Superintendent Plummer, of the Oregon Division, who succeeds him, is said to be an efficient business man, whose *forte* is low wages and cutting expenses.

Mr. J. B. Whittlesey, one of the old timers, has been appointed railroad operator at Tacoma, the coming city.

Query? At the present rate of progress, how long before San Francisco becomes a suburb?

Your correspondent, Webfoot (an old personal friend), in company with Mr. Sheridan, of Albany, Oregon, W. U. office, paid us a flying visit a few weeks since.

I will crack a joke or two and then subside for the

present. Our worthy Superintendent is a star receiver, but his sending makes the shade of Morse quake in its quiet repose, if well meaning spirits are really cognizant of things sublunary.

He was sending slowly, and quite plainly for him, to "D," who did not know who it was. An impatient break and "Can't you write plain?" came in very indignant tones.

"I call that plain, and if you can't read it you had better wax your ears," was the response. Poor "D" subsided, while there was many a snicker behind the curtains, for how many had longed to say the same, but did not dare. We can't complain of F., though he did get "two good axes," "two foot axes." Guess it was H.'s sending.

"W." is generally there with O. K., but accidents will happen. In report he broke on: "She lost a hundred and four children," "g. a. lost." "Lost a husband an—" "Now stop this joking. Do you think a woman could lose a hundred and four children?" "She was a Mormon," chips in some reprobate.

How is it a man can't make a blunder but all hear, while ordinarily they do not listen. I know when first commencing to frighten Morse, the Superintendent told me I was worse than a wooden man. From the inquiries about that *chip*, I know every man on the line heard it.

It will sound better for some one else to relate my adventure with Miss Emma Lawrence. Probably Webfoot has already done so.

In a few months I will retire to the calm and rustic beauty of a farm in Iowa, and instead of rasping others' nerves with my lightning jerking, will reap turnips, plough wheat and thresh potatoes in quiet, under my own sunflower and basswood tree.

Then will no more be heard the sig. on the line of H., No.

The Demise of the P. & A. Lines, and the Consequent Telegraph Changes.—The Telegraph School Swindle.

PHILADELPHIA, PA., Feb. 24.

TO THE EDITOR OF THE TELEGRAPHER.

I SHOULD have sent you some account of the changes which have taken place in telegraphic arrangements consequent upon the absorption of the Pacific and Atlantic wires into the main office of the great telegraph corporation, the Western Union Telegraph Company, on the corner of Third and Chestnut streets, but for the fact that my time has been so fully occupied.

The main office of the Pacific and Atlantic Company, which has been so long located at No. 303 Chestnut street, was finally closed up on and after the 1st of January, the wires taken into the Western Union office, and the competing company, which at one time was so baughty and self-sufficient in its management, and from which so much was anticipated in its earlier days, ceased to exist as a practical telegraphic organization. It was high time that something was done with this concern, as latterly, during its existence, it was a miserable apology for a telegraph company.

Feeble and impecunious through bad management, and the impracticable character of those who were supposed to control it, it had become a telegraphic nuisance, and the sooner it was out of the way the better.

The operators formerly in the employ of the P. and A. Company, with the exception of four, were given positions with the Western Union Company. Mr. J. M. Sailer, the receiver at 303 Chestnut street, has been employed as receiver for the Franklin Company, at the main office on the northeast corner of Third and Chestnut streets. Mr. R. J. Wynne, formerly chief operator of the P. and A., has been employed as operator by the Franklin Co.; and Mr. W. J. Burt has accepted a position as operator at the Philadelphia, Reading and Pottsville Company's branch office.

The closing up of the P. and A. office has given considerable strength to the Franklin lines, and a prosperous future may be predicted for the latter company.

The patrons of the telegraph in this city are very much displeased with an order just issued by the Western Union Company, to the effect that persons doing business with them, and not having *charged* accounts, shall be required to pay cash for any night or half rate messages they may desire to send.

The Philadelphia, Reading and Pottsville Telegraph Company, which occupied the office 303 Chestnut street jointly with the P. and A. Co., have moved their wires formerly connecting with the latter company into that of the Franklin Company on the northeast corner of Third and Chestnut streets, until the completion of the new office which is being prepared for them, and which is expected to be ready about the middle of March.

The Automatic Telegraph Company have rented the basement floor of the new building No. 310 Chestnut street, and moved into their new quarters on the 10th instant. This company is doing quite a good share of

the business, their rates being 25 cents for twenty words. The inquiry is frequently made for "the company that sends twenty words for a quarter."

There is a plug factory in full blast here, which does business on a large scale, and promises to turn out two operators (?) a year. Notwithstanding that the fact is well known that there is now a surplus of operators, which is not likely to be diminished for some time to come, these so-called telegraph schools, institutes and colleges succeed in deluding many unsophisticated victims into believing that they have only to go through their mill to insure them speedy, pleasant and profitable employment! Verily, the fools are not all dead yet, as these novices find out when their money is spent, and they seek to turn their dearly bought instruction to advantage. W.

Nettie Bronson and "The Telegrapher" Correspondents.

TO THE EDITOR OF THE TELEGRAPHER.

IT pleased me so much when I read that communication from "Elias." The idea! to think that I am an old maid of thirty-five, and must be wanting to get married! If I was as old as that no doubt but what I should be looking around for a man. But, if you please, "Elias," I would never hunt for a husband through the columns of a paper. I don't think one who considers herself a lady would wish to correspond with a married man. This city has plenty of young men, and good ones too, without going further for them.

I did not intend to give any one the thought when I wrote that article of January 24th that I wished any person to send me the paper. I thank "Elias" for his kindness in wanting me to receive the paper, and that he would be one of the donors; but a thousand thanks to "Silver State," who sent two dollars to renew my subscription. I am very glad that I am again able to peruse its interesting columns, and shall welcome it each week—often thinking of the generosity of "Silver State."

I am sorry that "Jennie" has given up the idea of obtaining my address. Would gladly answer her letters, and am not at all partial to the male sex in regard to correspondence. NETTIE BRONSON.

A Scientific and Practical Problem.

TO THE EDITOR OF THE TELEGRAPHER.

WILL C. C. H. and other eminent electricians consider this worth their attention? Cannot relays be made with extra coils removable at pleasure, that the operator may have instruments of large or small resistance, according to condition of the line to be worked? H. No.

"Agitator" Snubbed.

TO THE EDITOR OF THE TELEGRAPHER.

KINDLY request your correspondent, "Agitator," to view himself in a mirror. He will certainly see two elongated auriform appendages on the sides of his head. SOOTHER.

A Good Hit.

SCENE—Near switch board; time, 12.30 P. M.

Dramatis Personæ—Chief Operator and Night Man.

C. O.—"Who cut out last night?"
N. M.—"I suppose I did."
C. O.—"At what time?"
N. M.—"When I got 30."
C. O.—"Well, you left two lines open by putting the plugs in the wrong places."
N. M.—"Oh, I have often seen plugs where they shouldn't be."

The Pima Indians and the Telegraph.

CAPTAIN PRICE tells a good story about the Pima Indians and the Arizona Telegraph. The line runs directly through the villages of the Pimas, passing over their houses. It appears that these well disposed Indians have suffered in their farming operations for want of rain, and in some way they became possessed of the notion that the telegraph wire was a mysterious device of the Americans to bring rain, and watched its building with corresponding satisfaction. Sure enough, bountiful rains descended soon after the completion of the line, and the Pimas were happy. But the heavy storm in the latter part of January was too much for them, and the floods threatened to drown them out. The obvious remedy was to pull down the wires and stop the rain, and the Indians, with the best intentions in the world, proceeded to apply it. Sure enough, the storm ceased just at that time, and this served to confirm the innocent people in their idea of the use of the telegraph. Capt. Price says it was useless to try to explain the matter, or reason with them; and it required some pretty sharp talk to the head men to make them understand that their people must let the wire alone.—*The San Diego (Cal.) Union.*

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, MARCH 14, 1874.

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,
AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE
AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

(P. O. Box 5503.) NEW YORK.

The Demand for The Telegrapher.—Back Numbers Wanted.

We have endeavored to print enough of each number of the present volume of THE TELEGRAPHER to supply all who may wish to commence the volume with the back numbers through the year, and supposed we had done so. It turns out, however, that the demand has been so much in excess of our calculation that one number is entirely exhausted and another nearly so. Of the rest we have a pretty good supply. It sometimes happens that the demand for certain numbers will be unexpectedly large, and the consequence is that the ordinary edition, or that which had been printed in anticipation of such demand, is insufficient. We are entirely out of No. 391, for January 10, and nearly out of No. 392, for January 17, of the current volume. Our friends who may have copies of either or both these numbers on hand, which they do not care to retain, will confer a very great favor upon us if they will return them to this office, and one which will be gratefully appreciated.

The Present Condition of Telegraphs, Telegraphers and Telegraphic Service.

THE existing condition of the telegraphs, telegraphers and the telegraphic service in this country, and their relations one to the other, deserves, and should receive careful consideration from all who are interested therein. In the last number of THE TELEGRAPHER we spoke of the telegraphic projects at home and abroad, and in another article gave some facts in regard to the excess of telegraphic labor at the present time over the demand, which leads us naturally and logically to the further consideration of the subject which we propose to briefly discuss in the present article.

As has already been shown, the telegraph business at the present time is passing through a season of dulness and depression such as it has not experienced for many years. This arises, of course, from the depression which exists in business generally, and the hesitancy of people to engage in active and extensive business operations while doubt and uncertainty continue as to the financial policy of the future. The panic of last fall, and the losses and suffering which have resulted from it, have made capitalists and business men cautious and economical, and the anticipations of a speedy revival of business generally have not, as yet, been realized. There is a disinclination especially to engage in new enterprises, which involve the investment of a considerable amount of capital, and business men are inclined to wait further developments before making any important move in any direction. Money at the financial centres is in excessive supply, and seeking employment at almost nominal rates, and large amounts are practically lying idle in this city, which ordinarily would stimulate enterprise and speculation. It is not so at the present time, however, and the telegraph business is depressed in consequence.

How long this condition of things will continue it is, of course, impossible to predict. It does not seem probable, however, that it can continue for very long, but the present indications are that there will not be the ordinary amount of business doing the present season.

The effect upon the telegraphic fraternity is, of course, to reduce the demand for their services, and render it difficult to obtain situations by those who chance to be unemployed. We do not learn of any proposition for a reduction of compensation, and if the situation should become no worse, there is not likely to be any attempt to effect a general reduction. Telegraphers should pursue a conservative policy, and should not become impatient, even if they do not realize all their expectations and desires as regards situations and remuneration. They should do their duty cheerfully and faithfully, and await developments, as most others are now compelled to do. Nothing is to be gained by a contrary

course; and whatever may be the ills they now have to endure, they cannot be improved by flying to others that they know not of.

We do not write this on account of any manifestation of a disposition on the part of the fraternity to make antagonistic demonstrations. On the contrary, there has been very little indication of united or effective action on their part for a long time. It is true that our correspondents occasionally discuss the desirability and importance of a telegraphic association or organization, but the discussion does not seem to result in any very considerable movement of the telegraphic waters. We believe that such an association is desirable, and, properly organized and conducted, would be of great value and importance. That it will be effected in time we think probable, but for the present it may be considered as not likely to be brought about. In the meantime the continued discussion of the subject can do no harm, and in the columns of THE TELEGRAPHER the views of all parties may be presented for the consideration of the fraternity.

The condition of the telegraphic service has been pretty well indicated in what we have here set forth. It does not offer inducements at present for large accessions to the telegraphic ranks, and the deluded victims of the telegraph schools, so-called, which are already in existence, and which are springing up all over the country, are likely to find out the truth of the saying that "a fool and his (or her) money are soon parted." They are paying out their money for that which, even if it were what is promised them, would at the present time be of little value to them. When the supply of telegraphic labor is so much in excess of the demand it is the height of folly to still further crowd the ranks. We speak in this matter more in the interest of the victims of these plug factories than of the telegraphic fraternity, as so few of the former ever succeed in obtaining a foothold in the business, and those who do find it necessary to serve a second apprenticeship in a regular telegraph office before they become competent to discharge the duties of an operator.

Upon the whole, while we do not see any very special encouraging outlook in the immediate telegraphic future, we do not think that the present situation is likely to become permanent. There will be at no very distant day a revival of business, and telegraphy with the rest. We must wait patiently for the good time coming, and in the meantime, by economy, diligence, and faithfulness, make the best of things as they are.

Literature.

The International Review. March, 1874. New York: A. S. BARNES & Co.

THE March number of this review contains several articles of great value and interest upon current topics, among the most noticeable of which is a paper by Professor J. E. HILGARD, of the Coast Survey Service, upon the approaching transit of Venus, which will occur on the 8th of December, 1874. Professor HILGARD explains with great clearness the methods which are to be employed by the different observers stationed at various points in the southern hemisphere, by means of which the true distance between the earth and the sun will unquestionably be determined with far greater accuracy than has heretofore been possible. The importance of this determination arises from the fact that it is really our fundamental unit of measure for all the celestial spaces. As an illustration of the accuracy with which these measurements are carried out by modern observers and modern methods and apparatus, Professor HILGARD states that the polar diameter of the earth, of some 8,000 miles, is certainly known within a limit of error of thirty yards! A new method of measurement, far superior to any former one, will be employed on the present occasion—that of photographing the different stages of the phenomenon, and then making the measurements and calculations from the photographic plate itself. The paper is of great interest and will well repay perusal.

The Illustrated Annual of Phrenology and Physiognomy, 1874.
S. R. WELLS, New York.

This handsomely printed and beautifully illustrated annual fully maintains the well established reputation of its publisher. Every person will find something in its pages that will be of interest and benefit to them. It can truly be said of Mr. WELLS, that every publication issued by him is intended to make the world better, healthier and happier. We trust that the number of his readers may increase and multiply. The price of the annual is only twenty-five cents, and it is well worth the money.

Annual Announcement of Packard's Business College, 805 Broadway, New York. 1874.

The pamphlet announcements of educational institutions are usually very dry reading, but the present one is a conspicuous exception. Mr. PACKARD is one of the most intelligent, progressive and common sense men of whom we have any knowledge, and his "Business College" has, as a necessary consequence, become a distinguished success. We wish that every young man and young woman could have a copy of this pamphlet—probably Mr. PACKARD will send it on application—and read, mark, learn and inwardly digest the principles of business success contained in its pages, as expounded by Dr. BELLOWS, HORACE GREENE, PETER COOPER, ELIHU BURRITT, S. S. RANDALL, and many others—men who have been successful themselves, because they were honest, upright, industrious and energetic. No young person can read the addresses of these distinguished men, as given in this little volume, without feeling a renewed inspiration to be true to themselves and the right, as the only path to permanent success and happiness. In his address to the graduating class in 1872, ELIHU BURRITT said: "It is because I believe that this College teaches and promotes this higher law of commerce, that I have come from another State to testify to its value. If its aims, and ends, and influences were merely to issue in the training of young men in the adroit art of unscrupulous money making, I would not have gone ten rods to attend its anniversary."

A New Style of Telegraphic Journalism.

We have received copies of two papers which have been started by operators in the office of the Western Union Telegraph Company at Chicago, Ill., which inaugurate a new style of telegraphic journalism. One is entitled *The Switch*, and was the first to make its appearance, and the other *The Fraternity*. *The Switch* is a seven by twelve inch paper, and is published by Mr. WM. WALLACE, Jr., and we understand is to be edited by Mr. FRANCIS. Subscription, 40 cents per month. *The Fraternity* is somewhat more pretentious, being about twelve by nineteen inches in size, and bears the name of Mr. J. W. STRONG as editor and proprietor, and is published at 275 West Monroe street. The subscription price of the latter is put at \$2 per year; single copies ten cents.

These journals are local in their contents and make up, and we have no doubt but that they will for the time amuse those for whom they are designed. They do not aspire to a high standard of journalistic ability, and the contents are especially made up of personals and matters concerning the Western Union offices and employes in the city where they appear. They have inaugurated their enterprises with what appears to be a violent rivalry and antagonism, but this may be a shrewd but not novel dodge to excite an interest and induce a demand for the publications among their associates.

We understand that a similar publication has been commenced in this city, but have not, as yet, been favored with a copy. It is very probable that there may be an epidemic of this kind of telegraphic literature for a time, as every place of any considerable size can thus have its own telegraphic organ. They all have our best wishes for their success, but to attain it and make it permanent they will find that hard work, patience and perseverance will be requisite.

Elementary Principles of Electrical Measurement.

THE continuation of Mr. POPE's articles on the above subject has been unavoidably delayed in consequence of his absence from the city, but will probably be resumed in our next issue. We are receiving many letters testifying to the exceeding clearness and great theoretical and practical value of these papers, and although the author's business engagements are such as to render it impossible for him to furnish the articles with entire regularity at all times, yet it is not probable that any serious delay will occur in their publication. The revision of the matter and the preparation of the engravings renders the personal supervision of the author very desirable, if not absolutely indispensable, and it is for this reason that delays may occasionally happen in the publication of the series.

Brooks Insulators.

WE would invite the attention of telegraphic managers and superintendents to the advertisement of Mr. BROOKS, which appears in another column, and will be found interesting reading for practical telegraphers. So far as we can learn it is pronounced a practically perfect insulator by all of the hundreds that have used it during the past six years. The improvement of line insulation is the very foundation and corner stone of all progress in practical telegraphy, and the absurdity of our leading telegraph company in repeating the English blunder of erecting extra heavy and expensive wires, with the necessary accompaniments of proportionately heavy and costly poles, in order to be able to use cheap insulators at a saving of about five dollars per mile, is so glaring as to be almost beyond criticism. Mr. BROOKS makes a rather unique challenge at the end of his advertisement, and we really wish somebody would publicly take him up on it. An insulator that will enable a No. 9 wire to be worked at full speed through a direct circuit of 1,000 miles better than a No. 5 wire on the same set of poles insulated with any of its rivals, certainly ought to make its way in the world. Mr. BROOKS claims that attempts have been made to depreciate the value of his insulator by the publication of measurements of the old style of insulators made by him fifteen years ago, and totally unlike the modern one, and leaving the public to infer that such tests referred to the present insulator. It is not probable, however, that the ultimate success of a valuable invention will be prevented by any possible misrepresentation. Mr. BROOKS ought to remember that the most clubs and stones are thrown at the trees bearing the best apples, and keep on making, advertising and selling insulators. Insulators appear to be his forte, as Artemus used to put it, and he has certainly attained a wonderful degree of perfection in their manufacture.

Important to Telegraph Instrument Makers.

THE attention of telegraph instrument makers is called to the advertisement in another column of the Canadian Telegraph Supply Manufacturing Company, of Toronto, Canada. This is a good opportunity for first class workmen to obtain permanent employment with a reliable company, which is doing an extensive and profitable business.

The Telegraphers' Mutual Benefit Association.

A DESIRE having been expressed by many subscribers to THE TELEGRAPHER that the assessments and acknowledgments of the Telegraphers' Mutual Benefit Association should be published in this paper, we shall for the future print them regularly.

The following are the first assessments which have been made for over three months. Others will appear next week.

After the lapse of over three months notification has been received of the deaths of three members of the Association, two of whom have been connected with it since the first few months of its existence. A triple assessment is thus rendered necessary, and has been issued. The following are the deaths reported, and

which will be covered by assessments Nos. 55, 56 and 57:

J. M. Worden (certificate No. 330, issued Oct. 6, 1868), died Feb. 8, 1874, at Oxford, Ala., of congestion of the lungs.

F. E. Curtis (certificate No. 1,363, issued Jan. 19, 1872), died Feb. 11, 1874, at Springfield, Mass., of apoplexy.

Gilbert M. Simmons (certificate No. 111, issued Nov. 15, 1867), died Feb. 12, 1874, at Williamsburgh, N. Y., of heart disease.

Members holding certificates numbered up to and including No. 2,152 will remit for assessments 55, 56 and 57; those holding certificates numbered from 2,153 to 2,200, inclusive, will remit for assessments 56 and 57. Members restored by "Resolution of Nov. 5" are assessed for 55, 56 and 57.

The following circular has been issued to the members:

"At the Annual Meeting of the Association, in November last, resolutions were adopted establishing

"1. That a member in default sixty days after any assessment forfeited membership.

"2. That restoration could only be effected after application as at the first, the payment of back dues, and a second admission fee of one dollar and a half.

"The Executive Committee, whose duty it is to protect the Association from harm, are apprehensive that the obligation to pay the second admission fee is operating so as to prevent the restoration of many valuable members, who feel it oppressive. They do not complain, but they do not return, as, we think, many would were this exaction removed. I have been instructed to advise you of our apprehensions in this matter, and ask your opinion thereon. Very truly yours,

"JAMES D. REID,
"Treasurer."

Personals.

Mr. W. CULLEN has resigned the situation as night manager of the Dominion Telegraph Company at Toronto, Canada, and accepted a position on the day force of the Montreal Telegraph Co., Toronto.

Mr. MULLEN has been appointed night manager of the Dominion Telegraph Co., at Toronto, Canada.

Mr. R. MERRIFIELD has been transferred from the Buffalo, N. Y., to the London, Canada, Dominion Telegraph office.

Mr. D. L. WILSON has been transferred from the Toronto, Canada, to the Buffalo, N. Y., office of the Dominion Telegraph Co.

Mr. E. M. MARSHALL has been appointed telegraph operator at Beauventura, Canada, station of the Grand Trunk Railroad, the duties at that station having increased very much of late, rendering an increase of the operating force necessary.

Mr. WOOD has been appointed to take charge at Dickinson's Landing, G. T. R., at night.

Mr. BOYD has been promoted to the Brockville office of the G. T. R.

Mr. WALLIS, late of Lachine branch office, has been promoted to the agency of Kingston Mills Station, G. T. R.

Mr. HEAGENS, late of the Montreal Telegraph Co., has accepted a situation with the G. T. R. at Lyn, Ontario, Canada.

Mr. MCGAUGHEY, of Ewestown Station, G. T. R., has resigned and engaged in other business.

Mr. D. H. ELLIOTT, operator at the Kingston, Ontario, office of the Montreal Telegraph Co., who was obliged to give up work through severe illness, is now quite restored to health again.

Mr. BURBRIDGE, of the train despatcher's office, Island Pond, G. T. R., has resigned, and accepted a position in the night office, Collins' Bay, of the same road.

Mr. R. B. PEARSON, late superintendent of the Pacific and Atlantic Telegraph Co. at Chicago, Ill., has accepted a position on the regular day force of the Western Union office of that city.

Mr. JOHN F. STEVELY, late manager of the P. and A. Co. at Chicago, Ill., has accepted a position on the day force in the Western Union office in that city.

Miss ANNIE F. VEAZEY has accepted a position on the operating force of the Western Union Co. at Chicago, Ill.

The screw steamer Ambassador, having on board 538 knots of telegraph cable, recently sailed on her way to Brazil. The cable forms part of that contracted for by Messrs. Siemens Brothers for the Platino-Brazilian Telegraph Company, to connect Rio de Janeiro with Uruguay.

The Telegraph.

Foreign Telegraphic Notes.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended February 14, 1874, was 352,426—an increase on the corresponding week of last year of 59,979.

The Eastern Telegraph Company (Limited) have notified that their cable between Vigo and Lisbon, as well as the direct Portuguese line, being interrupted, messages for Malta, Egypt and the East will for the present be forwarded *via* Marseilles, and that, should there be any delay on this route, messages for India and places beyond India will be handed over to the Indo-European Company for transmission *via* Teheran. The company's repairing ship will proceed to sea at once to restore the lines which are now interrupted.

A circular has been issued by some of the shareholders in the Cuba Submarine Telegraph Company, recommending the amalgamation of the undertaking with that of the West India and Panama Company.

A new steamer called the Paraday, specially constructed for laying ocean cables, has been launched from the works of Messrs. Mitchell & Co., of Newcastle-on-Tyne. The vessel has been built to the order of Messrs. Siemens Brothers, of London, for the purpose of laying their Atlantic cables. The Paraday is 360 feet long, 52 feet beam, 36 feet deep, and measures about 5,000 tons gross register. She will, however, carry about 6,000 tons dead weight.

The subject of telegraphic extension and communication with the other Australian colonies and with Europe, was brought under the notice of the Legislative Council of Western Australia, at a special session held in November last. A resolution submitted by the Colonial Secretary, affirming the desirability of such communication with Adelaide, *via* Eucla and urging the Government to lay definite proposals on the subject before the Council for consideration at its next session, was passed.

Electric Railroad Crossing Alarm.

The bell placed on the Pennsylvania road at the South street depot on trial has thus far proved a success. It is a large gong, placed on a post near the crossing, and is connected by wires to a galvanic battery, and to one of the steel rails in the track, about one thousand feet from the depot. The bell sounds the alarm the moment the train strikes the rail to which it is attached. The sound of this bell can be heard at a distance of a quarter of a mile. This novel way of "flagging" a crossing has attracted considerable attention, and all who have seen it say it works like a charm, and is, beyond a doubt, a good and cheap flagman.—*The Elizabeth (N. J.) Daily Journal.*

New Patents.

For the week ending January 27, 1874, and bearing that date.

No. 146,758.—ELECTRIC ANNUNCIATOR.—Louis Finger, Melrose, Mass. Application filed February 1, 1873.

A cylinder, upon which various wants are indicated, is revolved by clock work, controlled by an electro-magnet, till proper order is displayed at an opening in outer case. Caller has a series of inclined pivoted levers caused to close a circuit by tilting. A hall, introduced into an aperture opposite the article called for, runs over a series of the levers, closing circuit proper number of times to cause the cylinder to be revolved and show name of article desired.

1. In an annunciator, the combination of a series of inclined planes or levers, circuit closers controlled by the passage of a weight or hall from one plane or lever to another, and of the mechanism for operating the alarm and indicating cylinder, substantially as described.
2. The ratchet sector *o*, connected by the lever arm *o'* to a shaft *h*, and depressed by a spring *p'*, in combination with the train *g m'* the latter operating the indicating cylinder of an annunciator, substantially as described.
3. The cam or escape wheel *q*, held and released by the lever *r r'*, armature *t*, magnet *u u'*, in combination with train *g m* of the indicating cylinder, substantially as and for the purpose specified.
4. The combination of the ratchet sector *o*, constructed as described, with the arm *i* and lever *k*, for carrying the indicating cylinder back to its original position, substantially as described.
5. The wheel or disk *a''*, of insulating material, provided with a metallic conducting piece *b''*, in combination with the metallic spring *c'* bearing on its surface, said spring being connected with a battery operating an electro-magnet *d''*, and armature *e''*, by which a bell or gong is struck at every contact of the piece *b''* and spring *c'*, substantially as described.
6. The face of the collar of an annunciator, having apertures *C C'* and receptacles *M M'*, arranged to receive a device for operating a circuit closer, substantially as specified.
7. Inclined planes *D''*, arranged at the bottom of a caller, and meeting at the centre, and sloping inward to direct a hall or other movable body through the aperture *C'* into the receptacle *M'*, substantially as specified.
8. A caller of an electro-magnetic annunciator, having apertures *C C'*, properly designated by the name of the article or person desired, and provided with suitable cups or receptacles, *M M*, on the outside, and in the interior with inclined levers or planes *D D' D''*, all arranged and operating substantially as described.

Married.

WOOD—CROWLEY.—On Tuesday, February 15th, at the residence of the bride's father, Winnemucca, Nevada, by Judge O. R. Leonard, Mr. R. W. Wood, Manager of the Atlantic and Pacific Telegraph Company, to Miss MATTIE CROWLEY, all of that place.

Died.

CALKINS.—In Cleveland, Ohio, March 4th, GEORGE W. CALKINS, an operator for the Western Union Telegraph Company, at the Union Depot in that city.

BROOKS' PATENT INSULATOR.

WORKS, No. 22 SOUTH TWENTY-FIRST ST., PHILADELPHIA, PA.

The attention of those interested in the economy and efficiency of Telegraph Lines is called to the merits of this insulator. The following are among the advantages derived from its use: FIRST.—It is not affected by rain or damp weather—being the only insulator possessing this quality.

The direct advantages are the avoidance of error and delay in transmission consequent upon defective insulation. The indirect advantages refer to economical construction and maintenance.

When this insulator is used a No. 11 or 12 wire is ample, unless the circuit is extraordinary in length. A No. 12 steel or charcoal iron wire can be worked farther and better in every condition of weather than a No. 8 wire, such as usually employed on ordinary insulators. The expense of the No. 8 wire is fully double that of the No. 12. The other advantages of the smaller wire are: Less liability to break, from contraction by cold and other causes—less strain upon the posts and greater ease of splicing and manipulation. It enables an ordinary No. 9 wire to be worked a thousand miles in rain, at full speed and capacity, a condition not attained with ordinary insulators, even when a wire twice the size and costing nearly double is employed.

Over one hundred measurements of the resistance of the Prussian Insulator in rain, during the past six years at these works, as compared with the common glass insulators of this country, give an average result in favor of the former of over six to one. In Germany, where the Prussian Insulator is used, the wire most employed is only two and a half millimetres in diameter, or weighing less than one hundred and fifty pounds to the mile. As "the practical working value of a telegraph line is the margin between the joint resistance of the conductor and the insulation and that of the insulation alone," a wire upon the ordinary glass insulators of this country, would weigh equally well as the small wire upon Prussian Insulators, would have to weigh a thousand pounds per mile. The Patent Insulator exceeds the Prussian insulator as much as the Prussian does the common insulators of this country.

To railroad companies this insulation is of great importance, inasmuch as the resistance of the lines is generally greatly increased by intermediate relays, diminishing the margin or "practical working value." Lines of a hundred or more miles in length are worked in rain without inconvenience, where as many as thirty relays are in the circuit. Such circuits with ordinary insulators are little better than useless in rain; besides, it requires a much more skilful and expensive class of operators to work them, if worked at all. In cases where the common insulators are furnished railway companies by the telegraph company, free of cost, it is no economy to use them. The Patent Insulator has been adopted by the Pennsylvania Railroad, the Philadelphia and Reading, the Philadelphia and Erie, the Northern Central, the Lehigh Valley, the North Pennsylvania, Baltimore and Potomac, and other railway companies, to the exclusion of all other kinds. There is little or no breakage, thus avoiding the derangement of wires and expense of maintenance, owing to this cause.

GUARANTEES.—To enable a wire of a given size to be worked farther in rain at full speed and capacity than a wire of twice the

size placed on common glass insulators or the Kenosha insulator, or no pay. Wherever the glass or Kenosha insulators are used, the proprietor is ready to insulate parallel wires upon the foregoing specified conditions.

To enable a No. 9 wire to be worked at full Morse speed and capacity in a single circuit of a thousand miles in rain, and better than is possible with a No. 5 wire on the same set of poles, and insulated with the common glass or Kenosha insulator, those employing the larger wire can have the privilege of using as many repeaters as they please. No pay unless these conditions are fulfilled.

AGENCY FOR SIEMENS' GALVANOMETERS, RESISTANCE COILS, SUBMARINE CABLES, CABLES FOR RIVER CROSSINGS, POLARIZED RELAYS, INK RECORDERS, AND EVERY VARIETY OF ELECTRICAL APPARATUS MANUFACTURED BY THAT CELEBRATED FIRM.

PHILADELPHIA, March, 1874.

WANTED.—

FIRST CLASS TELEGRAPH INSTRUMENT MAKERS, to work by the piece. Only the most competent need apply, and must be well recommended. Compensation will be liberal and living is cheap.

CANADIAN TELEGRAPH SUPPLY MANUFACTURING COMPANY, Toronto, Ontario, Canada.

P. O. Box 1421.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

WATTS & CO.,

47 HOLLIDAY ST., BALTIMORE.

OUR ILLUSTRATED CATALOGUE NOW READY.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.
Acknowledged to be a decided improvement.
Price, same as the ordinary key.
Superintendents and Purchasing Agents are invited to examine our **EXTENSIVE FACILITIES** for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Between Fulton and John Streets, NEW YORK.

One half of actual size

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

- The Platina Points are large and hard.
- Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight.. \$50 00
- Sounders, from..... 4 50 to \$6 50
- Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00
- Relays, from..... 9 50 to 16 00
- Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars.

The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. BOX 496.

A MERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.
J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.
15 MAIDEN LANE, NEW YORK.

This instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world.

It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also,

ELECTRIC AND CONTROLLED CLOCKS

of all kinds,

CHRONOGRAPHS,

ASTRONOMICAL CLOCKS,

REGULATORS,

ETC., ETC.,

OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,

Send for Circulars and Catalogue.

DR. L. BRADLEY,

No. 9 Exchange Place,

JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

CAUTION.

All persons are hereby notified that Batteries infringing upon our patents are in the market (some of them nearly worthless). The public are warned against using any such infringements, as in every case the guilty parties will be prosecuted to the fullest extent of the law. The genuine Batteries have the words "Pile Leclanché" on the carbons and glasses. Any information concerning such infringements will be thankfully received by the

LECLANCHÉ BATTERY Co.,

No. 40 West 18th Street.

New York, October 11, 1873.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand. No local required. Always ready for temporary offices.

Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,

and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

COMPLETE OUTFIT, WITH BATTERY, CHEMICALS
AND MANUAL,
Seven Dollars.

Sounder and Key only..... 6 00
" " with Cut-out and Lightning Arrester... 7 00

SHAFFNER'S
TELEGRAPH MANUAL.
TO TELEGRAPHERS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,

78 and 80 Broadway,

NEW YORK.

MODERN PRACTICE OF THE ELEC-
TRIC TELEGRAPH.

A HAND-BOOK

FOR

ELECTRICIANS AND OPERATORS.

By **FRANK L. POPE.**

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND

FULLY ILLUSTRATED.

THE BISHOP GUTTA PERCHA WORKS,
422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE, AND FOR

BLASTING AND MINING PURPOSES,

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,

8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,

has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

Elementary Principles of Electrical Measurement.

BY F. L. POPE.

A GALVANOMETER so constructed that the mathematical tangents of the angles of its deflections are in all cases strictly proportional to the strength of the currents by which the deflections are produced, is called a *tangent galvanometer*. This effect is produced by so arranging the conducting wire relatively to the magnetized needle, that the current traversing the conductor will act uniformly upon the needle in whatever position it may place itself, or in the same manner that the earth's magnetism does.

The principle of the tangent galvanometer will readily be understood by a reference to the diagram (fig. 10).

Let *n s* represent a freely suspended magnetic needle, which has assumed its normal position in the line of the magnetic meridian *N S*, under the influence of the earth's magnetism. If now a conducting wire or

76° would be 4 nearly in the table of tangents, as we see by the diagram that it should be. It will also be noticed, by reference to the diagram, that for a distance of 14° or 15° from *N*, the line of tangents *N 4* is very nearly parallel to the arc *N B*, which is the reason why the deflections of a galvanometer are proportional to the currents producing them, when the angle of deflection does not exceed 14 or 15 degrees. A degree on the scale is here almost exactly equal to its tangent, but above 15° the tangents rapidly become greater and greater in proportion to the degrees, until the tangent

Fig. 11.

of 90°, represented by the line *A B*, is infinite, because it is in fact parallel to the line of tangents *N 4*. The conditions requisite in the construction of a true tangent galvanometer have already been referred to,

Fig. 12.

of wire placed in a vertical position, and having a short needle suspended precisely in the centre of the ring. To insure accuracy in the indications, it is necessary that the needle should be very short relatively to the diameter of the coil, and the shorter the needle in proportion to this diameter, the greater will be the accuracy of the instrument. It should not in any event be more than one sixth the diameter of the coil. The deflection is observed by means of a light aluminum pointer at right angles to the needle, which traverses the graduated scale. This form of galvanometer has been very extensively used.

Gaugain's "Tangent Multiplier."

M. Gaugain, a prominent French electrician, found that when the conducting wire is wound upon the surface of a frustrum of a cone, having the plane of its base parallel to the magnetic meridian, and the magnetic needle is suspended in such a manner that its centre coincides with the vertex of the cone, the tangents of the angles of deflection will be proportionate to the forces of the currents producing them. This theorem is correct to within $\frac{1}{1000}$ when the needle is from 1.17 in. to 1.36 ins. in length, and the diameter of the coil not less than thrice the length of the needle. The height of the cone must also be one fourth of the diameter of its base.

This arrangement is shown in figure 11, which is a plan view of the needle and coil of Gaugain's Multiplier. The needle *N S* is placed so that its centre coincides with the vertex of the cone *B C D E*, upon the surface of which the conducting wire is wound. Figure 12 is a perspective view of an instrument of this kind manufactured by Messrs. Knox & Shain of Philadelphia.

Gaugain's method of construction is a great improvement upon that of Weber in two respects; first, in the accuracy of its indications, and second, in the greater proximity of the coil to the needle upon which it acts, by which its sensitiveness is much increased. The difficulty which arises in the construction of this instrument, is in making the centre of the needle precisely coincident with the vertex of the cone, as the

Fig. 14.

Fig. 10.

coil be placed in the plane of *N S*, so as to surround the needle, and this conductor be traversed by an electric current of such a strength as to produce an effect upon it precisely equal to that of the magnetism of the earth, it will tend to deflect it into a position exactly at right angles to the one it originally occupied. This position is represented by the line *A B*. But the two opposing forces acting upon the needle being equal, the latter will assume a position equidistant between *N* and *B*, which is called the *resultant*, and corresponds to the diagonal line *A 1* in the figure, which is at an angle of 45° with the zero line *N S*. Now, if we double the strength of the current traversing the conductor, the needle will assume the position denoted by the line *A 2*, which is an angle of 63½° nearly. If we again double the strength of current, we shall increase the deflection to 76°, represented by the line *A 4*. The line *N 4* is termed in geometry a *tangent* to the arc or quadrant *N B*. It is therefore desirable for the student who has occasion to use a tangent galvanometer, to provide himself with a table of natural tangents, which may be found in most works on trigonometry and surveying, as well as in Haskins', Clark's and Culley's hand-books. Such a table gives the tangent corresponding to every degree and half degree of the scale. For example, if we call the distance from *A* to *N* unity or 1, the tangent of 45° is 1 also, because a line drawn from the centre at *A*, at an angle of 45° to the line *A N*, will intersect the line *N 4* at *1*, and the distance from *N* to *1* is the same as that from *A* to *N*. In the same way the tangent of

and there are several different modes of construction by which these are fulfilled with sufficient accuracy for all practical purposes.

Fig. 13.

Weber's Galvanometer.

The earliest and simplest form of tangent galvanometer was that designed by Professor W. E. Weber, of Gottingen. This consists of a circular coil or ring

position of the centre of any magnet is not absolutely certain; and according to the researches of Clerk Maxwell, an eminent mathematician, Gaugain's coil, with an eccentrically suspended magnet, is subject to far greater uncertainty than even Weber's.

Farmer's Tangent Galvanometer.

Mr. Moses G. Farmer converted Gaugain's galvanometer into a trustworthy instrument by placing a second coil, equal to the first, at an equal distance on the opposite side of the needle. It is found to be quite unnecessary in this case to wind the coils upon a conical surface, as all the necessary conditions are equally well satisfied by coils of rectangular section, which have the further advantage that they can be constructed with far greater accuracy than is possible where the wire has to be wound upon an obtuse cone. Mr. Farmer's galvanometer is shown in figure 13. The mode of construction was invented by him in 1853 or '54, and a number of them were subsequently made by him. In 1859 he constructed a very fine one with 18 inch coils, and a compass 10 inches in diameter, graduated to 6' of arc, and which could be read to 1' without difficulty. This instrument would give correct indications as high as 89° 45'. It was unfortunately destroyed by fire in 1868. In a galvanometer constructed upon this plan the coils must be in exactly parallel planes, and the distance between them equal to their radius or one half their diameter. The magnet is suspended

equi-distant between the coils and in their common axis.

Bradley's Tangent Galvanometer.

The arrangement differs materially from any of those previously described. It consists of a circular or disc needle, either composed of a single piece of steel, or of several short needles placed side by side, and the whole trimmed into a circular form. The north and south poles of the circular needle are at opposite points upon its circumference. Light aluminum pointers are attached to the disc for registering its movements. The coil is flat and is placed directly underneath the needle, and in close proximity to it. The breadth of the coil slightly exceeds the diameter of the needle. This mode of construction, which was invented in 1866, by Dr. L. Bradley of Jersey City, combines in a high degree the merits of compactness, portability and accuracy, and has come into extensive use. Figure 14 gives a very good idea of its external appearance.

Work of the Telegraph Construction and Maintenance Company in 1873.

THE report of the directors of the Telegraph Construction and Maintenance Company for the year 1873, has the following statement of the cables manufactured and laid by the company during the year, and of the work which it now has in hand and contracted for, for the current year:

During the year 1873 the following works have been carried out: The laying of a cable for the Anglo-American Company between Valentia and Heart's Content, Newfoundland, and two cables between Placentia and Sydney, Cape Breton, a total length of 2,470 nautical miles, and both sections of the French Atlantic Cable of 1869 have been successfully repaired. A duplicate cable for the Eastern Telegraph Company was laid during the summer between Lisbon and Falmouth, touching at Vigo (866 nautical miles), and the first section of the Brazilian cable (625 nautical miles) was submerged between Lisbon and Madeira, but in consequence of a fault having subsequently developed itself, the cable had to be broken in deep water to remove the fault; and, owing to the lateness of the season, and unusually tempestuous weather having set in,

the repair had to be abandoned until the spring of 1874. In fulfilment of a contract entered into some time since with the Eastern Telegraph Company, this company, assisted by Mr. W. T. Henley, of North Woolwich, have laid in the Levant 785 miles of cable, forming another connection between Italy and Egypt, via Zante and Candia. The West India and Panama Telegraph Company having applied to this company to put certain of their cables into working condition, and to lay a new cable between Jamaica and Panama (subsequently changed, so as to connect Jamaica with Porto Rico), the work was undertaken, and satisfactorily completed early in the present year. The total length of all cables laid during the past year amounts to 4,701 nautical miles. The manufacture of the second and third sections of the Brazilian cable has been so far completed that the operation of submerging them will be forthwith commenced, and it is expected to complete that contract by the middle of this year. Your directors have also to report that a contract has just been concluded with the Anglo-American Telegraph Company for the manufacture of 1,100 nautical miles of cable, and for laying the same, together with 900 miles surplus cable belonging to that company, between Ireland and Newfoundland, during the current year. The company has taken steps for extending the system of submarine telegraphy along the west coast of South America, where a valuable traffic awaits its completion; in furtherance of this object an exclusive concession has been secured from the Peruvian Government, and within eighteen months your directors hope to have laid a cable connecting Peru with Panama. The Tasmanian cable has been transferred to the Eastern Extension Telegraph Company, and now forms a part of its system.

Spanish Telegraphy in the year 1873.—Submarine Telegraphs.

THERE has been marked progress in telegraphy, notwithstanding the disturbed state of the country. The cable from Bilbao to Land's End was opened in January (1873). An interruption occurred in March, fourteen miles from Bilbao, but the injury was repaired by the end of April. A worse interruption was caused by the blockade of Bilbao by the Carlists. Concession was given in the beginning of the year for a cable from Barcelona to Italy, in connection with the line from England to Bilbao, while a land line was to be made from Bilbao by Madrid to Barcelona for the cable despatches. But owing to disturbances in the north, this scheme has been abandoned for a time; and M. Aparicio, to whom the concession for the Italian cable was transferred (from Mr. C. S. Stokes), is about to lay a cable from Barcelona to Marseilles. In June a cable was completed (by the Telegraph Construction and Maintenance Company) from England to Vigo, and it was extended in July, by another from Vigo to Lisbon. In January (1873) M. de Juan de Lasarte was authorized to lay a cable from the east coast of the peninsula to Havana in Cuba, passing through the Cayo. The concession has been transferred to M. Adolf Clave, and the plans, etc., have been submitted by Count de Brockman, an eminent engineer, but the civil war has prevented the necessary capital being supplied.—*Revista de Telegrafos.*

The Light Cable Company

WE are glad to see that the directors of the Light Cable Company, the prospectus of which was recently issued, have been so well advised as not to follow the example set by the promoters of a similar company—the British and North American Telegraph, which is just now occupying the attention of the Court of Chancery—and endeavor to float a concern which appears to have failed as signally and as completely as its predecessor has done. The directors, finding that the proposal to make a costly experiment at the expense of the public has not been fully appreciated, have issued a circular, in which they state that “the number of shares applied for by the public not being sufficient to enable the directors to make arrangements for laying a cable during this year, they have resolved to make no allotment, but to return the deposit moneys in full to each applicant.” The circular attributes the failure of the scheme to “the prejudiced attacks made by interested parties on this undertaking, casting doubts on the minds of investors as to the practicability of laying and working a light cable.” We do not perceive in the circular any statements to the effect that the promoters and directors of the company were themselves actuated exclusively by disinterested motives in their proposal to test, at the expense of the public, the practicability of laying and working a light cable across the Atlantic. It would have been only fair to the public to have assured them that the active promoters of this abortive scheme were not themselves “interested parties” before venturing upon this silly explanation of the cause of their miserable failure.—*The Railway News.*

Testing Lines for Insulation Resistance.

HENPECK, March 10.

TO THE EDITOR OF THE TELEGRAPHER.

SCHWENDLER gives the following formula for testing line resistance: $L = 2 (R - \sqrt{R(R-r)})$. R = the measured insulation resistance of line, and r = wire resistance without relays in circuit. This formula is based upon the supposition that the escape is uniform, and is said to give the absolute wire resistance regardless of the escape through defective insulation. This word *absolute* is a very positive term, and should be used with caution. If we test a certain wire first by grounding at distant end; second, by opening at distant end, we get two results from which this *absolute* wire resistance is obtained. Suppose we repeat the test, but use double the battery employed in the first case; we get altogether another result. Is this also the *absolute* resistance? It would seem, that in order to get an *absolute* result it is necessary to use a definite amount of battery power. What is that definite amount? To arrive at the absolute resistance of a certain number of insulators with a definite battery power, it would be necessary to have them placed close together and all connected by a wire of no appreciable resistance. In practice, however, they are not so placed, and although every insulator may be exactly equal in resistance, yet, by virtue of their unequal distances from the testing station, no two will conduct the same amount of electricity from the line to earth; or, in other words, under these peculiar circumstances no two will be equal as insulators. Suppose we have a wire 100 miles long extending from A to B, and ordinarily worked with 75 cells of battery located at A. Now, with “B” open, test the resistance of insulation from A—care being taken to have instrument selected or arranged that will allow the same current to pass to line while being tested as when being worked. Will not the result thus obtained be *practically* the *absolute* resistance of the insulation? It of course will not be the resistance which would be obtained were the insulators all joined with a wire of no appreciable resistance, but as the arrangement is the same when line is being worked as when tested, is this not the *practical* resistance of the insulation in this particular case? If it is, then we have the following rule for obtaining the corrected wire resistance: Arrange testing battery so that the same *current* will flow to line while being tested as when being worked; divide the product of the apparent insulation resistance and the apparent wire resistance by their difference. This may be demonstrated as follows:

Let apparent insulation resistance = 5,000 ohms.

Let apparent wire resistance = 1,500 ohms.

Let correct wire resistance = X.

Fifteen hundred ohms represents the joint resistance of the wire and insulation. Then if, as stated above, the 5,000 ohms represents the *practical* insulation resistance, according to the rule for finding joint resistance we would have $\frac{5000 X}{X + 5000} = 1500$, or $X =$

$2142 + \text{ohms}$ —which is equivalent to dividing the product by the difference. According to Schwendler's formula, we would have for the corrected wire resistance 1634—quite a difference—which result is the nearest correct, practically speaking.

In Haskins' late work, at bottom of page 40, we find a formula for testing grounds. Is there not an error in printing it? Should it not be $\frac{L + S - R}{2} = G$?

PED.

Suggestions to Telegraph Employes.

TO THE EDITOR OF THE TELEGRAPHER.

THAT there should be dissatisfied persons in any business employing so many as does the telegraph is a matter of course. That these may imagine and believe that the cause for such dissatisfaction is the injustice and lack of recognition of their merits and services is but an incident of human nature. The columns of THE TELEGRAPHER almost weekly contain the evidences of the truth of the above reflections. The communications which are continually appearing from this class would give the impression to telegraphers as a body are exceedingly ill used and underpaid. The writers do not seem to consider that there may be two sides to this matter, and that all the wrong and injustice does not necessarily appertain to the telegraph employes.

It is not intended to claim or assert that there is in no case good ground for complaint and remonstrance. Quite otherwise. It is not unfrequently the case that telegraph employes are ill used and underpaid. When

such is the case it is right that such influences be brought to bear as, if possible, to correct the wrong and injustice, but it is apparent that this cannot be done by continual and persistent grumbling and complaining.

On the other hand, it is not unfrequently the case that telegraph employes obtain situations and receive compensation far better than their abilities warrant, or than they could obtain in any other business. And just here it would appear as if the principal cause of the difficulty lies. What is needed is a classification of positions and salaries and a system of promotion, which shall insure to the best qualified the positions and compensation to which they are entitled, and relegate the others to such positions and compensation as they are fitted for. It is safe to say that no telegraph company in this country has any system in this matter. Appointments and promotions are made haphazard, or from personal favoritism and influence, with but indifferent regard to the qualifications of the appointee.

If the intelligent and worthy portion of the great body of telegraph employes would take this matter into consideration, and would seek to establish a better state of things, wise and intelligent action on their part might eventually effect something. It is just here that a telegraphic organization is desirable and might prove effective. It is useless for telegraphers to write communications to THE TELEGRAPHER on the necessity and desirability of an organization of the telegraphers—and then let the matter drop. Most of those whose communications have appeared seem to have not the slightest conception of what such an organization should be, or what its real purposes ought to be, or how it shall be effected. They have an indefinite idea that in some way an organization will correct all the evils of which they complain, and establish a telegraphic millennium. Again, they are all waiting for somebody else to assume the responsibility and do the necessary work. The only way to effect an organization is to *start it*—first determining on a sensible and reasonable basis, with clearly defined purposes and objects, and, at least an idea of how these purposes and objects are to be attained. No matter how small the original body may be under such an arrangement, it will *grow*—slowly at first, it is true, but with constantly augmenting speed and vigor.

If this communication finds favor I may hereafter point out what it seems to me are the objects and purposes to be attained by such an organization, and how it may be effected.

COMMON SENSE.

The Telegraph College Humbug.

ALLIANCE, OHIO, March 10.

TO THE EDITOR OF THE TELEGRAPHER.

IN the last week's number of THE TELEGRAPHER I notice a communication over the signature of "Agitator," in regard to telegraph colleges, so called. Your correspondent so fully expresses my opinions on this subject that I cannot refrain from endorsing and approving of his communication through THE TELEGRAPHER.

In the instance which he sets forth so feelingly and properly of the poor duped German girl, is shown up what is a common occurrence all over the country. It shows very forcibly how these humbug telegraph colleges are swindling the young and unsuspecting, who are seeking for a means of livelihood, throughout the country; and it is no wonder that "Agitator" should enter his protest against them.

These so called telegraph schools, institutes or colleges are the greatest humbugs of the day, and telegraph operators, in justice to themselves, ought to take the matter in hand, and find means to suppress such frauds.

We cannot rely on telegraph companies or the organs of telegraph companies to act or protest against these institutions, and the reason is very evident. I could give you the names of more than a dozen prominent telegraph officials, whose names I have seen given in the glowing circulars issued by the proprietors of these humbugging institutes, as endorsing and recommending them. These men sell their names to these humbugs as endorsing them. Oh! how some men's consciences must be calloused and seared, to allow themselves to become the tools of such fellows.

"Agitator's" German girl reminds me forcibly of a similar incident right in the office where I am employed.

A certain young man residing in our city, who has been away attending one of these telegraph colleges with which our land is so well supplied, had spent about six months, and came home with a gorgeous *sheepskin*. It represented him as a first class operator, and he himself claimed to be able to receive thirty words per minute, and applied to our manager to know if he would allow him to come and practice in our office a few days. He said he only wished to learn the calls and the telegraph rules. So the young man obtained the consent of the manager, and accordingly came, and to his *own*, but not to our astonishment, he could not tell a single office call, to say nothing about receiving thirty words per minute. He has already been here over two months, and he knows but little more about the *art* than he did

when he first came into the office. I guess he has concluded that he would not have any need to learn the rules until after he knew something about telegraphing. Such is life! but, brethren, these things ought not so to be. "Agitator" is quite right; he only gives them their proper name when he calls them swindlers; they are such, and of a dangerous kind, too. It is not prejudice that makes me speak as I do, but actual observation.

Down with humbugs! Come again, "Agitator."

JOHN WILKES.

Experience of a Young Telegrapher.

STOUCS CITY, IOWA, February 27.

TO THE EDITOR OF THE TELEGRAPHER.

I WANT to say a word or two in praise of the present management of your paper. I think your policy of soliciting and encouraging correspondence from the telegraphers themselves a good one. My opinion is that the paper is now becoming better and more interesting every issue. The articles by the "old timers" are very readable. Although not an old timer, I remember when telegraph lines were not as plenty as now, and well remember the first instrument I ever saw. It was a "paper mill" of huge proportions, and sounded very much like a couple of boys hammering on a board. The operator sat in an arm chair, with his feet upon the desk. I was buying a ticket and "taking in" the telegraph department at the same time. All at once, Mr. Operator broke into a loud guffaw, and says, "That chap at Po spells Kansas K-a-u-z-a-s." I was doubly surprised—surprised that he could "tell what it said" without looking at the paper, and surprised that so scientific a man as an operator could be so illiterate as to spell Kansas so terribly. Then who "Fo" was puzzled me too.

From that hour I thought I never would be happy until I was an operator, and here I am, and that *rusher* at "Di" is calling me, too. There—didn't break him this time.

By the way, tell "Jennie" I'm a pretty good boy; don't smoke, chew, drink spirituous or malt liquors, wine or cider, never played but three games of billiards in my life. Then "M" at "Ma" treble discounted me, and beat me thirty points each game. It cost me seventy-five cents, which would be very acceptable at the present stage of the game. I really like the tone of her letter generally, but don't think telegraphers are morally any worse than any other class of people of like calling. With "73" all around, I bid you and your readers good bye. Still I am not happy; I can't put in any poetry to advantage.

C. ROSS

On a Telegraphers' Union.

TO THE EDITOR OF THE TELEGRAPHER.

MUCH has been written on the subject of a Telegraphers' Union, and many schemes have been advanced for the formation of a Union. And why is it no one is bold enough to come out openly and declare a Union which we must and will have? We need a Union for numerous good reasons: To break up the swindling institutions styling themselves telegraph colleges; to cut off the learners, and by so doing we bring the long wished for result—

Pay in proportion to our capabilities and labor.

To adjust matters in which we are most interested, and to secure to us those rights which belong to us, and which our employers are every day robbing us of.

We are men, and as such we are entitled to such privileges as by right belong to us. Every class of mechanics have unions, and why not we as well? What a grand and good thing it would be if we had as good an organization as the Locomotive Engineers!

How can this Union be formed? Brothers, let us organize in self-defence, and let us be governed by God's laws as laid down to us, and let our motto be: "In union is strength." We should arise and flock to our standard; put down all things which tend to lower our calling, and the desired result is obtained.

SCOTT.

Why we Should Support The Telegrapher.

TO THE EDITOR OF THE TELEGRAPHER.

THE difficulties and discouragements which are experienced in obtaining subscriptions to THE TELEGRAPHER among the average members of the fraternity, have been quite forcibly set forth in recent communications which have appeared in its columns. It is true that it is sometimes discouraging in presenting the claims of the paper to support to be met with indifference, and sometimes even rude refusals from those whose interests it is constantly laboring to advance. In some cases this comes from the fact that the parties are not actually aware of the real character and importance to them of the paper. In others—and these, perhaps, are the most numerous—there is an entire lack of appreciation of anything beyond the mere personal and sensual gratifications of the moment.

If I understand it aright, the purpose of THE TELEGRAPHER is to educate, as well as interest telegraphers. The amount of valuable instruction and information contained in a volume will be hardly conceived, unless an examination of a completed volume is made. In fact no practical telegrapher can afford to be without it who desires to advance in his chosen profession. If I could have my way its weekly visits should be paid to every telegraph office in the country, and every telegrapher should look forward to its coming with an interest which could not be felt in any other event of the week. Two dollars per year is, indeed, an insignificant sum compared to the consideration which is given for it. Another point which should be impressed upon the minds of all who are solicited to enroll themselves upon the subscription list of THE TELEGRAPHER is, that it is *constantly being improved*. A comparison of the volumes which have appeared during the past ten years will demonstrate that every succeeding volume has been an improvement on all which have preceded it, and the present volume has already shown a most marked and decided advance. The fact that it is quoted in other countries by leading newspapers and periodicals as the recognized authority in electrical science and telegraphic matter, in this country shows its appreciation by the scientific and practical minds throughout the world.

In presenting these considerations, it is my desire only to indicate the manner in which the claims of the paper should be presented to attract attention and secure support from telegraphers. Such a presentation, and that of the additional fact that it comprises a complete weekly record of telegraphic news and information throughout the world, would I think, give a success which would gladden the heart of the publisher, and enable him still further to enlarge and improve it. Let us all give an energetic and combined effort to the work of increasing the circulation of the only recognized telegraphic organ in this country.

TELEGRAPHER.

Well Informed Telegraphic Artists.

TO THE EDITOR OF THE TELEGRAPHER.

MUCH has been said by yourself and others regarding the knowledge etc., requisite to become a first class operator. Now, I respectfully submit the following, hoping that after its perusal you will be inclined to acknowledge that a class of men able to make so much out of a little historical fact certainly deserve to be classed above the "Bread and Beer" fraternity.

A few nights ago, upon one of the press wires radiating from the metropolis, while the regular sender was absent at his lunch, a "relief" operator, while transmitting "Honors to the memory of Sumner," came upon a passage in this wise:

"At a meeting held in the Church of — (few dots) (this must be a "nigger" name), Shiloh (t t s it) Shiloh (t t s darkey name), etc."

In a few moments one of the offices on the line came in with, "T t s good on U—t t church was named after a celebrated battle west, 'Shiloh'!" Now suppose you suggest to them that the name might have been derived from the Bible; being one of the names applied to our Lord and Saviour.

S.

"Soothe," Soothe Thyself.

TO THE EDITOR OF THE TELEGRAPHER.

"AGITATOR" has viewed himself in a "mirror." He never before discovered the fact, that sure enough there were the "two elongated auriform appendages on the sides of his head."

"Agitator" is an ass. He hereby *kindly* thanks "Soothe" for making the suggestion which has led to the discovery.

How easily it is for a man when cornered to resort to the low habit of calling names, thereby acknowledging that arguments fail him, and that he is utterly powerless to reply. How very humiliating then is the position into which "Soothe" has voluntarily surrendered himself. Placed *hors du combat* by an ass!! "Soothe," soothe thyself.

AGITATOR.

Correction of "Personal."

ISLAND POND, VT., March 17.

TO THE EDITOR OF THE TELEGRAPHER.

ALLOW me to make a correction of a "Personal," printed in THE TELEGRAPHER for the 14th inst. It is stated that Mr. Burbridge had resigned his position in the train despatcher's office of the G. T. R. at this place. This is incorrect, as he never worked in this office, but at a small water station on the Island Pond and Portland Division of the Grand Trunk Railroad.

CHIEF TRAIN DESPATCHER.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS OF THE

Telegraphic Fraternity and the Advancement of Electrical Science and the Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of THE TELEGRAPHER will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

The Rapid Increase and Extension of Cable Telegraph Lines.

THE statement which we reprint on another page from the report of the directors of the Telegraph Construction and Maintenance Company of England, of the operations of the company during the year 1873, exhibits the very rapid increase and extension of cable telegraphs throughout the world. It is but a few years, comparatively, since this branch of industry and enterprise was developed, but during that time it has grown with a rapidity which is almost unparalleled. It should be recollected, also, that there are two other extensive telegraph cable manufactories in England, both of which are successful and profitable enterprises, although neither of them can compare for extent and importance with the one to which attention is called. That of the Messrs. SIEMENS BROTHERS is now completing the cable for the United States Direct Cable Co., which it is intended to lay down during the coming season.

England has had a monopoly of this business of manufacturing deep sea cables from the start, and will probably retain it. Most of the capital invested in ocean cables has been supplied by English capitalists, and the headquarters of all the important cable telegraph companies is in London, and they are almost exclusively managed by Englishmen. The attempt to obtain capital for investment in cable lines in this country has always met with little success—our capitalists apparently being content to accept the facilities provided by foreign means, and our people content themselves with occasional spasmodic growls and complaints at so called cable monopolies, but without any real or earnest purposes to relieve themselves of such monopoly by participation in a business which has yielded munificent returns to those who have risked their means in establishing it.

It seems somewhat singular that Americans, who are generally supposed to be so shrewd and wide awake to profitable business opportunities; should have so persistently ignored this business, and permitted its profits to pass into the hands of foreigners. This is the more singular when we consider that it is to American zeal, persistence and energy, the earlier success of cable telegraphy is due. It can only be explained on the ground that originally there was little faith in the practicability of ocean telegraphy, and that when this had been demonstrated, faith in its extent and permanence was wanting. In the meantime, English capital and English enterprise had got a start in the business which gave them a monopoly of it. Various attempts have been made by sanguine promoters to establish cable telegraph enterprises in this country, but all, with the exception of the comparatively small one of the International (Cuba) Telegraph Company, proved abortive.

The Telegraph Construction and Maintenance Company has evidently been an exceptionally well managed corporation, and as it was the first in the field, and supplied with ample capital and facilities, it has had the best and most profitable part of the business. The profitable character of the work is shown by the fact that upon its last year's business it divided twenty per cent. to its shareholders, besides carrying a large amount to the reserve or surplus account. It now has in hand some large contracts, and, from present indications, its business the current year will be fully as extensive and profitable as in 1873.

The requirements and necessities of cable laying, as demonstrated in the case of the first Atlantic cable, demanded very large ocean steamships for the purpose. Fortunately, the Great Eastern was in existence, and it was found that the big ship which had proved a failure for the purpose for which she was designed, was just what was needed for this special service. She was transformed into a cable ship, and will probably never be used for anything else. We printed last week an account of the launch and a description of a new monster steamship, the Faraday, which has a registered tonnage of 5,000, and an actual carrying capacity of about 6,000 tons, which has just been built at Newcastle for the SIEMENS BROTHERS, especially for cable service.

Her first use is intended to be in laying the cable of the U. S. Direct Cable Company, to which we have before referred. Having been constructed especially for this service, which the Great Eastern was not, every necessary convenience is provided for the business in which she is to be engaged. Without these enormous vessels it would be very difficult to lay very long cables. With them the work is as certain, and attended with as little comparative difficulty, as any other.

The increasing demand for telegraph cable service will constantly require the manufacture of additional cables for routes over which they are already laid, as well as for new routes which are constantly being developed. It is only a question of time, and, probably, of only a comparatively brief time when a cable shall be laid from our Pacific Coast to Japan and China. A United States naval vessel is now engaged in making the necessary soundings to determine the best and most feasible route, and our obliging English friends, it is understood, are ready to furnish the capital and manufacture the cable for this route also. We should prefer that this cable should be provided by American enterprise and established with American capital; but as there seems to be little chance for this, we must be content to accept the favors of foreign capitalists, and see the management of this company also practically centred in London. The line must be established, and if American capital and capitalists will not do it, why, it is useless to waste time in repining.

The rapid extension of ocean telegraphs is scarcely less marvellous than the facility with which communication is had over thousands of miles of electric cord buried beneath the waves. The whole world is being rapidly bound together by the slender telegraph cables, and time and distance are practically annihilated. We have become so accustomed to these marvels that we take them as a matter of course, and most of those who daily read reports in the morning and evening newspapers of what is transpiring in the uttermost parts of the earth never give a thought to the wonderful advance which science and art have made in these latter days.

The manufacture of telegraph cables appears to have nearly reached perfection. There may be room for improvement in the details, but experience has shown that the heavy armored cables are the best, and it will be difficult to convince those who are familiar with such lines of the practicability and permanence of lighter cables, whose only recommendation is, that they are less expensive and more easily laid. The promoters of the Light Cable Company, whose prospectus was recently brought out in London, were unable to obtain any considerable subscriptions to its capital, and the project was very wisely withdrawn. We are aware that some able scientific men have expressed confidence in the feasibility of successfully laying, operating and maintaining these light cables; but the weight of evidence is against them, and it is evident that few are willing to risk their money in experiments which have so little, if any, chance of success.

The heavy and thoroughly well constructed telegraph cables are necessarily expensive, and until the speed of transmission of signals through them can be very largely increased, the charges for cable telegraphy will be comparatively heavy. It is in this direction that many are now experimenting, and we have confidence that eventually a very material increase of capacity will be developed. When this is accomplished it will be feasible to greatly reduce the presents rates for cable telegraph service. This and a bona fide competition in the business can alone insure such a reduction. The U. S. Direct Cable Company promises the competition, and he or they who shall first develop a system of working through the cables which shall double or treble their capacity will have solved the other factor in the problem of cheap ocean telegraphy.

"I'll not take business from that man."
"Why not?" the chief asks, with a shrug;
"Because this says: 'Att wem cog hog.'
"And 'bring a purple ostrich plug.'"

—The Switch.

Congress and the Patent Office.

It is probably not too much to say that the greater part of the readers of THE TELEGRAPHER are interested more or less, in one way or another, in patents. Notwithstanding its frequent and obvious defects as at present constituted the patent system of the United States is unquestionably far superior as a whole to that of any other country, and the actual money value of the benefits it has conferred upon the people of this country are simply incalculable. We might mention half a dozen single patented inventions, such as the sewing machine, the harvester, the telegraph and others, each one of which has increased the wealth of the country by an amount far exceeding the whole cost of maintaining the Patent Office from its foundation to the present day.

Representing, as THE TELEGRAPHER does, one of the leading interests above referred to, and one in which the inventive spirit is just now unusually active, we have lately taken occasion to look a little into some matters of paramount and vital interest to all inventors, and if possible of even greater importance to the particular class which we represent than to most others. We refer to the reproduction and publication of the drawings of past inventions, now on file in the Patent Office, and of the specifications in an abridged and convenient form.

The object of the patent laws is defined by the Constitution to be "the promotion of useful arts." This is accomplished, in part, by giving to each inventor a legal monopoly of his invention for a specified term of years; but it is a matter of scarcely less importance that each inventor may be enabled to inform himself promptly and at a small expense of what has been done and is being done by all the others, for without such knowledge it is utterly impossible for him to pursue his investigations either intelligently or economically. He cannot otherwise be certain that he is not wasting his time and his money in re-inventing some old device, or that the labor and thought of years may not be crowned with disappointment and failure, which might have been avoided had he been acquainted with the previous labors of others in the same field.

The present admirable system of promptly reproducing copies of each patent as issued, and selling them at reasonable rates to all applicants, went into effect July 15, 1871. Prior to that time there had been issued, in round numbers, about 115,130 patents. According to the *Official Gazette* of February 18, 1873, we find that at that date 20,400 of the back patents had been reproduced by the photo-lithographic process, while by the *Gazette* of February 17, 1874, it appears that the number had reached nearly 40,000, showing that some 20,000 had been copied during the past year, which would leave about seventy-five thousand still to be done. At this rate, the work should be completed in about four years.

Inventors and others interested, have experienced such immense benefits from the facilities afforded them by the work already done, that they are eager to have the whole completed at the earliest possible moment. As far as our own constituency are concerned, we are happy to be able to inform them that the electrical class, consisting of nearly 900 cases, is making rapid and satisfactory progress, and will probably be ready within two or three months. When this is done, persons living at a distance will be able to cheaply and speedily procure copies of references given by the office in examining applications for patents; or, if desirable, procure copies of everything that has been patented in any particular subject—often a matter of the utmost importance.

Notwithstanding all that has been done, there has been much complaint, and justly so, among inventors and others doing business with the office, at the slow rate of progress which is being made in this work, when its importance and necessity are so universally acknowledged. But the fault does not lie, as some of our correspondents seem to think, with the Commissioner. The true explanation is that the amount of

work that this official can have done is limited by the appropriations Congress allows him—we cannot say gives him, for, as far as we can ascertain, the Government never gives anything to the Patent Office. The fees paid by inventors are more than sufficient to support the office, and Congress simply directs the Commissioner as to how much of the surplus he may spend. As an example of this, we would call attention to the following figures from the report of 1873:

Amount paid for photo-lithographing back issues.....	\$52,485. 3
Amount received for copies.....	67,171.32

Thus the Government actually makes a profit on the needs of inventors—a class usually of limited means, yet one that contributes perhaps more than any other to the comfort and advancement of society.

We hold that it is a gross injustice to inventors for the Government to make the Patent Office a source of profit. The surplus should either be reduced by reducing the fees, or it should be expended solely for the benefit of inventors in improving the facilities of the office, and, as a natural consequence, the character of the work performed by it. No one, so far as we know, asks to have the fees reduced, but every inventor has a personal interest in the prosecution of the work we have referred to. Nor should this work cease when the back drawings are all published. The office should also take up another matter, scarcely second in importance to that already mentioned: that of preparing a series of separate digests of each of the 144 classes into which experience has shown that patented inventions naturally group themselves. This has already been done by the British Government, and should be done at once by ours.

On the 1st of January, 1874, there stood to the credit of the Patent Office in the United States Treasury the sum of \$806,124.21. This surplus fund has accumulated from fees paid by applicants for patents. We demand, as we have a right to, that every cent of this fund be judiciously appropriated and expended for the benefit of the office and the inventors of the country. The appropriations for reproducing the back patents ought to be doubled, and at least \$100,000 ought to be allowed for this purpose during the coming year, in order that this most necessary work may be pushed to speedy completion. The preparation of the digests above referred to ought also to be commenced at an early day, and completed without unnecessary loss of time.

Even in the present state of public feeling in regard to retrenchment and economy, Congress need have no fear that the country will find fault if liberal appropriations are made for carrying on the work of the Patent Office. It is the universal opinion that the money will be honestly and judiciously expended under the present administration of the office. Indeed, if Congress fears to make such seemingly large appropriations, it can at least authorize the Commissioner to expend for this purpose all the moneys actually received for copies of patents. This would merely be taking the money intrusted to the government by inventors for a specific purpose, and using the whole of it for that purpose, instead of, as heretofore, using only a part of it and turning the rest into the surplus fund.

Representing, as we do, a large class of inventors whose labors have perhaps done more to facilitate the transaction of commercial and manufacturing business throughout the world than any other that could be named, and fearing that, under the influence of the universal cry for retrenchment, Congress might be induced to withhold from the Patent Office money that not only rightfully belongs to it, but is imperatively needed for the protection of the interests of the class from whom it was originally derived, we have felt it a duty to devote considerable space to the proper presentation of the matter, feeling certain that nothing more than an adequate knowledge of the facts will be needed to prevent the ill effects that would certainly follow from hasty and injudicious legislation.

Valuable Contributions.

We print this week another of the series of articles on the *Elementary Principles of Electrical Measurement*, by Mr. F. L. POPE, which has met with such a favorable reception and appreciation. It will be found not less interesting and valuable than those which have preceded it. We are much gratified at the evidences which we are constantly receiving that these and similar contributions to the columns of THE TELEGRAPHER are read and appreciated by the fraternity generally. They impart information and instruction of the greatest use to all telegraphers, and will increase in value and interest as they progress. Other contributions of a like practical and scientific character are arranged for, and will appear during the present volume.

We are encouraged to believe that THE TELEGRAPHER is doing a good work in educating the practical telegraphers of the country up to a higher professional standard than they have hitherto generally attained, and that this fact is beginning to be appreciated.

Notwithstanding this we do not propose to relax our efforts to make the paper a complete record of telegraphic news and information, and to enliven its columns with the lighter and more amusing incidents of telegraphic service, giving also due place and prominence to the correspondence on matters of practical personal and professional interest. In short, we are striving to make THE TELEGRAPHER a journal of so much importance that no telegrapher or electrician can afford to be without it.

The Operator.

We have received the second number of a new telegraph journal, entitled *The Operator*, published in this city by Messrs. SAMUEL L. WELP and THOMAS ALLEN, Western Union employes. It is a neatly printed paper, published bi-monthly, and is devoted to personals, squibs, etc., relative to Western Union employes in this city and elsewhere. It is of the same class as *The Switch* and *Fraternity* of Chicago.

Personals.

AN old friend wishes to learn the present address of Mr. J. A. WRIGHT, who was agent and operator at Centreville, Crawford County, Pa., on the Oil Creek Railroad in 1866-67. He left there to engage in the lightning rod business, with headquarters somewhere near Chillicothe, Ohio. Any person knowing his present address is requested to communicate the same to the editor of THE TELEGRAPHER.

Mr. C. W. PRICE, formerly manager of the Pennsylvania R. R. telegraph office, at 526 Broadway, New York, has resigned, and established a general railroad, steamboat, steamship and telegraph office at Barnum's Hotel, Twentieth street and Broadway, connecting with the Atlantic and Pacific Telegraph Company.

Mr. B. M. DAMON, formerly freight clerk and operator, J. L. & S. R. R., East Saginaw, Mich., has resigned and accepted a situation on the Canada Southern R. R.

Mr. J. E. WEIRMAN has accepted a situation as freight clerk and operator of the J. L. & S. R. R. at East Saginaw, Mich.

Miss JENNIE TURNER has accepted the position of agent and operator at Crawford station J. L. & S. R. R., vice Mr. CORBETT transferred.

Mr. J. E. CORBETT has been transferred from Crawford station J. L. & S. R. R. to Gaylords, Mich., as agent and operator for the same road.

Pass Him Round.

Mr. WILLIAM MCCALLUM, an Englishman who was employed as operator for the Atlantic and Pacific Telegraph Co., at the Park Hotel office in this city, recently departed unceremoniously for parts unknown, a defaulter to the company for between eighty and ninety dollars, receipts of the office. Any information in regard to his present whereabouts would very much oblige the company. What makes the case particularly outrageous is that the situation was given to him in order to enable him to live through the winter, he being destitute and dependent upon the kindness of friends for subsistence previously. Pass him round.

The Telegraph.

The Kansas City Metropolitan Telegraph Company.

KANSAS CITY, Mo., has a city telegraph line under the above title, which is connected with the hotels, pork packing houses, stock yards, city telegraph office and the suburbs. It is intended by the company to extend the line this spring, open up a number of new offices in business houses and generally increase the usefulness of the institution, which is already extensively availed of by many business men. The President of the company, Mr. Wm. A. Smith, formerly of Cincinnati, is a prominent business man and banker of Kansas City, and the Superintendent and Manager is Mr. D. A. Williams, a practical and experienced telegrapher.

The Proposed Texas Military Line.

THE Chief Signal Officer informs the House that the proposed military telegraph line in Texas would be 1,275 miles long, and would cost \$100 per mile, provided the soldiers construct it. To keep it in repair, he estimates, would cost \$8 per mile annually. Both the military authorities and the Texas delegation are urging the construction of the telegraph as a means of protecting the frontier against Indian raids.

Foreign Telegraphic Notes.

THE Brazilian Submarine Telegraph Company (Limited) have notified that their cable between Madeira and St. Vincent is expected to be laid in March, and that on the announcement of its opening for traffic, pending the restoration of the Madeira-Lisbon section, messages for South America and the Cape of Good Hope will be received to be sent by wire to Lisbon, thence by post to Madeira, from there to St. Vincent by telegraph, and finally by post to their destination. The rate from Great Britain for messages of twenty words to St. Vincent will be £2 17s. 6d., including agency and postage. When the Lisbon-Madeira section is restored the messages will be sent direct by wire from England to St. Vincent, and thence by post at the same rates, with an additional charge for postage of 1s. 6d.

The electric telegraph is being extended to the Midland districts of South Africa, and will thence be continued to the Diamond Fields, and probably further on to the Gold Fields.

Telegraphic and Electrical Brevities.

THE operators at the Bennaventura street, Montreal, Lachine Junction, Broekville and Belleville stations of the Grand Trunk Railroad now work eight hours per day only. The change is duly appreciated by them.

Parties in Oregon are memorializing Congress to pass the bill, now pending, authorizing the Portland, Dalles and Salt Lake Railroad and Telegraph to be constructed—the Government to pay interest on the bonds authorized by the bill to be issued by the company. These memorialists claim that the road will be of national interest, but similar claims have been often set up before, and lately have all been denied. From present indications the bill, in its present shape, will not be passed.

Electrical Construction and Maintenance Company, of San Francisco, Cal.

THE Electrical Construction and Maintenance Company, of San Francisco, Cal., having a very modest beginning two or three years ago, has rapidly extended and developed into an important enterprise, and now furnishes the larger part of the electrical and telegraphic apparatus and material for the Pacific coast. The capital of the company is \$100,000, and it at present furnishes employment to thirty-five men, and occupies the entire third story of the building, No. 134 Sutton street, covering an area of 66 by 120 feet. Of this company Mr. George S. Ladd is President, and Mr. Stephen D. Field, Secretary and Electrician.

Dots and Dashes in the Stock Exchange.

THE bulls and bears readily take a fancy to anything that produces a noise. For this reason they have entered heartily into the manipulation of "Snapper" sounders.

This novelty soon became generally known among the brokers, and so rapidly did they multiply and so vigorously were they worked, that the noise became so exercising as to interfere with the transaction of business.

A fine of five dollars was then imposed upon any member of the Board who was detected in the act of working one of these sounders.

This tended to increase the nuisance, as the members

exult in violating a rule of this kind. They now work them in their pockets, or lay them on the floor and perform that celebrated act known among telegraphers as "writing with their feet."

It was expected that the Governing Committee would pass a rule for the suppression of this telegraph college, but the President of the Exchange is now busily engaged in learning the alphabet, so the law will probably not be enacted until he gets tired of it.

Why is electricity like the police when they are wanted? Because it is an invisible force.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each: Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended February 3, 1874, and bearing that date. 146,996.—TELEGRAPH-INSULATOR. Peter Eby, Salisbury township, near Kinzer's Post office, Lancaster county, Pa. Application filed August 5, 1873.

A sectional insulating plug, through which the wire passes, is secured by a groove which fits over a flange in a cylindrical vertical holder formed to shed rain from the wire, which is fastened from slipping by a leaden or other non-conducting wire.

1. The metallic cylindrical holder D, having an internal flange, E, open at e, and provided with a projecting water-table, d, below, and with cap or lid, G, to cover the top, together with the arm H of the holder, in combination with an insulator made in two sections, A B, and inserted vertically into said holder, substantially in the manner and for the purpose specified.
2. In combination with the flange cylindrical holder D E e, the sectional insulator A B, when inserted vertically with its sectional groove M horizontal and below the holder, and securing the ordinary wire W by means of a non-conducting and non-corroding material like leaden wire, passed through perforations N, made in said sections, the whole jointly connected, and operated in the manner and for the purpose mentioned.

147,020.—APPARATUS FOR LIGHTING GAS BY FRICTIONAL ELECTRICITY. John P. Putnam, Boston, Mass. Application filed July 5, 1873.

The turning of the gas cock rotates the electrophorous, brings the burner in proper relation to the conducting wires for being lighted, and immediately afterward separates the wires from the flame.

1. In an apparatus for lighting gas by frictional electricity, the combination of the following elements, viz.: The gas pipe G, the rotating tube T, cock J, electrophorous and conducting wires L L', arranged and operating substantially as and for the purpose set forth.
2. The combination of the hermetically closed case Q and the rotating tube T, passing through said case, and terminated at its lower end by a conical gas cock, J, substantially as and for the purpose set forth.
3. The combination of the rotating tube T, projecting pin P'' cog wheel W'', provided with the pin P', or its equivalent, cog wheel W', conducting wires L L', sockets Z Z', and spring S'', substantially as and for the purpose set forth.
4. The conducting wires L L', having their ends curved to conform to the shape of the chimney, all parts of said arms being removed an equal distance from the flame, these outward movements being limited by said chimney, substantially as shown and described.
5. The combination of the rotating gas tube T, insulating tube T', rotating disk D, square tube T'', disk D', square tube T''', pin P', wheel W, pulleys Y Y, cover C, and cords X X, substantially as described.

147,183.—PRINTING TELEGRAPH. John E. Smith, New York, N. Y. Application filed May 15, 1873.

Two line wires; type wheel magnet in one circuit; printing, unison, and an additional coil, reverse to main coil, on type wheel magnet in other circuit, which is normally closed, being broken only to throw in unison D' e. While a resistance is in circuit the current cannot energize printing magnet, the printing being affected by cutting resistance out by K'.

1. The insulated screw o and wires n' n'', in combination with the helices C1 C1 and the lever D, essentially as herein set forth.
2. The magnet C2 and the lever D', in combination with the pin e and the key K, substantially as specified.
3. The key K', situated in a shunt circuit of the resistance F, to cut the same out of circuit, essentially as described.
4. The combination of the magnets C2 C3 and the helices C1 with the circuit n and the resistance F, substantially as specified.
5. The combination of the magnets C2 C3, the lines m and n the wheel E, the arm J, and the key-frame or ring H, essentially as described.
6. An inking wheel, the body of which is composed of cork covered with cloth, substantially as and for the purposes specified.

147,186.—MORSE TELEGRAPH REGISTER. John E. Smith, New York, N. Y. Application filed May 2, 1873.

Pad or spring E on armature lever stops clockwork by friction while circuit is closed. Speed governed by pallet D instead of fly.

1. The pad or spring E, in combination with the lever F of an electro-magnet and the clockwork of a recording telegraph, substantially as and for the purpose described.
2. The pallet D, in combination with the pad or spring E, the lever F, and the clockwork of a recording telegraph, essentially as herein set forth.

Married.

HUNTINGTON—SWAYZE.—In Forestville, Mich., Feb. 23, 1874, Mr. GEO. E. HUNTINGTON, train despatcher, M. C. R. R., J. L. & S. Division, Saginaw City, Mich., to Miss GUSTA A. SWAYZE, of Forestville.

WANTED.—

FIRST CLASS TELEGRAPH INSTRUMENT MAKERS, to work by the piece. Only the most competent need apply, and must be well recommended. Compensation will be liberal and living is cheap.

CANADIAN TELEGRAPH SUPPLY MANUFACTURING COMPANY,
Toronto, Ontario, Canada.
P. O. Box 1421.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

WATTS & CO.,
47 HOLLIDAY ST., BALTIMORE.

OUR ILLUSTRATED CATALOGUE NOW READY.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.
Acknowledged to be a decided improvement.
Price, same as the ordinary key.
Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

Lawrence, Mass.,	Toledo, Ohio,
Lynn, Mass.,	Toronto, Canada,
Mobile, Ala.,	Washington, D. C.,
Montreal, Canada,	Worcester, Mass.,
Milwaukee, Wis.,	

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OR

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. BOX 496.

A MERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY

HOWARD WATCH AND CLOCK CO.

E. HOWARD, & CO., Proprietors.

FOR

ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.

Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his

CELEBRATED HELICES

WHICH ARE OF

Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-500th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.

CAUTION.

All persons are hereby notified that Batteries infringing upon our patents are in the market (some of them nearly worthless). The public are warned against using any such infringements, as in every case the guilty parties will be prosecuted to the fullest extent of the law. The genuine Batteries have the words "Pile Leclanché" on the carbons and glasses. Any information concerning such infringements will be thankfully received by the
LECLANCHÉ BATTERY CO.,
No. 40 West 15th Street.

New York, October 11, 1873.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard. Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.
See our advertisement in other columns.

WATTS & CO., Baltimore.

THE BEST TELEGRAPH MATERIAL IN THE WORLD

IS SUPPLIED BY

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.

With each Instrument is furnished

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

COMPLETE OUTFIT, WITH BATTERY, CHEMICALS
AND MANUAL,
Seven Dollars.

Sounder and Key only..... 6 00
" " with Cut-out and Lightning Arrester... 7 00

SHAFFNER'S
TELEGRAPH MANUAL.

TO TELEGRAPHISTS.

I am now revising my "TELEGRAPH MANUAL," and desire to make the work complete in its description of the present state of

TELEGRAPHIC SCIENCE AND ART.

There are some *Six Hundred and Twenty-five* Illustrations in the Edition of 1859, and the present coming Edition will contain at least *One Thousand*, descriptive of the latest improvements.

At present it is my design to issue two Volumes, containing about 600 pages each, separating the Historical from the Operative.

I will thank any one for information suitable for such a work. Would like drawings and description of apparatuses.

Respectfully,

TAL. P. SHAFFNER,
78 and 80 Broadway,
NEW YORK.

MODERN PRACTICE OF THE ELEC-
TRIC TELEGRAPH.

S. BISHOP, Proprietor,
ONLY MANUFACTURER

OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,
FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deliv-
ered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,
have been appointed by me GENERAL AGENTS for the sale of
any Telegraph Cable or Wire manufactured at the Works in New
York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods man-
ufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
sale in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway,

Testing Leaky Lines for Insulation and Conductivity.

A CORRESPONDENT OF THE TELEGRAPHER, who signs himself "Ped," in speaking of the testing of leaky lines for absolute insulation resistance, says:

"To arrive at the absolute resistance of a certain number of insulators with a definite battery power, it would be necessary to have them placed close together and all connected by a wire of no appreciable resistance. In practice, however, they are not so placed, and although every insulator may be exactly equal in resistance, yet, by virtue of their unequal distances from the testing station, no two will conduct the same amount of electricity from the line to earth; or, in other words, under these peculiar circumstances, no two will be equal as insulators."

This is a correct statement of the actual facts in the case; but it does not seem to be quite clear to "Ped" that the precise object of Schwendler's and other similar formulas is that of determining the true resistance of the insulators, by eliminating from the result of the observed measurement the error introduced by the resistance of the line through which the insulators are measured.

For example: suppose we take a line insulated upon common glass, 100 miles in length and having 30 poles per mile. After an exposure of two or three years, such insulators would give, in a heavy rain, a resistance of say 10,000,000 units each. The actual resistance of the insulation of the whole line would, therefore, be

$$10,000,000 \div (30 \times 100) = 3333 + \text{units.}$$

But as each insulator is measured through a greater or less length of line wire, it is obvious that the result obtained by measuring the line from one end with the other end open would be considerably in excess of the true resistance of the insulation. The elimination of the true from the apparent insulation resistance can only be performed with entire accuracy by the aid of the calculus; but in practice a sufficiently close approximation is obtained if we consider the total escape to be concentrated at a single point, midway of the line, and it is upon this supposition that the formulæ are usually based. Thus, in the case above referred to, let A B

represent the line of 100 miles. The conductivity resistance will be, say, 2000 units. The total insulation resistance of 3333 units is supposed to be concentrated at a. Therefore, if we test this line from A, leaving it open at B, the apparent insulation resistance will be

$$\frac{2000}{2} = 1000 + 3333 = 4333.$$

The apparent conductivity resistance when the line is to ground at B, becomes a simple case of joint resistance; therefore

$$\frac{1000 \times 3333}{1000 + 3333} = 769 + 1000 = 1769.$$

Having thus found by calculation what the resistance should be when measured from A, first with B open and then with B to ground, let us reverse the operation and work out these measurements by Schwendler's formula, viz.:

Let R=apparent insulation resistance;
" r = " conductivity "

then the corrected conductivity resistance R' will be

$$R' = \sqrt{R(R-r)} \quad (1)$$

and the corrected insulation resistance (L) will be

$$L = 2(R - \sqrt{R(R-r)}) \quad (2)$$

Applying these formulæ to the case under consideration we get the following results:

Subtracting 1769 from 1433 leaves a remainder of 2564, which multiplied by 4333 gives us 11109812, the square root of which last is the value of R'.

$$R' = 3333 +$$

To find the value of L in equation (2) we subtract the value of R' from that of R and multiply the remainder by 2.

$$4333 - 3333 = 1000 \times 2 = 2000.$$

Thus it will be seen that Schwendler's formula gives us the same numbers with which we originally set out, and, therefore, enables us to deduce the absolute resistance of the line wire and also that of the insulation from the observed measurements—upon the supposition, of course, that the resistances are practically uniform throughout the length of the line.

Now let us look at another case lately referred to the writer by a correspondent. A line of 93 miles, from A to a, is upon one kind of insulators, and on a section beyond this, of 6 miles, from a to B, another kind is used.

The following are the recorded tests from A:

Open at a.....14140 units.
" " B.....10740 "

The conductivity resistance is not given, nor the test to ground from which it might be deduced. We will assume it to be 18 units per mile.

It is required to know the mileage insulation resistance from A to a and also from a to B.

By Varley's formula, to be found on page 37 of Haskins' work:

$$\begin{aligned} \text{Let } 2x &= (\text{as above}) 93 \times 18 = 1674. \\ " R &= \text{do.} \quad 14140. \\ " R' &= \text{do.} \quad 10740. \end{aligned}$$

Also:

Let y = apparent insulation resistance of the second section, from a to B.

Let l = true insulation resistance of the first section, from A to a.

Supposing, as before, that all the escape of each section of the line is concentrated in the middle, then:

$$R - x = 1 \quad (3)$$

$$R' = x + \frac{1(x+y)}{1+x+y} \quad (4)$$

$$y = \frac{(R-x)l}{R-R'-x} \quad (5)$$

Transposing and substituting known numerical values in the above equations:

$$\begin{aligned} l &= 13303. \\ y &= 51212. \end{aligned}$$

Deducting half the conductivity resistance of the second section from y, gives its true insulation resistance (y'):

$$y' = 51158.$$

Multiplying these results by the number of miles in each section gives us the true mileage insulation:

For the first section.....1,237,179 per mile.
" second " 306,948 "

As your correspondent says, these tests ought to be taken with the same battery power as that ordinarily used to work the line.

The formula at the bottom of page 40 in Haskins' book should be $\frac{L+S-R}{2} = G$. Schwendler's formula

(page 39) should also be $L+2R - \sqrt{R(R-r)}$. The minus sign before the radical has been left out by a mistake of the printer. F. L. POPE.

Elizabeth, N. J., March, 1874.

On Working Wires of Different Resistances from a Single Battery.

SOME months since I was handed a letter from a chief operator in a western city, making certain enquiries in regard to the best method of working wires of widely varying resistance from a single battery. As this problem is one of frequent occurrence, and one of considerable practical importance, no apology is needed for presenting a short discussion of it in the columns of THE TELEGRAPHER.

It appears that the party referred to, upon taking charge of the wires in a large terminal office, found a single main battery employed to work the long circuits of some 300 miles, while a city line of moderate length was supplied by a separate battery of 18 cups. He changed the arrangement by adding these 18 cups to

the other main battery, and then attaching all the wires, including the city wire, to the end of the consolidated battery. He then employed an adjustable resistance, composed of two platinum plates immersed in water, by means of which the current upon the city wire was reduced to its proper strength. He states that the new arrangement works exceedingly well in practice, but that it is ridiculed by many of the other electricians of that locality, who contend that he should have "tapped" the main battery for the city line by attaching it at a distance of 18 cells, or thereabout, from the ground wire. He therefore writes to know who is right in the matter, and why.

Under the circumstances there is, of course, no doubt that the consolidation of the batteries was a good move, as the effective strength of current on the main circuits was considerably increased. The question is which is the best way of supplying the current to the city wire; whether to attach it at the end of the battery and reduce the current to the required strength by a resistance, or to "tap" the main battery at the proper point in the manner usually practiced?

The inquirer does not give the length of the city line, nor the number or kind of cells in the large battery, but this is, perhaps, not essential. Let it be assumed that the battery is a Grove; that there were originally 72 cells of battery, working three circuits of 300 miles each, and a battery of corresponding strength at the other end of each circuit, and that the city circuit with its instruments was equal to 50 miles of line, with no battery at the other end. Suppose each 300 mile circuit had 10 instruments of 200 units resistance each. This may not correspond with the facts in this particular case, but will serve to illustrate the principle.

If we call the resistance of the line wires 20 units per mile we have for each main wire:

$$\begin{aligned} 300 \text{ miles} \dots\dots &= 6000 \text{ units.} \\ 10 \text{ instruments} &= 2000 \text{ "} \end{aligned}$$

$$\text{Total} \dots\dots = 8000$$

The battery resistance, being comparatively very small, need not be taken into consideration.

For the city line we have:

Resistance of line and instruments, 1000 units.

Applying Ohm's law, that the strength of current in any circuit is found by dividing the electro-motive force by the resistance, we find the strength of current in each circuit on the original arrangement to be as follows:

$$\text{Joint resistance of 3 circuits } \frac{8000}{3} = 2666.6$$

$$\text{Strength of current leaving battery } \frac{72}{2666} = .027$$

This is divided between 3 circuits, which gives per circuit .009.

As there is supposed to be an equal battery at the other end of each circuit, the total strength of current in each of the long circuits would be .018.

$$\text{The short circuit would be } \frac{18}{1000} = .018 \text{ also.}$$

Now, if we add 18 cups to the original series of 72 cups, and transfer the city wire to the end of the consolidated battery, inserting a resistance of say 4,000 units, we shall have the following result:

Joint resistance of 3 long circuits (as above), 2666.6

" " " the 4 circuits.....1739.

$$\text{Current leaving battery } \frac{90}{1739} = \frac{90}{1739} .0517$$

This will divide between the four circuits in inverse ratio to the respective resistances as follows:

Current on city wire......018

" " each long wire......011 +

But each of the long wires is supposed to have 72 cups at the opposite end, giving a current of $\frac{72}{8000} = .009$

Add current from this end......011

Total current in each long wire......020

Therefore by this arrangement we get the same strength of current on the city wire (.018) that we originally had, while on the long circuits we get .020 instead of .018; an increase of more than 10 per cent.

Now take the other arrangement, viz., that of tapping the battery for the city wire, at a proper distance from the end, leaving 72 cups of the 90 working 3 wires, and the remaining 18 cups working 4 wires.

Joint resistance of all 4 wires.....727 units.

$$\text{Current from the 18 cups } \frac{18}{727} = \dots\dots.0246$$

The current produced by this portion of the battery will divide in the ratio of the respective resistances. The short line will get .0178, and the remainder, .006, will go to the 3 long wires.

The current of the 72 remaining cups will all go to the 3 long wires, which, as we have before seen, have a joint resistance of 2666. Dividing the number of

cups (72) by this, gives a quotient of .027, which, added to the balance of the current from the 18 cups, which we have found to be .006, gives a total for the 3 wires of .033, or .011 for each wire from the home battery, which is exactly what we got by the other arrangement. The strength on the city wire is a trifle less than before, only because the point at which the "taps" should be attached is between the 18th and 19th cups, while if placed between the 19th and 20th the current on this wire would be a trifle greater than in the first arrangement.

We find, then, that in theory it makes no difference which method is adopted for working a short wire out of the same battery that long wires are worked from. Practically the adjustable resistance would be the best, because an equal amount of work would be thrown on every cell in the battery, while with the "tap" arrangement the 18 cups would be worked much harder than the rest, and, under ordinary management, this unequal action is apt to give rise to waste of material.

F. L. POPE.

Elizabeth, N. J., March, 1874.

The Telegraphers who Disgrace the Profession.

BY DIOGENES.

AMONG the thousands engaged in telegraphic pursuits it is inevitable that there should be some who are a disgrace to the fraternity whose misfortune it is to include them among its members. The number of these among telegraphers is probably not larger, if so large, as in other professions, but all who have been engaged in the business can recall one or more of this class. There are various gradations even in this class, and those who are utterly worthless and contemptible are, fortunately for the credit of the fraternity, exceptions, and, it is to be hoped, rare exceptions.

There are some who are the victims of their appetites, who otherwise are good hearted; and, aside from their infirmity, are not discredit to the fraternity. These are generally whole souled fellows who are unable to restrain their convivial propensities, and indulge in intoxicating liquors, whenever they can be procured, to such an extent as to make them worthless and unreliable. This type is not so common now as in former times, when telegraphy was more of a Bohemian character than at present. They do not find it so easy to obtain situations as formerly, and when they do temporarily obtain employment their weakness soon sets them again afloat.

There are a few telegraphers who seem to be steeped in meanness and malevolence as to make them simply detestable, and whose early demise would be no misfortune either to themselves or the profession. They are a pest and nuisance to any office or line which may afford them temporary employment, and whenever one of them effects a lodgment, there is always more or less difficulty and dissatisfaction. Utterly heartless and selfish, they are continually striving to embroil their associates with each other and their employers, either from inherent depravity or in the hope in some way to profit thereby.

The worst case of this kind that can be recalled by the writer is well known to many of the readers of THE TELEGRAPHER, and it is some satisfaction that his true character has become so well known that it is extremely difficult now for him to obtain or retain a situation on any telegraph line. Of a mean and cowardly disposition, he is always seeking to undermine his associates in hopes of obtaining, which, fortunately, he never does, advancement and profit at their expense. He has been employed in many offices, his exit from which has been generally against his own desire and greatly to the joy of those who have been so unfortunate as to be compelled to associate with him for a time. Usually, after a short sojourn in an office, his companions ignore him as completely as the exigencies and requirements of the business will permit. Had he courage equal to his malignity and meanness he would bear about with him continual and forcible reminders of the indignation of those whom he has slandered and abused. While his conduct to his associates has been as mean and disgraceful as possible, he has been unremitting in his efforts to excite dissatisfaction and make trouble between the employers and employes of the lines on which he has been employed. No slander or abuse of his superiors has been too base for him to be guilty of, and, until his real character had developed itself, he succeeded in keeping in constant difficulty all with whom he was brought in contact. His flaming and bloated countenance proclaims unmistakably his devotion to the bottle, and his hogghish propensities and unlimited feeding capacity make him alike the terror and disgust of boarding house and hotel keepers and their guests.

The Telegraphers' League afforded this fellow an excellent opportunity to gratify his malevolent disposition, and he was one of the first who sought to embroil his fellows and the company by which they were employed. He was of course "a striker," and, of

course, after a few days, betrayed his brethren, and was one of the first to resume his situation in the employ of the company, who were glad to employ him as a frightful example to the others. His performance at the lunch table on his return to duty is said to have been astonishing, and there were fears that his defection would prove more costly to the company from the expense of supplying his insatiable maw with provisions than the benefit to be derived from his services at the key, or the influence of the example of his defection and perjury. Of course, in due time, when the requirement for his treachery had passed, he was ignominiously kicked out—as he ought to have been. What has become of him is unknown, but it is to be hoped that he has found his appropriate place, as a bar tender, or at some more degrading employment even.

This is an extreme case, it is true, and it is to be hoped that there are no others as bad. It shows, however, the possibility there is for such fellows to obtain entrance into, and for a time, some sort of standing in an honorable business.

There are others who disgrace the profession by an utter incapacity to properly discharge telegraphic duties. These drift about from line to line, and from office to office, seldom succeeding in long retaining a situation anywhere, always ready to accept any sort of a situation, at any rate of compensation. The worst effect of these is in regard to salaries. As they are glad to obtain situations at any price that may be offered—although at any rate which may be paid they are the most expensive employes that can be had—they prevent better and more capable operators from obtaining such compensation as their ability and services entitle them to. Many of this class are graduates of telegraph schools, so-called, who, having invested more or less in the attempt to obtain a telegraphic education, consider that for the rest of their lives telegraphy is bound to supply them with the means of prolonging their miserable existence.

It is hardly necessary to go on and detail all the different classes who, for various reasons, are a disgrace to the profession. The application of what has been said is not difficult of comprehension. It is that all competent and respectable telegraphers should seek to weed them out and exclude them permanently from the profession. This can be done by united action, and a standard of personal and professional character be established, which shall be for the credit and interest not only of the fraternity but also of the companies by whom they are employed, and of the public who are compelled to daily and hourly entrust to them the most vital and important interests.

Prominent Telegraphers of Elizabeth, New Jersey.

It seems to be a fact that Elizabeth is gradually becoming a resort for telegraphers, and among those residing here we find a number who are very prominent and whose names are as familiar among the fraternity as though bound by relationship. They are drawn here partly by personal solicitation, and partly by a desire to be brought in closer intercourse—a thing easily accomplished by the establishment of telegraphic communication between their several residences. Quite a few are already provided with this mode of communication, by a wire which starts near the corner of Morris avenue and Cherry street, and follows Cherry street southwardly, dropping in the residences of telegraphers in different parts of the city.

A visit among these "Knights of the Key" reveals many interesting and amusing arrangements provided for domestic use. At one place we find an electric bell, which creates an infernal racket if the room gets too hot or cold. At another we find a sort of electrical attachment on a dog—at least that is what it really amounts to. You proceed to open the outside gate, not cognizant that you are setting a trap for yourself. When behold! a two hundred pound dog appears on the steps and demands your card of admittance. This is brought about by means of an electric bell, worked in connection with the outside gate, which alarms the dog in the cellar. Gaining admittance, we find many more interesting arrangements provided for the protection and use of the family, such as burglar alarms, call bells, etc.

This, it is needless to say, is the residence of Mr. F. L. Pope, one of the acknowledged heads of the fraternity in this country. Mr. Pope has been connected with the business many years, and has manipulated, in his time, the Phelps, Halse and Hughes' Printing Telegraph, and the Morse and Bain Recording Telegraph; is the author of "Pope's Modern Practice of the Telegraph," the standard work of telegraphy in this country—also scientific editor of THE TELEGRAPHER; was commander of the American expedition to Alaska to survey the route for the proposed Russian telegraph. He has lately invented and patented several printing telegraphs and railroad signals. One of his signals has recently been placed at the crossing near the South Elizabeth station.

Mr. A. S. Brown, of this city, is likewise a "shining light," and said to be one of the fastest Morse receivers in the world. We are knowing of several trials of skill, in which he distinguished himself, and for which he will long be remembered. Mr. Brown was formerly operator on the old Albany and Buffalo lines, and, notwithstanding the many consolidations and changes that have taken place, he has gradually risen and now holds the management of the largest telegraph office in the country—corner of Broadway and Liberty street, New York.

D. R. Downer, also a resident of this city, is an old and well known telegrapher. Not being of a roving disposition, he may not have that extended acquaintance that others enjoy. Nevertheless, he is a first class operator, and well known to the fraternity through the Eastern and Southern States. He occupies the position of chief operator at Broadway and Liberty street, which is a position requiring all the qualifications for which he is noted.

R. W. Pope, of Cherry street, is connected with the Gold and Stock telegraph of New York; has been connected with the business for many years; was Quartermaster of the Telegraph Expedition to Alaska; organized the famous Telegraphers' League, and was twice elected Grand Chief Operator, the highest position in the gift of the fraternity. Recently he invented the "Snapper" sounder, which is having such an immense sale, and which is frequently to be heard on the cars and ferry boats.

Henry Van Hovenburgh, a late arrival, is a young telegrapher, but extensively known through the medium of his inventions. A few years ago he invented a peculiar and simple printing telegraph instrument, pronounced by competent electrical engineers to surpass anything of the kind in use. It was purchased, we believe, for \$10,000, by the Gold and Stock Telegraph Co. Mr. Van Hovenburgh is also the inventor of the "Rattler" sounder.

H. W. Pope, of Walnut street, is assistant superintendent of the American District Telegraph Company—a corporation organized for police, fire and messenger service in New York. The company employ 350 boys, a large number of policemen and have 2,600 signal boxes in stores, offices and residences in New York City. Mr. Pope is an old operator, and was formerly chief operator in the Private Line Department of the Gold and Stock Telegraph Company. Mr. Pope was a candidate for the superintendency of the Elizabeth Fire Telegraph, with a view to the establishment of a Police Telegraph in this city.

Jos. E. Fenn, of Orchard street, is an operator, and was formerly manager of the Atlantic and Pacific Telegraph in Brooklyn, afterwards Superintendent of the Gallagher Gold and Stock Telegraph Company. He was lately appointed General Superintendent of the Automatic Fire Alarm Company. This company is connected indirectly with the Board of underwriters of New York, and is one of the best arrangements for protection against fire that could be devised. The company's alarms are connected with the three Insurance Patrols. The instruments work on the principle of expansion and contraction by which an electrical signal is given—which indicates the building and the floor where the fire exists. The company are meeting with great success, and it has already become one of the leading enterprises of the day.

C. H. Walton, an old resident of the city, was formerly manager of the Elizabeth telegraph office. He is well and favorably known, and is at present connected with the Gold and Stock Telegraph Company of New York. There are several more telegraphers residing here, all of whom are a credit to the fraternity. Unfortunately we are not familiar with their history, and therefore cannot do them the honor at the present time that we should be pleased to.—*The Elizabeth Daily Journal.*

The Anglo-American Cable.

PROMOTERS of light as well as heavy cable companies, actuated solely by the benevolent and philanthropic idea of supplying the public with cheap telegraphy, will learn with satisfaction that a suggestion which we have made on several occasions—that the existing companies have it in their power to supply the "great want of this age"—will shortly be carried into effect. We have suggested that the messages sent through the cable, like that of passengers on the railways, might be divided into classes, and transmitted at greater or less speed as required. For some messages time is the essential element, and it is most important that they should reach their destination as quickly as possible; others, again, have not the same pressing importance, and can afford to wait their turn. For some hours in the day the pressure of business on the wires is very great, and such of those as are necessary to be sent with all possible despatch might be treated as "express" messages, upon which full rates should be paid, while others of a less urgent character might be sent at lower rates. By the summer of this year it is anticipated that the existing company will have four

cables available for messages; and we learn from the circular of Mr. Abbott, given on another page, that the company may then allocate two of the lines for ordinary messages at low rates—say, one shilling per word—while “for the commercial public, who value instant communication, and to whom a few minutes may be of vital importance, the two remaining cables could then be specially reserved for express service at express rates—thus introducing into the telegraph system the principle of a special rate, which would be freely paid for on an exceptional and instant service.” With such facilities as are possessed by the existing company the competition of a company owning only one cable would be out of the question, and the public would be infinitely better served than by rival companies. The competition of two companies would inevitably end, as in the case of railways, in combination, which would only be effected after the outlay of additional capital, which, in its turn, would absorb its proportion of the profits of the business in addition to that required to pay moderate dividends upon the capital already invested. Should the Anglo-American Company adopt the system of classification, it would secure to itself complete command of the telegraphic business, the public would be infinitely better served, while much disappointment would be spared to those who might be tempted by glowing prospectuses to invest in experiments which, if as successful as investors and promoters could desire, would still be far below the standard of perfection at present attained, and, if unsuccessful, would be attended with serious loss and disappointment to the investors as well as to the public.—*The Railway News.*

The Southern Telegraph Institute of Louisville a Humbug.

THE Southern Telegraph Institute of Louisville, we presume, has through advertisements, become pretty thoroughly known. It has been in existence about two years. It is now published by the Louisville papers as a grand swindle. C. W. Crozier, Jr., who has been a student there, passed through this city yesterday en route for his home in Knoxville. He says his experience with the concern cost him \$200. While he was there about 50 students were in attendance. The institution had proposed to teach the art in three months and furnish situations. He states that they did not pretend to fulfil the latter part of the obligation, and proved themselves incompetent to fulfill the first part. When this was discovered, about a month ago, Mr. Crozier says a party of the students had the proprietors arrested for obtaining money under false pretences, and placed under bond not to issue any more circulars or advertise their establishment. Mr. C. and three others also brought an action for damages. This is not yet decided. Many young men from various places have gone to that institution to learn the art of telegraphy—some from Texas and other States. It is a pity the outrageous swindle has not been long ago exposed.—*Nashville Union and American.*

A Fast Receiver.

EVERYBODY knows Eitemiller. Here's a story that is vouched for as an actual fact: One of the Chicago boys (we suppress his name from motives of delicacy), who prided himself he was some on the “salt,” got hold of Eitemiller one evening, with a big pile of Reds. After receiving a few, Eitey blaudly asked him to hoop them in. A few minutes later, getting impatient, he told the fast man to “leave out the day of the month—I know what day it is—‘To,’ and make no periods.” Not coming lively enough then, he said: “Don't say sig, I'll know when you get there.” Even this way didn't seem to suit, for he opened again and remarked: “When they are from Chicago, don't date them; and when they are for New York, leave that out, too.” After all this cutting, he finally said, “If you don't go ahead faster I'll fall asleep.”—*The Operator.*

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion. No notice will be taken of anonymous communications.

An Admirer of Nettie Bronson.

BAY CITY, MICH., March 18.

TO THE EDITOR OF THE TELEGRAPHER.

“NETTIE BRONSON” has again been tempted to give us a communication in THE TELEGRAPHER, and, as usual, it is short and interesting. I thought it strange if her generous nature failed to respond to the many anxious individuals who have expressed themselves so kindly to her. All credit is due to that one who has showu

his good will in something so substantial and pleasing as the subscription for THE TELEGRAPHER. And through its columns may we hear from “Nettie” often! Still, we must not doubt the sincerity of “Elias” in offering to donate 25 cents. His heart was in the right place, and his generosity is only exceeded by his good looks (an actual fact). No doubt he did not wish to appropriate all the honors, and I presume that quarter of a dollar, if not already spent for tobacco—I forgot he never uses it—is carefully laid away in his pocket ready to put to a good purpose next year. If the other chap gets the start of him then, I'm no prophet. But “Nettie” don't take any interest in “Elias.” Besides the name sounding so very ancient, I rather think from his talk he has two or three intimate female acquaintances now, perhaps half a dozen, and if they are not “old maids,” I doubt not some of them are not so young as they once were.

“Elias's” suspicions are very strong that “Nettie Bronson” is a gentleman in disguise, and the bare possibility of such an outrageous fraud fairly makes his hair stand on end; but if he can only be persuaded that the signature is rightfully appropriated, I will venture to say that 25 cents will be nowhere next time. He'll do better than that if he has to go to the bottom of his pocket. I honor his motive, but counsel him to be moderate—it seems to be setting a bad example of extravagance. And, to pay him for his unjust suspicion, I hope “Nettie” will not accept of any testimonial he may make.

“Elias's” bump of courage is very strongly developed. He has the courage to say “no” when asked to take a segar. If I had a segar that I didn't want very badly myself, I might offer it to him. If I had one and had no particular desire to get rid of it, I should think myself very courageous to put it in his reach. Operators, I think, as a general thing, are quite liable to answer in the affirmative to all such questions as that.

As to that office, and “Nettie's” promise to accept me as a student. On second thought, I'm not sure that the getting of an office is a necessary condition to her taking me as a student. There might be lots of business, and I am confident I should require a great deal of attention. I also think I should make more rapid progress if there were no wires in the office at all. On the whole, I am positive I should prefer a studentship without any office. This may be what “Nettie” will call a little bit of selfishness. I hope not.

FRANKIE.

Not Talk but Action Needed.

LAKE SUPERIOR, UPPER PENINSULA, MICH. }
March 21. }

TO THE EDITOR OF THE TELEGRAPHER.

THE communication in THE TELEGRAPHER of the 14th inst., entitled “a telegraphic organization, essential to the welfare of the fraternity,” was very good. Some twenty-five or thirty just such communications have appeared in your columns, and have been read and digested by us all, but as far as I can see it don't help much, unless your correspondents will commence and establish the basis of such an organization. When once the good work is commenced there are thousands of us ready to lend a helping hand, and will work cheerfully and with a will to make it a success.

The subject has been sufficiently argued, discussed and agitated, now let us proceed to practice what so many of us have been preaching for the past year. An organization we must and will have if the brethren will only work together. “Crotzier” asks, “When will such evils as this have an end?” The answer to this question is, when we have an organization, and not until then. At present we are mere slaves to our employers, subject to their overbearing and domineering rule.

It is, indeed, time that we had an organization of some character, to protect us from the slanders and machinations of a clerk of superintendents whose only desire is to benefit themselves by curtailing our wages to the amount of our board bills. We have stood this sort of thing long enough, now let us all rise in our might and burst the bonds of slavery, for it is nothing else.

If you will give this space in THE TELEGRAPHER you will confer a favor on one who looks for better times and who is AN OPERATOR.

Consolidation of Competing Companies Practicable and Advisable.

TO THE EDITOR OF THE TELEGRAPHER.

THERE seems to be a lull with regard to telegraphs just at the present time, and telegraph managers as well as others are waiting to see what will turn up. The season of construction, reconstruction and extension of telegraph lines is at hand, and with the exception of the Southern Atlantic Company, which is pushing its lines towards New Orleans, there is little heard of internal telegraph projects for the future.

While waiting the movement of the waters, why would not this be the opportunity for effecting the consolidation of the lines and companies competing with the Western Union, which has been so persistently and consistently advocated by THE TELEGRAPHER? With such a consolidation on a fair and reasonable basis, the future of the competing companies would be assured.

It is evident that the projects for a Government telegraph monopoly are practically dead, at least for some years to come. The most sanguine of the advocates of such a monopoly concede the impossibility of inducing Congress to embark in the telegraph business. This bugbear being happily disposed of, there would seem to be nothing in the way of such a consolidation as has been proposed. Its advantages are apparent. In place of the present weak and divided councils, which leave the companies open to attack by the great telegraph company of the country, there would be a strong and powerful company which could fairly divide the telegraph business of the country. We need two independent telegraph companies in this country, and the sooner we have them the better.

These suggestions are thrown out for the consideration of the parties interested, not because they are novel, for they have often been presented in the columns of THE TELEGRAPHER, but in the hope of attracting the attention of the managers of the competing telegraph companies, who, as it is understood, separately admit the desirability of such a consolidation, and bringing to their notice the exceptionally favorable circumstances at present existing for making it.

COMMON SENSE.

On Behalf of The Telegrapher.

TO THE EDITOR OF THE TELEGRAPHER.

PERMIT me to compliment you on the decided and constant improvement which is manifested in THE TELEGRAPHER from year to year. Thus far the present volume has been a decided improvement on any which has preceded it, in my estimation, and, from the commendation which I hear on all sides, in that of others. I have been a constant reader of the paper from its first number down to the last issue, and would not be without it on any account.

I notice that the demand for the numbers of this volume has been so great that you are obliged to solicit the return of Nos. 391 and 392 from those who can spare them in order to complete files. This is a gratifying evidence that the paper is making its way against all adverse influences, and that it is appreciated. For one, I cannot understand how any intelligent telegrapher can afford to be without it, and yet in endeavoring to obtain subscribers we are met with all sorts of excuses. This ought not to be. As a practical telegrapher I feel a pride that we are represented by so able and creditable a journal. It is worthy of and should receive the active support of telegraphers everywhere. It certainly shall have mine so long as its present policy and ability are maintained. Let every telegrapher make it a personal matter to bring the paper to the attention of his or her associates, and, if possible, secure the addition of their names to its list as permanent subscribers. AN OLD OPERATOR.

A Cheap and Convenient Appliance.

TO THE EDITOR OF THE TELEGRAPHER.

I NOTICE in the *Journal* of February 15th inquiry is made, “Is there any known appliance in connection with a relay to know when circuits are in use without adjusting?”

I would state through the columns of THE TELEGRAPHER that the Montreal Telegraph Company manufacture their relays with a polarized needle attachment for this purpose; but a cheap appliance and one which is convenient and attainable for all is a common compass, which costs from ten to fifty cents. This may be placed on either of the main line binding screws of the centre relay, or on the back corner of any relay. I would respectfully urge its adoption as far as practicable on all way wires in bad weather, as it avoids much breaking and ill temper. OLE.

Answer to Correspondent.

To B. F. SPEAR, San Francisco, Cal.—Letter and inclosure received. Mailed book and letter to you March 25. Last letter to you was returned by P. O., as not being able to find you. Be sure and get these.

THE West India and Panama Telegraph Company have received intelligence, through their engineer, Sir Samuel Canning, of the complete restoration of the section of their cable between Martinique and Dominica, thus reopening for traffic the whole of the lines from Cuba to Demerara. The interruption on the Cuba Company's cable is now the only obstacle to direct telegraphic communication with the West Indies, and it is hoped that this cable will be completed shortly.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, MARCH 28, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

TENTH VOLUME.

The Tenth Volume of **THE TELEGRAPHER** will commence with the number for SATURDAY, JANUARY 3d, 1874, and will close with the year.

All the popular features of the paper will be continued, and it will be improved from time to time, as opportunity shall offer.

THE TELEGRAPHER

has now, for nearly TEN YEARS, been maintained upon its merits, and without patronage or support, other than that derived from its legitimate business, for the past five years. (Previous to that time it was partially maintained by the National Telegraphic Union.)

The TENTH VOLUME commences under favorable auspices, and it may be said that it enjoys the entire confidence of the

TELEGRAPHIC FRATERNITY,

whose organ it is and will continue to be. It is a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,

bound to, or in the interests of NO TELEGRAPHIC CLIQUE OR COMBINATION, but honestly devoted to the interests of the

PRACTICAL TELEGRAPHERS.

As heretofore, NO LABOR, TIME OF EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Terms of Subscription.

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Canada Subscribers must remit Twenty Cents in addition for Postage.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but NO advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503), NEW YORK.

A Dull Business Season.

THE business of the country continues to be to a considerable extent paralyzed. The improvement which was expected to be realized upon the opening of spring has not taken place, and from all quarters the complaint is general that business is restricted, and the usual activity incident to the spring trade is wanting. Enterprise is checked, money accumulates at the financial centres, and with a superabundance of loanable capital and funds seeking employment, there is little speculation done upon the Stock Exchange. Labor is only partially employed, and even now tens of thousands who, at ordinary times, would find plenty of remunerative employment, are still idle, and dependent upon charity for the means of livelihood from day to day.

One of the principal causes of this condition of things is the financial situation, and the delay of Congress in deciding upon a definite financial policy. For three months that body has debated upon the subject, and it seems absolutely impossible for our legislative Solons to arrive at any conclusion. Inflation and contraction, free banking and redistribution of the currency have been discussed in both houses of Congress until there would seem to be absolutely nothing further to be said in regard to either, and still no definite conclusion is arrived at. On Monday last, it is true, the House of Representatives passed an act legalizing the increase of the legal tenders or greenback circulation to \$400,000,000; of which \$382,000,000 has already been issued; but this has yet to be acted upon by the Senate, and when that body will conclude its interminable talk and take action is one of those things which it seems impossible to form a reasonable conjecture upon.

The action of the House we cannot but regard as unwise. It is not a lack of currency that the country is suffering from, but rather from a definite and settled financial policy. The only wisdom that we can recognize in the action taken is, that it has a tendency, so far as the House is concerned, to relieve the business community as far as it goes from the uncertainty which has so long existed as to a financial policy. The step taken is in the wrong direction, and if concurred in by the Senate, will still further postpone the time when this country shall again be placed upon a sound financial basis.

It is not the province of THE TELEGRAPHER to discuss financial questions, and our readers may ask why we depart from our usual custom now? The reason will be obvious upon a moment's reflection. The prosperity of the telegraphs of the country is intimately connected with that of the general business of the country. For many years the telegraph business has not been so depressed as it is at the present time. The telegraph lines are suffering from the present general depression in business, and must continue to suffer so long as this depression continues. Telegraph companies are compelled to limit their expenditures and economize wherever economy is practicable, and at the best, the pecuniary results are unsatisfactory. Naturally and logically this condition of things reacts upon telegraph employes, not so much in the reduction of compensation of those who are employed, for we have heard of no general reduction, but rather in the reduction of the demand for telegraphic labor. New telegraphic, as well as other enterprises, are suspended until the financial condition is changed. Those which are already established cannot be extended because capitalists have no assurance that such extension can be made to pay.

If, as now seems probable, there is to be a further inflation of our irredeemable currency, business will undoubtedly be stimulated for a while, speculation will be revived; and there will be a fallacious appearance of prosperity, in which the telegraphs will of course participate, until we are again brought up by the recurrence of the panic, which a few months since threatened to overwhelm the country in ruin, and from which we have already suffered so severely, and are still suffering. That in such an event this will come, is as certain

as that with the decline of the sun night will follow the day. If further inflation must come, however, and all the lessons of experience are to be ignored, the sooner it takes place, and the race is run, the better. The laws of business and finance are as immutable and unchangeable as the seasons, and all the talk of Congressmen and callous financiers cannot change them.

At any rate let us have some policy decided upon, and telegraph managers can then make their calculations for the future, and prepare for the ultimate and natural result of such policy. Almost anything will be better than the present condition of business.

We should judge from the rapid increase of telegraph schools that, notwithstanding the fact that there is now a considerable surplus of telegraphic labor, and even skilled operators find it difficult to obtain remunerative employment, the general impression was that telegraphy, as taught, or pretended to be taught, in these schools, was the assured road to competence. Perhaps the fact that other kinds of business are so depressed induces many to credit the lying assertions of the circulars of the proprietors of these schools in regard to the ease and certainty with which telegraphy may be acquired by any person, whether otherwise qualified or not, and the certainty with which, after a longer or shorter course of instruction by incompetent teachers, remunerative situations may be obtained. We do not write this with the expectation of diminishing to any considerable extent the patronage of these institutions. Their patronage, of course, comes from those who know nothing about the telegraph business and who are not likely to see THE TELEGRAPHER, or heed its warnings. We long ago became convinced of this fact, and while we have endeavored to discharge our duty in the premises, we have despaired of accomplishing anything satisfactory in preventing their success in obtaining patronage.

The present situation is not by any means encouraging to those who desire to enter the telegraphic ranks, and the interests of the telegraph would not suffer if there were no accessions to the number of telegraphers for the next year or two. Until there is a revival of telegraphic business, and a renewal of the extension of telegraph lines and facilities, there is absolutely no encouragement for any person not now in the service to enter it. All that we can do, however, or that our readers can do, is to make known the facts as generally and as widely as possible, and counsel those who are contemplating engaging in the business to either abandon their intention altogether and seek a living in some other avocation, or, at least, postpone it until the prospects are more encouraging.

Speculation in Western Union Stock.

THERE has been quite a lively speculation in the Western Union Telegraph Company's stock during the past two or three days, and the price has advanced to over 82. This has arisen from several causes. There has grown up of late quite a large short interest in the market, and things were in good shape for an active bull movement. On Tuesday last, it was positively asserted that the Western Union had acquired a controlling interest in the Atlantic and Pacific and Franklin Companies, and that these were immediately to be consolidated with the Western Union Company, and that, consequently, the most important of the opposition companies were to be wiped out, and the competing forces demoralized, and telegraphic competition practically destroyed. The reports of a pending dividend on Western Union shares were also very positive, and the market was further strengthened by the report that Commodore VANDERBILT was purchasing the stock largely.

The street evidently credited these rumors, and the shorts were frightened into covering, which of itself would advance the price materially.

The report in regard to the Atlantic and Pacific was, of course, a canard. There has been, as we are informed, no such sale of the stock of the company as would give a considerable or controlling interest to any new party, and it is somewhat difficult to understand why it should

be desired to sell except at prices considerably in advance of that at which transactions have taken place. The situation of the Atlantic and Pacific Company is a very good one. It has no debt, bonded or otherwise. There is a surplus of funds in the treasury both of the A. and P. and the Franklin companies. Notwithstanding the reduction of tariffs and the loss of the connection afforded by the Pacific and Atlantic Company, the business for the current month makes as favorable a showing as for the corresponding month of last year, which, in view of the depression in business generally, is a very good showing.

It is true that neither the A. and P. or the Franklin stockholders are receiving any dividends, but in this respect they are no worse off than the Western Union stockholders. If, by absorbing the Atlantic and Pacific, competition would be destroyed it might be an object for the Western Union to obtain possession, but even in that case there would be a greater extent of competing lines outside of the two than there is in it. On the whole, we are decidedly of the opinion that our speculative friends will find that the telegraphic monopoly millenium is not just yet at hand. As we are not in the confidence of the managers of the Western Union Company we cannot say what foundation there may be for the dividend which is so confidently predicted, but as the same story has been told at intervals for the last year or two, and no dividend is yet apparent, we doubt whether one is likely to be declared very soon.

The Success of The Telegrapher.

WITH this number of THE TELEGRAPHER is completed the first quarter of the present volume. The circumstances under which the new year commenced were not such as to afford a very encouraging outlook, and we had some doubts whether the paper would not suffer from the general business depression. Thus far we have been much gratified at the success which has attended the new volume. The paper seems to have become indispensable to our telegraphic friends, and its patronage has rather increased than diminished. Its prospects for the future are most excellent, and we shall be much disappointed if the present does not prove to be one of the most successful of the more than ten years which have passed since the paper was established.

We are endeavoring constantly to improve the paper in every practicable manner, and to constantly add to it such new, valuable and interesting features as may from time to time be suggested. The practical and scientific features of the paper were never so well maintained as at present, and our arrangements for the future are certain to constantly add to its value and interest in these respects. The assurances which we are constantly receiving of the recognition of the constant progress and improvement of the paper are most flattering.

While this is true, and we are exceedingly gratified to know that our efforts to make THE TELEGRAPHER a creditable representative of the fraternity are recognized and appreciated by intelligent telegraphers in all sections of the country, the circulation has not yet reached the proportions which, in view of the large number of persons engaged in telegraphic pursuits, it should do. We hope that our friends will bear this fact in mind, and exert themselves to add to the number of its readers. Its circulation should be at once largely increased, and might be if the friends of the paper would realize the importance of their individual and united exertions to secure additions to its subscription lists.

This week and for the next two or three weeks quite a number of subscriptions expire. We hope that most, if not all, of them will be renewed, and that their renewal will be accompanied by many additional subscriptions. Remember, that the more generous the patronage the better the paper can be made; and that, while we do not ask for an increase of individual contributions, the aggregate increase will enable us to give to each a much better and more valuable paper in return.

THE TELEGRAPHER is one of the established institutions of the country. We ask every telegrapher to aid us in making it one of the best and most useful. The present volume has had a good beginning, and we confidently rely upon the telegraphic fraternity to see that it continues to improve until its close, and, we trust, for many volumes yet to come.

The Popularization of Cable Telegraphy.

AS WILL be seen from a brief article which we reprint in another column from *The Railway News*, of London, the Anglo-American Telegraph Company have under consideration a plan to cheapen and popularize the cable telegraph service, which, if adopted, will no doubt prove important and beneficial. This is to make two classes of business, as is now universally done on land lines in this country. The business and other messages which are urgent and important, requiring instant transmission and delivery, to be charged present rates; and social messages, and messages which will not suffer from a few hours' delay, to be transmitted at the convenience of the company at about one quarter of the present rate.

When the cable which is contracted to be laid for the Anglo-American Company during the present season is in operation, that company will have four good cables available, and can transmit daily a much larger amount of business than at present, even if the speed of transmission should not be increased. That this would be a popular arrangement we have no doubt, and it would largely increase the number of messages transmitted by the cables. The management of the Anglo-American company would be wise to carry this plan into effect, or, at least, to give it a trial. It would, besides popularizing and increasing the patronage of the cables, relieve them of the pressure of business upon them during the business hours of the day, and keep them fully employed at times when some of them are now idle.

The Automatic Signal Telegraph.

ONE of the most important adaptations of electricity to insure safety from extensive conflagrations in cities and towns is the Automatic Signal Telegraph, which is being introduced in this city by the Automatic Signal Telegraph Company.

This system is the invention of Mr. W. B. WATKINS, of Jersey City, who was engaged for several years in perfecting it. We gave a description of this system in THE TELEGRAPHER of December 6, 1873. It is being rapidly extended in this city, the demand for it taxing to the utmost the ability of the company to establish circuits, and connect business and other edifices with it. With this system it is almost impossible for a fire to obtain any considerable headway before the fire apparatus is on the spot, and the conflagration suppressed. A comparatively slight increase of the ordinary temperature of a room or building in which the thermostats are placed at once automatically notifies the firemen or watchman of an incipient conflagration, and automatically registers the location of the fire. With this system generally introduced, it becomes almost impossible for a fire to extend beyond the spot in which it originates.

Mr. JOSEPH E. FENN is the General Superintendent of the company in this city, and personally superintends the establishment of the circuits, and a very busy and active time he is having in accomplishing it. His experience and ability insures the work being done in the most thorough and effective manner.

Mr. JOHN C. BEALS is the President and Manager of the New York Company, which has ample capital and facilities for the business.

Arrangements have already been perfected for the introduction of the system in Boston, and are being completed for its speedy introduction in other places.

Like most inventors Mr. WATKINS had considerable difficulty in getting his enterprise started, but its success is now assured, and we congratulate him and the company on the brilliant prospects before them.

Seasonable Suggestions.

THE winter season may now be considered as about over, and the time has come for spring freshets and the usual upheavals of telegraph poles, and development of faults in telegraph lines and insulation which the frosts of winter have heretofore concealed. Frost is a good insulator, as probably most of our readers are aware, and conceals difficulties and defects while it continues, which would otherwise be very troublesome and annoying.

We do not propose to make a long discourse on insulation, but merely to suggest that attention to telegraph lines at this time and within the next two or three weeks will save time, trouble and money during the coming season. Every telegraph superintendent and manager should have his lines thoroughly examined and put in good condition now. Don't wait until the condition of the wires and insulation becomes such as to excite involuntary profanity on the part of the operators, or necessitate the sacrifice of business from inability to transmit it with promptness, or injure the reputation of your lines by undue and vexatious delay. Wise economy will dictate the spending of a few dollars now, if necessary, rather than somewhat later the expenditure of much time and money in making good the defects which a little present attention will obviate or prevent.

The public generally have become accustomed to reasonable promptness in the transmission of telegraph messages and in the receipt of replies when required, and will not be satisfied with having their business forwarded by express and the answers returned by mail.

Personals.

Mr. GEO. ARMSTRONG, late of the St. Louis Western Union office, has accepted a position in the Cincinnati, Ohio, office of that company.

Mr. W. S. DYER, formerly of Elmira, N. Y., has been appointed night operator in the Superintendent's office of the Central Railroad of New Jersey, at Elizabeth, N. J.

The address of I. A. WRIGHT, who was agent and operator at Centreville, Crawford Co., Pa., in 1866-67, may be learned by addressing Manager A. & P. Telegraph office, Buffalo, N. Y., giving real name.

The Telegraph.

By Cable.

THE NEW UNITED STATES DIRECT CABLE.

LONDON, *March 24*.—Messrs. Siemens Brothers announce that their new steamship Faraday, built specially for the purpose of laying cables, will commence, on the 15th of next month, to take on board the cable which is to be laid direct to the United States.

CABLE COMMUNICATION RESTORED.

HAVANA, *March 24*.—Communication by cable between Havana and Santiago de Cuba has been re-established.

THE PORTUGUESE CABLE.

LONDON, *March 25*.—The steamship Great Eastern will start in August to lay the Portuguese telegraph cable from St. Vincent, in the Cape Verd Islands, to Pernambuco, Brazil.

The Dominican and Martinique Cable Reopened.

THE cable between Dominica and Martinique has been repaired, and messages can now be forwarded direct. The steamer "Kangaroo" effected the relaying of this portion of the telegraph wire, and has since been engaged testing the line between St. Lucia, St. Vincent and Barbadoes, and, in all probability, will continue this work up to Demerara. The Brazilian steamer "Vital de Oliveira" has been engaged in taking soundings for laying submarine cables between Brazil and the West Indies, for the Western and Brazil Telegraph Company.

When Columbus, O., wants a better man to work with, he sends a message to the chief, requesting him to "infuse more ambition into that hairpin receiving special."

Foreign Telegraphic Notes.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended February 28, 1874, was 329,245, an increase on the corresponding week of last year of 28,114.

The traffic receipts of the Great Northern Telegraph Company for the month of February last amounted to 288,094f., and in the corresponding period of 1873 to 189,095f. On the European lines the receipts for February amounted to 173,235f., and in 1873 to 109,415f. ; and on the China and Japan lines for February to 114,859f., and in 1873 to 79,680f.

The screw steamer Gomos, 2,314 tons, having on board 593 knots of telegraph cable, left the Thames on Thursday, March 5th, for Rio de Janeiro. The cable forms the remaining portion of that contracted for by Messrs. Siemens Brothers for the Platino-Brazileira Telegraph Company to connect Rio de Janeiro with Uruguay, the first part having left England a fortnight ago in the steamer Ambassador.

Telegraphic and Electrical Brevities.

Mr. PIERCE, of Massachusetts, offered a resolution in the House of Representatives at Washington, Monday, to guard against the divulgement of telegraphic secrets. Under the Morse system there is not a secret in private despatches. In other words, a Morse operator can stand by a telegraph instrument and read the despatches that are going or coming. Mr. Pierce was an earnest opponent of the confirmation of Mr. Simmons as Collector of the Port of Boston, and it seems that all his telegrams to his friends in Boston were, within an hour of their transmission, known to another member of Congress, who was Simmons's most earnest advocate. Mr. Pierce wants to prevent a recurrence of this matter, and hence his resolution.

Two Chinamen are studying telegraphy in the San Francisco, Cal., Western Union Office. They are to have charge of a hand office in Chinatown, where the messages of Chinese merchants may be translated, and where the telegrams may be forwarded to the main office in California street for transmission to their final destination.

[From The Operator.]

Stage Telegraphy.

I WAS much amused one night in witnessing "Across the Continent," as played by Oliver Doud Byron in the principal theatres throughout the United States. One of the principal scenes being Station No. —, on the Pacific R. R., Oliver plays the part of station agent, ticket agent, freight agent, baggage master, switchman and telegraph operator. During the play the station is attacked by Indians, and Oliver having a small party with him, sends to the next station for help, and at the critical moment the train thunders into the station with a regiment of blue coats, rescuing the party. The amusing part of it to a telegrapher is where Oliver telegraphs for help. He places the instrument on a barrel, the wires lying along the stage floor; rolls up his sleeves, takes hold of the key and works it as if he was sawing a cord of wood, making a lot of dots all he could telegraphically; then closes the key and waits for a reply, which comes from the operator behind the scenes, thusly: "Say, Oliver, let's take a drink."

Oliver seizes the key again in a still more desperate manner, throwing his whole soul, boots and all, into his efforts, and again waits for a reply. It comes slow, but sure, in first class college Morse: "Oliver, give us a rest—I'm thirsty."

Oliver closes the key, satisfied that he has done his duty and saved the party from the hands of the ruthless savages, and that the train will be on time.

QUILP.

Our Telegraph Operators.

We have a class of people among us whose services are an hourly necessity; who serve the public by day and night. Intelligent, courteous and civil in manners and speech, they are invaluable. But there is one point in their favor upon which we have not yet touched, viz., their fidelity to their trust. In this day of speculation, jobbery, rings for robbing State and National treasuries, defaulting cashiers, betrayals of public and private trusts, it is most pleasing to turn to one class who are sans reproche. We have yet to learn of a single instance of a telegraph operator dishonoring the profession, and yet secrets worth millions of dollars pass daily under their observation.—Norristown (Pa.) Independent.

Good impulses are naught unless they become good actions.

The country for the telegraph builders—Pol-and.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: MARCH, WESTERN UNION, ATL. AND PAC., AMER. DIST. and rows of stock prices for dates 19, 20, 21, 23, 24, 25.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended February 10, 1874, and bearing that date.

No. 147,311.—ELECTRIC TELEGRAPH.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Case 82. Application filed July 29, 1873.

States that the static charge of a line proceeds in both directions from the centre of resistance of the line, and that at such centre the tension of the static or extra charge is zero, and that if the receiving instrument be placed at that point there will be no tallings. Makes such point by putting in a resistance between instrument and earth equal to resistance of line and instrument.

An artificial line between the receiving instrument and the earth to balance the resistance and static charge, or nearly so, at both sides of the receiving instrument, substantially as set forth.

No. 147,312.—PERFORATOR FOR AUTOMATIC TELEGRAPHY.—Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Case 75. Application filed July 29, 1873.

General features as in Edison's patent of December 5, 1871, improvements being in feeding devices, the arms 13 taking against cam slides c, and thereby limiting motion of rock shaft v' operating the feed mechanism. Spring arm t2 taking in rack v' lifts presser foot off paper when feed mechanism is moved up, releasing it to grasp paper on back stroke.

1. The stops 13 and cam arms 12 upon the shaft v', in combination with the finger keys a a', slides c, rollers 15, and paper feeding mechanism, substantially as and for the purposes set forth.

2. The spring arm t upon the pawl u, in combination with the rack v and reciprocating mechanism, substantially as set forth.

No. 147,313.—CHEMICAL TELEGRAPH.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Case 74. Application filed July 29, 1873.

Instead of single electro-magnet in a shunt circuit to the receiving and transmitting instruments, as in his patent No. 135,631, a number are employed, with a switch for throwing more or less into circuit, as in the case of the ordinary rheostat. Uses ordinary rheostat in connection with the series of magnets.

1. A shunt or derived circuit at the transmitting station, into which an adjustable resistance and one or more electro-magnets are introduced, as and for the purposes set forth.

2. The combination, with a chemical telegraphic receiving instrument, of several electro-magnets and a switch, k, to connect more or less of said magnets in a shunt circuit, for the purposes set forth.

No. 147,314.—CIRCUIT FOR CHEMICAL TELEGRAPHS.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. Case 77. Application filed July 29, 1873.

Opposing batteries at each end of line, transmitter and receiver being placed in short circuits to their respective batteries. The short circuit of transmitting battery being broken, its current is forced over line, neutralizing effect of receiving battery. Roller wheel falling in a perforation makes the short circuit, allowing receiving battery to act.

The circuit 4 from the battery d, in which the receiving instrument b is placed, in combination with the opposing line circuit 2 and the shunt circuit 3 at the receiving instrument, in which are placed the transmitting instrument and battery, as and for the purposes set forth.

No. 147,352.—TELEGRAPH APPARATUS.—Henry Van Hoovenbergh, Brooklyn, N. Y. Application filed August 16, 1873.

Call bell driven by clockwork released by an electro-magnet. Current derived from a magneto-electric machine in which the permanent magnet is fulcrumed and forms the operating key.

1. The permanent magnet e, set to swing upon the fulcrum b, and movable by the handle or knob, in combination with an electro-magnet, the cores of which are magnetised by induction, and from which the permanent magnet is separated by the movement thereof, substantially as set forth.

2. The cam wheel o, fingers r r', and armature k, in combination with the electro-magnet h, clock work n, hammer l, and belt m, substantially as and for the purposes set forth.

Died.

WHYTE.—March 16, 1874, Mr. R. H. WHYTE, agent and operator at Peterson Station, Utah, of the Union Pacific Railroad, of consumption.

Born.

BAILEY.—At Santa Cruz, California, a son to Mr. J. R. BAILEY Manager of the Western Union Telegraph office at that place, and formerly of the Northwestern Telegraph office at L'Anse, Lake Superior, Michigan.

WILLIAM BROWNLEE, Dealer in CEDAR TELEGRAPH POLES. OFFICE FOOT OF LIBERTY STREET, DETROIT, MICHIGAN.

SPECIAL NOTICE. That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS for Students and Amateurs. The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50 Instrument with Office Outfit..... 7 50 Two Instruments and Outfits..... 14 50

L. G. TILLOTSON & CO., 8 Dey Street, New York.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes. Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used. Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival. All kinds of Battery and Battery material for

WATTS & CO., 47 HOLLIDAY ST., BALTIMORE.

OUR ILLUSTRATED CATALOGUE NOW READY.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use. Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md. Send for catalogue.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.
Acknowledged to be a decided improvement.
Price, same as the ordinary key.
Superintendents and Purchasing Agents are invited to examine our **EXTENSIVE FACILITIES** for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

ELECTRICAL CONSTRUCTION AND MAINTENANCE CO.,
San Francisco, Cal.,

Special Agents for California, Oregon and Nevada.

THIS SYSTEM OF

FIRE ALARM & POLICE TELEGRAPH

WITH A CENTRAL OFFICE,

OR

UPON THE AUTOMATIC PLAN,

Is now in operation in the following Cities, to which reference is
made for evidence of its great

SUPERIORITY, VALUE

AND

UNIFORM RELIABILITY.

Albany, N. Y.,
Alleghany, Pa.,
Boston, Mass.,
Bridgeport, Conn.,
Buffalo, N. Y.,
Baltimore, Md.,
Chicago, Ill.,
Cincinnati, Ohio,
Columbus, Ohio,
Charlestown, Mass.,
Covington, Ky.,
Detroit, Mich.,
Dayton, Ohio,
Elizabeth, N. J.,
Fall River, Mass.,
Fitchburg, Mass.,
Hartford, Conn.,
Indianapolis, Ind.,
Jersey City, N. J.,
Louisville, Ky.,
Lowell, Mass.,
Lawrence, Mass.,
Lynn, Mass.,
Mobile, Ala.,
Montreal, Canada,
Milwaukee, Wis.,

New York City,
New Orleans, La.,
New Bedford, Mass.,
New Haven, Conn.,
Newark, N. J.,
Omaha, Neb.,
Philadelphia, Pa.,
Pittsburg, Pa.,
Portland, Maine,
Peoria, Ill.,
Providence, R. I.,
Quebec, L. C.,
Rochester, N. Y.,
Richmond, Va.,
St. Louis, Mo.,
St. John, N. B.,
Springfield, Mass.,
San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The Electro-Mechanical Gong Striker,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the
original *FARMER & CHANNING PATENTS*, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now coveted by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THREE**
CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its in-
troduction into their localities is cordially invited, and
their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**,
with Patent Platina Connection, introduced by us eight years
since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that
will work practically with a single **DANIELL** cell, a **BATTERY**
that does not require to be taken down but once a year, and the
very best **MAIN LINE SOUNDER** made

Our **CATALOGUE**, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.
 This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.
 This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.
 These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.
 Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS
 manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES
 constructed in the best and most substantial manner, and on reasonable terms.
 Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.
 For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.
 S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. BOX 496.

AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.
 Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
 CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
 And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
 Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring
EFFICIENCY AND RELIABILITY.
 Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.
 MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
 E. HOWARD, & CO., Proprietors.
 J. HAMBLET, Electrician.
 OFFICES:
 114 TREMONT STREET, BOSTON, Mass.
 15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH
 in the world.
 It has already been extensively adopted and has invariably given entire satisfaction.
 They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,
 which is the best watchman's time recorder in the world. Also,
ELECTRIC AND CONTROLLED CLOCKS
 of all kinds,
CHRONOGRAPHS,
ASTRONOMICAL CLOCKS,
REGULATORS,
ETC., ETC.,
OF ALL KINDS.
 All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
 MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
 OF
EVERY DESCRIPTION,
38 VESEY STREET, New York.
 NEW AND SUPERIOR PATTERNS OF

STANDARD TELEGRAPH INSTRUMENTS.
 These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.
RELAYS,
SOUNDERS,
REGISTERS and KEYS.

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as
BATTERIES, INSULATED WIRES, CHEMICALS
 of all kinds, etc., etc.
THE NONPAREIL TELEGRAPH INSTRUMENT,
 For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.
Bradley's Apparatus for Electrical Measurement.
 We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.
BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,
 of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for
HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.
 Sole Agents for the
EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.
 Descriptive Circulars and Price List forwarded upon application to
F. L. POPE & CO.,
 (P. O. Box 5503.) **38 VESEY STREET.**

REDUCTION OF PRICES.
POPULAR, EXCELLENT and ECONOMICAL.
THE NONPAREIL TELEGRAPH APPARATUS,
 For AMATEURS, STUDENTS and SHORT LINES.

Since the introduction of this *Pioneer Low Priced Telegraph Instrument*, a little over a year and a half since, nearly 2,000 have been sold, and they are constantly more and more sought after.

Hereafter we shall furnish them at the following popular rates:
 Single Instruments, including Three Cells Battery, Connecting Wire, Chemicals and Instruction Book..... \$6 50
 Two sets of Instruments, etc..... 12 00

DR. L. BRADLEY,
 No. 9 Exchange Place,
 JERSEY CITY, N. J.,
 Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS
 FOR
ELECTRIC MEASUREMENT,
 Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.
 Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
 Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his
CELEBRATED HELICES
 WHICH ARE OF
Naked Copper Wire,
 So wound that the convolutions are separated from each other by a regular and uniform space of the 1 800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1 150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.
 These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY AT THE **CINCINNATI INDUSTRIAL EXPOSITION OF 1873.**

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION, and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY, or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

New York, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.90.

LECLANCHÉ BATTERIES.

CAUTION.

All persons are hereby notified that Batteries infringing upon our patents are in the market (some of them nearly worthless). The public are warned against using any such infringements, as in every case the guilty parties will be prosecuted to the fullest extent of the law. The genuine Batteries have the words "Pile Leclanché" on the carbons and glasses. Any information concerning such infringements will be thankfully received by the

LECLANCHÉ BATTERY CO.,

No. 40 West 18th Street.

New York, October 11, 1873.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order. See our advertisement in other columns.

WATTS & CO., Baltimore.

ENGINEER TO THE
ELECTRIC AND INTERNATIONAL
TELEGRAPH COMPANY.

Published with the sanction of the Chairman and Directors of the Electric and International Telegraph Company, and adopted by the Department of Telegraphs for India.

FOURTH EDITION,
REVISED AND ENLARGED.
1 Vol. 8vo, cloth..... \$5 00.
Copies sent free by mail on receipt of price.
My new Catalogue of American and Foreign Scientific Books, eighty pages, 8vo, sent to any address on receipt of ten cents.

D. VAN NOSTRAND, Publisher,
23 MURRAY STREET, N. Y.

THE AMATEUR'S
TELEGRAPH APPARATUS.
(Patented April 16th, 1872.)

This is a *bona fide* Telegraph Instrument, with a full sized Trunnion Lever Key, with Friction Circuit Closer and a Pony Sounder, both on same base.

The Battery used is HILL'S Patent Gravity Battery, the most constant and economical in use.
With each Instrument is furnished

ONE CUP OF BATTERY,
TWO YARDS OFFICE WIRE,
ONE PACKAGE BLUE VITRIOL,
ONE PACKAGE SULPHATE ZINC,
and a "Manual of the Telegraph," for the instruction of beginners. This is a sufficient outfit for the student.

In operating a short line there will only be required, in addition to the above, more cups of battery, according to the length of line.

—:◇:—
COMPLETE OUTFIT, WITH BATTERY, CHEMICALS
AND MANUAL,
Seven Dollars.

Sounder and Key only..... \$6 00
" " with Cut-out and Lightning Arrester... 7 00

GEO. H. BLISS & CO.,
SOLE AGENTS,
41 THIRD AVENUE,
Chicago, Ill.
SEND FOR CIRCULAR.

BUY THE BEST.

If you want EQUIPMENT for a TELEGRAPH LINE, order of
L. G. TILLOTSON & CO.

They have the GREATEST VARIETY.
They carry the LARGEST STOCK.
Their PRICES are the LOWEST and QUALITY the BEST.
They guarantec EVERYTHING TO BE AS REPRESENTED.
They always RECTIFY MISTAKES at their OWN EXPENSE.
Every ARTICLE required for the CONSTRUCTION and OPERATION of LINES ALWAYS ON HAND.
Their EXCELSIOR TELEGRAPH INSTRUMENT FOR STUDENTS, comprising Sounder and Key, is the greatest success of the times.

L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK.

MODERN PRACTICE OF THE ELEC-
TRIC TELEGRAPH.

A HAND-BOOK
FOR
ELECTRICIANS AND OPERATORS.
By **FRANK L. POPE.**

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,
AND
FULLY ILLUSTRATED.

8vo, cloth..... \$2.00

50 Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books sent per mail, on receipt of ten cents.

23 MURRAY STREET and 27 WARREN STREET.

THE BISHOP GUTTA PERCHA WORKS,
422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
ONLY MANUFACTURER
OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,
FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,
Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES,
In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and de-
livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,
have been appointed by me GENERAL AGENTS for the sale of
any Telegraph Cable or Wire manufactured at the Works in New
York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods man-
ufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
sale in New-York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway.
D. HODGMAN & CO., 27 Maiden Lane,
SHEPARD & DUDLEY, 150 William St.

Address all Communications to
S. BISHOP,
OFFICE AT FACTORY.

Original Articles.

The Criticism of the Annual Report of the Atlantic and Pacific Telegraph Company, by the W. U. Official Organ.

By FAIR PLAY.

IN the official journal of the Western Union Telegraph Company for March 2d, appeared what purported to be, and probably was intended to be, a criticism of the annual reports of the President and Executive Manager to the stockholders of the Atlantic and Pacific Telegraph Company. This pretended criticism is so unfair, and written with such an evident intention of misrepresenting the reports, and giving a false and erroneous impression of the business and condition of the company, that it is eminently proper that the official critic should be criticised in turn, and the *animus* of the critic shown up.

In the first place, the pamphlet which is criticised is not "professedly made up of the reports of the President, the executive manager and the treasurer," nor is the omission of the treasurer's report so unfortunate as the critic would have us believe. The omission is fully explained—from the inability to prepare in time a complete statement of the business of the company, and the financial results for the year. It was in view of this fact that the proposition was made in the report of the President to change the time of the annual meeting from January to April. Perhaps, if the critic had chanced to recollect that, while the annual meeting of the Western Union Telegraph Company is held in October, the report of the business of the company is made only to the 30th of June preceding, he might have found nearer home a satisfactory solution of the doubts and misgivings which, apparently, so severely trouble him.

Having disposed of this omission, the reports which are published come logically under consideration. Naturally the official critic discovers a considerable collection of mare's nests in them, which he proceeds to unveil for the delectation of the Western Union Company and his readers. Through nearly two columns a labored attempt is made to demonstrate obscurity in the statements of the President and executive manager of the Atlantic and Pacific Company, and to convey the impression that either the writer of those reports intentionally so presented the facts to the stockholders as to disguise the true condition of the company and its business, or that they are naturally so obtuse as to be incapable of presenting them clearly and intelligently.

The report of the executive manager, which was printed in full in THE TELEGRAPHER for March 7, would appear to the common intellect, not befogged by too near a location to the executive office of the Western Union Co., as sufficiently explicit in everything except that omission of the financial accounts, which had not at the time been completed for the year.

In the President's report the Atlantic and Pacific Company is justly congratulated on the continuation of the advance in prosperity, which in the previous year had relieved the company of the heavy debt that had hampered it. It may serve to amuse the writer, and those for whose gratification he writes, to endeavor to obscure the language of the report in this respect, and make it appear inconsistent and illogical, but there is nothing in the language used or the literary construction of the paragraph to warrant it. The language of the report is as follows:—"The last official report to you, submitted at the annual meeting in this city, January 29, 1873, reviewed the important features in the company's history for the year 1872, in which this organization, then for the first time relieved of a heavy debt, had made rapid advances in increase of lines and material prosperity. I am happy to state that the year just closed has shown a continuation of the prosperity then inaugurated," etc. This point is, perhaps, an immaterial one, but it has been noticed to show the unfairness and purposed misrepresentation which characterize the whole article. The actual reason for the President's congratulations is plainly and unmistakably in the fact that, notwithstanding the very material reduction of tariffs in July, and the loss of business in consequence of the panic in September, the encouraging prospects with which the company began the year just closed; appeared to him and to any candid observer just as bright and encouraging at its close.

The critic, who has perhaps been studying up the history of the Western Union Company and its various consolidations and extensions by absorption of other lines and companies, is, perhaps, naturally troubled in regard to the terms upon which the controlling interest in the Franklin Company has been obtained by the Atlantic and Pacific Company. In view of the enormous fortunes which have accrued to a number of the manipulators of the Western Union Company heretofore, through their connection with these purchases and consolidations, and the well known dark and mysterious manner in which some of them at least have been effected, and the immense personal pecuniary benefit resulting therefrom, such suspicions are, perhaps, not to be wondered at. If the writer had only a little further considered the President's report, he might, perhaps, if desirous of doing so, have found some relief in the statement contained in the same paragraph, that the exchange of the Franklin stock by the individuals who purchased it is fully set forth in the minutes of the company. To these minutes, as the writer should know, any stockholder of the company can have access as his legal right, and through them ascertain just how badly the company has been victimized for the personal benefit of those who advanced the large sum required to obtain a controlling interest in the Franklin Company.

The criticism of the language and punctuation of the concluding paragraph of the President's report is so hypocritical and strained as to call for no reply. This paragraph states clearly and intelligibly a policy which has been decided upon of using, as they are realized, the available earnings of the company in extending the lines, etc. If it means anything this paragraph can only be construed as announcing a policy which, while the system is incomplete, must be regarded as a wise and proper one of devoting the surplus earnings or profits to the extension of the lines and improving the facilities of the company.

It may not be out of place in this connection to refer briefly to some of the deficiencies in the last report of the President of the Western Union Company. For instance, it is stated in that report that on June 30, 1873, that company operated 65,757 miles of line and 154,471 miles of wire. The legitimate inference from this statement would be that the company owned that amount of lines and wires. On the contrary, it is known that a considerable extent of these lines are merely leased by the Western Union Company. The report fails to inform the stockholders how much of this property is actually owned by the company. In view of its enormous nominal capital this must be regarded as a very noticeable omission. Again, the report gives no information in regard to the amount of rent paid for leased lines, which is another noticeable omission. Is this included in the operating expenses? Again, no distinction is made between the lines owned by the company and those which are operated in connection with railroads and entirely or partially owned by the railroads. A critical examination of that report would develop other deficiencies and omissions, which should suffice to cause the official organ to be careful in making imputations and insinuations in regard to its competitors.

In criticising the report of the executive manager of the Atlantic and Pacific Company the official organ attempts to be facetious—especially in regard to the calculation of what the receipts of the company on its business would have been if the tariff had averaged fifty-one cents per message. The disingenuousness of this criticism is apparent from the omission of the qualification which is made in the report, that the fifty-one cents per message was the rate received the previous year, before the great reduction in tariffs had been made. An examination of Western Union reports would have shown the critic similar statements, based on similar conditions. It is a legitimate method of arriving at an accurate conception of a corporation's comparative prosperity.

The real advance of the Atlantic and Pacific Company is shown by the fact, which is carefully omitted in the review, that, notwithstanding the reduction in tariffs, and the depression of business consequent upon and following the panic, there was an actual increase of receipts over the previous year of \$32,504 49. It may, perhaps, gratify the critic and the Western Union managers to know that, notwithstanding the operation of the causes mentioned and the additional loss of the business derived from the connection with the moribund Pacific and Atlantic Company, the receipts of the Atlantic and Pacific Company for March, 1874, exceed those of the corresponding month of 1873. The critic is, in this connection, referred to page 9 of the last report of the President of the Western Union Telegraph Company, where exactly the same principle of mathematical comparison above referred to is adopted.

This criticism of the Western Union official critic has already grown to such a length that it will be necessary to close with an allusion to only one point additional. The most miserable and despicable resort of any, even an interested critic, is the perversion of a writer's language to suit his own ends. This, and

nothing less, is precisely what is done in the article considered. Reference is made, of course, to the perversion of the language of the report in regard to completing the Atlantic and Pacific system by extensions and additional facilities. The language of the report is certainly sufficiently clear and explicit, and, to avoid misconception, it is here quoted *verbatim*: "To complete such a system it will be necessary to reach New Orleans, Galveston, Louisville, Memphis, Nashville and St. Louis, which, with additional cross and lateral lines, to be acquired generally without *monied* expense to the companies, will enable us to build up a business which cannot fail to yield a handsome profit."

The writer misquotes the paragraph, supplying by a sneer, the actual language of the report, and comments upon the figment of his own brain as if he believed his attempted ridicule could react upon the Atlantic and Pacific Company in such a way as to annihilate the corporation, and cover with confusion its officers and managers.

[From *The Telegraphic Journal*.]

Light versus Heavy Cables.

A SETTLEMENT of this much vexed question seemed at hand, and, provided all went well, we expected to hear of the submersion of a light cable of the latest improved type before the autumnal gales of the present year had set in. In consequence, however, of the insufficient pecuniary support accorded to the enterprise, the promoters of the Light Cable Company have, for the present at least, given up the idea of laying a new cable, and the question will remain an open one.

Although the leading engineers have, we believe, hitherto taken a decidedly adverse view as to the practicability of laying and maintaining a light cable, yet the fact that such thoroughly competent and experienced men as Sir Samuel Canning and Mr. Robert Sabine had undertaken the engineering work for the company is a sufficient guarantee of the possibility of completing a cable of the light type.

The causes which have hitherto delayed the submersion of a light cable are not far to seek. Primarily the reason seems to be that no sufficient proof has as yet been applied to show the durability of hemp, tarred or otherwise, when exposed to the continued action of sea water for a lengthened period. This doubt is now considered to be at rest, and it is confidently stated that tarred Manila hemp is practically indestructible in sea water. Nevertheless, this indestructibility has been disputed by some men eminently qualified to give opinions on the subject—Sir James Anderson among others.

The recovery of a portion of the 1858 Atlantic Cable last year, from midocean, in good preservation after a submersion of sixteen years, is certainly an argument in favor of light cables, but it is also favorable to the iron sheathed type of cable; for the iron wires, as well as the hemp, were found in good condition.

Provided the core of a deep sea cable remained uninjured for an indefinite period of time when once submerged, the perishability of the protecting sheathing would be a matter of small importance. But although it is said that no disturbing influence exists at the deep sea bed, yet experience has more than once shown that no cable can be relied upon to remain sound at great depths, even when submerged in an apparently perfect condition.

Whether this liability to injury is owing to the chafing of the cable against rocks whose existence is unsuspected in midocean—the attrition of the cable against the rocks being occasioned by currents, or to imperfection in manufacture—remains to be shown. That rocks may exist at the bottom of the Atlantic bed seems possible, when we consider the strange freaks which Nature sometimes exhibits in placing huge boulders in the middle of an open prairie, without anything to account for their being there. If such rocks exist, it is easy to see that an iron sheathed cable may bear a good deal of chafing without injury, under which a hemp covered cable would fail. It is, however, quite possible that the faults which have developed themselves after a time in the different ocean cables have been due to imperfection in manufacture. Not traceable when the cable was lying in the factory, these may have been discovered only when the cable was submerged and subject to the enormous pressure of water above it for some time. Such imperfections might be found out by the exercise of greater care in testing, and by a greater refinement in the present system, which in principle, however, seems to be all that could be desired.

As regards the mechanical strength of an iron, compared with a hemp covered cable, the balance is wholly in favor of the former, for iron possesses some 25 times the tenacity of hemp; and even taking into account the loss of strength due to the weight of the wire in deep water, an iron wire 2½ miles long or thereabouts, when immersed perpendicularly in the ocean, would still bear 16 or 17 times as great a strain as a rope of hemp would of an equal diameter. But there are causes which render an iron sheathed cable more liable to

facture than a hemp one when being laid. One of these is due to the momentum which an iron sheathed cable acquires when running out of the ship. This momentum is very great, in consequence of the weight of the cable; and any sudden check which might arise, either from some hitch in the paying out machinery, or from a sudden lift in the stern of the ship, would throw a very severe strain upon the cable. With a light cable this extra strain would be quite inconsiderable, as the momentum which it could acquire would be but small, and it might be jerked suddenly with but little danger of fracture. It is evident, however, that when a continuous pull is exerted on the cable through its becoming fast jammed in the machinery, whilst the ship is running, the iron sheathing would have the advantage.

One of the great disadvantages of iron sheathing is the liability of broken ends of wire to become forced into the core of the cable. This has been a frequent source of trouble in cable laying. From this disadvantage the hemp sheathed cable is manifestly free. The liability to kink and foul is also greatly diminished by using a hemp cable. Inasmuch, also, as a light cable can be stowed away in ordinary sized ships, whose way can be easily checked when an accidental hitch occurs in the paying out machinery, another advantage is found by their adoption.

The electrical considerations put forward by the Light Cable Company do not in any way affect the question under consideration, except, perhaps, in so far as the improved instruments allow a comparatively small core to be used without any diminution in the speed of working. This consideration, however, is obviously as applicable to heavy cables as to light.

In conclusion, we may state that the relative values of the two types of cable can only be satisfactorily ascertained when the result of a light cable expedition is known. Should the result prove propitious, a great impulse will be given to submarine telegraphy, in consequence of the small cost of the new type as compared with the old. It is, however, doubtful whether, even should such an enterprise prove successful, the system could be adopted in tropical regions, where the destructiveness of marine insects is so great, and where various causes of mechanical injury exist in greater number than in higher latitudes.

The Practical Applications of Electricity.

Professor E. C. PICKERING has recently delivered a very interesting course of lectures at the Lowell Institute upon "The Practical Application of Electricity."

In his introduction to the subject he remarked that many guesses have been made as to the nature of electricity, and many theories advanced that will not bear the test of experiments, and that directly contradict many of the known facts. Attempts have been made to combine the wave theory of light and electricity by supposing that the vibrations of the ether which produce the phenomena of electricity are longitudinal, resembling those of sound, while the phenomena of light are produced by transverse vibrations of the same medium. Another theory, which has long been believed, is that electricity consists of two fluids, and that a body is electrified positively or negatively according as one or the other of these is in excess. According to Dr. Franklin's theory there is a single fluid, and the phenomena depend upon the excess or deficiency of this fluid.

About three years ago Professor Edlund read a paper before the Swedish Academy, in which he advanced the theory that this single fluid was the ether by whose vibrations light is produced—a body being charged positively when it contains an excess of ether, and negatively when the ether is deficient. He has shown that with a given charge it can be calculated with mathematical precision with how much force a body similarly electrified will be repelled, or with what force one dissimilarly electrified will be attracted. The lecturer advanced this last theory only provisionally, as the one that seems to answer all the requirements of the case better than any other.

There are three methods of causing the ether to pass from one body to another. The first is *friction*, as in rubbing glass with a cloth; and this is utilized in the common frictional electric machine. The second is *chemical action*, as in the galvanic battery. In the case of copper and zinc placed in an acid liquid, the copper acquires an excess of ether while the zinc loses it. On connecting the two there is a constant flow from the copper to the zinc. The third source of electricity is *heat*, as in the thermo-electric battery, in which the junction of two dissimilar metals is heated, causing a current to flow from one metal to the other.

Two parallel currents of electricity attract each other when they both flow in the same direction, but repel when they flow in opposite directions. This was very neatly shown by two wires in the field of the stereopticon, one of them being free to move. When the current was sent through the wires in the same direction they approached each other; on reversing the current in one, they were repelled. The vibration of a helix, one end of which just touched the surface of

some mercury, was shown in the same manner. The current being sent through the wire the helix contracted, lifting the lower end from the mercury; contact being thus broken the current ceased and the helix fell by its own weight, again making contact, only to be again broken.

There are four cases of induced currents: (1) Currents producing induced currents; (2) Magnets producing currents (magneto-electricity); (3) Currents producing magnets (electro-magnetism); (4) Magnets producing magnets.

If a wire through which a current is passing be suddenly brought near another wire, a current is induced in the other wire in the opposite direction; and the same thing happens if the wire through which the current is flowing is suddenly removed; but the current in the second case flows in the same direction as in the primary wire. The same effect is produced by suddenly making or breaking the current in the wire. These induced currents are much more intense than the original currents. Advantage is taken of them in the construction of the Ruhmkorff coil, in which a current that will hardly give a visible spark induces, on being interrupted, a current in a second coil which gives sparks several inches in length.

The second case was shown by introducing a magnet into a coil of wire. This produced a current that deflected the needle of the galvanometer. But this is only another instance of the first case, as in the magnet there are currents of electricity continually flowing around the bar. In the south end of the bar these flow in the same direction as the hands of a watch, and in the north end in the reverse direction. This was illustrated by making a current flow through a horizontal helix supported so that it could turn freely; it then acted in the same manner as a magnet. It was further illustrated by two bar magnets hung so that their like ends faced each other; on swinging one it communicated its motion to the other without actual contact. This shows that unlike currents, or currents flowing in opposite directions, repel each other. In ordinary iron bars the currents flow in all directions, and therefore neutralize each other; but, by surrounding the bar with a coil of wire, we can make all these currents move in the same direction, and thus produce magnets; and these magnets are far stronger than any other kind. We can cause this magnetism to cease instantly by breaking the circuit. Upon this property of iron are founded some of the most important applications of electricity.

One of these is the transmission of time from one place to another. A small dial on the table was shown, that had been ticking at intervals of two seconds all the evening. This dial was connected with the clock in the Observatory at Cambridge. Clocks were also shown upon the wall, the hands of which moved once a minute by the same means. The use of the chronograph was also explained. This is a clock which carries a large cylinder upon which is wound a band of paper. A pen is arranged so that it traces a continuous line upon this paper, in the form of the thread of a screw; but every second this pen is pulled a little to one side by an electro-magnet connected with the observatory clock, and thus keeps a perfect record of the time. But this electro-magnet is also connected with a key near the observer, by depressing which he can also draw the pen to one side. At the instant he sees a star cross the spider-line in his telescope he presses the key, the pen is drawn aside, and thus the observation is recorded. He has only to note the time within a minute, and then on examining the paper the exact second is found, and from this determinations of longitude or of time can be made.

A Solution of "Ohm Catcher's" Problem.

HENPECK, March 23.

TO THE EDITOR OF THE TELEGRAPHER.

In your issue of December 6th, '73, "Ohm Catcher" gives a problem which as yet I have seen no answer to. Is it possible that among the many electricians who read THE TELEGRAPHER not one can be found able to solve this every day problem? Henpeck is a lonesome little village, out of sight of telegraphs and railroads. Such a thing as a galvanometer was never heard of here until recently, when a city telegrapher from a distant place happened to lose a pocket book, marked "Haskins' Galvanometer," as he was passing our school house, *en route* for squirrels and snipe. Since that time the scholars have gone through Haskins so often that any of us work problems like the above either mentally or chalked upon one side of the coal house. Now, "Ohm Catcher," stand from under

and see how it's did. From New York to Harlem the insulation test was 12,620 ohms. This, multiplied by the distance, 8 miles, equals 100,960 ohms, the mileage insulation between the above two points. From New York to New Haven insulation test = 6,805 ohms; this multiplied by the distance, 82 miles, = 558,010 ohms mileage insulation from New York to New Haven. We have just seen that the first 8 miles measured only 100,960 ohms per mile; we therefore have 457,050 ohms per mile on the 8 miles (in the second test of 82 miles) that clearly belongs to the 74 miles between Harlem and New Haven. $\frac{457050}{8} = 57131$, the

amount of resistance which should be added to the 74 miles. This 74 miles in second test averaged (when connected to the 8 miles) 558,010 per mile; dividing by 74 to get the resistance for that portion of line we have 7540. Adding to this the 57131 ohms, = 64671 ohms, multiply by 74 and we are supposed to have the mileage resistance between Harlem and New Haven, $64671 \times 74 = 4,785,654$. It is safe to say that "Ohm Catcher" is not employed upon Western Union lines, as they can't show 74 miles of line in Eastern Division that will average 4,785,654 ohms per mile on a wet day. It is probable, however, that they built the line from New York to Harlem. Now, if this solution is all wrong, charge it to Mr. Haskins and not to

PED. SQUINTFIZLER.

The Canadian Telegraphs and Telegraphers.

OTTAWA, CANADA, March 23.

TO THE EDITOR OF THE TELEGRAPHER.

BEING a constant reader of THE TELEGRAPHER, I am somewhat surprised that a paper like it, having the interest of the fraternity so much at heart, has not more Canadian correspondence, items, etc. I am sure our Dominion ought at least to be able now and again to furnish an item worth the perusal of your readers. I notice that Washington, D. C., sends you the largest amount of correspondence; I suppose it being the capital has a great deal to do with that. As this city also is the capital of this Dominion, perhaps a word now and again would not be thrown away. Business here, and in Canada generally, is pretty dull, but we are on the eve of our harvest now, for the Dominion Parliament meet on the 26th inst. We are not troubled during the session here with Government telegraph bills, or the novel idea of Government telegraphy. Our people have enough on their hands without trying that game; besides, they see that the telegraph facilities provided by the two private companies are quite sufficient for the wants of the people—especially the Montreal Company, whom the press and the public give due praise to, as always pushing the lines into the most remote hamlets and villages. As proof thereof in several places the agents of the company are The Hudson Bay Company Fur Traders—the places being so very remote as to be unable to furnish other agents. In the far backwoods the lines of the Montreal Company extend to the lumber shanties, and several of the offices are located in the shanties; and during the ensuing summer it is thought there is to be extra vigor shown in extending the lines.

Operators are plenty here as elsewhere, and a great many, after arriving at a certain point in the business, throw up the sponge and go in for more reliable employment. Our Canadian operators have a deuced knack of knocking under and marrying rich lumber merchants' daughters. In a drive round the Ottawa valley you can have pointed out to you several responsible looking mansions, and are told such a person lives there. He was a telegraph operator until he married such a one's daughter, and now he's in the lumber business with papa.

We also have our commercial college telegraph nuisance, but it don't make much headway. There is scarce one in the employment of either company but has had to start at the foot of the ladder with a book in his hand as messenger. We don't believe in college diplomas—at least, the heads of the business don't; but, still, something should be done to protect the business from overcrowding, in justice both to the employes at present in the business, and to prevent the public from laboring under the idea that situations are vacant by the hundred, and "fat things" in the business waiting the picking up. I will not trouble you much further, but if you think this worth insertion, I may adopt the old maxim and "try again." FATHER JACK WELSH.

The Urgent Necessity for a Telegraphic Organization.—By Whom and How shall it be Established?

PHILADELPHIA, March 30.

TO THE EDITOR OF THE TELEGRAPHER.

THERE already seems to have been said on the subject, and with reference to a telegrapher's association, quite a good deal.

As regards its being essential to the welfare of the

fraternity, there certainly remains no question of doubt with any of us.

To say a single word more of the necessity of such an organization would seem like a waste of time and material.

What is most needed now is firm, prompt and decided action. Let us not demur any longer upon the subject, but proceed at once to take such steps as will accomplish this desired result. Delays are dangerous.

I am waiting, I fear, rather impatiently for some one to make the start. I trust, however, that it will not be long, for I believe the little spark has already been fanned into a living, burning coal.

Perhaps some one may say "Oh, yes, it is all well enough for you, Mr. Crotzer, to take a back seat and halloo 'sic 'em,' and all that sort of thing. But why don't you make the start? Is it any more obligatory upon us to do so than it is upon you?" This might seem like a perplexing question, and indeed it would be were there no extenuating circumstances on my part. But stop, gentle reader. You know that it never was intended by Holy Writ for any one to attempt exercising talents they do not possess. Perhaps no one among us is more willing to do what they can than your humble servant; but the deprivation (I am very sorry to say) of an early school room, such as many of you have enjoyed, and the benefit of a proper education has rendered me utterly unfit for even a suggestion with reference to a basis for this organization. The spirit is indeed willing, but the flesh is weak. I appeal to you, and those of you, my brothers, who are possessed of the five and ten talents, to make the start; and when the good work has once commenced, I will join you in the exercise of my one talent, and you will find that I shall ever be ready and willing to do whatever is in my power for the furthering of the glorious cause.

We have all been eye witnesses of the many evils which have sprung up from want of such an organization, and many, yea, very many of us have felt the oppressive hand of petty officials binding us, as it were, like so many slaves, and compelling us to accede to their tyrannical and unjust demands. What has been our condition, and what is our true condition to-day? Why, we stand utterly powerless to defend ourselves.

Now, here comes the question: have these evils ceased to exist, and the fetters which have so long bound us down been removed? If so, then we are free, and no organization for protection is needed.

But, ah! how vividly and strikingly does this question come to us all! The very thought of our condition pierces our hearts with a thrill that almost makes our blood run cold. Those who have not experienced the evil can form but little conception of its hateful-ness and true nature; and they, of course, are not sympathizers with us.

This leads me to remark, in conclusion, that we must not depend on outsiders to make the start. If we do we shall always remain just where we are. There is work, and ardent work, to do, and it involves upon us to do it.

Let us go forth with strong hands and willing hearts, and we shall accomplish a work which will cause our names to shine forth as bright as any upon earth. The longer this matter is delayed, the more difficult will it be to accomplish; so we can see at a glance the great necessity of immediate action.

It needs not that we should search deep down into the hidden mysteries of some ancient organization for a form upon which to establish or found our organization. All we need is a plain, simple form, yet binding and impressive.

Now, do let us realize our awful condition, and take such steps as are necessary to eradicate the existing evils. It may prove an arduous task; but we must plant and suffer if we would reap and rejoice.

CROTZER.

Suggestions for a Telegraphic Organization.

TO THE EDITOR OF THE TELEGRAPHER.

FOR some months past correspondents through THE TELEGRAPHER have been agitating the question of a Telegraphers' League. They seem to have no definite idea about the matter—at least, they do not express any, as far as I have seen—and all the while we are losing most valuable time. Some one should bring the subject forward in a tangible shape. It may be that a great many of those writing merely wish to see something of their own production in print, and do not care whether we have a League or not. When the subject was broached by me to a brother operator to-day, he said: "Well, I don't know; I had such a sad experience with the old League that I am almost afraid to join another one. Still, if there were one gotten up on a good sound basis, and having the welfare of the fraternity at heart, I would join it." There, that hits the nail squarely upon the head, and I believe the great majority of operators throughout the country hold the same views to-day; yet, I am aware that some would oppose it from fear that there would hereafter be a strike. It by no means follows that, if we have a League a strike should necessarily be the result. Telegraphers, as a class, are not

fools, and there is no reason why we should not have a League that all would be proud of—employers as well as employés. Now, let us brace up and start this thing somehow, and we can soon have a League that all telegraphers will be glad to become members of—not only operators, but linemen, and everybody that ever "cleaned a zinc," or "shinned" a pole.

If I may be allowed a little more space let me advance a few ideas as to what our objects should be in organizing a League. Let us organize something after the style of the B. O. L. E., having for our watchwords, Charity and Benevolence. In case of sickness let each circuit, "whenever necessary," provide and care for the member so afflicted, and in case of death levy a small tax upon each member—say 50 cents. The amount so collected would go far toward relieving the wants of the family of the deceased; assist unemployed members to obtain situations, and, if necessary, support such members while out of employment—"provided, however," that they are not thrown out for any wrong action of their own—use every honorable means in our power to adjust difficulties that may arise between employés and employers, labor assiduously for the development of a plan of action that may be beneficial to both parties, and cultivate that friendly intercourse which is so conducive to the prompt and satisfactory transaction of all business entrusted to our care. Discourage "plug" factories, and events will soon place many of these anxious aspirants for telegraphic honors where nature and their abilities naturally intended them—i. e., "hoeing corn." Organize such a League that operators will be anxious to become members, and not be in continual dread of seeing that skeleton "strike" behind the door. Provide for annual conventions and the attendance of one or more delegates from each circuit, with power to decide all questions affecting the interests of the League throughout the country. Have no one man power; start it on a good sound basis, and we shall have clear sailing right along.

Now, who are the ones to begin the work? We certainly should have as much "spunk" as the "errand-boys," and not be backward in this matter. Start the ball and there will be plenty of earnest workers to keep it in motion. More anon "SIERRA."

Plan for a Telegraphic Union.

TO THE EDITOR OF THE TELEGRAPHER.

IN THE TELEGRAPHER of March 21st I notice a communication on a Telegraphers' Union. I would say that the only way in which we can establish such an organization is for every operator to work for it; take it in divisions, call a meeting of the operators of the surrounding places, and form a local organization. This will induce others to engage in the work, and, by so doing, in a short time all will be combined together. Railroad Telegraph operators should call a meeting on their respective divisions, and let each do this until a combination of all is effected. By doing this we can help each other along. One thing should be understood at the start, and that is that the organization is not intended to encourage strikes, for nothing substantial can be accomplished by such means. The Western Union employés tried that experiment to their cost, and I have known many first class operators who were engaged in it and lost all that they had, and more than that, were, for a time at least, debarred from obtaining employment in consequence.

This is the first time that I have attempted to write an article for THE TELEGRAPHER, and I am induced to do so now in the hope that we may succeed in establishing a Union that shall be a union of telegraphers now and forever. Let us, one and all, act together, and do all in our power to organize such a Union. Let us not put it off from day to day, but go to work as if we were in earnest. F.

Experience of a Telegraph College Student.

CINCINNATI, March 26.

TO THE EDITOR OF THE TELEGRAPHER.

IN last week's issue of your paper I noticed a communication entitled "The Telegraph College Humbug," in which is mentioned the experience of a student just returned from college with a full fledged diploma, etc.

If not occupying too much time and space, let me state my experience. Although only a student at the present time, I bid fair to become an operator one of these days.

Last July I came to the conclusion to become one of those fellows that handle lightning so deftly.

I made application to one of these "College Humbugs" (which Mr. Wilkes so properly named), and made inquiries as to the length of time it would take to become competent of taking charge of an office.

His answer was, "about four months." So I plunked down my \$40, and went to studying like a good fellow.

About a month after, I had a little conversation with the President of the College, and he said, Mr. — (teacher of telegraphing), tells me you are the most

apt scholar in school; so if you keep on as you have for the last month we'll have you in the "Western Union office" in another two months or so, commanding a salary of \$70 or \$80 per month. I kept on studying, of course, highly elated with such fine prospects ahead.

Well, things went on thrivingly until, at the end of fourteen weeks, I could receive (as I thought) thirty words per minute, and the teacher hinted several different times that it was about time I was going.

So, through the influence of my father, one day I got permission to study in some regular office to learn the calls and business of the line. Judge my surprise when I arrived at the office to find that every dot and dash was like so many raps with a hammer. Occasionally I could get a letter of the calls (I couldn't have received them if they hadn't been repeated so often).

But, nothing daunted, I settled right down to commence over again, and here I expect to remain until I become what I intended to be—an operator.

A STUDENT.

P. S.—Should this meet the eye of any young man intending to learn the art, take the advice of one that has "been through the mill," and study elsewhere.

A Problem for Mr. C. H. Haskins.

CHILLICOTHE, O., March 26.

TO THE EDITOR OF THE TELEGRAPHER.

IN Mr. Haskins' work, "The Galvanometer and its Uses," page 37, he gives a rule for finding the mileage insulation resistance of different sections of a line when tested from a single station. Will Mr. Haskins be kind enough to solve the following problem by his rule:—From "A" to "B" 93 miles, glass insulation, the resistance, when tested from "A," with "B" open, was 14,140 ohms; with "C" open, six miles farther, resistance was 10,740 ohms. This six miles is insulated with Pond insulators. I am unable to work out a satisfactory result according to Mr. Haskins' rule. Perhaps I do not exactly understand the rule.

I. N. M.

Telegraphers' Association.

TO THE EDITOR OF THE TELEGRAPHER.

IN nearly every number of THE TELEGRAPHER of late we see something in reference to a telegraphic association, either protective or otherwise. "Common Sense," after minutely detailing our necessities, says, "It is useless for telegraphers to write communications to THE TELEGRAPHER on the necessity and desirability of an organization of the telegraphers, and then let the matter drop," and "The only way to effect an organization is to start it," etc.

If "Common Sense" is now a Western Union employé, and wishes to sever his connection with the company to engage in something more lucrative, and don't know just how to go to work to do it, we would suggest that he start it at once. If after starting it, he can feel a head on his shoulders every day for a month, he will have made himself famous among his fellow craftsmen forever. If he has a wife and children dependent upon his telegraph salary for support, and has no other means of getting a living, we would advise great caution. However desirable an organization may be, if the craft lacks backbone and nerve it is simply impossible. A large number of operators are now under bond (the more shame to them) not to again associate themselves with an organization while in the employ of the Western Union Company. Those who are not so bound dare not initiate the movement, because the supply of "bread and butter" is thereby greatly endangered.

"Scott" asks: "Why is it no one is bold enough to come out openly and declare a union which we must and will have?" My friend, ask your own heart that question, if you are a Western Union man. Why do you come to us under an assumed title asking a question in a communication, which of itself is evidence of your lack of backbone?

When we see a call for a convention of operators, signed by enough of the first class men of the country to half fill the columns of THE TELEGRAPHER, then we will have some confidence and sympathy with the movement. BACKBONE.

Don't Want Him.

TO THE EDITOR OF THE TELEGRAPHER.

ENGLAND declines, with thanks, the questionable honor of being (as stated in your issue of week before last), the birthplace of the defaulter, McCallum. Ireland is the unfortunate country he lays claim to—he hailing from near Dublin. JOHN BULL.

The Eastern Telegraph Company's traffic receipts for the month of February amounted to £31,084 against £30,284 in the corresponding period of 1873.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.
The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The Correspondence of The Telegrapher.

THE portion of THE TELEGRAPHER devoted to the publication of the communications of correspondents is, perhaps, the most interesting department of the paper. It comprises an average of three or four columns per week, and an attentive perusal of it will afford a very good indication of what, for the time being, most interests the fraternity. As it is the rule to permit the freest discussion and presentment of the ideas and views of the fraternity, it not unfrequently happens that there is found in the same issue the most opposite and dissimilar contributions. Our constituency is a very large one, and naturally not always of one mind upon any subject. Just now the subjects which appear to interest the largest number of correspondents are those of a telegraphers' organization, and a very determined opposition to telegraph schools and colleges. The present number contains several communications upon these subjects, which will be found well worthy of perusal.

The discussion of a telegraphers' organization seems to break out periodically; and, judging from the number of communications on the subject which have appeared of late, the fraternity might be supposed to be at fever heat in regard to it, and ready to proceed at once to the inauguration of a movement which shall concentrate the efforts of the thousands of telegraphers towards improving their condition. And yet it is not improbable that it will gradually subside without even an attempt being made to effect any real organization. The reason for this is obvious. It is much easier to discuss and advocate than to actually accomplish any desired or desirable movement or reform. It is human nature to look to somebody else to accomplish a task which involves a considerable labor, and which may, perhaps, prove damaging to those who shall proceed openly and effectively to do what so many are talking about. Many of our correspondents have very indefinite ideas as to what shape such an organization should take, or what is to be accomplished by it, or how it is to be effected. Some seem to suppose that merely establishing an organization will at once bring about a telegraphic millennium, in which all telegraphers shall receive the highest amount of compensation for the minimum of labor and responsibility. On one point most of them are careful to be explicit, and that is, in disavowing any desire or intention of favoring another strike. The lesson received on that head is too recent

and was too severe to admit of its being considered as one of the means by which the welfare of the fraternity is to be advanced.

It is undoubtedly desirable that a telegraphic organization should be effected; but that it would at once realize the sanguine anticipations of some of the more ardent of its advocates may well be questioned. It may as well be understood at the outset that such an organization cannot spring up at once full grown. It must be effected, if at all, gradually, and through persistent and hard labor on the part of those who may institute it. Unless more carefully and thoroughly elaborated than either of those which have preceded it, it cannot succeed in becoming either important or powerful. It must have a carefully considered basis of principles and purposes, and the means by which the latter are to be accomplished must also be decided upon in advance. It is well that strikes should be ignored at the outset. They are illogical, and generally eventuate in more injury to the strikers than anybody else, though they are exceedingly damaging to all parties concerned. But our purpose was rather to offer some general suggestions in regard to our correspondence than at this time to ventilate our own opinions otherwise than incidentally upon the subjects discussed.

Telegraph schools, institutes or colleges, naturally come in for a good deal of indignation and denunciation on the part of our correspondents, and very justly so. They are generally arrant swindles and humbugs, but we do not believe that they actually add any considerable number to the operating force. It is, perhaps, unfortunate that those who are induced or inveigled into wasting their time and money upon these affairs so seldom see or read THE TELEGRAPHER, otherwise they might save both.

Scientific and practical telegraphic ideas and subjects are also very frequently and forcibly discussed by correspondents of THE TELEGRAPHER, and much valuable instruction and information is thus imparted in a popular and effective manner.

There is not, we are pleased to note of late, so much disposition shown to personalities in our correspondence. This comes, in some degree, from a better comprehension of the relative duties of the employés occupying positions as officials and subordinates, and in part, perhaps, from better treatment of the telegraphers, as a whole, by their superiors. No doubt there are yet many instances of oppression, but except in extreme cases, it is, perhaps, better to forbear than to rush into print with denunciatory communications.

It is somewhat curious to note how subjects which have at times excited the greatest interest cease to be the occasion of even occasional mention by our correspondents. A few years since, for instance, the columns of THE TELEGRAPHER were flooded with communications on the female operator question. So hotly did the contest rage, in fact, that we were obliged to close it, so far as the paper was concerned, for some time. When we did so in self-defence, and because about all had been said on the subject, pro and con, that could be said, and the communications were mainly repetitions of the same ideas by different persons, we had on hand letters enough on the subject to fill a double number of THE TELEGRAPHER. Since that time women have come to be accepted as a part of the telegraphic force, and the dire evils and exclusion of the masculines from the telegraph service, which some of our then correspondents predicted and anticipated, not having been realized. We have received no communications on the subject for two or three years past, although the embargo has been raised. The question does not now possess sufficient interest to induce any one to shed ink or waste telegraph blanks in its discussion.

We do not propose to follow the consideration of the correspondence of THE TELEGRAPHER out in detail. We have no doubt but that the communications are read with much interest, and that the value of the paper as a medium for expressing the views, sentiments and wishes of the members of the fraternity, is duly appreciated. We are pleased to be able to afford the tele-

graphers such a medium, and welcome to our columns their contributions. We will give all a chance to be heard—provided their communications are not libellous or objectionable, are written on one side of the paper, and are accompanied by the names of the writers, not for publication, but as an evidence of good faith on their part. Anonymous communications are not desired, and as some have doubtless learned from the non-appearance of their letters, receive very little attention or consideration at our hands.

Railroad Telegraphs.

A RAILROAD without ample telegraph facilities is inefficiently equipped for service. This fact is generally recognized everywhere on the American continent except in New England, which, notwithstanding the enterprise and intelligence that usually characterize New Englanders, is far behind the rest of the country in this respect. With one or two exceptions, New England railroads are, without any telegraph system especially adapted to their service. This may be economy, but to the rest of the country it seems rather like parsimony, and a very unprofitable parsimony at that.

The railroad telegraphs have within the last few years assumed an extent and importance which constitute them a very important branch of the telegraph service. The capacity of a railroad is so largely increased, and the safety and reliability of the movement of trains so greatly augmented by adequate telegraph facilities, that it appears most singular that the managers of any road should allow their road to be without them.

There are thousands of telegraphers specially employed in the railroad telegraph service, and the standard of telegraphic ability and character of railroad telegraph employés has been much improved within the past two or three years. There is still room for material improvement in this respect, and it would be greatly facilitated by a more adequate remuneration for such services. The position of a railroad telegraph operator is one of the most laborious and important in the whole range of telegraph service, and should be remunerated accordingly. Upon his faithfulness, ability and reliability, constantly depend not only the safety of most valuable property, but the lives of thousands of passengers and railroad employés.

We long since recognized the importance and extent of the railroad telegraph service, and THE TELEGRAPHER has given to it that consideration which it so eminently deserves. This is the only telegraphic publication in the world that has accorded to this important branch of telegraphic service such recognition, and this fact has been appreciated to a considerable extent by the railroad telegraph operators and employés generally, who very justly look upon THE TELEGRAPHER as their organ and representative.

We shall at all times endeavor to secure justice and proper compensation to this hard working class of telegraph employés, and shall continue to urge an improvement in the standard of telegraphic talent employed on railroad lines.

So important do we regard it that all railroads should be operated by means of the telegraph, that where railroad managers do not voluntarily establish and maintain telegraph lines especially devoted to their roads, we think that they should be compelled to do so by law.

President Orton Gone Abroad.

MR. WM. ORTON, President of the Western Union Telegraph Company, sailed for Europe on Saturday last on the steamship Republic. Mr. ORTON has been very ill for the past two or three weeks, and goes abroad now for relief and relaxation from the exhaustive duties of his onerous and laborious position as the Executive of the Western Union Company. We hope that he will experience the benefit desired from this respite, and will return with renewed health and strength.

Reports were industriously circulated last week that

his visit to Europe was in connection with proposed important telegraphic arrangements; but this, we are assured, is incorrect. The speculation in Western Union shares is so active, and the fluctuations in the quotations so great, that the movements of every person prominently connected with the company are closely watched, and are made the occasion for the circulation of all kinds of reports calculated to influence the price favorably or otherwise.

Tillotson & Co. on Hand.

OUR friend TILLOTSON is evidently determined not to be outdone in any department of the telegraph instrument and supply business. The numerous advertisements of his firm which may be found on nearly every advertising page of THE TELEGRAPHER, sets forth the inducements to patronize the firm. They have won a very high position in business by the fair and liberal dealings for which they are noted, and which is eminently characteristic of the firm.

They carry the largest stock of any dealers in the country, and are ready to fill promptly any orders sent them, however large or small they may be. It is almost impossible to call for anything required for telegraphic purposes that cannot be found in their extensive establishment.

The Advertising Patronage of The Telegrapher.

OUR advertising patrons are literally overwhelming us with their favors. We are obliged to encroach somewhat on our reading space this week to accommodate those who desire to avail themselves of the advertising facilities afforded by THE TELEGRAPHER. If the pressure on our columns continues we shall be compelled to again enlarge the paper at no distant day.

With an increasing circulation, and so liberal an advertising patronage, the future of the paper certainly appears, to say the least, encouraging.

The Snapper Sounder.

THE Snapper Sounder, the invention of Mr. RALPH W. POPE, of the Gold and Stock Telegraph Company, 61 Broadway, is one of the greatest successes of the season. They are all the rage, and may be heard in all public places where telegraphers are found. Those telegraphers who have not already purchased them are being rapidly supplied.

The Pennsylvania Telegraphic Agency.

AN advertisement of this new telegraphic agency will be found in our advertising columns. A new railroad telegraph sounder is a specialty with this concern, which is now offered to the public, with battery, chemicals, etc., all complete.

Mr. GEORGE L. SPARKS, a practical telegrapher, is the manager of this enterprise, and we would bespeak for it a share of patronage.

Personals.

Mr. CHAS. C. WHITNEY, for many years connected with the Indianapolis, Ind., W. U. office, has resigned his position as chief clerk to Supt. WALLICK, to accept that of assistant secretary to the Franklin Life Insurance Company of that city.

Mr. GEORGE P. LENNOX, late of St. Louis, Mo., is on his road to San Francisco, Cal., where he was for a long time operator in Gov. Stafford's office, and occupied a good position as an operator.

The Telegraph.

Additions to the Atlantic and Pacific Telegraph Lines.

THE Atlantic and Pacific Telegraph Company have recently purchased the Scioto Valley line, which extends from Columbus to Portsmouth, Ohio, and will put it in good working condition immediately.

They have also taken on a perpetual lease the Marine and Inland line, from New York to Long Branch, N. J., which gives a connection at New Brunswick, Red Bank, Keyport and other places in New Jersey. The

additional telegraphic facilities afforded at Long Branch will be of great value and importance during the coming season.

The Contract for the Panama and Payta Cable.

THE Panama correspondent of the *New York Herald*, writes, under date of March 22d, in regard to the contract for the submarine telegraph cable between Panama and Payta, that the Peruvian Government has just entered into a contract with Mr. Donald Cruikshank, the agent of the Telegraph Maintenance Company, of London, to lay a cable between Panama and Payta, the Peruvian Government pledging itself to get the consent of the United States of Colombia, and a similar privilege for the enterprise to that to be enjoyed while running through Peruvian territory. After the contract had been signed it was discovered that, some weeks before, the Foreign Office in Peru had been informed that Colombia conceded the privilege desired, on condition that the cable should not only connect Panama and Payta, but should go out of its straight course and touch in at Buenaventura, another port in Colombia. Mr. Cruikshank would have nothing more to do with the affair, and is here on his way home to report to his company.

Foreign Telegraphic Notes.

THE Great Northern (Chinese) Telegraph Company has recently established a line between Woosung and Shanghai. Twenty words are sent for a dollar. This is the first attempt to introduce the telegraph through the main portion of the empire, as previous efforts have been met with violent opposition from the people, who cut the wires and destroyed the poles.

The Brazilian Submarine Telegraph Cable Expedition left Madeira on the 28th ultimo, for St. Vincent, Cape Verd, and it is presumed the cable will by this time have been successfully laid. Any messages addressed to Charles R. Blandy, of Madeira, by the African or other steamers leaving England, will be at once sent forward to St. Vincent, whence they will go on by steamer to South America.

The accounts of the Direct Spanish Telegraph Co., made up to December 31, 1873, show a balance to the credit of profit and loss of only £12, 15s. 8d. The causes which have prevented a more satisfactory result for the past year are the breaking of the cable, and the manufacturers, who had to restore it at their own cost, being unable, owing to an accident to their steamer, to complete the repairs until the 28th April, when business was at once resumed, the interruptions caused by the Carlist insurrection, and the working of the cable having been entirely stopped in consequence of the close investment and siege of the town of Bilbao by the Carlists. Out of the 306 days between the 1st March and the 31st December, 1873, the cable, for the reasons above stated, was only at work 113 days. Having in view the possibility of Bilbao remaining blockaded for an indefinite period, the directors have applied for and recently obtained from the Spanish Government a concession for the temporary removal of the Spanish end of the cable from Bilbao to Santander (a town not likely to be affected by the Carlist insurrection, and having uninterrupted communication with the interior of Spain), and have made arrangements to carry out the necessary works at once.

The report of the Directors of the Mediterranean Extension Telegraph Company to the shareholders stated that the traffic for the entire year was slightly in excess of that for 1872, and it would be seen that the amount claimed under the guarantee was not so large as for the preceding half year. The cables and land lines were all in good working order, and the cost of maintenance had been small. The Directors proposed to recommend payment of the usual half yearly dividend on the 8 per cent. preference shares of the company, and of a dividend at the rate of 3 per cent. per annum on the ordinary share capital, payable on and after the 16th inst., leaving £491 to be carried to the reserve, which would then amount to £6,256.

In answer to a question of a shareholder at the half yearly meeting the chairman stated that the negotiation with the Eastern Telegraph Company for a consolidation had fallen through, and the proposal had been withdrawn. The dividends recommended were declared.

The receipts of the Eastern Extension, Australian and China Telegraph Company, for the month of February, amounted to £17,706 against £18,085 in the corresponding period of 1873, from the four separate lines, viz: The British Indian Extension, China, Submarine, British Australian, and the Victoria and Tasmanian Telegraph.

The receipts of the Submarine Telegraph Company for the month of February, amounted to £7,800 against £7,616 for the corresponding month of 1873.

Action of Western Union Employees on the death of George H. Everett.

CINCINNATI, O., March 26.

At a meeting of the operators of the Western Union Telegraph Co., held March 26, at their office in this city, the following resolutions were unanimously adopted:

Whereas, God, in his infinite wisdom, has taken from amongst us Geo. H. Everett, our former fellow operator,

Resolved, That in his death we feel the loss of a genial companion and a warm and faithful friend.

Resolved, That his abilities had placed him high in his profession, and that the fraternity have lost an able co-operator.

Resolved, That we deeply sympathize with the family of the deceased in their affliction, and that a copy of these resolutions be sent to them, and also to the newspapers of this city, and the telegraphic journals, for publication.

Break! For the Light is Breaking!

(A LOW COMEDY.)

"Oh! running stream of sparkling joy,
To be a soaring, human boy."—*Dickens.*

ACT I.—*Scene*, Trenton (G). Time, 11 P. M.

"Jf" (M'g'r) busily engaged with reports, suddenly arises to answer a persevering *plume* at Phillipsburg, who has been calling since 10:

"Jf"—I, I, G.

Plume—"Is it Jf?"

"Jf"—"It is."

Plume—"Will you practice with me?"

"Jf"—"Aye."

Plume—"68 send something to me."

"Jf"—"You don't want any practice in 'receiving.' It's 'sending' practice you need. Start off on some press, and don't stop to ascertain if I am getting it. I never break."

Plume shoots off on an editorial in the *New Jersey Agriculturist* (3 columns).

"Jf"—"Let her come, young man."—Cuts out [Exeunt.]

ACT II.—*Scene*, the same. Time, 7 A. M.

"Jf," upon cutting in the Phillipsburg wire, hears something which sounds very much like "an ambitious hen among broken bottles."

"Jf"—"Please sine 'G.'"

Plume—"Pa, pa, I thought I could maj you break." —*The Switch.*

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5509, New York City.

For the week ended February 17, 1874, and bearing that date.

No. 147,487.—**DUPLEX TELEGRAPH.**—George D'Infeville, New York, N. Y., assignor of one fourth his right to William N. Armstrong, same place. Application filed April 25, 1873.

No additional local or split batteries used. Two main batteries opposed, and battery at sending station localized, for preserving equilibrium.

1. The method of duplex telegraphing, substantially as described, by localizing or short circuiting the main battery at the sending station, thereby preserving the magnetic equilibrium in the signaling instrument of that station, and allowing the battery of the receiving station to exert its full force in recording or indicating signals, substantially as herein described.

2. In combination with a normally closed telegraphic line having main batteries, one at each terminal, connected to the line in opposition to each other, open circuit single contact keys M¹ and branch circuits N¹, connected to the relay magnets at a suitable point, the closing of the said keys short circuiting or localizing the battery of the sending station through the proper proportion of the coils of the relay, substantially as set forth.

3. In combination with a relay magnet having its layers exposed for connection to key, and for approximate adjustment, as described, the shunt circuit M and rheostat c, substantially as and for the purposes set forth.

4. In combination with the normally closed line, having the branch circuits h¹ and open circuit single contact keys, and opposed batteries, as described, the battery reversers and closed circuit keys, substantially as set forth.

5. The combination, at an intermediate or way station, with the main line of a duplex telegraph, of the open circuit key P and branch circuit t, connected to the relay between the terminals, the depressing of the key closing independent circuits for both terminal batteries, giving signals to both sides of the way station in single transmission, or forming a duplex line with one terminal, substantially as described.

No. 147,524.—**DUPLEX TELEGRAPH.**—Joseph B. Stearns, Boston, Mass. Case C. Application filed February 21, 1873.

Current divided at a point between the line and relay of sending station, the line current going to distant station and returning through home relay to battery, the equalizing or local current going directly through home relay, the effects being neutralized therein, and, through an additional relay, enabling the sender to read his own writing.

The combination of the differential relay's M, sounder or relay 2, resistance R, key K, battery L B, and their connecting circuits, as and for the purposes set forth.

No. 147,625.—**DUPLEX TELEGRAPH.**—Joseph B. Stearns, Boston, Mass. Case A. Application filed February 21, 1873.

Equalizing current passed through coil around armature of

relay, so as to neutralize inductive effect of relay magnet thereon.

The combination of the magnet R, armature A, and coil C, in the manner and for the purpose substantially as set forth.

No. 5,768.—(Reissue).—GALVANIC BATTERY, AND COMBINING THEREWITH SECONDARY OR ACCUMULATING BATTERIES.—Georges L. Leclanché, Paris, France, assignor to Hilborne L. Roosevelt, New York City.—Patent No. 64,113, dated April 23, 1867.—Division A. Application filed January 27, 1874.

Peroxide of manganese sealed up in porous cup with graphite muriate of ammonia used in solution. Accumulating cells used in connection therewith.

1. The combination, with the other necessary elements of a galvanic battery, of peroxide of manganese, substantially as described, and for the purposes set forth.

2. The combination, in or with the porous cells of a galvanic battery, of an anode and salt or salts to be decomposed, substantially as described, and for the purposes set forth.

3. The combination, with the anode in a porous cell, of the decomposing and to be decomposed salts packed therein in a dry state, substantially as described, and for the purposes set forth.

4. The combination, with the anode in a porous cell, of salts highly insoluble, and salts for decomposing the same by electrolytic action, substantially as described, and for the purposes set forth.

5. The graphite plates, the flask, and the porous vase, all in combination, substantially as described, and for the purpose set forth.

6. A polarizing apparatus in combination with the battery, as hereinbefore described, and for the purposes set forth.

7. The combination, in general, in a galvanic battery, of the ammoniacal salts with the peroxide of manganese, substantially as set forth.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,
BY
TAL. P. SHAFFNER, LL. D.,
Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Caton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Oersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but not mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE "SNAPPER." Price, 30 cents.

How the Boys "tumble" to it!

READ THE FOLLOWING:

St. Louis, March 24.

R. W. POPE.
DEAR SIR—Enclosed please find \$1.20, for which please send four of your "Snapper" Sounders to the following addresses:

- E. A. ALLEN, W. U. Telegraph office,
- H. J. FOREMAN, W. U. Telegraph office,
- W. J. FOY, W. U. Telegraph office,
- Ed. A. KLENE, Jr., W. U. Telegraph office.

Your little Sounder has created quite an excitement among the boys here.

Later.—Still they come. Send one more to the following address: MARC GAUTIER, W. U. Telegraph office. ED.

P. S.—Another County heard from.—Send one more to CHAS. E. BURROWS, W. U. office. The total inclosed for six Sounders, \$1.80.

EDDYVILLE, IOWA, March 21.

DEAR SIR—Please find enclosed 60 cents for two more of your "Snapper" Sounders. If you get this before filling order of the 20th, please enclose the four in paper box. Think will send for couple more in a week. They make more fun for their price than anything I ever saw. Please hurry them along. Can hardly wait.
ED. LEGGETT.
Manager W. U. office.

DETH MILLS, MICH., March 24.

DEAR SIR—Please send me three more of the "Snappers." Best thing out. Boys all like them. Please find enclosed 90 cents. Respectfully,
H. HALL.

Sent, post paid, for 30 cents, or six for \$1.50. Purchasers in the British Provinces will please remit 5c. for additional postage.

R. W. POPE,
Box 5278, New York.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

- Instrument complete, Key and Sounder..... \$6 50
- Instrument with Office Outfit..... 7 50
- Two Instruments and Outfits..... 14 50

L. G. TILLOTSON & CO.,
8 Dey Street, New York.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Tannton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The **Electro-Mechanical Gong Striker**,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the
original *FARMER & CHANNING PATENTS*, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THESE**
CAN BE NO QUESTION.

*The cooperation of TELEGRAPHERS in securing its in-
roduction into their localities is cordially invited, and*

*their efforts will be duly appreciated and
compensated.*

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that
will work practically with a single DANIELL cell, a BATTERY
that does not require to be taken down but once a year, and the
very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS

FOR
ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$250, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his
CELEBRATED HELICES

WHICH ARE OF
Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch. The layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

SMITH'S
MANUAL OF TELEGRAPHY.

PUBLISHED EXCLUSIVELY BY
L. G. TILLOTSON & CO.,
Price 30c. 8 DEY STREET, NEW YORK.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.
The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any attention whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of
 Railroad Telegraphs who find an attractive combination, giving
 loud sound without materially increasing the resistance beyond
 the standard of their relays.

We have rewound some of the old Box Sounders, in which we
 found the helices to have a resistance equal to 400 and 450 ohms.
 None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.
 Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet
 lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

BUY THE BEST.

The Craven.

BY OWTON A. FLYE.

Once upon a mid-week dreary, while we all sat faint and weary,
With our hearts out in the sunlight of the blessed words "no more,"

As we all sat idly gazing, suddenly there came a flapping,
As of some one wildly slapping, slapping at our office door.
"Tis some creditor, we muttered, "slapping at our office door,
As he oft hath done before."

Ah, distinctly I remember, it was in the fresh November,
And each sad, insolvent member cast his eye toward the door.
Vainly had we tried to borrow from a friend until the morrow—
The morrow which we all felt to deplore;
And our hearts went fondly back to the plentiful days of yore—
Gone from us forever more.

And the fierce and lively bustling of the check boys quickly
hustling,
Thrilled us—all filled us with fantastic terrors never felt before;
So that now, to still the beating of our hearts we stood repeating,
"Tis some creditor entreating entrance at our office door;
Some ardent creditor entreating entrance at our office door;
That it is," as we said before.

Presently Griswold's soul grew stronger; hesitating then no
longer,
"Sir," said he, "or Madam, truly your forgiveness we implore;
But the fact is, we were gazing, and so loudly you came flapping,
And so wildly you came slapping, slapping at our office door,
That we almost thought we heard you"—here he opened wide
the door—
What a look his visage wore.

"Come in," we heard him mutter, when, with many a flirt and
flutter,
There stepped a stately crow in, of the saintly days of yore.
Not the least obeisance made he; not a minute stopped or
stayed he,
But with mien of lord or lady, stalked across the dirty floor,
Up on to Reynold's shoulder, just three feet from the floor—
Perched, and sat, and nothing more.

Then this ebullient bird beguiling his sad fancy into smiling,
Such grave and stern decorum of countenance to see:
"Though thy crest be shorn and shaven, thou," he said, "art
sure no raven,
Ghastly, grim and ancient craven wandering from the hemlock
tree—
Tell me what thy lordly name is on the lonely hemlock tree?"
Quoth the crow then, "73,"

"Prophet!" said he, "thing of evil! prophet still, if bird or
devil!
Whether tempter sent, or whether tempest-tossed thee here
to me;
Busy, yet undaunted, in this noisy spot I'm planted,
In this place by horror haunted—tell me truly, 'tis my plea:
Is there—*is there* balm in Gileads? Tell me truly, 'tis my plea!"
Quoth the craven, "73,"

"Be that word our sign of parting, bird or fiend!" he shrieked,
upstarting;
"Get thee back into the tempest and the lonely hemlock tree!
Leave no black plume as a token of that lie thy soul hath
spoken!
Leave my business hour unbroken! Got thee down onto my
knee!
Take thy beak from out my eyebrow; take thy form from off my
knee!"
Vamosed the craven, saying "73."—*The Operator.*

[From *The Ghost*.]

Posie Van Dusen.

I HAVE a remarkable memory for faces, and though it
was ten good years ago that I first saw Posie Van
Dusen, and I had never seen him, and had scarcely
heard of him since, I recognized him instantly when I
saw him again last fall.

I don't know why he is entitled "Posie." There is
nothing about him suggesting the exhalation of flowers.
His nose is the only blossoming feature about him, but
I have no reason to think he derived his fragrant *sobriquet*
from that. It must have been in the summer of
1863 or 1864 that I first saw Posie. It was the occasion
of my first visit to New York. I was a message
boy then, in a New England office, with a very slight
knowledge of dashes and dots, and having rendered a
railroad superintendent a service, he offered me a pass
to New York. My sensations, on debarking in this
wonderful metropolis, were much, I fancy, as were yours,
my reader. I was captivated with everything I saw,
and astounded with the length and breadth of this
swarming island. To me at that time the poet's bitter
denunciation—

"False land of promise, paved with gold
That turns to iron 'neath the blistering foot,
Lured by that rustic lie to pace her streets!
That loadstone rock whereon adventure splits
And wrecks ambition starves."

To me, I say, this had no unusual significance. I saw

only the bright side of the picture, and I tripped gaily
along the route of the telegraph poles, vainly expecting
to reach the office by that means. When I had tired of
this I used my tongue, and ere long I stood before the
great "No. 145," of which I had heard and thought so
much. My cousin was an operator, and in due time I
was ushered into the operating room of the American
company. He was in good standing; he has since risen
to a position of trust; his name is identified now with
the invention of "duplexes" innumerable, and "no
bugs repeaters," and I find him, moreover, despite his
great modesty, a man whose knowledge of electrical
science is generally respected. He introduced me to
the manager, Mr. J. C. Hinchman, to Mr. M. S. Roberts,
general assistant, to Wm. B. Clum, chief operator, and
to Dixon T. Marks, night manager, also to operators
in considerable number; and finally prefacing my
presentation with the remark, "Of course you want to
know all the celebrities," he brought me to where two
young men, apparently cast in the Swivellean mould,
were standing, and said: "This is Tip McClosky, Mr.
Oakum, and this Posie Van Dusen—you have heard of
them both." Indeed I had, and I felt much the same
in their presence as I remember to have felt several
years later, when I stood face to face with Charles
Dickens, and tried to comprehend that this was the
man who had created Cuttle, Copperfield, Agnes, Dame
Durden, and the host whose hopes and experiences
were a part of my own life—the sunniest part of it,
need I add?

The next morning, as I stood waiting for the arrival
of my *chaperone* and relative, who was not due until
8.30, I saw the little army of operators file into the
side door. I was a little shaver, with a round rosy face,
like hundreds of other boys, and I dare say they did
not recognize me. Certainly none of them honoured me
with a bow—not even with the ghost of a wink to be-
token they had ever seen me before. I had not learned
then how slight a claim a boy's introduction to a busy
New Yorker entails. At the end of the list, as invari-
ably happened, came Tip McClosky. His appearance,
even in the distance, was dishevelled, but there was a
devil may-care-air about him as he strutted along,
which was not without its element of smartness. I
turned my face away; I had been snubbed by every-
body, and I would not give this man a chance to wound
my foolish sensibilities. But Tip accosted me with a
kindness in his tones that I have never forgotten. He
shook hands with me and called me his dear boy, and,
leaning up against the little iron railing with as much
nonchalance as if he had been fifteen minutes ahead of
time, instead of fifteen behind, he proceeded to inquire
how old I was, how long I had been learning, and as-
sured me I was doing first rate. "Stick to it, Oaky,"
said he, "it can't be accomplished with a *lep*, it requires
patience and practice. Don't get discouraged, the war
is creating a big demand for operators, and before it is
over I shall expect to hear of you as one the best op-
erators around. And let me give you a little advice, my
boy," he continued, quite seriously, "don't go too much
on your reputation. I have got a big reputation my-
self, and I *must* sustain it. There is no such thing for
me as starting anew, but you can learn wisdom from
my experience. Try to become a good, reliable op-
erator, steer clear of liquor, and you will win. And re-
member, above everything, that it is impossible to do
telegraphic work correctly, without occasional inter-
rogation in doubtful instances, as it would be to print a
book or newspaper correctly before the proof reader had
improved it by his emendations." With this he bade
me "good morning," and, shaking hands again, he dis-
appeared within. I walked on air that morning. All
the encouragement I had ever received was not a tenth
of that which this seemingly abandoned Bohemian had
voluntarily excited. Some one says that every man
has the ashes of a poet in him. I am sure Tip McClosky,
long wandering through this land, and now an exile in
Mexico, has the ashes of a gentleman in him. What a
pity that fortuitous circumstances, home influences, or
an inherent will had not guided the warm instincts of
his soul, and developed them into something worthier;
how sad to contemplate a man wrecked on the waste
waters of dissoluteness, from a mere lack of—something
to change his course.

But I am forgetting Van Dusen. Before I left New
York I learned from Tip that Posie had been dis-
charged. The story was a brief one. Van Dusen,
Tip, and Cap De Costa, another telegraphic knight,
had been up into Westchester County the week before
to a ball. Van Dusen went to play the violin, on
which he performed quite creditably, "though he got
a message going to 14 Milk Street as 1470 K street,"
said Tip, as he related the details. "Posie fiddled,"
said Tip, "as long as he could, and when he had be-
come not only too full for utterance but too full to scrape
the strings, the people piled us into the wagon and
started us home. It was awfully dark, and most of us
were asleep for a long time; but Posie woke up at
length and wanted me to stop the horse; said he
thought his Cremona was knocking around in the bot-
tom of the wagon. So I reined in the steed, and Posie
got out to make an examination. I went right to sleep,

and I guess Cap wasn't awake at all. Anyway we
fetched up at the stable next morning, and Posie
wasn't in. He says now that I drove off and left him
in the woods twelve miles from Harlem. He was five
days footing it into New York, and when he got here
J. C. H. had his paper sealed, signed and ready for
delivery." I wasn't as sorry as I ought to have been.
I didn't like Van Dusen particularly. Perhaps I was
prejudiced by Tip, whom I had once heard tell Posie,
"Yes, you are a big operator—let you tell it."

Last summer I embarked for Boston by the shore
line train, leaving Forty-second street at nine P. M.
There were not many in the cars—a young operator
from Watertown, N. Y., going to New London to work
for the position; a couple of dry goods drummers,
one or two miscellaneous human entities and myself.
Just as the train was starting, a chap whom I at once
recognized as Van Dusen entered the car. He was
redolent of vinous compounds, and before we had fair-
ly steamed into Harlem he had edged himself into the
conversation proceeding between the drummers. One
of them had said something about his "circuit," and
that was sufficient to set Van Dusen's tongue to run-
ning like mad. He worked the first wire that was
ever worked from New Orleans to New York, he
did; he took the first message that was ever sent
across the plains—that's what kind of a man he was.
But his auditors were not so much interested in tele-
graphics as they might have been, and they inconti-
nently snubbed the man of dots and dashes, and he
was obliged at last to address his conversation to the
boy. After a while he got out a railroad flask, and
saying, "The whiskey in that bottle is ten years old,"
he offered some of it to everybody. There were no
takers except himself. He had talked shop just enough
to raise the curiosity of the youngster from Watertown,
and the lad came over and sat with him on the seat
behind me. I couldn't help hearing much of what
was said, and I thanked my stars when I began to feel
drowsy just after leaving New Haven. The train,
however, was a lightning express, and the abrupt
curves and an uneven track swayed the smoking car
like a reed shaken in the wind, and I woke up at in-
tervals of ten or fifteen minutes, I should judge. By some
singular fatality my waking moments seemed to come
just as Van Dusen was beginning to relate the history
of some new adventure. As nearly as I can recall it,
the panorama shifted after this manner:

"Sorry you won't take a drink, young fellow. The
whiskey in the bottle is fourteen years old. I want to
give you a little of my experience; some heavy work I
did in Cincinnati. I took fourteen thousand words of
press—"

Then I fell asleep and woke up to this refrain.

"Sorry you won't take a drink, young fellow. The
whiskey in that bottle is sixteen years old. I want to
give you a little of my experience—some heavy work I
did in New Orleans. I took three hundred and thirty-
one messages in two hours and a half—"

Again, when the car disturbed my nap, I caught:

"Sorry you won't take a drink, young fellow. The
whiskey in that bottle is eighteen years old. I want
to give you a little of my experience—some heavy work
I did in Corinne. Business had been accumulating in
Omaha twelve days, old Jim Lawless was working
there then; fastest sender ever lived. I just told him
to leave out everything and go in. Received from him
seventeen hours and thirty seconds, and took sixteen
hundred messages without a—"

"Why, that is nearly a hundred an hour," ejaculated
the youngster, amazed.

"I don't know anything about that. Wo never
counted 'em to see what time we made," said Posie, in
return, and then I fell asleep again. I couldn't pre-
tend to tell you how many more times I came to the
surface, as it were, and heard the story about that aged
whiskey and the heavy work. The more he talked
about them the older the whiskey got, until its one
hundred and fourteenth year was roached, and I don't
know how many more, and the work became heavier
and heavier as the dust and cobwebs gathered upon
that inspiring flask of spirits. Finally, I fell into a
deep slumber, which lasted until the train went crash-
ing through Hyde Park and Jamaica Plains. I looked
behind me for Van Dusen as we came within sight of
Boston's domes but he was gone, whither I know not.
It was a beautiful morning, and the birds were singing
sweetly in the trees as I staggered across the Common
more asleep than awake. Somehow there seemed to
me to be a story of whiskey and heavy work permeat-
ing the limped tones of the feathered songsters; but
from away over on a hillside, where the branches were
waving in the summer wind of the early morning,
there came the tones of a sweeter singer than all the
rest. Above the din of the many its blithe notes rang
out sharp and clear, and it seemed to sing—possibly I
dreamed all this, but I remember it as a reality—it
seemed to sing those lines of Young's:

"We rise in glory as we sink in pride,
Where boasting ends there dignity begins."

JOHN OAKUM.

The Telegraphers' Mutual Benefit Association.

ASSESSMENTS NOS. 58, 59 AND 60, ISSUED MARCH 24, 1874.

Death of W. H. Kelty, C. P. Rosser and Samuel Porter.

ANNOUNCEMENT is made of the death, during the past month, of three members of the Association. Messrs. Kelty and Porter were among the first members. These frequent deaths may seem to impose a heavy burden on many members, but they also show the need of the Association. Let all be as prompt in their remittances as possible. These deaths necessitate the issuance of another triple assessment.

Assessment No. 58.—W. H. Kelty (certificate No. 261), died Feb. 8th, 1874, at Titusville, Pa. from injuries received by being thrown from a sleigh.

Assessment No. 59.—Charles P. Rosser (certificate No. 1,648, issued Sept. 24, 1872), died Feb. 11, 1874, at Maysville, Ky., from the effects of an overdose of an opiate.

Assessment No. 60.—Samuel Porter (certificate No. 311, issued Sept., 1868), died Feb. 22, 1874, at Albion, N. Y., of pneumonia.

Members holding certificates numbered up to and including No. 2,194, will please remit for above assessments.

The following circular to the members has been issued:

"The testimony in favor of dropping the second initiation fee has been so nearly unanimous that the Executive Committee have determined to accept delinquents without its payment. The first initiation fee was, in point of fact, only fifty cents, the dollar going as a payment of the following assessment. The second fee was, therefore, practically, three times as much as the first, as no part of it was accredited to assessments. We hope the effect of this action may be to restore many valuable members to the Association.

"JAMES D. REID, Treasurer."

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS NOS. 55, 56 AND 57, UP TO AND INCLUDING MARCH 23, 1874.

2, 4, 6, 8, 13, 23, 46, 54, 58, 61, 67, 70, 72, 75, 76, 78, 80, 82, 89, 93, 97, 99, 103, 114, 120, 121, 129, 131, 134, 143, 146, 148, 175, 176, 177, 178, 183, 188, 189, 190, 191, 193, 197, 198, 201, 202, 213, 218, 240, 244, 247, 255, 257, 278, 279, 281, 282, 283, 285, 289, 346, 350, 353, 361, 367, 372, 378, 392, 393, 402, 405, 406, 413, 414, 425, 438, 456, 463, 464, 474, 476, 478, 484, 511, 512, 520, 533, 542, 548, 552, 553, 554, 561, 569, 574, 577, 590, 594, 600, 604, 622, 642, 646, 659, 660, 662, 663, 664, 665, 669, 678, 680, 685, 714, 729, 731, 635, 764, 772, 797, 803, 808, 813, 815, 820, 830, 848, 858, 859, 870, 883, 886, 901, 905, 911, 912, 922, 927, 938, 939, 941, 942, 952, 978, 991, 992, 995, 998, 1005, 1011, 1013, 1047, 1055, 1058, 1073, 1074, 1075, 1076, 1085, 1093, 1100, 1101, 1102, 1127, 1143, 1149, 1152, 1155, 1156, 1157, 1159, 1160, 1162, 1164, 1185, 1196, 1208, 1213, 1224, 1237, 1238, 1242, 1251, 1252, 1254, 1267, 1270, 1276, 1277, 1282, 1287, 1288, 1289, 1294, 1304, 1307, 1308, 1309, 1311, 1312, 1313, 1314, 1315, 1317, 1318, 1319, 1320, 1321, 1322, 1327, 1345, 1353, 1354, 1355, 1356, 1358, 1359, 1368, 1372, 1376, 1385, 1387, 1389, 1390, 1391, 1407, 1417, 1418, 1425, 1426, 1437, 1438, 1448, 1451, 1453, 1454, 1455, 1456, 1482, 1483, 1485, 1500, 1501, 1506, 1507, 1508, 1511, 1522, 1535, 1546, 1550, 1555, 1560, 1564, 1569, 1579, 1580, 1593, 1594, 1620, 1623, 1626, 1632, 1634, 1644, 1652, 1656, 1660, 1661, 1662, 1663, 1665, 1695, 1714, 1728, 1730, 1732, 1763, 1780, 1794, 1795, 1796, 1797, 1803, 1804, 1815, 1817, 1823, 1824, 1844, 1845, 1867, 1882, 1900, 1901, 1903, 1907, 1911, 1913, 1914, 1926, 1951, 1957, 1965, 1868, 1994, 1996, 1997, 1998, 1999, 2000, 2001, 2006, 2016, 2017, 2025, 2028, 2033, 2035, 2044, 2050, 2057, 3065, 2074, 2075, 2082, 2083, 2103, 2113, 2116, 2119, 2120, 2123, 2125, 2127, 2131, 2138, 2140, 2144, 2145, 2147, 2152, 2154, 2155, 2166, 2167, 2181, 2184, 2192, 2193, 2194.

ASSESSMENTS NOS. 58, 59 AND 60.

188, 208, 211, 277, 289, 302, 742, 858, 859, 915, 923, 1178, 1357, 1489, 1862.

MISCELLANEOUS.

53.—131, 332, 813, 1013, 1152, 1695, 1843, 1900.
54.—131, 332, 813, 1013, 1152, 1695, 1843, 1900.
55.—1629, 2143.
58.—29, 64, 103, 131, 381, 509, 564, 662, 870, 880, 912, 917, 1024, 1154, 1267, 1550, 2035, 2097, 2181.
59.—64, 103, 131, 381, 509, 564, 880, 912, 917, 1550, 2097.

Misfortunes Attending West India Telegraphs.

THERE must be some extraordinary fatality, or some blundering of a more than usually mischievous character, which prevents all the submarine cables connected with the West Indies from obtaining any profit upon the capital invested in them. Here is the Cuba Submarine line—one which should, under ordinary management, be about the most prosperous of undertakings of the kind, and yet we find the directors are not in a position to pay any dividend. The company were

singularly unfortunate in the selection of contractors for the cables and in the choice of officers to superintend the laying of them. The cables of the company and its connections with the West India and Panama are in a state of chronic disorder. During the short intervals when the cables are not at fault the shareholders are worried by the interminable lawsuits which the directors somehow or other contrive to get into, to the annoyance of all parties except the lawyers, who find suitable occupation in this costly litigation.

The report of the company last issued shows that the directors of the company have now added to their achievements by accomplishing the remarkable feat of going to law with themselves. Mr. Thomas Hughes, the chairman, and Mr. Brand, the secretary of the Cuba Company, held the same position in the West India and Panama Company. In their capacity as representatives of that company it appears that they suggested that the Cuba Company, of which they are also respectively chairman and secretary, should subscribe £3,000 towards the purchase and fitting out, and £4,000 towards the maintenance of the Suffolk repairing ship. The vessel, as might be expected from former experience of the blundering of this company, "has not been available when required," and the repairs of the cable have been in consequence effected at much greater cost and delay than would otherwise have been the case. Under these circumstances Mr. Hughes, of the Cuba Company, fears that the company will be involved in questions with the West India Company, of which Mr. Hughes was chairman when the suggestions which led to these "questions" were made and adopted by himself. Mr. Thomas Hughes, successful as the author of "Tom Brown's School Days," appears to lack the qualities which are essential to win success in the management of submarine telegraph companies.—*The Railway News.*

Another Electric Motor and Invention.

BY invitation of the inventor, Colonel H. R. Leonard, we were yesterday shown the model of his new electric engine. Taking us into a room in the second story of the building on the southwest corner of Washington and First streets, our ears were greeted with the regular tick, tick of revolving machinery, while on an elevated platform before us was a driving wheel, about twelve inches in diameter, revolving at a rapid rate. There was no impelling power visible, and for some time we were unable to gain an insight into the matter, and half suspected that our ingenious friend had succeeded in discovering that great mystery—perpetual motion. While, however, we were calculating on the financial value of such an invention, Mr. Leonard quietly unloosed a screw, and drawing out a piece of wire, the unseen power was withdrawn and the magic wheel was still. We then took occasion to examine it, and found that inserted in and forming a portion of its outside surface were several magnets, which, in turn, were acted upon by powerful coils, two of which are stationed on either side, and so arranged as to give an attractive and repulsive force to the revolving wheel. A powerful battery supplies the electric fluid, which, on being attached, sets the wheel in motion. The invention, if it proves successful, promises to be of incalculable benefit to the world at large and a fortune to the inventor. The motive power has been secured beyond a question, and the only matter to be decided is the volume of that power. The inventor has sanguine hopes of success, and has no doubt of its complete running capacity. He proposes to test it in the course of a few weeks by endeavoring to run a screw propeller on the yacht Owl, which, if it proves successful, will be as good a test as the inventor desires. In acknowledgment of Mr. Leonard's genius we sincerely hope the electric engine may prove all he claims it will.—*Albany (Oregon) Daily Bulletin.*

On Working Wires of Different Resistances from a Single Battery.

OUT WEST, April 1.

TO THE EDITOR OF THE TELEGRAPHER.

AS a matter of course, I was pleased to see that Mr Pope's decision in regard to the way I worked the city line out of the same battery as my wires of greater length, was rather in my favor. The difference being, as he explains it in the article under head of "On Working Wires of Different Resistances from a Single Battery," in THE TELEGRAPHER of March 28th, "a saving of material on the 18 cups tapped off.

Although no thorough electrician can fail to understand Mr. Pope's explanation, there are those who are not well versed in working out such problems in the way Mr. Pope has so plainly set it forth.

Now, the rule we go by is the old fashioned one that a ground wire is a ground wire, whether it is five miles or five feet distant from the battery.

Now, how any surplus electro-motive force, not necessary for the working of the city wire, generated in those eighteen cups, if tapped off, could pass beyond the point of tapping, and render any service to the wires worked out of the remaining larger portion of the battery thus tapped, is what we can't understand.

We want to be enlightened, and this communication is not intended to make light of our elder and better educated brother's explanation, but we want to rise step by step to the same high ground. Won't some one who thoroughly understands this matter explain it in "United States," as the boys put it out here, when a fellow puts big words to them?

Probably a more minute description of the way the wires were worked, that called forth Mr. Pope's explanation and this article, would give additional light on the subject.

There were three batteries—one of 54, one of 36, and one of 18 cups of carbon (or electropoin) battery. The former used for working two wires of 300 miles length, with a great number of way offices on each wire. The second (36 cups), for working two wires 250 miles long with but few offices, and the third (18 cups), for working the city line. An increase of business during the middle of the day made it necessary to make a change, whereby the battery of 36 cups was obliged to furnish the power for one of the 300 mile wires in addition to the two it usually worked of 250 miles each. This was found, especially in bad weather, to be almost impossible, and no new material being allowed to increase the battery, the expedient of merging the 36 and 18 cup batteries into one was thought of and put into execution. The first trial was a perfect success, as the increased battery of 36 and 18 cups combined was found to work the three wires when necessary to use it thus, and was none too large, apparently, for the two wires the 36 cup battery had been used to work. Feeling convinced that the tapping of one of the large batteries (both now being of the same size, *i. e.*, 54 cups) would practically result in making a 36 cup battery of either one thus tapped, the experiment of the "water resistance," with adjustable slips of platinum, suggested itself, and although the division superintendent was strongly in favor of the "tapping," arrangement, he was finally brought over, at least far enough to have "water resistance" tried, and after the trial said no more about it. The city line was then attached to the 54 cup battery that worked the two longest wires through the water resistance.

The idea was probably very crude and in part ignorant, but it suggested itself, nevertheless, that just enough battery power would pass to the city line through the "water resistance" to work it, and the remainder would be at the service of the longer lines. We were tried to be made believe the theory that one third of the electro-motive force generated in that 56 cup battery would either be used by the city line or be lost in the "water resistance." The two long lines getting the benefit of but two thirds of the battery power, but we cannot understand it in that way. These ideas, no doubt, are very crude, the manner of expressing them very unscientific, and the words used to express these views wrongly taken hold of and terribly misplaced; but we have to live and learn in our business. Let us have some sound theory on this matter, and corrections where wrong impressions are had.

WESTERN CHIEF OPERATOR.

The Erie Railroad Telegraph Department.—Some Scraps.

TO THE EDITOR OF THE TELEGRAPHER.

EVERYBODY knows the Erie Railway—at least everybody has heard of it. Every intelligent person who reads has committed to memory the flowery language used in their advertising cards about "the broad gauge, double track, air line from New York to San Francisco" (or little short of there), with the prospects good for bridging the Pacific before long and building a grand central depot in Yeddo, Japan, or somewhere among the Celestials. We say everybody has heard of this Erie Railway, but perhaps there are those who do not know so much of their telegraph department. They have one, however, although we cannot remember ever seeing it mentioned in THE TELEGRAPHER, except when we wrote it up in "The Excursion to Watkins Glen," last summer. Perhaps, then, a few facts from here may be of interest.

The operators on these lines, taken together as a lot, average by far the best it has ever been our fortune to meet on any railroad. They are nearly all first class, and, as far as we have observed during our brief sojourn with them, are jolly good fellows. While telegraphers seem generally to be degenerating, and the past three or four years have worked a change that is painfully

apparent, yet they seem to be the good old class on the Erie lines, almost to a man.

They all do W. U. business, and therefore get the Journal, and that is the reason why we never hear from them through THE TELEGRAPHER. Ask one if he gets THE TELEGRAPHER, and invariably he replies:

"Yes, we get THE TELEGRAPHER—or, well, that is, the Journal."

"Yes," we say, "but THE TELEGRAPHER is a sheep of an altogether different color. Why, man, it is 'a journal of electrical progress,' 'devoted to the interests of the fraternity.'"

And then they say, "Oh!"

And they see the difference, and we go on to explain how much of life they have lost in not subscribing for THE TELEGRAPHER years ago.

The wires here work tolerably well—as well, probably, as the generality of wires work, but yet are somewhat behind those of the Lehigh Valley R. R., as are also the old Daniells locals behind Sup't H. A. Clute's Hay and Excelsior Batteries.

The department is under the supervision of Mr. W. J. Holmes, of New York, and the eastern division (the only one of which we have an intimate knowledge) under the immediate charge of Mr. C. A. Sweet, division operator, who acquits himself creditably of his arduous labors, and is liked by all who know him; at least we suppose he is, but, for fear of drawing it too strongly, we will modify it, and say that he is known by all of whom he is liked.

And now we will tender you "sum skrap," which we "skraped" together for THE TELEGRAPHER, and then close our key. The first may be more poetical than plain to most of your readers, but we never explain our own jokes. Somehow we don't like to do it. Of course "we heard this on a way wire":

"I say, see here! Frite Gerse. John Smith."

"Oh! Mr. Gerse, why, really I—"

"Op! op! R. R., you dook cog wem; adjuv your relay and I'll fix my jy."

And this on the same wire, only the "jy" was all right this time. Imagine the character of the first part dandified and dignified to an alarming extent, while he of the second part works a small office, taking for his compensation thirty per cent. of its receipts, and the business of which for last month was three messages—two D. H., and the other collected at the other end.

"How's number 5? Can't raise you there?" "Yeow can't? By gum! Naow, ain't it queer? But then I s'pose the reason is because it doan't run in here."

The next it has always been our desire to see in print. We know no reason why; certainly not because of any merit in the rhyme, but we always thought we should like to see it in print:

Tell me ye winged winds,
That 'round my pathway roar,
Do ye not know some place
Where "plugs" exist no more?

Some city, village, town,
Some hamlet in the West,
Where paper is not found,
And registers non est?

The loud wind sneaked
Around the corner sly,
And winked at me and giggled:
"No, not I."

J. K.

Solution of a Problem.

PHILADELPHIA, PA., April 7.

TO THE EDITOR OF THE TELEGRAPHER.

I. N. M., of Chillicothe, asks Mr. Haskins to solve a very simple problem by one of the rules laid down in his own work.

The problem is this: From A to B is 96 miles of glass insulation, and from B to C is 6 miles of Kenosha insulation. To find the insulation resistance of B — C, when we know the insulation resistance of A — B and A — C—

A B x C A - B = 14.140
I I I A - C = 10.740
B - C = X

To find X or the value of the unknown quantity; subtracting A — B from A — C we have B — C = — 3.400 ohms, which is the inverted value of B — C or X. Then by the proportion, as 3.400 is to 10.740 so is 14.140 to the answer, which we find is 44.666 ohms, or the direct value or resistance of B — C.

Multiplying 44.666 ohms by 6 we have the resistance per mile of the Kenosha insulator, = 267.386 ohms. Multiplying 14.140 by 93 we have the resistance per mile of the glass insulation, = 1,325.020 ohms.

This shows the Kenosha insulator to be the poorer of the two.

We also arrive at the same result by another method viz.: We have an equation, 14.140 x X = 10.740, transposing and clearing of fractions we have 14.140 X

— 10.740 X = 151.864; from this we have X = 44.666 x 6 = 267.386 ohms resistance per mile of Kenosha.

If the foregoing is incorrect I would like Mr. Haskins to point out the error. If correct, I would like him to get at anything near this result by his own rule. DAVID BROOKS, JR.

Telegraph Affairs in the South.—Personals.—The Snapper Sounder.

CHARLESTON, S. C., April 4.

TO THE EDITOR OF THE TELEGRAPHER.

The damage done by the recent heavy freshet in the Alabama river has not yet been repaired and Selma is still unheard from. When the break is closed the Southern and Atlantic will be in communication with Mobile, Ala., their wires having been built through during March.

Mr. J. G. Thornton, formerly superintendent of the southern district, will have charge of the office there, and act as circuit manager. Mr. A. J. Wright is transferred from this office as one of the assistants there, and left last night with a carpet bag full of good clothes and a bottle of soda water—his pet beverage since January 1st. He was escorted to the depot by a committee of one from the Mulligan Guards, who toted his trunk on his arm and bought two five centers with the reward generously thrust upon him.

A lady of color, who keeps a laundry on Hazel street, has her house draped in mourning this morning—I presume for the late Senator Sumner, but some there are who are base enough to insinuate that it is for Wright. The vacancy here will be filled by Mr. J. H. Riddick, formerly manager at Montgomery, who is relieved by Mr. Flint.

Kidney Green has been sent from the main office here to the Pavilion Hotel branch, relieving Mr. Thos. Slattery, the poet laureate, whose exquisite song of the "Fastest Girl in Charleston" was recently published in the N. Y. Clipper, and beautifully commented on by Queen in his peculiar style. Mr. Slattery goes to the Rankin House office, Columbus, Ga., preferring a telegraphic life to the honors of a poet, refusing engagements with stupendous salaries, offered by all the principal journals of the country. 'Tis a pity that such talent is doomed to be lost to the world, and that Tom has decided to poetize no more forever.

Our line to New Orleans will be pushed as rapidly as possible, and we will soon have two wires working there.

Business for this season of the year is very good, keeping us busy about all the time. The W. U. moved their main office lower down Broad street, nearly opposite us, and will close their East Bay branch, thus reducing the force by two men.

Among other nuisances the Snapper Sounder is in our midst. Oh, shades of the mighty inventor, Martin, from what a height thou hast fallen! Chief inspector, acting superintendent, inventor of a masheeu in a little paste-board box, that was to throw all operators out of work, dealer in old covered wire, now maker of the "Snapper." You can hear his chuckle in every touch, and see his smile in every move of the lever; the instrument and the inventor, as he is dubbed for his genius, are alike both small and light in the head. All the Snapper needs to make it complete is the name M. Wiseman stamped on its base, then will the glory of both be complete.

W. H. Pierson should send his present address to the S. & A. here, so that four letters for him could be forwarded. QUILP.

Practical Sympathy with The Telegrapher.

BEATRICE, NEBRASKA, March 23.

TO THE EDITOR OF THE TELEGRAPHER.

NOT long ago I was sitting at my instrument, reading THE TELEGRAPHER, and my eyes fell on one of those appeals to operators who are interested in the welfare of our paper, to try and extend its circulation. Being one of those interested ones, I at once opened my key and called up "Br," and asked him if he took THE TELEGRAPHER. His reply was "No," but he thought he would like to, and requested me to send him a copy of it, which I did. The consequence is, he has given his subscription for six months on trial, and, no doubt, at the end of that time he will renew, for our paper is one that will bear the test. I think there are more who would like to take THE TELEGRAPHER, but have never been solicited. Boys, don't be afraid to ask them. FRANK.

An Admirer of Nettie Bronson.

TO THE EDITOR OF THE TELEGRAPHER.

"FRANKIE" has this time tempted me to say something. I don't know, but I think my heart is in its right place. I know it is not as good as it ought to be, whether it is in the right place or not.

I would inform "Frankie" that I have that quarter of a dollar and some more to put with it for some other

good purpose, and I hope to have a chance to use it before next year. I suppose "Frankie" thinks "Nettie" has an interest in him, but I doubt it. I am sorry "Frankie" found fault with my name. It was my father's also, and I would not change it if I could.

I do not think I shall offer "Nettie" any testimonials until after I become better acquainted with her, if that should ever be. I have several female acquaintances, and some of them are old maids, but that does not make me think any the less of them. I think a person with any knowledge at all ought to know that a person living now would naturally be older than they were ten years ago—perhaps some folks don't know it though.

I will admit to "Frankie" that my suspicions were pretty strong in regard to "Nettie Bronson's" being a gentleman, but am fully satisfied now that the writer of those communications is a lady.

The only temptation that that segar of "Frankie's" would be to me would be to throw it in the stove. ELIAS.

A Letter from a Plug.—Another Telegraphic Paper Wanted.

TO THE EDITOR OF THE TELEGRAPHER.

I SEND you, as requested, the following communication which I received at a late hour last night on one of the way wires running from this office out into the wilds of Jersey. If you can't make it out don't blame me. The rules of the company, as expounded in the official organ, don't leave a fellow any discretion in such cases. Yours, 134.

"68 send tps to the xitir of tpe telegrafeer early in tpe mng so pe wim brint it tps week!! to tpe xitir if tpe telegrafeer dear hir I nitice tpe o6rs tpat frite fir yr 6a6er are am tpe tig making fun of yung o6rs coming uh 6lugs and anoter 6a6er in epicago camed tpe switpe and apr in N Y camed tpe o6rator are am tpe tig running on 6lugs too nof sir hof fould tpey lij it if tpey could not frite gerse very fast to be told dry 6p go soak your pead &c!!!! ud ud. A Telegrapher who Proposes to Act as well as Write.

WASHINGTON, D. C., March 28.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE been watching very closely the discussion going on in your columns for some time in reference to a "Union" in the delusive hope that some one would start the ball rolling, not feeling competent to make the first step myself; but have come to the conclusion that "procrastination is the thief of time," and what is to be done should be done immediately. "Scott," in your issue of March 21st, asks, "Why is it no one is bold enough to come out openly and declare a Union, which we must and will have?" I will reply, it is timidity and lack of self-confidence; every one, doubtless, thinking there is some one more competent than himself. I am going to start the movement, and will advise you further soon. I would be glad to hear from "Scott" and "Common Sense" again. Doubtless many will ridicule this attempt, but it shall not daunt me, as I am acting from pure motives, and have resolved to do my share. If others will do theirs, the desired object will soon be obtained. You will hear from me again IN EARNEST.

Answers to Correspondents.

COUNTRY PLUG.—No, the "Snapper Sounder" is not an electrical instrument. It is a diabolical contrivance of RALPH POPE's to destroy the peace and quiet of public gatherings and the domestic circle. It is heard on steamboats, railroad cars, in the streets, ferryboats, stages, eating houses, sample rooms, etc., but the jealousy and illiberality of managers and chief operators prohibit it in respectable telegraph offices. Patent applied for.

NEW ENGLAND OPERATOR.—THE TELEGRAPHER is an independent telegraphic journal, and is not owned by or published in the interest of any telegraph company. It is regarded at home and abroad as the authority in telegraphic and electrical matters in this country. We shall be pleased to have you solicit subscriptions; and New England presents a good field—so far as the present number of subscribers in that section is concerned—for missionary efforts in its behalf.

RAILROAD OPERATOR.—Nettie Bronson's real name and address will not be given by us to any person without her permission. Save your postage stamps. She is a woman, and not a masculine, as you suspect.

From Star to Star the living lightnings flash;
Clash, crash, splash, kuash, trash, rash, hash, dash.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

The Financial Utopia.—How it is Likely to Affect Telegraphic Interests.

FOR more than four months past a very determined contest has been going on in Congress on the financial question, to which we have once or twice alluded heretofore. On the one side there has been a very determined and persistent effort to inflate the currency and expand the irredeemable promises to pay both of the Government and of the National Banking institutions, and on the other an equally determined and protracted resistance to such inflation and expansion, and to establish measures looking to the redemption of such promises, already authorized and issued, within some reasonable and not indefinitely protracted period. It is to be deeply regretted that this resistance has proved ineffectual, and that the inflationists have virtually triumphed. On Monday last the Senate, by five majority, passed an Act fixing the limit of the Legal Tenders at \$400,000,000, and increasing the limit of National Bank Circulation to the same amount, which is an increase of \$46,000,000 of the latter. The House has already adopted the increase of the Legal Tenders, and there is little hope of any more conservatism on its part in regard to the Bank Circulation.

Pending the decision of this matter the business of the country has been to a great extent paralyzed, labor unemployed, and much suffering thereby entailed upon the laboring and producing classes. Naturally and inevitably telegraphic interests have suffered with the rest, and telegraphic enterprise has been practically suspended for the time.

Nothing that we could say would probably have any effect in resisting this inflation madness. It rules the hour, and the country is doomed apparently to pass through trials and suffering to which what has been endured since last September will be of little account, before business can again be placed on a solid and reliable financial basis. The result is as inevitable and unavoidable as the physical prostration which follows excessive fever in the physical system. All experience of the past, since paper tokens were invented as representatives of actual money, has shown this. It has been so often demonstrated that it seems unaccountable that intelligent persons should doubt or question it; but so it is. We suppose that this is one of the legacies which the late contest between the South and North has bequeathed to us, and is an ad-

ditional punishment which we as a nation are to suffer for our manifold transgressions.

We do not propose in THE TELEGRAPHER to discuss this question, nor is it our business to do so. It has been discussed at Washington, and throughout the length and breadth of the land, until everybody is sick and tired of it. The inflationists have the power and are determined to use it, and all that those who have opposed them can now do is to limit their evil and unwise policy as much as possible, and prepare, as far as it can be done, for the troublous times through which the country has yet to pass as a consequence of such action.

Our object at this time is to consider what the effect of this policy of currency inflation is likely to be upon telegraphic interests. As we have said, pending the settlement of the financial questions by Congress the telegraph has suffered with other business, and telegraphic enterprises have been virtually suspended. It is probable that we are about to enter upon a season of wild speculative excitement preceding the crash which must eventually come. Money, or rather the illusory representatives of money, will for a time be plenty, and speculative schemes will flourish. There will very likely for two or three years be an active business and an apparent prosperity, in which telegraphic interests will participate. We believe that within the next few months we shall witness a revival and renewal of telegraphic activity, and that there will be an increase of telegraph facilities, which will be called for by the revival of business which is likely to follow the increase in the amount of the circulating medium. If this opportunity be wisely taken advantage of by telegraphic managers, the interests under their charge may be so advanced, and put into such a condition as that, when the reaction comes, they may be prepared to meet it, and may have the system so far completed as to be enabled to weather the storm without being wrecked. The natural growth of the country, and its enormous natural resources and wealth, will eventually bring it out of the financial storm which it has to encounter, and start it once more on the road to prosperity. Fortunes will be wrecked, the rich become poor, and the poorer classes suffer terribly from its effects, enterprises will be for the time prostrated, but actual values will not be destroyed. After the storm has passed the sun of prosperity will once more shine upon the land, and then, if wisely managed, the telegraph interests of the country will enter upon a season of success which shall establish them upon a solid and lasting basis.

Many of our readers may suppose that, as they own no telegraph stocks and are merely employes, all these matters concern them but little, if at all. In this, however, they are mistaken. Every telegraph employe, however humble or subordinate may be the position held, is directly interested in the prosperity or adversity of the entire telegraphic interests of the country. If the business is good and remunerative it creates a demand for their services, secures them better payment therefor, and a greater certainty of receiving such payment when earned. How many have experienced the disadvantages of working for embarrassed and unremunerative telegraph companies! To such there should be no argument needed to convince them that they are vitally interested in the prosperity of the business.

At the present time the demand for telegraphic services is limited, and many telegraphers are unable to obtain remunerative employment. If the business were prosperous this would not be the case. As a consequence of this condition of things, there has been going on for some time not only a reduction of the number employed, but also a reduction of compensation to many who are employed. The law of supply and demand applies to telegraphy as to all other descriptions of business, and if there is an over supply of labor in any department, it naturally leads to a decrease of the amount paid for such labor. This law is superior to any possible combination to resist it. Labor combinations can only be successful when the demand for labor at least equals the supply, and those who

imagine otherwise have very limited conceptions of the higher laws which dominate the relations between work and wages.

We may, in conclusion, sum up the whole matter as to the effect of the policy of inflation and expansion of our irredeemable currency upon telegraphs and telegraphers briefly as follows:—The immediate effect will be to excite to renewed activity for the time the enterprises which have of late been dormant and awaiting the decision of the financial question. How long this will continue we do not feel competent to predict, but probably not more than two or three years at the utmost. Following this, we look for a general financial break down, whose severity and completeness will be in proportion to the lengths to which speculation may be carried in the meantime. Then the telegraph, as well as other business interests, will have to pass through a season of depression, eventually coming out on a sounder basis and reviving with the returning prosperity of the country. In all operations undertaken henceforth these facts should be kept in view, and so far as is possible the managers of telegraphic enterprises should make their calculations and arrangements so as to be able to successfully weather the storm, and come out of it in the best condition possible.

The Correspondence of The Telegrapher.

IN our article last week upon the correspondence of THE TELEGRAPHER, we did not allude to the anonymous communications which we, in common with all newspaper editors, are constantly receiving, notwithstanding the rule which is imperative with all respectable newspapers, that the real name and address of the writer shall accompany the communication, unless previously known—not for publication, but as a guaranty of good faith on the part of correspondents. In some cases the disinclination to give the name and address of the writer proceeds, no doubt, from an excess of modesty, or doubt of the ability to produce acceptable and interesting communications. In others, and by far the greater number, it is caused by a desire to shift the responsibility of the statements made on to the journal itself and its publisher. More especially is this the case where accusations and statements are made of a personal nature, which are calculated to injure the parties concerned either in their positions or feelings. This is a mean, cowardly and contemptible thing to do, and we consign such effusions to our waste basket with a feeling of disgust and contempt for the person who believes that he can make use of our columns for his own selfish and ignoble purposes. Once more we take this occasion to say to all who write communications which they wish to appear in THE TELEGRAPHER, that it is indispensable, unless previously known to us, that the real name and address of the writer should accompany the communication. And to those who desire to use the columns of the paper to obtain revenge for fancied personal injuries, or to gratify mean and malevolent feelings, that it cannot be done in any instance unless we are imposed upon. We are no more exempt from imposition than any other newspaper, but it is our aim to exclude from the columns of this paper anything like that which we have above characterized.

The Hubbard Bill Reported in the Senate.

ON Thursday of last week Senator RAMSAY, Chairman of the Committee on Post-offices and Post-roads, reported to the Senate the HUBBARD bill for establishing a partnership between a private corporation and the Government in carrying on the telegraph business of the country, and it was placed on the calendar. This bill is the same substantially as has been reported from the same committee two or three times before. There is, probably, no expectation, even on the part of Mr. HUBBARD or Mr. RAMSAY, that it will even be considered much less acted upon at the present session, but it is deemed advisable to get it out of the Committee and on the calendar. The business of the Senate has been so much delayed by the protracted discussion of

financial matters that, even if there was the disposition, there would be no opportunity to consider telegraph matters at this session. We presume that the "WM. ORTON and GARDNER HUBBARD debating society" may now be considered as closed out for the season. The debates have lost their interest, and the public is heartily weary of the whole subject of a Government telegraph monopoly. We do not look for a speedy revival of interest in it; and while it is well to watch the movements of the monopolists closely, that no surprises may be accomplished in the closing hours of the session, otherwise we think we may consider the subject as practically closed up for some time to come at least.

One More Unfortunate.

WE recently announced the commencement of the publication of a telegraphic journal entitled *The Fraternity*, at Chicago, Ill. Its life has been a short one, the third number, that for April 1, containing its valedictory. We judge that it failed to meet with the support expected, and the publishers have displayed good sense in retiring from the field before they had invested a considerable sum of money as well as labor, for which there was not much probability of obtaining an adequate return and remuneration. Publishing newspapers is an expensive and laborious business, and the field for telegraphic journalism is not so extensive as many telegraphers suppose. A class journal must grow—it cannot be expected to spring into immediate and profitable success. Patience, perseverance and the investment of considerable capital will be found necessary to make any newspaper permanently successful.

The Fraternity was a handsomely printed sheet, and a very good one of its class.

Geo. H. Bliss & Co.

THE new advertisements of Geo. H. Bliss & Co., of Chicago, Ill., which will be found in this paper, will be of interest to those who may have occasion to purchase the almost endless variety of telegraph and electrical apparatus and supplies which they offer. This enterprising concern have already established a very flattering reputation for themselves, and hold a leading position among the manufacturers and dealers in electrical and telegraphic apparatus and supplies.

Bliss's new "Telegraphic Manual" and price lists will be furnished free on application.

Personals.

Mr. L. H. LONG, formerly of the Pacific and Atlantic, Dubuque, Iowa, office, has accepted a situation with the North Western Telegraph Company at Green Bay, Wisconsin.

Mr. G. A. SINGER has resigned his position on the Western Union day force at Chicago, Ill.

Mr. J. B. DRAKE has accepted a position on the Western Union, Chicago, Ill., night force.

Mons. OCTAVE VALIQUET "Sr.," for the past two years "all night man" in Chicago, Ill., Western Union office, has resigned, to engage in the wholesale boot and shoe business with his brother, also an ex-operator in Boston, Mass.

Mr. J. DEWITT CONGDON, of the Chicago, Ill., Western Union night force, formerly of the Western Union, New York office, succeeds Mons. VALIQUET as assistant all night man—Mr. HARRY STANSBURY being all night chief.

Mr. J. W. McROBIE, late of Detroit, Mich., Western Union office, is employed in the Chicago, Ill., office, on extra work, *pro tem*.

Mr. E. L. CUTBERT has resigned his position on the Western Union, Chicago, Ill., day force to accept the position of night manager with the same company at Dubuque, Iowa.

Mr. E. R. ADAMS has resigned his position as manager Western Union office at Sedalia, Mo., and accepted a position with the Philadelphia and Reading Railroad, at Reading, Pa.

Mr. A. J. WRIGHT has been transferred from the Charleston, S. C., to the Mobile, Ala., office of the Southern and Atlantic Co.

Mr. J. G. THORNTON, formerly Superintendent of the Southern District of the Southern and Atlantic Telegraph Company, has been appointed manager of the Mobile, Ala., office of the same company, and will also act as circuit manager.

Messrs. JAMES W. CHRISTIE, CHARLES R. RICHARDS, GEORGE FRED. BEULEN, SAMUEL BALES and CHARLES J. BARCLAY have resigned from the Superintendent's office, Central Railroad of New Jersey, at Elizabeth, N. J., and accepted positions with the Automatic Signal Telegraph Company, New York.

Mr. E. V. ELLIOTT has resigned from the Superintendent's office at Elizabeth, N. J., and accepted a situation in the Assistant Superintendent's office of the American District Telegraph Company, New York.

Mr. WILLIE A. FENN has resigned his position with the Franklin Telegraph Company, and accepted a position with the Automatic Signal Telegraph Company, in this city.

The Telegraph.

Foreign Telegraphic Notes.

A CORRESPONDENT, writing from Cape Coast Castle on the 20th February, says: "I suppose you heard that the Ashantees could not understand our telegraph, and so they, in imitation, carried a line of white cotton from tree to tree all along the road, passing it here and there through rags of white calico."

A deputation waited upon the Postmaster-General (Lord J. Manners) at the chief office, St. Martin's-Grand, recently, to ask for the extension of the national system of telegraphic communication with Lundy Island. The deputation were desirous that the Government should obtain possession of the wires to the Scilly Islands and to Shetland, which are now private property, over which messages were conveyed at a very high rate, and that very little accommodation was given to the public. His lordship said that the question of communication with Lundy Island formed part of a very considerable question which was now under the examination of the department. He hoped before long the result of the examination would be brought before him, and after what had been said there, and what he had heard elsewhere, he had very little doubt but that the claims of Lundy Island would be favorably considered; but beyond that he could not venture to go on the present occasion.

The Hooper Telegraph Works (Limited) have received a certificate from the engineers of the Western Brazilian Telegraph Company, Sir William Thomson and Professor Fleeming Jenkin, that the cables of that company from Pernambuco to Rio Janeiro have been successfully laid, and have answered the tests for the stipulated period after submersion. The portion of cable from Para to Pernambuco having been previously certified, the Hooper Company has now completed the contract, and telegraphic communication along the indicated portion of the South American coast is permanently established.

Cuba Submarine Telegraph.

THE report states that the gross receipts for the half year, including the balance from last year's account, amount to £6,349; expenses (including £147 paid for income tax) to £2,065, leaving a balance of £4,283 for the half year. It will be observed, upon comparing these receipts with those of the previous year, that the present account shows a considerable falling off. This result is owing to the fact that the company's cable ceased to work at the end of October. The steamship Suffolk, as explained in last report, not being available for the repair of the cable, the directors immediately invited tenders from all the telegraph construction companies for this work, and considered themselves fortunate in securing the services of the Telegraph Construction and Maintenance Company. That company, in the early part of December, despatched the steamship Investigator, which arrived at Cuba on the 20th of January; but, although the directors have heard of the repair of a portion of the cable, they regret to say that up to this moment they have not yet heard of the work being completed. They are now, however, in hopes of hearing from day to day that such as been the case. The heavy expenses connected with the repair of the cable will, it is feared, involve the company in questions with the West India Company, at whose suggestion this company subscribed the sum of £3,000 towards the purchase and fitting out of the steamship Suffolk, and laid aside a further sum of £4,000 towards her maintenance, on which outlay they have received no return. As stated above, the vessel has not been available when required, and the directors have thus been compelled to adopt a course which involves a much greater cost and delay in effecting the repair than otherwise would have been the case. The directors do not, therefore, recommend any interim dividend, inasmuch

as they are as yet unable to state what expenses the company will be put to for these repairs. Under these circumstances they propose to carry the whole amount of £4,283 to the reserve fund specially applicable to the payment of these expenses. The directors have received, in common with the other shareholders, circulars from Mr. William Abbott and Captain Gandy with reference to the amalgamation or lease of this company to the West India Company. They have not, however, had any personal communication with either of these gentlemen on the subject, nor have they received any communication from the West India Company thereon. Under these circumstances they have considered it the wisest course to take no action in the matter.

Sundries.

"I understand your office is divided into two classes—receiving and transmitting. Have you a vacancy for a good transmitting operator?" Such was the "application" received by M'g'r Swain from Clinton, Iowa, some time since.

Evidently the name and fame of Sterns's Duplex had reached "Po" in dubious form.—*The Switch*.

Time is so precious that there is never but one moment in the world at once, and that is always taken away before another is given.

The anxiety displayed by the Western Union official organ for the welfare of the Atlantic and Pacific stockholders is affecting.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ending February 17, 1874, and bearing that date.

No. 5,769.—(Reissue).—GALVANIC BATTERY.—Georges L. Leclanché, Paris, France, assignor to Hilborne L. Roosevelt, New York City. Patent No. 55,441, dated June 5, 1866.—Division B. Application filed January 27, 1874.

Carbonate of copper is salt preferably used, moistened with muriate of ammonia.

1. The combination, in electrical piles or batteries, of insoluble or slightly soluble salts of copper, or other equivalent material, and a liquid containing a salt in solution capable, by its decomposition, of rendering the said salts of copper or other equivalent material soluble, substantially as described.

2. In a galvanic battery, the materials packed and sealed, substantially as described, and for the purposes set forth.

For the week ended February 24, 1874, and bearing that date.

147,793.—MACHINE FOR MAKING TELEGRAPH PINS.—Charles O. Ripley, Newark, N. J. Application filed February 3, 1874.

A device for cutting a screw thread upon the end of the pin is attached to the lathe.

A telegraph pin cutting machine, consisting of an ordinary lathe, in combination with the cutting knives E F, screw cutter G, feed guide J, and feed screw K, constructed and arranged to operate substantially as described.

147,827.—ELECTRIC LIGHT.—Matthias Day, Jr., Mansfield, Ohio. Application filed March 27, 1873.

Upper and lower electrode holders connected to one motor, so as to have simultaneous motion toward each other. Applies also a constantly acting clock movement.

1. In an electric light, the combination, with each electrode holder and one electrical circuit, of two or more electrodes, substantially as and for the purposes set forth.

2. The combination, with the magnet R, of the carbon supporting rod J, arranged to act as the armature of the magnet, substantially as described, and for the purposes set forth.

3. The combination, with the armature or guide rod, of the electro-magnet M, arranged upon the top thereof, in the manner and for the purposes set forth.

4. The combination, with the motive power of an electric light and the carbon electrodes thereof, of a connecting rod and gearings, imparting simultaneous motion to both electrodes, substantially as herein set forth.

5. The combination, with the motive power of an electric light, of a constant and regularly acting clock movement, substantially as and for the purposes set forth.

147,917.—DUPLEX TELEGRAPH.—Thomas A. Edison, Newark, N. J. Application filed June 27, 1873.

Three electro-magnets of different adjustments, central circuits of three local batteries. Key c closes circuit of main battery, and through d and e of l and k, which neutralize each other, b being of such tension that it is not effected, if, at same time, circuit at

other end is closed. The joint effect of both operates b, and through it the sounder. If c is at rest and a current comes from other station too weak to operate b, it will operate the weaker magnet d, destroying the balance between d and c, and hence operating the sounder.

The batteries k l o and circuits and circuit closers of the electro-magnets b c d, in combination with the electro-magnetic sounder or call m and key e, the parts being adjusted to operate substantially in the manner specified.

147,975.—ELECTRIC ALARM.—Frank L. Pope, Elizabeth, N. J. Application filed January 14, 1874.

Vibrating or continuous alarm placed in a closed circuit, and kept inactive by the continued closure of the circuit, and operated by break in main circuit.

- 1. The combination of a vibrating or self-breaking electric alarm apparatus with a shunt circuit, arranged and operated substantially as herein specified.
2. The combination of a vibrating or self-breaking electric alarm apparatus, a galvanometer, and a switch (either or both) with a shunt circuit, arranged and operated substantially as and for the purpose specified.

For the week ended March 3, 1874, and bearing that date.

148,215.—TELEGRAPHIC AND THERMOSTATIC FIRE ALARM.—Albert F. Johnson and Frank B. Johnson, Parkville, N. Y. Application filed December 26, 1872.

One thermostat, and fire alarm controlled thereby, in a building, pipes or flues from the various rooms carrying any unduly heated air to the thermostat.

The combination, with a fire alarm signal mechanism, of a thermostat controlling the same, arranged within a flue, by which the heated air from any apartment is conveyed to such thermostat, as and for the purposes set forth.

Married.

LICHTY—SUPPLEE.—On the first of April, at Cenetary Parsonage, by Rev. Wm. Ridgeway, Mr. B. A. LICHTY, of the Superintendent's office P. R. R. Co., Philadelphia, Pa., to Miss E. A. SUPPLEE, of Columbia, Pa.

BEN—We tender you and your young bride our congratulations and best wishes for the future. May the current of peace and happiness keep its strength, and the circuit never be broken, with no grounds or crosses; and may the little sounders ever be as true as the main line-er. May you read your sounder clear and prosper through life; and at the close of the same, with your hooks clear on Nos. three and six, may you both be united at headquarters, are the sincere wishes of the remaining bachelors at F. OFFICE.

THE AMATEUR TELEGRAPHIC INSTRUMENT.

This instrument is in some respects similar to the "SNAPPER SOUNDER," but differs from that device very materially in the matter of form, finish and CONSEQUENT DURABILITY. The base is composed of the best metal, highly polished, the Spring being Nickel Plated, and capable of producing a clear and pleasant sound. All who have used this instrument pronounce it to be par excellence. Sent to any address, post paid, on receipt of 50 cents.

The "SNAPPER SOUNDER" will be sent for 25 cents.

Very liberal discount to Agents.

Address, J. M. FOSTER,

397 Broadway.

Late Manager Am. Dist. Tel. Co.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"

"History of America," "Civil War in America;" Member

of many Scientific and Learned Societies of Europe

and America; Commander of the Order of Dan-

nebrog, Denmark; Order of St. Olaf,

Norway, and of the Sword Order,

Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Caton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Oersted and manipulated by Schwelgger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but not mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE "SNAPPER." Price, 30 cents.

How the Boys "tumble" to it

READ THE FOLLOWING:

St. Louis, March 24.

R. W. POPE.

DEAR SIR—Enclosed please find \$1.20, for which please send four of your "Snapper" Sounders to the following addresses:

E. A. ALLEN, W. U. Telegraph office,

H. J. FOREMAN, W. U. Telegraph office,

W. J. FOY, W. U. Telegraph office,

Ed. A. KEENE, Jr., W. U. Telegraph office.

Your little Sounder has created quite an excitement among the boys here.

Later.—Still they come. Send one more to the following address: MARC GAUTIER, W. U. Telegraph office. ED.

P. S.—Another County heard from.—Send one more to CHAS. E. BURROWS, W. U. office. The total inclosed for six Sounders, \$1.80.

EDDYVILLE, IOWA, March 21.

DEAR SIR—Please find enclosed 60 cents for two more of your "Snapper" Sounders. If you get this before filling order of the 20th, please enclose the four in paper box. Think will send for couple more in a week. They make more fun for their price than anything I ever saw. Please hurry they all along. Can hardly wait.

ED. LYGGETT.

Manager W. U. office.

DELHI MILLS, MICH., March 24.

DEAR SIR—Please send me three more of the "Snappers." Best thing out. Boys all like them. Please find enclosed 90 cents.

Respectfully,

H. HALL.

Sent, post paid, for 30 cents, or six for \$1.50.

Purchasers in the British Provinces will please remit 5c. for additional postage.

R. W. POPE,

Box 5278, New York.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50

Instrument with Office Outfit..... 7 50

Two Instruments and Outfits..... 14 50

L. G. TILLOTSON & CO.,

8 Dey Street, New York.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities.

A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

TILLOTSON'S BATTERIES.

EVERY KNOWN FORM ALWAYS ON HAND.

LOCKWOOD, LECLANCHE, HILL,

CALLAUD, EAGLES, GROVE, CARBON,

DANIELLS, NITRO-CHROMIC (for Electro-Plating),

QUICKSILVER, ACIDS, BLUE VITRIOL,

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.
Acknowledged to be a decided improvement.
Price, same as the ordinary Key.
Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for the manufacture and sale of the
EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty-years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF

Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,

22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES
constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.
S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

AERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring
EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his
UNIVERSAL APPARATUS

FOR
ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. Considering the wide range of its capacity, it is cheaper than any other instruments.

Price of apparatus complete, is \$200 to \$280, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his
CELEBRATED HELICES
WHICH ARE OF
Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionally stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

SMITH'S
MANUAL OF TELEGRAPHY.
PUBLISHED EXCLUSIVELY BY
L. G. TILLOTSON & CO.,
Price 30c. **8 DEY STREET, NEW YORK.**

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of
Railroad Telegraphs who find an attractive combination, giving
loud sound without materially increasing the resistance beyond
the standard of their relays.

We have rewound some of the old Box Sounders, in which we
found the helices to have a resistance equal to 400 and 450 ohms.
None of our Wreckers have over 175, while 150 is the standard.
Brass or nickel plated always on hand.
No local required. Always ready for temporary offices.
Just what is wanted for officers' cars.
Two sizes black walnut cases. Handsome leather cases, velvet
lined, to order.
See our advertisement in other columns.

WATTS & CO., Baltimore.

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,

AND FOR

BLASTING AND MINING PURPOSES,

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with in-
creasing superiority in the practical test of over twenty-five
years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and de-
livered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,

Review of Modern Telegraphy.

On some of the disturbing causes that had to be compensated for in the practical introduction of various systems of telegraphy, involving the use of Electro-Magnets, Polarized Magnets, Shunt Helices and Condensers, or Accumulators. By GEORGE LITTLE, Consulting Electrician to the Automatic Telegraph Company. Inventor of and Sole Patentee of the American Rapid System of Automatic Telegraphy.

In a communication made by me, and dated December 1st, 1873, I undertook to state what I considered were the chief functions of the "condensers," its use in the absorbing of extra currents induced in the helices of electro-magnets, and from thence passing on to the main line when connected in the circuit of a line of telegraph; and which had, previous to the introduction of condensers or accumulators (shunts or shunt helices and polarized relay magnets), offered most serious obstacles to the rapid and correct transmission of telegrams, automatically or otherwise. I will now proceed to enter upon the subject more fully, and in so doing I refer to those distinguished telegraphic scientists of all nationalities, of eminence in their profession, who, I feel assured, owing to their own practical experience, will verify the assertions I here make.

It is well known that induction diminishes rapidly on air lines of telegraphs; therefore, its effects on a telegraph wire extended and suspended upon poles is very trifling, and exceedingly small, diminishing rapidly as its distance above the earth's surface increases; and it requires a very sensitive magnetic needle placed by the side of a long and well insulated line wire to give any clear indications of either the direct or return current. In order to show to the slightest extent this effect of induction on an air line five hundred miles in length it would require a battery of from two to three hundred cells to make any effect of an induced return current apparent by its action on a most sensitive magnetic needle. On breaking battery contact in the ordinary way, the current would cease to flow at both ends of the line simultaneously. Now, to carry out and verify the experiment, we must not on any account allow a single electro-magnet, polarized relay magnet, helix or accumulator in or connected in any way with the main line; neither are the entering current battery contacts to be made and broken at a greater speed than is necessary for first class Morse operating.

Not only has the above fact been verified, but it is also well known that, in order to render apparent the induced return current from a single yard of line wire employing the electro-motive force of one hundred cells of Daniell's battery, it becomes necessary to insulate in the nicest possible way that single yard of line wire, and to cause the return current to flow by the aid of a discharging key through multiplying or inductive helices surrounding a sensitive magnetic needle.

In the case of a main line wire, or more properly an air line wire, we must not forget that the same must not only have its ends, but also its whole length insulated from the earth in order to take a charge so as to place the same under a somewhat similar condition to a Leyden Jar; and then, owing to its form as compared with an ordinary condenser or accumulator, capable of taking a sudden charge on the whole of its surface at the ordinary Morse rate of signaling, an air line would not only have to be well insulated, but most perfectly so to retain a charge when operating with an ordinary Morse key in the transmission of signals.

A perfectly insulated long air line requires time, and also a large electro-motive force or driving power, in order to charge the same to any high degree of tension, owing to its inductive capacity or surface being of an elongated form.

Now, in the practical working of an ordinary line wire, as we understand what the same should be when in ordinary working condition, it becomes evident to any ordinary electrician that we could not afford to devote the time which would be required to charge and operate an air line if the same were placed under similar conditions to that of a submarine or a subterranean line. That being the case, we much prefer to let the ordinary leakage of nature assist us (in this case to

some extent at least) in as far as the same relates to air lines.

Since our telegraph engineers thoroughly understand the above we will now follow up this subject with the reinvestigation of the causes brought to bear in the developing of extra currents, together with the disturbing effects of the same as heretofore, under certain conditions, was known to exist in all first attempts to work the duplex and other systems of telegraphy. The influence of extra currents, as developed by primary currents entering helices, and more especially helices surrounding an iron core, the disturbing effects of which upon the line signals become more evident when connected at the sending end of a main line wire, as they are, in all well known arrangements of electro-magnetic apparatus, employed for the purpose of double transmission, is generally understood by electricians.

It is well known to telegraph scientists that the effect of an electro-magnet introduced in the circuit at the sending end of a main line wire (and more particularly in the case of a submarine cable, or a subterranean wire,) will be to shorten the signals or to entirely confuse the same—it being quite understood that the entering current has become retarded during a time sufficiently long to magnetize the iron core. For, until the iron core becomes magnetized, no current of sufficient force will enter the line to be of any practical moment, and every time a break is made with the entering current the same will cause a constantly varying effect upon the iron core, and the varying current set up as often as a break occurs produces in its turn a different effect on every succeeding entering current, which will conduce to the greatest possible confusion of signals.

By another "*experimentum crucis*," if, instead of introducing helices having iron cores into or at the sending end of a long air line wire, a polarized relay magnet be connected in the circuit (as first suggested and put into practical operation by the Messrs. Siemens, of London and Berlin, we shall evidently perceive a decided change brought about in consequence of the polarized cores not admitting of such inductive variations of current on the main line consequent upon the feebleness with which the permanently magnetized core alters in varying retention of more than its already allotted permanent charge. This practical experiment proves most conclusively that it is not with the action of the entering current direct upon an extended main line wire that we have to form a correct diagnosis.

I would here observe that the polarized relays, as introduced by Messrs. Siemens here referred to, have to be operated by double or alternating currents + and — otherwise the retractile force of springs would be required. Heretofore it was also a difficult matter to so construct a very small polarized relay as to retain its permanent magnetism for any considerable length of time—due to the overpowering at times of an excess of entering battery current, or from other well known causes.

On the 22d of March, 1872, I applied for a patent (since obtained) for a direct current, and local, constant, polarized iron or steel core relay of small proportions, entirely dispensing with the Siemens large inductive magnet, and so constructed that the same could be operated by single entering line currents, and also without the aid of retractile springs, around the iron or steel core of which two helices were wound, and connected one with the main line circuit and one with a constant local or constant earth circuit local (as in my patent of December 26, 1871, and July 9, 1872), the constant local operating on the small core becoming momentarily neutralized or lessened by each pulsation of the main line entering current, and regaining its normal polarized state very rapidly. It is necessary that the armature should be also polarized so as to be attracted by opposite, or be repelled by similar polarity in the core by the use of single entering line currents only; and this polarization of the armature may result from permanent magnetism, induced by the core, or from electro-magnetism—in the latter case the armature may be enclosed by a helix, which may be also in the same constant local circuit or local earth circuit. This polarized relay magnet may be also arranged so as to permit the main line entering current to flow through one and the same helix through which the insulated local constant current flows—the currents being caused to flow in opposite directions (as in my patent of December 26, 1871), thereby economizing space and material. In this case the local constant may be so balanced as to act also as a shunt, B.

Another great advantage of paramount importance resulting from the use of polarized relay magnets in the main line circuit arises from the fact that proportioned double wound shunt coils or the liquid condenser can be used in connection with the same, without interfering with or offering any impediment to the quick response of the armature, a very great desideratum in connection with automatic telegraphy—the more especially when it becomes desirable to leave all the ordinary local magnetic sounding or signal apparatus in

the same main line circuit, regardless of cutting out or switching off the same, a great economy of time in manipulating the automatic system being thereby effected. To Messrs. Siemens is due, I believe, the credit of being the first to demonstrate the very important fact as regards the efficacy of polarized relay magnets in, to a very great extent, diminishing the disturbing effects of extra currents upon the main line signals, as superinduced to the fullest extent by the use of ordinary electro-magnets.

As regards the use of ordinary electro-magnets in apparatus for duplex telegraphy, it would seem that the same cannot be well dispensed with, the more especially where receiving by sound is the object. That being the case let us see in what way these extra currents the resultant of static and reactionary electro-magnetic induction had so seriously heretofore interfered with duplex telegraphy, when first attempted by the use of differential electro-magnetic relays, or by the use of opposing electro-magnets.

We will first investigate the action of the current as it applies to the double helices, or differential coils. In this case the electro-magnet or relay having its iron core surrounded with two helices, wound so as to allow the same entering current to pass in opposite directions, the entering or battery current to one of the helices, being so adjusted with the aid of rheostats, it being intended that the operator when transmitting could not hear his own signals, or in other words the armature of the magnet was not intended to be effected by depressing the key of his instrument—he having, with the aid of the rheostats, so balanced the entering current that the same, when divided, neutralized its own separate inductive influence upon the iron core of the electro-magnet at the sending end of the line. But on the operator breaking circuit with his battery, the third induced current of high intensity was developed, which, as is well known, is of momentary duration only, and making its escape by the shortest route to earth. The equal division and consequent neutralizing on itself of the third induced current and its own equal division through both of the differential helices being prevented in that case by the necessary introduction of rheostats between the earth and one of the differential helices; at the same time the inductive effect of the extra third current exerted its greatest influence by way of the inner helix, and therefore momentarily polarizing the iron core and its armature, which was simultaneously attracted when under delicate adjustment, the neutralizing power of the entering current upon the iron core at the sending end of the main line disturbing its normal or non-magnetic state, and thereby confusing the signals at both ends of the line.

In the second case wherein opposing magnets were employed—that is to say, a receiving apparatus consisting of two electro-magnets opposed to each other and provided with one common armature. One end of each of the helices are connected together in order that the entering current may divide one portion of the current being caused to flow through the helix of one electro-magnet of the relay or sending and receiving instrument on to the main line wire, whilst the other portion of the current was caused to pass through the helix of the second or opposing electro-magnet of the instrument to a set of resistance coils, offering a resistance nearly equal to the main line wire and connected thence in a branch circuit to earth.

By this arrangement the two opposing electro-magnets were equally excited by the primary entering current at the sending end of the main line on the operator pressing down his key. In order to make battery contact the entering current of one electro-magnet being regulated by the rheostats, so as to balance or proportion its inductive influence equal to the opposing electro-magnet, and thereby keep the common armature in its normal state of rest, and so held by its retractile spring against a screw stop equi-distant between the opposing poles of the two electro-magnets, it being intended that no audible indication of the movement of the armature should be heard by the operator. Nevertheless, as soon as the operator broke circuit with the sending battery, by letting up his key, the well known third induced current announced its existence by disturbing the balance of the inductive power or influence of the first primary entering current; consequently, the armature lost its equilibrium, and would no longer keep its central normal position between the poles of the opposing electro-magnets. As very naturally the third induced current brought into existence, on breaking circuit with the battery, exerted its greatest inductive influence by intensifying the iron core of that electro-magnet, whose helix had both ends connected with the shortest route to earth (by line escape and otherwise), causing a momentary unequal attraction of the armature and consequent confusion of the signals.

In order to entirely overcome such serious difficulties attending upon the introduction of uncompensated electro-magnets into the circuit at the sending and receiving ends of the lines of telegraph, the more especially where the object sought was the keeping of the armatures free from the influence of extra currents, and at the same time preventing such extra currents

from in any way affecting the main line signals, I, in the early part of the year 1872, applied one end of a condenser (more properly an accumulator) between the main line and the electro-magnet of one of my direct acting main line sounders in a main line branch circuit of my rapid automatic telegraph system between New York and Washington. The result was very marked; and I here repeat a remark made by me in my former communication, that is to say, whoever performs the *experimentum crucis* will also see at a glance the advantages that would accrue from the application of condensers to the Morse instruments, now in daily use, by enabling the operators to work on a more delicate adjustment than ever before known, by the condenser in this case absorbing and recombining with its own static charge the whole of the third extra current. The application of the accumulator in like manner to the duplex system, involving the use of opposing magnets, has also been attended with great success. For inasmuch, as heretofore stated, the third induced current has by its aid been prevented from passing extra pulsations upon the main line, brought about by disturbing the inductive influence of the primary entering current when the operator necessarily let up the key of the instrument on breaking circuit; one end of an accumulator being connected to the wire between one of the before mentioned electro-magnets and the rheostats, its other end connected in a branch circuit to the earth, is ready to immediately perform its proper functions by its own static charge, suddenly absorbing and recombining with the third extra current reversing its physical action for the moment and simultaneously reducing the iron cores of the opposing magnets to their normal or non-magnetic state, the armature being unaffected and kept at rest against its stop pin by a retractile spring.

From the foregoing, the important value of the *condenser* or *accumulator* will become very apparent to us, as also to those electricians who have either not made very close observations in regard to such phenomena or are not well posted in relation to the various physical properties that, under certain conditions, are assumed by electro-magnets.

Reddy McGuire.

BY OWTON A. FLYE

WE felt badly when Reddy McGuire went away. The corners of Dolan's mouth lengthened themselves down into each cheek, so that his chin must have resembled an island with the Gulf Stream eddying about it; and Lapey's face assumed a complexion in which it was difficult to detect the dividing line between it and his immaculate shirt front. This was no trifling matter with us, and the tears which were silently dropped in out-of-the-way places were affecting tokens of esteem for our friend. Reddy was the pride of the office, and no eulogy from my pen could do him justice. When sympathy was in order Reddy was ready with a heart full of the feeling that makes us wondrous kind. He could shed more tears in an emergency than any man out of Congress. His heart was always bleeding for somebody, and his purse strings were as sensitive to the needy touch as Griswold's views on the liquor movement. Yet he always had a yearning to be away, and the subject of his childhood days was his constant theme. "Sunny Texas" was always on his lips, and when he left us for a journey to his birthplace we felt a sense of joy thrown in with our sorrow, to know that Reddy's hopes were to be realized at last.

He has left a record here which is unspotted from the world. A few of his achievements are noteworthy. What could be sublimer than the sentiment which prompted him to give his last chew of tobacco to a soliciting comrade? I've seen him do this with a deluge of tears furrowing his cheeks as in the bitterness of his spirit he lamented that he could do no more. The chief sat him down to a Washington special after dinner one day. This was an opportunity for which "the favorite" had long waited; here was a chance to distinguish himself. Removing the relay and sounder, and after having had his hands tied behind him, he took the wire in his teeth, the pen between his toes, and while Davidson executed a painful air on the base drum, Reddy in a unchalant way turned out the finest chirographic effort ever seen west of Utica. We all kissed him, and O'Reilly, in the exuberance of his mirth (which is 'always playful), loaned him thirty-five cents.

This is but a sample of the many pleasantries in which Reddy indulged. Who can forget the time when, chewing three cents' worth of gum at once, he received sixty-three consecutive messages from Harry Jones without a struggle. My heart aches now as I think of the envy creeping into my soul while I watched him carry on a running conversation with four ladies, perform the balance act with a chair, swallow two swords and spit blood, while receiving from

Catlin, even when Catlin was boiling over with the effort.

It was the Dolly Vardens, however, who worshipped him. How many games won last season must be attributed to his energetic spirit. How we shall miss him. We all remember how, last season, when, after a hotly contested struggle, we carried him home with three teeth out, a shoulder blade broken and both thumb nails gone. He could catch a ball on his under lip with the greatest of ease, and in a home run was only excelled by the immortal Wilson. But I can't linger with you any further on this subject. He's left us, and it took three "shupers" to assuage Cork. Maybe I'll revive him again.

Telegraphic Monsters.

THE Indo-European Telegraph Company appear to be just now contending with the same difficulties which the early days of electric telegraphy experienced in America, when the ingenuity of the Press Association in that country invented a "code" by which a very large amount of information was conveyed in a very small compass respecting the markets and proceedings in Congress, at a very small cost to themselves, and a serious diminution of profits to the company. The Indian Government, in order to prevent what they consider of the nature of a fraud on them, have published a list of compound words that they say must be paid for at a higher rate. It certainly does seem hard that a telegraph company should have to take on their line such words as "fireinsurancepolicy," "foradvertisement," "powerattorney," "royalfamily," "wireanswer," "marriage treaty." There are many other words in the code which evidently do not convey the meaning that they appear to imply; such for instance as "lanternjaws." We are afraid, however, that as long as the rates remain at the present high figure it will be useless for the Government to contend against the ingenuity of "code makers." In America, where the system of "coding" was endeavored to be put down, telegraph managers went so far as to declare that every word of more than five letters should be charged at an extra rate. A few weeks, however, only elapsed before an amended "code" was prepared, in which no word was to be found with more than five letters. Again an edict went forth that no word should have more than four letters; the Press Association were equal to the emergency, and a new code was quickly made, in which every word was within the stipulated limit. A third attack followed, and the number of letters in the code words was limited to three. Filing the contest with so powerful a body unsuccessful, a new and more liberal system was adopted; reduced rates were given for the press messages, and from that time may be dated that enormous expansion of the telegraphic system which has grown up in America and in this country.—*The Railway News.*

Cuba Submarine Telegraph.

THE fifth ordinary general meeting of the Cuba Submarine Telegraph Company was held at the London Tavern, on Monday, March 23d, Mr. Thomas Hughes in the chair. The Chairman, in moving the adoption of the report, which was given last week, referred to the circulars which had been sent round by two or three of the shareholders, and said that the directors had not replied to those circulars, thinking it best that the shareholders should settle their own future in their own way. He was happy to say that they had now come pretty nearly to an end of their troubles in connection with the repairing of the cables. The shareholders would remember that the first cheering news came exactly a month ago, upon which day the directors received intelligence that the cable had been perfectly repaired up to Cape Cruize. He was happy to say that a telegram had since been received, dated March 22, stating that the expedition had arrived at Cien Fuegos, and that the cable was perfectly repaired up to that point. They might hope, therefore, that in a few days the cable would again be in full working order. Referring to the finances of the company, he said that on previous occasions the shareholders had expressed their approval of the financial policy of the directors, and that policy the directors intended to continue in future. The directors proposed to carry the whole amount of £4,283 to the reserve fund specially applicable to the payment of the expenses connected with the repair of the cable, the directors being unable as yet to state what expenses the company would be put to for these repairs. Referring to the question of amalgamation, which had been prominently suggested in one or two of the circulars which had been sent round to the shareholders, he pointed out that this company's line was a most valuable link between two large independent telegraphic systems, and expressed his belief that the time would shortly come when the value of the Cuba Company's property would greatly increase, and when, no doubt, in case of an amalgamation with any other company, good terms would be obtained. He moved the adoption of the report and accounts. Mr.

Alex. F. Low seconded the resolution. Mr. W. Abbott referred to the advantages which would accrue to the company from amalgamation with one of its powerful neighbors, and expressed the hope that the directors would keep this subject before them. After some further discussion the resolution was put and carried, and the meeting broke up.

On Working Wires of Different Resistances from a Single Battery.

TO THE EDITOR OF THE TELEGRAPHER.

I SUPPOSED that I had made my calculation of the comparative effects of arranging different wires to work from the same battery in different ways, about as plain as it could be made, but it seems that I shall have to try it again, though I may as well first as last say to "Western Chief Operator" that it is not possible for him or any one else to understand the science of electricity without a good deal of hard study, no matter how carefully and clearly it may be explained. If there is any "short cut" to this knowledge none of us have as yet succeeded in finding it, so far as heard from.

The "old fashioned rule that a ground wire is a ground wire," at all times and under all circumstances, is hardly an infallible one. There used to be a young person on a certain line between New York and Boston, who was accustomed to put on his ground wire in the evening, after the close of business, for the purpose of holding sweet converse with a telegraphic maiden who presided over a small office farther east. But unfortunately, his ground wire, though a ground wire, was not a ground wire. This was demonstrated by an unscrupulous rival, who held forth in the New York office, and was accustomed to cut off his main battery, and by the application of a ground wire that was a ground wire, and a judicious and mighty fee adjustment of his relay, he succeeded in eavesdropping our friends to a most frightful extent. Let us hope that the event justified the old saw, that "listeners never hear any good of themselves."

If I rightly understand the point that troubles our "Western Chief Operator," it is this: A battery of 54 cups works three wires, of 250, 250, and 300 miles. It is proposed to attach a shorter line at such a point as to include 18 cups, counting from the common ground wire. He thinks that the entire current proceeding from these 18 cups goes to the short line, and that the experiment would "practically result in making a 36 cup battery of either one thus tapped."

If he had taken the trouble to make an actual experiment he would have found that a considerable share of the current of the 18 cups would go to the three long circuits, as I showed by calculation in my previous article. If an absolutely perfect ground wire were put on at the point in question, of course it would take the whole current of the 18 cups, leaving the long wires practically working on a 36 cup battery. But if, instead of this, we attach a city line, we put in a resistance, and a portion of the current goes to the other wires. The greater the resistance, or length of the city line, the less current will flow through it, and the more will go to the other wires.

"Western Chief Operator" might have proved this in some such way as this. He might have put on his city wire at the point 18 cups distant from the common ground wire, and noted the strength of current on his long wires. Then he might have taken off his city wire and substituted for it a good ground wire, connected to the nearest gas pipe. If after this he didn't discover an immediate and striking difference in the effects of his two ground wires (situated respectively five miles and five feet distant) upon the working of his long wires, then I am not a prophet, nor the son of a prophet!

The idea of using the water resistance was not "ignorant," nor especially "crude." It was a good move in several respects. It saved bringing an extra battery wire to the switch board, and it made the action upon all the cells of the main battery equal. In my opinion this is a better plan than tapping the battery under most circumstances. In theory, as regards the current that each of the four wires gets, it makes no difference which method is adopted. It is like the old dispute about putting in intermediate batteries on long circuits, which used to give rise to interminable discussions, until calculation and experiment both demonstrated that, except under peculiar circumstances, one plan was just exactly as good as the other.

One word in regard to the theory that one third of the force generated in the 54 cup battery would be used by the city line or "lost" in the water resistance.

April 18, 1874.]

Of course the use of the resistance is to prevent too strong a current going to the city line. But the current thus kept out of the city line is not "lost;" it is merely forced on to the other wires. It is like putting a dam into a river, which forces a greater portion of the water into a canal while a less amount flows over the dam into the original channel. F. L. POPE.

Elizabeth, N. J., April 13th, 1874.

Congress and the Telegraph.

WASHINGTON, D. C., April 15.

TO THE EDITOR OF THE TELEGRAPHER.

IT is so long since a communication from me has appeared that it may have been supposed by some of your readers that I have abandoned the field as a correspondent of THE TELEGRAPHER. As you know, however, such is not the case, but Congress has been so much occupied with financial and other matters that there has been nothing for me to write about.

The fact that the Hubbard bill had been reported from the Committee on Post-offices and Post Roads, by its chairman to the Senate, and placed on the calendar, has already been noticed in your editorial columns, and I have only to say that there is little if any probability of anything further being attempted with it at the present session.

On Wednesday of last week a petition of Norvin Green, Vice-President of the International Ocean (Cuba Cable) Telegraph Company, was presented in the Senate, asking for the passage of a law authorizing the issue of an American register to the steamer Suffolk, which had been purchased abroad by the company, to be used as a repair steamer, and the change of her name to the Professor Morse, which was referred to the Committee on Commerce.

On the same day Mr. Sargent, of California, introduced in the Senate, by request, an act to secure anti-monopoly ocean cable communication between Europe, America and Asia. This was referred to the Committee on Foreign Relations. The following is the full text of the bill, which as will be seen consists of a long preamble, the necessity of which is not apparent, but which is characteristic of its author, and an enactment sufficiently comprehensive, if it should become a law, to enable the grantees, perhaps, to make a good thing of it by disposing of their grant to the hated monopolists:

"An Act to secure anti-monopoly ocean cable communication between Europe, America and Asia, by W. Cornell Jewett and his associates.

"Whereas, Cyrus W. Field and his associates have secured an ocean cable monopoly in the interest of England, through which France, Holland, Germany, United States of America, and other nations are at the mercy of amalgamated English telegraph ocean cable combinations, in connection with independent telegraph communication with the world and tariff rates of messages; and

"Whereas an anti-monopoly ocean cable will be laid within a few months between Ireland and the State of New Hampshire, via Newfoundland, by Messrs. Siemens Brothers, London, contractors for "Direct United States Cable Company," under a charter prohibiting by the laws of England amalgamation or a joint purse arrangement with the "Field" or Transatlantic Cable interests, now existing, and which anti-monopoly cable will be laid under the telegraph act of Congress of March 29, 1867, pledged to a tariff of one half present ocean telegraph rates; and

"Whereas the interests of the Government demand independent ocean cables, and W. Cornell Jewett and his associates propose to lay, land and operate, in the year 1875, or as soon after as practicable, a cable, or cables, between France, Holland (or other points of Europe) and New York, or other points of the Atlantic coast; also, between San Francisco (or other points of the Pacific coast) and China, Japan, or points of Asia, with the right of touching at intermediate points, if necessary, on the Atlantic and Pacific coasts, under acquired charter rights so to do, the cable or cables on the Pacific coast to be landed, used and operated between the years 1876 and 1878, or as soon thereafter as practicable; therefore,

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That W. Cornell Jewett and his associates, citizens of the United States of America, be and are hereby granted all the rights, powers and privileges necessary to lay, land and use, as well as operate, ocean cables in the interests of the American Government and people, between Europe and New York, or other desirable points of the Atlantic coast; also, between San Francisco (or other desirable points of the Pacific coast) and China, Japan (or desirable points of Asia), under the same provisions, restrictions and limitations, from the date of the approval of this act, as granted by the telegraph act of Congress, March 29th, 1867."

The only person who appears in this proposed act is well known here in Washington, where he is constantly

appearing in connection with some job, but who is seldom successful in accomplishing anything. His "associates," as usual, are mythical personages, and it is hardly probable that Congress will pass such an act without evidence that it is substantially backed up by adequate capital.

The well established disinclination of American capitalists to invest in telegraph cable property does not afford a very encouraging prospect, especially under such auspices, of securing any considerable amount of funds in this country, even if this act should become a law.

Mr. Cyrus W. Field has been here for the last two weeks, it is understood, looking after telegraphic interests.

The Western Union Telegraph Company has recently transferred its Southern wires from the Aqueduct Bridge to the Long Bridge over the Potomac River. By the latter route cables are required under the draws, while by the former no cables were required, but there was an annual rent to pay, which, probably, it was desired to get rid of.

Telegraphic matters have been unusually quiet here during the past season, out of Congress as well as in, and there are no present indications of a change in this respect. CAPITOL.

Action for a Telegraphic Association Demanded.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE noticed of late a revival of the "Telegrapher's League," or Association discussion. I sincerely hope it will assume some definite form soon. Are there not men enough in our ranks who will lend their aid and the benefit of their experience to produce something that will be acceptable to the many who are writing this subject to death, and arriving at no conclusion? It was my fortune to be one of the dozen who tried, some two years ago, to start an association in one of our largest cities, and which failed—owing to the disinclination or fear (impossible to say which) of the operators in adjoining places to cooperate with us. Their advice was, "stop where you are—do not continue in your ruinous course," as in their opinion it could not and would not succeed. I am very sorry to say they were right, for had each and every one put themselves to work earnestly it would be something not of the past.

Our motto should be, "United we stand, divided we fall;" and we will continue to fall until something substantial is done. As your correspondent "Sierra" says, "It by no means follows that, if we have a League, a strike should be the result."

Neither should it be controlled by officials of any company, but by solid, sound, sensible men who have had experience. There are plenty of them capable of doing this, and doing it right.

Let a committee be formed and act on this important matter, and the sooner done the better. The material to be used must be the best, thereby uniting us in one immovable band of brothers. Let brotherly love prevail. SERIOUS.

Summer and Summer Luxuries.—A Bill to Regulate Telegraph Charges.—The Military Telegraph Line.

SAN DIEGO, CAL., March 28.

TO THE EDITOR OF THE TELEGRAPHER.

WHILE at the East you are still having cold, snowy, wet and boisterous weather, in this section we are enjoying all the pleasures and advantages of early summer weather. The past season was unusually moist—more rain than for five years before—and, as a consequence, we had strawberries six weeks ago, and wild flowers cover the whole earth. There are 78 varieties of grass here, each bearing a different flower, which blossoms at some period of the year. I wish I could put a bouquet of my wild flowers on your desk—if you appreciate them half as much as I do you would be pleased.

The newspapers in this State have been somewhat exercised over an act proposed in the Legislature by a Mr. Dnfly to regulate the rates charged on telegraph lines in this State. The provisions of the bill are not very clearly understood; but it establishes a uniform rate for telegraphic services, and the telegraph companies would be compelled to charge the small papers in the interior as much as they do the large city papers for news despatches, which, of course, would be fatal to the former. The act passed the Senate, but the House refused to order the bill engrossed by 27 yeas to 28 nays, and it is defunct, for this session at least.

The military telegraph from this city to Arizona Territory is in full and successful operation. The line was inspected by Capt. Price, U. S. A., who pronounced it all in good shape, and ready to encounter hard weather, except in the Colorado desert, through some miles of which it was necessary to construct it through a fine sand, so light as to be constantly drifted by the wind like ashes, at times burying the poles, at others

undermining them. Capt. Price, finding that the construction party had experienced some difficulty in setting poles through this section, invented and had made a cylinder about four feet in length, and twenty inches in diameter, hinged to a bar about seven feet long. This cylinder being pushed down in the sand, and the sand dug out from inside, made space for the pole (which was then cut down three feet, as nothing crosses the track of the line, it not being necessary to have the poles higher than is required to keep the line clear of the ground), which was placed inside of the cylinder, and the cylinder withdrawn. When raised clear of the ground, unkeyed and opened, the cylinder left the poles standing firm, as the sand closed in on all sides. The cylinder was made in two pieces, first, to allow it to be carried easily on the pack horse; second, on account of some poles requiring resetting which had wire attached, and if the cylinder was made in one piece it would have been necessary to take off the wire to remove the cylinder from the pole.

Capt. Price is now in San Francisco superintending the draughting of a map of the whole line, which, when completed, will be photographed.

Mr. R. B. Haines, Division Superintendent of the Western Union Telegraph, paid San Diego a flying visit recently. While here he superintended the removal of the wire to the "Observatory Monument," erected during the observations of Prof. Davidson, about three years ago. CLIX.

A Telegraphers' Convention Proposed.

TO THE EDITOR OF THE TELEGRAPHER.

I NOTICE several very interesting communications in THE TELEGRAPHER, of April 4th—one signed "Sierra," another, "F.," both of which I heartily endorse, and would like to have a chat with them and all concerned. I do not want *only* "to see my writing in print"—would not have it if I could reach *you* otherwise—but I do want a League or an Association. I would suggest, with "F.," that local meetings be held on every circuit, and delegates be appointed and instructed to attend a general meeting, or convention, to be held at some central point, say in July. That would give every circuit time to appoint delegates. I am talking to *you*, reader, *you* are the one to help start this thing. Now which circuit will be ready first? We are ready on the SOUTHERN KY. CIRCUIT.

In Re Plugs.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR worthy correspondent on the "6cjsyl4ania" Railroad, who thinks that a "6cger" ought to be started in the interest of "6lugs," must live so far out in the wilds of Jersey that the *Journal of The Telegraph* has never come under his notice. I think that the said sheet fulfils nearly every requisite of an organ for this persecuted and despised tribe. One would naturally think *The Switch* was the proper place for "plugs;" but it don't seem to be the case. Perhaps, however, it is not a "plug switch." Do you suppose, Mr. Editor, that it is possible *The Fraternity* died because there were too many "plugs" in it? I have long suspected that this was going to be a bad thing for the fraternity, and now I'm quite sure of it. SNIDE.

Miscellaneous.

GALVANIC ELECTRICITY.—Put a rod of amalgamated zinc in a glass cell filled with dilute acid, and it will be seen that the apparent action is limited to the gradual production of a few bubbles of gas. On placing this copper wire in the cell beside the zinc, there is no change until I allow the two metals to touch, when you see torrents of bubbles are evolved from the surface of the copper wire. On substituting platinum or silver for the copper we get a similar effect, and that whether we join the metals within the liquid or at a point exterior to it. Thus, if I join the copper wire to this galvanometer, and connect the other end of the coil with the zinc rod, you see that the magnetic needle is deflected as long as contact continues; but immediately on breaking the circuit, the action on the needle and the evolution of bubbles cease instantly. Such an arrangement of two metals, in a liquid capable of acting on one of them, is called a galvanic battery, and by means of it, in connection with a very delicate galvanometer on the other side of the Atlantic, we are able to send telegraphic signals across the ocean.

From the fact that the bubbles of gas are given off from the surface of the copper, we might suppose that it was that metal which was acted on; but if we were to weigh them, we should find that it was the zinc which had lost weight, while the copper remained quite unacted on. The dissolved metal is known as the positive, and the unacted metal as the negative; in fact, there is less tendency to solution on the part of the copper when connected with the zinc than in the absence of the latter metal, which, on the other hand, is far more rapidly dissolved than it would be alone.—Lecture by A. H. Allen, F. C. S.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Some Reflections on the Different Characteristics of Telegraphers.

It may not be out of place or uninteresting to devote some space to the consideration of the different characteristics of telegraphers. We have printed several character sketches recently which have been universally recognized by telegraphers—especially those who have been engaged in the business for several years past. We have all known or heard of operators who are represented by the various characters therein delineated. The race is not extinct, but the individuals are not so commonly met with as they were a few years since, and, in fact, the telegraph service is becoming so systematized and exalted that such men find it difficult to retain a position in it. The subject is by no means exhausted, and we hope to present, from time to time, to our readers similar character sketches, which will not be less interesting than those printed in this and previous issues.

The telegraph service, employing as it does so many thousands of individuals, naturally and unavoidably comprises many different classes, whose characteristics differ as widely as their location and positions.

The operators of a dozen or fifteen years' experience, familiarly known and spoken of as "old timers," constitute almost a distinct class. They have grown up with the business generally, during the time having passed from early boyhood, or incipient manhood, to maturity or middle life. Their experience has been different from that of the more recent accessions to the telegraphic ranks. Some of them are apt to pride themselves, perhaps overmuch, on the fact that they are "old timers," and assume an importance and superiority over their younger associates which, in some cases, the facts do not warrant. It must be conceded, however, that, as a general thing, they have more thoroughly learned the business than is common at the present day. They were from necessity obliged to acquire a more general and practical knowledge of the different branches of the business. They were expected and required to be able, not only to manipulate the key, and read the signals easily and correctly when receiving, but to be able to set up and take care of batteries, repair telegraph wires, act as receivers, delivery clerks, etc. In fact, except in the very large offices, and sometimes in these even, they were expected to be able and willing to turn their hand to

anything that was required to be done to facilitate the business. It is, therefore, not very surprising that they should be disposed to look down upon those who only know enough of the service to merely send and receive messages.

Some of them are given to dilating upon the telegraphic wonders which they have seen performed, and not unfrequently in which, according to their own statements, they have personally bore a not unimportant part. We fear that these stories sometimes have a considerable amount of exaggeration in them, and that they would not be entirely sustained by contemporary and unbiassed evidence. These are generally good fellows at heart, and worthy members of society. They are apt to, rather despise science, and to regard the time spent in testing wires and circuits with galvanometers, and other newfangled instruments, as being practically wasted. They have more confidence in practical than scientific telegraphers, and "Ohm Catchers" are in little favor with them. We do not intend to say that this is true of all the old time telegraphers. Many of them have become very good practical electricians, and occupy positions in telegraphy which they could not without some knowledge of electrical science.

The later accessions to the telegraphic ranks are generally less thoroughly trained in the practical duties of the service, except in so far as is necessary to send and receive telegraphic signals, than those of whom we have been speaking. Many of them know nothing whatever of the manifold details which are essential to the successful operation of telegraph circuits. Insulation, resistance, escapes, etc., are to them mysteries which they do not attempt or care to fathom. Is not the chief operator or manager on hand to attend to such matters, and why should they puzzle their brains over them? Of course such telegraphers can never aspire to the higher and more important telegraphic positions, but must be content always to occupy subordinate situations. They, too, despise scientific knowledge and information, and their chief objection to THE TELEGRAPHER is, that it seeks to educate, as well as interest and amuse. This class are loud in their denunciations of the wrongs and oppressions under which they suffer, and look upon all telegraph officials and managers as natural enemies. They consider themselves usually as overworked and underpaid, and look to a telegraphers' association, which they expect somebody else to organize and maintain, as the precursor to a telegraphic millennium. They do not realize that in such an arrangement of the details of the business, of positions and compensation, as should properly result from coöperation between telegraphers and telegraph managers, and in the redistribution of positions and salaries that would follow, they must, necessarily, take a lower place and smaller compensation until their abilities should entitle them to advancement. There are a good many of this class now in the telegraph service, and one of the principal advantages which could result from a proper telegraphic organization would be their assignment to such positions and compensation as they are entitled to.

It is pleasant to turn from the consideration of this class, to that, which if less numerous is certainly more important, and on which the best hopes of the telegraphic service present and prospective are based. There is, we are happy to know, a class of telegraphers possessing a large amount of industry, ability and intelligence, who would be an honor to any profession. Instead of idling away their leisure time in frivolous amusements or dissipation they are constantly seeking to acquire a more thorough knowledge of the science upon which the telegraphic art is based, and qualify themselves to fill worthily and creditably the highest positions in the profession which they have adopted, and which they love. We know of many such among telegraphers, and we believe that the number is increasing. We are constantly receiving from such encouragement and commendation for the advance in the character of THE TELEGRAPHER, which they are quick to notice. They do not complain of the space devoted to scientific and practical telegraphic instruction and in-

formation, but the contrary. Such telegraphers are valuable to any telegraph company or line, and they are seldom in want of situations. In the good time coming they will, we firmly believe, command better positions and more adequate compensation than they now do. At all events, there is no danger of any telegrapher being too well informed in his profession or business, and, as a rule, those who are properly qualified and disposed to progress theoretically and practically have the preference for the better telegraphic positions.

It is worth while for those who are just entering upon a telegraphic career to consider the different classes and characteristics which we have hastily sketched, and decide which is most congenial, and most profitable for him or her to emulate. Aside from all other considerations the satisfaction of knowing that you are seeking to acquire the knowledge and information which shall enable you to rank among the better informed and more worthy portions of the telegraphic fraternity, should be sufficient to induce you to choose the better part. There is, undoubtedly, a brilliant future to telegraphy. While it cannot properly be considered as in its infancy, it is unquestionably destined to a much greater development than it has yet attained; and if it is worth adopting or following at all, it is worth excelling in. The young telegraphers of today, occupying however lowly and subordinate positions, are necessarily the leaders and masters of the future. The rewards and triumphs as well as the toil and study are to be theirs, and those who would win must labor for the prizes, and be content, to some extent, to sacrifice present ease and indulgence to future success. Nothing in this world worth having is attainable without labor and sacrifice, and this is eminently true as regards telegraphy.

THE TELEGRAPHER has a higher and nobler purpose than mere temporary gratification or amusement of its readers. It is to elevate the standard of electrical and telegraphic knowledge and proficiency, and, while it seeks to advance the welfare and improve the condition of the fraternity as a whole, and to secure for them proper consideration and just treatment from employers and the public, it desires to make them capable of securing their own advancement, and, by becoming properly qualified and instructed, more powerful and important as a body. Knowledge is power, and it is the lever which will elevate telegraphers to their proper position and importance.

Presentation to Mr. S. C. Rice of Albany, New York.

THE *Albany Evening Journal* gives the following account of a presentation to Mr. S. C. Rice, of the Albany, N. Y., Western Union Telegraph office, which will gratify his numerous telegraphic acquaintances and friends, as an evidence of the deserved esteem and regard in which he is held by his friends and associates in the National Guard:

Appreciating the valuable services of Seymour C. Rice, who for a number of years has filled the position of Secretary for Washington Continentals Company B, and wishing to make some expression of their regard for him as a faithful officer, they, at a regular meeting held last evening, presented him with an elegant testimonial. The gift consisted of a massive gold cross surmounted with an unique raised laurel wreath, and in the centre an enamelled monogram, "W. C. B." The reverse bears the inscription: "Presented to Seymour C. Rice by the members of Washington Continentals Co. B, 10th Regiment N. G. S. N. Y., in appreciation of valuable services rendered as Secretary." Major Davis made the presentation speech in behalf of the Company, to which Mr. Rice, although taken completely by surprise, responded in a very graceful and feeling manner.

Another Atlantic Telegraph Cable Interruption.

ANOTHER of the Anglo-American telegraph cables—which was laid in 1866—has been broken. Fortunately, the fault this time is near the Irish Coast, and in comparatively shallow water, so that there will be but little difficulty in raising and repairing it. It furnishes another illustration, if such were needed of the insecurity of such property, and the necessity of what

may, perhaps, be considered high charges for ocean telegraph service. The cause of this interruption is not, of course, as yet known, and cannot be ascertained until the cable is raised and examined.

There will be no material interruption to cable communication, as the cables which are yet intact will suffice to transmit promptly the business at present offering, and the broken cable will undoubtedly soon be repaired and again in active service.

For Our Next Issue.

THE TELEGRAPHER for April 25 will contain another of the series of articles on the *Elementary Principles of Electrical Measurements*, by Mr. F. L. POPE, in addition to much other interesting and valuable matter. Nothing ever published in this paper has met with a more appreciative reception than these articles, which contain a large amount of information that every telegrapher will find useful and valuable in his every day experience with telegraph operation and management.

We feel considerable pride in the constant improvement which is taking place in THE TELEGRAPHER, and gratified that this improvement is so generally recognized by those best qualified to give an intelligent opinion in regard to it.

The American Fire Alarm Telegraph.

Messrs. GAMEWELL & Co. have just completed and put in successful operation the Fire Alarm Telegraph for Halifax, Nova Scotia. They have also recently closed contracts with the city of Nashville, Tenn., and Somerville, Mass., for the construction of Fire Alarm Telegraphs, and have several other important contracts nearly completed. This company has the only complete and effective municipal telegraph system, and by their liberality and just and honorable dealings have secured the favor of all with whom they have had dealings, and deserve the marked success which has been obtained by them.

A New Firm of Patent Solicitors.

THE eard of Messrs. RICHARDS & HALE, Patent Solicitors, of Washington, D. C., will be found in our advertising columns.

Mr. HALE has recently resigned his position as an assistant examiner in the Patent office, where he was specially entrusted with electrical and telegraphic inventions, and is thoroughly familiar with the practice, and those who may entrust their patent business with this firm will have the advantage of the valuable experience gained through his recent connection with the Patent Office. This firm will also attend to applications for foreign patents.

Personals.

Mr. ED. B. LERNED has resigned his position with the Pennsylvania Railroad, at Tullytown, Pa., and gone to his home at Lockport, Ill., to recruit his health.

Mr. J. H. WOODRUM, operator and agent O. and C. R. R. at Comstocks, Oregon, having resigned to go into the drug business at Portland, Oregon, Mr. J. D. BODLEY has been appointed in his place.

Mr. GEO. F. CRAW, operator and agent O. and C. R. R. at Jefferson, Oregon, has resigned, and started for the East by steamer.

Mr. S. T. JOHNSON has been appointed to fill the position at Jefferson, Oregon, on the O. and C. R. R., vacant through resignation of Mr. GEO. F. CRAW.

Mr. RAY FITCH, formerly of the Pittsburgh, Pa., Pacific and Atlantic office, has accepted a situation with the Western Union Company at Oil City, Pa.

Mr. O. L. PERRY has been appointed manager of Canton City, Ohio, W. U. office. He has been manager of Canton R. R. and W. U. office together for about six years past, and recently the W. U. city office has been opened and he now assumes control of it. He is a first class man; steady, reliable, and a gentleman in every respect. He has the best wishes of his numerous friends in his new position.

Mr. ROBERT K. HAINES has been appointed night operator, Canton R. R. office.

Mr. M. E. BOOTH has been transferred from night manager, Alliance, Ohio, W. U. office to day manager, Canton R. R. office.

Mr. IRA BELNAP, late night operator Canton R. R. office, has for the present withdrawn from the service. Mr. BELNAP is an old operator, and a good, steady man. He takes with him the best wishes of his numerous friends.

The Telegraph.

By Cable.

THE 1866 ATLANTIC TELEGRAPH CABLE INTERRUPTED.

LONDON, April 14.—During a terrific hurricane yesterday off the southwest coast of Ireland, the 1866 Atlantic cable ceased working. The fault is not yet precisely localized, but it reported to be about twenty-five miles from Valencia, and, consequently, in shallow water. As there are still two cables in good working order, messages will not be delayed to any appreciable extent. The land lines between Valencia and London were interrupted yesterday for a short time in consequence of a severe storm.

Extension of the Southern and Atlantic Telegraph Lines.

ON the 7th instant the wires of the Southern and Atlantic Telegraph Co. were completed to Mobile, Alabama. This extension was made under great difficulties—the work being interrupted and delayed by floods and freshets. After the line was completed to Mobile, communication was interrupted for several days by a very extensive and disastrous freshet which inflicted much damage upon all telegraph lines in that section. Upon the 11th instant, however, by great exertion, the lines were repaired and the office opened for business, and is now in successful operation.

This is a most important extension of the lines of this company, which will be continued to New Orleans, La., the present objective point, which it is intended to reach during the present season.

Change in the San Francisco (Cal.) W. U. Office.

JAMES S. URQUIART, who has been in the employ of the Western Union Telegraph Company for about fifteen years, and who for a long time has been manager of the office here, has resigned his position. He is widely and favorably known in this city. John R. Yountz, one of the oldest and most experienced operators on the coast, takes his place.—*San Francisco Bulletin*, April 2d.

Foreign Telegraphic Notes.

THE report of the Direct United States Cable Company (Limited), to be submitted on the 31st inst., shows that 1,536 nautical miles of the cable have been manufactured, and that landing places in Newfoundland, Nova Scotia, and New Hampshire in the United States, have been selected, as also a suitable site in Ireland for the shore end. It is added that the new cable steamer, Faraday, built to the order of the contractors, of 5,000 tons burden, will be moored off Messrs. Siemens's works at Woolwich for the reception of the cable on the 15th of April next. The subscribed capital of the company is £1,300,000, of which £1,056,521 is paid up.

As some misapprehension seems to prevail with reference to the declaration of an interim dividend of but 1 1/2 per cent. for the first quarter upon Anglo-American stock, it may be worth while to point out that this interim payment has been made in response to the unanimous expressed wish of the shareholders at the last annual meeting that quarterly dividends should be paid by way of interest, leaving the balance of profits to be divided at the end of the financial year. We understand that the Board have decided to hold half yearly meetings, thus responding still further to the wishes of the proprietors.

An interim dividend has been declared by the Globe Telegraph and Trust Company of 3s. per share on the preference shares for the quarter ending the 18th of April, 1874, and of 5s. per share on the ordinary shares, being at the rate of 5 per cent. per annum for the six months ending the same date.

The Directors of the Eastern Telegraph Company have announced the usual interim dividend of 2s. 6d. per share for the quarter ended the 30th of December.

Mr. Thompson, Superintendent of the Indian telegraph lines, in a letter in reference to compound words in Indian telegrams, says: "It is not desired to interfere with the sender's choice of words further than to check a practice, which has become general, of joining together syllables and words having no legitimate connection, or introducing long foreign words into English messages with the object of evading payment of the full charge."

The Dominica and Martinique Cable is repaired, and is now open to the public.

Telegraphic and Electrical Brevities.

THE United States ship Tuscarora left Honolulu March 19th, to continue the soundings for the Pacific Telegraph Cable.

H. R. MYERS, of Chicago, was found dead in his bed at the Central Hotel, in that city, yesterday morning. Mr. Myers was formerly manager of the Pacific and Atlantic Telegraph Company at Baltimore, and afterwards held the same position in Chicago, until the recent absorption of that company. For some time past he had been employed as a night operator in the office of the latter company.

Galvanometrical Measurement of the Resistance of Insulators

At the BROOKS INSULATOR WORKS, Philadelphia, April 9th, 1874.

Constant of Galvanometer 18,000 degrees through 1,000,000 units, with 100 cells Callaux.

Description and Number of Insulators.	Date of Exposure.	Deflection per Insulator.	Resistance in Siemens Units.	Date of First Measurement in Rain.	Resistance in Siemens Units.
10 Porcelain (French Administration Standard)	Mar. 1, 1868	30	600,000,000	Apr. 7, 1868	No deflection.
10 Western Union Glass, with painted brackets.	" "	1400	12,800,000	" "	83,000,000
10 West. Union new style (de wire at top).....	" " 1872	1200	15,000,000	Mar. 10, 1872	116,000,000
20 Kenosha on Brackets..	Nov. 1, 1872	1500	12,000,000	Nov. 6, 1872	2,300,000,000
10 Brooks in cross arm...	Mar. 1, 1868	1	18,000,000,000	Apr. 7, 1868	No deflection.

The foregoing table gives the resistance of the insulators when first exposed, and also extent to which their insulating properties have been reduced by exposure.

New Patents.

63 OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ending March 10, 1874, and bearing that date.

148,289.—APPARATUS FOR FILING FUSES BY ELECTRICITY.—Moses G. Farmer, Salem, Mass. Application filed June 21, 1873.

Upon a suitable base are two keys, one single and one double, and a galvanometer, so arranged that when, by proper connecting wires, a feeble current is completed through the fuse it will be shown by the galvanometer when the double key is closed; but when the other key is closed at the same time the galvanometer coil is cut out, and the direct current thereby sufficiently increased in intensity to fire the fuse.

The combination of the double key C, single key D, galvanometer G, and their connections, in the manner and for the purpose as set forth.

148,403.—ELECTRIC GAS LIGHTER.—William W. Batchelder, New York, N. Y. Application filed June 27, 1873.

The lower plate of a portable electrophorus is pulled down by a pivoted thumb lever, which is held by a spring against the edge of the upper or fixed plate. On applying the thumb to the lever its contact with the upper plate is broken an instant before the lower plate is withdrawn.

1. In an electric torch, substantially such as herein described, a thumb lever or trigger, pivoted to the movable section of an electric generator, with one end arranged to cross the junction

formed by the electric generating sections when in contact, for the purpose described.

2. The combination, in an electric torch, of the making and breaking lever J, with the fixed and movable sections A B of the electric generator, and a flexible metallic connection or spring, I, connecting said lever with the gas receiving and diffusing chamber G, substantially as described.

148,338.—ELECTRIC FUSE.—Thomas Varney, San Francisco, Cal. Application filed November 15, 1873.

An electric fuse composed of a single shell containing the requisite fulminate or detonating powder, the electro-sensitive powder, and the ends of the conducting wires, all in proper contact, and secured therein by sulphur, or its equivalent, substantially in the manner and for the purpose set forth.

THE RAILROAD GAZETTE.

The Catechism of the Locomotive (which is now being published weekly) in the *Railroad Gazette* of April 18, will contain engravings and descriptions of the Steam Whistle, Throttle Valve and Grates, and accurate engravings made to a scale of 1-8 in. equal 1 ft. of an 8-wheeled Locomotive by the Grant Works; 8-wheeled, 10-wheeled and Mogul Locomotives by the Baldwin Works. Single copies, 10 cents; \$4 a year; \$2 f. r. six months.

IMPORTANT!

We want all desirous of purchasing LEARNERS' INSTRUMENTS to know that the Sounder and Key of our PEERLESS SETT can be detached from the base and worked separately. An advantage not enjoyed by any other instrument of its kind.

PENNA. TELEGRAPHIC AGENCY,
WAVERLY HEIGHTS, PENN.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
Instrument with Office Outfit..... 7 50
Two Instruments and Outfits..... 14 50

If money be sent in advance by registered letter..... 12 00
Instruments without Battery..... 11 50
Telegraphic and Electrical goods of every description at manufacturers' lowest prices.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"

"History of America," "Civil War in America;" Member

of many Scientific and Learned Societies of Europe

and America; Commander of the Order of Dan-

nebrog, Denmark; Order of St. Olaf,

Norway, and of the Sword Order,

Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 800 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE "SNAPPER."

Price, 30 cents.

How the Boys "tumble" to it!

READ THE FOLLOWING:

ST. LOUIS, March 24.

R. W. POPE.

DEAR SIR—Enclosed please find \$1.20, for which please send four of your "Snapper" Sounders to the following addresses:

- E. A. ALLEN, W. U. Telegraph office,
- H. J. FOREMAN, W. U. Telegraph office,
- W. J. FOY, W. U. Telegraph office,
- Ed. A. KEENE, Jr., W. U. Telegraph office.

Your little Sounder has created quite an excitement among the boys here.

Later—Still they come. Send one more to the following address: MARC GAUTIER, W. U. Telegraph office. ED.

P. S.—Another County heard from.—Send one more to CHAS. E. BURROWS, W. U. office. The total inclosed for six Sounders, \$1.80.

EDDYVILLE, IOWA, March 21.

DEAR SIR—Please find enclosed 60 cents for two more of your "Snapper" Sounders. If you get this before filling order of the 20th, please enclose the four in paper box. Think will send for couple more in a week. They make more fun for their price than anything I ever saw. Please hurry them along. Can hardly wait. ED. LEGGETT.

ED. LEGGETT.

Manager W. U. office.

DELHI MILLS, MICH., March 24.

DEAR SIR—Please send me three more of the "Snappers." Best thing out. Boys all like them. Please find enclosed 90 cents. Respectfully,

H. HALL.

Sent, post paid, for 30 cents, or six for \$1.50. Purchasers in the British Provinces will please remit 5c. for additional postage.

R. W. POPE,

Box 5278, New York.

THE AMATEUR TELEGRAPHIC INSTRUMENT.

This instrument is in some respects similar to the "SNAPPER SOUNDER," but differs from that device very materially in the matter of form, finish and CONSEQUENT DURABILITY. The base is composed of the best metal, highly polished, the Spring being Nickel Plated, and capable of producing a clear and pleasant sound. All who have used this instrument pronounce it to be par excellence. Sent to any address, post paid, on receipt of 50 cents.

The "SNAPPER SOUNDER" will be sent for 25 cents.

Very liberal discount to Agents.

Address,

J. M. FOSTER,

397 Broadway.

Late Manager Am. Dist. Tel. Co.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other. For closed circuit it is without a rival.

All kinds of Battery and Battery material for

WATTS & CO.,

47 HOLLIDAY ST., BALTIMORE.

OUR ILLUSTRATED CATALOGUE NOW READY.

WATTS & CO.,
BALTIMORE, MD.

PATENT CIRCUIT-CLOSER KEY.

Does not keep line closed by binding against the anvil.
Will not jar open.
Slight pressure of the finger required to put lever in circuit or cut out.
Acknowledged to be a decided improvement.
Price, same as the ordinary key.
Superintendents and Purchasing Agents are invited to examine our EXTENSIVE FACILITIES for supplying the

"BEST" GALVANIZED WIRE,
OAK OR LOCUST SCREW PINS AND BRACKETS,
CROSS ARMS,
BROOKS' OR GLASS INSULATORS,
SUPERIOR INSTRUMENTS AND BATTERIES,
at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information for Superintendents and others interested in the Science of Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for the manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

W. HOCHHAUSEN,
Manufacturer of
ELECTRICAL INSTRUMENTS,
132 WILLIAM STREET (rear),
Between Fulton and John Streets, NEW YORK.

One half of actual size
ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)
Price.....\$5 50
The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.
In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.
The Platina Points are large and hard.
Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight..\$50 00
Sounders, from..... 4 50 to \$6 50
Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00
Relays, from..... 9 50 to 16 00
Improved Switch Keys, from..... 3 00 to 5 50
Send for Illustrated Circulars.
The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

JEROME REDDING & CO.,
30 HANOVER STREET, BOSTON,
MANUFACTURERS AND DEALERS IN

Electrical and Telegraph Instruments.

A FULL ASSORTMENT OF TELEGRAPH INSTRUMENTS CONSTANTLY ON HAND.

Telegraph, Magnet, Office, and other Insulated Wires, INSULATORS, BRACKETS.

PATENT ELECTRIC WATCH-CLOCK THE BEST IN USE.

ELECTRIC BELLS AND ANNUNCIATORS, At prices which defy competition.

Batteries of Every Description, At unusually low prices.

Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OR

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,
TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON GARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

DR. L. BRADLEY,
No. 9 Exchange Place,
JERSEY CITY, N. J.,

Has discontinued the manufacture of Telegraph Instruments, and is now giving special attention to the manufacture of his

UNIVERSAL APPARATUS
FOR
ELECTRIC MEASUREMENT,

Which consists of his Tangent Galvanometer and his Rheostat as they have been recently improved, which, taken separately or unitedly, constitute a means for correctly determining the resistance of all conductors of electricity; the resistance and insulation of telegraph wires; the location of breaks, faults, crosses, &c.; the relative specific resistance and conductivity of metals and other conducting materials; the resistance and electro-motive force of batteries; as well as the strength, quantity, or electro-chemical equivalence of all currents of dynamic electricity. The capacities of all other instruments for similar purposes combined, are embraced in this one. Its measurements are accurate and absolute, and are easily read off in British Association units, without the necessity of arithmetical calculations. It packs in a case seven inches deep and nine inches diameter, with a handled strap, convenient for safe transportation. (Considering the wide range of its capacity, it is cheaper than any other instruments.)

Price of apparatus complete, is \$200 to \$230, according to style, &c. Price, Tangent Galvanometers, \$40 to \$60.
Descriptive pamphlets may be had on application.

He also pays special attention to the manufacture of his
CELEBRATED HELICES
WHICH ARE OF
Naked Copper Wire,

So wound that the convolutions are separated from each other by a regular and uniform space of the 1-800th of an inch, the layers separated by thin paper. In Helices of silk insulated wire, the space occupied by the silk is the 1-150th to the 1-300th of an inch; therefore a spool made of a given length and size of naked wire will be smaller and will contain many more convolutions around the core than one of silk insulated wire, and will make a proportionably stronger magnet, while the resistance will be the same.

These Helices are now offered for the use of manufacturers of Telegraphic and Electrical apparatus, and orders will be filled promptly and on reasonable terms.

SMITH'S
MANUAL OF TELEGRAPHY.
PUBLISHED EXCLUSIVELY BY
L. G. TILLOTSON & CO.,
Price 30c. 8 DEY STREET, NEW YORK.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
NO. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

No. 8 DEY STREET, N. Y.

N O EXCUSE.
There is now no excuse for using a poor quality of TELEGRAPH WIRE, when JOHNSON'S FAMOUS GALVANIZED WIRE can be purchased at reduced prices. Orders solicited in large or small quantities.
References: Western Union, Atlantic and Pacific, Southern and Atlantic, Franklin, American, Gold and Stock, American District, and every other Telegraph Company in the United States.

L. G. TILLOTSON & CO.,
SOLE AGENTS,
8 DEY STREET, NEW YORK.

C ALLAUD BATTERIES
KEPT ON HAND, AND ORDERS FILLED BY
W. MITCHELL McALLISTER,
728 Chestnut Street, Philadelphia,
CHARLES WILLIAMS, Jr.,
109 Court Street, Boston,
AND BY THE
WESTERN ELECTRIC MANUFACTURING CO.,
AGENTS FOR THE UNITED STATES,
220 East Kinzie Street, Chicago, Ill.

W ALLACE & SONS,
MANUFACTURERS OF
BRASS, COPPER & GERMAN SILVER WIRE.
Also, BRASS, COPPER and GERMAN SILVER,
in the Roll and Sheet.
We make the manufacture of Electric Wire a specialty—especially the finer sizes of Copper for conduction, and German Silver for resistance purposes—guaranteeing the conductivity of the same in every instance to be superior to that of any other manufacturer in the market.

AHAND-BOOK OF PRACTICAL TELE-
 GRAPHY.
 By R. S. CULLEY,
 ENGINEER TO THE
 ELECTRIC AND INTERNATIONAL
 TELEGRAPH COMPANY.

Published with the sanction of the Chairman and Directors of the Electric and International Telegraph Company, and adopted by the Department of Telegraphs for India.

FOURTH EDITION,
 REVISED AND ENLARGED.

1 Vol. 8vo, cloth.....\$5 00.

Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books, eighty pages, 8vo, sent to any address on receipt of ten cents.

D. VAN NOSTRAND, Publisher,
 23 MURRAY STREET, N. Y.

THE AMATEUR'S
 TELEGRAPH APPARATUS.

(Patented April 16th, 1872.)

ONE CUP BATTERY, CHEMICALS, WIRE AND
 MANUAL WITH EACH INSTRUMENT.

Complete outfit for the Student or short line use.

Price, complete,
 Seven Dollars.

Key and Sounder only..... \$6 00
 " " with Lightning Arrester..... 7 00
 Five per cent. discount for cash in advance.

GEO. H. BLISS & CO.,
 SOLE AGENTS,
 41 THIRD AVENUE,
 Chicago, Ill.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
 No local required. Always ready for temporary offices.
 Just what is wanted for officers' cars.
 Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.
 See our advertisement in other columns.

WATTS & CO., Baltimore.

BUY THE BEST.

If you want EQUIPMENT for a TELEGRAPH LINE, order of

L. G. TILLOTSON & CO.

They have the GREATEST VARIETY.

They carry the LARGEST STOCK.

Their PRICES are the LOWEST and QUALITY the BEST.

They guarantee EVERYTHING TO BE AS REPRESENTED.

They always RECTIFY MISTAKES at their OWN EXPENSE.

Every ARTICLE required for the CONSTRUCTION and OPERATION of LINES ALWAYS ON HAND.

Their EXCELSIOR TELEGRAPH INSTRUMENT FOR STUDENTS, comprising Sounder and Key, is the greatest success of the times.

L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK.

MODERN PRACTICE OF THE ELEC-
 TRIC TELEGRAPH.

A HAND-BOOK

FOR

ELECTRICIANS AND OPERATORS.

By FRANK L. POPE.

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND

FULLY ILLUSTRATED.

8vo, cloth, \$2.00

Copies sent free by mail on receipt of price.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,

AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
 GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The PROPRIETOR will guarantee, to all parties purchasing,

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deli-
 vered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
 any Telegraph Cable or Wire manufactured at the Works in New
 York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods manu-
 factured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
 sale in New York by

SARGENT & STUDLEY, 26 Park Place,
 RUBBER CLOTHING CO., 363 Broadway,
 D. HODGMAN & CO., 27 Maiden Lane,
 SHEPARD & DUDLEY, 150 William St.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, APRIL 25, 1874.

VOL. X. WHOLE No. 406.

Original Article.

The Elementary Principles of Electrical Measurement.

By F. L. POPE.

(Continued from page 67.)

In some of the tangent galvanometers more recently constructed in Europe, and also in those made for the Western Union Telegraph Company by Mr. Phelps, one half of the scale of the instrument is divided into true degrees, and the other half into spaces proportional to the tangents of the degrees. Inasmuch as the strength of the respective currents by which two different deflections are produced are in proportion to the tangents of those deflections, if we read the indications from a scale divided into degrees, we must reduce these degrees to tangents by means of a table of tangents. Before proceeding to make any calculation having reference to the strength of currents, and where the utmost accuracy attainable is required, this is probably the best way; but where one half the scale is divided into spaces corresponding to the tangents of the degrees, the numbers may be read off directly from the indication of the opposite end of the needle, by which operations are greatly facilitated.

Many of the more recent galvanometers are provided with a section of mirror let into the dial plate of the instrument, beneath the needle and close alongside the scale, by means of which the inaccuracy known as "parallax error," or that arising from observing the pointer obliquely, is corrected. When, in looking at the indication of the pointer upon the scale, we place the eye in such a position that the reflected image of the pointer in the mirror is hidden by the pointer itself, we know that the line of sight must necessarily be perpendicular to the scale.

It is scarcely necessary to add, that in using the instrument care should be taken that it is properly leveled, so that the needle will swing perfectly free, and that the extremities of the pointer precisely coincide with the zero points.

The Sine Galvanometer.

A galvanometer so arranged as to admit of its coils being turned in a horizontal plane around the axis of suspension of its needle, is called a *sine galvanometer*. Such an instrument is sometimes arranged with a single needle, and sometimes with an astatic system of two needles, as heretofore explained. If, therefore, after the needle has been to a certain angle by the influence of a current passing through the coils, the coils themselves be turned in the same direction, so as to follow the needle, as it were, the latter will be still further deflected from the meridian, but always through a smaller distance than that traversed by the coil when turned after it. Hence a point may be found by trial, at which the coil and the needle will again coincide with each other and become parallel. This is owing to the fact that the force with which the coil acts upon the needle is constant, provided the current remains uniform, while the tendency of the needle to return to the magnetic meridian becomes greater and greater as it is more and more removed from it, and when these opposing forces exactly balance each other the needle will again be in a position parallel to the coils. The strength of current by which the deflection of the needle is produced will then be directly proportional to the sine of the angle through which the coils have been moved to bring them parallel with the needle.

The results obtained by the sine galvanometer are entirely independent of the size or length of the needle, shape of the coils, etc., and, with careful management, are exceedingly accurate. Great care should be taken to have the instrument properly adjusted before commencing operations. It should be placed on a firm support, and the screw to which the fibre is attached turned until the latter is shortened sufficiently to permit the needle to swing freely. The instrument should be placed as nearly as possible in the magnetic meridian, with the needle directly over the zero points of the scale. It should then be adjusted to an exact horizontal plane by means of the levelling screw upon which it is supported, which may be known by the metal wire which passes through the scale to connect the two needles being exactly in the centre of the opening provided for it.

The sine galvanometer may be made very sensitive, especially when provided with an astatic system of needles. It is principally employed in the measurement of very feeble currents, such as the leakage from a small number of insulators, and other similar purposes; but, during later years, it has been, in a great measure, superseded by the more sensitive and more convenient reflecting galvanometer.

The Differential Galvanometer.

Any of the different forms of galvanometer which have been described may be constructed as a *differential galvanometer*, simply by winding the coils with two insulated conductors side by side, so arranged that each will make precisely the same number of convolutions around the needle. The ends of each conductor are brought to separate terminals upon the base, so that two different currents may be passed through the two conductors at the same time, or they may readily be connected so as to form in effect but a single continuous conductor. The instruments of Gaugain and of Farmer, illustrated in a preceding article, are arranged in this way. Such an instrument is very convenient in comparing different currents or different resistances. Its application in ordinary electrical measurements will be explained hereafter.

Adaptation of Galvanometers to Different Conditions.

A galvanometer for any particular purpose must always be selected with reference to the total resistance of the circuit in which it is intended to be used. In a circuit of very small resistance the greatest deflection will be obtained by an instrument having but a few turns of very thick wire, or in some cases even a single wire or band passing but once around the needle. On the other hand, a circuit of very great resistance will almost necessarily have a very weak current, and the best arrangement in this case would be to have a coil of very fine wire, with many thousand convolutions around the needle. For different purposes, coils of a resistance intermediate between these two extremes are frequently found useful. Very often the same instrument is provided with a coil of very small resistance and another of very great resistance wound on the same bobbin, either of which may be used as circumstances require, and some instruments even have four or five coils thus arranged, and of varying resistances, as, for instance, the Bradley tangent galvanometer illustrated in a former article.

Mr. Jenkin very properly terms these two classes of instruments "long coil" and "short coil" galvanometers, and in relation thereto remarks, that "in some writings these two classes of instruments are spoken of as adapted to two different classes of currents, instead of to two different classes of circuits. The instrument with numerous turns of fine wire is said to indicate *intensity* currents, and the other class to indicate *quantity* currents. These two old names survive, although the fallacious theory, which assumed that there were two kinds of currents, is extinct; the term 'intensity galvanometer' was used to signify an instrument with thousands of turns of thin wire in its coil, and 'quantity galvanometer' an instrument with a few turns of thick wire."

"The student must clearly understand that equal deflections on the same galvanometer always indicate equal currents. These currents may be flowing through very different circuits, and any given change may produce very different effects in the two circuits; but so long as the currents produce the same deflection in the same or equal galvanometers, the currents are equal though the circuits may be very different."*

The greatest effect in any given circuit is always obtained by a galvanometer, the coils of which are equal in resistance to the remainder of that circuit, including the resistance of the battery itself.

(To be continued.)

The Theory of Magnetic Forces.

This forms the subject of a memoir recently communicated to the Imperial Academy of Sciences, Vienna, by M. Stefan. The work consists of three parts.

In the first, "On Calculation of the Magnetic Forces of Electric Currents," it is shown that the equivalence between forces obtained from magnets and those from systems of electric currents is complete, not only (as is known) in the exterior, but also in the interior space, and that the action of a magnet on a point lying beyond its elements must be distinguished from its action on one found within these. A simple rule is given for calculation of electro-magnetic forces; and it is specially remarked that the interior of a ball, round which currents circulate in parallel circles, affords a homogeneous magnetic field; that the same property belongs also to an ellipsoid; and such systems of currents afford galvanometer and magnetisation spirals of constant force.

In the second part, "On the action of a Magnet on an Interior Point," this problem, already touched upon

in the first part, is handled more fully. It is shown that the action of a magnet on an interior point is not perfectly determined by the magnetic potential; that, besides the forces given by this potential, there are others operative, various in direction and strength, according as the point affected is within or without a molecule of the magnet. These forces are dependent on the form and position of the molecule, and of such a nature that the sum of their work, in a finite path, is nil. Only where the magnetism of the molecules arises from electric currents, the latter is generally not the case; and the principle of conservation of work requires the appearance of induction currents.

The third part has for subject the "Theory of Magnetic Induction." The principle found in the second part as to the action of a magnet on a point in the interior of one of its molecules, serves here as a basis. This principle being assumed, the general equations of the theory of magnetic induction, and the theory (identical with this) of dielectric polarization can be directly written; and, with the aid of some principles ascertained in the first part, certain problems as to the magnetization of a ball, an ellipsoid, a ring, can be solved without further calculation. Several series of experiments are then discussed, from which it appears that all kinds of iron and steel permit of the same maximum of magnetization, that the resistance of iron and nickel to magnetization is at first very great, then decreases to a minimum value, which is reached when the induced magnetic moment is become a third of its maximum; and thenceforth the resistance again increases to an infinite extent. From these data, and some general considerations, a formula is deduced for the magnetic molecular force, which is found to agree well with experience.

Novel Application of Electricity.

A novel adaptation of electricity has just been applied to several of the carriages of the London General Omnibus Company, which appears destined to add considerably to the profits of the shareholders, by providing an efficient check against the numerous petty frauds on the part of the conductors, which for some time past have seriously affected the revenue from this and other public conveyances. By a very simple piece of mechanism placed under each seat of the passengers a tell-tale or dial is made to register the number of passengers entering the carriage and the distance which each travels. There is nothing of the mechanical portion of the arrangement visible to the passenger, and the dial is so placed as to be entirely free from any chance of tampering with on the part of the conductors, while the register made is so complete and accurate that no chance of dispute can possibly arise. The electric apparatus referred to is one of the numerous inventions for which the public are indebted to Sir Charles Wheatstone, and which, together with several other of the inventions of that distinguished electrician, have been purchased by the Electric Power Company. So much importance is attached to the value of this apparatus as a check on conductors of omnibuses that already a considerable advance has taken place in the shares of the Omnibus Company, and a further extension of the system to omnibuses and tramways appears to be a boon to the shareholders of these companies.

Pacific Ocean Deep Sea Soundings.

At a recent meeting of the California Academy of Sciences, Professor Davidson announced some of the results of the soundings made by Captain George T. Belknap, of the United States steamer Tuscarora, during last year, with reference to the projected laying of a telegraphic cable from this coast to Japan. This work had accomplished a remarkable development of the depths of the Pacific Ocean which had no parallel in the plateaus of the Atlantic. The Tuscarora first started in her line of soundings from the entrance to the Straits of Fuca, across that portion of the North Pacific designated as the Gulf of Alaska, toward the Asiatic coast. After leaving the entrance to the straits the bottom slopes gradually to a depth of 100 fathoms, and then a sudden descent occurs which reaches to 1,400 fathoms at a distance of 150 miles from the coast. The temperature of the water at the greatest depth on this line of survey was 34 degrees.

Commander Belknap then returned, prosecuting off and on soundings all along the coast to the entrance of San Francisco Bay. This work determined the fact that the sudden descent at the bottom of the Pacific to a great depth is continuous down the entire coast, varying from twenty to seventy miles out. In the latitude of San Francisco Bay the great bench is reached a short distance off the Farallones, where the bottom suddenly descends to a depth of two miles. Off Cape Foulweather the bottom descends precipitately from 400 fathoms to a depth of 1,500 fathoms, and then the plateau continues westward for hundreds of miles and comparatively as level as a billiard table. Off Cape Mendocino, where shoals have been erroneously supposed to exist from the seaward jutting of the moun-

* Electricity and Magnetism, page 190.

tains, a depth of 2,200 fathoms is reached eighty miles from the shore. Thirty miles off the Golden Gate the bottom is reached at 100 fathoms, at 55 miles it has descended to 1,700 fathoms, and 100 miles out the enormous depth of 2,548 fathoms has been measured without reaching bottom.

A Bit of Advice to Correspondents.

THERE are a few things that we would like to impress upon the minds of those whose fortune, or misfortune, necessitates sending their correspondence to a newspaper. Here they are:

Write plainly. Not to do so is to make an item almost valueless, and sometimes worse than useless.

If you write a "back hand," learn to do it with the left hand, that the compositor may not have to stretch his neck to the left to a dangerous extent to get the run of a word.

Don't underline every adjective in a sentence, after the style of a lawyer's brief.

If you have ever studied punctuation at all, punctuate; but, if you have not, let it slide.

If you have occasion to make a capital J, write below and not on the line.

If John Smith or William McFadden have purchased a piece of property of Hezekiah Hobbetop, for \$1,000, say so if you desire to see the notice in print. There is no occasion to say: "Our highly respected and honorable citizen, John Smith, who for the last ten years has been selling milk at ten cents a quart, thereby realizing a munificent profit, has purchased from his neighbor, Mr. Hezekiah Hobbetop, a most estimable citizen, and honorable vender of garden sass and sich, that beautifully located piece of property known as "Fools' Folly Plot," and in that most salubrious location intends erecting a house thereon. Self-praise is no recommendation, neither does it pay the printer, but it doth disgust him.

Dot your i's, cross your t's, point your u's, and make them distinct from the rounded n.

Use ink. Lead pencil writing overstrains the eye of the compositor when deciphering it, and also causes him to indulge in "cuss words."

Crowd as many facts into as few words as possible, so that your neighbor can find room to advertise his tortoise shell cat, which strayed from his bed and board.

Be sure to spell names correctly. A man wants his name given rightly or not at all.

Never write Sabbath for Sunday.—Yonkers Gazette.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS NOS. 55, 56 AND 57, UP TO AND INCLUDING APRIL 13, 1874.

- 17, 19, 22, 27, 31, 33, 51, 55, 69, 84, 98, 100, 121, 136, 138, 139, 141, 142, 144, 153, 154, 156, 158, 160, 164, 169, 171, 181, 182, 185, 186, 187, 206, 227, 230, 232, 237, 238, 242, 246, 248, 252, 258, 271, 273, 280, 288, 294, 303, 316, 319, 323, 328, 341, 344, 347, 357, 360, 362, 364, 366, 371, 376, 379, 382, 394, 398, 411, 412, 418, 428, 429, 430, 431, 434, 441, 451, 453, 455, 457, 481, 482, 490, 495, 497, 499, 500, 503, 504, 505, 506, 507, 508, 525, 527, 555, 556, 557, 555, 566, 573, 575, 584, 586, 597, 605, 618, 626, 648, 649, 655, 670, 671, 690, 692, 694, 695, 697, 701, 703, 705, 710, 712, 717, 722, 723, 724, 728, 730, 733, 737, 750, 751, 756, 758, 766, 780, 781, 782, 783, 785, 786, 790, 791, 802, 804, 809, 812, 823, 825, 831, 836, 838, 841, 842, 855, 869, 871, 874, 875, 876, 897, 899, 904, 906, 908, 916, 926, 930, 931, 932, 934, 944, 949, 954, 956, 957, 959, 960, 963, 964, 979, 980, 1000, 1002, 1009, 1014, 1016, 1026, 1030, 1031, 1033, 1034, 1038, 1041, 1046, 1050, 1057, 1063, 1069, 1071, 1072, 1080, 1099, 1103, 1104, 1105, 1106, 1107, 1108, 1109, 1110, 1112, 1113, 1115, 1117, 1119, 1120, 1121, 1122, 1123, 1125, 1131, 1134, 1135, 1136, 1139, 1141, 1153, 1169, 1182, 1190, 1191, 1193, 1194, 1195, 1198, 1207, 1214, 1217, 1221, 1226, 1227, 1234, 1235, 1248, 1255, 1256, 1268, 1269, 1273, 1274, 1275, 1279, 1281, 1283, 1284, 1285, 1286, 1290, 1292, 1295, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1366, 1371, 1673, 1398, 1400, 1405, 1406, 1415, 1421, 1427, 1428, 1431, 1432, 1433, 1444, 1450, 1457, 1458, 1465, 1469, 1470, 1471, 1474, 1475, 1476, 1481, 1488, 1490, 1495, 1496, 1497, 1498, 1502, 1503, 1504, 1505, 1513, 1514, 1515, 1516, 1519, 1528, 1529, 1530, 1531, 1532, 1537, 1542, 1553, 1556, 1557, 1558, 1559, 1562, 1563, 1570, 1573, 1576, 1582, 1586, 1596, 1597, 1601, 1603, 1604, 1605, 1608, 1609, 1610, 1611, 1612, 1613, 1616, 1625, 1629, 1639, 1641, 1646, 1649, 1650, 1653, 1655, 1657, 1666, 1667, 1669, 1670, 1673, 1676, 1677, 1680, 1681, 1682, 1684, 1687, 1688, 1689, 1690, 1696, 1700, 1701, 1702, 1704, 1707, 1708, 1709, 1710, 1712, 1713, 1715, 1716, 1718, 1719, 1720, 1721, 1722, 1723, 1724, 1726, 1727, 1731, 1733, 1737, 1741, 1742, 1743, 1745, 1746, 1747, 1650, 1751, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1765, 1766, 1767, 1768, 1769, 1771, 1772,

- 1773, 1775, 1777, 1778, 1785, 1786, 1788, 1789, 1791, 1802, 1807, 1810, 1814, 1828, 1830, 1837, 1838, 1839, 1840, 1841, 1847, 1854, 1857, 1858, 1859, 1860, 1863, 1864, 1874, 1877, 1888, 1889, 1895, 1896, 1897, 1915, 1916, 1929, 1931, 1938, 1939, 1941, 1942, 1945, 1946, 1947, 1958, 1964, 1969, 1972, 1973, 1974, 1975, 1976, 1985, 1986, 1991, 1992, 1993, 1995, 2004, 2007, 2010, 2012, 2022, 2023, 2024, 2037, 2040, 2041, 2045, 2048, 2053, 2056, 2060, 2061, 2063, 2064, 2066, 2072, 2079, 2081, 2085, 2089, 2092, 2095, 2098, 2105, 2106, 2108, 2110, 2112, 2115, 2128, 2129, 2130, 2132, 2134, 2137, 2139, 2146, 2148, 2150, 2151, 2156, 2157, 2159, 2163, 2168, 2171, 2175, 2176, 2177, 2180, 2182, 2183, 2184, 2185, 2189.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS NOS. 58, 59 AND 60, UP TO AND INCLUDING APRIL 13, 1874.

- 16, 17, 19, 25, 37, 46, 50, 52, 53, 54, 56, 59, 60, 61, 64, 67, 77, 86, 88, 91, 95, 97, 99, 100, 113, 121, 129, 133, 134, 138, 145, 157, 176, 177, 181, 201, 202, 217, 218, 220, 228, 244, 245, 454, 257, 267, 269, 276, 278, 279, 281, 282, 283, 285, 286, 301, 312, 219, 349, 353, 361, 367, 378, 383, 375, 394, 406, 411, 416, 425, 426, 434, 438, 456, 463, 464, 467, 478, 509, 510, 520, 526, 532, 533, 536, 546, 547, 548, 549, 564, 576, 577, 579, 587, 594, 603, 615, 626, 656, 661, 670, 672, 678, 680, 703, 715, 721, 722, 731, 734, 740, 772, 799, 813, 815, 821, 825, 832, 875, 886, 911, 938, 995, 1001, 1009, 1011, 1013, 1023, 1024, 1039, 1054, 1055, 1061, 1081, 1088, 1090, 1126, 1143, 1144, 1148, 1173, 1175, 1183, 1195, 1198, 1199, 1200, 1208, 1213, 1225, 1245, 1251, 1252, 1259, 1260, 1276, 1296, 1294, 1300, 1306, 1325, 1329, 1353, 1354, 1355, 1356, 1359, 1364, 1365, 1368, 1371, 1376, 1394, 1398, 1402, 1403, 1404, 1407, 1410, 1412, 3440, 1444, 1448, 1451, 1453, 1454, 1455, 1456, 1482, 1506, 1507, 1516, 1517, 1518, 1519, 1522, 1550, 1560, 1568, 1571, 1589, 1590, 1615, 1634, 1635, 1658, 1695, 1728, 1735, 1736, 1742, 1763, 1790, 1809, 1811, 1812, 1817, 1831, 1869, 1874, 1877, 1882, 1894, 1906, 1911, 1913, 1914, 1919, 1932, 1944, 1946, 1947, 1958, 1965, 1970, 1991, 1995, 1999, 2000, 2001, 2006, 2019, 2020, 2021, 2028, 2029, 2030, 2035, 2036, 2044, 2048, 2049, 2050, 2069, 2082, 2086, 2097, 2099, 2103, 2118, 2120, 2129, 2133, 2135, 2164, 2172, 2174, 2178, 2186, 2190, 2194, 2201.

NOS. 53 AND 54.

- 98, 237, 496, 1069, 1256, 1916, 1929, 1941.

MISCELLANEOUS.

- 55.—496, 1917. 56.—1629. 58.—553, 825, 1742, 1874, 1938, 2119, 2130, 2139, 2168, 2175, 2176. 59.—553, 1874, 1938, 2119, 2139.

How the English Government Treats its Female Operators.

A CORRESPONDENT of the English Mechanic, who signs himself "a father of six girls," writes to that journal giving a not very flattering account of the treatment the young ladies receive in the Government Telegraph office in London. He says that the ventilation of the new building in St. Martin's-le-Grand is so bad that it is very difficult to work there in the evening. No place is provided for hats, cloaks, &c., and every one's knife, fork, plate, mug and slippers have to be carried backwards and forwards every day. He adds: "The girls seem to be made to work as hard as possible, and if the slightest mistake is made they are mulcted in one, two or three hours' extra duty, without even a chance being given them of knowing whether they were fairly culpable or not. The company of the men and messenger boys is not only most disagreeable but baneful to a young girl, for the conversation which is allowed to go on unchecked; while as to salary, all sorts of excuses are made to keep them as low as possible. Ex post facto laws are made which make the girls cry shame on the managers; for they are all intended to get more work out of them."

The Pacific Cable.

THE San Diego, Cal., Daily Union of March 21, has the following in regard to the soundings for the proposed Pacific Telegraph Cable, which U. S. steamship Tuscarora is now engaged upon: "Letters were received in this city yesterday from the U. S. steamship Tuscarora, dated at Honolulu, Hawaii, March 5th, conveying the gratifying intelligence of the entire success of the survey between San Diego and the Sandwich Islands. Readers of The Union will remember that when the Tuscarora sailed from this port the hope was expressed by Commander Belknap that soundings would not be developed showing a depth of over three thousand fathoms. It appears that the greatest depth found exceeded his expectations by only fifty-four fathoms, so that the perfect feasibility of this route for

a cable across the Pacific ocean has been established. The Tuscarora was to leave Honolulu in about a week from the date above given to engage in the prosecution of the survey between the Sandwich Islands and Japan. Profiles of the survey between San Diego and Honolulu have been sent to Washington for examination. If the indications of the work as far as it has progressed are to be regarded, little doubt can be entertained that the Southern route will be adopted, and that The Union's prediction that San Diego would be made the American terminus of the Asiatic cable will be realized. From the correspondence referred to we learn that the people of the Sandwich Islands are fully awake to the importance of this great work, and anxious for the early establishment of cable communication. The American Minister Resident states that Mr. Cyrus W. Field has already secured a concession from the Hawaiian Government."

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion. No notice will be taken of anonymous communications.

What the Objects and Purposes of a Telegraphic Association Should Be.

TO THE EDITOR OF THE TELEGRAPHER.

IN a communication published in THE TELEGRAPHER of March 21st, I submitted to the consideration of its readers and the telegraphic fraternity some views and suggestions in regard to the organization of a telegraphic association. The discussion has continued very actively in the columns of the paper since the communication referred to appeared, and, except in one instance, there has been no indication of any attempt at advancing the object which your correspondents apparently have so much at heart. They all reiterate the necessity that exists that something should and must be done to accomplish the work, but neither of them seem to have any definite idea of how it is to be effected or by whom the movement is to be initiated, or upon what basis an association is to be formed. From the indications so far, it seems to me that the whole matter is likely to terminate, as usual, in mere talk.

To arrive at any definite conclusion in the matter, it is essential that somebody should propose a reasonable and practicable basis for such an organization, and in my previous communication the purpose was intimated of stating my views as to what the purposes of such an organization should be.

Your correspondents very generally and sensibly repudiate the idea that any organization that may be effected shall favor "strikes" as a means of attaining their purposes. Leaving this method—which experience has shown to be about the worst that could be adopted, and which should never be resorted to except in very extreme cases—out of the question, what shall be the means by which any desirable reform is to be effected? This is a most important question, and until it is satisfactorily answered, I do not think any material progress will be made towards effecting an organization.

The idea that any organization is to accomplish at once the desired reforms and improvements, or become powerful and effective, is absurd. It must commence, if at all, in a small way, and as it gradually secures the confidence and coöperation of the fraternity its power and importance will increase.

My idea as to the objects to be accomplished by a telegraphic organization is to establish, in the first place, a standard of ability and proficiency among telegraphers, which shall be recognized both by employers and employes, and which shall secure to the latter their proper positions and compensation. As is well known, there is at present no recognized standard of professional ability, and operators not unfrequently hold positions to which they are by no means entitled, while others are compelled to accept situations and compensation below those justly belonging to them. It should be the purpose of any organization that may be effected to correct this. It can only be done by coöperation between employers and employes, and it should be the object of an association eventually to effect this.

There should be combined with this to make an association immediately useful and attractive a system of mutual brotherhood and relief to members who may temporarily be unemployed or unable to labor. This would need to be carefully guarded in order that the association should not become the victim of drones, frauds and incompetents, with which the fraternity is cursed.

We should not undertake, as some labor organizations do, to forcibly interfere between employers and employes, and establish a scale of compensation which shall apply alike to the good and the bad, the efficient and inefficient among us. Every employe has his proper place and value, and no association which under-

takes forcibly to dictate in this respect can be permanently successful.

We should seek to enrol in our proposed organization as nearly the whole working telegraphic force as possible, so that when it speaks through its proper officers or representatives it shall be understood as giving form and substance to the desires and purposes of the fraternity as expressed by the majority, and any proposition or arrangement which may be agreed upon should be binding upon all.

I will not proceed further in this communication, but if there appears to be a desire for it, will, at a future time, give my views as to the form of such an organization and how it may be effected.

COMMON SENSE.

Value and Importance of The Telegrapher.—An Operator Sold.

BAY CITY, Mich., April 4.

TO THE EDITOR OF THE TELEGRAPHER.

It is now verging on two years since I first subscribed for THE TELEGRAPHER, and if I may presume to pass any opinion as to the present standing of the paper, I would say there is a marked improvement. With many others, I think it is a paper decidedly well adapted to our wants, and indispensable to all of our profession, principally because it is the means afforded us whereby we are at perfect liberty, and feel comfortably at home in discussing all matters telegraphically concerning us, in accordance with our sense of right and wrong. By its weekly visits we are kept well posted regarding all telegraphic enterprises, projects, etc., occurring in all quarters of the globe. It is also invaluable for those of the profession who are tolerably well advanced in electrical science, inasmuch as that they will occasionally find some good, sound, information from the pen of our most learned and experienced electricians. And, again, the many interesting letters occurring week after week in that portion of the paper set apart for correspondents, cannot fail to be of interest to the junior class of operators.

Unfortunately the world does not appear to entertain very encouraging views of the character of operators in general. This, to our sorrow, we are all well aware of. To use a common phrase, we are looked upon as "hard cases;" but it does one good to see occasionally in your columns the productions of those who are not to be denounced as such, but who hold their heads erect and have their hearts in the right place; and it is consoling to know that we are not entirely devoid of good men—men who mean well, and are equally as good as any other man as long as they strive to do that which is right; but I am deviating from the point.

Dear reader, ponder for a moment and see if you don't arrive at the same conclusion as myself, and that is: ought we not to be proud in possessing such a paper as this? or, in other words, how would you like to be without it? Let us one and all encourage the publisher. He spares no pains in making it what he, in his experience, thinks it ought to be. How are we to manifest an appreciation of the same? The least we can do is for each one of us to resolve to procure at least one subscriber in addition to our own subscription. Let us make the resolution binding upon ourselves as a duty we owe to the support of our paper, with which we all ought to be satisfied, and see that no man goes back on his word, also bearing in mind the maxim, "Live and let live."

I will now turn your attention to a somewhat laughable joke practiced on one who is naturally good natured and a whole soul sort of a fellow.

The following conversation occurred between the manager at B. C. office, and an operator working that circuit in repeating office at D. E.

Manager B. C.—"Here's a country chap wants a situation, and wishes me to recommend him to the superintendent. Will you try him and see what he can do?"

Operator D. E.—"Certainly; let him sit down."

Manager B. C.—"All right; try him on the send first." [Here "country" proceeds to manipulate, and sends quite a few messages.]

Operator D. E.—"Think you are pretty good on the send. At present I have no messages, but will try you on report."

He commences very slow and sure, evidently intending not to make "country" nervous, and gives him all the show in the world. Operator writes his best.

Country.—"Can't you send faster?"

Operator D. E. opens up a little.

Country.—"Is that the best you can do? 'Hoop it up.'"

Operator D. E.—"My hand is stiff this morning. But thinks he can make it lively enough for any 'greeny' like him.) "Country" never breaks.

Country.—"Are you one of the best men they have in that of?"

Operator D. E.—(who is somewhat wrathful, but curbs his anger, and modestly exclaims)—"It wouldn't do or me to say!"

Country.—"Do you think I could get a situation in that of?"

Operator D. E.—"I guess so—you appear to be a pretty good operator. Better try." Here "country," who is the regular man on that string in B. C., signs his private "Q."

Operator D. E.—"Holy Moses! I thought you had lots of cheek for a stranger."

It's useless to make any further comment upon the feelings of the poor deluded victim. Suffice it to say that we all know how we would feel ourselves were we to place ourselves in his place. I regret it had not occurred on the first of the month. More anon.

Q.

The Ville du Havre Disaster.

TO THE EDITOR OF THE TELEGRAPHER.

SINCE the announcement of this distressing disaster I have indulged pretty freely in mental speculations in search of a species of preventive of sacrifice of life by shipwreck or accidents like that which destroyed the Ville du Havre.

Why would it not be the correct thing for governments to take up the matter, and give shipowners to understand that they must provide more means of escape from a sinking, or burning, or wrecked ship than a few boats, which, as a rule, are so well fastened to the ship that in an accident equal to that in point, not one of them can be got in the water in time to be of service.

I would suggest making every mattress of rubber, an air tight affair, in order that passengers situated similarly to those who were on the Ville du Havre may have a tangible life preserver at their hauds—one which they can feel a certain amount of confidence in in the event of being obliged to jump or get overboard. Some will say that the concussion of jumping into the water on one of these mattresses would burst the mattress. I think every rubber company in the world will guarantee to manufacture an article which will refute the objection. I am sure that, in addition to the life preserver object of my mattress, the comfort of the passenger will be greater in their ordinary use than while using the orthodox hair (?) or straw, especially in warm latitudes; besides I have doubts whether "specimens of natural history" would take kindly to the rubber.

I would also suggest that as much as may be practicable of the deck work of a ship be made portable; for example, the usual benching should be in sections, and so put together that an ordinary passenger may observe that it is portable and may be taken apart in a moment and made to serve as a buoy in case of shipwreck. The doors of every room on the many ships I have been on board of were hinged "to stay;" now, I propose that all doors be fastened with the ordinary hook hinge, and that they be constructed with a view to securing the utmost buoyancy should they be unhinged and used as a life preserver in the water. I would also require that the roofing of deck houses be constructed so that it may be unshipped if required, and be buoyant in the water. Even the iron pipes used as ventilators, and which are screwed on at the deck, may be constructed so that in an emergency they can be converted into first rate buoys, to which many would be glad to cling. I would have plates with rubber packing alongside of each ventilator to clap on to the two ends of the pipe. Deck chairs might be constructed with an eye to depreciating my mattress and doors!

I have made so many voyages on steamers overladen with passengers, that it is probable I am more disposed to hamper a ship with life preservers than any steamship company or owner can see the necessity for.

This is scarcely a fit subject for a telegraphic journal, unless you admit that I have, perhaps, introduced one in which the whole civilized world is very much interested; and that if from our fraternity should go forth something new and advantageous on the subject, you will find your excuse for publishing the reflections of SA.

On What Shall a Telegraphic Union be Based?

TO THE EDITOR OF THE TELEGRAPHER.

LIKE "In Earnest," I too have been watching the discussion about the proposed Telegraphers' Union, but perhaps I am slower to comprehend what benefit there would be in it for the operators. From all that has been said, I understand that it is to be used to kill off a certain class known as "plugs." Another wants it because he did not receive a merited promotion. Another because he thinks the operators, as a class, are going down hill. In the moral line perhaps it is so; they all seem to smoke on this division, but they are pretty much all married, so it don't make much difference. As for me, I would not feel hurt if I was hit with a box, providing the cigars were inside; but the above would hardly do for a basis to start this Union upon. Still another complaint is that the wages are getting low. That, I admit, is a sound complaint; but what is the Union going to do about it? Can they raise it? Some say we won't allow any but good or

first class operators in the Union; but that won't bring the pay up, or prevent a company from hiring whom they please and putting them where they please; nor will it close up these plug manufactories, and I think there was a time when the best among the operators were wont to "frite gerse," and tried to murder the "Althephet" with as much earnestness as any beginner of these days; so give them a show. I would suggest that, ere we take the elephant we know what we are going to do with him and how to do it. I would not care about forming a Union to turn it into another fizzle, merely because some one was not satisfied with his lot.

A Telegraph Pickle Factory.—An Unsatisfactory Ground Wire.

NEW BUFFALO, April 15th.

TO THE EDITOR OF THE TELEGRAPHER.

A FEW evenings since, two men, who had been drinking, stepped to our office window. Looking in, they saw our main battery of nearly a hundred cups. One said to the other, "That's what they run the thing with." "No, it ain't," said his companion; "this is a pickle factory, and those jars are full of pickles." I guess, if he had got hold of any of our pickles it would have pickled him! I was told a few days ago of a line repairer, not over a thousand miles from here, who opened an office at G—. He put the ground wire in a pail, and filled it up with earth. He couldn't see why it would not work. He is the repairer who can read from a cedar pole which is perfectly dry!

F. D.

Another Telegrapher in Earnest.

TO THE EDITOR OF THE TELEGRAPHER.

IN reply to "In Earnest," I will say—if, as you say, your motives are pure—I am with you heart and hand in the cause—a cause which is noble.

I should be pleased to hear direct from you, and the Editor of THE TELEGRAPHER is at liberty to give you my address.

I hope you may prosper, and that ere long we may see the operators one and all united.

SCOTT.

Answers to Correspondents.

S. McNEIDER.—Your subscription expires with No. 422 for July 25, 1874.

ANONYMOUS.—We have often stated in our editorial columns, and you will find the announcement standing at the head of the correspondence columns, where it has been since the first number of THE TELEGRAPHER was issued, that anonymous communications would not receive any attention. The idea is a mean and cowardly one to use the columns of a newspaper to attack a person while concealing, or endeavoring to conceal your own individuality, and cast the responsibility of your lies and abuse upon the paper publishing them. Your effusion followed many predecessors into our waste basket.

Personals.

MR. R. J. HEWETT has been transferred from the Kansas City, Mo., to the Milford, Barton Co., Mo., W. U. Tel. office.

MISS HATTIE PAINE, from the up town branch office, St. Catharine street, Queen's Hall Block, has been appointed to a position in the new office of the Grand Trunk Railway Co. at Montreal, Canada.

MISS ALICE SCOTT from Lachine, BELLA FULLER from Point St. Charles branch office, and M. A. MCGONIGAL have also received appointments to the new office of the G. T. R. at Montreal, Canada.

The operating room and staff of the G. T. R. in the new Montreal office continue under the supervision of Mr. J. R. MCPHREE as Manager, with Mr. J. S. MACKENZIE as Asst. Manager, and from April 1st, Mr. J. S. HENDERSON, formerly of Ogdensburgh, N. Y., as Night Manager. The total number of operators employed in the office is 32.

MR. W. N. EASTABROOK has been appointed Division Operator and Assistant Train Master of the Elmira and Canandaigua Divisions of the Northern Central Railway Company. Headquarters at Elmira, N. Y.

MR. M. S. ROBERTS, our genial friend and old time telegrapher, now the manager of the checking department of the Western Union office, 145 Broadway, New York, has recently been elected as one of the vestrymen of the Episcopal Church at Orange, N. J. Pretty good for Mose! Father, grandfather and vestryman. *Tempus fugit.*

MR. W. H. STEPHENSON has been appointed night manager of W. U. and R. R. telegraph office at Alliance, Ohio. He is a first class operator, a worthy and popular gentleman.

"In the bright lexicon of youth there's no such word as fail."

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, APRIL 25, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Telegraph Lines in Cities.

THE rapid increase of telegraph facilities and, consequently, of telegraph wires in large cities, must, before long, compel some radical change in the construction of such lines. In this city, for instance, in the section below Union Square, there is a perfect labyrinth and net work of such wires. They are suspended on the roofs of buildings in all directions, and the streets are encumbered with huge telegraph poles, some of them carrying 25 to 40 wires. Every day almost adds to the number of these lines, and it is fast becoming a difficult matter to find a place for new wires in certain streets and sections. Other large cities are similarly troubled, though, as yet, not to such an extent as New York.

We have repeatedly, heretofore, referred to this subject, and it has been discussed to some extent in other journals not specially interested in telegraphic matters.

There can be no question but that eventually these wires must go under ground in all large cities, and the sooner some system of subterranean city telegraph is determined upon the better. A year or two ago a company was specially chartered by the New York Legislature for the purpose of establishing a subterranean telegraph system in this city, but we do not learn that it has made any progress towards accomplishing its purpose.

It is a curious fact that nearly twenty years ago the then American Telegraph Co. endeavored to obtain permission from the municipal authorities of New York to run its wires through the city under ground, and it was refused. Had the desired privilege been granted, and that company succeeded in constructing a practicable subterranean telegraph system, it is probable that all or nearly all the lines which have been built since would also have been put under ground even without any legal compulsion. It certainly is no ornament to any city to be crossed in every direction and at all sorts of elevation by telegraph wires; and the poles not only encumber the streets, which should be kept clear of such obstructions, but are unsightly, and are anything but "a thing of beauty," or "a joy for ever," or even temporarily.

With a properly constructed and insulated subterranean telegraph system much of the difficulty experienced now in working these lines would be obviated, and, once established, no one would desire to go back to the present system. It would prove advantageous to

the proprietors of telegraph lines as well as to the city, and it is only a question of time, and, in our opinion, of but a comparatively brief time, when, if not done voluntarily, it will be compulsory upon such proprietors, not only here, but in other large cities, to remove the wires from over the heads to beneath the feet of the public.

Let it be satisfactorily demonstrated that such a system of underground wires has been devised as shall afford proper conductivity, insulation, etc., and be at the same time economical and durable, and its practical introduction may be assured. Who will be the first to provide this?

The Value of Telegraphic Protection Against Conflagrations.

THE exemption enjoyed by New York City from extensive or destructive conflagrations during the present season has been most marked. Other localities have suffered very severely from fires—the most valuable and important part of some towns and cities having been entirely destroyed.

The good fortune of this city, in this respect, has arisen primarily from the protection arising from the extensive systems of telegraphic notification of the inception and location of fires. The municipal fire alarm telegraph system, which is that so generally introduced throughout the country by GAMEWELL & Co., is very complete and efficient. Under the excellent superintendence and management of Mr. C. KINNEY SMITH, the Superintendent, this system is maintained in the most effective condition, and a fire cannot get many minutes' start before the steam fire engines are upon the spot with steam up and ready for work.

In addition to the municipal fire telegraph, the American District Telegraph gives prompt notifications of fires, and has a corps always ready to proceed at once with fire extinguishers to any locality attacked which may be connected with its offices.

Besides this, the Automatic Signal Telegraph Company are doing good service in affording protection by notifying automatically the very commencement of a fire in any building with which it is connected.
