We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior:

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.
 CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
 And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
 American Compound Telegraph Wire Co.,
 ALANSON CARY, Treasurer,
 No. 234 West 29th St.,
 New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
 FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

MANUFACTURED BY
HOWARD WATCH AND CLOCK CO.
 E. HOWARD, & CO., Proprietors.
 J. HAMBLET, Electrician.

OFFICES:

114 TREMONT STREET, BOSTON, Mass.
 15 MAIDEN LANE, NEW YORK.

This Instrument is offered to the public as the oldest, most rapid, and best.

MAGNETO-DIAL TELEGRAPH

in the world. It has already been extensively adopted and has invariably given entire satisfaction.

They also manufacture and put up

THE ELECTRO-MAGNETIC WATCH CLOCK,

which is the best watchman's time recorder in the world. Also, ELECTRIC AND CONTROLLED CLOCKS

of all kinds,
 CHRONOGRAPHS,
 ASTRONOMICAL CLOCKS,
 REGULATORS,
 ETC., ETC.,
 OF ALL KINDS.

All instruments and work from this establishment guaranteed to give satisfaction.

F. L. POPE & CO.,
 MANUFACTURERS AND DEALERS IN
TELEGRAPH INSTRUMENTS AND SUPPLIES
 OF
 EVERY DESCRIPTION,
38 VESEY STREET, New York.
 NEW AND SUPERIOR PATTERNS OF
STANDARD TELEGRAPH INSTRUMENTS.

These Instruments are elegantly designed, thoroughly well finished, and scientifically adapted to the service required.

RELAYS,

SOUNDERS,

REGISTERS and KEYS.

In addition to these we furnish ALL DESCRIPTIONS OF TELEGRAPH MATERIAL AND SUPPLIES, such as

BATTERIES, INSULATED WIRES, CHEMICALS
 of all kinds, etc., etc.

THE NONPAREIL TELEGRAPH INSTRUMENT,

For Amateurs and Learners, and Short Lines.

GLOBE LIGHTNING ARRESTERS.

Bradley's Apparatus for Electrical Measurement.

We are the Agents for the sale of this new and very superior Instrument for Electrical Measurement.

BRADLEY'S BOX RELAYS AND SOUNDERS.

BRADLEY'S NAKED WIRE HELICES AND MAGNET SPOOLS,

of any desired size and resistance, will be supplied upon orders through us, at the Manufacturer's lowest prices.

Also, Agents for

HOCHHAUSEN'S SUPERIOR LOW PRICED TELEGRAPH INSTRUMENTS.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the *Best and most Economical* Battery, for telegraphic and other purposes, offered to the public.

L LEWIS' TELEGRAPH MANUAL.
 A few copies of the last edition of
THE TELEGRAPHIC MANUAL,
 by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE TELEGRAPH MANUAL,

BY TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over 3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR,** without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a **LOCAL BATTERY,**

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard. Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight.. \$50 00

Sounders, from..... 4 50 to \$6 50

Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00

Relays, from..... 9 50 to 16 00

Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars. The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and it is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50

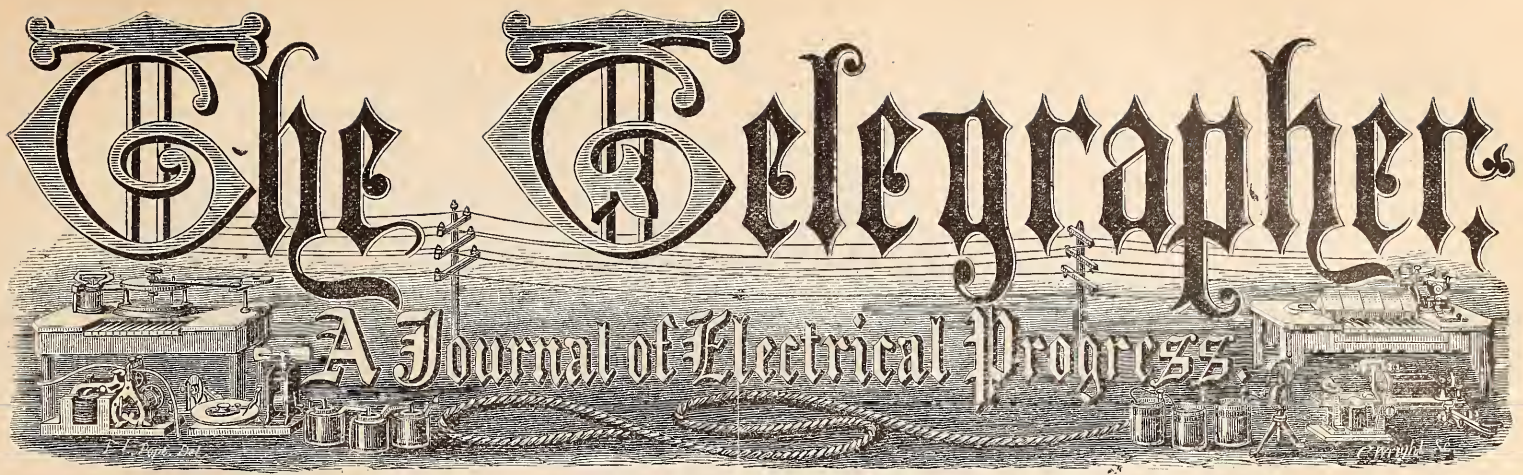

Two sets of Instruments, etc., 12.00

Send for our new Circular and Price List.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard. Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

Original Articles.

Ferg. McClevery.

BY GNIMMUC.

JOHN OAKUM having made himself so famous as a delineator of telegraphic heroes of the olden time, it is with faltering footsteps that I attempt to follow in the path he has marked out, knowing how far I shall fall short of his inimitable pen.

I first met the subject of this sketch in the little town of New Weston, which is situate on the banks of the noble Ohio, some few miles above Cincinnati. It was in the spring of 1867, and Ferg. was at that time manager of the office. I had been sent to relieve him—he having been appointed to a position on the way circuits in Porkopolis. As I stepped into the eight by ten room consecrated to the art that Professor Morse had founded, and announced myself as the new candidate for managerial honors, Mac came forward with both hands extended, his round face dimpling with smiles, and greeted me in such a truly fraternal manner that I felt at home at once, and it was not long before we were on the very best of terms. But, alas! for human hopes, and that my fair image should be so quickly shattered, my high opinion of Fergie so soon dispelled. The next day, in answering a call from the city, I found I had McClevery at the other end of the wire, and, Holy Moses! what murdered Morse and blind guessing he made of his work. The first message was from New York. I got along all right until I came to the signature, which I put down

"Prek and Baird.

Civing Plao."

Naturally thinking this could not be exactly correct, I asked for a repetition, when, lo! and behold, with a more careful transmission from the ever careless Mac, it now came

"Peck and Baird,

Irving Place."

This was better, but my feelings were rankled by his assertion that he had sent it carefully both times, according to the second rendering; which imputation on my ability I, of course, resented with indignation, and in the language of him who was well assured of his own capacity, I replied: "If you can't write better I will report you to the superintendent." From that time forward there was a constantly growing coldness between us which, though now softened by years, there still remains a certain disdain for the man who had proved himself so ignorant on matters telegraphic, for is it not a well established fact that operators, as a class, look down with scorn on one who is a whit less able in putting down fast writing, not to speak of our contempt for those who are not able to write more than twenty words per minute, while our own nimble fingers handle the key to the tune of thirty. With what delight I used to grasp my key, proceeding to rush the life out of my genial colaborer. He used only to break me fourteen times in a ten word message (I kept an accurate account in those days; I have since given up the practice, however), but always declared it was accounted for by my mean sending, sometimes adding, "Look here, young feller, there's a cross in this wire and you come mighty shaky," both of which assertions I rejected as miserable subterfuges, for how could I, who had graduated from one of the finest telegraphic collegiate institutes in Ohio, be otherwise than perfect in all branches of the art? and why, indeed, should I, too, not feel the trouble on the line if there was any? Oh, no, the thing was not to be thought of for a minute, so I would dash on regardless of the consequences. Well, time passed, and I, thinking myself so superior in every way to Fergie, naturally thought that if he was competent to work in a city office, why, too, should not I? why, indeed? "all it requires is a little cheek and a little influence" was the uppermost thought that filled my brain, and so, flattering myself I had plenty of both to back me, wrote to the superintendent, and with a short delay I was transferred to the main office, and summoned to appear before the awful presence of the chief. I was set down to a slow wire, and managed to hold my own, as I thought, with perfect confidence. I soon found, however, that McClevery, who, by the way, had been

given the regular New York wire nights, had ingratiated himself with the authorities, and was slowly but surely, working my ruin, for reasons best known to himself. I did not give him the credit of having any ability, but I knew he had a winning way about him and a certain braggadocio air that took the place of competency. I was not long in finding out that poor I stood a very slim show in advancement, and certain hints were thrown out that I was not absolutely needed, and that the company could, on a pinch, get along without my services. I had asked for promotion to a wire where I could show my knowledge, as I felt that I was wasting my talents and losing ground by being forced to work what one of our present New York force calls a "Meguffinsville wire." This promotion was refused me, and I attributed all my ill success to the overbearing Ferg. McClevery. This opinion of mine was shortly corroborated by a conversation I overheard, which was not intended for my ears, Mac being the chief spokesman of the party. 'Tis said that "listeners never hear any good of themselves," and so it was in my case." That "Gnimuc," Ferg. was saying, "is one of the d—dest conceited chaps I ever came across; why he thinks he knows it all, and be is the biggest plug in the office. When he was up at 'Wn' he sent me a message one day going to Chillietho with the check all in a lump, 10 Paid 2.50. I told him that ought to be made a double check, when he said, 'Oh! oh! of course, yes, make it read 20 Paid 2.50.' Well, I just fainted at that, and I tried to beat it into his head that I meant to split it up, but all I got out of him was, 'Well, if you know any more about it than I do, why fix it to suit yourself,' so I made it read '10 Paid 50 & 2.00 via Cin.' as it should be, and said no more about it; and then another time I sent him a telegram from Buffalo, giving cattle markets for Jones. As it was a collect message he refused it on the score that Jones had gone to Lexington, Ky., and that he didn't want to be charged with it, and he actually asked me to send it to Lexington instead. How's that for high? I managed to get it to him with considerable wrangling, but it was a hard job I had of it, I tell you." Long before the narrator was through he was interrupted by loud guffaws, in which I saw no meaning whatever except they might be ascribed to Mac's funny way of telling anything. There was evidently nothing sharp, as far as I could see, in what he was saying. Of course, after this evidence of Ferg.'s influence over and numerous misrepresentations of me, I resigned, and left for a more genial clime, where new and better friends were found.

Callaghan.

AMONG the old timers whose names have shone forth like bright gems in the mighty West, Callaghan ranks foremost.

No one knew his full name. No one knew whence he had come or whither he went. In short, he was a mystery. Some say that he was from the "Emerald Isle," others that he was an American, and a graduate from an Eastern college.

Callaghan never spoke of his past life, and always was very reticent regarding his family affairs. Notwithstanding, however, he was well educated, and even a casual observer had every cause to believe that he was of a good family.

He was well versed in poetry, and could write an ode a mile in length at the shortest notice. He had a weakness, however, for borrowing money; and whenever he was in want of scrip he always sent a polite note, and in most cases got a polite answer. On one occasion I was the happy recipient of one of these *billet dour*, and, as I was not very rich, I could not oblige our hero with "a tenner," as he termed it. I met him next day. He looked at me and smilingly said:

"I did send to you for certain sums of gold to pay my legions." (Creditors, of course, is understood.)

I politely apologized, saying that in my present condition I was not able to oblige him.

"Oh," he said, "that's all right. Have a drink."

Whenever he came to the office—another sad case of spree—he would quote Shakspeare, Moore and Byron in the most fluent manner.

Callaghan travelled all over East, West, North and South, and after twelve years of roaming, he settled down in New Orleans, where he made himself agreeable with his vams—not that he strictly adhered to the truth—but the boys liked to hear him talk.

There was a Down-easter who used to say, "Wal, I swan! That 'ere chap Callaghan, he's the goldardest case of chin I ever kim aerost. He's wss'n my old aunt Jemimy. She talked my grandfather out'n twenty thousand dollars, which was my rightful property."

I remember on one occasion this venerable Yankee was telling our hero all about New England—its beautiful chowder, clam bakes, along with the doughnuts and rum. After he had finished, Callaghan, drawing himself up proudly, said: "Young man, I think you lie."

Brother Jonathan poured out his vials of wrath, calling Callaghan "a galvanized Mick," etc.; but he

laughed heartily and said: "Go—go show the slaves how choleric you are, and make your bondsmen tremble."

After three years in New Orleans Callaghan disappeared. No one heard of him or knew where he was. Again a mystery.

About a year after Callaghan had bidden the classic arches of the Crescent City adieu I was travelling in Georgia. I happened to be in Savannah. It was a fine spring morning; the trees were putting on their coats of green and the birds sang merrily. I strolled into the cemetery—not that I am very fond of burying grounds, but my footsteps led me there, and on a solitary tombstone I saw the following inscription:

"Sacred to the memory of our fellow operator,

CALLAGHAN.

Died January 18th, 18—"

I knew at once who it was, and shed tears of sorrow over that solitary grave. I decked it with flowers and inquired after his death. I was informed that one evening Callaghan, being in a state of intoxication, had fallen down a flight of stairs and was instantly killed. "In the midst of life we are in death."

G. O. WEST.

A Chance for Inventors.

WHILE there is reason to doubt the possibility of devising an electric motor capable of doing heavy work as economically as the steam engine, there can be no question that, for light service, a satisfactory electric engine is one of the most widely felt needs of the age.

All that is lacking to meet this want is a snitable battery; in other words, a simple, compact, portable, and, if possible, dry apparatus, capable of generating a steady current of electricity for a considerable period without renewal, capable of standing unused without material waste, yet able to give out its full power on the instant when required, capable of being easily and cheaply kept in working order, free from fumes, and not liable to leak or spill its contents under ordinary circumstances.

The applications which await such a battery are practically innumerable.

Even with the fuming, slopping, troublesome batteries already in use, enough has been accomplished with electric motors to demonstrate the superiority of electricity for light work. Everything that steam can do in such cases it can do; and there are many occasions, domestic and otherwise, where steam power cannot be conveniently employed, where a small electric engine might do the required work quickly, neatly, without heat or risk of explosion, and without calling for special engineering skill or knowledge, the common lack of which must ever act as a bar to the general employment of steam for household service. And though the power obtained may be, in itself, many times more expensive than an equivalent amount of steam power, the advantages attending the use of electricity are so pronounced, the possible saving of time and trouble so great, that, with a generator such as we have described, there would be no hesitation in giving it the preference in thousands of cases where a little power is wanted for continuous work, or where there is occasional need of a small but instant effect.

Take, for example, that almost universal household necessity, the sewing machine. How immensely would its usefulness be increased by an acceptable means of running it; a motor which would require no winding up, which would not easily get out of order, which would be always safe, always ready, and perfectly under control! A man who should devise a battery to meet this demand alone would be sure of a fortune.

But this is only one of a countless number of uses to which such a battery might be put.

In almost every civilized home there is water to pump, washing machines to operate, wood to saw, coal to lift, and a multitude of other labors, all of which might be done advantageously by simple electric motors, provided the requisite battery were forthcoming. Besides, there is light to furnish, doors and windows to guard against burglars, errands to run, and accidental fires to report. It is not impossible that the common dwelling house of the future will rival Houdin's in the diversity and completeness of its electrical appliances; yet, without entering the region of speculation, or looking beyond the simple daily needs of ordinary households, there is a present call for the services of this fleetest, neatest and most tractable of servants, sufficient to ensure wealth and renown to whoever shall capture and harness him satisfactorily.

For light manufacturing purposes the call is equally urgent. In every workshop where steam is not used there are presses, saws, lathes, drills, and numberless other present or possible machines, to which electro-motors might be profitably applied. For amateur workmen nothing could be more desirable or more likely to meet with immediate acceptance. Then what an admirable contrivance it would be for driving light wagons or propelling pleasure boats! There

would be no fuel to carry, no fire to watch, no possible explosion to fear; there would be no stabling or grooming to pay for, and no food to buy for the hours of idleness. Mr. Bergh ought to offer a premium for the invention, simply for the sake of the animals he loves.

Where the range of application is so great, it is needless to multiply examples. Our purpose is to suggest, not to demonstrate the multitudinous uses to which a satisfactory electro-motor may be put, and to call the attention of inventors to the certain reward that will come to whoever shall overcome the last remaining obstacle.—*Scientific American*.

Recent Soundings for the Pacific Cable Route.

A SPECIAL despatch from Washington to the *Boston Globe* says: Captain Belknap, commander United States steamship *Tuscarora*, engaged in deep sea soundings in the Pacific, in a report dated Hakodadi, Japan, June 26, gives an interesting and valuable account of the recent soundings. It will be remembered that he first ran a course of soundings from Puget Sound to San Diego, thence to Yokohama via Sandwich Islands. It was his intention to return on the line of the great circle, passing through the island of Sanoga, of the Aleutian group, and towards Puget Sound. He left Yokohama on his return voyage July 8, at daylight, and the next morning began sounding homeward. When about 100 miles east by south of King Kusan, or Sendai Bay, on the east coast of Japan, the lead sunk to a depth of 3,427 fathoms, showing a descent of 1,594 fathoms in a run of thirty miles. The result seemed extraordinary, especially in view of the short distance from land; but the next cast revealed a depth still more astonishing, the sinker carrying the wire down 4,643 fathoms without reaching bottom. On this occasion, when some 200 fathoms of wire had run out, the sinker was suddenly swept under the ship's bottom by a strong undercurrent, and all efforts to get the wire clear and to keep it from tending underneath were unavailing, the difficulty being increased by a fresh breeze and a moderately heavy sea.

Finally, when 4,643 fathoms of wire had run out and only about 150 fathoms were left on the reel, it broke close to the surface and about five miles were lost. After this experience Commander Belknap concluded that the currents of the Japan stream proved too strong for a hight of six or seven miles of telegraphic cable, and perhaps will render the process of laying it impossible. He, therefore, ran back in shore, in order to skirt the stream, and began now the great circle off Point Komato, in latitude 40 degrees north. On this new line he found very deep water. At one cast the sinker reached a depth of 4,654 fathoms, but with slight current. The conditions under which these latter deep casts were made were conveniently favorable. The wind was light and the sea smooth, the swell being remarkably gentle for the Pacific, and the ship was as quiet and steady as though at anchor. The wire ran straight down, and in a moment touched bottom, which was instantly and accurately known at 4,655 fathoms, or more than five miles and a quarter, as at 1,000 or 100 fathoms, the indications of the dynamometer being wonderfully accurate and unmistakably clear in all deep soundings made. On the return trip the wire broke three different times, involving a loss of fifteen miles of wire. The line will be abandoned, as it is impracticable for telegraphic cables, and a new line, close to the northern shore, will be taken up, and, if found practicable, continued to the American coast.

Uneconomical Economy in Australia.

THE Melbourne, Victoria, correspondent of the *Balarat Star*, in a communication to that newspaper, calls attention to the necessity which exists for a more rational system of management of the Telegraph Department of that colony. It seems that Mr. Langton, who has been Postmaster General for the last two years, in order to diminish the difference between receipts and expenditures of the telegraph branch of the postal service, has cut down the maximum compensation of the employes very considerably. The maximum salary of the operators has been reduced from £250 to £180 per annum, and the consequence is that the best men are leaving the department to engage in similar service in other Australian colonies, where they are more liberally compensated, much to the detriment of the service. He says:

Very recently three first class men have left the department to accept better positions in one of the other colonies. One of these men was in receipt here of £180 per annum, the maximum pay for abilities that in almost any other part of the world would be better rewarded. The Sydney Government give him £200 per annum as a minimum salary. Two other Victorian operators, one receiving £135, the other £160, go to the same colony, each receiving there £200 per annum. In fact, the policy adopted towards the service here is killing it. There is no reward for merit in this, one of the most skilled branches of the public service, and I

apprehend that in a short time the Victorian telegraphic service will rank in every respect as the lowest in all the Australian colonies. The Telegraph Department, like railways, wants at the head of it a man of practical business mind, whose efforts will be directed to maintaining the revenue by increasing the business of the department, rather than by cheeeping the salaries of able men, and making it appear hopeless to juniors of ever being able to earn a decent living by the profession they have adopted. The latest feature of departmental economy is to introduce the female element into the service, and a room is being fitted up at the office in Melbourne for them, and, as a commencement, I believe, the female staff will have charge of the suburban lines. But this system will not be perfect, it may be opined, until either a Mrs. Gamp or a Mrs. Harris is inducted into office as general manager. A gentleman connected with the department observed to me recently, "It is asked in society why don't men marry? The inquirers should come here in search of an answer. Why, we have young married men here of three or four and twenty receiving thirty shillings per week only, and, from present appearances, they will be grandfathers before they reach the maximum of £180."

The (Melbourne) *Argus* commenting on this communication, says:

"This surely is not a desirable state of affairs, and we trust that, when Parliament meets, some honorable member will make it his business to inquire into the truth of these statements. It seems almost incredible that gentlemen whose work requires the possession of considerable professional skill should be paid at a rate which would be considered shabby in the case of ordinary commercial clerks of any standing. When giving evidence in Sydney on the subject of the management and working of telegraphs generally, Mr. James and Mr. Todd stated that a good operator must be a man of special natural qualifications, and that when persons possessing the requisite gifts had been secured, it took from three to five years to render them thoroughly efficient. Is it reasonable to suppose that any one who has gone through such a lengthy training will rest content with a pittance of £180 a year, or that fitting candidates will present themselves in future for appointments which require so much and offer so little? It must not be supposed that an operator who is equal to his work at once steps into possession of the munificent salary we have mentioned. This magnificent reward of industry and patience is reserved for those who have reached the topmost branch of the tree in their own particular line."

A New Duplex Telegraph.

MR. E. C. CRACKNELL, at a recent meeting of the Royal Society of New South Wales, read a paper on the "Duplex Telegraphic Instrument." His remarks were listened to with great interest. After sketching the origin and progress of duplex telegraphy, from its first trial by Dr. Gintl, the Director General of Telegraphs in Austria, on a line from Vienna to Prague, in 1853; and briefly describing the devices of Frischem, Siemens, Halske, Stearns and others, he said:

"The arrangement before you this evening is perhaps the most simple duplex working apparatus yet devised. The two instruments are the ordinary Morse recorders, with relays, in every day use on the lines in this colony. The relays are wound with one continuous wire, and the only additions are the two vertical water columns for producing the necessary artificial resistance for dividing the currents, the actual line resistance being equal to 150 miles of wire. With this plan only one battery is employed for the line circuit, which is continuous, that is, in one direction, and the adjustment requires very little attention. It must not be understood that two distinct currents of electricity pass in opposite directions through one line of wire at the same time; but the problem has been solved by increasing the amount of current on the main circuit when signals are sent simultaneously. Although duplex telegraphy may now be considered beyond a doubt as to its practicability, we are not likely to remain satisfied with its success for any lengthened period. Mr. Meyar's ingenious invention of the multiple telegraph, exhibited in the late Vienna Exhibition, bids fair to eclipse all the telegraph instruments now in use for rapidity of signaling through one wire. This instrument has already been tried between Paris and Lyons, with four transmitters on one line, and 100 to 120 messages of average length are sent through per hour."

The Electrical Railway Alarm.

THE bell rope commonly used on our railways, while it is very serviceable for short trains, is not of much use on long freight trains, because the weight and friction of a long cord is such that the rear portion of the cord may be broken without moving the forward portion. Thus, if the coupling of the rear cars of a long freight train breaks and the train separates, no alarm

will be sounded on the engine gong, because the rear portion of the cord breaks while the front portion, to which the bell is attached, is not moved. An improvement which overcomes this difficulty consists in placing a magnetic bell hammer upon the engine, together with a small electrical battery, and in providing each car with a set of wires, joined by flexible joints, so arranged that while the train remains united all is well, but should any of the car couplings or wires break, the gong on the engine will instantly commence ringing. The same device may be employed by the conductor to give any signals that he may desire to the engineer, from any part of the train.

The Western Union Telegraph Company Opposing Telegraphic Monopoly.

THE PENSACOLA TELEGRAPH COMPANY, THE PENSACOLA AND LOUISVILLE RAILROAD COMPANY, AND THE WESTERN UNION TELEGRAPH COMPANY.

ON the 10th inst. Judge Woods, U. S. District Court, heard the application of the Pensacola Telegraph Company for an injunction against the P. and L. R. R. Co. and the Western Union Telegraph Company, and, though he did not grant the injunction, he decided that the charter granted the Pensacola Telegraph Company by the Florida Legislature, giving the company the exclusive right to erect telegraph lines in Escambia and Santa Rosa counties, is valid under the laws and Constitution of the State of Georgia. This seems to be a sufficient guarantee to the Pensacola Telegraph Company that they yet have the exclusive right to operate telegraph lines in the counties named.

The above action was in consequence of a controversy, first, between the railroad company with the Pensacola Telegraph Company, which was afterwards transferred by the P. and L. R. R. Company to the Western Union Telegraph Company. The W. U. Tel. Co. began to erect poles, etc., for a telegraph line running from Pensacola to the Pensacola Junction, and the Pensacola Telegraph Company considering their rights threatened, applied to Judge Woods for an injunction.

The curious part of all that is that the railroad company and the W. U. Tel. Co., among other things, say that the Pensacola Telegraph Company enjoy a monopoly which they desire to break up. This sounds strange, because, if it is a monopoly in the hands of the Pensacola Telegraph Co., what would it be if controlled by the Western Union Telegraph Co., the greatest monopolist in the United States?

When the State of Florida granted the charter to the Pensacola Telegraph Co., it did so to encourage a company to construct telegraph lines which were needed, and which did not promise to be a paying investment, and which would not have been built except under the guarantee of such a charter. If it is a monopoly, 'tis one that has not worked to the detriment of the City of Pensacola.

The charter of the A. and F. R. R. Co., now the P. and L. R. R. Co., is also a monopoly; yet we can't see why, if it is properly managed, it would not work to the advantage of Pensacola.—(*Pensacola Florida Weekly Press*).

Atmospheric Telegraphy.

AN interesting exhibition of telegraphic machines worked exclusively by air was recently held by Mr. Guattaris, the inventor, in the Pillar Hall of the City Terminus Hotel, Cannon street, London. A number of different instruments were on view, but the motive power in every instance was excited by the impulse given to a column of air at one end being transmitted instantaneously to the other end of the column, and taking effect upon certain mechanical arrangements so as to produce such results as might be required. The impulse is produced at one end of a tube by the operator, and performs the mechanical work at the other end either by ringing a bell or turning a needle round a dial. Mr. Guattaris claims for his invention a superiority over others in the fact a complete message can be despatched by its means. Mr. Guattaris' instruments are only worked by a single tube, along which the air is impelled in each direction. The rapidity and precision can be made equal to the electric telegraph, the conducting tube being able to be laid under or over cover in the same manner as the ordinary telegraph. Attached to each machine is a bell and dial, and the message is transmitted by the moving of a small lever, which drives the air through a pipe to the other operator. As the lever is moved up and down, the dial, which stands where the message is destined for, registers whatever the words may be. Each dial is supplied with a needle, and, as each spurt of air presses against the works of the machine, the needle is moved exactly the number of times that the lever is pressed. Each instrument can either receive or send a message. The mechanism is not likely to

become disarranged; but it appears that the invention will not transmit messages any great distance. By the aid of condensed air the inventor has succeeded in carrying a message ten miles, but without compressed air the present limit is about 400 yards. The instruments exhibited were designed for intercommunication between large coffee houses, offices, hotels and vessels.—*The Telegraphic Journal.*

Post-office Telegraphs.

IN Parliament, July 25th, in reply to Mr. McLaren, the Chancellor of the Exchequer said he was aware of the fact that the capital sum expended in the purchase and formation of the post-office telegraphs, amounting at the 31st of December, 1873, to £9,465,197, had yielded a net revenue of only £95,956, or about one per cent. on the outlay. His attention had for a considerable time been directed to the general position of the telegraph service—a subject of very great importance, involving an expenditure of great magnitude, and requiring very careful control and supervision. All expenditure upon new works or extensions out of capital had been stopped since October last, and no new works or extensions could now be undertaken except out of sums voted by Parliament. The Treasury exercised the same care and supervision in respect of the votes which might be proposed to Parliament for works in this service as in regard to any other expenditure for Government purposes. During the present year there had been very considerable strictness in revising the estimates, with a view to asking for as small a sum as possible. He was in constant communication with his noble friend, the Postmaster General, for the double purpose of keeping as low as possible the expenditure upon new works, and reducing the expenses of management, and, at the same time, of providing as efficient a system of control as possible over any expenditure connected with this service. In reference to another point referred to in the question, he had to say that since the 31st of December last the Treasury had created stock to the amount of £325,000, and that of this sum about £70,000 was still in hand. The amount expended had been applied to the purchase of works which had been taken over but not paid for. No part had been expended on extensions or new works. The honorable gentleman had asked, in conclusion, whether an estimate could be given of the probable amount which would still have to be paid to companies for telegraphs and rights acquired by the post-office. There were claims which were still under consideration and arbitration, and, therefore, in the interest of the public service it would not be desirable to give an estimate of the kind suggested.—*London Times.*

The Government Purchase of the British Ocean Telegraphs.

IN his last monthly circular, Mr. Wm. Abbott, of London, says: The proprietors of submarine telegraph property will no doubt have noticed with considerable interest that the question of the Government purchase of the British ocean telegraphs is likely to come into prominence under auspices of some influence. Mr. Reed, M. P., late constructor of the navy, has this week placed upon the notice paper of the House of Commons a motion which he will submit next session, "to call attention to the desirability of bringing British ocean telegraph lines under united and responsible public management, and in closer coöperation with the telegraphic systems of the Continent, and that a select committee be appointed to inquire and report upon the subject." There may be many and various opinions as to the policy of the purchase of these properties by the Government. International as well as imperial interests are involved in it; but there is no doubt it is high time that the question should be impartially and thoroughly investigated thus early, as delay only adds still more to the difficulties surrounding it.

Recent Advances in Electrical Sciences.

AT the session of the American Association for the advancement of Science, recently held at Hartford, Conn., Professor Lovering, the President of the Association, read an address on "Recent Advances in Science," in which he thus refers to advances in electrical science:

"Wheatstone, he said, by a revolving mirror, determined the velocity of electricity, the duration of electrical discharges, and the direction in the direction of the transmitted disturbances. Peddersen, and more recently our own associate, Rood, repeated his experiments. Indirectly the velocity of electricity thus ascertained (and the greatest known except that of gravitation) has been tested by signals through long lines of land and ocean telegraph, giving a lower figure than that of Wheatstone. But the anomaly is due to a misinterpretation. That electricity moves through a quarter of a mile of wire at the rate of 288,000 in a second is not evidence that it would move

over 288,000 miles in one second. Electricity has no velocity in the ordinary sense. The transmission of the electrical disturbance is proportional to the square of the disturbance to be travelled; therefore the velocity varies with the length of the journey."

Mr. Herring and the Telegraphs.

A PAMPHLET has been issued by Mr. Richard Herring, the patentee of a new system of printing telegraphic messages, in which the relative merits of his plan and the Morse system now in use are discussed. Mr. Herring's system, which has received the weighty endorsement of Mr. Latimer Clark, and Messrs. Clarke, Ford & Co., appears to have the following undoubted advantages over the Morse system of printing. The signals are more legible, and may be more accurately deciphered; the ordinary telegraph clerks can learn to work it with greater facility; it saves sixty-five or seventy-five per cent. in paper; as regards mechanical sending the punched paper is simpler and stronger, owing to the fewer perforations; and, finally, it is peculiarly adapted for reading by sound. Professors Thomson and Jenkins, however, have reported against the instrument on the ground that it is not adapted to work on the double current method, by which two currents are used for each symbol, and that it is more complicated than the Morse instrument. To these opinions Mr. Herring takes exception, and here the matter rests for the present. With the advantages conceded, however, there appear grounds for further inquiry into the merits of the system.—*The Railway News.*

Common Sense Suggestions to Telegraphic Inventors.

TO THE EDITOR OF THE TELEGRAPHER.

IT has occurred to me, in reading THE TELEGRAPHER, especially during the last six weeks, that a great deal of energy was being wasted by telegraphic inventors, or those who desire to be considered and recognized as such, and persons interested in such inventions, in fighting each other, and demonstrating the baseness of each other's claims, which might be put to more profitable use. As a mere matter of priority or ownership, the public don't care a straw whether the duplex is the invention of Gintl, Siemens and Halske, Farmer or Stearns; or the automatic the invention of Wheatstone, Little, Foot and Randall, or any other man, or woman either. What is wanted is the best practical telegraphic system, which shall do the business most rapidly, reliably and economically.

As a matter of fact, it may as well be conceded at once that no great and useful invention is the production of one person or one mind. Such inventions are the aggregate result of the accretion of ideas and the operation of many different individual minds, usually at last combined and made practical by some individual who is recognized as the inventor, and whose (as it may be termed) perfected invention is subsequently improved upon by others, until it reaches as near perfection as is possible. This has been the case with the Morse, the duplex and the automatic, as is well known to all who have intelligently investigated them, and it is, therefore, the height of folly for those who are interested in automatic telegraphy to waste their time and energies in quarrelling about to whom the honor of the invention really belongs. The honor is of but little account any way—it is the profits that should be looked after.

I would respectfully submit to all the parties interested, whether it isn't time to stop this senseless wrangle, and see if they can't unite their forces and bring about a practical and general introduction of the automatic system in this country. If they do not do this they are likely to lose the substance while fighting for the shadow. The Western Union Telegraph Company, as is its custom when the merits of an invention can no longer be ignored, as shown in the case of Stearns' duplex, have at last become awakened to the real value of the automatic system, and are experimenting with a view to bringing out some automatic system which shall render them secure from injury from its introduction and extension by other and rival companies. It won't do to sneer at and decry these efforts—they will doubtless blunder along as usual—but in the end they will succeed, for they have abundant capital and can subsidize the necessary talent, when convinced that it is not now in their employ. "A word to the wise is sufficient;" but, judging from the lack of wisdom shown in this matter so far, a great many words, and hard knocks even, will be required before the automatic contestants will become con-

vinced of their folly, and realize the danger which threatens them. COMMON SENSE.

Telegraphic Journalism.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR remarks on telegraphic journalism in the last issue of THE TELEGRAPHER have met with very general approval and commendation among intelligent telegraphers, so far as I have had opportunity of knowing. It is a matter of humiliation that such stuff as appears in certain so-called telegraph papers should meet with favor from the members of a profession which should be composed of intelligent and reasoning individuals. For one, I am loth to believe that the majority of telegraphers are of so low a grade of intellect as to read and enjoy such stuff, but there are evidently enough of this class to keep such publications going—for a time at least. If they were witty and amusing that would be something in their favor, but when the jokes are pointless, and the attempted witticisms witless, the result is a dreary waste of words to no purpose, unless to still further addle the already too addled individuals who read them.

Instruction, information and amusement should be combined in due proportion in a paper published by telegraphers mainly for telegraphers, and a paper which properly combines these, and is at the same time enterprising and kept fully up with the times in telegraphic matters, should meet with a liberal support. The sooner the other class ceases to exist the better.

It would, indeed, be mortifying if the world were to judge of the calibre of the telegraphic fraternity by such journals as their representatives. Fortunately they are seldom seen and more seldom read by any but the least intelligent among the telegraphers themselves, and none others outside of the telegraphic ranks would waste time upon them.

I speak earnestly and feelingly upon this matter, because as a telegrapher I have at heart the welfare and good reputation of the fraternity to which I belong, and with whom my fortunes are cast. DUPLEX.

Something About the Lake Superior Region and its Telegraphers.

MARQUETTE, MICH., Aug. 18.

TO THE EDITOR OF THE TELEGRAPHER.

AS I seldom see anything from this section in your columns, I have concluded to let the fraternity know something about those of us who reside in the greatest copper and iron region in the world.

Marquette is situated on Lake Superior, and is at nearly the same altitude as Quebec. It is the principal point for the shipment of ore by vessels to Cleveland and other Eastern cities. The Marquette, Houghton and Ontonagon Railroad extends from Marquette to L'Anse, sixty-two miles, connecting at Negaunee with the Chicago and Northwestern Railroad, passing through the richest and most prolific iron lands in the world.

I will briefly mention the operators of my acquaintance on this road. Mr. Lew. Glasin is our tram despatcher at Marquette and circuit manager, and one of the best boys that ever worked a wire. Mr. J. McCombs is operator in the Superintendent's office. Morgan Station is run by Mr. W. Wilson, a young operator of good ability, as operator and agent. Eagle Mills Station has been ornamented by Mr. Ed. B. Lerner this summer, but who resigned and left us last week, having become tired of hard times, etc. "Sx" made many friends while he was with us, and he has travelled and worked in telegraph offices from Boston to San Francisco. I presume that many will remember him. Hope he'll "strike it rich," as the miners say.

Negaunee is represented by Mr. Ned Blodgett as operator and ticket agent. He is well liked for his uniform affability. Isbpenning "V" was taken charge of last week by Mr. Nath. McComber, who relieved Mr. J. Van Brocklyu. Mac is also one of the boys. He left Greeu Bay, Wisconsin, Northwestern Telegraph Company's office, last fall, and wandered down through Texas and the Gulf States operating, teaching and other employments to procure a living, until he got round up North to take charge of "V."

Greenwood takes in Mr. Scribner; Humboldt, Mr. Mike McGee; Champiou, Mr. Tyler; Michiganmé, Mr. Lounsbury, and L'Anse Mr. Frank Wheeler; all good fellows, who can draw their pay as regularly and become impecunious again as quick as the next.

From L'Anse freight goes by boat to Houghton, and a wire follows round the shore, connecting through the great copper country of North America. The times are very dull at present, as everything here depends on the demand for and price of iron, and, as that is now quoted at about half the price that it was before the panic, it is no wonder that times are not encouraging.

That better prospects are in the near future we may safely predict. SUPERIOR.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE

TELEGRAPHIC FRATERNITY.

SATURDAY, AUGUST 29, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

THE legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster.

The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Back Numbers Wanted to Complete Files.

THE supply of the following numbers of THE TELEGRAPHER is exhausted, and we are desirous to obtain them to complete files of subscribers. Any one who may have either of them that can be spared will confer a great favor if they will forward the same to this office:

- Vol. IX, No. 342.....4 copies.

Cable Telegraph Enterprises.

THE principal activity as regards telegraphic extension at the present time is manifested in cable telegraph enterprises. There is a pause, both in this country and in Europe, in the construction of new land lines, and the additions to them the present year will be comparatively few and unimportant. The causes which have led to this in the United States are familiar to our readers. The general prostration of business interests has, for the time, checked all new enterprises, and, although in the financial centres money is in excessive supply, and is loaned on call at 2 and 3 per cent., there is not the confidence required to induce capitalists to invest their funds in such undertakings. There are indications of a revival of business to some extent this fall, but confidence is of slow growth, and it will require yet some time before there will be a complete recovery. Another consideration which prevents any very general confidence in telegraphic enterprises in this country is the quarrels and contentions of rival inventors and claimants of inventions for fast telegraphy. It is difficult to make those not familiar with telegraphic matters have confidence in any pro-

posed system so long as it is decried by interested parties, who are supposed to have a better knowledge of the true status than those who are not actively engaged in the business.

In Europe the land lines are generally owned by the Governments, and seldom prove remunerative. In Great Britain the telegraph system has cost the Government so much, and the charges for telegraphic service have been reduced to so low a figure, that the telegraphs entail a very large annual loss upon the revenues of the postal department. This was covered up for a time by illegal and unauthorized use of funds of another branch of the Post-office Department, but this is no longer possible, and no expense is now incurred for the time which can be avoided.

But there is great activity in cable telegraph enterprises, as is shown by the reports of new cables being laid and new routes opened, which appear every week in the columns of THE TELEGRAPHER. The business of manufacturing and laying submarine telegraph cables has grown to very large proportions, and the largest steamships in the world are actively employed in the service. Telegraph cable laying has been systematized and reduced to almost a mathematical certainty. In every section of the world British capital and British enterprises and skill are stretching beneath the waters of the ocean the electric cords which bind nations and peoples together.

By the time this paper reaches the reader two of the largest steamships ever built will be upon the Atlantic laden with new cables, to add to the facilities for Atlantic telegraphy already in existence. The Faraday is engaged in laying the long section between the Irish coast and Newfoundland of the cable of the United States Direct Cable Company, and the Great Eastern is on the way to lay the sixth cable of the Anglo-American Telegraph Company, which will be laid from this side—the first time that a cable has been started from the western shore to the eastward. The Great Eastern finds constant and profitable employment in cable laying, and it is to be hoped that on this trip the Faraday will redeem its character and show its adaptation to the service for which it was specially designed. Its initial performance was not very satisfactory, but this probably arose from exceptional circumstances, and we sincerely hope that its present voyage may be satisfactory and encouraging.

The laying of long submarine telegraph cables has become so common an affair that the success of such undertakings does not attract the attention and is not greeted with the enthusiasm which attended them at first, but they are not less notable and important. We should find it much more difficult to get along without the facility of ocean telegraphy, now that business and social relations have been adapted to it. If telegraphic communication between this country and Europe were interrupted for a week it would throw matters into a state of direful confusion, and would demonstrate fully to the comprehension of even the most thoughtless its paramount importance, necessity and value. Fortunately there is little probability that this misfortune will occur, and every new cable beneath the Atlantic lessens the chances of such an interruption. It has never occurred heretofore—at least one cable having been at all times serviceable.

With the completion of the Direct Cable, so called, we presume there will be, for a time at least, some competition between the new company and the Anglo-American, which has at present a monopoly of the business. What effect this will have upon the charges for the service remains to be seen, although it is understood to be the intention of the managers of the new company to reduce the rates materially. The effect of this would be to crowd the cable with business. We do not see how any very material reduction can be made profitably unless the capacity of the cable for the transmission of signals can be largely increased. The new cable will labor under the disadvantage of having to work a much larger circuit than that of either of the Anglo-American Cables, as the first relay station will be at Torbay, Nova Scotia. We do not suppose that

it is expected that the new cable can be landed at Newfoundland, at present at any rate, although efforts have been made and are still making to wrest from the Anglo-American Company its exclusive right to land cables on the Newfoundland coast. It has not been accomplished as yet, however, and as, if laid at all the present season, the new cable must be done within the next month, we do not consider it probable that it can be landed at Newfoundland this year.

The new company has met with much opposition, as, naturally, the old company does not like to have its monopoly infringed upon, but it is in a fair way to triumph over all obstacles so far as putting down the cable is concerned. It will have the good wishes of those in this country who have occasion to patronize the cables, but American capitalists are too cautious and have too little confidence to invest money in such enterprises. Our people confine their encouragement of them to using them when they must and grumbling at the charges.

If means can be found by which the speed of transmission over very long cables can be largely increased, then we may look for material and permanent reduction of rates for cable service. Those who invest their money in cables do so for profit, and not at the present time primarily for the benefit of the public. It is but reasonable that they should realize a fair profit on the investment, and in calculating what may be considered such, the character of the property and its peculiar risks and liabilities must be taken into account.

Quiet Along the Lines.

THE contest which has of late raged in the columns of THE TELEGRAPHER between the inventors, or those claiming to be inventors, and those interested with them, in systems of fast telegraphy, seems to have quieted down, for the present at least, so far as ventilating their claims and views in print are concerned. They have all had an opportunity to present their views and claims, and although undoubtedly either contestant has failed to convince the other, yet they and the public are more fully informed as to the merits of the controversy, the reasons for which lie deeper than appears to the casual observer. We do not propose to go into the matter or express any opinion upon the merits of the inventions or the validity of the claims made by either of the parties. So far as is known to us, we have the most friendly feelings towards all of them, with the exception of one notorious embezzler and appropriator of others' ideas and inventions, towards whom it is difficult to understand how any honest individual can entertain any feelings of either friendship or respect.

We believe that fast telegraphy has now been practically developed to the point when it should be introduced and made available in general use, not only on a line between New York and Washington but throughout the country. Its progress and introduction are, however, checked and delayed by the dissensions which have existed for some time past, and which recently have found expression in the columns of THE TELEGRAPHER. A communication which we print this week, over the signature of COMMON SENSE, states some important truths, and gives the parties interested some sensible warning and advice, which they will do well to heed.

If there is anything of value in the different patents and devices which have been made and secured during the last few years, why would it not be the best and most reasonable course for those interested in them to come together and combine their several interests and present a united front, so that those who must be depended upon to secure their practical introduction, can deal with them in the confidence that they are not to be victimized, or have their plans and investments possibly ruined by some contestant or contestants, who has patented an improvement which may be essential to practical success?

In this matter, as we understand it, there are two parties interested; one the inventors, or those who

claim to be inventors of improved fast telegraphic systems, and the other those who have a pecuniary interest in developing one or the other of the systems. While the latter are scheming to secure the profit which may result from the adoption of the systems or improvements in which they may be severally interested, the others are reaping no reward, or but an inadequate and insufficient compensation for their time, labor and genius embodied in their inventions. Surely it is time they should be considered, and their interests made available and remunerative.

Personally and pecuniarily, we have no interest in any system of fast telegraphy, and, as we have before stated, being friendly to all the parties concerned, with one exception, hope that what we have felt impelled to say on the subject will be duly considered and productive of good results.

Telegraph Business Improving.

WE are pleased to know that the business of the different telegraph lines is improving, and that the general improvement in business incident to the commencement of the fall trade is being felt beneficially upon the telegraph interests. The summer vacations are now nearly over, and business men are returning from their various summer resorts, and there is a more cheerful feeling generally in business circles. It is not to be expected that there will be so extensive and active a business done this fall as in the few years preceding the panic, but there is a feeling that the worst is over, and that we are to experience a permanent, though necessarily gradual improvement in this respect. The lesson of caution and economy has been a severe one, but it was greatly needed, and did not occur a moment too soon for the welfare of the whole country. The telegraph interests have suffered with the rest, but there are unmistakable indications that there is a good time coming, and that telegraphers as well as the rest of mankind may be happy yet.

Personals.

Mr. PARRISH has been transferred from Howard station, Mich. Central Railway Air Line, to Tolleston, Ind., day office, same road.

Mr. S. D. HAWTHORNE has been appointed day operator and agent at Howard station, Mich. Central Railway Air Line, *vice* Mr. PARRISH, transferred.

Mr. FRANK BARNES has been transferred from Tolleston, Ind., to Grand Junction, night office, M. C. Railway.

Mr. DOYLE has been transferred from Grass Lake, Michigan, to Three Oaks, Mich., day office, M. C. Railway, *vice* Mr. J. J. SMITH.

Mr. BOARDMAN has been appointed day operator at New Buffalo, Mich., M. C. Railway, *vice* Mr. FRANK DUNNING, resigned.

Mr. RISDORPT has been transferred to New Buffalo, Mich., night office, M. C. Railway, *vice* Mr. JAMES DUNNING, resigned.

Mr. GEO. W. COMSTOCK, formerly relief operator, has been appointed night operator, M. C. Railway, at Niles, Mich.

Mr. D. S. FLEMMING has been transferred from Niles, Mich., to Pokagon, Mich., day office, M. C. Railway.

Mr. FRANK MARSHALL has been transferred from Christmans, Ind., to Battle Creek, Mich., night office, M. C. Railway.

Messrs. FRANK and JAMES DUNNING, operators in the New Buffalo, Mich., office of the M. C. Railway, have resigned, and are attending school at Paw Paw, Mich.

The Telegraph.

By Cable.

THE NEW CABLE.

LONDON, August 22.—The shore end of the United States Direct Cable has been laid at Cahirciveen, on the Irish coast, two and a half miles Northeast of Valentia. The steamship Faraday, which is to lay the sea section, will proceed to Cahirciveen to-day.

The Brazilian Telegraph.

THE great ocean cable between Lisbon, Portugal, *via* the Azores and Rio Janeiro, Brazil, is now completed and open for business. The charges from New York to Rio Janeiro are about \$2.50 per word. The message goes *via* England, and through some eight thousand miles of submerged cables. Complimentary messages have been exchanged between President Grant, the Emperor of Brazil, the President of the Argentine Republic, and the President of Uruguay.

Last year the section of the above cable between Lisbon and Madeira was broken, and so remained until the present summer, when the two ends were fished up, joined and relaid. The depth of water at the place of fracture was 2,500 fathoms, or about 2½ miles deep, and the successful finding, raising, and joining of the broken ends at sea, shows the great perfection of mechanism and skill that has been acquired in ocean telegraph engineering.

Foreign Telegraphic Notes.

SIR DANIEL GOOCH and Admiral Richards, directors of the Anglo-American cable, visited the Great Eastern steamship, and made a final inspection of the vessel the evening before she left the Medway to proceed to execute the laying of the new cable.

Vice-Chancellor Malins has authorized a further dividend of one shilling in the pound to the creditors of the Great Oceanic Telegraph, making, with former payments, sixteen shillings in the pound.

The number of messages passing over the Cuba Submarine Telegraph Company's line during the month of July amounted to 1,758, estimated to produce £2,000, against 1,078 messages, producing £1,065 in July last year.

With reference to the Barcelona-Marseilles Cable, it is notified that the number of messages (of twenty words) passing over the line for the month ending July 31, 1874, was 6,382 against 5,451 for June.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ending August 1, 1874, was 408,286, an increase of 31,612 on the corresponding week of last year.

The second and third cables have been successfully submerged across the Simonosaki Straits—the former on the 14th of May and the latter on the following day—by Mr. J. Tasker Foster, the resident engineer for the Japanese Government, assisted by Captain Taylor, of the "Densinn Maru." The cables are of the same size as the shore ends of the Atlantic cables.

The Western and Brazilian Telegraph Company received on Thursday an intimation that the land lines connecting Rio Grande do Sul with Montevideo are completed and open for traffic. Communication by telegraph is thus established between Europe, the River Plate and the west coast of South America.

A grand ball was given at Rio de Janeiro, Brazil, on the 18th of July, by the Commercial Body, in honor of the establishment of telegraphic communication with Europe. Their Majesties and about 1,500 persons were present. The Emperor has decorated various gentlemen connected with the Transatlantic Cable Company.

The cable from Para to Cayenne is reported to have a defect in it which prevents practical working, and a steamer has gone to repair it. Communication with the River Plate, either by cable or land, is still incomplete, but the land lines are nearly joined, and cable to replace the wrecked section is expected out early in September.

Telegraphic and Electrical Brevities.

The lady telegraph operator at Moawequa, Ill., telegraphed that the passenger train due there at 9:15 had "left on time." After performing this duty, she immediately boarded the cars and eloped with a nice young man who parted his hair in the middle and wore a pink moustache. They rode gaily to Pana, where the nuptial knot was drawn in a lovely bow knot, and the happy pair returned on the next train. The newly made bride alighted from the cars and telegraphed, "The up train gone," thus making a bridal tour without missing a call.—*Chicago Tribune*.

The Navy Department received at Washington on Saturday, Aug. 15, its first official despatch by cable from Rio de Janeiro, Brazil. It was dated on that day, and was received at ten A. M. from Admiral Leroy.

While a number of boys were playing on the corner of Fifth street and Vernon avenue, Hunter's Point, Long Island, a telegraph pole fell down in their midst, injuring several of them, one very seriously.

The Southern and Atlantic Telegraph Company have opened an office at Fort Valley, Georgia, on the line of the Southwestern R. R. of Georgia.

The British Postal Telegraph.

IN the House of Commons, on the 27th ult., on the supplementary vote of £37,687 for the Post-office Telegraph Service, Mr. Smith explained that this vote was brought forward as a supplementary estimate in consequence of a change of practice which had only recently been introduced, and which he thought was a very desirable one. Until this estimate was presented it had been customary to charge the amount for annuities to the servants of the late telegraph company to the capital accounts, which was considered to be entirely improper. In answer to Mr. Fawcett, the Chancellor of the Exchequer said he was informed that the amount of business that was being done was largely in excess of that done last year, and that there was at present no reason to fear that the estimate which was given to him for the telegraph revenues for this year could not be realized. Lord J. Manners said that, taking last month, there were 200,000 more telegrams despatched and received than were despatched and received during the corresponding month of 1873—a gratifying proof of the immense development of this particular branch of the Post-office system. The vote was agreed to.

Death of Ex-Commissioner of Patents S. S. Fisher.

WITH the deepest regret we record the death, by drowning, on August 15, of Samuel S. Fisher, Esq., of Cincinnati, O., formerly Commissioner of Patents; the duties of which important post he performed with the most distinguished ability till the end of the year 1870, when he resigned. The accident which terminated this useful life was truly calamitous, as Mr. Fisher's son was drowned at the same time. They left Elmira, N. Y., on a summer boating excursion, intending to float down the Susquehanna to Havre de Grace, and enjoy the wonderful scenery which that river presents. The boat was unfortunately capsized in the Conewago Rapids, fourteen miles below Harrisburg.

The record of Commissioner Fisher will long survive him. His learning and practical good sense, accompanied by great force of character, gave him more than customary authority over the important department in which he presided, and enabled him to carry out many salutary reforms in the administration of the Patent Office. As a patent lawyer he was widely renowned, and many of the most important litigations were entrusted to him, and some very heavy cases were in his office at the time of his death.

Commissioner Fisher served his country in the late war as Colonel of an Ohio regiment, was President of the Board of Education in Cincinnati, and has filled many other important public positions.—*Scientific American*.

Dr. Priestley and the Voltaic Pile.

A FRIEND of the late Dr. Priestley, Hugh Bellas, Esq., wrote: "In the summer of 1800 I called on Dr. Priestley to return some books I had borrowed, when he told me he had just received a very curious present from Europe, which he would show me. He took me into his laboratory and pointed to a small pile of plates of silver and zinc, in alternate layers, with pieces of wet flannel interspersed, each plate about the size and form of a common playing card. A piece of small wire was inserted at the top, and another piece near the bottom, and the other ends of the wire were brought together, and there underwent decomposition. 'Now, this is called the pile of Volta,' said the Doctor, 'and here is the electric fluid destroying the ends of the wires. Put the joint of your thumb to these points and you will feel a slight electric shock. You need not be afraid; it will not be severe.' I did as he directed, and received successive slight shocks upon repeated applications to the points." This was the first electric machine brought to America.

Miscellaneous.

ELECTRICAL GAS LIGHTING.—One mode of lighting numerous gas jets is by the electric spark, which is the sudden passage of an electric current through an aeriform body, producing heat, light and sound. The electricity that produces a spark is of very high tension—that is, it moves with much greater velocity than the ordinary current from a galvanic battery, and hence possesses peculiar powers. This high tension electricity is generated chiefly by friction and by "induction," or the influence from a passing current in an adjacent conductor. It has little quantity, but great penetrating power, and might be compared to a bullet shot from a rifle, if a galvanic current were likened to a large stone thrown by hand. In igniting coal gas by this means, the sparks leap between the points of two wires that are brought together, but do not touch, at the orifice of the burner. The heat of the spark is sufficient to cause the ignition of the gas when this is

combined with the air, but if the spark points be entirely immersed in the pure gas, unmixed with atmospheric air, no inflammation will ensue when the spark passes, because pure coal gas is not an explosive compound, and a lighted candle introduced into an inverted jar full of such gas is as effectually extinguished as if dipped into water. When the gas is mingled with a certain proportion of atmospheric air or oxygen, it is readily and powerfully explosive.

TOOTHACHE CURED BY ELECTRICITY.—Dr. Bouchard, of Paris, says that toothache may be almost instantly arrested by a constant battery current from ten cells. The positive pole is placed against the jaw, on a level with the painful tooth, and the negative pole to the antero-lateral region on the same side of the neck.

ARRANGEMENT OF LIGHTNING CONDUCTORS.—According to the views of Mr. Preece, presented at great length in a paper read by him before the Society of Telegraph Engineers, London, the two main conditions that determine a perfect lightning conductor are—that it shall expose, in some prominent position on a building, a metallic point, and that it shall offer from this point to the earth a path of little or no resistance to the passage of the current. He also asserts that, instead of the costly copper rods, the ordinary galvanized iron wire, known as number four, and which is one fourth of an inch in diameter, is amply sufficient for the purpose, in the case of any ordinary dwelling house.

The reason given by Mr. Preece for recommending telegraphic wire is based on the experience of English companies in protecting the poles of their telegraph lines. These, it appears, are invariably supplied with lightning conductors of number eight wire, running from the upper end of the pole to the ground, and it is stated that no pole so protected has ever been known to be damaged by lightning.

Among the precautions mentioned by Mr. Preece as necessary to be observed in fixing conductors, the first is that it should be solid and continuous, there should be no joint unless it be a well soldered one, and chain-like rods, braided rope, tubing, etc., should be avoided. The ground connection, too, must be sound and good, and each conductor, if there be more than one, should have a separate ground connection, but they should also be all connected together, and connected with the lead roofing and all masses of metal in their neighborhood.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ending July 28, 1874, and bearing that date.

153,456—ELECTRO-MAGNETIC ENGINES.—Henry M. Payne, Newark, N. J., assignor, by mesne assignments, to the American Electro-Motor Company, New York City. Filed Nov. 4, 1873.

An electro-magnetic engine in which both the cores and helices of all the electro-magnets are of concentric segmental shape, has an adjustable commutator for varying the speed.

1. The magnets A I, constructed of broken annular sections having their coils wound in reverse directions, substantially as herein shown and described.

2. The combination of the permutator wheel *o*, sheet 2, fig. 3, current wheels S S, standards T T, and lever Y, actuated by the worm *c* working in the sector *b* substantially in the manner and for the purpose specified.

153,498—ELECTRIC SIGNALING APPARATUS.—Wm. H. Sawyer, New York, N. Y. Filed April 16, 1874.

For signaling a variety of wants in "district telegraphy," the want being designated by the repetition of an arbitrary signal a certain number of times. The crank K winds the spring and releases the circuit wheel. The crank cannot be moved till the appropriate button, F P K M, is pushed in, which releases the crank lever, at the same time placing a detent, *f*, *p*, *r* or *m*, in the way of the crank lever to limit its movement, and also breaking the "cut-out" *o*, throwing the current through the sounder *s*. Shaft projects through face of box and carries a pointer for additional safeguard in showing that proper want was signalled.

1. In a telegraphic apparatus for automatic signaling the combination of the circuit breaker E (arranged to transmit a specific arbitrary signal), and a train of wheel work driven by a weight or spring for actuating the same, with the stops *f* *p* *r* *m* ar-

anged to permit said spring or weight to be wound sufficiently tight to repeat said arbitrary signal one, two or more times at pleasure, substantially as herein specified.

2. The combination of the stop *t* with the winding mechanism and the cut-out *O*, all arranged to prevent the operation of said mechanism until after the cut-out is opened, placing the sounder in the circuit, and until the rod which is to limit the travel of the arm L is put into position, substantially as hereinafter specified.

3. The combination of one or more stops, *f* *p* *r* *m*, with the cut-out lever *O* and the stop lever T (either or both), substantially as and for the purpose specified.

4. The combination of the dial plate W, index K, ratchet wheel B, pawl *c* and axis *b*, the latter being provided with a convolute spring, substantially as and for the purposes herein specified.

153,593—TELEGRAPH REGISTERS AND SOUNDERS.—Henry Middleton, Charleston, S. C. Filed Feb. 16, 1874.

+ and — currents used, E or E' being caused to move according to polarity of current; the magnet M remaining fixed different sounds are produced through the medium of sounding pieces of different metals. These sounder magnets also actuate styluses.

1. In a telegraph register and sounder two movable electro-magnets arranged to have their unlike poles turned toward each other, in combination with an immovable electro-magnet, substantially as described.

2. The movable electro-magnets E E' and E' E'' constructed with projecting soft iron cores, the ends of which are arranged to operate over the ends of the soft iron cores of the electro-magnet M M', substantially as described.

3. In a telegraph register and sounder, movable permanent electro-magnets, in combination with sounding pieces made of unlike metal, constructed and arranged substantially as and for the purpose described.

4. The sounders K K', the frame F F' and the movable electro-magnets E E' and E' E'', in combination with the wheels U and V, by means of which the sounds produced through the movements of the magnets are simultaneously signified by marks made on the paper during the passage through the machine, substantially as described.

153,613—ELECTRIC RAILWAY SIGNALS.—W. Robinson, Brooklyn, N. Y. Filed July 18, 1873.

Signal banners on and at right angles to counterpoised cross arm moved in a horizontal plane by a magnet.

1. A signal provided with two or more banners having their faces in planes parallel or at right or other angles to each other, in combination with the magnet B and suitably interposed mechanism operating and controlling said banner by means of said magnet, substantially as specified.

2. The combination of the magnet B, lever E and crank I with the cross-arm K, adapted to carry one or more banners, or a banner and counterpoise, substantially as set forth.

AUTOMATIC TELEGRAPH COMPANY.
(LITTLE'S AMERICAN SYSTEM.)

It is with pleasure that I take this opportunity to inform my many distinguished friends of both hemispheres that, after September 1st, 1874, I will be more frequently at the offices of the Automatic Telegraph Company, 64, 66 and 80 Broadway, New York.

GEORGE LITTLE,

Consulting Electrician Aut. Tel. Co. Inventor of and Patentee of the American Automatic Tel. System.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities.

A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon application to

Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which this apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above,

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.
Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.
Favorable arrangements will be made with line constructors, telegraph employés, &c., for the introduction of the Printer.
For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
No. 234 West 29th St.,
New York.

MAGNETO-ELECTRIC ALPHABETICAL DIAL TELEGRAPH,
FOR
RAILROADS, GAS COMPANIES AND PRIVATE BUSINESS PURPOSES GENERALLY.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vessey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheelcr, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Buusen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Oersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, scaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION, and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

TILLOTSON'S EXCELSIOR
TELEGRAPH INSTRUMENT

(PATENTED JUNE 24, 1873.)

This apparatus is constructed of the best material, and finished equal to any Telegraph Instrument, and is warranted first class in every particular. It is especially adapted to the requirements of Students of Telegraphy and the operation of Private Telegraph Lines.

Price, complete, Sounder and Key mounted on finely finished Mahogany Base, with one Cell Hill's Patent Battery, with Chemicals, eight feet of Office Wire, and "Smith's Manual of Telegraphy"..... \$7 50
Two sets..... 14 50
Price of Sounder and Key only..... 6 50
" " " with Cut Out and Lightning Arrester attached..... 7 50

SEND FOR CIRCULAR.

General Agents.

RUSSELLS' AMERICAN
STEAM PRINTING HOUSE,
 17, 19, 21, 23 ROSE STREET, near FRANKFORT,
 NEW YORK,
 EXECUTES ALL DESCRIPTIONS OF
BOOK, JOB AND COMMERCIAL PRINTING.
TELEGRAPH PRINTING A SPECIALTY.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS
 for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
 Instrument with Office Outfit..... 7 50
 Two Instruments and Outfits..... 14 50

 Chicago, Ill.

THE ONLY PERFECT
 MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard. Brass or nickel plated always on hand.

No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
WATTS & CO., Baltimore.

THE REASON WHY
 THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
 8 Dey Street, N. Y.

MODERN PRACTICE OF THE ELEC-
 TRIC TELEGRAPH.

A HAND-BOOK
 FOR

ELECTRICIANS AND OPERATORS.

THE BISHOP GUTTA PERCHA WORKS,
 422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
 ONLY MANUFACTURER

OF
PURE GUTTA PERCHA GOODS
 IN THE
UNITED STATES.

Has also on hand, and makes to order,
 SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
 WIRES OF EVERY VARIETY,

FOR
 TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
 Fuse Wires, Leading and Connecting Wires for SUBMARINE
 and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
 and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
 of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
 required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUN-
 CIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
 SUBMARINE CABLES, INSULATED WIRES, for
 TELEGRAPH AND ELECTRIC USE,

AND FOR
BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
 practical Electricians and Manufacturers of Telegraph Cables and
 Wires in this country and Europe, and has sustained, with in-
 creasing superiority in the practical test of over twenty-five
 years' general use.

The PROPRIETOR will guarantee, to all parties purchasing,

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated
 with Gutta Percha, as low as they can import Cable of the same
 style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and deliv-
 ered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of
 any Telegraph Cable or Wire manufactured at the Works in New
 York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
 has been appointed Agent for the sale of any and all goods man-
 ufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for
 sale in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway,
D. HODGMAN & CO., 27 Maiden Lane,
SHEPARD & DUDLEY, 150 William St.

Anders' Magneto Printing Telegraph Instrument.

UNTIL within the last two years it has not been considered practicable to use advantageously the magneto-current of electricity for operating recording or printing telegraph instruments. The difficulties to be overcome in adapting it to actuate the printing mechanism required in a printing telegraph instrument were very great, and, although many electricians and inventors had experimented with a view to overcoming these difficulties and producing a practical magneto-printing telegraph instrument, they had not met with success. At last, however, Mr. George L. Anders, of Boston, Mass., succeeded in devising such a printer, of which a general view is given in the engraving which illustrates this article. Patents have been obtained upon the invention in this country and in Europe, and it has been introduced in practical use for private and short telegraph lines, railroad and police telegraphs, etc., and has been received with marked favor and approbation.

Dial telegraph instruments operated by magneto-generators have been manufactured and used in Europe for many years, and also in this country for several years past. Mr. Anders invented and patented five years ago a magneto-dial instrument which is used quite extensively in Boston and its vicinity. In 1872, after much study and experimenting, he completed a printing instrument to operate with the same generating and transmitting machine that he used in his magneto-dial telegraph instrument. The electric current, which operates both the printer and the dial instruments, is generated by induction from permanent magnets. These magnets may be seen in the engraving projecting below the table at the right. Between the upper ends or poles of the magnets, which are of the U shape, commonly known as the horseshoe form, is a Siemens armature, which is composed of a bar of soft iron grooved longitudinally on opposite sides and wound with insulated copper wire. This armature is rotated rapidly by the motion of the treadle, and each revolution gives a positive and negative electric current, which is transmitted to the electro-magnets of the printing apparatus seen on the top of the table. Both the type wheel and the press are operated by clockwork impelled by a spring, the electric currents controlling the escapement wheels.

The type wheel is shown on the front of the apparatus, with the press or printing pad underneath, and the ink roller above it.

The paper on which the messages are printed in Roman characters is moved along between the type wheel and press by the action of the latter as each letter is printed.

In transmitting a message the armature of the magneto-generator is rotated rapidly by the action of the treadle (which latter is easily kept in motion by one foot), and the type wheel moves with the same rapidity, it being driven by the clockwork or spring, each impulse from the generator releasing one tooth of the escapement and carrying forward the type wheel one letter. By pressing down the key having upon it the letter which it is desired to transmit and print, the circuit is broken and the type wheel arrested, the printing mechanism allowed to operate, and the letter is printed plainly upon the narrow strip of paper, as shown in the engraving. This is done quite rapidly—each instrument printing the messages sent as well as those received from other stations; and as the opera-

tion is automatic the messages are printed by the receiving instrument without requiring attention while coming.

3. Great reliability, which they state has been demonstrated by the working of the instruments on private lines in Boston and vicinity during the last year and a half.

4. Simplicity of construction, which makes it easy for persons not mechanics or professional electricians to keep them in order.

These instruments are manufactured by Messrs. Welch & Anders at 30 Hanover street, Boston, Mass., whose advertisement may be found in THE TELEGRAPHER. It is understood that they intend soon to establish an agency in this city for the sale of both their printing and dial instruments.

[From The Telegraphic Journal.]

On the New Contact Theory of the Galvanic Cell.*

By J. A. FLEMING, B. Sc., F. C. S.

THE old contact theory of Volta had its origin in an entire ignorance of the science of energy. It simply referred the current produced through the circuit of a pile to the effect of the metallic contacts, and it ignored the thermal and chemical changes which are also necessarily present; but it had to be finally abandoned when once it became clearly understood that the appearance of a current involved the disappearance of some other energy, actual or potential, as an invariable accompaniment. The new contact theory may be said to have had its source in the discovery of Sir W. Thomson, that there is undoubtedly a difference of potential produced when dissimilar metals are placed in contact—a fact not only abundantly proved by Thomson by direct experimental evidence, but, as he has pointed out, confirmed in a remarkable way by the phenomena of the Peltier effect, which, when interpreted by the dynamical theory of heat, furnish the most reliable measure of its amount. These facts, together with others presently to be referred to, have been made to furnish the key to a fresh explanation of the dynamics of the galvanic cell, which I have ventured to call the new contact theory, as opposed to the old or voltaic one.

The object of the present paper is to draw the attention of those interested in this question to the objections that may be raised against this new contact theory—objections based on facts, some old and some which perhaps may prove new, but all of which alike seem to throw fresh difficulties in the way of this theory, although capable of simple explanation by the old chemical hypothesis. It will be necessary, then, to review briefly the precise statements of this new contact theory, in order to show exactly what are the points against which objection may be taken. This will be best accomplished by collecting the statements

of its principal supporters, and arranging together their explanations of the phenomena which arise—(1) when dissimilar metals at the same temperature are placed in contact; (2) when one insulated metal is placed in a liquid capable of acting chemically upon it; (3) when two different metals are placed insulated and unconnected in one such liquid; (4) when the two metals are joined across by a metallic arc, or when two or more cells are joined up in series.

1. That the contact of metals is always attended with the production of a difference of potential between them was for a long time denied by ardent supporters of the chemical theory. De la Rive endeavored to show that the effects observed might be attributed to

of its principal supporters, and arranging together their explanations of the phenomena which arise—(1) when dissimilar metals at the same temperature are placed in contact; (2) when one insulated metal is placed in a liquid capable of acting chemically upon it; (3) when two different metals are placed insulated and unconnected in one such liquid; (4) when the two metals are joined across by a metallic arc, or when two or more cells are joined up in series.

1. That the contact of metals is always attended with the production of a difference of potential between them was for a long time denied by ardent supporters of the chemical theory. De la Rive endeavored to show that the effects observed might be attributed to

1. Entire saving of the first cost of batteries, and of all expense for material and keeping them in operation.

2. Greater rapidity in printing than has been attained

* Read before the Physical Society, March 21, 1874.

oxidation; but his experiments are not conclusive, and to Sir W. Thomson belongs the credit of having established the fact by experiment, irrespective of his theoretical deductions from the facts of thermo-electricity. He thus describes his decisive experiment: "A metal bar insulated so as to be movable about an axis perpendicular to the plane of a metal ring, made up half of copper and half of zinc, the two halves being soldered together, turns from the zinc towards the copper when positively electrified, and from the copper towards the zinc when negatively electrified." The difference of potential he finds to be about 0.6 or 0.7 of that of a Daniell's cell when the metals are perfectly clean; but by oxidation of the copper it may be made equal to or even greater than that of a Daniell's cell. He has also shown that if zinc and copper cylinders be connected by a wire, the electrometer detects a difference between the potentials of the air in the interior; and, lastly, that if copper filings be allowed to fall from a copper funnel in contact with a vertical zinc cylinder, they convey a negative charge to a receiver below. Sir W. Thomson concludes that there is sufficient evidence to show that zinc and copper attract one another chemically at any distance if connected by a fine wire, and that, as Prof. Tait remarks, "when any two bodies of different kinds are brought into contact, there is a certain amount of exhaustion of the potential energy of chemical affinity between them, and that the equivalent of this is—partly, at least—developed in the new potential form of a separation of the so-called electric fluids, one of the bodies receiving a positive, the other a negative charge, the quantity depending on the nature and form of the bodies." This is equivalent to saying that at the surface of contact there is perpetually a force tending to separate the two electricities in a direction perpendicular to that surface, while at all points ever so little within it there is no such force.

Prof. Maxwell reiterates essentially the same facts. He remarks that the electro-motive force, as determined by this method experimentally, does not account for the whole electro-motive force of a simple couple. This latter is in general far greater than that given by the Peltier effect for the same pair of metals. "Hence the greater part of Volta's force must be sought for, not at the junctions of the two metals, but at one or both of the surfaces which separate the metals from the air or other medium which forms the third element of the circuit." Prof. Jenkin, referring to these experiments of Thomson, adds that "In cases where no known chemical action occurs, as where zinc and copper touch each other, and yet difference of potential is produced, since this involves a redistribution of electricity, a small but definite consumption of energy must then occur; the source of this power cannot yet be said to be known."

2. It seems to be universally admitted that when an insulated metal is placed in a liquid capable of acting chemically upon it, a difference of potential is produced between the metal and the liquid, a sudden rise in potential taking place in passing from the metal surface to the liquid in contact with it, or that the metal becomes negatively and the liquid positively electrified, metals differing in the degree of electrification they can produce with any one electrolyte.

3. But if we ask what are the conditions when two different metals are so immersed, we find the most contradictory statements given. Sir W. Thomson expressed his opinion thus in 1862: "For nearly two years I have felt quite sure that the proper explanation of voltaic action in the common voltaic arrangement is very near Volta's. I now think it quite certain that two metals dipped in one electrolytic liquid will (when polarisation is done away with) reduce two dry pieces of the same metals, when connected each to each by metallic arcs, to the same potential"—which seems equivalent to saying that there is no difference of potential produced other than that due to dissimilar contact. Thus, also, Prof. Tait: "By interposing between two metals which have been electrified by contact a compound liquid or electrolyte, these metals are at once reduced to the same potential—a result which could not have been obtained by connecting them by any metallic conductor. By the passage of the electricity a portion of the electrolyte is decomposed, and the potential energy thus developed is equal to that possessed by the electricity while separated in the metals." Prof. Jenkin advocates essentially the same views: "When two dissimilar metals are plunged side by side into a liquid, such as water or dilute sulphuric acid, they do not exhibit any sign of electrification: the three materials remain at one potential, or nearly so. If, while the two dissimilar metals are in the liquid, they are joined by metallic contact to terminal pieces of one and the same metal, these terminal pieces will be brought to the same difference of potentials as that which would be produced by direct contact between the dissimilar metals." This amounts simply to saying that, as long as no wires are attached to the plates of a single cell there is no difference of potential; but that when wires are joined on, the observed difference of potential is due to the

contact of the wire with that metal plate to which it is dissimilar. Again: "When a single metal is placed in contact with an electrolyte, a definite difference of potentials is produced between them; zinc in water becomes negative, copper in water becomes negative, but less so than zinc. If, however, the two metals are plunged together into water, the copper, zinc and water forming a galvanic cell, all remain at one potential, and no charge of electricity is observed on any part of the system." "If a piece of copper be now joined to the zinc it (the copper) will become negative, and the other copper plate positive, the difference of potentials being that due to direct contact between the zinc and piece of copper only, the water having the effect of simply conducting the charge from the zinc to the copper plate, and maintaining them at one potential."

The foundation for these statements is found apparently in an experiment due to Sir W. Thomson. He finds that if half discs of zinc and copper be arranged under a movable metallic needle maintained at a high positive potential, if they are connected by a wire or by contact, the needle moves in such a way as to show that the copper is negative and the zinc positive; while if they are separated by a slight interval, and connected by a drop of water, no difference of potential is observed. Prof. Jenkin also lays great stress on the fact that, whereas, copper in contact with zinc becomes negative in a single cell with wires attached, it is the zinc attached to the zinc that shows a negative potential. This he holds to be conclusive that the junction of the wire with the zinc plate is the real seat of the electrical separation; although he admits that there may be a slight difference due to the liquid, and that different liquids may augment or decrease this difference.

In another place he says: "If the voltaic theory of the cell were absolutely correct, the electro-motive force of the cell would depend wholly on the plates in the electrolyte, and not at all on the solution employed to connect them." But it has been found that the potential series of the metals is slightly changed by the solution employed to join the plates; in order to account for this fact it is necessary to treat the voltaic theory as incomplete. He adds, however, that the potential series of the metals for water, dilute acids, and ammoniac chloride, do not differ so much as to invalidate the theory, although the series for alkaline sulphides is quite different and anomalous.

4. When the two plates in one electrolyte are joined by a wire, or when simple cells are joined up in series and the circuit closed by a wire, we find it stated that there is a constant separation of the electricities at the point of contact of different metals, and a constant recombination, attended with decomposition, through the electrolyte. "Perhaps it is strictly accurate to say that the difference of potential is produced by the contact, and that the current which is maintained by it is produced by chemical action." And, lastly, that in a series of cells the electro-motive force is due to the sum of the differences of potential produced by all the contacts.

The Electromotograph.—A New Discovery in Telegraphy and "My Duplex Review."

TO THE EDITOR OF THE TELEGRAPHER.

Will you permit the insertion in your journal of the following remarks, together with my Duplex Review, in reply to a communication published in the *Scientific American* of date September 5th, 1874.

To the Editor of the *Scientific American*.

Allow me to remove the glamour from the eyes of a multitude of your intelligent readers in regard to a communication printed in your issue of September 5th, 1874, over the signature of one Thomas A. Edison, Newark, N. J., August, 1874, and prefaced with some remarks made by yourself, professing to give a description of a new discovery, the discovery in this particular instance being, for the want of a better title, called by said discoverer "the Electromotograph."

Now, I propose to take exceptions to his statements, and by so doing show to your readers that this new discoverer must be laboring under hypochondriac hallucinations.

"MY DUPLEX REVIEW."

<p>What you said.</p> <p>That, 1. Within the past few days, we have had under examination, in practical operation in our office, a novel electric telegraph apparatus, which presents some very remarkable features, and promises to result in the creation of an entirely new and advantageous system of telegraphy. It is the discovery of Mr. Thomas A. Edison, of Newark, N. J., who is well known as a telegraph engineer of the highest ability, and the inventor of a larger number of electrical devices, probably, than any other person living. His improvements are employed upon all the various telegraph lines in this country.</p>	<p>What I say:</p> <p>That, 1. On the twenty-third day of April, 1873, "a well known telegraph engineer, of the highest ability," set sail, per steamer Java, for Great Britain, and endeavored, on his arrival, to pass off on the British telegraph department my American automatic fast system of telegraphy as his own discovery and invention. Falling in this, he put himself forward as my agent, but was not accepted. Officially signed documents in relation to this mode of procedure being in my possession from her Majesty's Postal Telegraph Department.</p>
---	--

<p>2. The present discovery relates to that form of apparatus known as the automatic or chemical telegraph, in which signals are made and recorded by causing the electricity to pass through paper, the latter being saturated with a chemical substance, which changes in color when the current acts. Lines, dots and dashes are thus produced with great facility. In the ordinary working of this form of telegraph, the electricity is sent over the line wire by a key, in the usual manner, and passes through a pen, stylus or lever, which has no movement, but simply rests upon the paper; the latter being moved by a weight or clock-work. No magnet and armature are used.</p>	<p>2. I beg to refer my friend, Mr. A. E. Beach, to my patents of 1871, 1872, 1873, and also the specifications signed by me in the following order: October, 1871; February, 1872; March, 1872; April, 1872; and February, 1873. By virtue of which I hold a broad claim to a moving lever, pen or stylus, set in motion by a mechanical force, or by an electro-motive force, and conveying an inductive current or currents for electro-chemical automatic telegraph operations.</p>
---	---

<p>3. The salient feature in Mr. Edison's present discovery is the production of motion and of sound by the pen or stylus, without the intervention of a magnet and armature. By the motion thus produced, he works any of the ordinary forms of telegraph printing or sounding instruments or relays, and is enabled to send messages by direct transmission over thousands of miles of wire, at the highest speed, without re-writing, delay or difficulty of any kind. More than this, his apparatus operates in a highly effective manner, under the weakest electric currents, and he is able to receive and transmit messages by currents so weak that the ordinary magnetic instruments fail to operate or even give an indication of the passage of electricity. Thus, when the common instruments stand still, owing to weakness of current, the Edison telegraph will be at work up to its fullest capacity.</p>	<p>3. The Hon. George Harrington, the President of the Automatic Telegraph Company, in his official circular of March 10th, 1872, says "this great desideratum has been accomplished by Mr. George Little, whose method of manipulating the electrical currents permits telegraphing to be done automatically, and reduces the demand for capital and the current expenses to a minimum, with results of immense magnitude" (at the same time doing away with the defects of the Morse instrument, that may be interpreted by any Morse expert by feel, taste or by sound). * * * "Little's automatic telegraph process." * * * To my mind the experiments were very satisfactory. * * * Any desired length of circuit can be worked. * * * From my long practical knowledge of the wants of the press, and the defects of the Morse system of telegraphy, it seems to me that I cannot</p>
--	---

recommend the new system too strongly.—George B. Hicks, general agent of the Western Associated Press, Cleveland, Ohio, December, 1869.

* * * Can do 200 to 2,000 words per minute from Charleston, S. C.—Harry Bertram, manager Automatic Telegraph Company, Washington, Nov. 27th, 1872.

As an illustration of its value and reliability it may be stated that, on several occasions during the past twelve months, in stormy weather, when communication was interrupted over the routes covered by the wires of the Automatic Telegraph Company, upon the lines of companies competing with the Western Union Company the business of these companies was transmitted by this system (as a favor on the part of the Automatic Telegraph Company), which works equally well, if not better, during such storms, as would seem to render other systems unreliable and sometimes useless, as under ordinary conditions.—THE TELEGRAPHER, Dec. 28th, 1873.

What T. A. Edison says :
To the Editor of the Scientific American.

1. In my new system of telegraphy, it would seem that power was obtained or that electricity had been passed into a new mode of motion, as with magnetism.

2. The electricity, acting by electrolysis, changes the nature of the surface of the paper, either by depriving it of some constituent, or the hydrogen, in conjunction with the metal and paper, form substitution compounds.

3. In trying to ascertain what caused the lever to move, whether it was by reducing the lead by hydrogen to a finely divided powder that acted as a lubricant, or whether the nature of the surface of the lead were changed by the absorption of hydrogen, like palladium, or whether the effect were due to the effort of the gases to escape from under the lever, I was led away from these notions by finding that platinum, with sulphate of quinine, will likewise show the movement. It then struck me that the nature of the paper was changed by the electrolysis.

4. I then passed the strip into the electro-motograph (I use this name for the want of a better one), the colorations being in a direct line with the lead point. On rotation of the drum, and when no coloration was under the lead point the lever was carried forward by the normal friction of the paper. But the moment a coloration passed under it, the lead point slid upon the paper as upon ice, the friction was greatly reduced, and the lever moved in an opposite direction to the rotating drum.

5. In this experiment no battery was connected to the instrument. This proves that electrolysis produces a change in the nature of the paper.

6. Afterwards found that, if a tin pen were used to receive the message from Washington, although no marks were seen, the paper appearing unchanged, yet, on passing the paper through the instrument, the movement of the lever was more marked than before. Receiving the message with a lead pen did not give so good results, although lead is the best when used, standing at the head of the twelve metals tried. The next is thallium. On paper moistened with aqueous solution of pyrogallous acid tin is as good as thallium. Of all the solutions yet tested, potassium hydrate has been found to give the most marked results. The second best is sulphate of quinine. Third, rosaniline ox-

idized and discolored by nitrous acid.

A peculiarity of the quinine solution is that platinum shows an action, and shows it when either oxygen or hydrogen is evolved on its surface. With hydrogen the friction is lessened, as with all other metals; but with oxygen the friction is increased. This is so with all the metals subject to oxidation; but it appeared strange, at first, that it would show with a metal upon which the nascent gases had no effect.

With a lead point and a solution of the disinfectant known as bromo chloralum, the evolution of hydrogen increases the friction of the paper enormously.

Silver seldom shows a movement with any solution; and when it does, it is very weak.

7. It appears to be a matter of indifference as to the character of the metal used for the drum, which acts as one of the decomposing electrodes. Considering that the lever will close a secondary circuit under the great pressure used upon the lever, its sensitiveness to electricity is wonderful. With a delicately constructed machine, moved by clockwork, which I have nearly finished, I have succeeded in obtaining a movement of the lever sufficient to close the local circuit with a current (through one million ohms, equal to 100,000 miles of telegraph wire) which was insufficient to discolor paper moistened with potassic iodide, or move an ordinary galvanometer needle. Messages may be read from the sound of the lever, when the most delicate telegraph magnet shows no current.

8. The uses of this instrument are many; in fact, it gives an entire new system to telegraphy.

9. As no secondary currents are generated, as with an electro-magnet, to prevent the instant magnetization or demagnetization of the iron cores, and electrolysis being instantaneous, it is obvious that the lever will respond to signals transmitted with great rapidity. I have succeeded in transferring signals from one circuit to another at the rate of 650 words per minute; hence, it may be used to repeat the rapid signals of the automatic telegraph into secondary circuits.

By attaching an ink wheel to the extremity of the lever, opposite a continuous strip of paper moved by clockwork, messages transmitted at a speed of several hundred words per minute may be recorded in ink. By attaching a local circuit to the repeating points, and adding thereto a sounder, it may be used as a Morse relay to work long lines of telegraph.

With regard to this alleged discovery of electro motion, Professor Faraday said, twenty years since, of this force, in his experimental researches, series xvii: "That a force which is able to overcome the resistance of a conductor, good or bad, through which the current passes, and that again by the electrolytic action, where bodies are decomposed by it, can arise of nothing; that without any change in the acting matter, or the consumption of any generating force, a current can be produced, which shall go on for ever against a constant resistance, or only be stopped as in the Voltaic trough, by the ruin which its exertion has heaped up in its own course. This, indeed, would be a creation of power, and would be like no other force in nature."

We have many processes by which the form of the power may be changed, that an apparent conversion of one into the other takes place, but in no case is there a pure creation of power or force; a production of power without the corresponding exhaustion of something to supply it."

Electro chemical decomposition sets out with a force or power of electro motion, the existence of which is "preproved," its variation assuming nothing which is not supported by some corresponding, simple chemical fact—instead of being the firm, unchangeable thing as first supposed by "Volta, in 1796," is as variable as chemical force itself—were it otherwise, the equality of cause and effect must be denied, then would perpetual motion be also true.

My scientific friend, Mr. Alfred E. Beach, in the issue of his *Journal* of November, 1873, speaks as fol-

lows, in regard to the American system of automatic fast telegraphy:

"Mr. George Little, who is well known for his indefatigable efforts and ingenuity in connection with automatic telegraphy, has applied the condenser to his instruments with marvellous results. He states that it enables him to transmit 5,000 words, or 30,000 signals per minute, over one wire, with perfect legibility, and that the Automatic Telegraph Company are now working the system between New York, Philadelphia, Baltimore, Washington and other cities.

This discovery promises to be of much importance in the business of electrical transmission. It will enable people to do their correspondence in full by telegraph, instead of by brief sentences, as at present. It will assist to prevent blunders in transmission, for which at present there is no remedy, except by double payment. It is well known that the Western Union Company will not otherwise guarantee the correct delivery of any messages sent over their lines. The successful introduction of the automatic system will, however, put an end to this extortion. The facility of transmission is so great that the Automatic Telegraph Company is now enabled to send twice as many words for the same money as the other lines; and thus the sender may make sure of a correct delivery of his message, without loss of time or payment of extra charges."

Finally, the operations of the Automatic Telegraph Company are carried on by virtue of a temporary license, provided the stipulations of an agreement on record be carried out; and for the use of my American system of fast automatic telegraphy—which is capable of recording thirty thousand flashes of the electric fluid by the product of thirty thousand separate decompositions in the chemically prepared paper, in "one minute of time."

7. In regard to indifference, I think our discoverer will find, if he takes the trouble, that one hundred thousand miles of ordinary line wire will equal in resistance over two millions of ohms. Since 1869 the quietest state of a galvanometer needle, as also that of a most delicate telegraph magnet, has frequently been shown during automatic transmission by my American automatic telegraph.

8. My time has been expended in order, if possible, to find out this fact.

9. See account (in "Electrician's Text-book, Noad," pp. 318, 19, 20,) of the experiments in this direction by one of our own distinguished scientists, Professor Henry. See also my own method employed for the automatic separation of, or the neutralizing of extra currents, which, in a dual form, takes possession of all conducting bodies when under the influence of electro motion. The operating of local or transferring circuits by the aid of different kinds of chemically prepared paper would be, figuratively speaking, like passing clouds, causing more or less insulation of the "glorious sunlight."

low, in regard to the American system of automatic fast telegraphy:

"Mr. George Little, who is well known for his indefatigable efforts and ingenuity in connection with automatic telegraphy, has applied the condenser to his instruments with marvellous results. He states that it enables him to transmit 5,000 words, or 30,000 signals per minute, over one wire, with perfect legibility, and that the Automatic Telegraph Company are now working the system between New York, Philadelphia, Baltimore, Washington and other cities.

This discovery promises to be of much importance in the business of electrical transmission. It will enable people to do their correspondence in full by telegraph, instead of by brief sentences, as at present. It will assist to prevent blunders in transmission, for which at present there is no remedy, except by double payment. It is well known that the Western Union Company will not otherwise guarantee the correct delivery of any messages sent over their lines. The successful introduction of the automatic system will, however, put an end to this extortion. The facility of transmission is so great that the Automatic Telegraph Company is now enabled to send twice as many words for the same money as the other lines; and thus the sender may make sure of a correct delivery of his message, without loss of time or payment of extra charges."

Finally, the operations of the Automatic Telegraph Company are carried on by virtue of a temporary license, provided the stipulations of an agreement on record be carried out; and for the use of my American system of fast automatic telegraphy—which is capable of recording thirty thousand flashes of the electric fluid by the product of thirty thousand separate decompositions in the chemically prepared paper, in "one minute of time."

GEORGE LITTLE, C. E.
Bloomfield Avenue, Passaic City, New Jersey, U. S. A.,
Consulting Electrician to the Automatic Telegraph Company, Inventor of and Patentee of the American Automatic Telegraph System.

The Official Organ's Criticism of Bear's Duplex Criticised.

MITCHELL, IOWA, Aug. 25.

TO THE EDITOR OF THE TELEGRAPHER.

WHY don't the *Journal of the Telegraph* take up my combination duplex and dispose of it as summarily as it attempted to do with my first? For I think there is much better opportunity offered in my second method for criticising the same principle he thinks he disposes of in my common instrument plan. I don't thank you, Mr. TELEGRAPHER, if your reply to your part (the lion's share) of his criticism above referred to causes his late temerity in this respect, for I am only too glad to be taught anything relating to our profession. In his last issue he repeats nearly a quarter of a column of his first criticism, in which he tells me that somebody supposes Mr. Preece's problem to be solved by me by signaling with two batteries at the same terminal. Now, I have yet to learn that a battery will give signals without some interruption of its circuit, and that my battery connected to relay is ever thus disconnected by any of the keys. Also, "were the line open no current would pass through the relay, for the reason that any tendency in the battery connected to the relay to set up a current, is balanced by the opposing current from the battery connected with the resistance coil." Applying this admission to the battery connected to resistance coil tending to set up a current through relay, and I fail to see what difference it makes in this battery's effect on relay whether main line is open or closed. But his next assertion shows how he gets thus mixed up, viz., that I "send the whole current from the sending battery through both coils of the relay." Now, it may expose ignorance when I acknowledge that I always supposed the battery connected to the sending key was the "sending battery," and that the key which breaks the battery circuit is the sending key—being in my method armature "a" at B." You will excuse me, I trust, for taking so much of your space when I inform you that I DO NOT use a condenser, and never saw one. SIMÉON J. M. BEAR.

Miscellaneous.

MAGNETS.—M. Jamin describes experiments which support these three propositions: (1) The number of elementary magnetic threads and so the quantity of magnetism a magnet may contain, depend only on the middle section. (2) The (*épanouissement*) of the poles of these threads, or the distribution of intensities, is regulated by the form and extent of the exterior surfaces of the magnet. (3) If the surfaces diminish, the tension increases till they become insufficient to allow of the elementary poles opening out, and a portion of the two contrary magnetisms disappears, reproducing the neutral state.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, SEPTEMBER 5, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

The legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster. The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Back Numbers Wanted to Complete Files.

THE supply of the following numbers of THE TELEGRAPHER is exhausted, and we are desirous to obtain them to complete files of subscribers. Any one who may have either of them that can be spared will confer a great favor if they will forward the same to this office:

- Vol. IX, No. 342.....4 copies.

" " " 352.....1 "
" X, " 391.....6 "

What Causes the Excitement?

AS OUR readers are aware, the contest between the inventors, or those who claim to be inventors of systems of fast telegraphy—under which term may be included the duplex, quadruplex and automatic systems—has recently been very acrimonious. The charges of infringement of patents, and improper appropriation of ideas, have been numerous, and we have no hesitation in saying that some of these charges (we will not now particularize them) were well founded.

It may have seemed strange to those who are distant from the telegraphic centres, and who have little knowledge of the inner workings of the interests which control telegraphic matters, that a contest so animated should thus suddenly spring up, when apparently there exists no special occasion to excite it. There are, however, underlying, these demonstrations, causes and motives which, when properly understood, will fully account for them. The interests involved are very important, and extend much farther and deeper than the individuals who claim to be the actual inventors themselves.

The recent excitement commenced with the attempt

which was made, through the city newspapers, to depress the price of the shares of the Western Union Telegraph Company for speculative purposes, by reports of a great combination to take up and carry out the construction of a general system of automatic telegraph lines throughout the country. This had the desired effect, and it was considered necessary to counteract it by a demonstration on the other side. For this purpose a telegraphic chicken, which had been for some time incubating, prematurely broke its shell, and was announced to an astonished community by a tremendous crowing on the part of its supposed progenitors. This was the wonderful quadruplex system, which in an instant "quadrupled the capacity of the 176,000 miles of line of the Western Union Telegraph Company." Wonderful and valuable, indeed, if true! But unfortunately this newly hatched telegraphic chicken was very soon demonstrated to be a fraud and no chicken at all, but a very old fowl, fully described in telegraphic annuals extending back twelve or fifteen years, and which had before proved of little value, and whose value had not been increased by age. The reputed inventor was the worst sufferer by this exposure, as his chicken had not been sold, as had been intended, before being fully hatched out, to the Western Union Telegraph Company. It was soon discovered that that particular rooster wouldn't fight, and it was speedily relegated to a back seat.

The Western Union officials however, had become awakened to the fact that automatic telegraphy had progressed somewhat, and was likely to prove, before long, a serious antagonist. Having, after decrying and denouncing the duplex inventions of Mr. STEARNS, ended by purchasing the patents and lauding the invention even more extravagantly than they had previously denounced it, there could be, of course, no valid objection to a similar recantation in regard to automatic telegraphy, which has been equally denounced and ridiculed; and the same distinguished appropriator of anybody and everybody's ideas and inventions, whose recent quadruplex abortion had cast him somewhat into the shade, sees a chance to recover his ground, and, in conjunction with the electrician of the company, is now engaged in an attempt to adapt some automatic combination for the purposes of the Western Union Company. As usual, he is working for the interests of both parties—with the Automatic Company against the Western Union—and with the Western Union against the Automatic. Under such circumstances he cannot be otherwise than happy, for he is in his element, and it is doubtless a matter of indifference to him which is ultimately fooled the worse.

All these things, however, have demonstrated the fact that there is likely to be a demand and remuneration for a successful fast telegraph system, and there is a very natural desire, on the part of the contestants, to realize fame, and so much of fortune as is possible under the circumstances. The distinctive automatic interests is also divided, and has not worked harmoniously for some time past, which has aggregated the contest and increased its bitterness. This is and has been a serious obstacle to the success and extension of automatic telegraph lines; but it is to be hoped that this will not long be the case, and that the advice tendered in the last number of THE TELEGRAPHER will be appreciated and followed. It will be understood by our readers, from what we have said, why our columns have been occupied so much, recently, in the discussion of these matters. It is undoubtedly true that there is soon to be a material change in the systems of telegraphy in general use in this country. The conditions necessary for this have been gradually but surely created, and the result cannot be much longer delayed. Realizing this fact, all who are interested in fast telegraph systems are seeking to put their houses in order, that they may be ready to receive the reward which is expected to be realized by the successful system, but of which, we fear, the share falling to the actual inventors will not, ultimately, prove very large.

How to make an open circuit work—close it.

Lightning Rods and the Protection of Buildings from Lightning.

AS THE heated term passes gradually away that industrious specimen of human nature, the ubiquitous lightning rod man, prepares himself for the fall campaign.

Everywhere, from Maine to Texas, on the prairies, in the mountains—no place is secure from his intrusion, no person from his good natured impudence.

The insurance solicitor has generally been deemed the king of importunates, but he isn't half a circumstance to the lightning rod man, who roams at will and attacks you, regardless of time or circumstance.

In view of the terrible destruction of life and property by lightning during the past summer, especially in the Middle and Western States, it might be well to examine the subject of protection from lightning, that we may be prepared, whenever the inevitable rod peddler does come, to judge of the excellence of his wares and criticise his method of erecting his protectors.

There are several requisites to a good rod:

First, it must have a large degree of conductivity; otherwise, even when well erected, it may fail, partially, in its work.

Second, it must go to water or it is worthless, and even worse. For a building without a rod is much more safe than one that has a rod, the bottom of which does not lead to damp earth.

Third, it should never be insulated from the building on which it is placed.

Now, let us see how nearly, in practice, these well ascertained and clearly defined laws are obeyed. The conductivity of a rod depends not only upon its size but also upon the metal of which it is composed. For instance, the conductivity of iron is only about one seventh that of pure copper. Therefore, an iron rod, to have the same conducting power, must be about seven times as large in diameter as a copper one.

Various forms of iron rods are sold, the lengths of which are screwed together. This is bad, because the iron rusts in the joints, and oxide of iron is a poor conductor. Iron rods should be welded or brazed together at the joints. Covering them with a coating of zinc (erroneously termed galvanizing) prevents corroding and rusting to a great extent, especially in the country, where coal is not burned.

Rods made of wires of iron and copper twisted together are faulty, because, the portion buried being damp, speedily begins a galvanic action, which soon results in the entire destruction of the iron, leaving no rod except a few thin copper wires.

The best form of rod, undoubtedly, is a copper strip, either nailed to the house, flat, or, if preferred, rolled into a tube and fastened by hooks to the wall.

In regard to carrying the rod to water. Dry earth is a non-conductor of electricity. Rods are generally put up in the fall, when the ground is thoroughly saturated, and the rogue who erects it digs down next the wall three or four feet only, and calls his job an excellent one. The victim forgets that the earth dries rapidly next the wall, and fancies that he is perfectly protected during the hot days of the following summer, when really the bottom of his rod is in earth or sand as dry as can possibly be; and it is only after his rod has received a charge that it cannot get rid of legitimately, and an explosion follows which injures, if it does not ruin his building, that he realizes the inadequacy of the protection.

Do not be afraid of putting the rod too deep. If a well is convenient dig a trench to it and carry your rod down to the bottom—or, at all events, so deep that it shall always be immersed to the depth of two feet. If the well is too far off dig down to permanent moisture, take a plate of old copper, solder your rod to the middle of it, and set the plate on edge in the hole. If laid flat, you will only have the bottom for an escaping surface, for the top, if not very deep, will become dry. Remember always, that the greater the conducting power of the rod, and the better the avenue for escape at the bottom, the more certain it becomes as a protector. In cities, where gas or water pipes, or

either, are in the building, connect your rod to the gas and water pipes, outside the meters, and this will furnish ample avenues of escape. The metal roofs, gutters, eave troughs and cornices should all be connected with your rods, as each piece becomes a rod of itself, and when charged, must discharge to something—into the building if there is no other outlet.

Do not allow the fellow to insulate the rod. It is dangerous in dry weather and useless in wet. Glass, when perfectly dry, is a very perfect insulator. Almost every one can recall an instance of houses being struck by lightning before a storm, when the building was dry—houses too, that had rods upon them and were supposed to be safe. How was it done?

A highly charged cloud, flying low, came drifting over the building; immediately the house became charged from the earth by induction. Suddenly another cloud, less highly charged, approaches the first, which discharges to its neighbor, and the tension of the two is made equal.

Instantly the charge which collected in the house top released, endeavors to return to earth with an energy proportional to its excess of tension over the earth below it. It has accumulated gradually, but it is discharged suddenly.

Now, if all metals on the building are attached to the rods, and the latter, with plenty of branches, is fastened direct to the house, the accumulation will pass to earth silently. If, however, the rod is insulated with dry glass, the current scatters, and in its endeavors to get to earth it commits, at times, fearful havoc.

It is strange that, although the danger of insulating rods has been known ever since rods were made, yet the brilliant gentlemen who perambulate the country erecting these danger traps are as profoundly ignorant and indifferent as if nothing had ever been known on the subject.

The inventor of lightning rods, Dr. FRANKLIN, would have scouted the idea of insulating them. It remained for an enterprising Englishman to "add to their safety" by insulators. Forthwith all the dealers caught the infection, and the frequency of shattered houses attest the result.

We advise all readers to examine any lightning rods on buildings they may have. If they do not comply with the above conditions change them or take them down. For, unless they do, the buildings they are upon are safer without them.

And when the talkative, impudent, ignorant lightning rod man comes again don't try to out talk him (that would be useless), but make him come to your specifications or go in search of other victims.

The Laying of the New Cables.—Reports of the Direct Cable being Sold to the Anglo-American Company.

If no accident or unexpected delay occurs, within a few days the new cable of the Anglo-American Telegraph Company will be successfully laid from Valentia to Newfoundland, the Great Eastern, which is engaged in the work, having at the latest accounts made excellent progress, notwithstanding she had encountered a severe gale. It appears that the proposed laying of this cable from this side to Ireland was abandoned, and it is being laid, as all the previous cables have been, commencing at the Irish coast. Although without definite information on the subject we presume the plan has been changed on account of the lateness of the season, making it hazardous to delay the work so long as would have been necessary to first make the voyage across the ocean. When this cable is complete the Anglo-American Company will have four cables in operation across the Atlantic. It has been decided to postpone the attempt to recover and repair the cable which has been broken for a long time until another season.

We presume that the Faraday is also engaged in laying the long section of the direct cable from Cahircivren, on the Irish coast, to connect with the end

buoyed off the coast of Newfoundland, although up to the time of writing no reports had been received of her progress. She was to leave London for the purpose on the 24th or 25th of August, the shore end of the cable having been already laid.

Unpleasant reports are in circulation that this cable has been sold out to the Anglo-American Company, but we have not been able to trace them to any reliable source. We had not originally very much faith in the enterprise as a competing cable, but it has been carried out as such up to the present time, and we had become convinced that we were mistaken in supposing it to have been, like the Great Western and some previous cable enterprises, initiated merely to sell out to the Anglo-American Company.

It has been stated recently by parties who profess to know, that an arrangement had been made to turn the cable over to the Anglo-American Company after its completion, but this story was brought to the attention of Mr. SIEMENS, who came over in the Faraday on her first trip, and he denounced it as a falsehood. The reports have revived, however, since, and are repeated in a communication from a London correspondent of the *New York Herald*, which appeared in that paper of last Sunday. We hope that they may prove to be unfounded, and that we shall see the experiment of ocean telegraph competition tried, now that the enterprise has proceeded so far.

Personals.

Mr. ROBERT MORTON, of the Cable room, at 145 Broadway, New York, has been transferred to the Western Union, Milwaukee, Wis., office.

Mr. H. L. GRAMZOW, of the night force, at 145 Broadway, New York, succeeds Mr. ROBERT MORTON in the Cable room.

Mr. CHARLES J. BROWN, manager of the Western Union office, at 125 Federal street, Boston, Mass., contributes a touching poem to the current number of *Hearth and Home*. Mr. BROWN will be remembered as the author of "Thomas Tot" and other telegraphic sketches, metrical and otherwise, appearing in this and other journals, over the signature of "Beta."

Mr. C. H. JENNINGS, formerly of the "B" Western Union office, New York, has resigned and accepted a position in the Signal Department of the United States Army, at Washington, D. C.

Mr. E. C. BOILEAU, of 145 Broadway, New York, has returned from a brief trip into the wilds of New Jersey, bringing home a complexion as ruddy as a berry. He was accompanied by Mr. BEN. LLOYD, of Pittsburgh, Pa., one of the most expert, most reputable and best known telegraphers of the times.

Any one knowing the present address of Mr. GEORGE WEBSTER, recently employed at No. 198 Broadway, New York, will confer a favor by communicating the same to Mr. CHARLES H. MIXER, at No. 145 Broadway.

Mr. J. D. WHITE, for the past three months report operator for the Western Union Telegraph Company at Jackson, Mich., has been transferred to the same position at Grand Rapids, Mich., office of the same company.

The Telegraph.

By Cable.

THE NEW ANGLO-AMERICAN CABLE.

LONDON, August 31.—The Great Eastern, up to yesterday (Sunday) noon, had paid out 647 nautical miles of the Anglo-American Company's cable, and all was going on well.

LONDON, September 1.—At noon yesterday the Great Eastern had paid out 722 nautical miles of the Anglo-American Company's new cable, and all was going on well, although a hard northeast gale had been blowing for thirty-six hours.

FACILITIES FOR DIRECT UNITED STATES CABLE.

LONDON, Sept. 2.—The Government telegraph authorities have agreed to lease a wire to the United States Direct Cable Company for transmission of its business to the cable terminus, with the privilege of operating it by the company's employés.

Quarterly Dividend of the W. U. Telegraph Co.

At a meeting of the directors of the Western Union Telegraph Company, held at the executive office of the company on Wednesday, Sept. 2d, a dividend of two per cent. was declared, payable Oct. 15th, for the quarter ending Sept. 30th.

Foreign Telegraphic Notes.

THE Eastern Telegraph Company's traffic receipts for the month of July, 1874, amounted to £27,247, and to £28,975 in the corresponding month of 1873.

The traffic receipts of the Eastern Extension, Australasia and China Telegraph Company (Limited) for the month of July, 1874, amounted to £19,641, and for the corresponding period of 1873, to £18,190.

The traffic returns of the Great Northern Telegraph Company for the month of July were—this year, 410,501 francs; last year, 271,873 francs. Total traffic receipts, 1st January to 31st July—this year, 2,499,909 francs; last year, 1,722,112 francs.

Mr. R. T. Brown, manager of the West India and Panama Telegraph Company's cables, arrived at St. Thomas from Para, where he left the Brazilian Cable Expedition. He has proceeded to Jamaica, but will return to meet the cable steamer Hooper with the cable to connect Cayenne with Demerara.

The British ship Challenger has finished sounding for the telegraph cable between Sydney and Wellington, New Zealand.

The king of the Sandwich Islands, in proroguing the Assembly on the 8th ult., congratulated the members on the introduction of bills to aid the construction of telegraph lines.

A "telegraph capital account," made up at the Post-office in May last, states the expenditure on the telegraphs of the United Kingdom to that date at £9,028,845; namely, £6,764,409 for undertakings, £2,132,595 extensions, etc., and £131,741 for pensions and commutations.

A dividend for the six months ending January 30th, 1874, at the rate of 15½ per cent., less income tax, has been declared by the Submarine Telegraph Company.

New Telegraph Line in Japan.

THE telegraph line between Foo Chow and Pagoda anchorage is opened and in full working order. The line is about eight miles in length. It runs for more than two miles on the right bank of the river. The entire line was constructed in twelve days at an expense of about \$4,000. It is worked on the Morse system, and is capable of transmitting fifteen words per minute with an experienced operator at each end. The mandarins of the province have examined the working of the line and are highly pleased.

There has been talk of the Mikado formally and ceremoniously opening the telegraph system, which, although now in operation for some years, has not yet been so honored. It was spoken of as his Majesty's wish that some such opening should take place a long time ago, but constant interruption on the main line between Yokohama and Nagasaki has interfered with it hitherto.

A Practicable Route Discovered for the Pacific Telegraph Cable.

THE following despatch has been received at the Navy Department, at Washington, from Comandor Belknap, of the United States steamer Tuscarora, who has for some time past been engaged in making soundings in the Pacific Ocean, to ascertain the practicability of laying a submarine telegraph cable between China, Japan and the Pacific coast of the United States:

"U. S. Steamer TUSCARORA, }
OUNALASKA, July 29. }

Hon. Geo. M. Robeson, Washington.
I arrived here to-day. A shore line is practicable. The greatest depth found is 4,037 fathoms, eighty miles from Aggalton; the next greatest depth, 3,754 fathoms, 120 miles east of Kuriles Straits. There is a ridge between Karilo and Aleutian Islands, the least water on which is 1,777 fathoms. There is a fine harbor and beach at Todega.

(Signed), GEO. E. BELKNAP,
Commander."

Arrival of the U. S. Steamer Tuscarora.

THE United States Steamer Tuscarora, sent out to make soundings for a cable from the Pacific coast to Japan and China, arrived at San Francisco on Wednesday last. She left that port just a year ago on that date to survey the line and make the soundings for the cable. The first attempt from Cape Flattery was abandoned, on account of the lateness of the season,

and she made soundings on and off the coast from Cape Flattery to San Diego. From that port she struck out from Honolulu, making soundings as she went. From Honolulu she proceeded to Yokohama via Boum Island. The deepest water found on this line was 3,287 fathoms. Two lines were started from the coast of Japan, but abandoned on account of the great depth of the water. The third line was found feasible, and a line was run to Roorile Island, one of the Aleutian group, thence run to Ounalaska, and from there to Cape Flattery. The greatest depth found on this line was five and one fourth miles.

Telegraphing from Stenographic Notes.

THE most important speeches and proceedings of the Democratic State Convention of Missouri, held at Jefferson City, Missouri, on the 26th and 27th of August, amounting in all to about 15,000 words, were reported *verbatim* by Mr. Charles E. Weller, formerly chief operator at Milwaukee, Wis. He was a short hand reporter of St. Louis, and telegraphed by him to a St. Louis daily paper from his original stenographic characters at the ordinary rate of speed.

This is believed to be the only instance of this feat being successfully performed.

What Does This Mean?

ONE great desideratum which the "Direct United States Cable Company" is expected to supply, namely, cheap telegraphy, is said to be in jeopardy. There is an ugly rumor of an amalgamation with other cable companies, a process which was expressly guarded against in the articles of association. Shareholders and the general public are alike interested in seeing that these articles are not infringed in the slightest degree, for if any concession is made the "amalgamated" companies will continue the monopoly and we shall be at their mercy, as we so long have been. The Newfoundland Colonial Legislature is also said to be playing into the hands of the Anglo-American Cable Company, and everything is being done by which the use of the direct cable is likely to be cramped and fettered. Petty opposition of this kind, though much to be deplored, was to be expected, and can only be defeated by energy on the part of the directors of the new company, backed by the good will of the public. —London Correspondence of the *New York Herald*.

SHOULD telegraph operators be considered dishonest because they "hook" all their messages?

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended Aug. 4, 1874, and bearing that date.

153,700—ELECTRO-MAGNETIC ENGINES. — L. Bastet, New York, N. Y. Filed Aug. 24, 1874.

Armatures borne on radial spokes, each armature and spoke forming a T shaped piece. Armatures have no connection with each other, except through a common hub.

In an electro-magnetic motor the combination with the rotary shaft G or hub S, of the series of T shaped armatures B C, consisting of radial arms B and axially or laterally extending cross heads C, the said T shaped armatures being magnetically isolated from each other, and having no connection of any kind one with another, except through their common hub S on the shaft G, substantially as herein specified.

153,800—ELECTRO-PNEUMATIC RAILWAY SIGNAL APPARATUS.— Alexander Bernstein, Berlin, Prussia. Filed March 17, 1873.

Electric circuit closer at station, operated by a pneumatic apparatus, part of which is at some distance therefrom, and which is operated by a passing train.

1. In a railway signal apparatus, the combination with the pneumatic apparatus, consisting essentially of the air bulbs j and k and connecting tube i, and operated by a passing train, of an electrical circuit closer operated thereby, substantially as and for the purpose described.

2. The combination of the slide rails B with the cross piece D, and the bow spring e with its hanger f and adjustable plate g,

as a means of operating the pneumatic apparatus, essentially as described.

3. In combination with the rails B, cross piece D, and spring e, the pieces l, arranged to prevent a side movement of the cross piece, essentially as described.

4. In a railway signal apparatus the combination of two slide rails B, to be acted on by the wheels of a car, and a connecting bridge piece, D, centrally pivoted, substantially as and for the purpose described.

5. In combination with the pneumatic apparatus, the depressing devices and spring e, the adjustable plate g to regulate the degree of pressure on the bag h and the power required to operate the pin m, and thus connect the circuit, essentially as described.

6. The combination of the rails B, cross piece D, pin c, bow spring e, hanger f, adjustable plate g, rubber bag h, metal tube i, rubber bag j, plate l, pin m, spring o, and platinum plate p on the metal strip q, and the wires r of an electric alarm signal, all arranged and operating essentially as described.

153,841—CELLS FOR GALVANIC BATTERIES. — A. L. Nolf, New York, N. Y. Filed March 13, 1874.

Outer cell made of carbon, forming one element in the battery.

As a new article of manufacture, an outer cell of carbon for galvanic batteries, rendered impervious to moisture upon its exterior, and provided at its base with a cushion, all constructed substantially as described, for the purpose specified.

For the week ended August 11, 1874, and bearing that date.

153,035—RAILWAY SIGNALS OPERATED BY ELECTRICITY.—Arthur H. Dailey, Dwight, Ill. Filed April 11, 1874.

Signal placed at any desired point; a current is sent through the magnet's, releasing detent, and allowing arm to fall across track; arm acts as detent to a spring hammer, whose stroke, on being freed, fires a torpedo; arm swung around by a passing train, allowing hammer to strike a torpedo.

1. The combination of the hammer B, actuated by a weight, D', the swinging pole G, latch or detent F, spring trip H h i, and the electro-magnet, the armature of which is attached to and operates to disengage the said spring trip, substantially as specified.

2. The combination of the hammer B, the wheel C, weight D', the detent arm F, shaft F', arm F", and pole G, substantially as specified.

3. The combination of the pole G, detent contrivance, and the shaft H, provided with hook h and arm J, and the hook i upon the pole G, substantially as specified.

4. The noted yoke I, in combination with the swinging pole G, substantially as specified.

5. The combination, with the arm J, of the magnet M, the cog wheels m p, swinging frame m', armature n, pawl l, and weight r', substantially as specified.

Died.

ANDREWS.—At Chicago, Ill., July 24, 1874, the only child of Mr. CHET. A. ANDREWS, operator, Chicago, Ill., Western Union day force, aged one and a half years.

ARMSTRONG.—At Chicago, Ill., August 15, 1874, the infant son and only child of Mr. E. L. ARMSTRONG, operator, Chicago, Ill., Western Union day force.

MAYNARD.—At Chicago, Ill., August 15, the infant daughter of Mr. H. C. MAYNARD, night manager of the Western Union, Chicago, Ill., office.

IMMENSE REDUCTION OF PRICES.

New York, May 30, 1874.

We are offering our Telegraph Instruments at 20 per cent, discount from our list, or from the present published price list of any other manufacturers of first class Telegraph Instruments. Quality will be strictly maintained.

L. G. TILLOTSON,
8 DEY STREET, N. Y.

ANDERS' MAGNETO PRINTING TELEGRAPH INSTRUMENTS.

These instruments require

NO ACIDS OR CHEMICAL BATTERY,

the currents required to operate them being generated from PERMANENT MAGNETS.

They print very rapidly, and having been fully tested on private lines during the last eighteen months, have proved to be

VERY RELIABLE.

The following parties, among others, have purchased them after giving them

THOROUGH TRIALS

on their several lines:

- THE BOYNTON PACKING COMPANY, Boston, Mass.
- CHAS. HULBERT, Esq., 8 Exchange Place, Boston, Mass.
- THE BOSTON AND ALBANY RAILROAD CO., Boston, Mass.
- Messrs. J. H. CHADWICK & CO., Boston, Mass.
- JAMES ALEXANDER, Esq., Agent Cunard Steamship Company, Boston, Mass.
- CHAS. S. LOVERING, Esq., Treasurer of Whittenton Mills, Taunton, Mass.
- HON. ISAAC BRADFORD, Mayor of Cambridge, Mass.
- GEO. H. COPELAND, Esq., Chief of Police for the Cambridge Police Telegraph, Cambridge, Mass.

We also continue to manufacture.

ANDERS' MAGNETO DIAL TELEGRAPH INSTRUMENTS,

which have been extensively used for several years, and are recommended as the

BEST DIAL INSTRUMENTS MADE.

Parties who purchase either our PRINTING OR DIAL INSTRUMENTS can exchange one for the other at any time, as both the Printers and Dials are used with the same transmitters.

WELCH & ANDERS,

30 HANOVER STREET,

Boston, Mass.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF
**FIRE ALARM TELEGRAPH
IN THE WORLD.**

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of.

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unfellability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
 No. 234 West 29th St.,
 New York.

BLISS RESERVOIR BATTERY.
 PATENT APPLIED FOR.

Price per Cell, \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISED AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

One half of actual size

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard. Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight. \$50 00

Sounders, from..... 4 50 to \$6 50

Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00

Relays, from..... 9 50 to 16 00

Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars. The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and it is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50

Two sets of Instruments, etc., 12.00

Send for our new Circular and Price List.

SOLE AGENTS,

41 THIRD AVENUE, Chicago, Ill.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars. Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

Original Articles.

Old and New American Telegraph Systems.

By OLD TELEGRAPHER.

WHEN the writer first engaged in telegraphic service, and for several years subsequently, there were but three systems of electric telegraph in use in this country—these were the Morse, which had been quite generally introduced and tolerably familiar to the public; the electro-chemical system of Prof. Bain, known as the Bain system, which at one time promised to become a popular and general telegraph system, and the printing telegraph invention of Prof. Royal E. House; the latter by all odds the most ingenious, and which, in some respects, possessed decided advantages over both of its competitors, and was believed to be destined eventually to supersede the others very generally in practical use. The causes which led to the triumph of the Morse system over its competitors are too well known to the old time telegraphers, or those who can date back fifteen to eighteen years, and, perhaps, would not be of sufficient interest to the later generation, who only know Morse—and, it is to be feared, many of them the Morse but indifferently—to warrant occupying time and space in repeating the story.

There was one element which entered into the contest, however, of which there was not sufficient account taken at the time, but which was a very important one, and would of itself have ultimately decided the question, and that was the inferior insulation and conductivity of the lines. With the Bain and House systems no local circuit could be used, even if they could be adapted to them, for the reason that the local circuit was patented and in the hands of the Morse party. This, as it will at once be understood, gave the Morse a decided advantage in working over the inferior lines which, in those days, were considered good enough for telegraphic purposes. The House instrument, especially, in order to be worked in circuits of even 200 to 300 miles, required that the lines should be in pretty good condition, which then was seldom the case. The true principles of insulation and conductivity had yet to become generally learned through much trouble, tribulation and cost, and even at the present day are not so generally recognized and understood as they might be to advantage. By means of the local circuit and sounders or registers operated by the local battery, the Morse lines, with operators of fair ability, could operate what were then considered long circuits much more advantageously than either the House or the Bain, and by means of repeaters their circuits could be indefinitely extended—and no repeater was ever invented that would repeat successfully and reliably the rapid breaking and closing of the House circuit wheel.

The actual condition of some of the lines constructed and used in the early telegraphic days have been already described in former contributions by the writer, and that their defects have not been exaggerated any old time telegrapher will bear witness. How the House instruments could have been worked at all upon some of them, was more wonderful than that they should not have shown better results. One reason why they were worked as well and reliably as they were, arose undoubtedly, to a great degree, from the fact that the House telegraph operators were more thoroughly educated in the business, and that with scarcely an exception they were enthusiastic in their affection for the instrument and system—notwithstanding the days and nights of toil, tribulation and trouble experienced—and firmly believed it to be, in almost every respect, superior to any telegraph system that ever had been or could be invented. We of the House persuasion looked down with kindly, compassionate feelings upon those who were so unfortunate as to occupy a lower place in the profession as "Woodpeckers" and "Dye-tub" operators. Each and all were firmly convinced that within a few years the printing telegraph was destined to be "the telegraph system" of the country, and that Morse and Bain would occupy only subordinate places in the telegraphic temple. This may, and no doubt does seem very absurd now, but it was the universal feeling and belief among the House telegraph operators, and it was, therefore a labor of love as much or more than of

labor with us to make the system a success. "Prompt, accurate and reliable" was the motto of the House telegraph companies, and for accuracy the House printing telegraph has never been exceeded. As for the promptness and reliability none of the earlier telegraph lines could boast very much.

If we had in those days had wires as well insulated or with conductivity equal to that of some of the main wires of the Western Union Company now, we could have exceeded the record, which was by no means one to be ashamed of, of the old House lines. No instrument has ever yet been made that could quite equal it for speed, when everything was in good condition—of course I do not include in this the automatic transmission, which is an entirely different affair. It furthermore had the advantage that, once the message was over the line, it was complete, and needed no re-writing or copying, with multiplying chance for error. Most of these advantages are preserved in the combination instrument used in a very few offices by the Western Union Company, which has also advantages of its own which should entitle it to more general use on the lines of the company.

The Bain system possessed but few, if any, advantages over the Morse, and labored under some disadvantages which could not but result in its final abandonment as a distinct system. It was introduced mainly for the purpose of competition with the Morse, which had begun to obtain a foothold, and was likely to prove valuable and remunerative to the introducers, and naturally became absorbed into the Morse combination much sooner than the House. There was not, so far as could be discovered, that enthusiasm for the Bain system on the part of the Bain operators that there was for the House system on that of the House operators, and there was apparently but little regret when it ceased to exist as a practical system. In these later days the chemical telegraph system has been revived in the automatic telegraph systems, and in these it is likely to render good service yet, as there appears to be no other method by which a fast automatic telegraph system can be worked.

The printing telegraph instrument of Prof. Hughes, for some reason, did not give as satisfactory results on American lines as was anticipated, but has since been extensively adopted in Europe. It was a most ingenious instrument and deserved to succeed, and it is a satisfaction to know that in other countries the Professor has reaped fame and fortune from his invention. The Hughes instrument had a duplex attachment, and was, so far as known, the first and only duplex printing telegraph ever operated. The writer assisted in working the Hughes duplex printer on the line between New York and Boston, and it worked successfully, though never very constantly or reliably. For the failure to realize Prof. Hughes's expectations, undoubtedly the bad condition of the line, its defective insulation and large percentage of escape was, largely chargeable. It is believed that after he left this country Prof. Hughes practically abandoned the duplex feature of his invention, as nothing is said of its use on European lines. It was a very ingenious idea, however, and very well worked out, and under more favorable conditions and circumstances might have proved of value and importance. The Hughes, as well as the House printer, were absorbed in the "Combination Printer" of Mr. Geo. M. Phelps, then of Troy, N. Y., but now and for many years past Superintendent of the Western Union shops in this city.

It was not intended when this article was commenced to go into so extended a dissertation upon telegraph systems of the olden time, but it is one of the peculiarities of advancing years that we become garrulous over the recollections and remembrances of the days long since passed away. Since the time of which I am now writing a new telegraphic generation has come upon the stage, to whom House, Hughes and Bain, if known at all, are but traditions, and, doubtless, many even of those who may, perhaps, be regarded as in their second telegraphic childhood, will be surprised to learn that a duplex telegraphic printer was actually worked between New York and Boston sixteen or seventeen years ago.

Many printing telegraph instruments have been invented since the time of which I have been writing, but none which have succeeded in obtaining any standing for general commercial telegraphy. For reporting telegraphs, private and short lines, they have been and are extensively used, but none has been brought out as yet whose superiority for commercial telegraphy has been so satisfactorily demonstrated as to lead to its adoption. This class of instruments seems to have been fully developed at first in the House, Hughes and Combination, and, except for specialties, has had its day. To work either of the instruments mentioned to the best advantage three things were indispensable—a good line, an instrument in good order, and last, but by no means least, a good and competent operator. "Plugs" are of little use on printing telegraph instruments, and if after due course of trial the operator failed to be developed, but one thing remained for the

student or apprentice, which was to "step down and out" into some more congenial employment.

The inevitable tendency of the present time is to seek to develop faster systems of telegraphy. The business has increased so enormously, and the demand for telegraphic facilities is increasing so constantly and rapidly, that it is becoming essential that the capacity of lines and instruments should be increased rather than that these should be indefinitely multiplied. The duplex systems of Farmer, Stearns and others are important advances in this direction. Other duplex systems have been and are being perfected, and will be introduced, by means of which the capacity of a wire is very largely increased. The number of duplex inventions which have already been brought out is quite large, and others still are incubating to be brought forth in due time. Many, perhaps it may be said most of them, will in practice prove failures, but then it has already been demonstrated that no one company can hold a monopoly of duplex telegraphy.

So much has already been said in regard to the automatic telegraph system in THE TELEGRAPHER that it may hardly be considered necessary to say much about it at this time. It is, however, the great fact in telegraphy at the present time, and undoubtedly is to exercise a most important influence in the future. Its progress has been slow heretofore, it is true, but it will, under some management and control, eventually be generally introduced in telegraph lines throughout the country. It will not do for any leading telegraph organization to ignore automatic telegraphy, for the times and the interests of telegraph companies, employes and the public demand it, and that it will be forthcoming and successful there is not the slightest doubt. My friend Craig's celebrated "ten year old child" will not be far advanced in its teens when automatic telegraphy will have taken its proper place among the telegraphic systems in general use.

New Printing Telegraph Line.

SOME twenty years ago there was nothing that so much and so regularly excited the editors of leading newspapers and telegraphic news agents as the weekly hudget of European news, which was brought to Halifax, N. S., by the Cunard steamers, and to this city by the Collins steamers. The New York Associated Press, under the lead of its practical founder and late general manager, D. H. Craig, Esq., had long held a monopoly of the news at Halifax, but the news by the direct steamers, at New York, was often obtained by the opposition news agents ahead of the Associated Press. This difficulty Mr. Craig determined to overcome by the aid of carrier pigeons and electricity; and to this end the underwriters and shipping merchants of New York were prevailed upon to furnish the necessary capital to build the first, and, at present, the only telegraph line between this city and Sandy Hook. Simultaneously there was erected at the point of the Hook a building which answered the double purpose of a telegraph office and carrier pigeon "home," which was stocked with some of the celebrated birds which had done service for Mr. Craig and the *New York Herald* between Halifax and Boston years before the telegraph was extended east of Boston.

The agent of the Associated Press at Liverpool was then instructed by Mr. Craig to prepare a complete digest of the leading features of the week's commercial and general news, which was given to the pursers of the steamers with orders to throw the same overboard wherever the Associated Press's news boat should be seen, and as soon as the steamers were signaled from the Highlands the agent of the Press, with a carrier pigeon in a basket, would put off from the point of the Hook, and sailing out in the track of the approaching steamer, would obtain the news and quickly transfer it to his winged companion, and in a few seconds or moments, and generally before the steamer had passed the Hook, the carrier had delivered its precious freight into the hands of expectant operators at the telegraph office, who quickly telegraphed the news to Mr. Craig, at the office of the Associated Press in this city, and through him it generally reached the editor of every daily journal in the country long before the steamers reached the inner harbor of this city.

Up to this time the old semaphore telegraph, stationed on top of the present Custom House, and the rival telegraph news agents had managed to sustain themselves, in opposition to the monopolizing tendencies of Mr. Craig's management of the Associated Press—but here was a dilemma for which they were not prepared, and to extricate themselves was wholly out of their power, and our old time friend Leggett's antiquated semaphore telegraph, and the whole opposition telegraph news agency business tumbled into something worse than printer's devil's "pi;" and thereafter, so long as Mr. Craig continued in the management of the Associated Press—some fifteen or eighteen years—that institution was probably one of the most absolute despotisms in business which ever existed on the face of the earth; and yet the press of the country

seemed to thrive under it as they never throve before; for the reason, probably, that the despot who reigned over them knew much better than their editors did what they really needed.

It will be seen, therefore, that the first telegraph line to Sandy Hook, twenty years ago, played no insignificant role in stamping out, for fifteen or eighteen years consecutively, every vestige of effective opposition to the rule of the New York Associated Press.

And now, under very altered circumstances, it appears that some of the originators of the first line to Sandy Hook—the underwriters, shipping merchants, etc., etc., under the lead of the Merchants' Exchange News and Maritime Associations, of Beaver and Pearl streets, in this city, are about to build a new line to the upper and lower Quarantine, to the Highlands of Neversink, Sandy Hook and Long Branch, etc., and there is a certain something about the beginning and the management of this enterprise, up to this time, which looks as though these new comers into the telegraph field had come to stay; and they show, in their first manifestations of life, that they are directed by people who have level heads and who are not novices in telegraphy or in news and news appliances.

The line is being engineered by W. H. Heiss, Esq., late General Superintendent of the W. I. Cable Company, and one of our most competent and faithful old time telegraph constructors and managers. Mr. Heiss has received *carte blanche* from the gentlemen he serves, and he is expected to give the news room and its supporters a model telegraph line, and it promises to be the line of the country.

The poles are of extra size and best chestnut timber, neeled and set not less than four feet into the ground. The wire is of a special size, and is being made by the American Compound Telegraph Wire Company, of Twenty-ninth street, from best steel, covered with pure copper. The strength of the wire compares with best No. 5 iron wire, and the conductivity is fully equal to No. 7 iron wire, and yet the weight of the wire is but little more than one half the weight of No. 9 telegraph iron wire. Mr. Cary has recently made great improvements in his wire, and has made it incomparably superior to all other kinds for reliable telegraphing. His patent hooks and joints, for holding and joining the wire, have added to the last needed links in the compound wire chain to place its reputation far above and beyond all other forms of wire for telegraph conductors.

The best form of the Brooks paraffine insulators will also be used upon this line, and every third pole will have a substantial lightning rod affixed to it, and leading from twelve inches above to ten feet (coiled) below the ground end of the pole.

The line is to be worked by an entirely new and, as alleged, greatly improved Printing Telegraph Machine, invented by Foote & Randall, of this city, which is so simple that any person of ordinary intelligence can work it reliably after a few hours' practice, and, when manipulated by experts, a reliable speed, in circuits of 300 miles, of thirty to forty words per minute, is easily obtained. In the peculiar character of marine news reporting, consisting largely of figures and strange and sometimes unpronounceable names, which it is nearly impossible to telegraph correctly by the Morse system, the printing system will be a very great improvement, both in accuracy and speed, and we think the projectors of this line have evinced excellent judgment in choosing the printing in preference to all other systems of telegraphing, as correctness in names and figures are of first importance.

It is understood that Foote & Randall have also completed a very excellent reporting telegraph machine (also a printer), which the news room will soon be prepared to supply at a very low figure to all their patrons who may wish to be connected with the news room. This will be a great convenience to the underwriters and others who have need for the prompt delivery of marine news.

Among other novelties also about to be introduced at the news room is a new type writing and manifolding machine, for printing in plain Roman characters (large and small type) the reports which the rooms send out to their patrons every few moments through the day. The machine prints very neatly and with perfect accuracy in lines and pages, and at a speed twice as fast as can be written in manifold with a stylus. This machine will be likely to come into general use amongst all parties who, like the agents of the Press and others, have many copies of news, etc., to manifold.

With this hasty outline of the movements connected with the new line to Sandy Hook, who can say that the second and last line to that desert sand bank may not lead to quite as important results as the first line, which we have imperfectly sketched?

It is in order for our friends of the Western Union Company to begin to pick their flints and keep their powder dry.

The Route for the Pacific Cable.

A SECOND communication has been received at the Navy Department at Washington, from Commander Belknap, of the U. S. steamer Tuscarora, dated Ounaslaska Island, July 31. He says that five days were spent in making a *reconnaissance* of a portion of the Bay of Glory of Russia, Tanaga Island, which seemed to be the best adapted for the shelter of shipping and for the landing of the proposed submarine cable. The results of the soundings show that the water deepens rapidly the moment the land is left, until a depth of 3,754 fathoms is found about 110 miles west by south from Cape Lopatka, where the bed of the ocean begins to rise, forming a ridge between the shores of Kamtschatka and the Aleutians, the highest point of which is 1,777 fathoms below the surface. He states that he proposes to run a line south of this chain as far back as Tanaga before proceeding to finish up to the line to the point to the eastward, at which the soundings were discontinued last fall.

An occasional correspondent of the *New York Tribune* on board the Tuscarora, under date of Hakodadi, Japan, June 24th, sends that journal an interesting account of the soundings made to discover a practical route for the new cable. He says: "On the 8th day of June we left Yokohama, anchoring that night at Titiyama Bay, and upon the following morning at daylight the work of sounding was begun from the entrance to the bay. After rounding Cape King a line of soundings was run parallel with and from five to ten miles from the coast, until Cape Cho-osi was reached, and from thence the line gradually trended to the northward and eastward, following the great circle route to Cape Flattery. Everything was favorable with the exception of strong undercurrents until lat. 38° 11' N., lon. 144° 33' E. was reached, when to our great surprise no bottom was found at 4,643 fathoms (27,858 feet), at which depth the wire was carried away, undoubtedly by fouling the copper on the ship's bottom. The ascertained depth was over five miles and a quarter; of course it is impossible to say how much greater the depth actually was. It was evident that as this depth was found at only about 120 miles from the coast, the route proposed was impracticable, and to proceed further on it would be but a waste of time, and would unnecessarily risk the loss of more wire."

The route was abandoned and the ship was headed to the northward and westward and sailed to lat. 38° 13' N., long. 142° 07' E., where only 411 fathoms was obtained. Sailing thence, at the position lat. 38° 34' N., long. 142° 39' E., the depth was found to be 1,358 fathoms. A new line was run, nearly parallel to the coast, to Cape Kuro-Saki, lat. 40° N., long. 141° 51' E., and from that point to the northward and eastward. This route is about 100 miles to the northward and westward of the proposed great circle route.

On the line now tried, in lat. 42° 34' N., long. 140° 07' E., 4,340 fathoms (26,220 feet) depth was found, and the depths ran about the same to lat. 44° 55' N., long. 153° 26', where there was 4,655 fathoms (27,930 feet) of water, the greatest depth yet found; so for a distance of nearly 300 miles there was a plateau of over four and a half, and at some points five miles in depth. These results occasioned great astonishment, as the line is but about 100 miles from land, where, comparatively speaking, shallow water was expected. It is of course impossible to say what depth would have been found had we followed the great circle route proposed; but it is natural to surmise that there are still greater ones. This route, of course, was likewise declared impracticable, and nothing remained to be done but to seek one nearer the land. The ship, starting from the last station, lat. 44° 55' N., long. 152° 26' E., was headed to the northward and westward until lat. 46° 21' N., long. 151° 25' E., was reached, a position about 30 miles due east from Cape Kastriem, which is on the northern end of Urup Island of the Kuril group. From this position a line was drawn skirting along the Kuril group and meeting the second line in lat. 40° 09' N., long. 144° 01' E. Thence we proceeded to this place to replenish our coal bunkers. The depths on this line are moderate and favorable to the end in view. It remains now to see what the continuation of it to the Aleutian Islands may divulge.

To give some idea of the intense pressure at these great depths, which at about five miles beneath the surface is over five tons to the square inch, I shall mention its action on one of our thermometers. These thermometers are made especially with reference to deep sea operations, the glass stems and bulb being partially enclosed in ebony and then in a strong copper cylindrical case. One was sent down in 4,340 fathoms of water, and upon its return to the surface the ebony covering of one bulb was broken into pieces and the bulb itself and stem into small particles. Very interesting observations were made regarding the currents. It was especially remarkable how distinctly they were defined by temperatures. It was determined that the depth of the Japan stream was about eighteen fathoms and that itself was to the northward

and eastward. The depth of this stream, it will be remembered, was found to be about the same of our Western coast. Below this depth there sets to the southward, following the contour of the land, a cold polar current, which extends to the surface as a counter current along the shores of the Kuril and Japan Islands, and is on the surface from thirty to fifty miles in width. On our western coast, in passing from the surface to the under currents, the changes of the thermometer were very gradual, and, comparatively speaking, slight: here the temperatures fell over six degrees between fifteen and twenty fathoms depths. Also, in passing from the Polar counter to the Japan stream the temperatures rose in one hour (during which time only about five miles of water was passed over) 10°, *i. e.*, from 50° to 60° Fah.

The Japan stream on its northern and western borders, or rather on the line run by us, lost in a distance of about 800 miles from the Japan coast about 20° Fah., the temperature being from 60° to 65° at five miles from the coast, and in lat. 44° 55' N., long. 152° 26' E., 41° Fah. This great fall is easily comprehended when it is considered what influence cold air above it and a cold current of water of about 33° Fah. only eighteen fathoms beneath the surface must have on it. There were found to be but slight variations of temperature from twenty fathoms depth to the bottom, no matter what was the depth."

[From the Buffalo Sunday Morning News.]

Bryant's Big Humbug.

Editor Sunday News.

The following advertisement I clip from the Buffalo Morning Express:

"BUFFALO TELEGRAPH COLLEGE.

"Young Men and Ladies qualified for practical operators at the Buffalo Telegraph College and City Line Telegraph. Every graduate secures a position. Operators' salaries \$50 to \$100 per month. Largest and most complete in America. Send stamp for 1874 Catalogue to C. L. BRYANT, Sup't, Buffalo, N. Y."

Telegraph Colleges and Institutes have been exposed by the telegraph journals, but as they only reach a small number of readers, generally operators. I will with your permission enlighten the public of Buffalo and vicinity, whom the above advertisement is liable to mislead.

Telegraphing has been brought to such perfection that it must be recognized as a business—a *trade*, as much as any other which requires time and patience to learn and skill to perform. These advertisements, circulars, etc., sown broadcast throughout the country, make it appear to people ignorant of the business that it is but child's play, and any one who wishes a "soft" job has but to enter a College and in two or three months be turned out a first class—or, to put in milder shape—a "practical operator." This is what I should call telegraphic lathe work or electric phenomena.

The "Sup't" is out of his sphere; there is a vacancy for him in the "Great Monopoly" as well as every railroad and telegraph company in the country, who are bothered with an infinity of impractical operators, and they would no doubt pay handsomely any individual who would straighten them out, in fact make them worthy of earning "fifty to one hundred dollars per month." I will simply take this advertisement, reserving the catalogue, which is more liable to deceive the uninitiated, for a future occasion if necessary.

"YOUNG MEN AND LADIES QUALIFIED, ETC."

Three or four years' steady practice in a telegraph office, if the person has the requisite qualities, will make him a first class operator. A "practical operator" is a "College" phrase, and may mean anything the "Sup't" wishes. To the minds of ordinary operators it means a "plug." A great many men would spend fifty years at the business and still be nothing but "plugs," although every old stager, in his own estimation, is a 1.

How does this tally with the information an unsophisticated applicant would receive at the Institute?

"Every graduate receives a position." Where? On the street corners, or on the "City Line Telegraph?" What telegraph, railroad company or corporation has the "Sup't" a contract with to supply operators? There are ten thousand telegraph offices in the United States and Canada, and on an average each office has one student; here are ten thousand applicants, I might say, every two years. Will not the companies prefer them to College graduates? A first class operator can always secure a situation in some part of the country, a "practical" operator cannot; the country is overrun with them; they are thick as flies on a putrid carcass, and a stench in the nostrils of every telegraph superintendent and manager in the Union.

"Operators' salaries \$50 to \$100 per month." There are probably one hundred operators in Buffalo (Colleagues not counted) and not six in the hundred receive the latter amount, managers and chiefs excluded. The six are like "the last of the Mohicans," the remnant

of a race, and when they resign or die out—not intending a pun—their figures will go with them.

The average pay of railroad operators in this State is about thirty-five dollars per month. The N. Y. C. R. R., the richest corporation entering Buffalo, will not average over thirty as the magnificent recompense of the telegraphic employes. Of course, where the operator does station work and extra duties, he receives more.

For those wishing to learn I would say there is no scarcity of operators, the supply far exceeding the demand. "A complete outfit for a telegraph office with manual" may be obtained of Geo. H. Bliss & Co., Chicago, for seven dollars. This is a sufficient outfit for the student. He can be his own teacher and learn as much about the business as any Colleague in the country will impart to him. There are other dealers in New York, Baltimore and Philadelphia, but I do not remember the addresses; they can be obtained at any telegraph office in the State where the *Journal of the Telegraph* or *The Telegrapher* is taken.

The Western Union has a business office in Cooper Institute, New York, where students are taught free, and, when found competent, given situations. Were there a scarcity of operators the same company would doubtless establish schools in all the large cities.

In conclusion, I would say that I have no intention of attacking any legitimate business. I consider the advertisements and pretensions of Telegraph Colleges as an insult to every intelligent telegraph operator, lady or gentleman, who by years of patience and hard work have obtained positions which institutions of this character, by their appeals for patronage, are liable to make the public think could be filled by any dough-head who had money enough to pay for three or four months' practice on their toy wires.

The Status and Condition of Railroad Telegraph Service.

TO THE EDITOR OF THE TELEGRAPHER.

THE connection between the railroads and telegraphs has become so intimate, and the operations of the former are so controlled and regulated by the latter, that a railroad without ample telegraphic facilities, except in the New England States, has become an anomaly. Necessarily from this fact a very numerous class of telegraphers has grown up, devoted especially to the telegraph service.

It is not too much to say that the railroad telegraphers as a class are not adequately compensated for their services. The interests dependent upon their reliability and faithfulness are so important that the service should command the best talent in the business. It cannot do so while the average compensation of railroad telegraph employes is so much below that paid for corresponding services on commercial lines. It is not intended to assert that there are not many first class telegraphers employed in railroad telegraphy, for this would not be true. It is also true that the average of ability of the railroad telegraphers has advanced during the last few years. The time was when it was rather a reproach to be ranked as a railroad telegrapher, but this is no longer the case. Still, there is not that care exercised in selecting persons for this service which there should be, and it is considered more essential that the compensation demanded and received should be small than that the employes should be properly qualified and instructed.

When it is considered that the interests of property and life confided to these employes are of so important a character, the impolicy of such a course will be readily understood. A single blunder or instance of carelessness may in an instant not only result in the destruction of a large amount of property, but also in the loss of life, which otherwise might have been safe. This is no supposititious case, for such accidents and destruction have occurred from this cause. It is probably of not much use to expect a general improvement in this respect while the railroad business is as depressed as it has been for the past year, but it will do no harm to ventilate the subject, and bring it to the attention of the higher powers.

As a class, I believe the railroad telegraph operators are meritorious and worthy, and render more than adequate service for the compensation received. It is in their interests, as well as those of the railroad companies and the public, that I have brought up the matter, and hope that they will generally give us, through *THE TELEGRAPHER*, their views and ideas on the subject. There are enough railroad telegraphers to organize an

association for themselves, which shall be for mutual protection and benefit, and for the advancement of their interests and the elevation of the professional standard of those employed in this department of the telegraph. I believe that if a movement in this direction were undertaken by parties generally known, and who have the confidence of the employes, it would meet with almost universal encouragement. Cannot something of this kind be done?

I am not myself a railroad telegrapher, but have known a good many of them and the inadequate compensation accorded for their services, and desire that a reform should be initiated, not merely in the interests of the employes themselves, but of the roads and of the public as well. The time is not distant when the transportation interests of the country will recover from the depression under which they are now suffering. This depression can be but temporary, and the future of the railroads, as well as the telegraphs of the country, is destined to be a prosperous one, and in that prosperity every employe should participate.

JUSTICE.

The Use of Tobacco and Intoxicating Liquors Condemned.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE too good an opinion of "Tom's" intellectual abilities to believe for a moment that he really misunderstood my meaning, as he pretended to—it was evidently enough the contrariness rather than the gallantry of the men that I depended upon for the abolishment of tobacco. I am afraid the latter would, in too many cases, be but a poor dependence. As to counting on their "established custom of giving up everything for the sake of peace," I am very sure I did not, for I never heard of such a custom. Mr. Tom evidently thinks he is quite safe in offering me that pet little pipe of his should I learn to use it. It was, however, a rash offer: I should certainly have accepted it, but that I would not willingly cause any one so much sorrow, and especially to one so forlorn as he must be, without sister, wife or friend. It would be too cruel to deprive him of his only companion, the solace of his lonely life. But, seriously, though I can tolerate the use of tobacco I cannot of intoxicating liquors, and I am sorry to hear "Tom" speak so lightly of it as he does. I would be inexpressibly rejoiced to see every member of our profession total abstainers—not moderate drinkers. I don't believe in them at all—sooner or later they come to the same thing. As to billiards, I know nothing of the game. I have no doubt it is a very good game and very harmless in itself, but, as a means of gambling, I protest against it. Gambling and drinking go hand in hand, and they are, separately and together, the sources of more than half the misery and sorrow in the world.

I suppose "Tom" will say I must be some intolerant and prejudiced old maid. I am not an old maid, nor do I think I am intolerant, but it grieves me deeply to see so many of my gentlemen friends giving themselves up to this hateful practice of "tippling." I suppose you think that as long as you do not take enough to affect your senses your lady friends will never know it. I can tell you you are mistaken; you cannot take a single drop but we can detect it the moment you come near us, and if you only knew how saddening the discovery, and how disagreeable the effect, I do believe you would try not to inflict it on us so often. I make due allowance for the temptations you are all subject to—that it is considered "the thing" to ask a "fellow" to "have a drink" when you meet him; but, surely, there is such a thing as resisting temptation and overthrowing a most detestable fashion. I think I will subside for the present.

ELINOR.

A Frightened Telegrapher.

CALIFORNIA, Sept. 2d.

TO THE EDITOR OF THE TELEGRAPHER.

WE had been talking about ghosts, and one of us had capped the climax by telling a true (?) story, which happened near home, of some ten or twenty Chinamen who had been killed by a cave in a tunnel, not far from where we were seated, and been buried under the engine house, some thirty or forty yards from the office.

He made the remark, casually, it seemed, that a something was in the habit of striking on the smoke stack of the engine in the "wee sma' hours of the morning," and at one time had rivalled all past manœuvring by actually appearing to the night watchman and ringing the bell of his engine.

As the mystery was still unfathomed, our historian hesitated to express his opinion as to who or what it was, but left it to us to form each an opinion for himself. The man who "pounded brass," nights was considerably worked up, and as we prepared to retire we noticed him carefully priming his old horse pistol and putting on fresh caps. We thought no more of it till morning, when we were informed that the "Morser" had seen a hard night, as, according to his story, about

the time "when graveyards yawn" he heard an unearthly yell and a wild rush into the office, followed by the slamming of doors. Looking up he espied Ned C—, the track walker, braeed up against the door as though an army were demanding admittance, and a most diabolical smile on his phiz, as he remarked:

"You can't come in here alive!"

Somehow Ab. couldn't cock that pistol of his, no matter how hard he tried, as his teeth were chattering in a vain endeavor to rival the trembling of his hands. As soon as the excitement of the moment passed Ned ventured to look out, and saw the unwilling cause of the scare, which proved to be a harmless and playful pup, who, attracted by the light carried by Ned, had followed him from tunnel thirteen in an unsuccessful effort to overtake him, for as soon as our hero discovered he was followed he accelerated his speed until it amounted to a flying jump as he crossed the threshold of the office. We cannot conjecture where Ab. was the rest of the night, but we hear G. T. W. swear he couldn't raise "Sm." with a "9" for No. 6 until after she reported passing Cisco, having met No. 5 at Tamarrack. ONE WHO WASN'T THERE.

The West Wisconsin Railway Telegraphers.

EAU CLAIRE, WIS., September 2.

TO THE EDITOR OF THE TELEGRAPHER.

HAVING seen nothing in your paper from this corner of Wisconsin since I have been a subscriber to *THE TELEGRAPHER*, now nearly two years, I have concluded to give some account of the telegraphers employed on the line of the West Wisconsin railway.

Commencing with our popular train despatcher and circuit manager, Mr. Hugh Spencer, whose office is at Hudson, we find as whole souled a gentleman as has ever been my lot to answer calls for.

Mr. Charlie Kittredge, who handles the key as day operator in that office, is a good operator and does the railroad business up in fine style. "Coon. Prairie Jack" does the business at this office when all is still and clear.

Mr. Kingsley holds forth at St. P. & P. Junction in good style. At the other end of the wire, at Elroy, we find Mr. Pierson, who is a good fellow.

Mr. Kearney at Camp Douglas, just in from the prairies of Michigan, is quite a popular telegrapher, the only objection to him being that he is a Britisher, born near Liverpool, England.

At B. R. Falls, Mr. Joseph Harris manipulates the key with grace and elegance combined.

Mr. Cuddy runs things at G. B. Junction, and in first rate style; and last but not least, comes Mr. Will Rudd. He is the operator that copied "Ist Paul brass" for "send me I St. Paul brass." In amazement he was discovered wondering "what that fellow meant." FRENCHY.

To Correspondents.

L. E. M., Charleston. The communication of the Major will hardly answer for *THE TELEGRAPHER*.

Miscellaneous.

MAGNETO-ELECTRIC MACHINES.—The magneto-electric machine recently introduced in Paris appears to be a valuable improvement on other machines of its class. It gives a continuous induced current, the rotation given to the coils is three hundred and fifty revolutions per minute, the driving power required is from two and a half to three horse power, and the current developed is represented to fully equal that of five hundred and twenty-five Bunsen cells. The luminous and calorific effects produced by this apparatus may be judged of by the statement that a light has been obtained by it whose brilliancy was nearly equal to one thousand carcel burners—that is, between nine and ten thousand sperm candles—and a light, equivalent to nine hundred burners, was emitted during a series of experiments extending over several hours; the spectrum afforded by such intense illumination exhibiting, as might well be supposed, a number of notable features in various lines never before observed. Compared with other machines, when employed for light-house purposes, this is found to take up but one fourth the room, gives double the light for the same expenditure of power, and for the same light is only half as expensive. It is well known, too, that one of the most recent and celebrated machines of this kind, of English invention, driven by a fifteen horse power—the armature making from 1,500 to 2,000 revolutions a minute—achieved a great feat when it fused a platinum bar two feet long and twenty-five inches in diameter; but this French apparatus, driven by a three horse power, the coils rotating at the rate of 350 revolutions per minute, will fuse almost instantaneously an eighteen gauge platinum wire of eight feet in length, and a piece of a round file, one half inch in diameter and four inches long, was burnt away in five minutes.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, SEPTEMBER 12, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

Special Notice.

The legal rate of postage on THE TELEGRAPHER, addressed to its regular subscribers, is 20 cents per annum, or 5 cents per quarter, payable in advance. Subscribers who receive their copies by letter carriers will please hand the annual or quarterly postage to the carriers, taking their receipts. If any higher rates are demanded, report the facts to the local Postmaster. The postage on copies directed to subscribers in New York City has been prepaid by the publisher.

Back Numbers Wanted to Complete Files.

THE supply of the following numbers of THE TELEGRAPHER is exhausted, and we are desirous to obtain them to complete files of subscribers. Any one who may have either of them that can be spared will confer a great favor if they will forward the same to this office:

- Vol. IX, No. 342.....4 copies.
" " " 351.....2 "
" " " 352.....1 "
" X, " 391.....4 "

Seasonable Considerations.

THE summer season is over, and, although we may expect some warm, perhaps hot weather yet, still the shortening days and lengthening evenings and nights forcibly remind us that the harvest season has come, and that very soon we may look for the chilling winds and frosts which usher in the winter.

Business, generally, is reviving and putting on a more cheerful appearance. The prospects are encouraging for the future, and there is good reason to believe that, so far as the panic and the subsequent business depression are concerned, we have witnessed the worst.

We would remind the telegraphic fraternity and the friends of the telegraphers' representative, THE TELEGRAPHER, of the necessity for renewed exertions to increase the subscriptions to the paper. The summer is always a dull season, so far as subscriptions are concerned—a fact which is easily accounted for. Now that the summer is over, we look for the usual fall

revival of interest in THE TELEGRAPHER, and the reception of a handsome addition to the number of subscribers to and readers of the paper.

We rely upon the active and persistent cooperation of the telegraphers themselves to enable us to maintain vigorously and effectively the paper which is published for and in the interests of the practical telegraphers of the country. They have hitherto not disappointed us, and, we have faith to believe, will not do so now. Let all who believe the effective support of the paper essential to the welfare of the telegraphic fraternity consider this statement, and respond with handsome lists of subscribers procured through their exertions.

Attention is called to the terms printed at the head of our editorial columns, and the liberal offer there made to those who may interest themselves on behalf of the paper.

Encouraging Telegraph Prospects.

THERE are very encouraging indications of prosperity of the telegraph interests in this country. The great telegraph company of the country, the Western Union, last week declared its second quarterly dividend of two per cent. on its capital stock, and it is stated that there is no probability of another suspension of dividends so far as that company, at least, is concerned. And not only so, but it is privately given out that the annual report to be made to the stockholders, in October, will show a highly prosperous condition of the company. Upon these reports its shares have advanced to about eighty, and it is generally understood that they will be carried to even a higher figure before the annual meeting takes place.

The Northwestern Telegraph Company, which connects with the Western Union at Milwaukee, is also in a very prosperous condition, and under the active and intelligent management of its president, Mr. Z. G. SIMMONS, and its General Superintendent, Mr. CHAS. H. HASKINS, of whose ability as an electrician the columns of THE TELEGRAPHER have seen frequent evidence in his contributions to its columns, and who, in the West, is known as one of the most able telegraph managers in the country, has become one of the best and most reliable telegraphic organizations in the United States.

We are also informed that the Atlantic and Pacific Telegraph Company is doing a very good and increasing business, and that its prospects are very flattering. The new line of the company between Chicago and Omaha, to connect its eastern and Pacific sections, is rapidly approaching completion, and will, doubtless, prove of great value and importance in the future to the company.

The Southern and Atlantic Company will, also, when its line is completed to New Orleans, become a leading and profitable telegraph organization, covering as it does the territory south of Washington, as the only company competing with the Western Union for the telegraph business of that section. We understand that all necessary arrangements for continuing and completing its lines are nearly consummated.

We do not hear much of the Great Western Telegraph Company, but it is so involved in litigation that its chances of being maintained as a separate organization do not appear to be very encouraging. Still, it is possible that it may work clear of its legal complications and become an important part of the telegraph system.

The Automatic Telegraph Company is, as we are informed, doing a good business on its wire between New York and Washington, and, it is to be hoped, may, before long, be extended so as to cover a larger extent of country. The day for comparatively short telegraph lines to prove permanent and profitable in this country has gone by. Only those companies which are progressive, and cover a considerable extent of territory, can expect to prove permanently successful.

All those telegraphic organizations outside of and competing with the Western Union should be consolidated into one strong company, and must be eventu-

ally. There is room and demand for two powerful and national telegraphic organizations, which by reasonable and intelligent competition shall regulate each other and satisfy the public. The Western Union supplies one of these, and if the companies competing with the Western Union can be brought under one organization and management they will supply the other. This should have been done long before this time, but the obstacles in the way of such a consolidation are numerous, and some of them difficult to be overcome, but we believe that eventually they must be.

Two such competing organizations could do the telegraph business of the country satisfactorily, be able to adopt new and useful improvements in telegraphy, satisfy the public, work advantageously for the employes, and prove reasonably remunerative to the stockholders. There is every reason why such a consolidation as we have persistently advocated should take place, and no good reason why it should not be effected.

It gives us much pleasure to record this flattering and satisfactory improvement in the telegraphic prospects. It indicates further returning prosperity to the country, and a general though gradual revival of business enterprises. Investors in telegraphic enterprises have not, of late years, found them very remunerative legitimately, and it is time that they should again become so.

There has been a very general suspension of telegraphic construction and reconstruction during the past year. This condition of things naturally could not last very long, and unless some unforeseen financial and commercial disaster shall intervene, we expect, with the next year, to witness a renewal of telegraphic enterprise and extension which will be required to meet the constantly increasing demand for telegraphic facilities. This country can never long stand still or be paralyzed in its industrial and commercial enterprises. Severe as has been and yet will be the lesson taught us by the panic of a year ago, and the consequences since, it will in the end prove largely and permanently beneficial to the country. We were going ahead too fast, and it required some such rude shock to check us in our career, lead us to examine the situation, and once more establish ourselves upon a sounder basis. Unavoidably much suffering and disaster has resulted from it; but the country, as a whole, is and will be in a better and sounder position for the puncturing of the bubble and the enforced economy which it has caused.

While the indications are propitious, we are not yet entirely out of the woods, and it will be necessary for us to proceed cautiously and slowly in rebuilding the waste places and reestablishing ourselves in our former position financially and commercially. This will apply to the telegraph as well as other lines of business, and we are inclined to think that those who are engaged in and responsible for telegraphic management appreciate this fact.

The Effective Way to Do It.

WE reprint from the Buffalo Sunday Morning News a communication exposing the falsehoods and absurdities of the advertisements and circulars of a local so-called Telegraph School in that city. This is the proper manner in which to reach such establishments and those who patronize them. Their proprietors and managers care very little for what telegraphic journals proper may say about them or their business, because the class that patronize them, and from whom they derive the means to procure their whiskey and provisions, seldom see or know anything about such journals. They read the lying advertisements which are spread abroad through the columns of the country press, are attracted by the inducements held out, send for a circular and the business is done. Exposure like that which we have copied and referred to is much more effective, because it reaches the notice of those who are hesitating whether to invest their time and money or otherwise, and in most cases will be the means of saving both.

How this particular plug factory obtains its telegra-

phic instruments for the pupils it succeeds in inveigling, our friends, L. G. TILLOTSON & Co., know to their cost, and the facts have already appeared in THE TELEGRAPHER. We presume, however, it is no worse than the generality of such establishments, and what is said of one may be said of nearly all of them. The best way is to have nothing to do with them. If there were any necessity for the introduction of additional operators into the telegraph business the telegraph companies and managers would see to it that the demand was fully supplied. At present the number of those who consider themselves, and who generally rank as telegraph operators, is largely in excess of the demand, situations, except for those who are really good operators, are difficult to obtain, and salaries, as a general thing, tending downwards. There is no demand or necessity for additions to the telegraphic ranks at present, and if there were, at least twice as many are learning in the telegraph offices throughout the country as will be likely to obtain situations. So, save your time and money, students, and don't credit the statements of lying advertisements and circulars that the managers of telegraph lines are anxiously awaiting your applications for situations, with a diploma from some telegraph plug factory that you can send or receive thirty words per minute. There's no truth in it, and your reception with one of these Telegraph College diplomas would most likely be anything but pleasant, for their real value and truthfulness are well known on every respectable telegraph line in the country.

The New Telegraph Line to Sandy Hook.

WE print this week on our first page an account of the new line which is being constructed from this city to Sandy Hook, for marine reporting, which will be found of interest. This line is being constructed under the direction and superintendence of Mr. WILLIAM H. HEISS, whose telegraphic record is an excellent one, and who knows how to construct a first class telegraph line if anybody in the country does. We are informed that no effort or expense will be spared to make this in every respect a model line.

This line is being constructed by the New York Merchants' Exchange and News Association, which is located at 113 Pearl and 56 Beaver streets, and which has been in successful operation for nearly fifteen years under the immediate management of Mr. JOHN C. SMITH, Superintendent. There has been for some time past growing dissatisfaction with the facilities afforded by the Western Union line, now in operation to Sandy Hook, which has finally led to the inauguration of the new enterprise.

The history of telegraphing from Sandy Hook, and its important bearing on news monopolies heretofore, are fully set forth in the contribution to our columns to which we have referred, and the facts in reference to the present and former telegraphic enterprises are so fully stated as to render unnecessary any additional details.

We are informed that the new line will start under most favorable auspices, and as many of the patrons of such a line are interested in it, it will, without doubt, at once secure a profitable patronage.

New printing instruments manufactured by Messrs. FOOTE & RANDALL, of this city, are to be used on the line, and a new feature will be the furnishing merchants and others with printing telegraph instruments connected with the News Room, so that they may be kept instantly and constantly advised of the marine and other news received there.

Is the Organ Silenced or Afraid?

YET another number of the Western Union official organ has made its appearance, and no attempt is made to afford us the information for which we hunger and thirst, and for which we have repeatedly and courteously asked our somewhat slow going contemporary in regard to Mr. STEARNS' duplex telegraph inventions. As the Official started in with unwonted juvenility and

sprightliness to pick up THE TELEGRAPHER on its supposititious endorsement of a communication which appeared in its columns, we supposed that now surely we were to be supplied with electrical and telegraphic wisdom in chunks; but alas! with but one glimpse of the glories within the door is closed, and we and the rest are left in utter scientific and telegraphic darkness. The Official has relapsed to the platitudes with which it feeds the weak and weakening intellects of those who look to it for mental and professional abulium, and we are constrained to mourn as those without hope. If the combined and concentrated wisdom of the electrical department of the Western Union Company can afford to confess its inability to maintain the positions assumed, perhaps somewhat recklessly, by its organ, why, we must submit with as much grace and resignation as possible; but surely it ought not to go back ruthlessly upon our duplex correspondent "BRAR," who, finding that after the first blast the wind of the Official organ appeared to be somewhat exhausted, took his case directly to the organ for consideration and discussion, and was eventually compelled to return to THE TELEGRAPHER for consolation and ventilation. To its columns all are welcome, and while we do not profess to endorse everything which we print, we are willing to give everybody a chance to advance and sustain their views.

The New Atlantic Cables.

THE interruption to cable communication has prevented, up to the time this is written, the receipt of definite information as to their progress. The new Anglo-American cable has, no doubt, been completed.

The direct cable should also, by this time, be well on its way to the Newfoundland coast, and by the time our next paper is issued we expect to be able to announce the successful laying and operation of that cable also. The station at Torbay, Nova Scotia, has been finished, and the employes have taken possession of it, and are ready to commence business as soon as the connection is made off the Newfoundland coast.

Congress and the Postal Telegraph.

IT is not our intention to inflict a regular postal telegraph screed upon our readers this hot weather; this we fear may necessarily become the burden which they will have to bear some months hence; but, at present, we purpose only to call attention to the fact that the subject of a Government telegraph proprietorship and management is only slumbering, but by no means defunct. The members of the Congressional committees are yet kept in mind of the topic by the receipt from the public printer of sundry exceedingly heavy and dry documents, printed by order of Congress, which they are expected to carefully peruse and collate preparatory to framing another lengthy and ponderous report to add to those which have already accumulated. Near the close of the last session Mr. GARFIELD gave notice that he should ask that the subject be finally disposed of at the coming session, and it is to be hoped that it will be so effectually that we shall hear no more of it for years to come. Favorable action is impossible, whatever committees may report or interested parties argue, and that fact being recognized, the whole subject may as well be laid upon the table and its further consideration indefinitely postponed.

Personals.

Mr. A. J. PATTISON has resigned the position of night manager of the Dominion Tel. Co., at Toronto, Canada, and accepted a position with the Atlantic and Pacific Tel. Co. at Syracuse, N. Y.

Mr. J. B. SPALDING has resigned his position with the Western Union Tel. Co., at Baltimore, Md., and accepted a position with the Atlantic and Pacific Tel. Co., at Syracuse, N. Y.

Any information concerning the present or probable whereabouts of Mr. WM. H. AUSTON, a native of San Francisco, Cal., aged about twenty years, and a telegraph operator, will be gratefully received by his friends. When last heard of he was in the employ of

the Western Union Tel. Co., at Omaha, Neb. Any information in regard to him may be addressed to Mr. JOSEPH B. AUSTON, P. O. Box 1,463, San Francisco, Cal.

Mr. J. N. CRITTENTON, of the W. U. Chicago office, was in New York on Monday last on a vacation. He started Monday night to return to duty, having enjoyed his temporary relief from duty and experienced much benefit therefrom.

Mr. W. W. BURHANS has resigned his position with the Southern and Atlantic Telegraph Co. at Washington, D. C., and accepted a position with the Atlantic and Pacific Telegraph Co., at 198 Broadway, New York.

The Telegraph.

By Cable.

THE NEW ANGLO-AMERICAN CABLE.

LONDON, Sept. 5.—At noon yesterday the Great Eastern had paid out 1,534 nautical miles of the Anglo-American cable. She was then in latitude 51 deg. 30 min. north, longitude 47 deg. 35 min. West. All was going on well.

STEAMSHIP GREAT EASTERN, Sept. 5, noon, via London, Sept. 7.—One thousand six hundred and ninety-six nautical miles of cable have been paid out.

Sept. 6—5 o'clock, A. M.—We are close to the Skellys, and we are going to buoy, and hope to make the final splice to-day. The cable is in perfect condition.

THE UNITED STATES DIRECT CABLE.

LONDON, Sept. 7.—The work of laying the new direct cable from the Irish to the American coast has commenced, and the following despatch from the steamer Faraday reports the progress made:

"STEAMER FARADAY, Sunday, Sept. 6, 1874.

We spliced the deep sea cable with the Irish shore end on the 3d, and had payed out 330 knots, when a fault was discovered on the 4th. It was found that a wire had pierced the gutta percha. While we were overhauling the cable it got entangled in some wreckage, broke, and was lost in 2,570 fathoms of water. The grappling apparatus was set at work and the cable recovered. The insulation is now perfect. We are in latitude 50° 51', longitude 17° 34'."

Interruption of Telegraphic Communication with Europe.

FOR the first time in several years telegraphic communication between the United States and Europe was completely interrupted on Tuesday last. The French cable between Duxbury and St. Pierre was broken, and a break was reported east of North Sidney on the Cape Breton lines connecting with the Anglo-American cables. The cable despatches are sent to North Sidney, where a steamer will call for them from the East, and convey them to where the connection can be made with the Atlantic cables.

There are three cables in operation. One, the old French cable, lands at the Island of St. Pierre, South of Newfoundland, which is connected with Duxbury, Mass., by another stretch of ocean cable. The other two cables land on Newfoundland, and communication is thence continued to Sidney by two smaller ocean cables, each of which lands at the Island of St. Pierre. St. Pierre, therefore, is where all of the cables meet as at a common point. Now all that is known is that suddenly and without warning each of the cables was interrupted between the main land and this island. Mr. Gaines, the chief electrician, is at work at Sidney trying to locate the points of interruption.

The two lines between Sidney and St. Pierre are very close together, but the Duxbury cable approaches from the south, and is in proximity to the other cables only in the neighborhood of the island.

The interruption of communication continued for more than twenty-four hours, causing much anxiety and a large accumulation of business. The break in the lines communicating with the old cables was repaired at about eight A. M. on Wednesday. Much relief was experienced in commercial circles when it was found that the difficulty was not as serious as had been feared.

The break in the French Atlantic cable was also discovered late on Wednesday afternoon and communication restored.

The Reports on the Postal Telegraph Question.

THE congressional printer has completed the printing of the views of the Government, the Western Union Telegraph Company, and of others on the postal telegraph question. A copy of the document will be forwarded at once to each member of the Appropriation Committee, and the sub-committee on the subject, o

which Mr. Wheeler, of New York, is chairman, will prepare their report, in order that it may be acted on early in the next session. The committee has had this subject under consideration so long, and so much has been said *pro* and *con*, that it has been pretty well exhausted. Mr. Garfield stated at the close of the last session that he would ask the House to dispose of it finally next winter.

The Merchants' Exchange News Room and the Western Union Telegraph Co.

On Monday last some excitement was occasioned by the posting of a bulletin in the rooms of the Merchants' Exchange and News-Room, No. 113 Pearl street, announcing that the Western Union Telegraph Company had cut out the branch office heretofore maintained in the News Room for the accommodation of the merchants and others patronizing the room.

For some time past there has been much dissatisfaction existing between the Exchange and the telegraph company since the removal from Pine to Pearl street; it is alleged that the telegraph company have refused to furnish the accommodations required. On the 29th of July, Mr. Smith, the Superintendent of the Exchange, made a written complaint to Mr. Orton, the President of the Western Union Telegraph Company, against the company's arrangements in connection with the Exchange. It is stated that this was referred for investigation, which was made and the report returned to Mr. Orton. In the press of official business the matter was laid over. Receiving no reply, Mr. Smith again wrote to Mr. Orton about it, and about the same time it became known that an opposition line to Sandy Hook was building, on account of the lack of accommodation.

Upon learning this Mr. Orton ordered the operator to withdraw from the room, and the office was cut out on Saturday afternoon of last week.

On Tuesday last communication was established between the Exchange and Sandy Hook, by connecting temporarily the wires of the new line, as far as constructed, with those of the Atlantic and Pacific Telegraph Company. The new Sandy Hook line is being pushed forward very rapidly, and it is expected to be in operation by the first of October.

Foreign Telegraphic Notes.

The telegraph line to Merida, Yucatan, Mexico, will be completed by the 16th of this month. This will bring the capital into direct communication with Merida, and the event will be celebrated with appropriate ceremonies.

In the House of Assembly of South Africa, July 13th the Submarine Telegraph Bill was again considered in committee, when it was agreed to substantially as introduced by the Government. It appears that the contractors, Messrs. Hooper & Co., had requested the Government to release them from that portion of their engagement under which they were compelled to carry the line to Aden, and asked permission to make their terminus in India or Ceylon. Under these circumstances the bill was introduced, making the concession asked for.

The Legislative Assembly of New South Wales has approved of an agreement for the construction of a telegraph cable between New Zealand and New South Wales, and one between Normantown, in Queensland, and Singapore.

Great rejoicings took place in Chili on the completion of telegraphic communication with Europe, which occurred August 4th.

The line of telegraph in Chili to the frontier of Auranca was completed on the 21st July.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended Aug. 18, 1874, and bearing that date.

154,214—ELECTRO-MAGNETIC GOVERNORS FOR STEAM DRYING APPARATUS.—J. M. Bradford, Portland, Me., assignor of one third his right to Z. K. Harmon, some place. Filed Jan. 31, 1874.

Thermometers in kiln or drying rooms. One circuit closed thereby operates valve reverser; circuit closed by other controls valve to engine working pumps and valves.

1. The combination of a regulating valve, a reversing engine, and mechanism for working the valve, and an electrical circuit for controlling the reversing apparatus, with the feed pipe of a steam heating apparatus and a thermometer in the heating chamber, substantially as specified.

2. The combination of a cut-off valve with the regulating valve, reversing engine, electrical reversing circuit, feed pipe to the heating apparatus, and a thermometer in the heating chamber, substantially as specified.

3. The combination of stopping and starting mechanism, substantially as described, and the electrical circuit for controlling it, with the engine, regulating valve, and a thermometer in the heating chamber, substantially as specified.

4. The combination of the cut-off valve and reversing valve, rod I, collars s n, pawl m, magnet r, armature g, and thermometer k', substantially as specified.

5. The combination of the circuit for controlling the stop valve mechanism with cut-off valve and reversing valve mechanism, substantially as specified.

6. The combination of the magnet d, lever g1, and armature lever f1 with the stopping and starting valve M, substantially as specified.

154,258—TELEGRAPH INSULATORS.—Chas. L. Le Baron, Pensacola, Fla. Filed June 11, 1874.

Insulator held on spike by the spring of the split arms b' b' of spike.

The combination, with an insulator having an inwardly tapering central and bottom hole, a3, of an angle spike, having the elastic prongs b' b' on the short arm, as and for the purpose set forth.

154,309—ELECTRO-MAGNETIC STATION INDICATORS.—Charles W. White, New York, N. Y. Filed Feb. 28, 1874.

Two sets of electro-magnets, pawls and ratchets, working the indicating ribbon in opposite directions, there being a complete circuit for each set of electro-magnets. A retaining or holding device (ratchet M', pawl M, and levers N) is worked by either set of electro-magnets.

The combination, with shaft E, ratchets E2, and pawls F, of the ratchet M', check pawl M, and levers N, arranged as and for the purpose specified.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities.

A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

ANDERS' MAGNETO PRINTING TELEGRAPH INSTRUMENTS.

These instruments require

NO ACIDS OR CHEMICAL BATTERY,

the currents required to operate them being generated from PERMANENT MAGNETS.

They print very rapidly, and having been fully tested on private lines during the last eighteen months, have proved to be

VERY RELIABLE.

The following parties, among others, have purchased them after giving them

THOROUGH TRIALS

on their several lines:

THE BOYNTON PACKING COMPANY, Boston, Mass.
CHAS. HULBERT, Esq., 8 Exchange Place, Boston, Mass.
THE BOSTON AND ALBANY RAILROAD CO., Boston, Mass.
MESSRS. J. H. CHADWICK & CO., Boston, Mass.
JAMES ALEXANDER, Esq., Agent Cunard Steamship Company, Boston, Mass.

CHAS. S. LOVERING, Esq., Treasurer of Whittenton Mills, Taunton, Mass.

HON. ISAAC BRADFORD, Mayor of Cambridge, Mass.

GEO. H. COPELAND, Esq., Chief of Police for the Cambridge Police Telegraph, Cambridge, Mass.

We also continue to manufacture

ANDERS' MAGNETO DIAL TELEGRAPH INSTRUMENTS.

which have been extensively used for several years, and are recommended as the

BEST DIAL INSTRUMENTS MADE.

Parties who purchase either our PRINTING OR DIAL INSTRUMENTS can exchange one for the other at any time, as both the Printers and Dials are used with the same transmitters.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

No. 2 is a round cell, designed for main line. Price, \$2.

Peoria, Ill.,
Providence, R. I.,
Quebec, L. C.,
Rochester, N. Y.,
Richmond, Va.,
St. Louis, Mo.,
St. John, N. B.,
Springfield, Mass.,
San Francisco, Cal.,
Savannah, Ga.,
Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
 No. 234 West 29th St.,
 New York.

BLISS RESERVOIR BATTERY.
 PATENT APPLIED FOR.

Price per Cell, \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

F. L. POPE & CO.,
 (P. O. Box 5503.) 38 VESEY STREET.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawkshee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watsou, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Oersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Roudal, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.
The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR,** without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

New York, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.80.

SOLE AGENTS,

41 THIRD AVENUE,
Chicago, Ill.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand. No local required. Always ready for temporary offices. Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A HAND-BOOK

FOR

ELECTRICIANS AND OPERATORS.

By **FRANK L. POPE.**

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND

FULLY ILLUSTRATED.

8vo, cloth,.....\$2.00

33 Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books sent per mail, on receipt of ten cents.

D. VAN NOSTRAND, Publisher,
23 MURRAY STREET and 27 WARREN STREET.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

—:—:—

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE, AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,

8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,

has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

SARGENT & STUDLEY, 26 Park Place,

RUBBER CLOTHING CO., 363 Broadway,

D. HODGMAN & CO., 27 Maiden Lane,

SHEPARD & DUDLEY, 150 William St.

Industrial Exhibitions.—Their Uses and Abuses, their Advantages and their Defects.

AS THIS is the season when industrial exhibitions or expositions are in fashion, it may not be without interest to consider their uses and abuses, their advantages and defects, and suggest some reforms in their management which would add to their value, and render their premiums, medals and diplomas of more reliability and importance in determining the actual standing of the articles and exhibitors for which and to whom they are awarded.

In this matter of industrial exhibitions we are displaying our national characteristic to the fullest extent—that is, we are, to use a popular and expressive saying, “running them into the ground.” Originally and for many years the Annual Fair and Exhibition of the American Institute in this city was the only one of any special account, and to it came everybody who had anything which was considered worth exhibiting, or for which it was desired to obtain the endorsement of an award of merit. The success of these exhibitions, however, eventually attracted the attention and excited the emulation of other cities and communities, until now there is scarcely a city of any size which does not have its annual show under some high sounding name, and invite, by an extensive system of advertising and a lavish proffer of premiums, the whole country to come forward and secure fame and fortune in their courts.

It is an old but true saying that “familiarity breeds contempt,” and it is not less so in this than in other matters. The awards of prizes, medals and diplomas at these exhibitions is very fast in the popular estimation degenerating into a farce, and they are coming to be regarded as of little value in determining the relative value and importance of competing inventions and manufactures. The exhibitor who fails to obtain an award at one exhibition has only to put in his claim at another, perhaps not a hundred miles distant from the first, and where he is pretty sure of not meeting his previously successful competitor, and his ambition or business venture may be rewarded by the success which was previously denied him. Or, if that be deemed the better policy, he can wait another year, and with a reasonable probability that, having already secured the highest award, his previously successful competitor will not again put in an appearance, he may be able to offset the first award by the later and presumably more meritorious one.

So notorious have these things become that some of the best manufacturers of telegraphic and electrical apparatus, which formerly made no unimportant feature at these exhibitions, now decline to go to the trouble and expense of making a show at even the best of them, regarding the game as not worth the candle. The telegraphic and electrical department at these exhibitions ought to be the best and most attractive of any, but of late years, with one or two exceptions, such has not been the case.

The first reform which suggests itself in connection with this matter is that their number shall be reduced and their relative importance increased. The ancient but by no means declining exhibition of the American Institute should suffice for the Eastern States; the Cincinnati Exhibition for the West (it might, perhaps, be considered better to locate the Western exhibition somewhere else, but the enterprise and public spirit which have made the Cincinnati Exhibitions so successful would seem to indicate that as the best place at which to hold it); and a third somewhere in the South, should suffice for the whole country. Is it not evident that if the number were thus reduced their relative importance would be vastly augmented, and their awards become more valued and valuable? The endorsement of all three of any invention or device would be almost final and conclusive in determining its practical value. Another reason which tells very powerfully against the multiplication of these exhibitions is the additional expense they entail, and frequently upon persons and inventions which are both ill able to bear it. There is no doubt but that this consideration keeps many away from these exhibitions who, if their number were limited, would be glad to avail themselves of the advantages afforded for bring-

ing their inventions and manufactures prominently before the public.

Another reform which is of great importance, and which must be adopted, and that at no distant day if it is expected that any value shall continue to be accorded to their awards, is in the manner in which they are made. For instance, we will suppose that an invention of great importance, value and merit receives a favorable report diploma and medal at either the American Institute Fair in this city or at the other leading exhibitions this fall; this is very gratifying to the inventor and the proprietors of the invention, who have been to considerable trouble and expense to exhibit it, and demonstrate its value and superiority. They take the necessary steps to disseminate the information that they have met with the approval and endorsement of the managers, and that their invention is of public use and benefit, and the best of its kind. This is all very well so far as it goes. A year rolls round and the time comes for another exhibition. Again competition is invited for this specialty. The successful exhibitor of last year, perhaps, cannot afford the expense attending another exhibition, or, supposing as the award of the previous year has demonstrated the superiority of the invention, and knowing that no improvement has been made during the intervening time, concludes not to exhibit. What is the result? Perhaps his inferior competitor of the previous year, “running for luck,” puts in his inferior article or invention again. There is no competitor, and the premium is awarded to him as a matter of course. Then the inferior and superior inventions both stand on the same ground: both have received the highest award, and the value of the award for either is utterly destroyed.

It would seem to be the true policy to adopt that in offering premiums for articles or inventions which it is desired should be exhibited, that where an award has previously been made for a similar article or invention that another similar award shall not be made, unless the article or invention shall possess superiority or merit over that which has already received official recognition and endorsement.

The managers of these exhibitions will no doubt urge against this that it will tend to reduce the completeness and attractiveness of their exhibitions, as it will relieve exhibitors from the necessity of putting in an annual appearance in order to maintain their standing. That there is force in this argument cannot be denied, and yet upon the other hand it is believed to be true that the contrary course is not only discouraging many from participating in these exhibitions, but is gradually but surely bringing the public to consider their awards of no value, as indicating superiority, novelty or usefulness in that for which they are made. Certain it is that in any event those who have inventions of real value to exhibit will not continue year after year to incur the trouble and expense of making exhibitions merely to prevent another and inferior invention receiving endorsement. They are coming to consider it rather for their interest to keep away from such exhibitions altogether, and show to the public that the awards are of little value and reliability in determining merit or superiority.

Another thing which has detracted very much from the value of the awards at some of the exhibitions has been the suspicion that they are not always made with perfect fairness and impartiality. It has been charged that they are frequently obtained through improper influence and personal favoritism. Probably it will be found impossible to avoid such imputations altogether, however careful and circumspect the management may be. Every effort should be made, however, to do so as far as possible, and in the appointment of committees and juries seek to display perfect fairness and impartiality, and so constitute them as to leave them open to no reasonable imputation of being organized to determine in a pre-arranged manner in certain cases. It will, of course, be impossible to convince many who fail to obtain the prizes or endorsement they seek that they have been judged fairly, and in the bitterness of their disappointment they may be expected to indulge in assertions of partiality, and even of more culpable motives in the decision. If, however, the design is evident to disinterested persons that each article or invention shall be judged fairly, and the judges are wisely and properly constituted with a special regard for their fitness and qualification for their duty, such complaints and assertions would find but few to listen to and less to credit them.

These remarks are not made with reference to any particular exhibition, but are intended to be general in their application, and are believed to be applicable to all the leading Industrial Exhibitions which are given in various parts of the country. Neither is the writer a sufferer from any unfavorable action on the part of committees or judges at such exhibitions, as they have usually looked kindly upon the few inventions in which he was interested and which have been submitted to their judgment. Regarding these exhibitions as of great value and importance to the industrial and business interests of the country, it is desired that they shall be arranged, organized and managed so as to best-

subserve those interests. Careful observation and consideration has satisfied myself and others whose opinions upon the subject have been obtained, that to establish and maintain the character of these exhibitions as they should be established and maintained these reforms and improvements are absolutely essential, and with a view of bringing them more prominently to the notice of those who have such exhibitions in charge these views have been put into their present shape and are given to the public through the columns of THE TELEGRAPHER. If the suggestions are impracticable or their adoption inadvisable I should be pleased to hear the reasons therefor, and have no doubt that space will be afforded in this paper for a reasonable discussion of the subject, as the telegraphic interests are perhaps as deeply concerned in it as any other.

[From The Telegraphic Journal.]

On the New Contact Theory of the Galvanic Cell.*

By J. A. FLEMING, B. Sc., F. C. S.

(Continued from page 211.)

THE preceding quotations may be taken as affording the plainest notion of the new contact theory; and it will be seen that its fundamental propositions are briefly these:

- I. That two plates of different metals in one liquid are at the same potential when insulated and separated; *i. e.*, there is *no* difference of potential due to chemical affinity.
- II. In a cell series the gradual rise in potential, or the electro-motive force, is due only to the dissimilar metallic contacts.
- III. The chemical action in the battery is the result rather than the cause of the difference of potential, and is looked upon as an accompanying action rather than as the actual creator of the current—*it* having little or no share in the production of the difference of potential between the terminals.

These are, I venture to think, points not to be admitted as proved without further inquiry, and against which, as I shall hope to show, some grave if not insuperable objections may be urged, founded on other experimental evidence. The first question to be settled is, then, whether in a series of cells the *whole* of the difference of potential between the terminals is due to the contacts, as above stated, or whether *any* portion is due to the tendency towards chemical combination existing between the metals and the electrolytes; and, as a consequence, whether in a single cell the plates are at the same potential or at different potentials, owing to the difference of chemical action upon them. Now, I think this point will be sufficiently proved if we can establish by experiment—(1) that a battery of cells can be constructed without any dissimilar metallic contacts, and with terminal plates of the same metal, and which shall yet exhibit difference of potential and continuous current; for if this is possible it must follow that chemical affinity *alone* is capable of *creating* electro-motive force as well as of maintaining a current, and that, in an ordinary cell-series, *some* part at least of the electro-motive force is due to this cause, whilst the remainder is the result of the metallic contacts that may exist. Or (2), if we can establish that the two plates in one cell are not at the same potential, as stated by more than one authority.

With regard to the first point, it will be remembered that an old experiment of Faraday's proved that a current can be maintained and decomposition effected by a single cell where there is no dissimilar contact. It is not easy to see how this experiment can be explained by any form of contact theory; indeed, it appears unanswerable. But, in order to leave no point unsettled by experiment, it seemed desirable to try and arrange a series of cells in which all dissimilar contact was absent, so that the difference of potential due to chemical action might be separated from that due to the contacts and rendered visible by the electro-scope. It is obvious that we can make no attempt to do this unless we can in some way or other obtain a battery with terminals of the same metals; for otherwise the very junctions with the electro-scope introduce what we want to eliminate, *viz.*, dissimilar metallic contact. But the following is a method by which this can be accomplished: If plates of lead and copper be placed in nitric acid the lead is positive to the copper, since it is most acted upon; but if lead and copper be placed in solutions of alkaline per sulphides, then the copper is most readily acted upon, and is positive to the lead—that is, the positions are reversed.

Now, if we place in a cell dilute nitric acid and a copper and a lead plate, we cannot join up another cell of the same sort in series without introducing contact. But if, instead of using a cell containing acid, we take another cell containing sodic pentasulphide, and bend over the lead plate of the first cell to dip into the liquid in the second cell, and place

* Read before the Physical Society, March 21st, 1874.

therein also a copper plate, we shall then have two cells joined up in series without dissimilar contact and with similar metals for terminals; and yet the action of the liquids on the metals is such that in the one the lead is positive to the copper, and in the other the copper is positive to the lead. Hence, there is a regular rise in potential in passing through the two cells, and on joining the terminals by a copper wire a current flows through both cells in the same direction. It is obvious that we need not limit ourselves to two cells. By forming a pile of alternate cells filled with acid and alkaline persulphide, connected by bent copper and lead plates alternately, we shall be able to accumulate difference of potential to any extent; and if the number of acid and alkaline cells be equal, we shall always end with a plate similar to that with which we began. Such a battery will exhibit a difference of potential between its two terminals when the circuit is opened, and will give a current when it is closed. In it we have nothing but chemical action to rely upon, both for creating electro-motive force and for maintaining the current. We have no dissimilar contacts; and as the terminal plates are similar we can effect the junctions with the electroscope without introducing an unbalanced dissimilar contact. I have constructed such a battery of sixty cells; and by the kindness of Professor Guthrie, to whom my thanks are due, I have been permitted to compare its potential with that of a Daniell cell, by means of a quadrant electrometer belonging to his laboratory. By this means it is at once seen that the difference of potential increases proportionally to the number of cells, the electro-motive force of four cells being about equal to that of one Daniell. Joined up with a galvanometer it indicates a current, which, however, rapidly falls off in strength, owing to the formation of an insoluble cupric sulphide upon the copper plates. Joined up in opposition to a single Daniell cell, with a galvanometer included in the circuit, I find that it requires from four to five cells to balance the force of the Daniell at first immersion; but after leaving it to work on short circuit for two and a half hours its electro-motive force had fallen off 50 per cent.; it then required about eight cells to bring the needle to zero. This gives for the electro-motive force of two cells at first about 0.5 of a volt; or the whole sixty cells are equal nearly to fifteen Daniell's cells. It readily effects the decomposition of many electrolytes, and exhibits, therefore, every property of an ordinary cell-series. Above all, it will be noticed that since there is a regular rise in potential in passing from cell to cell, and as all parts of each plate must be at the same potential, that rise can only take place at the surfaces where the active metals are in contact with the electrolyte (that is, at the seat of the chemical action), and that, therefore, two metals in one electrolyte *cannot* be at exactly the same potential. But I find that more direct evidence still of this fact is to be found in an experiment of Faraday's, which seems to have escaped the notice of the contact theorists.

In his "Experimental Researches" he gives the following fact: "I took a voltaic apparatus, consisting of a single pair of large plates, namely, a cylinder of amalgamated zinc and a double cylinder of copper. These were put into a jar containing dilute sulphuric acid, and could at pleasure be placed in metallic communication by a copper wire connecting the two plates. Being thus arranged, there was no chemical action whilst the plates were not connected; on *making* the contact a spark was obtained. In this case it is evident that the first spark must have occurred before metallic contact was made, for it passed through an interval of air; and also that it must have tended to pass before the electrolytic action began, for the latter could not take place until the current passed, and the current could not pass before the spark appeared. Hence," he says, "I think there is sufficient proof that the zinc and water were in a state of powerful *tension* previous to the actual contact." It is difficult to reconcile this with the experiment of the half discs and drop of water made by Sir W. Thomson. But, at any rate, a consideration of the whole of the facts would seem to point out that the only safe conclusion is, that in any series of cells, of any sort, the electro-motive force is a complex effect, being due to the algebraical sum of all the differences of potential due to dissimilar contacts *plus* the algebraical sum of the differences of potential due to the chemical affinities of the metals and the electrolytes *minus* any opposing force due to polarization, etc.; and that, so far from being the exclusive cause, the contacts can only be said strictly to have a share in producing the difference of potentials between the extremities of a battery. And, lastly, we may with advantage compare the statements of the contact theory with certain other well ascertained facts. Such statements, for instance, as these: "If we close the circuit by connecting the metals by a wire, we then have constant separation of electricities at the point of contact or different metals, and constant recombination attended with decomposition through the electrolyte." "The electricities separated at the metallic junctions recombine through the water," "whilst the current flows the water is decomposed," which seem based on the assumption

that the principal seat of the electrical actions is *not* to be looked for at the seat of the chemical actions. But, now, how does this fit in with those cases of electro-chemical inversions noticed by De la Rive, where the direction of the current in a cell is *reversed* by simply diluting the electrolyte? Thus zinc is negative to tin in strong nitric acid, and mercury negative to lead; but in weak nitric acid the positions are reversed. Hence, if couples be formed of these metals in strong nitric acid, and the acid be gradually diluted, the current first ceases, and then is reversed in direction.

Here, without altering the metallic junctions, we can at pleasure alter the direction of the current, and, therefore, also, the direction of the fall in potential, since the current must flow from high to low potential. This seems conclusive that the chemical electro-motive force must be even greater than the contact electro-motive force. This reversal of the current, by changing the seat of the chemical activity, may be shown in another way, depending on the application of a very old principle. If plates of copper and clean iron be connected by copper wires with a galvanometer and the iron rendered passive by immersion for a moment in strong nitric acid, then if these plates are plunged into dilute nitric acid the galvanometer indicates a strong current going through the cell from the copper to the iron. If they be removed for an instant, and the iron plate touched, on again immersing the current is found to be reversed. Or, we may again change the conditions, and notice that it is not sufficient to have merely two different metals and an electrolyte to form a cell. If plates of pure gold and platinum be placed in nitric acid the most delicate galvanometer detects no current, and the same for many other pairs of metals and electrolytes.

Here we have contact of different metals producing its difference of potential; yet no current flows round "decomposing the electrolyte," as, according to the contact theory, it should do; but the instant we give play to chemical combination the ordinary results ensue. If the extremities of the copper wires from a galvanometer be attached to iron plates, and these plunged into separate cups of dilute nitric acid, on making connection between the two cups—by a bent iron plate dipping into each—no current is detected. On making one limb of the connecting plate passive and reimmersing, a strong current is visible; and we find that we have the direction of the current completely under command by making any of the four plates more or less acted on than the other three.

If these experiments are to have any importance attached to them it can scarcely be doubted that they land us in conclusions similar to the others, namely, that we must look for the principal source of the electrical disturbances at that place where the greatest chemical activity is being brought into play; and that whereas contact of metals is in itself productive of definite electrical separation, there is in the battery another cause assisting in the production of difference of electrical potential between the terminals, namely, the potential chemical combination between the metals and electrolytes existing when the circuit is open—the energy of the current produced when the circuit is closed being, of course, the equivalent of this potential energy which disappears.

The Canadian Marine Telegraphs Bill.

At the last session of the Parliament of the Dominion of Canada a bill was passed "to regulate the construction and maintenance of marine electric telegraphs." This bill was intended to terminate the exclusive concession of the right to land telegraph cables on the coast of Newfoundland held by the Anglo-American Telegraph Company, and under which its cables are now maintained. The following article, which is condensed from the *Railway News*, of London, England, furnishes a statement of the present condition of this bill, which has not yet received, as it must before going into effect, the royal assent. The London newspapers have for some time past been engaged in an active discussion of this bill, which, as will be seen, is a most important one, as affecting the status of the Anglo-American and the Direct United States Cable Companies. The *Daily News* and *Standard*, of London, are urgently advocating the bill, in order that the monopoly of telegraphic communication with Newfoundland, now held by the Anglo-American Company may be abolished, and the *London Times* opposes it.

As the cable of the Direct United States Cable Company is now nearly completed, the subject is one of great importance, as until the royal assent is given to it the cable cannot be landed on the Newfoundland coast, but must be worked in one circuit from Ireland to Torbay, Nova Scotia. For the present, at least, the cable will be spliced off the coast of Newfoundland.

The *Railway News* says: "It was well known that the bill was prepared upon the instructions of Mr. Lawrence Oliphant, the agent of the Direct Cable

Company, and was passed mainly through his earnest and persevering efforts with the members of the Dominion Parliament. The bill consists of seventeen clauses, and fifteen of these are ordinary general provisions, mainly for protection of the public local rights and to prevent interference with navigation. The first section declares that the act shall apply:—1. To all companies hereafter authorized by act of the Parliament of Canada to construct or maintain telegraphic wires or cables in or across any tidal water within the jurisdiction of Canada. 2. To all companies already authorized to construct or maintain such telegraphs by any act of the Parliament of Canada, or any act or charter of any province of the Dominion now in force.

"Passing over the general provisions above referred to, we come to the 14th clause, which enacts that no company other than those mentioned in the first section, or which become incorporated in Canada under the 15th section, shall construct, maintain, or use any telegraphic wire connecting two or more provinces of the Dominion, or extending beyond the limits of any province in or across any tidal water within the jurisdiction of Canada. And then follows a proviso that 'nothing in this section contained shall be construed to prohibit any existing telegraph company, or association from continuing to receive and transmit messages over its line of marine telegraph until such time as another company, under the authority, and within the provisions of this act, has constructed and is operating a line of marine telegraph which has been determined by the governor in council to afford reasonable facilities for the transmission of marine telegraphic messages in lieu of the line or lines of such existing telegraph company or association, or to be a line for doing business over a route of a competitive nature.'

"The 15th section provides that in case any company is now or shall hereafter be incorporated by or under any act of the Imperial Parliament or royal charter for establishing or maintaining telegraphic communication in or across any tidal water within the jurisdiction of Canada, the Governor and Council may by letters patent grant a Canadian charter to such company with the same powers and conditions as if incorporated by special act of Parliament, 'but no such letters patent or grant of corporate powers to be exercised within the jurisdiction of Canada shall be made to or conferred upon any company or association which possesses any exclusive privileges of landing wire or cable for a marine telegraph in or upon the coast of any State, province, or country in America, Europe, or elsewhere, unless an equal or reciprocal right or privilege of landing wire or cable and establishing a marine telegraph upon the same coast is conceded to any and each of the companies in the first section of the act mentioned, or which may become incorporated in Canada under the provisions of this section of this act, so that any company incorporated or to be incorporated in Canada may enjoy the same advantages in maintaining its marine telegraph line in and upon the same coast as the said company which may possess such exclusive privilege.'

The radical objection to this legislation is, *The Railway News* says, that it is retrospective in its action. The "act wholly alters the conditions upon which property worth several millions sterling has been for many years held and worked, the alterations being made, not with the sanction of the proprietors, or even after notice given to them, but carried with a high hand in their absence, against their wishes and against their just rights.

"The *Standard* and *Daily News* would make it appear as if the bill applied only to lines of cable to be laid hereafter, and ignores altogether the fact that it would prohibit the working and using of lines, some of which (as those between St. Pierre and Nova Scotia, and between Newfoundland and Cape Breton) have been in existence and used for the last twenty years.

"Retrospective legislation is abhorrent to English principles, and when its effect would be to confiscate a valuable property, by means of which local and imperial interests have for many years been served with unvarying fidelity and with marvellous skill and success, there can be no shadow of justification for the act.

"The Anglo-American Company has, with and by its partners, the New York, Newfoundland and London Telegraph Company, been working for the last twenty years to establish and perfect a system of Atlantic telegraphs, and for the first twelve or thirteen years derived no return whatever for their labor and enormous outlay, and, as all the world knows, ran the greatest risk of total failure and loss. Before attempting to raise the capital for an Atlantic cable the promoters very prudently sought and obtained from the Legislature of Newfoundland an act which gave them the exclusive right for fifty years of landing telegraph cables on the island. This right the Government of Newfoundland can now, under the terms of the act, redeem by paying for the cables and telegraph property of the company in Newfoundland the value put upon them by arbitration.

The Anglo-American Company is now, by amalgamation and purchase, the sole owners of all the local cables and of the Atlantic lines, including those of the French Atlantic Telegraph Company. They represent a total capital of £7,000,000 sterling, and it is stated, we believe with truth, that they could not be replaced for a less sum. The company is, however, an English, not a Canadian company, and, therefore, does not fall within the description of companies entitled to the exceptional benefits of the Canadian bill, but, on the contrary, the bill subjects to forfeiture all the cables which the Anglo-American Company now holds on the shores of the Dominion so soon as the Direct United Company have successfully laid their line.

"The bill was brought in as a public measure near the end of the session, without notice to the parties intended to be chiefly affected by it, and the promoters doubtless hoped they would get it through without observation. They succeeded in passing it through the Lower House unopposed and without discussion, and it was not until it reached the Senate that the Anglo-American Company received any intimation that such a bill had been introduced. We are informed that only four or five days elapsed between the receipt in London of the first telegraphic message on the subject and the day when the bill was finally passed by the Senate. The Anglo-American Company, therefore, could not possibly present any petition against it, or lay its case before the committee. We believe that they tried by telegraph to get a clause inserted saving their rights, but were defeated by seven votes, in a House of fifty-five. A copy of the bill was received in London about ten days after it was passed. The Governor-General very properly referred to the Home Government the responsibility of giving or withholding the royal assent to the act.

"The effect of the act, if carried to its legitimate conclusion, would appear to be that the Anglo-American Company should remove all its cables from the Dominion shores and carry the whole of its traffic by St. Pierre and Duxbury, or direct from Newfoundland to the United States. Canada would then be left for its European communications to the solitary wire of the Direct Cable Company, which we hope may be safely laid this year.

"The pretence on which the bill is founded is the doing away with monopolies, but with admirable inconsistency the sixteen:th clause expressly saves the exclusive rights of any company heretofore incorporated by special Act of the Parliament of Canada. This clause applies, and was of course meant to apply, only to the Canadian and Great Northern Telegraph Company, the skeleton of a scheme for laying a line from the North of Europe, by Greenland and Labrador, to Canada. The Great Northern Telegraph Company, which we suppose is to be connected with this line, holds half-a-dozen exclusive telegraph concessions from Russia, Norway, Denmark and Sweden, but they do not interfere with Mr. Oliphant's so-called direct cable. The faint outcry recently got up against telegraph monopolies is little less than absurd. Mr. Emerson, the Speaker of the Newfoundland Assembly, in his able letters to the *Times*, has more than justified what that province did in 1854, but those who have seen how the submarine telegraph system has been formed and extended know perfectly well that not one tenth of the existing mileage of cables would ever have been laid but for the protection thus given to the shareholders. Whilst the man who invents a new nutcracker or corkscrew, or a new method of transmitting signals through a telegraph line can get a patent protecting him against all the world for fourteen years certain, and the editors of a new Wesleyan hymn book are entitled to copyright which no man may infringe, it seems unreasonable to cavil at the monopoly held by the Anglo-American Company in the little colony of Newfoundland, upon the faith of which such vast sums have been laid out, and which the Newfoundland Government may put an end to at any moment if they choose to pay the agreed price for it. There is no precedent in English or Canadian legislation for this bill, and we warn Canadians that if it is put in force they will find that they have done the financial interests of their country far more damage than would be repaid if the direct cable were to carry Canadian messages free for the whole term of its existence.

"The present bill should be disallowed, and a new bill be brought in next session, when the whole question can be fully discussed and the rights of all parties fairly considered. The legislation which is to protect the Dominion from telegraphic monopolies can then be made to apply with full effect, and without sacrificing existing interests."

REUTER'S TELEGRAM COMPANY (LIMITED) have announced that on and after the 1st September they will undertake the transmission of telegrams of one word and upwards at reduced rates to the United States and Canada.

Correspondence.

Suggestions for "Old Probabilities."

NEW YORK, Sept. 16.

TO THE EDITOR OF THE TELEGRAPHER.

THOSE who have noticed the weather reports of "Old Probabilities" for the last few days have no doubt observed that they have been erroneous almost every day, especially as far as this locality is concerned. To-day's "Probability" reads "Over the Middle Atlantic States winds shifting to northerly, with rising barometer; lower temperature and clearing weather." At this writing, eleven o'clock A. M., the wind is due east, and it has rained continually since six o'clock this morning, which, to my mind, constitutes a perfect failure in the prediction.

It seems evident to me that "Old Probability" is too general in the wording of his reports and predictions. He frequently groups together the New England and Middle States, with variable winds and local rains. This extent of territory is sufficient to embrace almost every variety of weather to which we are subject, and under such a prediction the claim for great accuracy would hold good. Even taking the Eastern or Middle States the term "local rains" is too indefinite, and under such a prediction a single shower in any part of these States makes the prediction good, and, I suppose, the Bureau would record it as a success, whereas to the great majority it would really be a failure.

To my mind the country should be divided into districts of not to exceed 100 miles square, with the most important seaport or place in its centre, and the prediction made with particular reference to that centre, and let the surrounding country judge of its local weather by its proximity to that place. The reports would then read something as follows:

"New York City, rising barometer, lower temperature, westerly winds, and clear weather."

This would be a clear and definite prediction, which in a short time would settle the question as to whether "Old Probability" gives a *quid pro quo* for the large amount he costs us.

I may refer to this subject again should it be deemed a subject proper for discussion in your columns.

WEATHERCOCK.

The Inter-State Exposition.—Telegraphic News and Notions.—Experience with a Telegraph Student.—A New Telegraph Line Talked of, etc., etc.

CHICAGO, ILL., Sept. 14.

TO THE EDITOR OF THE TELEGRAPHER.

CHICAGO is all ablaze again, not with a destructive fire this time but with the Inter-State Exposition. Everybody is flocking to see it, and "it" in this case means a great deal. I cannot as yet attempt a description fitting for your columns, as I have not thoroughly investigated it, or as some have it, "done the Exposition yet as a whole." Nearly all the makers of telegraph machinery who were represented last year are on hand again this year. I will attempt a description more fully in my next.

As will be seen by your personal column, quite a number of the operators of this city have been enjoying a short vacation; among them some of the W. U. managers, all of those so fortunate, except the latter, being obliged to furnish substitutes. Some of those taking vacations have been called to do so on account of sickness and death in their respective families. They have the sympathy of all their fellow laborers here in their afflictions. Those who have had a vacation of pleasure and rest have not been begrudged their recreation by their less fortunate associates, notwithstanding many of those unable to take vacations needed the rest and relaxation. "Did you have a nice time?" "Did you get some good butter to eat?" "Was there any water in the milk out there?" "Well, I'm glad to see you back again." These are some of the questions daily and nightly asked these hero and heroine "brass pounders" when enough of them get clear to form a "sauce" around some unoccupied table.

The damage done by the last fire we had here was soon repaired. The interruption of the working of the wires on the streets in that vicinity was so brief that I did not think it worth while to crowd your columns with a recital of the details at that time. Both the W. U. and the A. and P. Companies lost heavily, however.

The W. U. Company only last spring took down the Mullen stock poles on State street and on Third and Fourth avenues, and substituted therefor some very

fine fifty-five feet poles. In fact the Western Union last spring gave all the routes from this city a thorough overhauling. Their genial master of repairs, Mr. Hopkins, with his efficient force of linemen, doing some of the nicest work that it has been my pleasure to see for some time. Fifty-five foot poles were set along both the southern and western routes on North Clark street, leaning poles were straightened and decayed ones and those rendered unsafe on account of being made to do duty as hitching posts as well as bearers of the iron chord of civilization (that's original) and the victims to the molars of the fiery and untamed steed, were supplanted by fine forty and fifty feet poles, the latter being used nearest the main office. Previous to the great fire here all the wires of the Western Union Company in this city were strung on "Brooks' insulators," and I am informed by one in authority, who ought to know whereof he affirms, that the wires have never tested so satisfactorily since, from the fact that on repairs recently in the city the "Brooks" have not been used, for what reason I am unable to state. The Kenosha insulators have been used recently on repairs here in the city. An intelligent line repairer of my acquaintance, who has given insulation a good deal of thought, says the Brooks is the best insulator made, that although the first cost is much more than any other insulator its insulating properties are so vastly superior to any other he has used in his fifteen years' experience in line building and repairing, that they are by far the cheapest insulator in the market. He makes one serious objection to them however, which Mr. Brooks might remedy. The objection is that the way they are now constructed lightning bursts up through them, destroying their insulating properties of course, and it passes through the insulator in such a manner that the defect cannot be noticed by a repairer unless he climbs each pole and examines each insulator. Not being an insulation man I do not suggest a remedy, but give the information for what it is worth. Several of the Burlington and Quincy and some of the Michigan Central Railroad wires are strung exclusively on Brooks' screw shank insulators, and give great satisfaction, working well in either wet or dry weather.

It is currently reported here that Mr. Donald A. Smith is to be provisional president of the Central Canadian Telegraph Company for constructing or operating a transcontinental line from Canada to the British North American possessions. I have not as yet heard the route of the proposed line. I suppose it will be worked in connection with the Canadian Pacific Railway Company's lines. I believe negotiations for the building of the road and line are now pending at the seat of Government of the North American possessions, as well as at Montreal, Canada. As this is but a rumor in telegraph circles here, I give it to you for what it is worth.

I find that it is a prevailing idea among outsiders that the monopoly, as the Western Union is generally termed, had things their own way with the railroad companies in regard to the use of wires, etc. I was myself of the same opinion until quite recently, when one of the boys who used to work the overland wire in those happy days when San Francisco was worked direct, gave me a bit of his experience as to how he got stuck all night by the man in charge of a certain Western railroad terminus office. It seems the regular boss despatcher was the circuit manager, he arranging the wires before leaving the office for the night in such manner as, in his judgment, would provide facilities for all parties, and giving orders that the wires were to remain in that shape. During the night a heavy storm came up just as San Francisco was almost clear, and, although one of the chiefs, who thoroughly knew the route, suggested how some cross connecting and opening of bad wires could be done to allow "St." to clear, he was told it could not be done, as it was against orders to change the wires there, and the wires were not changed until morning, either. As several similar aggravations came to the same party's notice it looks as if he hold on the Western roads by the monopoly is not so firm as some suppose. However, this might be remedied by the proper officials if they were cognizant of the facts; but as it only "stuck" the all night men and held a few messages, probably it was not brought to their notice. These are some of the things "no fellow can find out."

I want to give you the following incident to show you the importance fledglings in the business attach to their being left in charge of an office. The youth in question was one of those fellows who know it all. It became necessary to hire some extra men from the day force, one evening, and one old reliable very reluctantly gave up the expected pleasure of an evening out, and sat down to a way wire to make the best of the situation. The fellow he tackled first, and one that lasted him nearly an hour, was a way office not a hundred miles from here, and one that generally sent but one message in the evening, which was a "red" and a "cipher" message. The manager was away, and the "yndie," i. e. student, was in charge. After listening for a few moments to something which "Old Reliable" thought sounded

(Continued on page 227.)

Mr. J. E. HOCKETT, formerly of Chillicothe, Ohio, has accepted a situation in the Cincinnati, Ohio, Western Union office.

Mr. O. C. BOSTWICK has been transferred from Christmans, Ind., night office, to Calumet, Ill., night office, Mich. Central Railway, vice Mr. RACE, gone home on sick leave.

Mr. WILLIE ABBOTT has been appointed night operator at Christmans, Ind., M. C. Railway, vice Mr. O. C. BOSTWICK, transferred.

Mr. S. H. BELCHER, night operator at Albin, Mich., M. C. Railway, has resigned and gone West. May success attend him is the wish of his late associates.

The Telegraph.

By Cable.

LAYING THE DIRECT ATLANTIC CABLE.—THE WORK PROGRESSING SUCCESSFULLY.

LONDON, Sept. 10.—A despatch from the steamship Faraday, which is engaged in laying the direct cable to the United States, dated the 8th inst., at noon, reports that she was then in latitude 50° 43', longitude 20° 32'.

Four hundred and fifty three miles of the cable had been paid out.

A later despatch from the Faraday, under date of ten o'clock A. M. yesterday, states that the work of shifting the paying out of the cable from the fore to the after tank had been successfully accomplished, and all was progressing well.

Competition in Marine News.

THERE is likely to be an active competition in the collection and distribution of marine news in this and other cities by telegraph as a consequence of the difficulty between the Merchants' Exchange and Newsroom and the Western Union Telegraph Company, and the construction of the new competing line to Sandy Hook, of which an account was given in the last issue of THE TELEGRAPHER. The Gold and Stock Telegraph Company have issued a circular to the "underwriters, shipowners and those interested in marine news," announcing that they will immediately add to their business in New York and other principal cities a department for the collection and distribution of marine and other news interesting to shipowners, underwriters and commercial men generally. A news room is also being fitted up in the basement of the Cotton Exchange, at the corner of Hanover and Pearl streets, in connection with an office of the Western Union Telegraph Company, and all important marine news, will be posted on the bulletin boards of the news room as soon as received, and will be furnished to customers at their residences and places of business by the printing telegraph instruments of the Gold and Stock Telegraph Company.

Under the stimulus of this competition there is no doubt but that the business of marine news reporting will be carried on more satisfactorily than it has been done before. The contest promises to be a very bitter and protracted one, and will undoubtedly prove beneficial to those who are interested in this class of news, even if it should not be remunerative to the contestants.

The Dominion Telegraph Company of Canada.

THE Dominion Telegraph Company of Canada is making an important extension of its lines and facilities this season. That company is adding about 600 miles of poles and 1,000 miles of wire to its lines already in operation. The new lines are expected to be completed before winter sets in.

Astoria Telegraph Line.

ARTICLES of incorporation of the Portland and Astoria Telegraph Company have been filed at the County Clerk's office by John West, George Flavel and Wm. Wadhams. The object of the company is to construct, maintain and operate a telegraph line from a point at or near Cowlitz Station, W. T., to Astoria and intermediate points along the Columbia river and elsewhere. The principal office of the company will be in Portland. The capital stock is put at \$15,000, in shares of \$50 each. A telegraph line could be taken overland at a considerably less cost, but the incorporators are satisfied that they can more readily dispose of \$15,000 worth of stock on the river route than they could \$8,000 worth by land. The Western Union Company will give the use of their line from this city to Cowlitz on reasonable terms, and this company will probably be entrusted with the placing of the wire from Cowlitz to Astoria. The promoters have received every encouragement in the scheme. They will have stations at the different fisheries and other points along the river, and

it will be their aim to so conduct their line that it shall be of the greatest possible advantage to the public. The work of construction will be commenced at the earliest practicable moment.—*Albany (Oregon) Daily Bulletin.*

Telegraphic and Electrical Brevities.

THE annual meeting of the Western Union Telegraph Company will be held at the office of the company, in this city, on Wednesday, October 14th, at noon. The Transfer Books will close on the afternoon of the 19th inst. and be opened on the morning of the 16th October. The quarterly dividend of two per cent. will be payable at the office of the treasurer on and after October 15th.

The annual meeting of the Gold and Stock Telegraph Company will be held at the office of the company, 61 Broadway, on Tuesday next, the 22d inst.

At the meeting on the 19th of August of the Mediterranean Extension Telegraph Company, Limited, a dividend at the rate of 3 per cent. per annum on the Ordinary shares, as well as the usual dividend on the Eight Per Cent. Preference Stock, was declared, leaving \$500 to be carried to the reserve fund.

Married.

PURDON—CLINE.—At Albany, Oregon, Tuesday evening, September 1st, 1874, at the residence of E. B. Purdon, Esq., Mr. Jos. S. PURDON, Manager Western Union Telegraph Office, Albany, to Miss JENNIE CLINE.

Joseph—I am rejoiced to see that Miss Cline and you are inclined to follow the noble example of so many G. & C. boys in getting married. Please do not de-cline my congratulations and best wishes for a protracted life of peace and prosperity and hope that you may glide smoothly down the de-clining years of the unknown future. W. H. FLOOR.

YORK—BALTHIS.—At Chicago, September 10th, 1874, GEORGE C. YORK, Esq., Assistant Manager Western Union Telegraph Office, Chicago, Ill., to Miss ANNE D. BALTHIS, of the same city.

Mr. York is one of the few men who know how to make his subordinates all love him, and at the same time command their respect and cheerful obedience to all his orders. The Chicago operators join with his many friends all over the country in wishing him and his estimable wife a happy journey over life's troubled sea and a blissful entrance to the haven of rest, where there are no "interruptions" to the "current" of eternal happiness. *

ANDERS' MAGNETO PRINTING TELEGRAPH INSTRUMENTS.

These instruments require

NO ACIDS OR CHEMICAL BATTERY.

the currents required to operate them being generated from PERMANENT MAGNETS.

They print very rapidly, and having been fully tested on private lines during the last eighteen months, have proved to be

VERY RELIABLE.

The following parties, among others, have purchased them after giving them

THOROUGH TRIALS

on their several lines:

- THE BOYNTON PACKING COMPANY, Boston, Mass.
- CHAS. HULBERT, Esq., 8 Exchange Place, Boston, Mass.
- THE BOSTON AND ALBANY RAILROAD CO., Boston, Mass.
- MESSERS. J. H. CHADWICK & CO., Boston, Mass.
- JAMES ALEXANDER, Esq., Agent Guard Steamship Company, Boston, Mass.
- CHAS. S. LOVERING, Esq., Treasurer of Whittenton Mills, Taunton, Mass.
- HON. ISAAC BRADFORD, Mayor of Cambridge, Mass.
- GEO. H. COPELAND, Esq., Chief of Police for the Cambridge Police Telegraph, Cambridge, Mass.

We also continue to manufacture

ANDERS' MAGNETO DIAL TELEGRAPH INSTRUMENTS,

which have been extensively used for several years, and are recommended as the

BEST DIAL INSTRUMENTS MADE.

Parties who purchase either our PRINTING OR DIAL INSTRUMENTS can exchange one for the other at any time, as both the Printers and Dials are used with the same transmitters.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the
EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
No. 2 is a round cell, designed for main line. Price, \$2.

Fire Alarm and Police Telegraphs

- First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.
- Second—The **Automatic Signal Boxes**.
- Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.
- Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

Only **PERFECT, COMPLETE and RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;
the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.
Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the **AUTOMATIC SYSTEM**, the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of
FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the **People, Municipal Authorities,** AND THE **PRESS** throughout the **UNITED STATES and CANADA.**

NO EFFORT, TROUBLE OR EXPENSE is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the **EFFICIENCY, RELIABILITY and ECONOMY**

of the system. They intend that, as far as possible, it shall be **ABSOLUTELY PERFECT!**

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES and the DOMINION of CANADA,**

CANNOT EASILY BE ESTIMATED, but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF
INSTRUMENTS,
BATTERIES,

AND EVERY DESCRIPTION OF
TELEGRAPH SUPPLIES:

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, a \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S
KERITE,
OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE
HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, **ANYTHING HITHERTO MANUFACTURED.**

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

A MERICAN COMPOUND
TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.

STEEL FOR STRENGTH.

The superiority of this COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.

And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.

Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON CARY, Treasurer,
No. 234 West 29th St.,
New York.

BLISS RESERVOIR BATTERY.
PATENT APPLIED FOR.

Price per Cell, \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of
THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawisbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, scaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
NO. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description.
This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without any ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is ABSOLUTELY UNIFORM at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.

No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
8 Dey Street, N. Y.

— of Sept. 15th.

SINCE the world began it has been a mystery which the human brain has found it impossible to solve that the men whose minds are developed to a degree of grandest sublimity are found impracticable for the uses to which we are expected to lend our abilities in this sordid, selfish world. When we contemplate the long list of names, and consult the varied and pathetic history of men to whom civilization in its present advanced stage would bend the knee in silent homage, and whose memory it is proud to cherish; when we think of these men, I say, and reflect how inadequate was the meed of credit yielded them in their own time, how cold and ill seeming the paltry applause that an unsympathetic and half cultivated generation grudgingly bestowed. The heart wearies at the ingratitude of mankind, and the frosty and hypocritical return for what has been freely given. Not until the sweet singer of Avon had played his part in life's drama, and his dust had gained sepulture in the homely little church whose modest spire towers amid the gentle landscape of Stratford were the grand tragedies given to the reading world which more cultivated ages have perused with reverence and awe. The wondrous melody of Chopin lay hushed and silent in the great composer's grave while the grass of many seasons was growing above the dead, and moss was forming on the gray old shaft which marked his resting place. But an ever advancing world has discovered his music, and fell to worshipping it as something long lost but destined to be immortal. I might multiply examples in support of my original proposition, but it seems unnecessary. Let me illustrate from the events of the present day.

A few months ago there came under my observation an enterprise which seemed to lack an experienced and able guide to place it on the road to prosperity and success. Its founders were inexperienced, and the spokesman proved himself a painstaking, hard working and conscientious man, who recognized what was needed, and sought a proper person to fill the niche. There were several who were tolerably available, but no one preëminently fitted for the work, until a flash of Fate's flickering torch revealed "a gem of purest ray serene"—in 1850th he so asserted himself. "Full many a rose is born to blush unseen," but this rare exotic who, up to the time in question, had wasted his sweetness on the desert air of by-places, and whose name had never been sullied by being known outside of the offices in which he worked, began to exhale a fragrance intoxicating to the senses and bewildering to the reason. The bounding swell of Byron, the sweet mellifluous flow of Moore, the simple winning grace of Goldsmith, as expressed in their poetry, paled beside the metrical marvel of this sad, sweet singer whose efforts in the realms poetic combined all the beauties of what had gone before, and anticipated all that could be hoped for from bards unborn. And his rhyme was scarcely to be compared with his prose. Blend the elegance of Addison and the humor of Steele with the terse sense of Thackeray; add the pathos of Dickens and the mellowing grace of Irving—but no, that would not equal it. Nothing like his prose was ever seen, nothing like it will ever greet this majestic world again. And this poet and essayist coming suddenly and strangely to the light, as I have intimated, became a ruler of journalistic destinies.

Nor was he led tremblingly up to the high place he was to occupy, but a true born genius he vaulted like a harlequin into the easy chair, which he subsequently mentioned to the world was located somewhere in "a dizzy eminence." True, it was said he made the leap without consulting the wishes of the founder of the enterprise, and stories are rife that a *coup de état* accounted for his presence at the helm, but evidently these are errors. And while it must be confessed that the wand which he flourished about so bravely at first, hitting foe and friend as pleased his mad caprice, has since become the merest lath, and he himself has tumbled from his high estate like the veriest Pantaloon,

still do I hold that while there he shone a star of most resplendent glory, and when he "oped his mouth" no dog essayed to bark. But he failed for all this, and the worst of it is no one can tell why he failed; no one can solve the riddle. Ranking first in the profession, the peer of Emerson as a scholar, the equal of Hassard, Chamberlain or Seilhamer as a trenchant editorial writer, a second Dana as a logician, and hardly inferior to Varley or Huxley in the matter of scientific research—to say nothing of his poetic fancy—he has proved a Jonah, and like him he has been thrown overboard by those associated with him. But so much of genius will not go unwept, unhonored or unsung. Tears are falling to-day like rain drops over the temporary absence of this blessed light from the fair firmament of letters. Already humble I have inaugurated an inquiry into the causes which render the success of great human luminaries so rare in this bad world, with a view to ultimately winning for him his rightful praise, and the time will come, I am certain, when a poet will arise to sing a requiem in remembrance of a gifted aspiring soul around whose name future generations shall weave garlands of love, honor and renown.

"McGrew—Brother of Bob's."

BY LEMONS.

HIS name was McGrew. He worked in a railroad way office. Several of our principal through wires were run into his office for testing purposes, but he used them for his own. He had a brother Bob, whom he imagined every operator in the country knew. Bob was his ideal; he thought there might be a few such operators as Bob in existence, but not many. Bob had been all over the country, from Maine to Texas, and of course was supposed to be widely known, and McGrew thought all that was necessary was to say, "I am McGrew—brother of Bob's," and any man would be glad to know him. Whenever there was a lull on the Washington "special" wire, this artist would call me up and ask me, "134?" After telling him it was Griggs, he would say, "Ah! Griggs, how are you to-night? My name is McGrew—brother of Bob's." I would say I was glad to know him, and tell him to be happy and virtuous—like Bob.

The next night he would call me up with his "134." I told him my name was Boggs. He replied, "Ah! Boggs, how are you this evening? I am McGrew—brother of Bob's." To which I responded that I didn't care much if he was. Then he would subside. At it again he would come the next night, and the next. I gave him a new name every night, until he flattered himself he would be as widely known as Bob himself, if he only persevered, and didn't grieve over the short answers he received.

But we settled him at last. One of the boys, named Mack, called him up one night and asked, "Is it McGrew—brother of Bob's?" He replied that it was; and Mack said, "My name is Rasmus; I know Bob very well. We were together two years out West and through the South. I would like to see you. Couldn't you get me pass to come out?" This tickled McGrew terribly. He replied, "Ah! Rasmus, I am delighted to meet you; glad to see any of Bob's friends. I am afraid I will not be able to pass you out; but, no doubt, if you asked the Superintendent of the road he would pass you." Mack replied, "No, the Superintendent has an old grudge against me; I wouldn't ask him; but never mind, I will walk out. I would do most anything to see a brother of Bob's; my dear old friend Bob! Many a day we have worked together. How sorry I was the day we parted." This was too much for McGrew, and he said, "Oh! no; don't walk out; I would rather pay your way—if I had the money. Don't think of walking; why, my dear friend, it is fifty miles to this place." Mack rejoined, "Oh! I don't mind the walk; Bob and I have frequently walked fifty miles a day on the plains. I am used to it. I will start about four o'clock in the morning. You can look for me in time to take supper with you. Good-bye, till I see you." McGrew concluded the dialogue with, "Well, if you will walk, all right. Good-bye; I will take care of you when you arrive," and, for the time, was presuadedly rejoiced.

In about fifteen minutes, however, Mack went back to the wire, and calling McGrew up, inquired if "That man Rasmus was talking to you to-night?" "Yes," replied McGrew, "what sort of a man is he? He is coming out to see me to-morrow." "Well, young fellow, I pity you," returned Mack. "You will have your hands full. That fellow has just got out of jail. He is one of the worst characters in the country. I expect that man will live on you for the next two months. That's the way he does, and you can't get rid of him, as he is terribly on his muscle." "Good heavens!" quoth McGrew. "Is there no way to stop him from coming? Couldn't you go and persuade him not to come? Tell him the roads are bad, and full of robbers. Tell him there was eighteen men murdered on that very road within the last month. Tell him I am a bad man. Tell him very likely I will kill him—

if he does anything to offend me in the least. Tell him anything, so you stop him from coming. I am going to see a nice young lady in this town, and dear knows what she will do if she finds I have acquaintances like that man."

Mack told him it would be impossible to stop him, that he had gone out now to try and steal a meal somewhere. "You had better receive him kindly," he concluded, "and don't aggravate him by treating him coolly, as he might abuse you, and he don't stop at anything when he is mad." McGrew answered very weakly, "I have the necessary courage, but I haven't the strength and muscular ability to cope with him. I will have some of my friends here with me when he comes, to protect me." The next night he called us up, and asked if Rasmus started for his place. Mack said, "Yes; keep a look out for him, he will be there soon." McGrew replied, "I have three men with revolvers and a shot gun in the office waiting for him. I have been to all the stores and hotels in town, and told them not to trust this man on my account, as I would not be responsible for any debts of his contracting." This was too much for Mack and the boys, they almost expired with laughter. Poor McGrew! He found out a few days afterwards when he was in town how cruelly he had been sold. He ceased to trouble us with "I am McGrew—brother of Bob's," and we were once more tranquil and happy.

[From *The Telegraphic Journal*.]

Duplex and Quadruple Telegraphy.

BY ARTHUR R. GRANVILLE.

WITHOUT question, the Americans are maintaining their ground for ingenuity and enterprise in the electrical world by turning their attention to telegraphic inventions. Although the practicability of duplex telegraphy was known as a scientific curiosity quite twenty years ago, it was far in advance of its age, and could not be put to any use by reason of certain difficulties—insuperable, according to the then known laws of electricity—so that the invention lay fallow for that period. A further reason for the invention not being followed up may be found in the fact that the traffic of those days was easily met, and telegraph engineers were not goaded on to investigate the difficulties attending the introduction of a system which, by enabling lines to perform twice their previous amount of work, has virtually doubled the efficiency of the wires in use.

To an American, Mr. Stearns, belongs every credit for dispersing those difficulties by a happy use of the condenser. Though not the inventor of the system—the honor of the invention belonging to Dr. Gintl, of Vienna, and W. H. Preece, of Southampton, Messrs. Siemens, Halske and Frischen, of Berlin—yet to him belongs the highest praise for having resuscitated an old laboratory experiment; for having nursed and trained it from infancy to maturity; and for introducing it to the practical world as a valuable system, requiring but slight additions to the instruments in use amongst telegraphers to render it ready for immediate practice. And so successful has the working of the "duplex" proved, that in a little over two years it has established itself as a great and most profitable system, and may be regarded as indisputably one of the most important turning points in the history of telegraphy and electrical science. It is reckoned equal in importance to the discovery of Steinheil, who demonstrated that return wires could be dispensed with by the use of earth plates. In resultant effects the "duplex" is strikingly similar to Steinheil's discovery, since both have doubled the resources of telegraphy—the former *directly*, by actually doubling the working capacity of wires; the latter by halving the lengths of lines, inasmuch as return wires were proved to be no longer needed.

The benefits arising from the "duplex" system bid fair to be multiplied still further by the joint labors of two Americans, Messrs. George B. Prescott and Thomas A. Edison, who announce the perfecting of what they designate "the quadruple system." This system is described as a "new process of multiple transmission, by which two messages can be sent simultaneously in the same direction over the same wire, and either message can be dropped at any way station on the circuit." The "duplex" system can also be applied to this "multiple" system, so that four messages may be despatched together over the same wire in the same direction. The recommendation in favor of the "quadruple" are that, like its predecessor, the old Morse key can be used, and the only expense attending its introduction is the purchase of additional parts of machinery; there is no sweeping away of old appliances and substitution of new ones. The Western Union Telegraph Company, of which Mr. Prescott is Electrician, is about to try this system—in fact, put it into practice on all their lines—so that we shall shortly learn with what success the system is capable of being worked. Of this we may be certain, that should fail—

ure threaten the system, Messrs. Prescott and Edison will not spare strenuous efforts to overcome whatever difficulties may present themselves.

How this "quadruple" result is obtained has not yet been explained, but the method is not difficult to conjecture. After the "duplex" had been perfected by Messrs. Gintl, Siemens, Halske and Frischen, other physicists endeavored to find a method exceeding even that, and the result of their researches was that, in 1855, Stark, of Vienna, proved two messages could be sent along a single wire in the same direction. His plan was to launch, by two keys, two currents of different potentials into the wire, to act upon two relays at the receiving station. These relays were arranged so that when the weaker current alone traversed the circuit only one relay was acted upon; when the stronger current traversed the line the other relay was worked; when both currents were in circuit, then both relays were set in action. How the arrangement was effected may be seen in Mr. Sabine's "History and Progress of Telegraphy," and it is no doubt this arrangement—perfected by the aid of modern experience gained in working the duplex system—which is about to be adopted in the offices of the Western Union Telegraph Company. Should this system succeed, there surely seems to be no reason why the number of messages capable of being transmitted along a given wire should not be still more increased by the addition of further appliances and the removal of difficulties, which, from experience gained in working the "duplex" and "quadruple" systems—may be even anticipated. Whatever, indeed, should be the ultimate perfection of the multiple system, whether by English enterprise or not, the chief honor belongs to the Americans for being the first adapters who cleared the way and acted as pioneers.

The Telegraphers' Mutual Benefit Association.

ASSESSMENTS 67 AND 68, ISSUED SEPTEMBER 14, 1874.

DEATH OF C. B. MATHEWS AND A. G. MARTIN.

C. B. MATHEWS (Certificate No. 2098, issued August 15, 1873) died at Chacahonla, La., August 5, 1874, of small-pox.

A. G. Martin (Certificate No. 376, issued December 4, 1868) died at Canoe Station, Ala., of bilious fever.

Two dollars are due on above assessments from members whose certificates are dated previous to August 5th, 1874; one dollar from those holding certificates dated between August 5th and August 26th, 1874.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENT NO. 66, UP TO AND INCLUDING SEPT. 11, 1874.

5, 6, 23, 25, 52, 54, 56, 59, 61, 67, 72, 80, 90, 93, 99, 103, 108, 114, 129, 134, 136, 139, 141, 142, 144, 146, 153, 175, 176, 177, 188, 201, 202, 235, 240, 244, 245, 247, 257, 278, 279, 281, 282, 283, 285, 286, 319, 328, 344, 351, 360, 367, 371, 372, 376, 379, 381, 391, 392, 393, 401, 405, 413, 414, 416, 425, 426, 430, 431, 456, 463, 478, 510, 520, 526, 533, 548, 554, 561, 576, 577, 594, 604, 618, 622, 672, 678, 680, 690, 715, 729, 730, 733, 735, 750, 751, 756, 769, 787, 791, 825, 830, 831, 832, 848, 855, 859, 871, 874, 880, 883, 886, 901, 927, 939, 943, 991, 992, 995, 998, 1024, 1028, 1040, 1047, 1054, 1055, 1058, 1081, 1088, 1090, 1099, 1102, 1173, 1193, 1194, 1196, 1200, 1241, 1251, 1266, 1274, 1277, 1292, 1307, 1308, 1309, 1311, 1312, 1313, 1314, 1315, 1317, 1318, 1319, 1320, 1321, 1322, 1336, 1371, 1372, 1385, 1389, 1390, 1391, 1402, 1403, 1404, 1410, 1412, 1428, 1437, 1438, 1440, 1453, 1482, 1485, 1488, 1500, 1501, 1511, 1515, 1522, 1537, 1569, 1576, 1580, 1582, 1591, 1593, 1594, 1623, 1625, 1626, 1632, 1634, 1707, 1721, 1728, 1732, 1736, 1745, 1790, 1791, 1795, 1796, 1797, 1804, 1810, 1817, 1818, 1823, 1824, 1847, 1869, 1874, 1906, 1911, 1913, 1914, 1931, 1938, 1951, 1969, 1985, 1994, 1999, 2000, 2001, 2024, 2025, 2027, 2036, 2040, 2044, 2048, 2069, 2082, 2099, 2113, 2118, 2119, 2123, 2125, 2137, 2162, 2172, 2195, 2196, 2202, 2212, 2214, 2216, 2223, 2224, 2226, 2232, 2240, 2243, 2261.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENT NO. 65, UP TO AND INCLUDING SEPT. 11, 1874.

27, 178, 237, 238, 242, 246, 258, 273, 288, 294, 347, 361, 398, 451, 453, 455, 457, 692, 766, 803, 804, 952, 1134, 1135, 1136, 1144, 1153, 1207, 1267, 1273, 1450, 1552, 1609, 1631, 1715, 1716, 1722, 1731, 1778, 1786, 1941, 1974, 1975, 1976, 2037, 2063, 2066, 2081, 2128, 2177, 2182.

63.—1182, 2127, 2194, 2199.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice, that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

The cable of the Post-office telegraph between Holyhead and Dublin has been repaired and communication restored.

The New Western Union Office of Cincinnati, Ohio.

THE well known building at the northwest corner of Fourth and Vine streets, formerly occupied by Squire & Eekstein in the drug business, has lately undergone, in a scouring of its stone facings, and in the manipulations by carpenters and joiners, frescoers, paper hangers, etc., so complete a change that, with its well seasoned raw materials, the rejuvenation renders it better than new. The last outfit was given on account of its proposed occupation principally by the Cincinnati branch of the Western Union Telegraph Company; and, in a minor way, by railroad companies and other business interests. Not as yet has the building received its finishing touches for habitation purposes, though the railroad companies have already established quarters on the first floor.

The Fourth street front of the ground floor is taken up by the passenger ticket and freight contracting agencies of the Indianapolis, Lafayette and Cincinnati, and Cincinnati, Hamilton and Dayton Railroads. These railroads have recently entered into a pooling arrangement as regards the profits on Western freight and passenger fares, and having done this, their agents are able to occupy a joint office in harmony together. Mr. E. L. Stark is passenger agent for the Indianapolis, Cincinnati and Lafayette Road, and Mr. A. F. Lindsay for the Cincinnati, Hamilton and Dayton Road. Mr. H. P. Clough is freight agent for the Indianapolis, Cincinnati and Lafayette, and Mr. W. H. Allen for the Cincinnati, Hamilton and Dayton. The corner they now occupy is more prominent and convenient than the time honored one on Third street.

The rest of the first floor of the building will be taken up by the Western Union Telegraph Company, which will not be ready to take possession for a month or more. The batteries will be located in the basement, and will consist of fifteen hundred cups. The number of wires running into the office from points outside of the city will be fifty-one, and including the city "loops," will be seventy-five or eighty. In the way of battery capacity, the new office will be much enlarged, as in the old place there are only one hundred and eighty Grove cups and five hundred of the Callaud description.

Back of the counter, on the street floor, will be the offices of the manager and the receiving and delivery clerks, and back of this, fronting on Vine street, will be situated the offices of the superintendent and his clerks.

The second and third floors will be for rent for offices. On the fourth floor will be the office of the Gold and Stock Company, and the telegraph company's reception room for those who call to see the operators, and a cloak and luech room for lady operators. The book-keeper's room, on this floor, fronts on Vine and Fourth streets, and its dimensions are fifty-six feet by twenty-eight feet. The entire fifth story, of dimensions of one hundred and four feet by twenty-eight feet, will be taken up by the tables of the operators.

The employes of the company are G. T. Williams, Superintendent; Frank Armstrong, manager; B. H. Johnson, chief operator, and three assistants; A. T. Gold, chief night operator, and two assistants; and W. J. Lawler, chief book-keeper. There are sixty-one operators, twenty-eight clerks and office boys, who perform clerical duty, and forty-two night and day messengers. The business of the company is very extensive. For the month of August the number of messages passing through it was 117,250. This is exclusive of press reports. For the press the number of words handled during the month was 2,045,018. The average is small, as during winter, when Congress and Legislatures are in session, and there is more general news, the number of words passing through the office is more than doubled. In summer the average of city messages is about 1,000 a day, and in winter, when business is brisk, from 1,200 to 1,500 city messages are handled.

The company will retain an office at the old headquarters on Third street in order to accommodate the bankers and other down town business men, who frequently require the transmission and reception of messages with a rush.—*Cincinnati Commercial*.

Robbery Prevented by Telegraph.

THE robbery of the residence of F. S. Winston, No. 18 West Thirty-first street, New York, was neatly and promptly prevented Monday. Two thieves broke open the grating under a basement window, worked their way to the first floor, and opening a door, started the alarm in the office of the Thirty-fifth District of the American District Telegraph Company. Patrolman Stacy, who was on the watch there, was at the residence of Mr. Winston so quick that the burglar had barely time to escape by the back door as he entered at the front, of course carrying no booty with them. The family was out of town, and had wisely left the key of the house with the telegraph company, whose alarm wire in the house was a certain protection against thieves.

Correspondence.

We do not hold ourselves responsible for the opinions of our correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

A Reply to Journalistic Criticism.

CINCINNATI, O., Sept. 16.

"What do you read, my lord?"

"Words! words! words! Slanders, sir,"

—*Hamlet, Act II.*

TO THE EDITOR OF THE TELEGRAPHER.

THERE are many inconsistent things in the "make-up" of most men. We find men frequently doing the very things they pretend most to abhor. In moments of weakness we find them saying the very things they most savagely condemn in others. Napoleon professed the greatest contempt for Wellington's tactics at Waterloo, but, nevertheless, made unusual efforts in planning to counteract them. Santa Anna pronounced "Old Rough and Ready" "a fool" at Buena Vista, and yet he was fain at last to draw off his discomfited legions from the front of the unpretending but victorious little army of Americans.

I do not intend to dwell at length upon the language of the editors of the "Plug," but would simply remind them of what they must have forgotten (in the hurry of editorial business), that such language, though very forcible, is apt to react. That epithets rarely convince an antagonist in an argument, while they do often show a lack of effective artillery in the way of logic, and are often, like the Irishman's gun, most deadly at the breech.

When I observe that they have devoted nearly or quite three columns of the "Plug" to replying to "a fool," I must confess that they place nearly as low an estimate on their own ability as they do on mine, and certainly I could not hope to attract any greater notice to myself were I to resort to the same extensive vocabulary they have so largely chosen from. Reasoning from their own standpoint, I fail to see that their artillery has damaged any but their own forces.

The same elegant editorial hopes, too, that when the "Plug" shall be published on my standard, to see it "knocked higher than a kite." I suggested in my first, and would kindly repeat, that a slight elevation would be good for it. But I would offer as a mere speculation that its present prospects of an elevation to even the kite level, depend much upon the contingency of its enlargement. It would take too many copies now to cover a frame to make it at all probable that it will soon be used for kites.

He hints that he only knows of one course which would be likely to meet my approbation, and that would be to publish Watt's hymns, an old almanac, or Solomon's songs. Candor compels me to admit that he has rightly guessed. I do think Watt's hymns slightly superior in moral tone to the "Plug." Probably, too, some portions of Solomon's songs might be thought by men of ordinary culture to possess nearly equal literary ability. Solomon was forever lamenting his folly, however, and I would not recommend his writings, as being likely to please the taste of any who may happen to possess the culture requisite to render them admirers of the peculiar literature of the "Plug." He calls my words in behalf of the ladies, "Heroism in rushing into print." So be it. I had rather bear his sarcasm than wear the laurels he will win in attacking them through the personal columns of his paper. His brother editor, referring to them and what was said of them, remarks "that nothing had been said which should have offended the most fastidious." I happen to know that in one case the "personal" was so pointed as to produce the best evidence a lady can give of intense mortification and shame—tears. So much for heroism. In the concluding lines of the first editorial, to which I have briefly replied, he says, "Ah! well, the moon's at full." *Ay!* and it soon wanes. It was a new moon not long since, and promised well; but it was only a moon. It will wane, because its light is only the thin cold shimmer of reflection, and it shines much of the time—I will not say all the time—from behind the object it should illuminate. The second editorial, which I noticed briefly above in relation to the ladies, remarks that my ideas of the kind of journalism likely to benefit the class among whom it was to circulate, *i. e.*, scientific, well informed journalism, "would not only not be appreciated, but would be repudiated by practical telegraphers. They do not want the standard literature, nor what is suited to the religious, political, or sectarian public." Does he mean to say that they are mentally inferior to other classes of workmen, as, for instance, engineers? That they have none of the finer feelings or higher powers of other men? For his own sake, not to mention any personal pride I may have in the matter, I hope not. And, if it is true, then all the more reason why we should have a higher grade of journalism within our

ranks. However limited, too, may be my own knowledge of the wants of my professional brethren, I know that there are many who could and would appreciate the opportunities given by such a journal. "Our harmless criticisms, and our occasional sarcasms, have already proven of benefit" he says, and reasons that they prevent many mistakes which might work much damage—this, by rendering "the boys" more careful. I would suggest that a more potent means of producing accuracy is the plan now in operation in the W. U. Co., of deducting half the damage caused by the mistake from the pay of the one who commits the error. This plan certainly has the benefit of being intensely practical. He closes this column by remarking, "If *Nihil* had a more fraternal interest in native productions it would have given us more material of which to make of our paper what we desired it to be." I wonder if he can possibly mean that he desired his paper to be even partially made up of the contributions of a fool? Elsewhere he says, "they would have published cheerfully the item signed by *Nihil* Nameless." Why! he talks of *inconsistency*; calls me a fool! and then blames me for not contributing to the "Plug," and all within the space of a square foot of the valuable surface of the "Plug." Deduct that square foot, and you can make a *homœopathic* label of the rest of it. Possibly, while it is profitable to "the boys" to criticize *harmlessly* their little errors in receiving, it would be found not unprofitable to retouch some old forgotten author on spelling. Were a careful use to be made of Webster, we should not notice so many eccentricities in this direction. He professes, in the first issue of the "Plug," a "paternal interest" in the boys, and to be laboring to produce "greater harmony" among them, while his journal is filled with slurring allusions to their errors and picking at their peculiar habits and tastes. He "offers legitimate telegraphic amusement." Shade of Morse! Then follows an article on the "Art Gallery," the nature of which the operators here will understand. Truly, he sets up pins and knocks them down with the facility of *légerdmain*. Truly, logic falls apart mightily. In brief conclusion, let me ask all candid readers of THE TELEGRAPHER, ay! even of the "Plug," whether I am not right in the general statement that an elevated journalism is necessary and is obtainable? If telegraph operators have not often developed into Congressmen, lawyers or doctors, it does not follow that they may not. Besides, there live and practice to-day, in Cincinnati, honorably and successfully, a lawyer and a doctor, who have developed from the key. And while it will never be possible for all operators to become C. W. Fields or S. F. B. Morse, still it is possible to lift the profession to an honorable level with the other walks of life. At least, it is certain that the plan of feeding us with chaff is not the best way to try the experiment. I am glad that some of our journals pursue a different course. *NIHIL NAMELESS.*

The Proposed New Society of Telegraph Engineers.—III Feeling Among Telegraphers, etc.

CHICAGO, Sept. 22st.

TO THE EDITOR OF THE TELEGRAPHER.

THE wet, disagreeable weather experienced here and through the northwest during the past week has made telegraphing, to those at least who do service at the key, anything but a pleasure. Business is picking up very fast, and the different companies represented here all seem to be doing a thriving and remunerative business.

As the fruits of a recent discussion in the columns of THE TELEGRAPHER in regard to forming a society in this country somewhat similar to the Society of Telegraphic Engineers in England, there was last week an initiatory movement in this direction.

Some of the Knights of the Key in this section were disposed, in view of none but those in authority having been invited to be present at this meeting, to take it for granted that, as they were not asked, they would not be wanted hereafter to participate in such a society, but if my information is correct, the gentlemen mentioned met more by chance than otherwise, and had any other telegrapher, no matter how humble his position, chanced to have dropped into General Stager's room, he would certainly have been invited to remain and participate in the deliberations of the meeting. I am positively informed, by a gentleman who was present and participated in the deliberations, that the standard of knowledge to be possessed by applicants will not be placed so high by the by-laws of the society but that any telegrapher of good moral character and standing can gain an entrance. This is a step in the right direction, and shows just exactly what kind of men deliberated upon the matter the evening of this first meeting. "*Long may they wave.*"

There has been considerable quiet talk here recently among the fraternity, in regard to starting a society that should have the sanction of the officers of the different companies here, and that the society should be rather of a literary or glee club stripe, and in this way

get up a harmonious feeling, and let the matter spread, as such things generally do, to other places; and after enough of these local societies had been formed to make it a general one, and put forth general features, then something substantial might be accomplished. A great many things were hinted at, which would only occupy your valuable space to relate, and until some more tangible shape is assumed we will not tire your readers with a *resume* of the theories. One great objection to any society whatever, outside of a local society spoken of above, seemed to predominate, and that was the lack, or apparent lack of friendliness between operators at opposite ends of circuits to each other. It is claimed, and with a great deal of truth, that very few circuits will be found in any large office where there is not more or less real or imaginary hatred shown by the operators working it to each other, very frequently necessitating the interference of the different chief operators to settle the trouble, either by removal or threatened removal of one or the other operator in case trouble should arise again.

The causes are varied. Very often an operator who can take anything, but whose sending is no more readable than so much Greek, is set down at one end of a wire to work with a man who is, to say the best, an average receiver only, but a tolerably good sender. The result of such a match is easily anticipated; various other cases might be cited.

Very often two men, who are first class in every respect, fail to agree because, as a lady very facetiously remarked, "*They have never drunk together.*" Very often chief operators are to blame for such a state of things, as business done by such men will frequently be rushed back and forth at such a rate as to endanger the accuracy of the business itself in the endeavor to make each other "squeal." In a majority of cases, however, chief operators know very little of this state of affairs until some trouble arises. How much better would it be, when two men find they are not suited for each other, to either try to remedy the evil, if in no other way by a polite referring, mutually, of the matter to their several chiefs. We are not uncharitable enough to believe that any chief operator, who has any regard for the safety of the business for which he is responsible, delights in seeing such feelings engendered. It will not do to say that it will be all right when the boys meet—that they will fix up the little quarrel. The impression upon the manager of such men will be just the reverse of what is necessary to bring about such feelings between employer and employé, that one will look with confidence and good will upon the other. We must, by our manly bearing and our attention to business, show our superiors that we are entitled to their respect, esteem and confidence, before we have a right to expect it. Until that time arrives, until we have a right to claim the respect of our employers, we cannot expect to start any kind of a society that shall extend beyond certain local limits and restrictions. We must learn to forego showing up our brother operator, separated by a few hundred miles of wire, simply because his sending or receiving don't exactly suit us. It is probable that nothing will be done in regard to this local organization now until the *modus operandi* of "*The American Electrical Society*" shall be fully developed.

A very unsatisfactory trial was given to Foote and Randall's Automatic Telegraph system in the Gold and Stock rooms in this city on last Wednesday evening. The wire that the Western Union kindly furnished the inventor seemed to be troubled by sympathy from other wires on the same route, so that tracings of the foreign current (if it may be so termed) manifested itself on the chemical receiving paper when it was attempted to signal faster than 80 words per minute. We saw some very fine work exhibited, however, which was done at Buffalo, at from 200 to 300 words per minute. Buffalo and Chicago are the only two points where they have experimented with the machine, using ground connections to complete the circuit. Other tests, and very good and satisfactory ones it is claimed, have been made on metallic circuit. It looks like a very simple instrument to do such fast work. It seems to us, however, that before this machine can be a perfect success a separate wire, well insulated on poles where there are no other wires, will have to be erected for its use; the magnet being necessarily so sensitive that the induction current or sympathy, as you please to term it, from other wires on the same poles, would seriously affect the reliability of the signals, especially at as high a rate of speed as it is necessary to work an automatic telegraph so that it can favorably compete with the Morse. It must be remembered, however, that these gentlemen do not claim to have as yet perfected their invention.

Of course at the present time no communication from this city would be considered complete without some reference to "the Great Industrial Exposition." A stroll through it a few evenings ago, however, failed to reveal to me anything that would interest the fraternity. Perhaps "Occasional" may be able to find something, as he pronounces you, predicting that all those who exhibited telegraph apparatus and machinery last year

will be on hand this year. I tried in vain to find a single telegraph manufacturing firm in the whole building. NORTHWEST.

A Railway Telegrapher Cowhided.

TO THE EDITOR OF THE TELEGRAPHER.

QUITE an exciting scene transpired at a station on the Western Railroad recently. A few minutes after the eastern bound passenger train had left H—, Mo., Mr. S—, a teacher in the public school of that town, accompanied by his daughter and a lady friend, were seen rapidly approaching the depot. On reaching the office Mr. S— called out the operator, Johnny —, and accused him of circulating reports calculated to injure his daughter's reputation. This the young man stoutly denied, but our teacher's wrath could not be thus easily appeased. Turning to the girls, who in the meantime had engaged in a stormy dispute with their intended victim, he said, "Girls, did you come here to talk or for business? Do your duty!" A cowhide was then drawn from beneath the wrappings of each of the young ladies, but either through fear or compassion they seemed to feel a reluctance in carrying out the performance for which they had come. This seemed to exasperate the father, who, snatching a cowhide from his daughter's hand, seized Johnny by the collar, and laid on the lash with a vengeance. Down came the cowhide wielded by an unrelenting hand, raising a welt at every stroke. The young man's shrieks could be heard for a block, the young ladies meantime standing by and apparently enjoying the performance hugely. There would have been but little left of Johnny had it not been for the timely interference of a line repairer, who made the infuriated parent desist, and that in the face of a revolver. Calling to the girls, our teacher retired from the scene, doubtless convinced that the family name was fully vindicated and the disciple of Morse had received a lesson which he would not soon forget.

The assaulted telegrapher is now engaged pistol shooting at a mark, and vows that he will yet be even with his impetuous and cruel assailant. EMMOTT.

A Telegrapher Sold.

WISCONSIN, Sept. 18th.

TO THE EDITOR OF THE TELEGRAPHER.

I AM of the opinion that Webfoot, Will Honeycomb, Peter, and a few others of the "literary persuasion," whose communications have shone forth so frequently from the columns of the "THE TELEGRAPHER," will comment upon the murdered English and blind guessing of the writer in a vain endeavor to stir up the humorous feelings of the reader, but, "here goes."

"Fm." the worthy "burner of the midnight oil" at "Du," was sold, just a little, the other day.

One of the boys, who we will call "W.," came home to "Dn" on a visit. As soon as Mac, the "invincible" day man, who is ever ready for a joke, heard of his arrival, he told "Fm." that "W." had come to relieve him, and that he was "doue for." He nearly fainted at that, but, recovering, forthwith set out for the abiding place of "W." That day happened to be an "old toaster," about a hundred in the shade, more or less, and by the time that mile and a half was traversed, "Fm." was in a woe-be-gone condition. Sweltering with the heat, and nearly frantic with excitement, he rounded the last corner to his destination.

He espied his man, and opened on him with "Hello! 'W.'" I-I heard you e-came to take my place, w-well, I don't care. I-I don't want it." (Oh! uo!) "W." smiled, and informed him that he "wouldn't be found dead in that office," and wondered where he got that information.

"Oh! Mac told me." "Ha! ha! that's a good 'un. He has been sending you down here on a wild goose chase. It looks like a veritable 'Tom Collius joke' to me."

A smile of comprehension passed over the features of our friend that was indeed laughable to see, 'twas so "childlike and bland."

"Fm." decamped rather unceremoniously, wiser by experience, and when "Mac" and "W." met, they had a hearty laugh at his expense. F. D.

A Retrospect.

G. N. from N. Y., at 4 A. M. (P. & A., 1871.)

In ancient Thebes, as the story goes,
There stood a statue, from whose marble lips,
Touched by Aurora's rosy finger tips,
At early dawn the sweetest strains arose;
So comes across the distant hills the first faint beam of light,
Kisses the wire, and straightway thrills the welcome sound,
"Good Night."
J. F. H.
PITTSBURGH, PA., 1874.

In opening the New Zealand Parliament, the Governor in his speech, referred to cable communication with the other colonies, and expressed the hope that it would be speedily carried out.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, SEPTEMBER 26, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST OF THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK ON ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

a No. 1 Telegraph Key, or a set of F. L. POPE & Co.'s popular NONFAREIL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

Publisher.

P. O. Box, 5503.

To the Friends of The Telegrapher.

It is with pleasure that we call attention to the new and liberal offer of PREMIUMS on the first column of the editorial page, to those who may be willing to exert themselves to obtain additions to the subscription list of THE TELEGRAPHER. We have usually published such an offer at this season of the year, and are willing thus to admit those who may aid us in maintaining and increasing the circulation of the telegraphers' organ to a participation in the benefits derived therefrom. These Premium offers have been very favorably received heretofore, and have resulted in interesting new assistants in the work of maintaining a telegraphers' organ, and calling attention to the necessity for constant effort and coöperation on the part of former friends and collaborators.

The independent course pursued by THE TELEGRAPHER—keeping it clear of complication with any telegraphic company or clique, and offering an opportunity for full and free discussion of all telegraphic subjects—naturally creates enmity and opposition on the part of some narrow minded and small souled individuals connected more or less prominently with the telegraph business. It has stood against the efforts of such persons heretofore to injure and destroy it, and has come out of all such contests hitherto more popular and prosperous than ever, and while it retains the confidence of the telegraphic fraternity, will, no doubt, continue to do so. We propose to speak the truth in regard to telegraphic matters and individuals without fear or favor, whoever may be pleased or hurt thereby. All honest and genuine advances or inventions in electrical science and telegraphic art will be recognized and advocated, while appropriators of the ideas and inventions of others—charlatans and would-be impostors—will continue to be shown up in its columns, as heretofore, in their true characters and colors.

In short, we propose that THE TELEGRAPHER shall continue to be in all respects an honest, reliable and independent telegraphic journal. No effort is spared to constantly improve it and make it more worthy and creditable to the fraternity as their representative and the telegraphic journal of the country.

In conclusion, we would again ask every telegrapher who has faith in the paper, and who considers its continuance and efficiency desirable and essential, to consider himself or herself an active agent for adding to its subscription list and material support. We await with confidence the hitherto never failing response to this request.

The Edison and Prescott Organ and Fast Systems of Telegraphy.

THE last number of the *Journal of the Telegraph* ventilates the ideas of Messrs. EDISON and PRESCOTT on the subject of "Fast Systems of Telegraphy" at considerable length. In 1870 Mr. PRESCOTT, in the interests of the Western Union Telegraph Company, published in the *Scientific American* a long communication, in which he demonstrated to his own satisfaction that the automatic telegraph system, then coming into general notice, was a failure as regards speed and economy. As time passed on and the statements, arguments and deductions of the writer were proved by actual performance in practical business operations to be unfounded and unreliable, the friends and advocates of automatic telegraphy from time to time have quoted this article and compared it with what was actually accomplished, much to the annoyance of the writer, whose zeal and haste had led him into making state-

ments as an electrician which proved more damaging to his professional reputation than to the system he had attempted to decry. Goaded at last by these constant references to his literary and professional *faux pas*, he attempts to wriggle out of the dilemma. For this purpose the *Scientific American* article is reprinted in the *Journal*, and an attempt is made editorially to show that the article was not so entirely without foundation as had been supposed.

One of the arguments relied upon to demonstrate this is that after five years only one line—that between New York and Washington—uses the automatic system. This, even if true, which it is not, amounts to nothing as an argument. A wire on the Philadelphia and Reading line was worked extensively by the automatic system for a long time, and we believe is now being thus worked very successfully. The automatic system has also been very successfully used by the Southern and Atlantic Company in a direct circuit between Charleston, S. C., and Washington. The comparison between the automatic systems used in Europe and in the United States amounts to nothing, as they are entirely different affairs. The WHEATSTONE duplex, used by the British Government to a limited extent upon the telegraph lines, is known to be comparatively slow; and yet the Western Union Company, under the guidance of its electrician, are now engaged in trying to adapt it to use upon its lines. "People who wish to send telegrams promptly are not going to wait for them to be first punched, and then transmitted, and then slowly and laboriously copied out by hand," says the *Journal*. It is a sufficient reply to this that they do wait, and are apparently satisfied that their messages, notwithstanding these three processes, are delivered as promptly, at least, as by any other method, if we may judge from the fact that the lines of the Automatic Telegraph Company are doing a good and constantly increasing business.

We have not space to follow out the subject, and will only say that Mr. PRESCOTT, in his second attack upon automatic telegraphy, has not bettered his case, and substitutes assertions which experience has disproved for argument.

But it is when the achievements of PRESCOTT and EDISON came under consideration that the writer warns up to his theme. The automatic inventions of LITTLE, WHEATSTONE and others sink into insignificance alongside of the great "quadruplex" invention, which is bound to at once revolutionize telegraphy and carry the inventors, the Western Union Telegraph Company and all concerned, on to glory and fortune. When this great invention is fully developed all other fast systems of telegraphy must subside into insignificance, and disappear from the face of the earth like the dew before the morning sun. This great "invention" has by no means been abandoned, notwithstanding the rude shock which was given it in the article published in THE TELEGRAPHER of July 18th, under the caption of "The Dutch have taken Holland." It still lives and thrives, as it has done since Dr. STARK of Vienna, in 1855, demonstrated the practicability of sending two pulsations simultaneously over a wire in the same direction and recording them. We have in the *Journal* marvellous accounts of the performance of the "quadruplex" under favorable conditions, but we are not favored with a statement of its workings on any other but the best wires and with perfect insulation, and with good climatic conditions.

In this connection we would call attention to an article from *The Telegraphic Journal*, of London, which we reprint on another page, in reference to the duplex and quadruplex, the writer of which seems to be somewhat satirical on the pretended new inventions of EDISON and PRESCOTT, and cruelly gives it to be understood that the new invention is really a very old affair, and goes on to describe how it is done. He evidently has not that overpowering appreciation of the genius of the reinventors that they have themselves, and it is to be feared that an application for a patent on it, were he the examiner, would scarcely meet with favor.

We shall refer to these matters again hereafter, but for the present have neither the time or space requisite to give them fuller consideration.

The *animus* of the *Scientific American* article above referred to was, evidently, that the Western Union Company, not owning the automatic system, was interested in its being decried, and the public made to believe it of little or no value—of this later emendation, that automatic and quadruplex are not likely to thrive together.

The American Electrical Society.

We print in another column an account of a meeting of electricians and practical telegraphers, held in Chicago on the evening of the 14th inst., to take action for the formation of an association for the advancement of electrical science in this country. We are assured that this is an earnest movement, and that it will be effectually and permanently carried out.

THE TELEGRAPHER has long and persistently advocated the formation of such an association as demanded by the best interests of the telegraph, and it gives us great pleasure to be able to record the initiatory steps for this purpose. It is scarcely necessary for us to repeat the advantages to be derived from such an association of the able electricians and practical telegraphers of which there is no lack among us.

The movement is in good hands and will not be suffered to flag for want of interest in it. The organization is intended to be catholic in its character, and to admit to active participation in its proceedings all who are interested in the advancement of electrical science. Its progress will be watched with interest, and there is no doubt but that it will prove not only advantageous but creditable to the electricians and telegraphers of the country.

The "Organ" Business.

It has been generally supposed that the *Journal of the Telegraph* was the official organ of the Western Union Telegraph Company. We have shared in this belief, and have occasionally referred to it as such. Of late, however, its character has been changed, and it has now become the personal organ of TOM EDISON and Mr. GEORGE B. PRESCOTT, the latter occupying the position of electrician to the company. It is EDISON and PRESCOTT and PRESCOTT and EDISON, *ad nauseam*. It was always heavy and dull, as became an "official organ," of which, as its circulation is mainly to the officers and employes of the company gratuitously, and as those to whom it was sent were under no painful obligation to read it, there was no reasonable cause for complaint, and it served a useful purpose in circulating the orders, tariff rates, etc., of the company.

As a personal organ, however, run in the interest of the two parties named, to advance their purposes and manufacture fame, reputation and fortune for them exclusively, it is quite a different affair, and is open to criticism. The electrical idiosyncrasies of EDISON and PRESCOTT (since they have entered into partnership) are fully set forth in its columns; and if much puffing could render them valuable they would be the most remarkable scientific geniuses of the present or any former age. Unfortunately for them, outside the limited "ring" of which they are the principal members, they are not regarded as the bright and shining lights which they evidently consider themselves. However effectually they may succeed in convincing the President of the company of their preëminent abilities and attainments, electricians and practical telegraphers refuse to accord them the high position in electrical science and practical telegraphy to which they aspire. In fact, they are regarded rather as pretenders than as actual electricians and scientists.

Not content with one "organ," however, we notice that they have adopted a nondescript sheet called *The Operator*, of which a few of our readers in this vicinity may have heard, as a sort of sub-organ or tender upon the larger and more pretentious sheet. Recent issues of this publication have contained such fulsome and ab-

surd slaverings of EDISON as to make that person appear even more ridiculous than he otherwise would. It is generally believed that these are the productions of his own pen, as it is not reasonable to suppose that any other person would venture to expose even him to such ridicule as must be caused by the stuff that appears in its columns. The "organ" business is truly being run into the ground.

The Steamer Faraday not Heard From.

THERE is something very singular about the disappearance so long from public notice of the steamer Faraday and the Direct United States cable, which it is engaged, or supposed to be engaged in laying. The last heard from her is from the steamship *Algeria*, of the Cunard line, that arrived here on Sunday last, which reports, Sept. 15th, in lat. 50° 34' lon. 25° 06', passed two steamers bound west, supposed steamships Faraday and consort.

There are not wanting those who are uncharitable enough to assert that, having failed to obtain the royal assent to the act which would permit the landing of the cable at Newfoundland, it is not desired or intended to lay and operate it this season. Unless it is completed within a very few days it is certain that it cannot be done before next summer.

Reminiscences.

"In the days of 'Auld lang syne.'

While reading THE TELEGRAPHER we are more forcibly reminded of its editor, J. N. Ashley, when we recall the days of the House Telegraph. We were in Columbus, Ohio, when our friend Ashley had the House in charge. We were in the 'National' lines then, and Jim Ware was our manager.

This was a matter of about twenty-one years ago, and often our youthful ears heard the interchange, between Jim and Ashley, of those magic and expressive letters, F. S. We saw them appended to office inquiries and social questions, and they were so indelibly fixed upon our mind that we recall that time as though it were but yesterday. We lost track of our friend Ashley until lately, when we ascertained the proper identity. If his memory should not serve him as tenaciously as ours regarding the mystic letters F. S., we will write him.—*The Plug*.

We well remember the season passed in Columbus, Ohio, in charge of the House Printing Telegraph office. We were somewhat younger then than now, but we have kept in kind remembrance the telegraphers connected with the Wade and National lines at that place, who, notwithstanding business competition and rivalry, were friends and social companions. WARE left the business about the time that we shook the mud of Columbus off our boots and returned to the east and the old New York and Boston House line. He was a good fellow, and we hope that he has met with success in life, which he certainly deserved to do. As to the mystic letters, F. S., to which our cotemporary refers, we must confess that their meaning has faded from our recollection, and we should be glad to hear from him, as promised, by letter, on that and other matters relating to the olden time, when we went west with anticipations of telegraphic success and progress which a few months' experience satisfied us were not to be realized.

Personals.

Mr. CLINTON H. SCOTT, formerly manager of the Wellsboro', Pa., telegraph office, has resigned and engaged in the coal business at Towanda, Pa.

Mr. H. A. CLUTE, Superintendent of the Lehigh Valley and Penna. & N. Y. R. R. Co.'s Telegraph, is at present engaged (in New Jersey) in the construction of a telegraph line over the Easton and Amboy R. R. (an extension of the Lehigh Valley R. R.) The line will extend from Easton to Perth Amboy, a distance of sixty-five miles. A peculiarity about this line from any others yet built in this country will be the use of a No. 11 galvanized steel wire on Brooks' Patent Insulators. The poles will be set sixteen to the mile. The E. & A. R. R. will be in partial operation by December next, and it is expected that early in spring the whole road will be in complete operation.

Mr. JOHN H. DWIGHT, who has had charge of the Western Union Company's interests in Albany, N. Y., for a year past, has been transferred to 145 Broadway, New York, where he has entered upon the duties of chief operator, *vice* Mr. Gerritt Smith, promoted to assistant electrician.

Mr. JAMES H. RUGG, an old and widely known telegrapher, succeeds Mr. DWIGHT as manager of the Albany office.

Mr. M. L. MORGAN, late assistant chief operator, has been promoted to chief operator, Albany office, *vice* Mr. JAMES H. RUGG, promoted to manager.

The Telegraph.

By Cable.

THE FARADAY NOT HEARD FROM.

LONDON, Sept. 18.—The steamer Faraday, engaged in laying the direct cable, has not been heard from for several days. It is the impression of the officers of the company that the cable has been broken and that the Faraday is engaged in grappling for it.

LONDON, Sept. 18.—Nothing has been heard from the steamship Faraday, laying the direct United States cable, since the 9th inst., when she payed out 574 miles and was in water over two miles deep.

It is supposed here that the cable broke in the gale of the 10th inst., and that the Faraday is trying to recover it.

Annual Meeting of the Gold and Stock Telegraph Company.

THE annual meeting of the Gold and Stock Telegraph Company was held at the office of the company on Tuesday last, September 22, and the following directors elected to serve for the ensuing year: Marshall Lefferts, William Orton, A. B. Cornell, G. B. Prescott, James H. Banker, George H. Mumford, Norvin Greene, Tracy R. Edson and Henry R. Pierson.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended Sept. 5, 1874, was 392,133—an increase of 30,361 on the corresponding week of last year.

The Western and Brazilian Telegraph Company have notified that their cable between Pernambuco and Bahia being under alteration, the through communication with Bahia and stations beyond is temporarily suspended. Pending the interruption, all messages for places south of Pernambuco down to Buenos Ayres and the West Coast of South America will be sent by post between Pernambuco and Bahia, to be telegraphed thence to their destination.

The Great Northern Telegraph Company have obtained a concession from the Chinese Government for the establishment of a land line from Amoy to Foochow, and as the erection of it has already been commenced, the important port of Foochow will soon be in telegraphic communication with Europe. In Japan the company's repairing steamer is at present submerging cables on account of the Japanese Government to connect Nippon and Yesso.

The official report of the telegraphs in the Swiss Confederation during the first six months of the present year shows that 775,316 telegrams were despatched from one part of the Republic to another—being an increase of 84,000 in the corresponding period of last year. The foreign telegrams arriving and despatched number 237,210, showing also a slight increase. The receipts have also increased to 759,051fr., but the expenditure has also been augmented, and there is a deficit on the whole of over 110,000fr.

The receipts of the Great Northern Telegraph Company for the month of August amounted to 414,553fr. (£16,582), and for the month of August, 1873, to 331,238fr. (£13,249). The total traffic receipts from the 1st of January to August 31 amounted to 2,914,362fr. (£116,574), and for the corresponding period in 1873 to 2,053,350fr. (£82,134)—showing an increase of 861,012fr. (£34,440).

The receipts of the Submarine Telegraph Company for August, 1874, were £8,853, against £8,439 for the corresponding month last year.

The number of messages of twenty words that passed over the Barcelona-Marseilles Cable was, for the month of August, 6,138.

The number of messages passing over the Cuba Submarine Telegraph Company's line during the month of August amounted to 1,725, estimated to produce £2,000, against 1,260 messages, producing £1,216 in August last year.

At Demerara, West Indies, arrangements for the construction of the system of inland telegraphs to connect the West Coast of Demerara and Essequibo with New Amsterdam, authorized by the Court of Policy, are in progress.

Telegraphic and Electrical Brevities.

The poles are all up between Jessop, Georgia, and Jacksonville, Florida, on the Great Southern Railroad; the wire, and insulators, and brackets, have been forwarded by the Southern and Atlantic Telegraph Company, and the line will be completed and put in operation immediately.

The section of the International Ocean Telegraph Cable between Key West and Punta Rasa is again interrupted, and messages are carried between those two places by steamer.

The American Electrical Society.

On the evening of Sept. 14th a meeting of electricians and practical telegraphers was held in Chicago, at the rooms of Gen. Anson Stager, General Superintendent of the Central Division of the Western Union Telegraph Company, for the purpose of taking measures looking to the formation of an organization for the advancement of electrical science in this country, corresponding, in some respects, to the Society of Telegraph Engineers, which has proved so successful in England.

Mr. C. H. Haskins, General Superintendent of the Northwestern Telegraph Company, was called to the chair. Mr. C. S. Jones, Superintendent Illinois Central Telegraph, was appointed Secretary.

The Chairman, after stating the object of the meeting, proceeded in a few brief but well chosen remarks to set forth somewhat in detail the character and aims of the proposed organization. A free interchange of opinion then took place among those present, in reference to the most efficient plan of organization; it being generally admitted that the peculiar circumstances to be met with in this country rendered it necessary to adopt one in many respects essentially different from that of the English society. The general sense of the meeting seemed to be that the new society should be made, as far as possible, of a practical character, and the conditions of membership such that every person, however humble his position, who is really interested in the advance of electrical science, should be able to avail himself of its advantages, so that its benefits should be confined to no one class, nor particular section of the country.

Some discussion also took place in regard to the name of the proposed association, and that suggested by Mr. F. L. Pope, of New Jersey, viz., "The American Electrical Society," was finally agreed upon.

A committee of five was then appointed by the Chair to draft a constitution and by-laws, consisting of the following gentlemen:

C. H. Summers, Chicago; Gen'l Anson Stager, Chicago, F. L. Pope, Elizabeth, N. J.; F. H. Tubbs and C. S. Jones, Chicago. This committee were also instructed to issue a circular of invitation to all interested to attend a meeting for the purpose of completing the permanent organization, which meeting is to be held at Chicago on the third Wednesday in October, and at which time the committee on the constitution were instructed to report. After some further conversation the meeting adjourned. A marked interest was taken in the matter by all present, and great confidence was expressed that the proposed society would prove an eminently prosperous and useful one.

Hymeneal Presents to a Western Union Cashier.

The marriage of Mr. George P. Riley, the attentive cashier of the Western Union Telegraph Company in this city, to Miss Maria C., daughter of ex-alderman Norton, of Troy, was solemnized in St. Joseph's Church of that city last Thursday. The young people were the recipients of several beautiful and costly presents, among them a splendid French bronze clock, from Mr. R.'s associates in the telegraph office. We hope the future of the young couple will be as bright as their friends could wish.—*The Press (Albany, N. Y.)*

Complimentary.

MANAGER John H. Dwight, of the Western Union Telegraph Company, has been promoted to the position of senior chief operator (a post he is eminently qualified to fill) of the New York office. Mr. James H. Rugg, a well and favorably known telegrapher, has been promoted to the managership, and Mr. M. L. Morgan chief operator of the office here. These promotions have been earned by many years' faithful service. The public generally will be glad to learn of this commendable act on the part of a great company.—*The Press (Albany, N. Y.)*

New Patents.

For the week ended August 11, 1874, and bearing that date.

154,002.—ELECTRIC TELEGRAPHS. Wm. C. Barney, London, England. Filed January 21, 1874.

Opposing batteries connected by positive poles at each end of line. When transmitting from a station, battery at that station is short circuited through a resistance current from receiving station going over line and back by earth, making record at its own station in instrument placed between negative pole of battery and earth, the earth or extra currents being cut off by resistances placed between earth and the instrument.

1. The combination with an insulated line having batteries at each terminal thereof, placed with their positive poles to said line, of the resistances R R', arranged between the receiving instrument and the ground, substantially as and for the purpose set forth.

2. The combination, with the insulated line, as described, and resistance R R', of the additional resistance R' and battery F, arranged and operating substantially as set forth.

3. The combination with an insulated line of a battery having its positive pole coupled to the line at the transmitting end and to the wire brush b, while the negative pole of the battery is coupled to the earth line through resistance R, substantially as and for the purpose set forth.

154,029.—ELECTRIC HOTEL ANNUNCIATORS. Louis Finger, Boston, Mass. Filed December 31, 1873.

Improvement in devices whereby a shield is caused, through a series of impulses, to designate at an aperture the nature of the want signaled for.

1. The combination of the rotating character shield or plate, or a series of such shields, with a single shaft, which at once constitutes the axis of said shield or series of shields, and the means whereby the said shield or shields, after having been actuated by the electro-magnetic apparatus, may be returned to its or their normal position, as shown and set forth.

2. The rotating shield or character plate, and escape pins projecting laterally from said plate, in combination with the magnet, armature and pallet carried by the said signature, constructed and arranged for joint operation, as shown and set forth.

3. The combination of shaft F, register I pins k and l, or their mechanical equivalent, and spring H, arranged for joint operation, as shown and set forth.

RILEY—NORTON.—In the City of Troy, N. Y., Sept. 17, 1874, at St. Joseph's Church, by the Rev. M. Driscoll, GEORGE P. RILEY, Cashier W. U. Co.'s Albany, N. Y., office, to Miss MARIA C. NORTON, of Troy.

The employees of the Western Union, Albany, N. Y., telegraph office, presented Mr. RILEY with an elegant bronze clock on the occasion of his marriage.

VAN SIZE—FELLOWS.—At Albany, N. Y., Sept. 22, 1874, by Rev. F. R. Morse, Mr. Wm. B. VAN SIZE, chief operator, Atlantic and Pacific Co.'s, Albany, N. Y., office, to Miss MARIAN G. FELLOWS, of Albany.

Mr. VAN SIZE was kindly remembered by his office associates in the happy occasion, they presenting him with a handsome silver ice pitcher.

ANDERS' MAGNETO PRINTING TELEGRAPH INSTRUMENTS.

These instruments require

NO ACIDS OR CHEMICAL BATTERY,

the currents required to operate them being generated from PERMANENT MAGNETS.

They print very rapidly, and having been fully tested on private lines during the last eighteen months, have proved to be

VERY RELIABLE.

The following parties, among others, have purchased them after giving them

THOROUGH TRIALS

on their several lines:

- THE BOYNTON PACKING COMPANY, Boston, Mass.
- CHAS. HULBERT, Esq., 8 Exchange Place, Boston, Mass.
- THE BOSTON AND ALBANY RAILROAD CO., Boston, Mass.
- MESSES. J. H. CHADWICK & CO., Boston, Mass.
- JAMES ALEXANDER, Esq., Agent Cunard Steamship Company, Boston, Mass.
- CHAS. S. LOVERING, Esq., Treasurer of Whittenton Mills, Taunton, Mass.
- HON. ISAAC BRADFORD, Mayor of Cambridge, Mass.
- GEO. H. COPELAND, Esq., Chief of Police for the Cambridge Police Telegraph, Cambridge, Mass.

We also continue to manufacture

ANDERS' MAGNETO DIAL TELEGRAPH INSTRUMENTS,

which have been extensively used for several years, and are recommended as the

BEST DIAL INSTRUMENTS MADE.

Parties who purchase either our PRINTING OR DIAL INSTRUMENTS can exchange one for the other at any time, as both the Printers and Dials are used with the same transmitters.

Durability, Efficiency, and Economy of Expense
 and **Labor at last Secured.**

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The **Electro-Mechanical Gong Striker**,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the
original *FARMER & CHANNING PATENTS*, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THREE**
CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its in-
troduction into their localities is cordially invited, and
their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, a
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that
will work practically with a single DANIELL cell, a **BATTERY**
that does not require to be taken down but once a year, and the
very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

A AMERICAN COMPOUND TELEGRAPH LINE WIRE.
COPPER FOR CONDUCTIVITY.
STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE, compared with iron, consists in its LIGHTNESS, reducing by over fifty per cent. the number of poles and insulators required.

Relative TENSILE STRENGTH, homogeneity and elasticity—decreasing the liability to breakage from cold weather, sleet, etc.

CONDUCTIVITY—insuring great improvement in the working of lines in any condition of the weather.
 And in its DURABILITY, which greatly exceeds that of the best galvanized iron wire.
 Altogether resulting in a very great reduction in the cost of maintaining and working telegraph lines, while, at the same time, insuring

EFFICIENCY AND RELIABILITY.

Address—
American Compound Telegraph Wire Co.,
ALANSON OARY, Treasurer,
 No. 234 West 29th St.,
 New York.

BLISS RESERVOIR BATTERY.
 PATENT APPLIED FOR.

Price per Cell, - - - \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of
THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,
 Author of "Telegraph Companion," "Telegraph Manual,"
 "History of America," "Civil War in America;" Member
 of many Scientific and Learned Societies of Europe
 and America; Commander of the Order of Dan-
 nebrog, Denmark; Order of St. Olaf,
 Norway, and of the Sword Order,
 Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given
 The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
NO. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS for telegraphic purposes, or closed circuits of any description. This Battery received the FIRST PREMIUM over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for MORE THAN ONE YEAR, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION, and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a **LOCAL BATTERY,**

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

New York, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.80.

Agents for towns, and counties wanted.

W. HOCHHAUSEN,
Manufacturer of
ELECTRICAL INSTRUMENTS,

182 WILLIAM STREET (rear),

Between Fulton and John Streets, NEW YORK.

One half of actual size

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard. Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight..\$50 00

Sounders, from.....4 50 to \$6 50

Electric Bells, single stroke or continuous ringing, from.....5 00 to 8 00

Relays, from.....9 50 to 16 00

Improved Switch Keys, from.....3 00 to 5 50

Send for Illustrated Circulars. The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular Pioneer Cheap Telegraph Instrument has recently been improved and a Straight Lever Key placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and it is still the leading telegraphic apparatus of its class.

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50

Two sets of Instruments, etc., 12.00

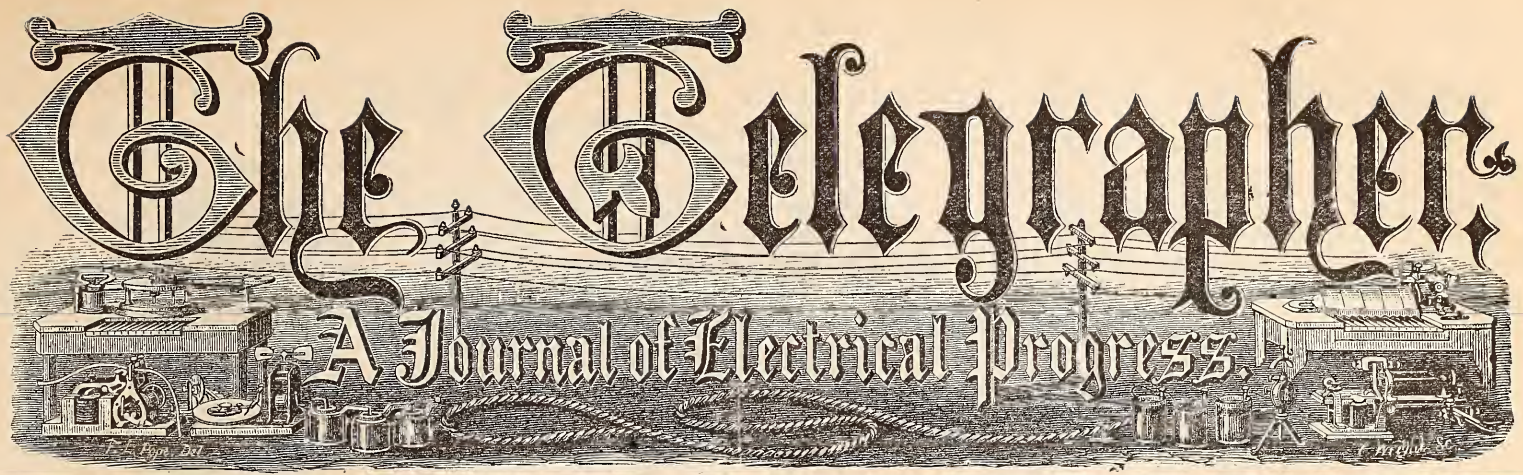

Send for our new Circular and Price List.

GEO. H. BLISS & CO.,
SOLE AGENTS,
41 THIRD AVENUE,
Chicago, Ill.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
No local required. Always ready for temporary offices.
Just what is wanted for officers' cars.
Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
WATTS & CO., Baltimore.

THE REASON WHY THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
8 Dey Street, N. Y.

My Last '73.

WELL, boys, I'm done with the business—
My fingers are stiff at last,
And I'll never jerk the lightning
Like I did in the days that's past.

My "battery" is lusted,
The "vitriol" all played out;
There's no more "local current"
Than you'll find in an old eave's spout.

My "magnets" have lost their power,
My "key" all covered with rust;
I hate to "cut out" forever,
But I must, for I can't adjust.

I've "pounded brass" for a livin'
Nigh onto forty years,
But the click of the "giant sounder"
Don't come to my weary ears.

I can't go back on "paper,"
For my sight begins to fail;
And I couldn't tell, to save me,
A "pole" from an old fence rail.

I feel the "relay" workin',
But cannot hear the sound,
I can't tell by these "patent fixins,"
The "cut out" from the "ground."

To-day the "circuit" lusted,
And I done my level best
At testin'; but, to save me,
Couldn't tell "east" from "west."

I tried to "screw up" for "X" to-day—
For I thought he was callin' me—
But with the magnets ridin' the armature,
I couldn't a worked with "B."

So, I says, old man it's comin',
You've surely had your day,
When you try to "adjust" by turnin'
The "screw" the other way.

So I wrote the train despatcher
That my day had come and gone;
If he had another man, I wished
He'd send him right along.

"On No. 3," he told me,
I can see the head lights shino.
So now I say good-bye to all
The "old boys" on the line.

Farewell! may Heaven bless you.
I can hardly hold the key;
Tears come when I try to say it,
My last long "73."

I. C. EDWARDS.

The Boston Industrial Exhibition.

The fair of the Massachusetts Charitable Mechanics' Association has been open at Boston for two or three weeks past, and is very complete and successful, as the exhibitions of this association always are. They are held but once in five years, and are a notable event in New England.

A correspondent sends THE TELEGRAPHER a brief account of the electrical and telegraphic instruments and apparatus on exhibition, which will be of interest. He writes that there is nothing especially new or interesting in the applications of electricity, unless we except the remarkable magneto-machine of Mr. Moses G. Farmer.

Mr. Charles T. Williams, the well known and long established manufacturer and dealer in electrical and telegraphic apparatus of 109 Court street, Boston, has a full line of telegraph apparatus on exhibition, which are very beautifully and substantially made, and highly finished with nickel plating. Mr. Williams has deservedly an excellent reputation as a manufacturer, and his contribution to the electrical department of the fair is highly creditable to him and the exhibition.

Mr. Thos. Hall exhibits his new portable battery for medical use, which is an improvement of Meyer's battery, and also a battery for galvano-caustic operations. He also exhibits a Ruhmkorff coil connected with a rotating Geissler tube, which is rotated by a very nicely constructed electro-magnetic engine, operated by the same battery that operates the coil. This apparatus can be used for illustrating the law of the persistence of vision, and when in operation will show a beautiful star of light.

Messrs. Jerome Redding & Co. exhibit some tele-

graph apparatus, electric bells etc., which are well made.

Messrs. Welch & Anders exhibit Anders' magneto-printer and magneto-dial instruments. The magneto-printer operates very efficiently and with considerable rapidity—as high as thirty words per minute being obtained on it.

The Gold and Stock Telegraph Company exhibit the celebrated Gray & Barton printer, and also a pair of the repeating instruments used in the business of the Company.

Mr. Edwin Holmes exhibits his well known and highly successful burglar alarm, which has been so generally introduced.

Another firm show many forms of the French annunciators and house telegraphs.

Press Telegraphing in Great Britain.—Inefficiency of the Postal Telegraph.

In the *New York Tribune*, G. W. S., its London correspondent, writes, under date of September 3d, in regard to telegraph matters in connection with the press as follows:

Of the curious views which some people who might know better entertain about journalism, a specimen has just turned up. I find in an important periodical two references to the report of Prof. Tyndall's address. It is described as occupying eight and a half columns of *The Times*, and every word of it, we are told, "was transmitted by telegraph at an immense cost to the leading journal." The telegraphic despatch is again mentioned in the same periodical as "one of the latest wonders of journalism, the cost of which, it is manifest, must have been enormous." I quote from *The Publishers' Circular*, which, concerning itself with practical matters touching literature of all sorts, ought to be better informed about the literature of journalism, and the expense of putting it in shape to be read. There is something ludicrous in the notion of enterprise and expenditure in getting Professor Tyndall's address. Whether the address was telegraphed at all may be doubted. It was in type in London some days before the meeting of the Association in Belfast. That copies were deposited with the principal journals of London may be inferred from the fact that one evening paper published extracts from the address some hours before it was delivered. It would be odd if no copy were sent to *The Times* office, or if their Belfast correspondent did not know that one had been sent, and so treated them to a telegraphic copy. Even in the latter case the expense would not cripple the paper. The actual cost which *The Publishers' Circular* speaks of as "immense" and "enormous" would be about nine pounds sterling, or \$50 in currency. I believe I have explained before that the English press gets its telegraphing done at very cheap rates. The ordinary rate for a telegram between any two places in the kingdom is one shilling for twenty words, addresses free. When the Government took over the telegraphs, a clause was put into the act securing to the newspapers the privilege of receiving one hundred words for one shilling. That is the price they now pay. In a *Times* column of solid minion there are about 2,100 words. If telegraphed, the column comes as near as possible to \$5. This is rather less than the \$2,100 gold we should have the pleasure of paying the Anglo-American Company for the same quantity of matter.

It is remarkable that the London papers, notwithstanding the cheapness of the inland telegraph, do not use it freely. One reason may be the inaccuracy of it, though special efforts are made to do good work for the papers. The meeting of the British Association is more fully reported by telegraph than most others, and a statement about it, either official or from official sources, has been published. The whole number of words transmitted during its six days' session to the English, Irish and Scotch press was 405,000. The cost is not mentioned—that would reduce the importance of the event too much—but the sum which the newspapers of the whole United Kingdom paid was a little over £200. I should say that *The Northern Whig* of Belfast spent just about the same amount for its extra reporting. The Post-office desires to have it understood that some of the wires between England and Ireland are out of order. There are 22 in all, contained in four cables, and seven out of the twenty-two were under repair. The remaining fifteen were asked to transmit on the busiest night of the meeting 80,000 words—and failed. The official account remarks that some portion—it does not say how much—of the matter telegraphed was "necessarily" too late for publication next morning. The sections adjourned at three in the afternoon, the papers go to press at four or later next morning, and, if the matter was reasonably handed in, one does not quite see the force of the "necessarily." Deducting two wires for the Anglo-American Company—of which they have the exclusive use between London and Valencia—there remain thirteen wires, which were asked on this one occasion to transmit less than 600 words each per hour, plus the ordinary business, and

"necessarily" failed. But the official apologist for the Department thinks that, having regard to its "vastly diminished resources," the work was "singularly well done."

Cuba Submarine Telegraph.

The directors in their report state that the gross receipts for the half year ending 30th June amount to £7,825, ordinary expenses to £1,930, leaving a balance of £5,895. The extraordinary expenditure for the repair of the cable has, however, amounted to £21,747, absorbing the whole of the balance of the reserve fund £12,283, the above balance of the half year's revenue £5,895, and leaving the sum of £3,567 to be carried forward to the debit of the current half year's account. They regret that the result is not more satisfactory. This is to be explained by the fact that the steamship Investigator, despatched by the Telegraph Construction and Maintenance Company in the beginning of December last year, took double the time to effect the repair to the cable that was anticipated, in this way doubling the cost of repair, and at the same time shortening the period during which the cable has been at work to about three months of the current half year. The receipts since the restoration of the cable have been satisfactory, and show a material increase on those of the corresponding period last year. The whole of the new capital authorized by special resolutions passed at the extraordinary general meeting of 12th of June last, was subscribed by the shareholders, and the contract for the new cable has been duly entered into with Messrs. Hooper's Company. The manufacture of that cable is now nearly completed, and the steamship Hooper is expected to sail in the beginning of next month to lay it. Instead, however, of landing the cable at Santiago de Cuba, it has been agreed, on the suggestion of the West India and Panama Company to carry it to Holland Bay, Jamaica, that company paying for the additional length required, but without thereby acquiring any property in the cable, which will remain the sole property of this company. By this arrangement, not only will a duplicate means of communication be provided over the whole of this company's system, but the extremely important section of the West India and Panama Company, between Cuba and Jamaica, will also be duplicated—an object of only greater importance to that company than it is to this. Arrangements are also in progress whereby it is believed the differences between this company and the West India Company will be brought to an amicable settlement, and a suitable vessel provided and stationed in the West Indies for the repair of both companies' cables. The cable of the Central American Company, referred to in the fifth paragraph of the special report submitted to the general meeting of 12th June last, has only been laid thus far from Para to Cayenne. The remaining section to Demerara is expected to be laid in November, and will then complete telegraphic communication between North and South America via the West Indies—a connection which, as previously stated, is expected to result in a very large increase of traffic to this company. Notwithstanding the diminished income for the working of the past year, owing to the length of time occupied in repairing the company's cable, the prospects of the company are better than at any former period. With duplicate lines of cable from England to the United States, thence as far as Trinidad (as will shortly be the case when the cable now in course of manufacture for the West India and Panama Company has been laid), and with the communication between South America and the West Indies established, there is every reason to believe that the company will be in a position to pay regular dividends to its shareholders, and, at the same time, lay aside a substantial sum to provide for any extraordinary repair or other contingency, which can never, under these circumstances, affect the prosperity of the company so seriously as it has done in the past.

A Telegraphic Blunder and What Came of It.

Mr. GIBSON, solicitor, writes to the *Times* that at the recent Assizes for Kent it became his duty to telegraph to a plaintiff and witnesses to attend the court on a particular day, and instructing them to travel by the "seven-thirty" train. The action was for breach of promise of marriage, and when the case was called on the plaintiff and her principal witness were absent. The case was so fortified by other evidence that counsel advised it should proceed, and the plaintiff obtained some damages, but not without strong and damaging observations by defendant's counsel upon the absence of the plaintiff and her family witnesses. A few minutes before the jury gave their verdict (about one o'clock) the plaintiff and her father came into court, and then produced a telegram directing them to travel by the "eleven-thirty" train—just four hours after the time appointed by my telegram. On inquiry it turns out that some one in the Post-office employ (elsewhere than at that town, though the

authorities do not say where) had made the gross blunder of writing "eleven" for "seven." The Post-office authorities write to me (says Mr. Gibson) and express their great regret, and assure me that they have taken "serious notice" of the blunder, the force and effect of which "serious notice" will be appreciated at once when I state that their letter is a lithographed form, the date only inserted in writing; from which I infer it to be obvious that discreditable mistakes are of constant concurrence, and the alleged "serious notice" a mere courteous expression, utterly without meaning or result. One of the jurymen, after the trial, was heard to say that they should have given nearly double the damages if the plaintiff and her father had been called. A telegraph company would have been liable to pay damages; but where is the remedy against the Post-office?—Dublin Freeman, Aug. 15.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS UP TO AN INCLUDING SEPTEMBER 25, 1874.

ASSESSMENT NO. 66.

- 22, 26, 31, 37, 70, 76, 82, 84, 100, 101, 120, 143, 154, 156, 158, 160, 164, 171, 189, 190, 191, 193, 197, 206, 218, 220, 227, 230, 248, 252, 254, 280, 288, 316, 323, 341, 350, 353, 357, 362, 364, 366, 378, 380, 382, 394, 402, 411, 412, 418, 441, 447, 466, 468, 469, 470, 471, 475, 476, 482, 484, 511, 512, 514, 556, 557, 560, 569, 573, 574, 575, 584, 586, 587, 590, 600, 603, 605, 642, 646, 648, 649, 655, 656, 662, 663, 664, 665, 669, 691, 701, 708, 710, 712, 714, 717, 723, 724, 728, 742, 772, 780, 781, 782, 783, 785, 786, 790, 802, 809, 812, 813, 820, 823, 836, 838, 842, 870, 875, 876, 897, 904, 905, 906, 926, 930, 931, 938, 942, 944, 949, 954, 957, 959, 963, 964, 876, 979, 980, 1000, 1001, 1002, 1005, 1014, 1016, 1023, 1030, 1031, 1033, 1034, 1041, 1046, 1050, 1057, 1063, 1076, 1080, 1093, 1100, 1101, 1105, 1106, 1107, 1108, 1109, 1110, 1112, 1113, 1115, 1117, 1119, 1120, 1122, 1123, 1125, 1131, 1139, 1141, 1149, 1152, 1155, 1156, 1157, 1159, 1160, 1162, 1164, 1185, 1190, 1191, 1195, 1207, 1208, 1210, 1211, 1217, 1221, 1226, 1227, 1233, 1234, 1237, 1238, 1245, 1248, 1255, 1256, 1260, 1263, 129, 1270, 1281, 1283, 1284, 1285, 1286, 1288, 1290, 1294, 1339, 1340, 1342, 1344, 1346, 1848, 1349, 1350, 1351, 1352, 1353, 1354, 1355, 1356, 1358, 1359, 1364, 1365, 1366, 1375, 1376, 1405, 1406, 1407, 1415, 1417, 1418, 1426, 1427, 1430, 1432, 1433, 1444, 1448, 1449, 1451, 1454, 1455, 1456, 1457, 1458, 1465, 1469, 1471, 1474, 1475, 1476, 1481, 1483, 1497, 1498, 1503, 1505, 1506, 1507, 1513, 1517, 1518, 1524, 1528, 1529, 1530, 1532, 1542, 1546, 1558, 1560, 1563, 1564, 1572, 1573, 1586, 1589, 1590, 1596, 1697, 1609, 1616, 1619, 1630, 1635, 1644, 1649, 1652, 1556, 1660, 1661, 1662, 1663, 1665, 1666, 1667, 1673, 1676, 1681, 1684, 1687, 1988, 1696, 1699, 1700, 1701, 1702, 1804, 1709, 1710, 1713, 1814, 1718, 1723, 1724, 1729, 1733, 1737, 1746, 1747, 1750, 1751, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1763, 1765, 1766, 1767, 1868, 1769, 1771, 1773, 1775, 1885, 1788, 1889, 1799, 1802, 1809, 1811, 1812, 1813, 1827, 1828, 1830, 1837, 1838, 1839, 1840, 1841, 1844, 1845, 1857, 1859, 1860, 1863, 1864, 1876, 1877, 1879, 1895, 1896, 1903, 1907, 1915, 1916, 1917, 1922, 1924, 1926, 1942, 1943, 1958, 1972, 1073, 1986, 1991, 1992, 1993, 1996, 1997, 2004, 2007, 2010, 2012, 2015, 2022, 2023, 2026, 2028, 2033, 2035, 2041, 2045, 2050, 2053, 2057, 2061, 2065, 2072, 2074, 2075, 2085, 2092, 2094, 2101, 2108, 2109, 2110, 2112, 2120, 2128, 2131, 2133, 2134, 2136, 2141, 2142, 2143, 2145, 2147, 2154, 2156, 2159, 2165, 2166, 2167, 2168, 2170, 2171, 2180, 2181, 2183, 3184, 2185, 1187, 2192, 2198, 2200, 1203, 2204, 2205, 2206, 2210, 2211, 2217, 2218, 2220, 2225, 2227, 2230, 2231, 2233, 2234, 2238, 2244, 2145, 2246, 2248, 2249, 2250, 2252, 2253, 2254, 2256, 2258, 2260.

ASSESSMENT NO. 68.

- 4, 16, 23, 28, 37, 46, 52, 53, 54, 58, 60, 64, 74, 75, 77, 86, 91, 93, 95, 113, 122, 131, 140, 145, 157, 188, 208, 211, 217, 245, 269, 277, 289, 301, 302, 312, 316, 349, 352, 361, 372, 383, 385, 405, 426, 464, 467, 509, 532, 536, 542, 546, 547, 553, 555, 564, 579, 615, 626, 646, 659, 685, 714, 715, 721, 729, 731, 734, 740, 742, 769, 815, 821, 825, 732, 858, 859, 873, 875, 880, 912, 917, 923, 932, 941, 991, 992, 1001, 1013, 1039, 1047, 1054, 1061, 1088, 1090, 1126, 1243, 1147, 1148, 1175, 1178, 1183, 1199, 1208, 1226, 1227, 1232, 1259, 1282, 1298, 1300, 1306, 1325, 1345, 1357, 1402, 1403, 1404, 1409, 1410, 1484, 1488, 1489, 1517, 1532, 1554, 1555, 1568, 1571, 1589, 1591, 1672, 1676, 1681, 1708, 1723, 1735, 1783, 1775, 1852, 1894, 1900, 1901, 1919, 1944, 1950, 1951, 1957, 1965, 1991, 2019, 2021, 2025, 2027, 2030, 2049, 2082, 2089, 2097, 2103, 2113, 2135, 2138, 2164, 2169, 2174, 2175, 2178, 2190, 2197, 2199, 2201, 2213, 2228, 2229, 2239, 2240, 2257, 2259, 2263, 2269, 2274, 2287, 2289, 2291, 2299, 2300, 2301, 2302.

ASSESSMENT NO. 67.

- 2, 15, 17, 29, 97, 98, 319, 447, 565, 916, 1024, 1074,

- 1154, 1169, 1205, 1276, 1527, 1881, 1915, 2237, 2242, 2271, 2272, 2273, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2288, 2290, 2292, 2293, 2294, 2295, 2296, 2297, 2298.

ASSESSMENT NO. 65

438, 1798, 2070.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt of all previous assessments.

A New Invention in Telegraphy.

THE Frankfurter Zeitung announces that an official in the Bavarian telegraph service has succeeded in making an apparatus which, if found to be of practical utility, may effect a revolution in the present system of telegraphy. The name of this gentleman is H. Becker, and the apparatus he has constructed, and to which he has given the name of "Electro-magnetic Copying Machine," appears to be a perfecting and improvement of Caselli's invention. The proprietorship of the apparatus has already been purchased by the banking firm of Messrs. Oppenheim & Weill, of Frankfort. Without any assistance from the operator it gives a fac simile of the original manuscript telegram in whatever language written—signatures, portraits, music, plans, etc., conveyed telegraphically to any distance, and in such admirable perfection that in comparing the original with the copy scarcely any difference can be discovered. "We, ourselves" says the above named journal, "witnessed the transfer from one apparatus to another not only of the lines of welcome issued by the Committee of the Musical Festival recently held in this city, profusely ornamented with instruments, wreaths of laurel and oak leaves, as well as symbolical arabesques, but also of bills of exchange filled up and signed, state despatches in cipher, telegrams written in Greek and Hebrew character, police notices with the portrait of the person wanted, military maps, such as a general might send to his subordinates to explain the situation described or mentioned in his written despatches and orders, together with the usual service communications as telegraphed from one station to another. All objects intended for transmission by this apparatus are written or drawn with prepared ink on silver paper, which is then placed on a revolving cylinder, and then telegraphed off to its destination, where it is received on clean tissue paper, and reproduced with most wonderful exactness."

Correspondence.

We do not hold ourselves responsible for the opinions of our correspondents. Our columns are open to free discussion on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Automatic Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

MR. GEORGE B. PRESCOTT, electrician of the Western Union Telegraph Company, having now thrice repeated his antagonistic papers on Automatic Telegraphy, I think it would not be out of place to reply to each statement in the following extracts from his oft repeated article; and I would here observe that in so doing I am actuated solely by the most kindly feelings towards my scientific friend, and wish the same to be taken by him as an act of "brotherly distinction":

[From the Scientific American of Nov. 5, 1870.]

AUTOMATIC TELEGRAPHY. BY GEORGE B. PRESCOTT.

"In a recent series of carefully conducted experiments with the automatic system in which chemically prepared paper of a very sensitive nature was employed, I found that the highest rate of speed attainable through 500 miles of No. 8 iron wire did not exceed the ordinary rate of transmission by the Morse apparatus, and that the greatest speed which could be attained over a telegraph line of 250 miles in length composed of No 8 iron wire was 100 words per minute. When the speed of the instrument was increased beyond this rate the signals were prolonged so as to run into each other and become unintelligible."

"I wish you a happy new year." We could not get as many as seventy words per minute that were legible, * * * This was the best wire cast of New York. * * * Extract from the report of an eminent eastern scientist who conducted and assisted, as aforesaid, in a recent series of carefully conducted experiments with the automatic system in which chemically prepared paper of a very sensitive nature was employed. * * *

* * * Boston, January 2, 1871, and in my presence attested January 10, 1871.

From the Scientific American, Nov. 5, 1870, republished in Journal of the Telegraph, Sept. 15, 1874:

"In a recent series of carefully conducted experiments with the automatic system in which chemically prepared paper of a very sensitive nature was employed, I found that the highest rate of speed attainable through 500 miles of No. 8 iron wire did not exceed the ordinary rate of transmission by the Morse apparatus; that the greatest speed which could be attained over a telegraph line of 250 miles in length composed of No. 8 iron wire was 100 words per minute. When the speed of the instrument was increased beyond this rate the signals were prolonged so as to run into each other and become unintelligible."

The distinguished editor of the Scientific American, attended by his able scientific editor, Mr. F. Allen, on September 15, 1870, assisted in some experiments with my American automatic system, and received from Washington to New York six hundred and fifty words in sixty-six seconds. Again, on September 22, 1870, Mr. A. E. Beach, his son, Mr. F. C. Beach and Mr. Allen, again assisted in the reception of automatic despatches from Washington to New York—and in their issue of October 15, 1870, says the paragraph as going the round of the press, stating that the Little system of transmitting telegraph messages from Washington to New York, is correct in that statement. We have ourselves been lately investigating this system, and have a message of about six hundred words per minute, and distinctly legible.

From the Scientific American, Nov. 5, 1870, republished in The Operator, presumed to be a sub-organ, Sept. 15, 1874:

"In a recent series of carefully conducted experiments with the automatic system in which chemically prepared paper of a very sensitive nature was employed, I found that the highest rate of speed attainable through 500 miles of No. 8 iron wire did not exceed the ordinary rate of transmission by the Morse apparatus; and that the greatest speed which could be attained over a telegraph line of 250 miles in length composed of No. 8 iron wire was 100 words per minute. When the speed of the instrument was increased beyond this rate the signals were prolonged so as to run into each other and become unintelligible."

Et Sequentia.

"In 1872 Mr. Orton asserted, before a Congressional Committee at Washington, that the wires and operators of the Western Union Company were capable of telegraphing upon an average only about ten words per minute. Mr. Orton now concedes that nearly 12,000 words can be and have been transmitted in distinct legible signals, in one instance in thirty-four and in another in twenty-two minutes, on about 300 miles of line by my system!"

"Actual work done in the presence of the Hon. John A. J. Cresswell, Postmaster General, and numerous other gentlemen, including Senators and Representatives in Congress, on the evening of December 11th, 1873, by my automatic system."

"This system is capable of a speed of from five hundred to eight hundred words per minute."

JNO. A. J. CRESSWELL, Postmaster General.

June 30, 1873."

In conclusion, it is very evident that the very carefully conducted experiments of Messrs. Prescott and Farmer, in the fall of 1870, was conducted on as Mr. Prescott says:

"The theory upon which most of the experiments in automatic telegraphy have apparently proceeded is that electricity has a definite and practically instantaneous velocity, irrespective of the medium through which it is transmitted, and that all that was necessary to insure the success of the system was to provide an apparatus by which despatches previously prepared could be rapidly transmitted and recorded by automatic machinery." A most erroneous theory.

GEORGE LITTLE, Cons. Elec.,

PASSAIC CITY, NEW JERSEY, U. S. A., Sept. 18, 1874.

Brooks' Patent Insulators not Liable to be Damaged by Lightning.

BROOKS' PATENT INSULATOR WORKS, } No. 22 South Twenty-first street, }

PHILADELPHIA, Sept. 29.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR issue of the 19th instant contains the following in the letter of your Chicago correspondent:

"Previous to the great fire here all the wires of the Western Union Company in this city were strung on Brooks insulators," and I am informed by one in au

thority, who ought to know whereof he affirms, that the wires have never tested so satisfactorily since, from the fact that on repairs recently in the city, the 'Brooks' have not been used, for what reason I am unable to state. The Kenosha insulators have been used recently on repairs here in the city. An intelligent line repairer of my acquaintance, who has given insulation a good deal of thought, says the Brooks is the best insulator made, that although the first cost is much more than any other insulator its insulating properties are so vastly superior to any other he has used in his fifteen years' experience in line building and repairing that they are by far the cheapest insulator in the market. He makes one serious objection to them however, which Mr. Brooks might remedy. The objection is that the way they are now constructed lightning bursts up through them, destroying their insulating properties of course, and it passes through the insulator in such a manner that the defect cannot be noticed by a repairer unless he climbs each pole and examines each insulator. Not being an insulation man I do not suggest a remedy, but give the information for what it is worth. Several of the Burlington and Quincy and some of the Michigan Central Railroad wires are strung exclusively on Brooks' screw shank insulators, and give great satisfaction, working well in either wet or dry weather."

Your correspondent says, "The way they (the Brooks' insulators) are constructed the lightning bursts up through them, destroying their insulating properties, of course." Now I beg leave to say to your Chicago correspondent that lightning does nothing of the kind. Lightning does not injure them in any manner. There are ten thousand insulators of mine used outside of Chicago to one used in Chicago, and that complaint has come from Chicago alone. If one of these insulators is heated on a stove to a point above 240 degrees Fahrenheit, the outer iron case will burst, provided the insulator is set upon the hot stove bottom upwards, in a manner that the sulphur nearest the stove and at the top of the insulators, is first melted. Many of the Brooks insulators that have been subjected to the flames of the Chicago conflagrations have been burst from this cause—but lightning has had nothing to do with it—a pot or vessel of sulphur, when allowed to cool, and then melted or heated at the bottom first will burst the vessel on account of the expansion which takes place in the change, from a solid to a liquid state.

The fewer the number of wires upon a set of poles the greater are the disruptive effects of lightning. I have never seen a pole or insulators injured where there were as many as thirty wires. There were from thirty to sixty wires upon the poles in Chicago. The greater the number of wires the more is the charge divided and dissipated. I refer to ordinary insulators, but with the Brooks insulators a pole with but one wire is very seldom injured; as the number of wires are increased the disruptive effects of atmospheric discharges are proportionately decreased.

DAVID BROOKS.

The Chicago Industrial Exhibition.—No Telegraphic Apparatus Shown, and Why?

CHICAGO, ILL., Sept. 28.

TO THE EDITOR OF THE TELEGRAPHER.

IN regard to the Exposition in my communication dated Sept. 14th, I should have said, "nearly all the makers of telegraph machinery who were represented last year are (expected to be) on hand again this year" I was informed that such would be the case, and I was perfectly satisfied at the time that my informant had good reason to believe so. That they were mistaken in their conjectures is indeed only too true, as not a solitary exhibitor of telegraph machinery of any kind whatever is represented in the massive building. The only way this can be accounted for, to my mind, is the utter disregard exhibited by the managers of the exposition to make a class for such goods separate and distinct from "medical electrical apparatus." This was not done last year, despite the recommendation, by either yourself, editorially, or by a correspondent, in THE TELEGRAPHER at that time (in decanting on the same feature of the Cincinnati exhibition), which recommendation was brought to their notice. It is probable that parties manufacturing such goods being cognizant of the fact that no separate award for the best telegraph machinery would be made, thought it not worth the trouble or expense they would be obliged to incur in order to make a showing, and concluded not to exhibit. This may or may not be deplorable.

A majority of the telegraphers who have visited the exposition have expressed themselves very much dissatisfied; after wandering for hours through the building, at not finding anything in their line.

As a means of advertising their wares however, we are disposed to think that the Exposition is a very poor place to show off telegraph supplies, as very few who visit such places are in need of such articles. The columns

of THE TELEGRAPHER will be found to be a much better place to advertise such apparatus and supplies.

The Western Union Company is the only one represented in the building, and their office is very seldom kept open evenings. It is near the centre entrance to the building, in quite a conspicuous locality.

Our attention was called to a sign not far distant from the entrance, and near the W. U. office, of the Western Electric Company of Chicago, but on repairing thither we found nothing but three or four of Sholes & Glidden's type writers, which, we understand, the Western Electric have made arrangements to manufacture for the trade.

I do not wish any one to infer by my remarks that the Exposition is not a success in other respects outside of the electrical portion of it, and any of our brethren who can make it convenient to visit Chicago during the Exposition, will find it an amusing and instructive place to pass away a few hours.

The display of surgical instruments and electrical appliances of that order is not very large or varied. The dispensers of the fluid for ten cents a trial, are of course on hand, duping the "greenies," who are made to suppose that after once getting their nerves shook up with the electricity dispensed by professor so and so with the shocking machine, that they are henceforth free from all the ills that flesh is heir to. If they should by chance get hold of one of "Porter's Telegraph College" circulars next, they, no doubt, would suppose they knew enough of lightning jerking to begin the study of the mystic art immediately.

Several styles of electrical alarm bells on exhibition are quite novel. The most notable thing in the Exposition, however, that came to our notice showing the various uses that electricity is being put to in these modern times was a burglar alarm, whereby if a door was opened or a window raised, it fired off a pistol, lighted a lamp, and, of course, woke the occupants of the premises at the same time.

Telegraphers, of course, do not expect to find in a strictly telegraph paper a description of pumpkins and squashes at an exposition, the local papers of their different sections furnishing that information, so I will not attempt any further description of the show at this time.

One of our boys, who has seen both the Cincinnati and Chicago Expositions this year, says we are considerably behind that city as far as the Exposition is concerned. The Chicago building, however, is the handsomest of the two.

The Western Union office here has been recently thoroughly equipped with Howard & Co.'s Boston electrical clocks.

Mr. F. W. Jones has perfected an improved automatic attachment for the signal bell of the pneumatic Board of Trade tube, which, by the way, is quite novel. The ringing of the bell after the box arrived in the receiving drum had to be stopped formerly by opening the door and breaking the circuit by inserting the hand into the drum. The ringing is stopped now by simply opening the door.

Before closing, I want to refer to the sensible original article in your issue of the 19th of September, entitled "Industrial Exhibitions. Their uses and abuses, their advantages and their defects." It is one of the best articles on the subject I have ever read. Our industrial exhibition managers would do well to study it. OCCASIONAL.

The G. R. and I. R. M. Telegraph.

TO THE EDITOR OF THE TELEGRAPHER.

THIS line is a railroad telegraph line, and extends from Grand Rapids to Petoskey, Michigan, on the G. R. and I. Railroad. The Western Union is nowhere up in this country. As a general thing the operators on this line are a pretty good set. We are, however, as usual, favored with a few plugs, who are inclined to think that they know all about what is business. Owing to a kindness and long suffering rarely met with, on the part of our chief, we have managed to get along with them, as the other operators think if he can stand it they can.

Mr. John J. Drew is, or rather was, Chief Operator and Train Despatcher on the road, but has now left us, and "cut in" on a better line, having accepted the office, duty and responsibility of master of transportation. There is not an employe on the line but that heartily unites in wishing him success in his new position. He will, undoubtedly, in his present, as in former positions which he has filled, do himself credit.

Mr. C. C. Weatherton, formerly agent and operator at Sturgis, Mich., has accepted the position vacated by Mr. Drew. He has our best wishes for his success.

We have some good operators on this line. Mr. L. Fleming occasionally gives us a shake up on this end, although his regular circuit is the Grand Rapids Southern. He thinks he is lightning, and we won't dispute it with him, as he gives a hard tussle to any of us who endeavor to try a tilt with him. It is a light task for him, when pushed, to give the boys a chance to learn how to drive a quill rapidly by rushing them

at the rate of 50 to 55 words a minute. Through Mr. Fleming's efforts there has been lately organized a "Telegraphers' Mutual Benefit Association," for the purpose of affording practice in receiving and general work of the office. They meet twice a week for practice. Every operator is expected to be in his or her (we are not without some female operators) own office on these occasions, and from about 8:15 to 9 o'clock P. M. the time is taken up in practice for those who are not as proficient as they might be. This is the time we receive. After that hour F. "wades in," and I don't wish to express an opinion as to who does or who don't receive and make a clean copy, but should like to see just a few of the first copies of some of the old "lightning" operators. As far as I am concerned, I take a back seat when this commences.

We have some more pretty good operators that understand business. Mr. W. E. Drew asserts that he won't take a back seat. He is at present located at Upper Big Rapids, and will probably stay there, as (whisper this softly) he don't want to leave his "ma."

Mr. L. Harris manages matters at Maneelona. He is what the boys style a "queer cove," but then when you get him worked up he is fully up to business. He has travelled some, too, and came up here to get a rest.

Well, I can't tell you about all the operators, male and female, in detail, and rather think this will fill space enough for the present. There are quite a number of the operators who might receive honorable mention. Lower Big Rapids is under the care of Mr. L. G. Wooley, who is a good operator and a gentleman. Rockford is a ladies' office, Miss Kingsley gathering in the lightning for the benefit of all interested. Morley is similarly fortunate, Miss Spaulding officiating at that station.

Am not going to tell where your correspondent is, but he works a little when opportunity offers, and is not entirely unknown upon the wire. Expect to go further north pretty soon, and see what it looks like up there.

There is now in this division 193 miles of line, not including the Traverse City branch of 26 miles. If I should take my contemplated trip North I may tell you at some future time where I went, and how things appear in that section. OH N.

Information for the "Organ" upon Duplex Telegraphy.

MITCHELL, IOWA, Sept. 25.

TO THE EDITOR OF THE TELEGRAPHER.

IN response to the questions of the editor of the *Journal of the Telegraph*, in his issue of August 15th, regarding my duplex, would say, like Mr. Farmer (I quote from the above journal), "by adjusting the mechanical force of the spring so as to equal the attractive force of the magnet when acted upon by one battery," is the extent of my adjustment. I said in above issue, "outgoing current does not operate relay at that station," and not "does not affect it." I did not say "without adjustment," but did say "without any changing of adjustment above that required in the single working circuit."

I still claim a permanent adjustment or equation in the duplex arrangement; for the currents from both batteries, i.e., the one which alone does not operate relay and is never disconnected from main line, and the battery connected with sending key at "A," flow through the same relay, and the same main line which is never opened by operating, therefore both currents are subject to the same variations. His last assertion is totally incorrect, because none of the current from sending battery flows through relay there, the principle of which he admits when he says "were the line open this suggestion would be correct;" for, be main line open or closed, how can it affect the polarity of the opposing currents or batteries?

Truly, my "supposition is that when both batteries are connected to line no current will pass through the relay" from "M B," the sending battery, "for the reason that any tendency in the battery connected to relay to set up a current" with "M B" in short circuit, when sending key "A 3" is closed, "is balanced by the opposing current from the battery connected with the resistance coil." S. J. M. BEAR.

Miscellaneous.

A CHEAP GALVANIC BATTERY.—Mr. W. M. Symons proposes a cheap but convenient galvanic battery; each of the zinc plates was two inches square, and covered with fustian or other fabric, outside which thick copper wire was wound to form the other plate; the exciting liquid was weak chloride of zinc. Pairs of plates thus made could be arranged in series to form a battery to give out weak currents for a great length of time.

"The celebrated inventor, EDISON." (?) Oh!

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, OCTOBER 3, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST OF THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK ON ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

a No. 1 Telegraph Key, or a set of F. L. POPE & Co.'s popular NONPAREIL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

P. O. Box, 5503.

Publisher.

The Policy, Creed and Practice of The Telegrapher.

MANY people appear to labor under the conviction that THE TELEGRAPHER is published mainly for the purpose of keeping up a warfare upon the Western Union Telegraph Company, and that we are constantly seeking for an opportunity to attack that mammoth telegraph corporation. Those who so believe have but a very inadequate idea of the true purpose and policy of this paper. We have endeavored time and again to explain, in a manner adapted to the comprehension of even the most obtuse reader, what the actual policy and purpose of this paper is. We have no special antagonism to any telegraph organization, corporation, line or combination; neither have we any special favoritism for any. We mean to pursue a perfectly independent, honest and fair course towards all; to blame whenever and wherever blame appears to us to be necessary, and to commend whenever commendation is deserved. We do not represent a telegraph company or combination but the telegraphic fraternity, and would not knowingly descend to injustice or unfairness even to advance their interest.

This misapprehension in regard to THE TELEGRAPHER has been caused very considerably by the foolish antagonism which has been manifested towards this paper by certain officials and employes of the Western Union Telegraph Company, who seem to imagine that the sun, moon and stars revolve around that corporation, and that it is only by its gracious permission that existence is possible outside the hallowed precincts of its offices. We have known some of the employes of that company who regarded with holy horror the audacity which would question the infallibility of its dicta upon any telegraphic or electrical subject, and who regarded as only fit to be cast into outer telegraphic darkness any person who shall dare to entertain, much less express an opinion or belief contrary to that held in official circles. All this is very childish and absurd, and it is to be hoped that the number of those who are thus affected may decrease until the class shall become extinct at no distant day.

There are others, and a good many of them, who consider it the duty of THE TELEGRAPHER to sustain, right or wrong, whatever may be done or proposed to be done by any company or line competing with the Western Union. Often have we had addressed to us personally and by communication the reproachful phrase "Why, ain't you the organ of the opposition?" To all such we have but one answer, whether friend or foe: By no means! This paper is not, and while it is under its present management shall not become an organ. We represent the interests of the telegraphic fraternity, but we are nobody's organ. We care no more for one telegraph company or combination than for another, and do not ask any favors of one more than another. THE TELEGRAPHER has room and welcome for all who have anything to present, or who may think they have, which it is important or desirable should be known. We do not, by any means, endorse everything which appears in its columns, but are not only willing but rejoice to afford space for all to ventilate their ideas, discoveries and opinions on electrical and telegraphic subjects, even if they proceed so far as to criticize the policy and management of any telegraph company or line. We do not desire or intend to do injustice to any one; and if we should do full justice to every one, we fear the outcries and denunciations of THE TELEGRAPHER in certain quarters would be even louder and more fierce than they have been hitherto.

That THE TELEGRAPHER has bitter enemies, and no inconsiderable number of them, we are proud to know. A newspaper that can be conducted in such a manner as to make no enemies is not worth keeping alive or reading for any length of time. We do not propose at any time to adopt or pursue a namby pamby Miss Nancyish policy. We have decided opinions upon most subjects and in regard to most individuals, and when proper and necessary do not intend to be backward or mealy mouthed in expressing them. We may be mistaken in these opinions, but they are, certainly,

such as we honestly entertain, and if we are wrong we are open to conviction.

We hate shams and humbugs, whether they are successful or not, and whenever it becomes necessary to expose them we intend to do so. And, above all, we hate and despise the pretended inventors who are forever making new and startling discoveries—which are, for the most part, either stolen from others or dug out of books where they have lain fallow, because they were not of sufficient importance or practicability to be worth bringing forward. One of these fellows we have frequently had the pleasure of exposing, and expect to have that pleasure renewed from time to time. Our readers will doubtless understand to whom we allude without the necessity of our calling his name. We can conceive of no meanness or moral degradation deeper than that of such a person. Any one having such characteristics should be ignominiously kicked out of any respectable telegraph office whenever he sets his foot in it, or dares to bring any of his spurious wares seeking for a market.

We do not desire to be understood as charging or asserting that all who attempt to introduce or obtain adoption of devices or inventions which are not new are either shams, humbugs or pretended inventors. It is a well known fact, of which the managers of telegraph lines and companies are constantly being reminded, that there is no end to the (supposed) wonderful and invaluable inventions and discoveries which are constantly being made, and which they are impertinent and urged to test and adopt. Nine out of ten of these at least are entirely worthless and impracticable, and a large proportion of them are not new. It does not follow, however, that in such cases deception is intended. On the contrary, most of these supposititious inventors and discoverers are self-deceived, and humbug and delude themselves much more than they do anybody else. It is a difficult matter, sometimes, for those in authority to decide upon applications to test supposed new inventions and discoveries, for possibly something of value may be rejected inadvertently. Consequently, much liberality is usually shown in making tests upon telegraph lines, and in this respect the Western Union Telegraph Company, from motives of policy no doubt, is, as we are informed, very liberal, and seldom refuses to any reputable person, and in some instances to those who are not reputable, an opportunity to demonstrate the value of their claims and assertions. For these self-deceived, and, in the end, usually bitterly disappointed individuals, we feel sincere commiseration, and would not knowingly add to their troubles and mortification by an unkind word or paragraph. It is only to the inventor sharps and confidence fraternity that we entertain personal hostility, and delight in exposing in the columns of THE TELEGRAPHER.

In conclusion, we desire once more to impress upon the minds of every reader of this paper two or three things upon which, notwithstanding what has been written and often repeated heretofore, there seems to be a misunderstanding on the part of many.

First.—THE TELEGRAPHER is not an organ.

Second.—It is not the object and purpose of the publication of this paper to maintain a constant, bitter and uninterrupted warfare upon the Western Union Telegraph Company.

Third.—THE TELEGRAPHER is the uncompromising enemy of all shams, humbugs and telegraphic frauds.

Fourth.—THE TELEGRAPHER is not subsidized by anybody except its subscribers and advertisers, and its only means of existence and support comes from them, and thus far has not failed.

Fifth.—While the editorial opinions and convictions of this paper are not for sale, its columns are always open for the discussion and presentation of any matter or thing interesting to the telegraphic fraternity, or of importance electrically or telegraphically.

Sixth.—These are our principles. If you like them, help, support the only independent telegraphic and electrical journal in this country. If you don't like them, of course we don't expect you to enlist under our banner, and while we pity we will not condemn.

A Deserved Promotion and Excellent Appointment.

It gives us pleasure to record in THE TELEGRAPHER the recent well deserved promotion of Mr. GERRITT SMITH, late senior chief operator in the Western Union main office in this city, who has been transferred from that position to be assistant electrician of the company. Mr. SMITH has been engaged in telegraphic pursuits from boyhood, and has made a creditable and honorable record in every position that he has filled. He is an electrician of no mean ability, having devoted himself to the study of electrical science from a love of such investigations, and with the determination to become proficient therein for its own sake.

Of a singularly quiet and unostentations character, he has won, not merely the esteem, but the love of those associated with him, and leaves them now for higher duties, much to their sorrow and regret at the separation. But few persons are so happily constituted as to move through life without making some enemies, and chief operators are not apt to be popular. In this respect, however, Mr. SMITH is more fortunate than the generality of mankind, and, if any person can look about him and see only friends, he is that person. Always pleasant, agreeable, dignified and honorable, he has won the esteem of his associates in New York as he did of others in New England years ago.

The position to which he has been promoted is one most congenial to his tastes, and he will, without doubt, do credit to himself and the company which he serves. While the loss is keenly felt in the operating room, there is no one there but that wishes him success, and entertains a lively interest in his future welfare and prosperity, in which his other friends fully concur. His is a promotion and appointment every way deserved and proper to be made.

Resignation and Appointment of Supt. Albany, N. Y., Fire Alarm Telegraph.

Mr. A. L. WHIPPLE, who has been Superintendent of the Fire Alarm Telegraph in Albany, N. Y., ever since its introduction there, has resigned, and Mr. WILLIAM J. CULL, the able and popular assistant, has been promoted to the Superintendency.

During the days of the old N. Y., Albany and Buffalo Telegraph Company no employé was better known than BILLY CULL. He then, as now, had hosts of friends, and we are sure that they will all be pleased to hear of his success. We congratulate the City of Albany upon having secured so efficient and faithful a man to oversee this important branch of their service.

The American Fire Alarm Telegraph.

Messrs. GAMEWELL & Co. are just completing the work of introducing their American Fire Alarm Telegraph in the City of Minneapolis, Minn., under contract with the municipality of that thriving city. They have also contracted with the City of Nashville, Tenn., and with Pawtucket, Rhode Island, for the construction of their Fire Alarm Telegraph in those places.

GAMEWELL & Co. have had the virtual control of this business for several years, and have given universal satisfaction to all with whom they have had dealings. Theirs is the only perfect and reliable system of fire alarm telegraph in the world, and no place of any importance can afford to be without the protection which it gives. Their automatic system is inexpensive in operation, and is adapted to and has already been introduced into many of the smaller cities and towns of the country. By their enterprise, honorable dealing, and the excellence of their work, they have fully earned the success which they enjoy.

Personals.

Mr. W. H. YOSTE, of Bucyrus, Ohio, has been appointed night operator at Canton, Ohio, Railroad office.

Mr. BRONSON C. KEELER has resigned his position at No. 145 Broadway, New York, and resumes his studies at the Michigan University, Ann Arbor, Mich.

Mr. J. M. MOFFATT has returned from Saratoga, and is working again at No. 145 Broadway, New York.

Mr. F. B. RAE, of No. 145 Broadway, New York, goes to Syracuse, N. Y., Western Union office.

Mr. ALBERT AYERS (Lightning Putsey), is working for the Western Union Company in New Orleans, vice Mr. WILLIAM WEST, who has become treasurer of the Globe Theatre.

The Telegraph.

By Cable.

NO LATER NEWS OF THE FARADAY.

LONDON, September 30.—No information concerning the whereabouts of the Direct United States cable steamer Faraday has been received later than that furnished by the captain of the steamship Algeria, who, upon his arrival at New York, on the 22d inst., from Liverpool, reported seeing, on the 15th inst., two steamers bound west, supposed to have been the Faraday and consort. When the Faraday started from Gravesend to commence the work of laying the cable she had a supply of coal on hand sufficient to last six weeks.

The Gold and Stock Telegraph Company.

At a meeting of the Directors of the Gold and Stock Telegraph Company, held at their office in this city, Thursday, September 24th, the following officers were re-elected for the ensuing year: President, Marshall Lefferts; Vice-President, Geo. B. Prescott; Secretary and Treasurer, Henry H. Ward. Executive Committee: Wm. Orton, Norvin Green, Jas. H. Bancker, Tracy R. Edson and Marshall Lefferts.

The company's earnings and expenses for the fiscal year, ending September 18, 1874, were:

From gold and stock instruments.....	\$140,000
Private line instruments.....	68,000
Private line instruments in country.....	32,000
Commercial news department, city.....	50,000
Commercial news department, country... ..	275,000
Snudry earnings.....	16,000

Gross earnings.....	\$581,000
Operating expenses.....	419,000

Net earnings.....\$162,000

During the last four years out of net earnings the company has expended on lines and instruments the following amounts:

1871.....	\$58,420	1874.....	\$142,270
1872.....	292,160		
1873.....	216,175	Total ..	\$709,725

A New Telegraph Line.

THE Cheyenne, Boulder and Denver Telegraph Company have completed their line from Denver to Cheyenne, and offices have been opened at Fort Collins, Longmont and Denver, Colorado. Additional offices will be opened soon. This line is worked in exclusive connection with the Atlantic and Pacific Telegraph Company.

Arrival of United States Direct Cable Operators.

MESSRS. HUGH OSBORNE, Frost and Gee, of the operating staff of the United States Direct Cable Company, have arrived in this city, and are temporarily located at the Astor House. The full operating staff of the Company for the stations in Nova Scotia and the United States have now arrived, and are awaiting the completion of the laying of the cable to enter upon the discharge of their duties.

The Marine Telegraph Fight.

IN reply to the circular of General Lefferts, the President of the Gold and Stock Telegraph Company, Mr. JOHN C. SMITH, Superintendent of the Merchants' Exchange and Newsroom, has issued a circular to their patrons and the public detailing their grievances from the Western Union and Gold and Stock Telegraph Companies, and the reasons which compelled them to build their own line to Sandy Hook.

The circular also announces that there is nearly ready for occupancy a very convenient general telegraph office, in connection with the Newsroom, which will be occupied respectively by the Atlantic and Pacific, the Franklin, the Southern and Atlantic and the Sandy Hook, Long Branch, Highlands and Quarantine Telegraph lines, all managed by experienced telegraphers.

The Central American Telegraphs.

THE telegraphic system which Mr. Stanley McNider has been engaged in constructing during the past three years, under contracts with the Salvadorian and Guate-

malan Governments, is rapidly approaching completion, and now puts the following places into electric communication with each other, viz:

SALVADOR.

Acajutla,	Izalco,
Ahuachapam,	Quesaltepeque,
Atiquizaya,	San Salvador,
Cojotepeque,	Sonsomate,
Chinameca,	Santa Ana,
Chalcutapa,	Santa Tecla,
Chalatenango,	San Vicente,
Isobasco,	San Miguel,
Jucuapa,	Sensuntepeque,
La Libertad,	Snehitito,
La Union,	Usulután,
Metapam,	Zacateculuco.
Opico,	

GUATEMALA.

Amititlan,	Guatemala,
Asuncion,	Jutipa,
Cuajiniquilapa,	Mita,
Esquintla,	San José de Guatemala.

The introduction of the telegraph met with much opposition from ignorant or interested parties in certain sections of these countries, but now that the benefits arising therefrom have become apparent to the masses, it is generally meeting with much favor.

A connection will be made with Mexico during the course of this year, which will place every village, town and city in Salvador and Guatemala in daily contact with the entire world.

It is understood that Mr. McNider has made a contract with Nicaragua for a complete telegraph system therein, upon which he expects to commence operations on the completion of his present undertaking with Guatemala. When Nicaragua is thus equipped, and the submarine cable (now being made) is laid from Panama to Peru the continents of North and South America will be connected by electricity—with the exception of a gap of about 400 miles between the southern boundary of Costa Rica and the city of Panama, which connection, it is to be hoped, will not remain wanting for any length of time. A scheme has been recently agitated to lay a cable off the Atlantic coast, from Aspinwall (Colon) to Port Limon, in Nicaragua. If this scheme should be carried out it would, in an indirect manner, complete the missing link alluded to.

It has been wisely observed that where the telegraphic system has been introduced in the Central American republics it has replaced revolutions and anarchy by peace and prosperity. The observation seems to be justified by facts, and it is to be hoped that it may ever continue thus. In the meantime we shall look forward with pleasure to the day when we can shake hands over the wires with our Central American and South American neighbors.

Foreign Telegraphic Notes.

THE West India and Panama Telegraph Company have at length got their system into such order that the "latest dates" show the time occupied between Demerara and London to be from forty-five minutes to three hours.

The traffic on the various submarine lines continues to be satisfactory; and it is understood that after the holidays the extension of the Globe Amalgamation will be carried out with vigor.

In Japan the company's repairing steamer is at present submerging cables for account of the Japanese Government for the purpose of connecting Nippon and Yesso.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended the 12th September, was 391,599, an increase on the corresponding week of last year of 19,579.

The steamer Great Northern is reported arrived at Pernambuco from Para to repair the Pernambuco-Bahia section of the Western and Brazilian cable.

Soundings for the Australian Cable.

THE result of the recent sounding by H. M. S. Challenger of the route for the laying of a telegraph cable between Sydney and Wellington, to connect with the lines to Europe, which the Australian and New Zealand Governments have long been negotiating, was most satisfactory. It is confidently expected that, on the information obtained, New Zealand will be telegraphically connected with Europe next summer.

The bottom was sand and mud, gradually shelving to a depth of 2,600 fathoms, at which it remained very evenly for a long distance, the temperature at this depth being thirty-three degrees, and at the surface

sixty-four degrees. At this point the soundings commenced getting less, and at the next was found to be 1,975 fathoms (temperature thirty-six degrees). Two days after this 1,100 fathoms was recorded, the temperature rising to thirty-six degrees. These indications of shallow water were not without cause, for on the second day they came unexpectedly into 400, 350, and, at last, only 275 fathoms. This was about 200 miles from land.

Owton A. Flye.—He Goes into the Country with his Family.

EARLY last week Mrs. Flye expressed a desire to visit her "Aunt Schonchin" in the country. I had never been out of the city in my life, and finding that Mrs. F. would need my assistance in managing the children, handling bandboxes, etc., I looked at it from a utilitarian standpoint, and concluded to accompany her. Now, a visit to the country, ordinarily speaking, involves nothing extraordinary; it is quite a commonplace affair; but in my place, attending circumstances served to convert it into something (to me) remarkable.

My spirits were dampened at the outset, when I surveyed with wondering awe the formidable array of boxes, bundles, etc., which were to be conveyed to the early train in the morning. I tried to convince Mrs. F. of the folly of this, by asking whether she intended visiting Europe before her return, but my argument was lost. "She wasn't going to leave valuables in the house to be burglarized out of it during a week's absence." I coincided—ten years of domestic experience has taught me to do it—and the valuables were shipped.

It might be in order here to show the nice discrimination displayed by Mrs. F. in the selection of articles for safe keeping. She took with her the "spring styles" in wearing apparel and left the silver in a promiscuous heap on the dining room table; she took with her a dozen novels "just out," and left the parlor carpet on a line in the yard; she took with her two trunk loads of children's clothing, and left the front door unlocked, to say nothing of several other precautionary measures, which were distracting enough. Aunt received us kindly, and stowed us away into the "spare room," which had such an air of cleanliness about it that I involuntarily shrank from defiling the neatness and purity of the place with my travel-stained appearance. The first day passed tolerably well, but the awful stillness of the country began to tell on me. I pined for noise; something to relieve the monotonous and oppressive quietude of the place. I tried to induce Uncle John to hitch up the thrashing machine for my benefit, but he declined, on the ground of insanity. It was a relief to go out where the hired man was ploughing, and hear him swear at the horses; I enjoyed this for a while, but it grew too severe and I left him. I judged from this man's painful language that ploughing must be nearly as exasperating as travelling with a family. I didn't say anything to my wife about it though.

After the third day it began to grow alarming. For the first time in my life the children's crying was a blessing to me; I gave them sly pinches when Mrs. F. was not looking, and when they shrieked with pain I lay back and closed my eyes in the very ecstasy of delight. I was sorry when they went to sleep.

Next day I went down to the meadow lot, and sat on a rail fence four hours watching the grass grow. Could see no improvement at the end of that time and withdrew. I went to the barn and shelled four or five hundred bushels of corn to kill time; watered the cattle every half hour in the day. Anything but the dreary monotony of seeing nothing, hearing nothing and doing nothing.

And when night came it was too quiet for me to go to sleep. Oh, how I longed for a fire alarm, an engine whistle, or an explosion of some kind to lull me to sleep. I got up and walked round the farm several times to tire myself into a sleeping condition. No use. After a week's loss of sleep, worry of mind and heavy inactivity, I began to manifest symptoms of acute mania, and my friends brought me home.

I had no idea there was so much melody in a tug whistle as I found when I got home; so much real music in a boiler shop. I enjoyed it. I positively refuse to go into the country again, unless there is a saw mill on the place, where I can take a little comfort. I think of going into the theatrical profession. I studied hard for a *debut* as gravedigger to Booth's Hamlet last week, but after five rehearsals I found the work too hard (physically) and resigned.

I want something easy. I'd try it as the ghost, but I'm too tangible altogether to make it a success.

New Patents.

For the week ended Aug. 25, 1874, and bearing that date.

154,451.—TELEGRAPH INSULATORS.—Homer Brooke, New York, N. Y. [Filed Apr. 20, 1874.]

Cast of one piece of glass, with top lugs out of a direct line for clamping and holding the wire without the necessity of a tie wire.

1. As an article of manufacture, a telegraph-insulator made of a single piece of glass, provided upon its top with the projecting ears C C, and grooves a, for holding the wire thereon in a curved or cramped manner, all substantially as and for the purposes herein set forth.

2. A telegraph-insulator made of a single piece of glass, and provided with projections C C and circumferential groove b, substantially as and for the purposes set forth.

154,479.—DUPLIX TELEGRAPHS.—Chas. H. Haskins, Milwaukee Wis. [Filed Apr. 14, 1874.]

Uses polarized relay; coils so wound that current entering from either end goes round both coils in opposite directions, causing armature to be moved; current (sender's battery) entering between coils goes round coils in same direction, holding armature inactive. Condenser P in branch circuit connected directly with main line circuit, so that extra charges from line and from condenser pass over same wire in opposite directions.

1. The relay, composed of two separate cores wound with helices in such manner that a current will pass in opposite directions around said cores when said current enters said helices from either of the free ends, one of said free ends being connected to line and the other to ground, in combination with the permanent magnet armature and the Morse key connected to both helices, between said helices, substantially as specified.

2. The combination of the helices C C', the parallel cores provided with semi-circular prolongations C C', the polarized armatures B, shaft D, contact points e e', and the wire M, attached to the connection m, and the key K, substantially as specified.

3. The combination, with the relay, substantially as specified, of the condenser P and the Morse key K, connected, arranged, and operating essentially as specified.

154,520.—AUTOMATIC ELECTRIC COMMUTATORS.—William Robinson, Brooklyn, N. Y. [Filed July 18, 1873.]

One battery, through the operation of a magnet in its own circuit, either upon the closing or breaking of the circuit, switches itself out and another battery into circuit.

1. In combination with two galvanic batteries, an electromagnetic commutator, constructed substantially as described, placed in circuits partially common to both batteries, and operating to switch out one and switch in the other battery through the action of one of the batteries, substantially as and for the purposes set forth.

2. In combination with the electro-magnet; commutator having the described circuit connections, the rail sections A A', the one closing the circuit through the commutator, and thereby determining the battery to be connected to the other rail section, substantially as and for the purposes set forth.

For the week ended Sept. 1, 1874, and bearing that date.

154,588.—GALVANOMETERS.—Wm. E. Davis, Jersey City, N. J. [Filed Mar. 5, 1874.]

Coil made in shape of sphere or cylinder, so that needle is always equally affected.

A galvanometer coil, B, whose convolutions cross each other at the pole a, beneath the centre of the needle, substantially as described.

154,617.—INSULATING TELEGRAPH WIRES.—Thos. L. Reed, Providence, R. I., assignor of one half his right to Eugene F. Phillips, same place. [Filed Aug. 25, 1873.]

Protects outer insulating jacket by a layer of soluble glass between such jacket and the wire.

Fibrous material saturated with a solution of glass, interposed between the wire and the outer covering of paraffine, wax or rubber, substantially as and for the purpose specified.

For the week ended Sept. 8, 1874, and bearing that date.

154,788.—DISTRICT TELEGRAPH SIGNAL BOXES. Thomas A. Edison, Newark, N. J. [Filed May 11, 1874.]

Circuit breaking apparatus is segment of circle attached to pivoted lever provided with finger knob. Depressing knob elevates segment, which falls to normal position by gravity.

1. A signal apparatus, composed of a lever with a segmental circuit closing surface, a contact roller, a finger key and connections, substantially as set forth.

2. A circuit closing segment and a weight at the end of a lever, in combination with a circuit closer and connections, substantially as set forth.

3. A telegraphic alarm and signalling apparatus, formed of two or more levers with circuit closing surfaces contained within a box, with finger pieces outside said box; substantially as specified.

154,928.—ELECTRIC ANNUNCIATORS. Albert Storck and John Lennox, Cleveland, Ohio. [Filed Feb. 19, 1874.]

The combination, in an electric annunciator, of a name or number plate, an electro-magnet, and an armature, said armature or the core of the magnet being made of hardened iron, to hold the plate in view by the force of residual magnetism, substantially as and for the purpose described.

AMERICAN COMPOUND TELEGRAPH LINE WIRE.

COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE compared with IRON, consists in its LIGHTNESS relative TENSILE STRENGTH, CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.

Address, American Compound Telegraph Wire Co.

THE BALTIMORE BATTERY.

Acknowledged to be SUPERIOR to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

All kinds of Battery and Battery material for

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.

No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THEIR CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,
TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SULLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Pistina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street. PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

BLISS RESERVOIR BATTERY.
PATENT APPLIED FOR.

Price per Cell, \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by MR. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE
TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Crnikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Oersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given
The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and it is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices:

Single Instruments, with *three* cells of Battery, Chemicals,

Connecting Wire and Instruction Book, \$6.50

Two sets of Instruments, etc., 12.00

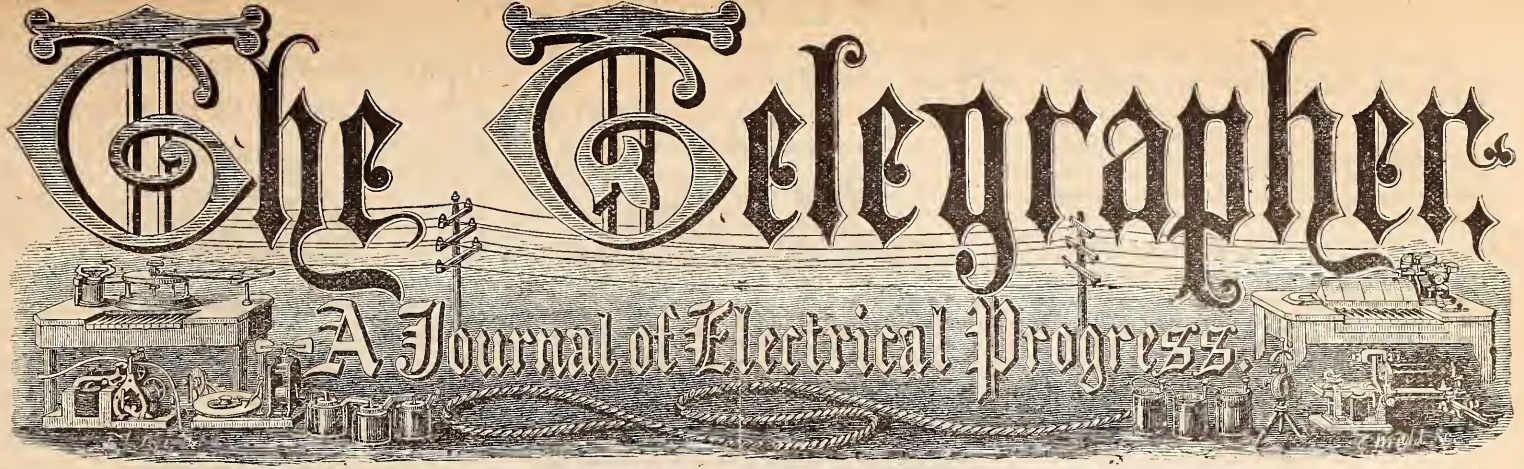

Send for our new Circular and Price List.

The Telegrapher

A Journal of Electrical Progress

Vol. X. New York, Saturday, October 10, 1874. Whole No. 430

CHARLES WILLIAMS, JR.,
109 COURT STREET, BOSTON, MASS.,
MANUFACTURER OF
TELEGRAPH INSTRUMENTS
OF ALL KINDS,
GALVANIC BATTERIES,
JONES' PATENT LOCK SWITCH,
PATENT ELECTRIC GONGS,
PRINTING TELEGRAPH INSTRUMENTS.
ALSO, ON HAND AND FOR SALE,
D. W. PUTT & CO.'S Mechanical Telegraph
Instruments,
"Pope's Modern Practice of the Electric Telegraph,"
AND A FULL ASSORTMENT OF
TELEGRAPH MATERIALS AND SUPPLIES
AT THE LOWEST PRICES.

PATRICK, BUNNELL & CO.,
38 SOUTH 4th ST., PHILA.,
AND 22 DEY ST., NEW YORK,
MANUFACTURERS OF
UNRIVALLED MORSE INSTRUMENTS
CHAMPION LEARNERS' APPARATUS,
with Complete Instructions, Battery, Wire, etc.,
GIANT SOUNDERS,
Improved Curved Keys,
Batteries and Supplies of every Description.

Send for Circulars and Catalogue.

WESTERN ELECTRIC
MANUFACTURING COMPANY
FURNISH ALL DESCRIPTIONS OF
Copper Office and Magnet Wire,
OF OUR OWN MANUFACTURE,
WITH
EVERY VARIETY OF INSULATION,
FINE RESISTANCE WIRE and DOUBLE and
SINGLE CONNECTING CORD.
Western Electric Manufacturing Company,
CHICAGO.

CHARLES WILLIAMS, JR.,
(ESTABLISHED 1856.)
109 Court Street, Boston,
has for sale the various kinds of Office and Magnet Wires, including Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
MANUFACTURER OF
REED & PHILLIPS'
PATENT INSULATED TELEGRAPH WIRES,
(PATENTED, NOVEMBER 18TH, 1873.)
Lock Box 169, PROVIDENCE, R. I.
Having recently enlarged our factory, we are now prepared to furnish at short notice any style and quantity of
BRAIDED LINEN or COTTON COVERED WIRE,
saturated and finished with our Patent Compound, which makes the most durable, handsome and best insulated Braided Wire manufactured.
PAINTED, PARAFFINE or SHELLAC WIRES
also furnished at the lowest prices. Iron or Compound Wires covered upon reasonable terms.
We are also prepared to furnish a new style of
ELECTRIC CORDAGE,
which has been pronounced by all superior to any in the market.
The American District and Gold and Stock Telegraph Companies have been supplied from my works with a greater portion of the office wire used by them.
Sample Card and Price List furnished when requested.
Phillips' Wire can be had of

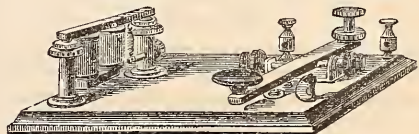

L. G. TILLOTSON & Co.	New York.

Five per cent. discount for cash in advance.

GEO. H. BLISS & CO.,
SOLE AGENTS,
41 THIRD AVENUE,
Chicago, Ill.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
No local required. Always ready for temporary offices.
Just what is wanted for officers' cars.
Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.
WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE,

AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors **GUTTA PERCHA** has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, OCTOBER 10, 1874.

VOL. X. WHOLE No. 430.

Original Articles.

The Mystery of Electrical Communication.

WHATEVER is familiar to us becomes in a very short time commonplace, and is regarded as a matter of course, and it surprises us when we find that to others not so accustomed the same operation seems wonderful and mysterious. This is strikingly true in regard to communicating signals by electrical pulsations between places separated perhaps by hundreds and thousands of miles of space. To the telegrapher nothing seems more commonplace and less wonderful than that he should be able to converse with his fellow, however distant he may actually be from him. It is hut to touch a key and the thing is done. When, therefore, a stranger or one unaccustomed to electrical communication expresses wonder or surprise at what is to him matter of constant occurrence, it not unfrequently excites his mirth at the oddity of the expressions of amazement which it evokes. And yet, when we stop to consider the matter, we cannot but realize that, after all, the electric telegraph is a wonderful and wonder working and marvellous affair. What electricity is, is as much a mystery to us to-day as it ever has been. We know as little of its real character as the most ignorant boor who is struck with astonishment and incredulity at his first observation of actual telegraphic performance.

It is true that by diligent study and observation we have learned some of the laws which govern its manifestations, and have been able to utilize it for our service. We have learned how to develop it in such a manner as to furnish just what is required for our use and make it do our bidding, but this is all.

Electricity is undoubtedly one of the mightiest agencies in nature, and is all pervading throughout the universe. Yet we are still ignorant of its purpose and part in the great economy of nature. We witness its corruscations in the heavens in the magnificent displays of the aurora borealis, and the sympathetic responses upon electrical conductors connected with the earth; we recognize its might as it rends the heavens in its passage from one thunder cloud to another, and tremble at its terrible effects as it is transmitted from the clouds to the earth, rending, burning and destroying whatever may obstruct it. Yet we know not what it is, and the mystery is as great to us as it has been to those who have preceded us during the millions of years which have elapsed since the earth became habitable and inhabited. Like the principle of life, which has eluded the attempts of the wisest, most studious and persistent investigators, electricity appears to be utterly incomprehensible to the human mind. It has been by some philosophers believed that electricity and life were synonymous, and that as one cannot exist without the other, electricity must be the great principle of life itself, but this belief has never had many adherents, and there can scarcely be found at the present day any intelligent person who entertains it.

While it may not profit us to expend time and study upon these abstract, and to finite minds apparently insolvable questions of life and electricity, yet it may be worth while to pause for a time in our accustomed daily routine of telegraphic service to consider the great mystery which is constantly transpiring under our observation—so constantly that we are apt to regard it as no mystery at all. It is indeed wonderful that we should be able to communicate, by intelligible signs and symbols, through the slender metallic cord which passes not only over forests, deserts and mountains upon land, but for thousands of miles through the trackless depths of oceans. And not only can we thus communicate by signs and symbols, but can produce the exact *fac simile*, of the marks and symbols which are to be transmitted if it is desired to do so. It would seem as though the inventive genius of man must have nearly reached its limit when this has been accomplished, but it is impossible to predict what may or may not be accomplished in the future.

This mystery of electrical communication is ever new and wonderful, and that it is so we may realize when persons not familiar with it, as are most of the readers of THE TELEGRAPHER, are brought into personal observation of it. Most appropriate was the motto first transmitted over the experimental line

between Baltimore and Washington, "What hath God wrought?" for it would seem as if nothing less than omnipotent and omnipresent power, manifested in the electric current, could accomplish such marvels as were then and have been since developed in the electric telegraph.

The Telegraph Cable Operators.

THE telegraph cable operators form a class by themselves, requiring a special education and special adaptability to the service. Their life must be anything but a cheerful or social one, for they are located usually in out of the way places on the sea coast, where neighbors, if there are any, must be few and far between, and scarcely of a character calculated to constitute an interesting and pleasant social circle.

When on duty they are closely occupied in watching and translating the slender point of light whose vibrations convey to the eye with them, as sound does to the ear of the ordinary telegraph operator, the intelligence which it is necessary to communicate. When off duty their pleasures and recreations must be few indeed, and taken altogether the occupation and its surroundings are not such as would appear to be very enticing to individuals of social and companionable proclivities.

It may be said on the other hand, however, that the labor required is not excessive, and is understood to be pretty well paid, and if there is a lack of opportunity for social enjoyment, there is also not much temptation to spend money, and that the position of cable operator is one in which there is an opportunity for financial accumulation. Most, if not all, of the cable operators on this side of the big pond came from England, and after a certain term of service they are entitled to a three months' leave of absence to visit their native land, if they so desire, and receive from the company a liberal allowance to defray their expenses upon the trip.

It will be seen, therefore, that in this as in most other kinds of business, advantages and disadvantages are both found, and, perhaps, on the whole, our cable telegraphic brethren may not consider that theirs is the least desirable position in the telegraph service.

Proceedings of the Chicago District of the Telegraphers' Mutual Benefit Association.

CHICAGO, ILL., Oct. 4th.

THE members of "The Telegraphers' Mutual Benefit Association" of the Chicago district held a meeting in the Gold and Stock rooms at ten o'clock this morning. The following members were present: C. Sweede, F. M. Crittenton, W. A. Leary, O. W. Hamilton, F. N. Benson, F. W. Jones (agent), E. Lomasney and W. C. Long.

On motion of F. W. Jones, agent, the meeting was called to order by the appointment of W. C. Long as Chairman, and on motion of F. M. Crittenton, Mr. E. Lomasney was requested to act as secretary.

Considerable talk was indulged in by the members present in regard to the object of this meeting, and as to what instructions should be given our delegate to the annual meeting of our association in New York City, on the eleventh of November next, which assumed tangible shape by the offering of the following preamble and resolutions by F. W. Jones, seconded by Mr. F. M. Crittenton.

Resolved, That our delegate to the annual convention, to be held in the City of New York eleventh of November next, be, and is hereby authorized to work for an amendment to that article of the constitution which debar delinquent members from being reinstated without paying up all back dues, etc., etc., as follows:

That delinquent members desiring to be reinstated who are in arrears over sixty days and under one year, shall be required to file an application for restoration to membership, and pay up all back dues: but after this time, in consideration of delinquent members incurring such great risks as they do by allowing themselves to become delinquent (it not being our province to inquire into the cause therefor) for one year or over, and who desire to be restored to membership, shall only be required to file the same application, furnish the same certificate and pay the same fees as new members; not being required to pay up all back dues as heretofore.

After considerable friendly discussion by the gentlemen present the resolution was unanimously adopted.

Mr. W. A. Leary then offered the following resolution, which was seconded by Mr. O. W. Hamilton, and without any discussion was passed unanimously.

Resolved, That it is our belief that many members who have become delinquent more than one year who are in good standing and desirable would again join our ranks did they fully understand the terms and conditions of the above resolution. That we suggest all such delinquent names be selected from the books of the association at New York, and a copy of these resolutions, if adopted by the annual meeting on the 11th

of November next, be sent them for their consideration, believing that the interests of this Association will be advanced thereby.

The chairman stated that the next thing to be considered was the appointment of a delegate to the convention, mentioned heretofore. Thereupon Mr. O. W. Hamilton moved and Mr. E. Lomasney seconded the motion that Mr. F. W. Jones, the present agent of the Chicago district of the association, be, and is hereby appointed as delegate to the said convention.

An animated discussion then arose, which, however, was a one sided affair, the only opposing element being Mr. Jones himself, who suggested the name of Mr. C. H. Summers, one of the oldest members of the association. Mr. Jones remarked that he had tried to induce Mr. Summers to promise that he would act as delegate if elected; that Mr. Summers had expressed himself as not being positive that he would be able to attend the convention, and that he (Mr. Jones) was not positive that he himself would be able to attend either, and begged leave to offer as an amendment the name of Mr. C. H. Summers as delegate.

The other members present, although having implicit confidence in Mr. Summers, declared that they had made up their minds that Mr. Jones should represent them as their delegate, he having served them in the capacity of agent for so long a time and so faithfully that they were positive that no one better understood their sentiments, and could so ably represent them as he could.

Mr. Jones wished the members to understand that it was not because he was not willing to serve the members of this district in this as in any other capacity possible. If elected he would promise to lay aside all views of his own in this matter, and faithfully represent the members of this district; but as far as his knowledge went of the views of the members of this district he had found no views of his own at variance with the views of any member of the district.

A vote was then taken, which was participated in by every member present (including the chairman, who called Mr. Benson to the chair while he recorded his vote) excepting Mr. Jones. The vote was, therefore, ordered to be recorded as a unanimous vote.

It was then suggested by the chairman that provision be made for an alternate delegate, when Mr. F. N. Benson, seconded by Mr. W. A. Leary, offered the following:

"That in case Mr. Jones should, from any reason whatever, find it impossible to attend the annual meeting, that he be empowered to appoint a substitute."

Passed unanimously.

On motion of W. A. Leary, seconded by F. N. Benson, it was resolved that the expenses of our delegate to the annual meeting be borne equally by the members of this district. Passed unanimously.

On motion of O. W. Hamilton, seconded by Mr. C. Sweede, it was resolved that hereafter seven members shall constitute a quorum for the transaction of the business of the association of this district; and all business transacted by them shall be binding on all the members of the district.

The Chairman then remarked, as there was not many members of the district present at this meeting, it might become necessary to call another meeting—probably more than one before the departure of our delegate for the annual meeting in New York, so that a larger majority of the members of this district might give expression to their views, and adopt the proceedings of this meeting in whole or part, or make some alterations in the instructions to the delegate.

It was, therefore, moved by Mr. F. M. Crittenton and seconded by Mr. O. W. Hamilton, that, upon request of any seven members of this district, a meeting may be called at any time hereafter for the consideration of any further business, upon written application to the chairman or secretary of this meeting; and that the said chairman and secretary of this meeting be and are hereby constituted permanent officers until such meeting is called. Carried.

On motion of W. A. Leary, seconded by F. M. Crittenton, a vote of thanks was rendered to Col. J. J. S. Wilson, Superintendent, for the use of the Gold and Stock Rooms for our meeting to-day; and the secretary was authorized to notify Mr. Wilson of this action by the meeting.

It was then moved by F. W. Jones, seconded by W. A. Leary, that a copy of the minutes of this meeting, and all the resolutions adopted, be furnished to the *Journal of the Telegraph*, THE TELEGRAPHER, and *The Operator*, for publication. Carried.

Moved by Mr. Leary, seconded by Mr. O. W. Hamilton, that we adjourn. Carried.

Accordingly, the meeting was adjourned at one P. M. E. LOMASNEY, Secretary.

The directors of the Eastern Telegraph Company announce the payment, on the 14th October, of the usual interim dividend of 2s. 6d. per share, free of income tax, for the quarter ended June 30, 1874.

Farmer's Dynamo-Electric Machines.

THE following description of the Dynamo-Electric Machine, of Mr. Moses G. Farmer, now on exhibition at the Fair of the Massachusetts Charitable Mechanic Association, at Boston, to which reference was made in the last number of THE TELEGRAPHER, will be read with interest. Mr. Farmer's ability as a scientific electrician is well known not only in this country but throughout the civilized world, and he has made many important and valuable inventions in connection with electricity, to the study of which his life has mainly been devoted:

"As the visitor passes through the entrance from section eight to section nine he may perchance notice standing upon a rude shelf two square cases or boxes of polished wood, not so large or heavy but that any one could easily take either or both in his hands and carry them off. Although by no means formidable in appearance, not likely to attract the attention of the careless stroller through the halls, these innocent looking boxes are really most terrible engines of destruction; one of the simplest and at the same time one of the most ingenious inventions to be found in the exhibition. With this apparatus a child could, at a distance of eight miles, utterly annihilate, the largest and strongest war vessel that ever floated; or discharge a series of blasts which would rend and shiver thousands of tons of solid rock. In the fierce heat evolved the hardest metals melt and dissolve like frost-work before a glowing furnace, while the light produced surpasses in brilliancy and intensity that of any artificial illuminator known. This is the invention of Mr. Moses G. Farmer, who, twenty-two years ago, furnished this city with the admirable fire alarm which has since been so generally adopted in all the principal cities of this country. The largest machine, weighing but 115 pounds, is designed for firing torpedoes and discharging simultaneously a series of blasts in mines and quarries. This has been adopted by the United States Government for torpedo service, has been successfully used in the torpedo experiments recently made at Newport, R. I., and several of the same have been furnished the Government of the Argentine Republic. The smaller one, weighing sixty pounds, is adapted to firing blasts in mines, tunnels and quarries. No cumbersome batteries, with the disagreeable adjuncts of acids and other chemicals, are necessary, as the electric current is generated by electro-magnetism, and the machines are really as free from anything unsightly or objectionable in their appearance or working as a writing desk, or lady's workbox.

"Their merits, which are apparent to any one, are their compactness, the ease with which they can be operated, their cheapness and certainty of operation, each one being provided with a testing attachment, by which the operator can be absolutely sure of the result before touching the key which explodes the torpedo or the blast. The operation of generating the electricity is produced by means of the simplest mechanism—a crank. Back of these is another machine substantially of the same construction, a little over two feet square, weighing less than 700 pounds, and run by steam power. This is capable of producing the most intense light and heat known to scientific men. Some idea of the brilliancy of the light may be given those who have witnessed the experiments of Professor Tyndall, and kindred experiments at Harvard College and the Institute of Technology, when we state the fact that the most intense light shown there was of the capacity of from five hundred to seven hundred candles, while the measure of this is *six thousand candles!* Mr. Stowell, assistant to Mr. Farmer, a practical electrician, who has charge of the machines, further demonstrates its power by casting the shadow of the flame of a lighted candle in bright daylight. A gentleman, who saw the light as exhibited by Mr. Farmer at Newport, estimated that it was fully six times as powerful as one he saw in Paris, produced by a fifteen horse power machine weighing 7,000 pounds. This brilliant light is generated at less than one tenth the cost of the same amount from gas, and it is not improbable that in the future our streets, theatres and public buildings may be illuminated by this method. Another practical application to which this may be put is that of electroplating and electrotyping. A machine costing \$1,000, occupying scarcely any space, requiring no outlay for acids as do the batteries, will in two hours accomplish the same amount of work performed by the ordinary battery in twelve hours, while the cost is less than one fifth that of the usual method. Simple as the construction of the apparatus may appear to the ordinary observer, it represents the persistent labor and patient research of years, not to mention the large outlay made in experiments by the inventor, who has spent almost a lifetime in the endeavor to render more available in the service of science and mechanics the mighty forces of this mysterious agent."

"The teeming brain and untiring nerve of this great genius," meaning TOM EDISON!

Reply to "Journal of the Telegraph" Criticisms on Bear's Duplex.

MITCHELL, IOWA, Sept. 26.

TO THE EDITOR OF THE TELEGRAPHER.

In the *Journal of the Telegraph* of the 15th inst., in the correspondence column, is this address to my name from the editor:

"We have tried your duplex devices and find them totally inoperative, for reasons already given in our articles on the subject, and we apprehend that if you will spend as much time in testing the question with a few cells of battery and a relay as you have in writing your objections to our criticism you won't feel disposed to argue the question any further. Why don't you obtain and publish the opinion of the editor of the paper who printed and illustrated your description of your apparatus as to its merits?"

I don't doubt in the least that he found them inoperative if he got as badly mixed in his experiment as he did in theory.

What good will my testing do if I cannot explain the result? And what benefit is it to ask questions he does not allow me to answer? As my answers to his former questions were not published, I will take his advice about spending so much time in writing a reply no longer than the questioning article. Ought he not to allow me the same weapon in defence that he attacks me with?

Mistakes were made in my diagrams which any honest investigator could perceive by comparing them with my descriptions, and were so evident that I did not care to correct but one. If he will give us a good reason for his failure in the trial of my devices, then some one may be benefited thereby.

This diagram represents my method for simultaneous communication between terminal offices, both communications in same or opposite directions, with common instruments. In this method the increased quantity of electricity from main batteries, over diverting batteries, operates the relays, they being adjusted so high as to overcome attraction of diverting current alone. The current from M B divides between M L and R in proportion to their respective resistances. Two like currents pass each other on same line in opposite directions, but as the diverting battery on one side presents a like pole of same potential the approaching current takes the other side which presents an opposite pole, as shown by arrows. When K' is opened all of current flows to line but its increased quantity may be neutralized in same manner as in my first published plan.

S. J. M. BEAR.

Chilly Weather.—Action of Chicago Members T. M. B. Association—Suggestions for Office Improvement and Ventilation.

CHICAGO, Oct. 5.

TO THE EDITOR OF THE TELEGRAPHER.

We are enjoying quite a cool snap in the way of weather just at present, and business has been a little dull of late.

The exposition still flourishes, although no telegraph machinery is upon exhibition yet, and from present indications none will be.

For some time past it has been known to the members belonging to this district of the *Telegrapher's Mutual Benefit Association* that on Sunday 10 A. M., the 4th of October, there would be a meeting held at the Gold and Stock Rooms in this city for the purpose of electing a delegate to the annual meeting of the association in New York, which takes place the 11th of next November; and also for the purpose of instructing the delegate as to the wishes of the members in this locality in regard to changes in the constitution. The subject of reinstating delinquent members has been a general topic of conversation among the members for some time, and it is to be hoped that some action will be taken at the meeting in New York which shall bring back all the good, healthy

delinquents now deprived of the benefits of the association. I understand that this meeting was held yesterday, and that although very few of the members were present, that those who were there manifested the greatest harmony of spirit.

Mr. F. W. Jones, the present agent of the association, was elected a delegate.

As I am reliably informed that a resolution was passed providing for the publication of the proceedings of the meeting in THE TELEGRAPHER and other telegraphic journals, I did not use any extra exertions to ascertain the result of the meeting farther than above stated.

I have often, in conversation with operators in the Western Union office, heard them express great dislike to the way the drawers were arranged in what is called the Western Union table. There is a drawer placed in each table just a little to the left of where each operator sits, and so near to the operator that when the check clerk gathers up the business, as they generally do every few hours in large offices, he is obliged to disturb the operator. It is claimed that one drawer just a trifle larger than the ones now used placed exactly between the two operators on one division of the table would be sufficient to hold the business, and would be accessible for the check clerks or any one else without necessitating the operators moving at all. This would require but half the number of drawers, *i. e.*, two on each side of the large eight instrument tables, or four drawers to one large table. Others have suggested to arrange the drawers for business this way, and then have an extra drawer for each operator directly in front of him provided with a lock and key in which to keep his pencils, pens, and any other small articles necessary.

By doing this, and making each operator thus furnished with a locked drawer responsible for these articles, no doubt a saving would be effected in one year that would pay for the extra expense more than double the cost. This would place six drawers on each side of a large table instead of as now only four. To those not accustomed to being troubled by being obliged to stop work for the check clerk this may seem a trifling matter, but those who have experienced this inconvenience, especially when a little hurried and been obliged to break for "that cust boy" (to make it mild as possible), it is a matter of considerable consequence; and if the tables in any new Western Union office hereafter fitted up shall contain the requisite improvements, we shall feel repaid for our "midnight oil" and toil in pointing out this defect; and you will have the pleasure of knowing that by your ventilating the subject you have saved some poor, tired telegraphers from unnecessary aggravation.

Propos of the chilly weather now upon us and the colder weather approaching, perhaps a few words on the subject of ventilating an office might not be out of place. as you are always ready and willing, I notice, to ventilate (that's no pun) anything for the good of the fraternity. It is generally the custom (and I am sorry to say our lady friends carry it to the extreme) to ventilate a room by raising the windows from the bottom, and I think I can clearly show that when windows reach all the way down to a level with the floor that this is a pernicious habit to say the least of it. In the first place, if the windows are raised from the bottom, and not far enough to be above the top of the heads of the occupants of the room, and there is no ventilation from above, all the foul air which has been expelled from the lungs of those in the room rises to the ceiling, the pure air from the outside rushes in from below and drives the impure air down to be again drawn into the tired lungs, which are starving as it were for pure, fresh air, and breathed over again; and if enough windows are hoisted to clear the room of all the impure air the result to weak lungs is very dangerous.

In the second place, if any of the occupants of the room are troubled with rheumatism at all (and this disease is generally manifested most violently in the lower limbs) the cold draft from below causes the feet and limbs to become chilled and cold, and stops or retards free circulation in that part of the body. This being the case the blood rushes back to the head, the brain is unduly excited, and besides a severe attack of the rheumatism brought on by the cold draught of air on the lower limbs, a severe headache sets in, and very frequently, on account of the upper part of the body becoming so heated, a heavy cold is taken in the chest, the lungs more or less affected, and, more than likely, the seeds of consumption are in this manner prematurely sown. The occupants of such a ventilated room, who, in the performance of their duties are obliged to be moving around on their feet, are not so materially affected as are those who are obliged to sit still for three or four hours at a time, without any chance to exercise their lower limbs. The proper way to ventilate a room in the summer is to let the windows down from the top to within a foot or eighteen inches of the head, and raise it just a little from the bottom. In very warm weather the observance of this rule is not so necessary, but in the spring

or fall of the year, when there is more or less chilliness and dampness in the air, the windows should never be allowed to remain raised from the bottom. When a person is seated for any length of time in the room, and only let down far enough from the top to keep the room supplied with pure air. If the room is thus ventilated the feelings of the occupants will inform them just how far and how long to let the window remain down; while, on the contrary, if raised from the bottom, there is no guide whatever, as the head will still be hot and feverish, while the feet and lower extremities of those in a sitting posture will ache from the cold.

I hope these suggestions will be carefully weighed, as I am certain that thereby a great deal of suffering will be avoided, and not so much red flannel adorning our lady friends' necks this fall and winter.

DOCTOR.

In the Wilds of Jersey.

TO THE EDITOR OF THE TELEGRAPHER.

THERE is not much going on, telegraphically speaking, in this part of Jersey, and, not being much of a writer, I hope your readers will excuse all shortcomings.

I shall try to give you a list of brass pounders in this region, commencing with "The New Jersey Midland Railway" telegraph lines. The operators on this road are a very nice class of fellows, though I admit some are very poor indeed. First, we will begin with our popular Superintendent, Mr. W. E. Lewis—"W. E.", who, as I understand, came from Elmira, N. Y. (N. C. R. R.), but later our chief and train despatcher. In my opinion, as well as a great many others, the company made a very good selection when they put him in as superintendent. We don't hear him on the wires quite as much as we used to, but he comes to the key occasionally to let the boys know he is alive. His headquarters are at Jersey City. Then next on the list comes that prince of good fellows—Mr. F. S. Gannon. "F. S." who makes both trains and operators stand around. All the boys like Frank first rate, but we hope he won't let that young lady up on the Erie take him from us.

Next comes Tom Thumb in disguise—Willie Holbrook; "W." who assists Frank during the day. He is scarcely fourteen years of age, yet is a very good operator for his age.

Stepping in this office any time between seven P. M. and seven "A. M." we find our young friend Mr. W. M. Maguire—"W. M.," who runs the string and trains till the wee sma' hours of the morn. Mac is one of the boys.

We will now cross over the river to 193 Broadway, where, at the Midland table, we find our old time friend Mr. J. W. Jarvis—J. who has travelled far and wide, both north and south, as well as east and west. He works No. 2 Midland wire to Oswego and way office. As we are not very well acquainted with the other operators who happen around to No. 2, we will bid adieu to this office and saunter down to 96 Liberty street, where we find Mr. Isaac Wortendyke—"W.," the son of President Wortendyke. Its fearful hard work to raise Ike, but then he has a great deal of writing to do, so we will excuse him and recross the river to Jersey City, where we will step in to see our friend Mr. W. E. Huntington, "U. N.," at 18 Exchange place ("Sx" office) who works on Nos. 1 and 2 Midland, and 9 A. & P. Long Branch wires. After taking a smoke with him we bid him farewell, and pass out just in time to catch the train. We whirl past the stores and streets of old Jersey for a couple of miles, when we leave the Penn. Central tracks and branch out on our own hook past West End, J. N. station. We pass on to New Durham, where we find friend Greenleaf—"G." enjoying himself all alone in the "Jersey Swamp." We can't say as we envy him his sanctum sanctorum, situated as it is in so lonely a spot. Leaving him in his solitude we pass on to Hackensack. On our way we pass J. C. & A. Junction, "Hs.," and Ridgefield Park, "R. P." The latter place is a very good summer resort, and we are very sorry we don't know the operator's name. At the former place Mr. S. S. Colton—"X"—did preside, until the office was closed about September 23d or 24th. He used to work for the N. Y. & O. M. R. R., at 111 Liberty street, N. Y. "Sid" reminds one very forcibly of a regular down-easter. Now, don't get angry Sid. We know not what he proposes to do now, but whatever he does or wherever he goes may success follow him is our wish. At Hackensack, "H. K." we find our friend Mr. A. Bates, with hardly an exception the most obliging, courteous and gentlemanly agent on the road, who, by the way, has held this position for a long time. At this station we also find Supt. Lewis, who spends his evenings here with his family at that place of places, "Home." Mr. M. S. Smith, Manager A. & P., 193 Broadway, N. Y., makes this his home also, and here we will stop for the time being and continue our journey in your next, till which time I bid your readers farewell, and sign myself P's. & Q's.

The Colusa Lake and Mendocino Telegraph Company Heard From.

COLUSA, CAL., September 24.

TO THE EDITOR OF THE TELEGRAPHER.

THE TELEGRAPHER has not been much known heretofore in this section—many of the operators here never having seen a copy of it, but, as soon as I got among them I brought it to their notice, and, as the first fruit of my efforts, I send you herewith ten additional names for your subscription list, and expect to come again soon with another list.

This company, the Colusa Lake and Mendocino Telegraph Company, has not been long in operation, but, since it was first initiated, it has built nearly 200 miles of wire, and is still engaged in extending its lines. We have, now, one wire from Colusa to Middletown, a distance of 180 miles, at each end of which we connect with the Western Union Telegraph Company; another from Colusa to Grand Island, which is being extended to College City, a distance of 30 miles, and a third from Colusa to Princeton.

To Mr. P. L. Washburne, who is the present Superintendent of the company, and, also, Manager of the Western Union office at Colusa, is due the initiation of the enterprise, and it is mainly through his energy and persistence that it has been established. He succeeded in interesting four others, capitalists, in it, and, in a comparatively brief time, they have accomplished what I have stated above.

Although we are rather out of the way, we do a lively business, and two operators are required to do the business of this company and the Western Union in the Colusa office.

The other officers of the company are as follows: President, Mr. J. K. Giles, of Princeton; Secretary, Mr. J. B. De Janette; Treasurer, Mr. J. B. Cook; and Mr. J. Stanton, Assistant Superintendent.

You will hear from me again before long, and, in the meantime, you have my best wishes and practical efforts for the success of THE TELEGRAPHER, to which I was a subscriber, and whose value and importance was fully appreciated when I was in Canada.

MAX ALIUS X,

Chief Operator C. L. & M. Telg. Co.

The Telegraph College Humbug Again.

TO THE EDITOR OF THE TELEGRAPHER.

IT does seem as if people loved to be humbugged, and the greater the humbug the better pleased they appear to be with it. How young men, especially in this enlightened day and age of the world, will read such infamous lies, as are largely circulated by these self-styled telegraph institutes and colleges, and will, without any further knowledge of these grand humbogs, allow themselves to be drawn into such a trap, I must confess is something I cannot fathom. If the circulars were not such bare faced lies; if they did not picture the thing out in such glowing terms; if they would not hold out inducements, which any sensible person, whether familiar with telegraphy or not, ought to know can never be realized, and more especially in the present state of affairs when so many old and experienced operators are unable to obtain situations. And these so-called telegraph colleges guarantee to provide the victim with a first class situation in three or four months from the time they enter the trap. A young man came to me to-day and wished to know if I had any one learning with me, and I answered him in the negative. He wanted to know what the chances were for getting in with me to practice. I told him, no show whatever; whereupon he said, "No one with you, and no chance for any one to get in?" Said I, that is just the way the matter stands with me. Then he told me, how he had been victimized at one of the humbug telegraph institutes of our land. He had spent over one hundred dollars, and was like the woman of old who came to our Saviour with an issue of blood. She had spent all she had with physicians, and was nothing better, but rather grew worse. So with the young man, he had spent all he had and was no better off—so far as telegraphy was concerned; but he has learned a lesson he will never forget. I advised him by all means to drop the matter and forever banish the idea of learning telegraphing, and he concluded to follow my advice. He said what I told him was just what several other operators had told him, but he had found it out after it had cost him dearly for the lesson. I told him that he did not deserve to be pitied, and still I could not help feeling sorry for him. His is only another case of misplaced confidence. If young men could only see the numerous exposures of these humbug colleges in the columns of THE TELEGRAPHER from experienced operators, they might be saved much needless expense and be wiser in the end, but as long as telegraphing continues, and base, unprincipled men who know enough about the business to entice innocent and unsuspecting youth into their traps by their glowing advertisements and false inducements can be found, just so long will humbug telegraph colleges

exist. Unless the law is brought to bear against them, and it ought to be in every instance, a humbug of any kind whatever should be exposed, and all intelligent persons do not hesitate in the least to pronounce all of these telegraph colleges and institutes grand humbogs. Enough has already been said through the columns of THE TELEGRAPHER in regard to these colleges, and it is not necessary to say anything further to the fraternity upon the subject, only, in all instances, deal with them as you would with any other fraud. We have already students enough in the land without encouraging any more to learn in colleges. Perhaps, some day operators will get their eyes open and see in just what a situation they are placing themselves by filling up their offices with learners. Nearly all operators are anxious for a Union. What good will such a thing do unless you guard against learning so many, who will cut your own telegraphic throats as soon as an opportunity presents itself?

OLD OPERATOR.

Are Brooks' Insulators Liable to Damage from Lightning?

ERIE, PA., Oct. 5.

TO THE EDITOR OF THE TELEGRAPHER.

OCCASIONAL and Mr. David Brooks do not seem to agree on the bursting of insulators at the top by lightning. And I wish to give my experience in the matter. As neither of these parties pay me anything for this letter of course I shall side with neither, but merely write what I have seen. My experience has been limited, as compared with the intelligent repairer whom "Occasional" quotes, but I have never, in ten years' experience with the Brooks insulator, found one of them injured in any way by lightning, although I have in several instances found the covered end broken open where they have been exposed to extreme heat, and the cross arm burned off—the breakage being caused, as I believe, by the melting of sulphur in the closed end by the burning arm. During the last four years I have taken down ninety-five miles of cross arms, and on taking the insulators out have found them in every instance uninjured.

We have thirty-seven miles of Erwinger (glass) insulators, and I have noticed that the lightning damages about ten poles on glass to one on Brooks insulators.

GEO. W. MOORE, Repairer.

Miscellaneous.

NEW ELECTRO-MAGNETIC STATION INDICATOR.—Mr. Charles W. White, of New York City, has patented, August 18, 1874, through the Scientific American Patent Agency, a quite ingenious station indicator, by means of which the names of places printed on an endless band are caused to appear and change by the action of mechanism, controlled by electro-magnets. The rollers over which the hand passes are geared to each other, and are rotated by a spur wheel, which is itself turned by a ratchet, in which a pawl engages. The latter connects with levers vibrated by the movements of the magnet armatures, so as to cause the pawl to turn the ratchet, and so cause the band to move around the rollers. There are two sets of this gearing, in order that the hand may be turned in either direction. In addition to this, there is a check pawl, which is lifted when the carrying pawl is operated. This locks a ratchet, so that the band is firmly held at any point until again set in motion by the mechanism. The indicators are placed in any convenient position in the cars, and from each set of magnets an independent circuit is led to the point whence the machine is to be controlled, where a suitable closer is placed in each circuit. Upon one circuit being closed, the indicating ribbon is unwound from the top roll, and wound on the lower one; the other circuit established, the reverse takes place. The mode of locking the mechanism and the ratchet arrangement for turning the rolls are novel, and embrace efficient improvements in the electro-magnetic principle for operating station indicators.

NEW MAGNETO-MECHANICAL SEPARATOR.—A new form of magnetic separator, for the removal of fine particles of iron that become mixed with turnings and filings of copper and brass from workshops, has recently been devised by M. Varin, of Paris.

Two superposed hollow cylinders turn in the same direction, and upon them the material to be separated is scattered through a hopper. The surface of the cylinders consists in bands of soft iron which are kept in a magnetic state. The particles of iron are attracted to these cylinders, and at a certain period of revolution are brushed therefrom into a receptacle, while the scraps of other metal fall to the bottom of the apparatus. The machine is said to be capable of separating 1,000 pounds of material per hour. It has also recently been employed by M. Magnon, for detecting titanic iron in arable earth, with remarkable precision, the iron, in such small quantities as fifteen or even seven grains in twenty-two pounds of earth, having been readily separated.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, OCTOBER 10, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST OF THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK on ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

a No. 1 Telegraph Key, or a set of F. L. POPE & Co.'s popular NONPAREL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by MR. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

Publisher.

P. O. Box, 5503.

The Proposed New Electrical Association.

THE movement which was initiated in Chicago on the 14th ult., for the formation of an American Electrical Association, appears to be exciting considerable interest on the part of the electricians and telegraphers of the country. The necessity and advisability of such an organization has long been evident, and we trust that it will now be carried forward vigorously and intelligently, and that it will have enrolled in its active membership all those who are interested in electrical science and the telegraphic art in this country and the adjoining British provinces of North America. The American and Canadian telegraphs are really parts of one system, and are mutually affected by whatever is of interest and importance to either.

It has been suggested that a better name than that of "American Electrical Society" should be adopted, as the term "Electrical" does not properly describe either the character or objects of the proposed association. The title of the English association, to which this is somewhat analogous, though, of course, it will differ from it in many important respects, is that of "The Society of Telegraph Engineers." This expresses exactly the character and composition of the association; but, of course, this would not be appropriate for the new American society. There can hardly be considered as existing in this country a class or profession distinctively characterized as telegraph engineers, although there is in England and on the continent of Europe. We have here some of the ablest electricians in the world, and some as capable managers and constructors of telegraph lines as can be found anywhere, but they combine these pursuits with others, so that they can scarcely be classed under one title. Perhaps a better and more appropriate name for the society would be "The American Society of Electricians and Telegraphers." We make this suggestion without consultation with any of the gentlemen who are engaged in completing and perfecting the organization, for such consideration as they may deem it worthy of. As it is proposed to admit to the membership of the association all who are interested in electrical science and practical telegraphy, whether actually engaged in telegraphic enterprises or not, it is somewhat important that the name finally adopted shall be such as to fully express the character of the association, and which shall not have a tendency to prevent any one from becoming a member who properly is entitled to membership.

It has for a long time been felt by leading electricians and telegraphers that the interests and reputation of the electricians and telegraphers of the country required an organization which should combine them into a body, which should secure for them that recognition at home and abroad which otherwise could not be obtained, notwithstanding the recognized ability of individuals among them. Another important object to be gained will be the concentration and development of the views of the members in the papers which will be read and the discussions which will take place at the meetings, upon subjects of scientific and practical importance in connection with electricity and telegraphy. If properly organized and conducted this society will eventually become a recognized authority in the decision of questions which are constantly arising in the progress of electrical science and telegraphy. It will render in this way an important service. We trust that it may be organized and conducted in a most catholic spirit, and that there will be no undue prejudice exhibited towards any who may desire to present their views, discoveries and inventions, and submit them for examination, discussion and criticism. The publications of the society will thus deservedly occupy a prominent position in the scientific and telegraphic world, and the good results which may reasonably be expected to follow cannot now be adequately estimated.

While we counsel liberality on the part of the society, we would also express the hope that electricians, and telegraphers generally, will realize the de-

sirability and advantage of cordially coöperating in the movement, and connecting themselves with and taking an active part in its proceedings. We had hoped that the society, when organized, would have had its headquarters in New York, but, as there has not been manifested here a desire or determination to establish it, and there has been a practical effort on the part of our Western brethren, we cheerfully concede to them the honor. It really does not materially matter where the headquarters are. The principal object will be accomplished wherever the society may nominally be located.

Explanatory.

IN consequence of the absence from the city and the severe and protracted illness of Mr. F. L. POPE, he has been unable for some time to continue his interesting and valuable series of articles on the "Elementary Principles of Electrical Measurement." His health is improving now, however, and we hope to be able to recommence publication of the series soon, and continue them regularly until they are completed, during the remainder of the present volume.

The Western Union Telegraph Company.

THE annual meeting of the Western Union Telegraph Company will be held on Wednesday next, at which time the usual report of the business for the year ended June 30th will be presented to the stockholders, and the election of directors for the ensuing year will take place. The present management of the company will, no doubt, be continued in power, and the changes, if any, will be unimportant.

The annual report of Mr. ORTON is looked for with much interest, as it will not only show the results of the business for the past fiscal year, which has witnessed a very material reduction in the tariff of charges for telegraph services, the wisdom of which was questioned at the time, but will doubtless explain in detail the policy, present and prospective, of the company, which to so great an extent represents the telegraph interests of the country. We are inclined to think that there will be some reduction of the gross receipts of the company, consequent upon the reduction of tariffs alluded to, and upon the effects of the panic of last fall and the subsequent business prostration, but this has probably been much more than compensated for by a reduction of expenditures.

We shall also be informed in regard to duplex, quadruplex and automatics, as fast systems of telegraphy are the necessity of the Western Union as well as other telegraph companies.

The resumption of regular dividends, so long suspended, is a legitimate subject of congratulation to the stockholders of the company, and the prosperous financial condition of the company which it indicates, establishes a strong point in favor of the present management. We shall, at as early a date as possible, present this report in full to the readers of THE TELEGRAPHER, as it is certain to be one of the most interesting and important telegraphic documents of the season. Mr. ORTON'S reports are always very excellent reading, and if, like the rest of us, he sometimes makes mistakes, he certainly recants them fully and candidly, as has been fully shown in the case of the duplex invention of Mr. JOSEPH B. STEARNS. We hope that in the present instance he will see his way clear to do equal justice to the automatic system, of which hitherto, judging from his official utterances, he has had a scarcely more favorable opinion than he had originally of the duplex.

We do not believe that Mr. ORTON intends to deal unfairly with any telegraphic system or invention, even though it may not be exactly in the interest of the company whose executive chair he so ably fills, but being a man of pronounced opinions upon most subjects presented for his consideration, he sometimes is betrayed into too hasty decisions and expressions before fully understanding the subjects of which he speaks officially.

The position of President and Executive Manager of

the Western Union Company is an onerous and responsible one, and any person who may endeavor to discharge its manifold duties as effectually as does Mr. ORTON, necessarily has not the requisite time to personally investigate practical telegraphic matters, and must, consequently, depend upon the advice and representations of others in deciding upon them.

Success and Failure in Telegraph Cable Laying.

THE failure to successfully lay the cable of the Direct United States Cable Company from Ireland to Newfoundland has relieved the Anglo-American Company from the danger of competition for another year at least. There seems to have been a fatality about this enterprise. Our readers will remember the delays which were encountered in completing even the comparatively short section of the cable between Torbay, Nova Scotia, and Rye Beach, New Hampshire, and from Torbay to the Newfoundland Coast. The Faraday at that time disappeared for some ten days at one time, and government vessels were sent out in search of her. It was reported at the time that she was lost in a fog, and it would seem that she has emerged from the fog only to lose the larger and more important section of the cable in a storm. It is true that the intention is announced of sending the Faraday out again, as soon as she can be provisioned and coaled, to make another attempt to recover the cable, and, if successful in so doing, in completing the laying of it; but there is little hope of success. The season is too far advanced to encourage the hope that the broken cable can be recovered and laid during the present year.

It is to be regretted that there should have been such a bungling failure after all that has been written and said on the subject of competition in Atlantic telegraphy, and of what the new cable was to accomplish. It is, moreover, a serious disappointment to the companies competing with the Western Union Company in this country, whose position would doubtless be considerably improved if they could have an independent communication with the people and the telegraph systems of Europe.

There are not wanting those who are uncharitable enough to assert that it was not really intended to complete the laying of this cable the present season, but that it was desired to postpone it until definite favorable action could be obtained for abolishing the present monopoly of the Anglo-American Company of landing cables on the coast of Newfoundland. The expense and damage arising from the delay are so great, however, that such a supposition scarcely seems reasonable.

The work had proceeded so far that we had really become convinced that we were to see the experiment tried of actual competition in Atlantic telegraphy, in good faith, although, as our readers know, we were somewhat sceptical in regard to it in the earlier stages of the enterprise. The new company, at the best, would have labored under many disadvantages, but those engaged in the work were confident that these would not prevent its being a success. However, it is all over for the present, and we must wait as patiently as possible to see what another year may bring forth.

While the direct cable was meeting with misfortune the Great Eastern was engaged in laying a new cable for the Anglo-American Company, in which work it was, as usual, entirely successful. The experience which has been gained by the Telegraph Construction and Maintenance Company's employes in cable laying is undoubtedly most valuable, and they do not consider the work at all uncertain or hazardous. But little talk or fuss was made about the undertaking, but when the cable was ready it was loaded into the Great Eastern, and although some rough weather was encountered, when once commenced the work was steadily continued until completed, and the Anglo-American Company, without any addition to capital, has had another cable added to the three already in use. The company is to be congratulated upon its good fortune in this and other respects, and its stockholders may

confidently reckon on comfortable and comforting pecuniary returns for their investment in ocean telegraphy.

Put your Telegraph Lines in Order for the Winter.

THE advancing season should remind telegraph managers of the necessity for putting their lines in order for the stormy months of the fall and winter. During the past year much less money has been expended, generally, on reconstruction and repairs of telegraph lines in this country than usual, and the result is beginning to be seen in the condition of the wires. While economy is not only desirable but essential, if telegraphic investments are to become permanently remunerative and profitable, reducing below certain limits the amount appropriated for maintaining in good condition the lines, is the reverse of economical. Although the money thus saved may for the time be very comforting to stockholders and investors in telegraph property, eventually it will prove to have been very dearly earned. The dollar received now must be replaced with two dollars at no distant period. The earning capacity of telegraph lines is also materially and constantly reduced by neglect to maintain the wires in a state of efficiency, and thus the damage is ultimately felt both ways, in increased cost, and in the reduction of earnings.

While the lines have gone through the spring and summer without serious interruption, the storms of the fall and winter, finding them in a depreciated condition, will tell upon them with added force unless immediate measures are taken to remedy the defects which have been and are being constantly developed. It will be found to be the truest economy to at once appropriate the amount required to put all the wires in the best possible condition. The telegraphs of the country have mainly recovered from the depression consequent upon the panic, and most of them are again receiving liberal patronage.

The telegraph prospects are good, and, although it is too late to look for any considerable extension of telegraphic facilities the present year, there is good reason to anticipate that, by next season, the effects of the panic of last year upon the business of the country will have mainly passed away, and that a fair amount of construction and extension of telegraphs may be anticipated. Comparatively little new line has been built this year, which will necessitate additional construction another season. With a return of prosperity to the general business interests of the country, which cannot much longer be delayed, those engaged in telegraphic enterprises may look for renewed and increased prosperity to their interest.

Why We Criticise and Commend.

It is much pleasanter to praise than to blame, to commend than to censure and denounce. While we have never hesitated to criticise and condemn in cases where such appeared to be demanded, it certainly is not pleasant for us to do either. Wholesome correction is not unfrequently advantageous to the person who receives it, and if it proves unpleasant the party censured, if satisfied that it is not deserved, has the consolation to be derived from that belief, if otherwise, the part of wisdom is to profit by it, and seek to avoid giving occasion for the repetition of the unpleasant experience.

As those who know the writer personally are aware, he is by no means an ill natured or cross grained individual by nature, although the severity which sometimes characterizes our editorial productions may give to others the idea that such is the case. We can only say that it is our desire and intention to be just, and if, unintentionally, we do injustice to any person or interest, our columns are always open for explanation and correction. We would not close our columns against the vindication of even a personal enemy if attacked. As a journalist we have duties to perform and obligations resting upon us which are superior to personal considerations. This we endeavor to keep constantly in

view in conducting THE TELEGRAPHER. As we have before stated we hate and despise shams and humbugs, but we would not refuse even those whom we consider such an opportunity to vindicate themselves from the imputation.

Friendly and Complimentary.

THE crowd of business during the Exposition, the general rush, and one thing or another, not to mention a miserable printer, made our late issue not only late but slim. We had intended sooner to have noticed some editorial remarks of our friend Ashley, of THE TELEGRAPHER. "Let us have Peace," is our motto. We know that he has copied liberally from us, and as liberally credited anything reproduced. We know that for himself, and the paper he so ably edits, we bear the best of feelings and the kindest of wishes, and we think that he feels the same towards us. So, across the bloody chasm of red ink we reach our quill-drawing arm, and, with hearty good will, we say, *Shake!*—*The Plug.*

We have always entertained the kindest feelings towards our friends SELDEN and MATTON, of *The Plug*, and have welcomed their paper to our table semi-monthly with pleasure. Long may they and it wave.

The number for September 15th, which, owing to circumstances above alluded to, has but just come to hand, is a decided improvement on any which have preceded it, and is creditable to the publishers and editors, and the paper deserves to receive a liberal support from the fraternity.

Personals.

Mr. EDWARD H. RICH having resigned his position as superintendent of telegraph and train despatcher on the Southern Central Railroad, his friends on the road presented him with a valuable clock and a handsome silver water pitcher and goblets. The board of directors also passed resolutions very complimentary to Mr. RICH's ability and faithful performance of duty.

OLD WAX, the Canadian, who signs "X," has been appointed chief operator of the Colusa Lake & Mendocino Telegraph Co., in the office at Colusa, Cal.

Mr. ROBT. MCFARLAND is manager of the Lakeport, Cal., office of the Colusa Lake & Mendocino Telegraph Company.

Mr. J. H. HENDERSON is manager of the Bartlett Springs, Cal., office of the C. L. & M. Telegraph Co.

Mr. J. H. MCCLURE is manager of the Leesville, Cal., C. L. & M. office.

Mrs. TURNER is manager of the C. L. & M. Telegraph at Turner's Station, Cal.

Mr. J. GUFFEY is operator of the C. L. & M. office at Turner's Station, Cal.

Mr. JAMES NEWELL is manager of the Mountain House, Cal., office of the C. L. & M. Tele. Co.

Mr. H. H. McDONALD is manager of Grand Island, Cal., office of the C. L. & M. Tele. Co.

Mrs. COOK is manager of Grand Island Mills office of the C. L. & M. Tele. Co.

Mr. JOHN SERSANNO is manager of Princeton, Cal., office of the C. L. & M. Tele. Co.

Mr. W. GORDON is manager of the Sycamore, Cal., office of the C. L. & M. Tele. Co.

Miss EVA DUNLAP is manager of Chapin's Landing, Cal., office of the C. L. & M. Tele. Co.

Mr. TORRENCE is the manager of the Grimes Landing, Cal., office of the C. L. & M. Tele. Co.

Mr. CHAS. PERFUNNO is manager of Munchville, Cal., office of the C. L. & M. Tele. Co.

Mr. JOE HOUSTON is manager of Upper Lake, Cal., office of the C. L. & M. Tele. Co.

Mr. J. F. MOORE is manager of Middletown, Cal., C. L. & M. Tele. Co.'s office.

Mr. H. H. HUNT has resigned his position on the Western Union, Chicago, Ill., day force and gone south with the Western Union Company.

Mr. A. J. MERENESS has been transferred from the New York duplex in the Chicago, Ill., Western Union office, to the same position (day), made vacant by the resignation of Mr. HUNT.

Mr. M. A. SMITH has resigned his position as day report operator, Chicago, Ill., Western Union office, to engage in business for himself as a short-hand writer.

Mr. STONE, of the night force, Chicago, Ill., Western

Union office, has been promoted to the position vacated by Mr. SMITH.

Miss ALICE NUTE, of the Western Union Chicago, Ill., office, has resigned, to accept a position in a photographic office, where she can give her time more exclusively to the study of that art.

Mr. JOHN KEMP has been promoted from the night force, Chicago, Ill., Western Union office, to the position on the South Water street office (day), vacated by the resignation of Miss NUTE.

Messrs. DUG. BURNETT, AUSTIN, KNOX and CUSHING have accepted regular positions on the Western Union Chicago, Ill., night force. The three latter gentlemen have been "subbing it" for some time.

Mr. J. BRITTON BOGART has resigned his position at No. 145 Broadway, New York, and becomes a train despatcher at Wilkesbarre, Pa.

Mr. DAVID B. MITCHELL has resigned his position at No. 145 Broadway, New York, and goes with the Western Union at New Orleans, La.

Mr. ABRAM J. LOCKE, of Peace, Kansas, whose crops were damaged to the extent of \$2,500 by the grasshoppers, has returned to No. 145 Broadway, New York, after a brief respite passed with his family, and purposes to repair the ravages in his fortune by another siege of hard work at the key.

Mr. JOHN W. McLAREN, of No. 145 Broadway, New York, goes home to his people in Canada for a month's vacation.

Mr. JUDD PERKINS has resigned his position with the Western Union Company at Duxbury, Mass., and engages in other business at Meriden, Conn.

Mr. THOMAS TOBIN, of the Western Union Syracuse, N. Y., office, has taken a position at 145 Broadway, New York, *vice* Mr. FRANK B. RAE, transferred to Syracuse.

Mr. JACOB GROFF has accepted a position with the Western Union at Chattanooga, Tenn.

The Telegraph.

By Cable.

The Faraday to Sail in Search of the Broken Cable.

LONDON, Oct. 5.—A despatch from Queenstown says the steamship Faraday will start this week to pick up the broken United States direct cable, and will complete laying it to the United States. No serious trouble in finding the cable is anticipated, as buoys were thrown over in the vicinity of the break.

Unsuccessful Termination of the Direct Cable Expedition.

On Thursday of last week the steamers Dacia and Ambassador, the consorts of the cable steamer Faraday, engaged in the work of laying the long section of the direct cable between Ireland and Newfoundland, arrived at Queenstown, Ireland, bringing news of the failure of the attempt to lay the cable. They report that the cable was lost in a heavy gale, after some 600 knots had been laid.

They were engaged with the Faraday several days in attempts to recover the cable but without success, and were compelled to return to Queenstown, because short of coals and provisions.

On Friday morning the Faraday, which followed the Dacia and Ambassador, also arrived at Queenstown.

A cable despatch to the Associated Press states that the steamer Faraday will put to sea as soon as she has taken in provisions and coal, and will resume the attempt to recover the direct cable, of which she had laid 600 knots when it was lost. Should her efforts be successful she will proceed to lay the remainder of the cable to the American coast.

A Telegraph for the Court House.

Mayor HAVEMEYER has signed and approved the resolution of the Common Council, giving the Law Telegraph Company permission to place instruments in the new County Court House, the Register's office, and the building containing the Marine Courts, the General Sessions, and the District Attorney's and Tax Commissioners' offices, the company paying a rental of \$1,000 a year. This will be of great convenience to lawyers and others doing business in these buildings

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the

week ended September 19th, 1874, was 415,816—an increase of 57,509 on the corresponding week of last year.

The Saigon Hong-Kong section of the Eastern Extension, Australasia and China Telegraph Company's cables, is interrupted. Messages for Hong-Kong can be sent only by post from Singapore, the Great Northern line between Amoy and Hong-Kong being under repair.

At a meeting of the Board of Directors of the Anglo-American Telegraph Company it was resolved to pay the usual interim dividend of 1 1/4 per cent. for the quarter ending September 30th, 1874.

The International Telegraph Conference.

At the International Telegraph Conference, to be held next year at St. Petersburg, a proposal will be made for the neutralization of the telegraphs in times of war. It will be remembered that at the last International Conference, in 1872, at Rome, a similar proposal was submitted by Mr. Cyrus W. Field, the delegate of the United States Government, and warmly supported by the representative of the German States. By a letter from a correspondent at Berlin we now learn that at the St. Petersburg Conference the German Government will again support the American renewed proposal, and strong hopes are entertained of its being agreed to in spite of all opposition. In addition to this the Congress will be occupied in drawing up a set of regulations in the form of an international code of instructions for the telegraph service, as it is found by experience that the Paris Convention of 1865 contains many items of detail that fluctuate according to the circumstances of the times, and require constant supervision and alteration. As far as is known at present, some twenty different States will be represented at the St. Petersburg Conference.

The Telegraph in the United States Army.

Gen. W. T. SHERMAN has written some "Recollections" of our great war, in which he played so conspicuous and effective a part, the latter portion of which has been published, and from this we extract the following on the use of telegraphs in our campaigns: "For the rapid transmission of orders in an army covering a large space of ground, the magnetic telegraph is far the best, though habitually the paper and pencil, with good mounted orderlies, answer every purpose. I have little faith in the signal service by flags and torches, though we always used them, because most invariably when they were most needed the view was cut off by intervening trees or by mists and fogs. There was one notable instance in my experience when the signal flags carried a message of vital importance over the heads of Hood's army, which had interposed between me and Altoona, and broken the telegraph wires—as recorded in my 'Recollections;' but the value of the magnetic telegraph in war cannot be exaggerated, as was illustrated by the perfect concert of action between the armies in Virginia and in Georgia in all 1864. Hardly a day intervened when Gen. Grant did not know the exact state of facts with me, more than 1,500 miles off as the wires ran. So, on the field a thin insulated wire may be run on improvised stakes, or from tree to tree, for six or more miles in a couple of hours, and I have seen operators so skilful that by cutting the wire they would receive a message with their tongues from a distant station. As a matter of course the ordinary commercial wires along the railways form the usual telegraph lines for an army, and these are easily repaired and extended as the army advances, but each army and wing should have a small corps of skilled men to put up the field wire and take it down when done. This is far better than the signal flags and torches. Our commercial telegraph lines will always supply for war enough skilful operators."

New Patents.

For the week ended September 15, 1874, and bearing that date.

155,062.—ELECTRO-MAGNETIC ENGINES. L. Bastet, Tarrytown, and Chas. J. B. Gaume, Brooklyn, assignors of one eighth their right to Chas. F. Alford, New York, N. Y. Filed August 21, 1874.

Regular series of stationary magnets and revolving armatures. Poles of the magnets are extended, and additional sets of armatures provided to be attached thereto. The extra sets reciprocate and are geared to communicate their force to the main wheel driven by the revolving armatures.

1. In an electro-magnetic motor, the combination, with the electro-magnets and main set of revolving armatures of extra or auxiliary vibrating armatures, arranged and operating to impart to the driving shaft, through proper intermediaries, power in addition to that derived from the movement of the main set of armatures, substantially as and for the purposes specified.

2. The extra or auxiliary armatures, one on each side of each electro-magnet, the armatures of the several pairs being coupled together and geared with the main or driving shaft of the machine, substantially in the manner and by the means shown and set forth.

Born.

HUBBS.—At 9.30 A. M., September 16, 1874, to Mr. C. H. Hubbs, manager Vallejo, Cal., Western Union office, a son—a twelve pounder.

AMERICAN COMPOUND TELEGRAPH LINE WIRE.

COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE compared with Iron, consists in its LIGHTNESS, relative TENSILE STRENGTH, CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
The undersigned having secured the exclusive Agency for manufacture and sale of the
EAGLES METALLIC BATTERY,
now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.
These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.
Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.
On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.
No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon application to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The coöperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
 ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities. A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

BLISS RESERVOIR BATTERY.
 PATENT APPLIED FOR.

Price per Cell, \$2.00.

This Battery gives a stronger current than the same size Hill or Callaud Cups. It will run as a local battery for six months without attention, and as a main battery for a longer period.

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

BLISS RESERVOIR BATTERY.

This battery has just taken the FIRST PREMIUM—a SILVER MEDAL—FOR FORCE, ECONOMY and DURABILITY, at the CINCINNATI INDUSTRIAL EXPOSITION.

Price per Cell, \$2.00.

It will run as a local battery for six months without attention, and as a main battery for a longer period.

GEO. H. BLISS & CO.,
41 THIRD AVENUE,
Chicago, Ill.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.
No local required. Always ready for temporary offices.
Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY
THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, OCTOBER 17, 1874.

VOL. X. WHOLE No. 431.

Annual Report of the President of the Western Union Telegraph Company to the Stockholders.

To the Stockholders of the Western Union Telegraph Company.

In pursuance of a requirement of the By-Laws of the company, and of instructions of the Executive Committee, I submit the following Report of the operations of the company for the fiscal year ended June 30, 1874:

The capital stock of the company is \$4,073,410, of which the company owns, and now has in its treasury, \$7,287,735, leaving the capital outstanding \$33,785,675.

The bonded debt is \$5,946,910. Of this sum \$4,448,900 is in seven per cent. currency bonds, which will mature November 1, 1875; and \$1,498,000 in seven per cent. gold bonds, due in 1902. The bonded debt was reduced during the year by the redemption of bonds of the American Telegraph Company, which matured October 1, 1873, amounting to \$89,500, and by the purchase for the Sinking Fund of \$2,000 of the bonds of 1902.

The company has no floating debt. The receipts for the year from all sources were \$9,262,653.98, and the expenses \$6,755,733.83. The difference \$2,506,920.15 is the net profit.

There have been added to the property of the company during the year, by construction, purchase and lease, 5,828 miles of poles, and 21,264 miles of wire, being equal to about eight per cent. of line and twelve per cent. of wire; and 448 more offices were in operation at the close of the year than at the beginning. The company operated at the close of the year, 71,585 miles of line, 175,135 miles of wire, and 6,188 offices.

The \$2,506,920.15 profits of the year have been applied as follows:

Interest on Bonds.....	\$315,138 83
Construction of new lines and erection of additional wires.....	511,849 52
Purchase of the stock of sundry telegraph companies in the Western Union system on which rent is paid annually.....	96,282 00
Patents.....	3,000 00
American Telegraph Co.'s Bonds redeemed Oct. 1, 1873.....	89,500 00
Sinking Fund for redemption of Building Bonds of 1902.....	30,000 00
Real estate (of which \$281,234.81 was expended on the building, Broadway and Dey street, in excess of the loan of \$1,500,000).....	291,602 33
Dividend of two per cent. payable July 15, 1874.....	675,574 00
	\$2,012,946 68
The balance.....	\$493,973 47

has been carried to the credit of Income Account, and is included in the following exhibit of the application of the company's

PROFITS FOR EIGHT YEARS.

The surplus of Income Account, July 1, 1866, was	\$275,357 24
The net profits for eight years, from July 1, 1866, to June 30, 1874, were.....	22,839,538 96

Making an aggregate, June 30, 1874, of.....\$23,104,896 20

Of this sum there has been—

Distributed in dividends to stockholders (including dividend payable July 15).....	\$5,532,813 34
Disbursed for interest on the Company's bonds.....	2,531,333 81
	\$8,064,147 15

The balance.....\$15,040,749 05

is represented as follows:

Construction of new lines, erection of additional wires, purchase of patents, &c.....	\$4,991,453 15
Purchase of telegraph lines and of the stock of companies controlled by the Western Union Company on which interest or dividends are paid as rental.....	1,301,985 45
Western Union stock (72,877 shares).....	4,054,483 07
Gold and Stock Telegraph Co.'s stock (47,710 shares).....	1,173,509 00
International Ocean Telegraph Company's stock (10,354 shares).....	961,556 42
Ando-American Telegraph Company's stock (\$1.308).....	10,000 00
Central District and Printing Telegraph Companies' stock (Pittsburgh), 200 shares.....	10,000 00
Western Electric Manufacturing Company's stock (500 shares).....	39,000 00
Western Union Bonds—redeemed and cancelled.....	1,072,345 00
Sinking Fund—Broadway and Dey Street Mortgage Bonds (amount not yet used for redemption of bonds).....	87,800 00

Real estate (other than Broadway and Dey street property).....	328,830 66
Broadway and Dey street property (in excess of the loan of \$1,500,000).....	281,234 81
Total.....	\$14,282,197 56
Leaving a surplus of.....	\$758,551 49

Represented as follows:

Materials and supplies on hand.....	\$440,051 49
Due from United States.....	70,000 00
Due from Agents.....	75,000 00
Cash on hand and loaned on call, in excess of amount required for dividend July 15th, and for current liabilities.....	173,500 00
	\$758,551 49

PACIFIC AND ATLANTIC TELEGRAPH COMPANY.

In my last Annual Report it was stated that we had acquired a majority of the stock of the Pacific and Atlantic Telegraph Company, and that negotiations were then pending for a lease of its lines to the Western Union Company. The negotiations were concluded in December last, and on the first of January the lines and property of that company were turned over to us on a lease for ninety-nine years, at an annual rental equal to four per cent. on the capital stock of \$2,000,000, the rent to be applied first to the payment of the debts of the P. and A. Co., and thereafter to be distributed *pro rata* among the shareholders. Of the capital of \$2,000,000 the Western Union Company owns \$1,415,950. The entire rental for the year 1874 will be required to pay the debts of the P. and A. Co. It is probable, however, that thereafter the rental can be distributed among the stockholders.

THE INTERNATIONAL OCEAN TELEGRAPH COMPANY.

The operations of this company during the past year have been very satisfactory, and give promise of still better results in future. As I write, however, communication by cable between Punta Rassa and Key West is interrupted, but the necessary steps have already been taken to repair the cable, and it is expected this will be accomplished in a short time. The new cable between Key West and Havana, successfully laid the year before, has been paid for, and the entire floating debt of the company discharged out of last year's earnings. There are now two good cables between those points. Unless it shall be found necessary, in order to insure permanent communication between the United States and the West Indies and South America, to lay an additional cable between Punta Rassa and Key West, it is probable that payment of dividends to the stockholders of the I. O. T. Company will be resumed within a year. This property is destined to increase largely in value in the near future.

The receipts of the I. O. T. Co., for the year ended June 30, 1874, were.....	\$308,870 99
Expenses.....	71,561 13
Balance, net profit.....	237,309 86
Add proceeds of \$80,000 bonds issued.....	72,000 00
	\$309,309 86

This has been appropriated as follows:

Paid India Rubber, Gutta Percha, and Telegraph Works Co., balance due for new cables.....	\$94,640 87
For expenditure on S. S. "Professor Morse".....	71,533 26
For loans repaid.....	49,500 00
" bonds redeemed.....	25,800 00
" reconstruction of cables.....	22,770 13
" interest on debt.....	20,418 40
" construction.....	2,836 64
	287,499 30
Balance, merged in general assets.....	\$21,810 56

THE GOLD AND STOCK TELEGRAPH COMPANY.

Of the \$2,500,000 capital of this company, the Western Union Company owns \$1,192,750. Its gross receipts for the fiscal year ended September 13, 1874, were \$581,000, and the operating expenses \$419,000, leaving \$162,000 as the net profit, all of which was expended in the extension of its lines and the provision of new apparatus, of which a large quantity was required in view of the extremely low rate fixed for the rental of Stock Reporting instruments to meet the competition of the Manhattan Quotation Company. The Gold and Stock Company has expended out of its net earnings during the last four years over \$700,000 for new lines, machinery and apparatus.

MONEY TRANSFER SERVICE.

The operations of the Department of Telegraphic Money Orders, which has been established less than three years, are highly satisfactory. During the last year it transferred—that is, received at one office and paid out at another—about \$2,000,000, for which service the company received a revenue of \$80,329.86. Of this sum about \$20,000 was for premiums, and the balance for tolls on the messages required in making the transfers. The revenue from this source during the preceding year was about \$57,000, and the increase during the past year has been about 40 per cent. The increase in the number of transfers, however, was about 60 per cent., attended by a reduction of the average amount transferred in each case from \$81.31 the preceding year to \$61.83 during the past year. This reduction

and increase indicates the growing popularity of the service. The receipt in small sums, at a large number of offices, of an aggregate of \$2,000,000, and the payment of this amount at other offices, involving the handling of \$4,000,000, has been attended by an aggregate loss to the company during the year, from errors and defalcations, of only \$110. During the same time a larger sum has accumulated in the treasury of the company from cases where it was impossible to find either the transferee or the person making the deposit for transfer. This branch of the service is under the immediate charge of Vice-President Mumford, who prepared the rules and regulations for the conduct of the business. In view of the success which has attended their operation, this specific acknowledgment seems to be due to him.

THE NEW BUILDING.

At the close of the fiscal year, June 30, 1874, the account with the new building presented the following exhibit:

Paid on account of real estate.....	\$855,000 00
Paid to architects and contractors.....	689,511 25
Paid engraving, printing, commission on sale and other expenses of negotiating the bonds.....	17,190 81
Taxes.....	21,369 56
Interest on bonds.....	204,163 19
	\$1,781,234 81

Of this sum \$1,500,000 is represented by the bonds of the company due in 1902, and the balance, \$281,234.81, has been paid out of current earnings. To the latter may now be added the further sum of \$153,080.98, paid during the quarter ended September 30th, making a total of \$434,315.79, for which the building account is indebted to income account.

The work on the building was greatly delayed during last fall and winter by the failure of the contractors to supply the granite at the rate agreed upon, and later, by delay in the delivery of other materials. The work is now progressing rapidly, and it is expected the portion to be occupied by the company will be ready by Christmas.

GENERAL REVIEW.

A comparison of the results of the company's operations during the last fiscal year, and the one preceding, shows a reduction of \$70,364.53 in gross receipts, and of \$251,042.54 in the net profits.

This diminution of receipts and profits resulted from two causes; first, the reduction of rates, which took effect on July 1, 1873, pursuant to plans formed and instructions issued six months before; and second, to the financial panic of September, 1873, and the general stagnation in every department of business which immediately followed, and from which there has been but a partial recovery.

Commencing with July, 1873, the profits, as compared with the corresponding months of the preceding year, were less each month up to and including February, 1874, at which time the aggregate falling off for the eight months of the fiscal year was \$589,564.09.

For March the profits were in excess of March, 1873, and at the end of June the increase over the corresponding four months of last year amounted to \$338,521.55, leaving a deficiency of \$251,042.54, as stated above.

Although this report is for the year ending June 30th last, it seems proper to add, in this connection, that the profits for the first quarter of the current year, which ended September 30th, show an increase over the corresponding months of last year of more than \$300,000.

The fiscal year is from July to June, both inclusive. A comparison of the business of the calendar years 1873 and 1874 shows that the profits of the nine months of 1874, ended September 30th, are in excess of the twelve months of 1873; the excess during the seven months ended September 30th being \$649,434.73 over the corresponding seven months of 1873—an average increase of over \$100,000 a month.

The number of messages transmitted during the last year was 16,329,256, being an increase of 1,872,424 (about 13 per cent.) over the preceding year. Deducting from the gross receipts moneys received from other sources than for the transmission of messages, and dividing the remainder by the number of messages, it appears that the average receipt for each message was about 55 cents. As the charge per message is for a minimum of ten words, the average message must contain more than ten words; so that the average receipt per message is necessarily greater than the tariff fixed for a ten word message. A uniform tariff of 50 cents per message of ten words between all stations on the company's lines, without regard to distance, applied to the messages transmitted during the last year, would have yielded a revenue somewhat in excess of the actual receipts.

The tariff of rates now charged on the lines of the Western Union Company are but little above the average European rates. Considering the vast difference in the density of population, and the greater distances over which messages are sent in this country, and the cost of maintaining a greater length of line through sparsely

settled sections, to reach the same number of people, and the higher cost of labor and of all material employed in telegraphic operations, the service in this country is relatively much cheaper than the average in Europe.

DUPLEX AND QUADRUPLIX TELEGRAPHY.

The duplex apparatus of Mr. J. B. Stearns, by means of which two messages are transmitted in opposite directions upon one wire at the same time, has fully sustained the opinion of its utility and value which I expressed in my last Annual Report. It has been put in operation during the past year upon a number of additional circuits, and is now working successfully between all the principal cities. Its latest application was upon the lines to the Pacific coast, and it is now in use between Port Hastings, on the Island of Cape Breton, where our lines connect with the cable wires, and San Francisco, a distance of nearly 5,000 miles.

But the past year has produced an invention more wonderful than the Duplex. Mr. Thomas A. Edison and Mr. George B. Prescott, the Electrician of the company, have discovered processes and invented apparatus, by means of which two messages can be sent in the same direction, and two other messages in the opposite direction simultaneously upon one and the same wire. This invention, which they have christened the Quadruplex, has been in successful operation between our New York and Boston offices for the last two weeks, and is satisfactorily performing an amount of work upon one wire quite equal to the capacity of four wires worked with the ordinary Morse apparatus.

The inventors claim that the quadruplex may be used either as one wire, as two wires, three wires, or four wires, as the pressure of business may require; that when it is worked as two wires, intermediate stations may be inserted, and may send and receive as with two separate wires in the ordinary way.

I have given much personal attention to the development of this invention, in the belief that if it could be utilized to the extent claimed by its inventors it would solve satisfactorily the most difficult problem which has ever been presented to the managers of telegraph companies, and that is: How to provide for the rapidly increasing volume of business without an annual expenditure for the erection of additional lines and wires that would prevent the payment of reasonable dividends to stockholders? So much has been accomplished already, and in so short a time that it seems more likely that these predictions will be fully realized, than that the fulfillment will fall materially below the promise.

In my last Annual Report I made the following statement concerning the duplex apparatus:

"We are now operating more than 150,000 miles of wire, and during the past two years have been extending at the rate of nearly 20,000 miles of wire per annum. The duplex apparatus is capable of doubling the capacity of these wires at a comparatively small cost. The value of this increase of facilities can be approximately ascertained by estimating the saving in the investment for wire, and the annual saving in repairs and maintenance of additional wires. But the great value of the duplex does not consist in the saving in the investment in wires, and the cost of repairs and maintenance, but in its ability to double the capacity of a wire when we have but one, and when no amount of money previously invested in wires, or even possible to be expended in repairs, can provide another."

These remarks will apply with even greater force to the quadruplex, if it shall prove capable of working through the same distances, and under like conditions as the duplex. It is not easy to estimate the value of an invention which enables any and every wire between all the principal cities in the country, and between the Atlantic and Pacific coasts, to be made equal to two, in a minute, by merely turning a button; but it is very evident that the ability to practically convert one wire either into 2, 3 or 4, as the convenience or necessities of the business may require, is still more valuable.

The quadruplex, like the duplex, is partially substituted for, and worked in connection with the Morse apparatus. No change in the ordinary operating force, nor any previous preparation of messages is required, as with the automatic system, so that a continuance of the same simplicity and economy of manipulation and promptness of service which have characterized the Western Union Company's system of telegraphy is assured. All the essential patents for the duplex are owned by this company. Negotiations for the purchase of the patents of the quadruplex are pending, but the terms will not be settled until after the character and extent of its capacity for work have been more fully ascertained.

"FAST" TELEGRAPHY.

This is the favorite designation given by its friends to what is better known as the automatic system. Why it should be called "fast,"—in view of the fact that, before a message can be sent at all, more time must be spent in getting it ready for the transmission to begin

than is required to send and deliver it in the ordinary way—I have never been able to comprehend.

In this review of telegraphic operations during the last year it is only necessary to say concerning "fast" telegraphy, that the progress of its development has been exceedingly slow. The latest attempt to utilize it in this country was made in 1869, on a line of one wire between New York and Washington, and now, at the end of five years, it stands about where it began.

Although the evidence which I have accumulated is not sufficient to convince me that automatic telegraphy possesses any value to the Western Union Company, in view of its control of the duplex, and of the probable utilization of the quadruplex, yet I have not failed to give careful attention to the subject, and whenever it shall be demonstrated that any system of automatic telegraphy can be advantageously used on our lines, it will be promptly introduced. The claim that anything essential to the successful operation of automatic telegraphy—whether by the chemical paper plan of Bain or the later one of Wheatstone—is covered by controlling patents, is without foundation.

RESUMPTION OF DIVIDENDS.

My last Annual Report concluded as follows:—
"With the increase of wires already provided and now in progress, the capacity of which the duplex apparatus will be able to double at small cost, it is believed that the constantly increasing volume of business, the growth of which will be stimulated by the present low and uniform rates, can be successfully handled with a less annual investment in new construction than has heretofore been necessary; so that, with competition checked, and in process of being extinguished, the percentage of expenses may be reduced and the patience of the stockholders rewarded at an early day by the resumption of regular dividends."

This prediction has already been verified. At the semi-annual meeting of the Directors, held on the 3d day of June last, a dividend of two per cent., payable out of the net profits for the quarter ended June 30, was declared. The profits for that quarter were \$762,029.44. On the 2d day of September another dividend, for the quarter ending September 30th was declared. The profits of the second quarter were \$832,993.85. The excess of profits for the two quarters over the amount required to pay the two dividends is \$243,875.

It is the intention of the Directors to continue the policy inaugurated at the June meeting, and to divide the net profits quarterly hereafter, and to provide otherwise for the payment of such property as it may be deemed advisable to acquire.

Respectfully submitted. WILLIAM ORTON,
President.

Original Articles.

The Fourth Cincinnati Industrial Exposition.

BY A VISITOR.

THE Fourth Cincinnati Industrial Exhibition was opened on the second of September and closed on the third of October. The arrangement of the building and the articles exhibited a decided improvement on either of those which have preceded it. The total number of entries, as compared with last year, showed an increase of about one third. There was a noticeable tendency towards a display of finer and more costly articles, exhibited in elegant glass cases with handsome and expensive surroundings, which added greatly to the attractiveness of the Exposition as a whole. The display of electrical goods was, in the aggregate, a good one. The Western Electric Manufacturing Co., of Chicago, Ill.; L. G. Tillotson & Co., of New York; E. Holmes, of New York; Eugene F. Phillips, of Providence, R. I.; David Brooks of Philadelphia, and others were represented by H. D. Rogers & Co. of Cincinnati; George H. Bliss & Co. of Chicago, Ill.; Watts & Co., of Baltimore, Md.; Partrick, Bunnell & Co., of Philadelphia, Pa.; and the Telegraph Supply and Manufacturing Co. of Cleveland, Ohio., by E. C. Armstrong, of Cincinnati.

The fact is that while the display as a whole was good there was not a single manufacturer or dealer in electric goods worthily represented. That there was any exhibition of such article was chiefly due to Messrs. Armstrong and Rogers, who were indefatigable in their efforts to have the list of premiums extended and amended so as to draw out, if possible, a full representation of all manufacturers of and dealers in electrical and telegraphic apparatus, yet these gentlemen, and McCullough, with his Fire Alarm Apparatus were the only exhibitors in this department, so far as the greater part of the visitors know.

Mr. Rogers has succeeded in advertising his concern, and Mr. Armstrong has made the City and Suburban Telegraph Association better known, if possible, but there has been but little substantial gain to anybody else. To give proper effect and secure the full advantage of the exhibition every exhibitor should make

himself individually known, and not have his contributions congregated in one space with a number of others, and entered in the name of one person. In the main hall there was a rectangular tower, neatly gotten up, some 25 feet in height, arranged with shelves around the four sides, containing about 1,500 packages of what are known as fancy groceries. As it was one of the most conspicuous objects in the Exposition no one could fail to see it, and it naturally attracted a great deal of attention, but out of the million people who have seen and admired that collection and the enterprise of the exhibitors how many of them recollect definitely anything but the name of the exhibitor and the business he is engaged in? It is the *tout ensemble* which invites inspection, and makes the lasting impression. Why should not the manufacturers of electrical and telegraphic goods follow a similar plan, each person or firm maintaining his or its individuality? I would advise that next year, and at the Centennial, that all who cannot or will not "hang their banner on the outer walls," so to speak, should save their time and money.

It is gratifying to notice the great improvement made in the design and finish of telegraphic goods, as shown at this exhibition. There were some articles exhibited worthy of special mention for their excellence. Messrs. Pearce & Jones, of New York, by Mr. Armstrong, exhibited a police and private line dial telegraph instrument, in use on the city and suburban wires, which attracted much attention. It was nickel plated, and beautifully proportioned and mounted. Scott's Annunciator, which is manufactured by Watts & Co., of Baltimore; and the new Annunciator Burglar Alarm and Bell Call, of the Telegraph Supply and Manufacturing Co., of Cleveland, Ohio; all in one case, which represented on one side a private residence from the outside, and on the other the annunciator, etc., were beautiful specimens of work. Messrs. Partrick, Bunnell & Co., of Philadelphia, also exhibited some very fine instruments. The case of goods from Geo. H. Bliss & Co., of Chicago, taken from the stock of E. T. Gilliland, of this city, embraced a full line of very handsome combination sets, box relays, students' sets, etc. This case doubtless secured the premium for best display for Mr. Armstrong. Mr. Rogers thought that justly he was entitled to this premium, and if he had had a larger space in which to arrange the many articles which he exhibited from the Western Electric Manufacturing Co. of Chicago, L. G. Tillotson & Co., of New York, and others, he might have been.

The display of goods from the Western Electric Manufacturing Co. was very beautiful. Messrs. L. G. Tillotson & Co.'s display was also a very good one, and their manufactures attracted attention, especially from telegraphers and those interested in telegraphic matters, by the excellence of the workmanship and finish they exhibited.

Mr. Frank Shaw's Morse Transmitter received special honor in being the only article selected and purchased at the Exposition by Baron Schwarz-Senborn, Director General of the Vienna Exposition.

L. C. Houore, of Cincinnati, exhibited a student's instrument, which consists of a wheel with the Morse letters in brass types on its periphery. Turning the wheel operates the key, which in turn operates the sounder. The correct sound of the letter thus produced is easily imitated with the hand. Another short cut to telegraphic learning. In other days the student's course was toilsome, rough and slow; but it is getting easier with modern inventions and appliances.

Mr. Henderson, one of the Commissioners, had a wire running from the main hall to the office of the United States Express Co., on Fourth street, to the railroad depots and his residence, enabling him, while devoting his time and labors to the cause of industry and science, to at the same time direct and regulate his business and social affairs. He and his wife and children, and all their men and maid servants are expert telegraphists, using the dot alphabet introduced by Mr. Armstrong. This is mentioned as an instance of what may be done by others using or needing private lines.

Doubtless every exhibitor would desire special mention of his or their show, but neither the available space in THE TELEGRAPHER or time of the writer will permit going into further details.

The Fourth Exposition has proved a great success, and reflects honor and credit upon the public spirited gentlemen who have devoted so much time and labor to make it the Exposition of the year. Every year this Exposition grows in importance, value and completeness, and nothing is left undone, regardless of cost, which will tend to make it worthy of the city, State and country.

Already the plans are being arranged for the Exposition of 1875, when every effort will be made to excel the splendid results already attained; and on that occasion Cincinnati will welcome all who may be able to visit her with every effort to make it pleasant and profitable for them, and maintain her reputation as the Great Exposition City.

The following are the awards of premiums for electrical and telegraphic articles, apparatus, etc., in full. Jurors—Messrs. L. C. Weir and E. T. Gilliland:

CLASS 60.

- 571. Best system of fire alarm telegraph, in operation, gold medal, National Fire Alarm Company.
- 574. Best fire alarm signal box, silver medal, National Fire Alarm Company.
- 577. Best telegraph battery, for force, durability and economy, silver medal, National Fire Alarm Telegraph Company.
- 578. Best electric light, silver medal, J. H. Wesling.
- 580. Best hotel annunciator, operated by electricity, silver medal, Telegraph Supply Manufacturing Company, of Cleveland.
- 586. Best switch for from four to twenty wires, bronze medal, Western Electric Manufacturing Company.
- 591. Best dial telegraph instrument, bronze medal, E. C. Armstrong.
- 592. Best lightning rod, bronze medal, David Munson, of Indianapolis.
- 760. Best general display of telegraph instruments and supplies, gold medal, to City and Suburban Telegraph Company.
- 761. Best type writer, silver medal, to the Western Electric Telegraph Manufacturing Company.
- 762. Best amateur telegraph instrument, bronze medal, to Charles Williams, Jr., Boston.
- 763. Best electric bell, bronze medal, to H. D. Rogers & Co.
- 765. Best electric medical apparatus, bronze medal, to the Western Electric Manufacturing Company.
- 766. Best insulator, bronze medal, David Brooks, Philadelphia.
- 767. Best electric clock, bronze medal, Howard Watch and Clock Company, New York.
- 768. Best insulated covered wire, for office use, bronze medal, E. F. Phillips, Providence, Rhode Island.
- 769. Best insulated covered wire, for line use, bronze medal, E. F. Phillips, Providence, Rhode Island.
- 770. Best electric gas lighting apparatus, bronze medal, A. L. Bogart, New York.
- 771. Best printing instrument, for private lines, bronze medal, to the Western Electric Manufacturing Company, Chicago, Illinois.
- 772. Best burglar alarm, bronze medal, E. Holmes, New York.
- 773. Best system telegraph call bells, for stores, etc., bronze medal, to H. D. Rogers & Co.

Excellent Arrangement of Western Union Lines in Cincinnati.

CINCINNATI, OHIO, Oct. 26.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR readers have been informed that a fine new telegraph office is being fitted up in Cincinnati by the Western Union Co. Some of the brethren here will no doubt give you a glowing pen picture of the gorgeous outfit as soon as the new quarters are occupied. But there is one matter I wish to mention that is generally overlooked by those who write up the descriptions. That is the live wires through the streets. This is an important point of the equipment, and one upon which great improvement might be made in many places. It seems that here in Cincinnati a decided departure has been made from the stereotyped Western Union catechism, so faithfully followed in the eastern cities. Compound wire is used where a large number of wires are required upon one set of poles. Every pole bearing any strain is securely guyed, and all set as erect as a plumb line can make them. These guy wires are placed where they will do the most good, the reverse of what is practiced in the East to a considerable extent. There is only one way to keep wires from becoming slack, and that is to thoroughly guy or brace all poles bearing any strain. They seem to have found this out in Cincinnati. A handsomer line we never saw than that just erected here by the W. U. Co. The beauty of it is, it will remain just as it is for years to come, unless damaged by accident. The compound wires are stretched very tight, and cannot be blown together. In cities where the poles are not properly secured and wires consequently very slack, much annoyance and delay occurs whenever a little breeze springs up. It is claimed by some that compound wire will soon rot and break when exposed to smoke. If this is true why not use a plain

steel wire for a few squares? The extra resistance would not be great enough to be taken into consideration on lines of any length. Glass insulators still are the favorite, judging from the fact that they are almost universally used. It seems to be the prevalent opinion here that Brooks' insulators are just what they are claimed to be when new, but after a short period they test no better than glass. We are inclined to accept this with a grain of allowance. If our Cincinnati friends will improve their insulation we venture the assertion that they will have some of the best lines to be found in this country. I could not find out during my brief stay here who the daring individual was that brought about this departure from Western Union doctrine. Whoever he is he deserves to be congratulated. Perhaps he is afraid of his scalp, and prefers to keep dark for the present. Mr. M. C. Bristol, I understand, has charge of construction. Whether he is responsible for this compound wire or not his skill in engineering and constructing city lines seems to be of a much higher order than that of some of his Eastern brethren. These Western fellows are far ahead of Eastern men in telegraph matters generally. If any one don't believe it let him take a trip West, passing through Pittsburg, Chicago, St. Louis, and returning via Cincinnati, Washington, Baltimore, Philadelphia, etc. In the three latter places, one will find a sad sight to behold—poles standing at all angles below 75 degrees, many of them carrying 20 to 50 wires, turning sharp corners without guy wires. The wires of course hang loose, and are constantly getting crossed. The sight reminds me forcibly of a little incident that occurred a few years ago. One of my neighbors had thrown out some cherries that had been soaked in a jar of liquor. A drove of turkeys happened to chance that way, and gobbled them up with a relish. The liquor, like Nasby's pills, attended strictly to business, and the way that drove of turkeys reeled around was comic in the extreme. They couldn't keep their heads erect without guy wires.

YANKEE ABROAD.

In the Wilds of Jersey.

TO THE EDITOR OF THE TELEGRAPHER.

I BELIEVE in my last I cut my letter short by stopping at Hackensack, on my trip over "The New Jersey Midland Railway," amongst the telegraph operators.

Jumping aboard of the train one is swiftly carried over to Paterson, where we find one of Mr. Bates' students, Mr. G. W. Post, "Q," a Hackensack boy, but we will leave both Post and Huntington, of down town office, until our letter of "Paterson operators," and we whirl on to Wortendyke station, the home of President Wortendyke. Here are located the shops of the company. At the shops office, "W. S." is Steve Jackson, "S," a very nice fellow, even if he is a nephew of the President. At the depot office, "W," we find our newly made temperance brother, James E. Flitcroft, "F," who is both agent and operator, as the y most generally are on this road. We hope Jim will not go back on his obligation.

Our young friend, Eddie Thompson, "Ed," from Pompton, takes care of the string at this office during the dark lonesome hours of the night. At the city office, "D. Y.," we find Manager Zabriskie, "Z," who is a whole souled fellow, but then I fear he can't be counted as one of us any more because he has went and gone and done it, and got murdered—married I suppose I should say. Well, God speed them, and may many "Qs" follow their union. Here we also find Abram C. Wortendyke, "B," another son of President W. He divides his time between "D. Y." and "Y. A." office, New York. We somewhat reluctantly leave this office and pass on to Pompton, where we find Mr. McIlroy, an old Erie man, who is both agent and operator. At Bloomingdale we find Mr. Hartwell, "A. X," agent and operator. Not being acquainted with him we cannot say much for or against him. We understand he comes from Unionville, New York. At night time we find here Tet Martin, "T," who is a good boy if he is lame. He has been on the road quite a length of time.

At Newfoundland we find E. B. Clay, "Cy," a Midlander. At Stockholm we find our friend Mr. M. P. Hendrickson, "Co." At Ogdensburg is Sands. He is lame, but that don't prevent the dear little girls from liking George. At Franklin Furnace we make connection, via Sussex Railroad, for New Town, New Jersey, and D. L. and W. R., M. and E. Div. At this place we find Mr. Smith, "S," his initials are "A. M.," whether he is an A. M. or not we know not. We have forgotten the name of the night man at this point. At Hamburg we find the popular agent and operator, E. K. Harris. At Deckertown we find the irresistible Joe Loomis, "Jo" the one armed fellow, but then Joe is one of those married fellows. At Unionville we come across another Mr. Smith, who runs a "thrashing machine" in his office, and has done so for the past fifteen years, being, as we understand, the first agent the Erie ever had at Un., when the Midland between

Middleton and Unionville was the Unionville Branch. At Johnson we come across another of Bates' students, a Hackensack boy, and a good boy he is too. His name is Harris, "W. D."

At Middletown we stop at Main street Depot, the western terminus of the New Jersey Midland. Here we find a brother of Tet Martin, who signs "J. E." He has his hands full in selling tickets and running the telegraph for three different roads—the two Midlands and the Erie. At the city office, "D. S.," we find another old Erie man, Mr. Merriman, who is a first class operator and receives as fast as you can send to him, very near, and he is also a first class fellow, both on and off the wire, in all respects.

As I am at the end of this road I will stop, but in conclusion I will say that there are three wires on this road. No. 1 is way railroad wire; No. 2 is for way commercial business, running only into principal offices between New York and Oswego; No. 3 wire runs from New York to Chicago, via Oswego. This wire is used only by the principal offices between Oswego and Chicago, no office on the Midland being allowed on it. Look out for my next. P'S AND Q'S.

An Organ Grinder Badly Sold.

ALBANY, OREGON, Sept. 30.

TO THE EDITOR OF THE TELEGRAPHER.

IN the days prior to Ben Halliday's advent in Oregon with his railroads our only public conveyances between Portland and San Francisco overlaid were six horse Concord stages of the Oregon and California Stage Co. At a good many of the towns along the line members of the telegraphic fraternity acted in the capacity of manager of telegraph and stage agent. This was the case at Corvallis, where our friend George Devondorf was agent, and at Albany, where "Webfoot" was the "observed of all observers," for there if a man wanted to be honored he must be a stage driver, agent or telegraph operator.

Well, one night as George was sitting in his office the stage drove up, and the driver, old George Weller, now of Albany, handed George out a large box which was quite "hefty," and wanted three dollars charges on it, as was the rule. George was dubious at first about "advancing," but thinking there *must* be "three dollars' worth" in the box, gave Weller the coin and chucked the box into the corner of the office, and thought no more of it for several days, when no one putting in an appearance to claim the box, and thinking perhaps some one was "playing" him, he concluded to make an examination of the contents, which he found to contain a complete *hand organ*, with the exception of the handle, which was gone. He got the handle replaced by a new one, and calling in a few of the "boys" and binding them to secrecy, told "Webfoot" if he wanted some fun to "come up to-night."

Now, fun of any kind was always my main weakness, and on this as on many former occasions, not knowing what it was to be till I went I took a seat on the stage and was soon in Corvallis. On arriving there George explained to me that I was to be the chief musician. He was to pack the organ on his back and I was to turn the crank! We started out in town, and created the biggest kind of a sensation—"serenading," as we facetiously termed the inflection upon the people. We kept the thing up till 3 A. M., when the stage came along and "Webfoot" went home, but George and the rest of "C's" boys kept the thing up for three or four weeks every night regularly, with the following good old tunes—all that the organ was capable of turning out: "Dan Tucker," "Arkansas Traveller," "Nelle Gray," and "Old Uncle Ned," till the citizens of that peaceful burgh got all the "music" they wanted; and after discovering that the boys could dodge all the bricks, pokers and flat irons thrown at them out of the windows, talked of passing a special ordinance against organs.

About this time there arrived on the stage from the north at 8 o'clock one night an old Italian organ grinder, who immediately claimed "our" instrument, and after paying George the three dollars he shouldered his organ and started up street to the City Hotel, under the piazza of which sat a crowd of men talking and enjoying the pleasant evening. He settled down to work and commenced grinding out a first class entertainment. After playing some time he "passed the hat around," but met with only laughter from the crowd. He started on grinding again, and after another half hour tried the hat business again, but with no better success. He kept it up till the crowd got disgusted and mad, and informed Mr. Organ Grinder that if he "didn't pick up and travel out of town right away they would murder him." The last seen of this poor imposed upon gentleman, he had his organ on his back and was *en route* for Albany and pastures new, wondering what kind of a town Corvallis was, not to appreciate music which would not "soothe the savage breast." WEBFOOT.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, OCTOBER 17, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST OF THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK ON ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

a No. 1 Telegraph Key, or a set of F. L. POPE & Co.'s popular NONPAREL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

Publisher.

P. O. Box, 5503.

The Annual Report of the President of the Western Union Telegraph Company.

WE print this week the Annual Report of President ORTON, of the Western Union Telegraph Company, which was made at the annual meeting of the Company on Wednesday last.

In order to give this report in the present number of THE TELEGRAPHER, we have been obliged to omit several columns of interesting matter which is in type, and was intended to appear this week. Correspondents and others whose contributions fail to appear as expected will understand the necessity of postponement of their favors. We shall have something to say about this report next week, but have neither time nor space to refer to it at greater length in this number.

Business and Telegraphic Prospects.

THE experience which we have been undergoing for the past year, and which is not yet completed, of coming down from the high prices and inflation attendant upon an irredeemable paper currency, and the enormous expenditures of the late war, while it is not pleasant, will in the end prove salutary and healthful. It was inevitable at any rate, and the longer it was postponed the more severe and distressing it would have been. The panic which a year ago so suddenly arrested us in what appeared to be the height of prosperity and business activity was by no means an unmitigated misfortune and evil. It has undoubtedly caused widespread distress, and has brought ruin and poverty upon a large number who supposed that they were either well to do, or at least certain of soon becoming so. It has given a severe check to many promising telegraphic as well as other enterprises, and has postponed the realization of the hopes and schemes which seemed on the eve of fruition.

For the past year there has been a steady and continual shrinkage of values which in some things has undoubtedly reduced them below an actual specie value. These will eventually recover their proper pecuniary status. Labor has declined less in nominal value than almost any other commodity in the market, but a large amount of labor is unemployed, and the price is gradually coming down in accordance with the general law.

Telegraphs and telegraphic enterprises have suffered with everything else in this process of contraction, and as our readers know there has been but comparatively a small amount of construction and reconstruction done during the past year. No new telegraph enterprises of any moment have been undertaken, and even less than the ordinary amount of repairs has been done upon existing lines. Economy has been the order of the day with telegraph companies; and, although as yet there has been no general reduction of telegraphic wages, yet the tendency in this direction has been unmistakable, if not as yet very marked.

While it is true that the telegraph business has been pretty good during the past three or four months, as reported by the companies, there has been wanting to a considerable extent the natural increase in such business which would have been noted had the business interests of the country not have been depressed. The resumption of dividends by the Western Union Company during the past year is a notable event, and it is authoritatively stated that these will not again be suspended. This has given additional market value to the stock of that company, which however has not as yet reached the figures which were obtained for it last year when no dividends were paid or immediately anticipated.

One unavoidable result of the tendency to cheaper rates—and telegraph rates have been reduced even in advance of other reductions—is the effort to increase the capacity of wires and instruments for the transmission of business—in other words to discover and develop fast telegraph systems. Duplex, quadruplex

and automatic telegraph systems, therefore, naturally are attracting much attention, and the introduction of fast systems in telegraph lines generally is a foregone conclusion. The duplex system has been and is being already used to advantage by the Western Union Company, and great results are anticipated from the quadruplex which is being experimented with on the lines of that company.

However beneficial these may prove, it is in our opinion to the automatic system that resort must be had eventually to solve the problem of low rates for telegraph service, and adequate pecuniary returns for such service. We had looked for a more general introduction of automatic telegraphy before this time in this country than has yet been accomplished, but for reasons which some of our readers well understand and appreciate this anticipation has not been realized. It is another illustration of the old proverb "that too many cooks spoil the broth," and we fear that our automatic friends while disputing over the shadow are losing the substance. The fault is not in the system, for it has been demonstrated to be capable of affording most satisfactory results on the lines upon which it has been tried.

With proper management and a consolidation of interests the lines of the Automatic Company may be extended with a renewal of business activity and a return of confidence which may be reasonably looked for at no distant day. To bring about the best results and with the least delay a consolidation of all the companies and lines now competing with the Western Union combination for the telegraph business of the country is undoubtedly most advisable, and we would again urge this upon the managers of these companies and lines.

With the reassembling of Congress we shall probably have a renewal of the postal telegraph agitation, which has already injuriously affected telegraphic extension and enterprises, and which, while there is no prospect of resulting in the taking of the telegraphs by the Government, still comes disinclination on the part of capital to invest in such enterprises. It would be a blessing to the telegraph companies and the country if the subject could be finally disposed of, but we fear there is not much hope of this at present.

On the whole the telegraphic situation may be regarded as promising and encouraging, and, with the revival of business and a renewed season of prosperity, the telegraphs will experience an impetus in their extension and development to which of late they have been strangers.

The American Electrical Society.

THE following circular has been issued by the committee appointed at the preliminary meeting of the Electrical Society at Chicago. It was the intention of the committee to send a copy of this circular to every person who would be likely to feel an interest in the objects of the society, or who would probably desire to become a member. Inasmuch as it is quite possible that many such persons may have been overlooked either by accident or inadvertence, it should be understood that this invitation is intended to be general, and is therefore published in THE TELEGRAPHER, in the hope that it may reach some who would otherwise have failed to see it.

CHICAGO, ILL., 1874.

DEAR SIR: A meeting of Electricians and Practical Telegraphers was held in this city on the evening of September 14th, for the purpose of taking preliminary measures toward the organization of a national association for the advancement of electrical science.

At this meeting it was decided to form such an association under the name of The American Electrical Society, and a committee of five was appointed to draft a suitable Constitution and By-laws for the government of the proposed society, and to issue a general invitation to all persons who are in any way interested in the objects of such a society, to attend a meeting for the purpose of forming a permanent organization, which meeting is to be held in this city on Wednesday, the 21st of October, 1874.

Believing that you are one of those who would probably feel desirous of participating in the organiza-

tion of the proposed society, as well as of becoming one of its active members, or would at least be likely to feel a friendly interest in its establishment and future prosperity, you are hereby cordially invited to be present at the above mentioned meeting, at which it is expected that a permanent organization will be effected and officers elected for the ensuing year.

It may be well to state that it is proposed to make the conditions of membership in the society comprehensive enough to include all persons interested in the advancement and diffusion of electrical knowledge, whether theoretically or practically. The project, so far as developed, has met with the warmest approval and coöperation of the leading electricians, telegraphers and telegraphic officials of the country, and it is hoped that it will also commend itself to your judgment and receive your support.

Should you approve of the project, but from any cause be unable to attend the meeting in person, the committee on organization would be grateful for any suggestions you may feel disposed to submit in writing, respecting either the plan of organization, or the best means of promoting the permanent welfare of the society.

All communications, including applications for membership, forwarded to the undersigned, chairman of the committee on organization, will receive due consideration.

C. H. SUMMERS,
Room 8, Union Building.

A Change of Location and Business.

Mr. WALTER P. PHILLIPS, who is well and favorably known to the readers of THE TELEGRAPHER, under the *nom de plume* of JOHN OAKUM, by his interesting contributions to his column, and also as a first class telegrapher generally, has accepted the appointment of Assistant Agent of the New York State Associated Press, and has moved across the street from the main office of the Western Union Telegraph Company to the office of the New York Associated Press, where he may be found during the day engaged in preparing the telegraphic news and dispatches for the press of the State outside of this city. The journalistic ability and proclivities of Mr. PHILLIPS have been exhibited in his connection with various newspapers for several years past, and have indicated that his proper sphere was in connection with journalism. Of untiring industry and excellent appreciation and acquaintance with the requirements of the press in the matter of news, the State Press is to be congratulated on having secured the services of so able, faithful and capable an agent in this city.

Phillips' Insulated Wires.

We take pleasure in calling attention to the advertisement of the insulated wires of Mr. EUGENE F. PHILLIPS, of Providence, R. I., which will be found in this paper. Mr. PHILLIPS manufactures every description of insulated wires, from line wires for outside telegraphic use to the finest magnet wires. The excellence of the wires manufactured by him is generally recognized by telegraph companies and others who have occasion to use such wires, and he has established a large business in his specialty, which is constantly increasing as his wires become more widely and practically known. He furnishes none but the best wires, and purchasers may rely upon any article procured of him, or of his manufacture, proving to be fully as good as it is stated to be.

L. G. Tillotson & Co.

THIS enterprising firm continue to do an extensive business in electric and telegraphic apparatus and supplies, as well as railway supplies, and their headquarters at No. 8 Dey street is one of the busiest places that can be found in this city.

They have a fine display of electrical and telegraphic apparatus at the Fair of the American Institute in this city, and also at the Philadelphia Exhibition. We understand, by the way, that they contemplate soon opening a branch establishment in Philadelphia, in order to more conveniently meet the requirements of their increasing trade in that section.

THE Government of Chili now possesses 4,900 kilometers of telegraph line.

Premium Awarded to the Brooks Insulator.

AS WILL be seen in the report of the premiums awarded at the recent Cincinnati Exhibition, that of the medal for the best telegraph insulator was given to Mr. DAVID BROOKS of Philadelphia, for his improved paraffin insulator. This is another proof of the superiority of these insulators, which have already secured flattering approval and endorsement wherever they have been used. We understand that notwithstanding the general dulness which has prevailed in telegraphic construction during the present year Mr. BROOKS has done and is doing an excellent business in the manufacture and sale of his insulators.

Personals.

Mr. S. C. RICE, one of the oldest and most experienced operators in the Albany, N. Y., Western Union office, has been promoted to the position of assistant chief operator.

On account of failing health Mr. S. C. SHELTON, who for the past five years has held the position of head bookkeeper in the Albany, N. Y., Western Union office, has resigned.

Mr. JOHN CARROLL has been appointed Assistant Superintendent of the Fire Alarm Telegraph in Albany, N. Y., vice Mr. WM. J. CULL, promoted to the Superintendency.

Mr. W. H. HARTNEY, Manager of the Harrisburg, Ontario, Canada, office of the Great Western Railway, and Montreal Telegraph Company, is enjoying a few weeks holiday among his friends, for which Canada at this season of the year presents many advantages. It is hoped that he will realize fully the pleasure anticipated, and resume his duties much refreshed and reinvigorated.

Mr. HARRY H. HAMILTON has been appointed Chief Operator of the Penna. & N. Y. Division lines, L. V. R. R., at Towanda, vice Mr. R. M. BILLINGS, resigned to engage in other business.

Mr. SAMUEL W. EYSENBACH has been transferred to Tunkhannock day office, Pa. & N. Y. R. R., from night office, Penn Haven Junct., L. V. R. R.

Mr. FRANK KING, operator at Tunkhannock, has withdrawn from the service and gone home on account of ill health.

Mr. L. C. MANN has taken the position of night operator at Penn Haven Junct., vice Mr. EYSENBACH, transferred.

Mr. S. S. COLTON has been appointed ticket agent and operator N. J. Midland Railway at 68 Broadway, Paterson, N. J., vice Mr. F. M. HUNTINGTON transferred.

Mr. S. W. HARRIS, formerly of Johnson's station, N. Y., N. J. Midland Railway, has been transferred to Broadway station, same road at Paterson, N. J., as agent.

Mr. R. C. LAVERY has returned (after a year's absence) to the position of Chief Operator of the Lehigh Valley Railroad lines at "Ch" office, Mauch Chunk, Pa., a position held by him for several years. The operators welcome him back.

The Telegraph.

By Cable.

TELEGRAPHIC COMMUNICATION FACILITATED IN TURKEY.

CONSTANTINOPLE, Oct. 13.—The Government of Turkey has withdrawn its prohibition of the transmission of cipher messages on the telegraph lines in Turkey.

Annual Meeting of the Western Union Telegraph Company.

THE annual meeting of the stockholders of the Western Union Telegraph Company was held at the office of the company, 145 Broadway, New York, on Wednesday, October 14th, at which the following were elected as directors of the company for the ensuing year: Messrs. William Orton, James H. Bancker, Alonzo B. Cornell, Harrison Durkee, Norvin Green, Joseph Harker, Edwin D. Morgan, Augustus Schell, W. K. Thorn, C. Vanderbilt, Frank Work, Chester W. Chapin,

Wilson G. Hunt, David Jones, C. Livingston, James Milliken, Levi P. Morton, George H. Mumford, O. H. Palmer, George M. Pullman, E. S. Sanford, John Steward, Moses Taylor, Daniel Torrance, W. H. Vanderbilt, W. R. Vermilye, E. B. Wesley, Stillman Witt, E. D. Worcester.

The Atlantic and Pacific Line from Chicago to Omaha.

THE new line of the Atlantic and Pacific Telegraph Company from Chicago to Omaha, by the route of the Chicago and Rock Island Railroad, has been completed and is in operation. This gives the A. & P. Company communication direct from New York to the Pacific Coast over its own wires. Heretofore the connection between Chicago and Omaha has been made over a line leased by the Western Union Telegraph Company to the Union Pacific Railroad Company. This line has been built under the personal superintendence of Mr. George H. Bliss, of Chicago, and has been put through in a very reasonable time, and has been thoroughly and substantially built—Brooks' insulator having been used. The company are to be congratulated on this important addition to their facilities. At Grinnell, Iowa, by means of the new line, the A. & P. Company connect with the Hawkeye Telegraph Company.

The following is a list of the offices opened by the A. & P. Company on this new line:

Washington Heights, Ill.	Sheffield, Ill.
Joliet, "	Genesee, "
Morris, "	Moline, "
Omaha, Neb.	Rock Island, "
Lasalle, Ill.	Davenport, Iowa.
Wilton, Iowa.	Des Moines, "
Iowa City, "	Stuart, "
Marengo, "	Atlantic, "
Grinnell, "	Avoca, "
Mitchellville, "	Council Bluffs, Mo.

On Hawkeye Company's line:

Mason City, Iowa.	Marshalltown, Iowa.
Rockwell, "	Gilman, "
Hampton, "	Grinnell, "
Ackley, "	Searsbow, "
Steamboat Rock, "	New Shara, "
Eldora, "	Oskaloosa, "
Union, "	Eddyville, "
Liscomb, "	Coal Field, "
Albion, "	Albia, "

Resignation of Operators from Manhattan Quotation Company.

ON the 5th inst. notice was given to the Supt., operators, etc., of the Manhattan Quotation Company, that their salaries had been reduced 25 per cent. from the first of October. This was done without previous intimation of such a purpose, and as it was the second reduction which had been made on a portion of them, it was naturally not favorably regarded. On the 10th inst. payment being refused by the company, except at the reduced rates, seven of the employe's of the company resigned and quit work. Two of these subsequently reconsidered and remained. Five of them, including the Superintendent, are still out, and do not propose to return. Their places have been temporarily supplied from the force of the Atlantic and Pacific Telegraph Company.

Those who quit the service of the company desire it to be understood that this is not a strike, or intended as such on their part. They consider that the company, in reducing their salaries without previous intimation or consultation with them, and dating such reduction several days previous to informing them of the fact, has not used them properly, and that as they were preëmporarily refused payment at the previous rate, even temporarily, they were under no obligation to give previous notice of their resignation.

Appropriate and Deserved Presentation to Mr. Gerritt Smith.

LAST Saturday evening the operators of No. 145 Broadway, New York, visited the room of Mr. J. D. Reid, where it had been arranged to have Mr. Gerritt Smith, late senior chief, in waiting. Mr. Smith's presence was the result of a *ruse*, and the demonstration was to the end of presenting him with an elegant gold watch, made by the Waltham Watch Company, and appropriately inscribed, and which had been purchased by subscription at the instance of Mr. Thomas J. Landy. The presentation speech was made by Mr. Joseph L. Edwards, a printing operator, and was a graceful and pleasant effort. Mr. Smith was quite overpowered by his emotion, but rose at the end of a few seconds and spoke in a most appropriate manner, disclaiming all claim to such kindness at the hands of his old associates, and assuring those assembled that the foundation of the feeling existing between him and them was laid and substantiated by themselves, from

none of whom he had ever received an ungentlemanly word during his connection with the operating department. Mr. Reid was invited to speak, and alluded briefly, but feelingly, to Mr. Smith's career, and his great value to the company in the position to which he has just been appointed. He congratulated the gentleman on the kindly feeling entertained toward him both as shown in the remarks of Mr. Edwards, in behalf of his fellow craftsmen, and in the bestowal of a tangible and beautiful memento of esteem. A general hand shaking, followed by three cheers and a tiger for Mr. Smith, closed the demonstration, which will long be remembered as one of the most gratifying events connected with the history of the soon to be abandoned, but ever to be cherished and famous institution, "No. 145."

SHEA.—At Troy, N. Y., October 7th, 1874, of hemorrhage of the lungs, Mr. VINCENT A. SHEA, operator in the Western Union Troy, N. Y., office, aged 21 years.

GEO. H. BLISS & CO.,
TELEGRAPH MACHINERY AND SUPPLIES
HOTEL ANNUNCIATORS,
 Electrical and Electro-Medical Apparatus,
 41 THIRD AVENUE, Chicago, Ill.

OFFICE OF EUGENE F. PHILLIPS,
 20 CONDUIT STREET.

PROVIDENCE, R. I.,
 September 15, 1874.

GENTLEMEN: I take pleasure in calling your attention to my
PATENT FINISHED INSULATED TELEGRAPH WIRE.

I claim this to be the best braided wire manufactured, and I believe it is universally acknowledged so throughout the country by all the large Telegraph Companies and Telegraph Supply dealers. Its points of superiority are:

- 1st. Its excellence of outside finish.
- 2d. The toughness of the Patent Compound with which the braid is saturated.
- 3d. By its polished outside finish, its adaptability for shedding rain and sleet.
- 4th. On account of the nature of the compound it can be laid directly against any wall or paper without staining or greasing it, which cannot be said of any other paraffine wire.

It is the only braided wire made, which, after it has been up for any lengthtime, will, with ordinary dusting, like any piece of polished furniture, look bright and fresh as when first put up. All other wire, regardless of its color, when first put up, will, in a short time, become dusty and dirt color, making an unsightly thing in an office, where mine, with its brilliant, fresh color, is an ornament.

The toughness of the compound, which also makes it capable of taking this splendid polish, makes it the most durable braided wire made. It is especially desirable for outdoor use, as the rain cannot beat the compound off, and its smooth surface prevents the snow and sleet from sticking to it.

A grease streak along the wall or paper behind the wire running into a nicely fitted up Broker's office, does not make him feel—well, good natured. This can be avoided by using this wire.

I also make it in cables of any number of conductors at the regular price for a single wire.

It is finished in any desirable color or plaids, with a light or heavy insulation, at the following prices:

No.	BROWNE & SHARPE'S GAUGE.	8. Price, per lb.
8.	"	\$0 85
9.	"	90
10.	"	90

17.	"	1 10
18.	"	1 20
19.	"	1 30
20.	"	1 40

Finer numbers at special prices.

Galvanized Iron Wire.....\$125 00 per mile.
 American Compound Wire..... 3 1/2 cents per foot.

Each covered with three heavy linen braids, and well saturated for outside use.

Ten per cent. discount in quantities not less than 10 lbs.

Fifteen per cent. discount in quantities not less than 20 lbs.

A liberal discount for larger orders.

Patented November 18, 1873.

I also manufacture plain cotton or linen covered wire, or will saturate the braid of the same with paraffine, shellac or paint. This may be covered with a wind and braid outside, or two braids, or a single braid, as the customer may wish.

This, if applied, is rubbed smooth on the outside, and I claim and believe is as good as any braided wire made, outside of my Patent Finished.

No.	BROWNE & SHARPE'S GAUGE.	8. Price per lb.
8.	"	\$0 75

18.	"	1 00
19.	"	1 10
20.	"	1 10

Finer numbers at special prices. Discount same as on Patent Wires.

I also manufacture a RUBBER COVERED WIRE, which will not grow stiff and crack off in cold weather, or grow soft in the hottest weather.

By my process of putting this rubber on the wire will be found in the exact centre every time. After the rubber is put on it is vulcanized, and then covered on the outside with a braid

and finished, and is suitable for under ground, under water, or any outside or other purposes.

I also manufacture a **PATENT ELECTRIC CORD**, which is pronounced by all to be the most flexible of any in the market, and the best suited of any made for Switch Boards, Medical Batteries, etc.

Silk covered, price per foot.....\$0 06
 Cotton or Linen covered, price per foot..... 0 05

Ten per cent. discount on 100 feet. Fifteen per cent. discount on 200 feet.

GENERAL REMARKS.

All wire used by me is made to my special order, and is the best that can be had in the market.

As one of the largest dealers told me a short time ago, "Your wires have come into the market on their merits alone, and we have been forced to keep them," so you may feel sure I shall feel chary of that honor, and shall be very careful to furnish none but the very best in my power.

I could give a long list of testimonials, but I will still depend on the "merits" of the wire, and respectfully solicit your patronage.

Your obedient servant,

EUGENE F. PHILLIPS.

These Wires can be had at my prices of

at the same prices offered by other establishments.

Our new Illustrated Catalogue contains some useful information
for Superintendents and others interested in the Science of
Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for
manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the
battery. Sulphate of copper is the only chemical required to be
used.

These Batteries have been fully tested during the last year,
although only recently offered for sale, and have proved to be
superior to any other as regards efficiency, economy and dura-
bility. When once set up they require no attention for from
four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
No. 1 is a large square cell, and can be used as a local or for
running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
savings of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
Descriptive circulars and price list forwarded upon applica-
tion to

F. L. POPE & CO.,

P. O. Box 4508.

38 VESSEY STREET, N. Y.

THE BALTIMORE BATTERY.

Acknowledged to be **SUPERIOR** to any other for Telegraph
purposes.

Every comparative test made the past year resulted in the
adoption of our Battery.

A prominent Superintendent writes: "My impression is the
Baltimore is to be the Battery of the future." He has others in
circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock report-
ing telegraphs, private lines. Superintendents fire alarm tele-
graphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New
York, who use no other.

For closed circuit it is without a rival.

Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given
 The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR,** without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

New York, Oct., 1873.
We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This **HOLDER** is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.80.

Agents for towns, and counties wanted.

GEO. H. BLISS & CO., Gen'l Agents,
41 Third ave., Chicago, Ill.

ANSON STAGER, Pres't. ELISHA GRAY, Sup'l. ENOS M. BARTON, Sec'y.

WESTERN ELECTRIC MANUFACTURING COMPANY.

No. 220 KINZIE STREET, CHICAGO.

TELEGRAPH, WIRES, INSTRUMENTS,
BATTERIES, TOOLS,
INSULATORS and SUPPLIES.

Annunciators for Hotels, Steamships, Dwellings.

Our Annunciators are the most extensively used and the most perfect in operation.

Automatic Mercury Fire Alarm, for Hotels, Steamships, Public Buildings.

Five years' operation have proved its merits.

SEND FOR CIRCULAR.

HAMBLET'S ELECTRO-MAGNETIC WATCH CLOCKS AND TIME DIALS.

Western Electric M'f'g Co., Chicago.

PRIVATE LINE INSTRUMENT.

Price, \$8.00.

This Instrument is well finished, and gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length. In ordering, give resistance of line and number of other instruments in circuit.

GEO. H. BLISS & CO.,
CHICAGO, ILL.

W. HOCHHAUSEN,
Manufacturer of
ELECTRICAL INSTRUMENTS,
132 WILLIAM STREET (rear),
Between Fulton and John Streets, NEW YORK.

One half of actual size

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard.
Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight. \$50 00
Sounders, from..... 4 50 to \$6 50
Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00
Relays, from..... 9 50 to 16 00
Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars.
The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

THE NONPAREIL TELEGRAPH APPARATUS,
NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices:

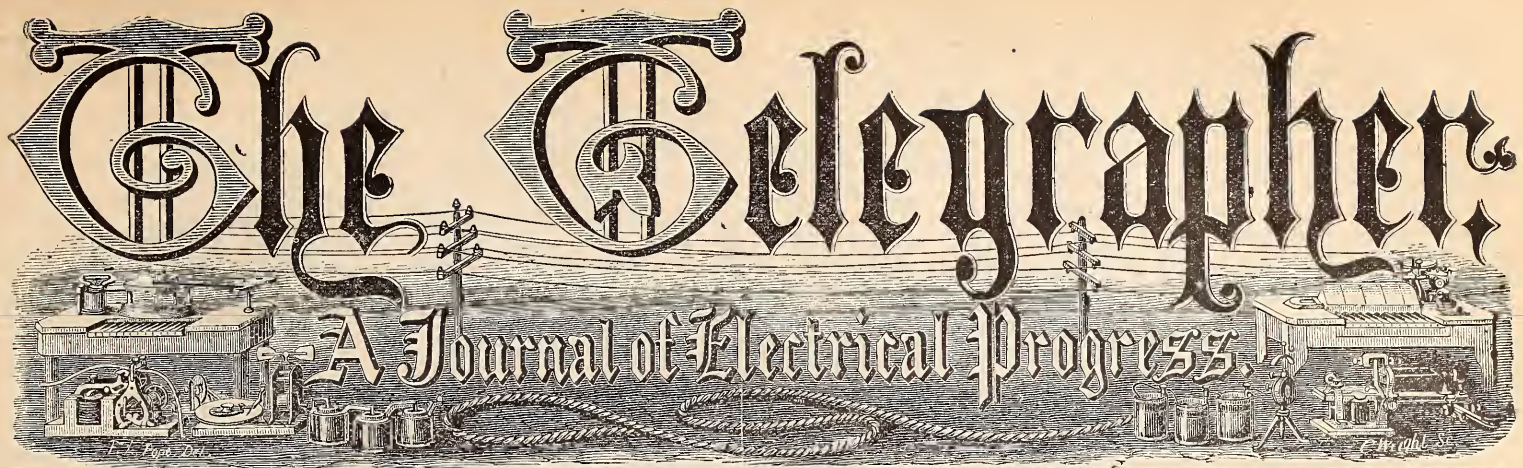

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50
Two sets of Instruments, etc., 12.00

Send for our new Circular and Price List.

BLISS RESERVOIR BATTERY.

This battery has just taken the FIRST PREMIUM—a SILVER MEDAL—FOR FORCE, ECONOMY and DURABILITY, at the CINCINNATI INDUSTRIAL EXPOSITION.

Price per Cell, \$2.00.

It will run as a local battery for six months without attention, and as a main battery for a longer period.

GEO. H. BLISS & CO.,
41 THIRD AVENUE,

Chicago, Ill.

THE ONLY PERFECT
MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.

No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY
THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

L. G. TILLOTSON & CO.,
8 Dey Street, N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE,

AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable. Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

Telegraphing as a Government Institution.

It has been a favorite idea with a not inconsiderable number in this country, as well as in Europe, that the telegraph system should be administered by the Government as a part of its regular functions. Accordingly, strenuous efforts have been made for several years past to induce Congress to take over the telegraphs of the country, and carry them on in connection with the Post-office Department. The subject just now is in a quiescent state, but the purpose has by no means been abandoned, and efforts will be renewed with the reassembling of Congress next winter to make progress towards the realization of the plans for the purchase and management of the telegraphs by the Government. Those who suppose that the danger of such action is past deceive themselves. It is true that at the present time there is apparently little interest felt in the subject, and it is equally true that the idea of a Government control and management of the telegraphs has never been a popular one in this country. Still it has powerful endorsement, and its friends are earnest and persistent in their advocacy of and efforts to secure such a telegraphic management and control.

Aside from the want of popular approval there are many reasons which interfere with the realization of the desires of those who are urging this matter. One of the most serious objections to the project is undoubtedly the great expense which it will entail in the first place upon the treasury to purchase existing telegraph interests. The experience of Great Britain in this direction has been a salutary warning to this country. Even granting that an extravagant price was paid for the telegraphs by the British Government, it is evident that upon any reasonable and fair basis the telegraphs in this country must cost a very large sum, and one which the treasury is in no condition at present to incur. The expenses to which the Government would be subjected in extending (as it inevitably must) the telegraph system to meet the popular demands if it became a Government affair, and in carrying it on would be enormous. In this respect the experience of our British cousins is suggestive and instructive. With the limited extent of the lines in that country, and the dense population, the comparatively cheap rates of telegraphic labor, and the other advantages which it has over this country, it has been demonstrated that the telegraphs can only be operated at an actual loss to the Exchequer. While the lines under private management are remunerative, the Government lines are a constant and increasing expense to the national treasury, and this is true not only of the British Government telegraph system, but of those of the Continent as well. How much more then would this be the case in this country, where the lines are so long, and a considerable portion of the country so thinly settled.

There is another and even more serious objection in the popular mind, and one which has had a very material effect in preventing popular approval and favorable action on the postal telegraph projects, so-called, and that is the conviction that Government administration of the telegraphs would be anything but satisfactory. Government business is not usually so well done here as to make the people desirous of adding to the duties of Government and government officials the administration of the telegraphs. There is here, as in every country, a party which considers it the province of the Government to engage in all branches of business that extend throughout the country. They desire to see banking and railroad transportation as well as the postal and telegraph business monopolized by the Government. They do not believe in the democratic maxim that "that Government is best which governs least," but would have the official control extend to all departments of business. In short they believe in a centralized and paternal government, and would cast upon it the management and responsibility regardless of the inevitable tendency of such a government to undermine and destroy the liberties and independence of the people. While they denounce monopolies unsparingly they desire to build up a Government monopoly which would be more odious

and more to be dreaded than any private monopoly could possibly become. It has been fully demonstrated that while the telegraph business remains under private management and control a permanent monopoly is impossible. Were all existing telegraph lines in this country this year consolidated into one great corporation, experience has shown that new companies would be organized and competing lines under construction within a few months. The money which has been lost heretofore has been very considerable in amount, yet the public have repeatedly contributed the funds requisite to supply new competing lines when old ones have been absorbed; and, notwithstanding all the consolidations of lines and companies into the Western Union Company, there are to-day as great an extent of competing lines in existence as ever before, and new ones are being built, and the system is being constantly extended and increased. There would be now a much greater extent of such lines in existence had it not been for the continued agitation of the Government telegraph projects during the past five years. Unquestionably, reasonable competition in telegraphy is best for the public, and will secure, at moderate cost, better and more satisfactory telegraph service than would be possible under a Government monopoly.

It is not intended to discuss this subject in detail, and for that reason no statistics have been introduced to show the working and results of Government telegraphing in other countries. The subject, it is true, is a trite one, and has been discussed until most readers are weary of it, but the danger of advantage being taken of the indifference of the public to it, to secure action which shall commit the Government to this folly should be realized, and it can only be averted by calling attention to the matter from time to time. The President in his annual messages has strongly recommended to Congress favorable action upon it, and as it is well known it was the pet idea of the late Postmaster General, Mr. Creswell, to have the adoption of the postal telegraph the crowning honor of his administration, and to that end he urged it upon Congress in season and out of season, but without success. What the opinion of the new Postmaster General upon the subject may be is not known, but it is understood that as yet he has not committed himself either way. As he was formerly a practical telegrapher and knows something of the telegraph business, he may reasonably be expected to consider the matter more intelligently than his predecessor. If he will use his influence to finally dispose of it, during his administration of the Post-office Department at least, he will do a signal service to Congress, the public and the telegraph interests.

Tom Larkins, the Messenger.

BY LEMONS.

WHEN he came to work at the depot office he was about fifteen years old, but very tall for his age, and his cheek corresponded with his height. He had scarcely been in the office two weeks before he knew everybody around the depot, and all the conductors and engineers on the road. He called them all by their first name, and was as familiar with them as though he had known them for years.

It was wonderful the stories he told of his abilities as a telegrapher. He said he frequently sent so fast it took two men to receive from him, and if there happened to be a wreck or any trouble on the road that it became necessary to rush business, he could receive on two wires at the same time. He never told these things when Barns the operator was around, but as Barns was experimenting with Dutch Bill's beer most of his time in a saloon around the corner, Larkins had plenty of opportunities of relating his wonderful feats.

The moment Tom saw any one looking in the office window, that moment Thomas would grab hold of the key of a short circuit there was in the office for practicing purposes, and commence a terrible racket with it; turning up his old magnet as high as it would go, then turning it away down again, muttering "plug," and looking very mad all the while as though the operator he was working with was doing his share of the work very unsatisfactorily.

In this he tried to imitate Barns, the operator. He had frequently noticed Barns getting very angry when he was working, and swearing if he had a pistol he would shoot that man at X.

Nothing pleased Tom more than to pass himself off as the manager of the office. He was always ready to receive messages at the window, and to tell the person sending the same that he would personally superintend the sending of the message, and have a reply as soon as possible.

One day Barns had a quarrel with Garvey, the operator at Bankton, having insulted him by requesting him to go back to blacksmithing where he would shine, as he would never be able to display his talents in this business. This touched Garvey in a tender spot, as he had at one time studied for a blacksmith, but was discharged on account of his experiments in trying to make the bellows blow themselves. He told Barns he

would make him swallow that before two hours was over; he said he would be down on No. five, which reached Barns' station at three o'clock, and he would return on the up train at three twenty, and he added if you are a man be at the train. Barns told him he would be there, and would also have a stretcher to send him back home on. "and for fear," continued Barns, "I should happen to let myself out and give you one with my left, in my excitement, I would advise you to arrange your earthly affairs, and be prepared for the worst." Garvey didn't deign a reply to this. About five minutes before the train was due Barns says to Tom, "I am going over home to see my sick mother; only be gone about half an hour; take charge of the office until I return."

Tom says all right, and swells himself out to his idea of the necessary proportions of a manager, with his feet cocked up on a chair, and a cigar in his mouth.

Shortly after the train comes in, Garvey steps off, goes up to the telegraph window and looks in; sees Tom with his feet up, and looking exceedingly consequential, says to him, "Are you the operator?" Tom replied that he was. In walks Garvey and says my name is Garvey, from X, at the same time grabs Tom by the back of the neck, shakes him up, hitting him one, two, in the face, bangs his head down on the table two or three times, then throws him in a corner, walks off, and gets on the return train with the idea that he has given that man Barns what he deserves.

But Tom! You never saw such a change as there was in that boy. He never aspired to be the manager after that. He didn't even want to be an operator. He said an operator's life was too full of vicissitudes to suit him.

Difficulties Attending the Introduction of the Telegraph in China.

A CORRESPONDENT of the *New York Herald*, writing from Foochow, China, under date of August 26, 1874, gives the following interesting account of the difficulties and observations encountered in the attempts made to introduce the electric telegraph in that country:

About the time of the embassy the Baron de Meritens, Commissioner of Customs at Foochow, endeavored to secure the erection of a telegraph from Pagoda anchorage to the foreign settlement, a distance of about eight miles. The work was commenced, but the poles erected in the daytime were summarily pulled down at night by the people, who declared that the telegraph would utterly and forever destroy the "fung-shui" of the neighborhood. (In this place "fung-shui" may be translated "good luck." There is no time for a philosophical dissertation on the subject just now.) The mandarins declared their inability to control the people in their prejudices, and it was very evident that if they did not actually encourage the rabble in tearing down the poles they at least had no word of rebuke for the action. Of course the project came to a premature end, and the "new era," so far as Foochow was concerned, was indefinitely postponed. Four or five years ago the foreign consuls at Shanghai made an effort to secure the erection of a telegraph from Woosung to Shanghai, about twelve miles. The intelligent Taotai replied to their application that the erection of a telegraph would undoubtedly destroy the "fung shui" of the entire region, and it could not by any means be allowed. The project slumbered until two years ago, when the foreigners, having obtained the concession of land for a road from Woosung to Shanghai, proceeded to erect a telegraph on their own ground, thus for once outwitting John Chinaman. The "fung-shui" has remained about as usual, and there is "nobody hurt." A cable having been laid from Woosung to Nagasaki, and one also to Hong Kong, Shanghai was put in telegraphic communication with the world. As, however, there was only a land line of twelve miles, and that on ground conceded to foreigners, not much was yet accomplished toward giving the "new era" a start.

But now it seems as though the Japanese are destined to do the world the favor of giving the "new era" a substantial lift. At the time the invasion commenced there was an application pending before the high provincial authorities here for the construction of a telegraph from Pagoda anchorage to Foochow. The application was made by the Foochow Chamber of Commerce in behalf of the Great Northern Telegraph Company, which is a Danish corporation. The chief advocate of the grant was M. M. Delano, Consul of the United States; and it is mainly due to his untiring energy and perseverance that it finally succeeded. Undoubtedly the Japanese trouble helped the promoters of the telegraph considerably. The arsenal is at the anchorage. It might be very desirable sometimes for the high officials at Foochow to communicate instantaneously with the arsenal and the gunboats. So Mr. Delano found the mandarins in a good frame of mind, and with the help of other consuls, soon secured permission to construct the telegraph along the banks of the river. The company went to work at once, and

up the poles on the north bank from the anchorage to the foot of Kooshan Mountain, laid a cable three-fourths of a mile long across the river and put up the poles on the south bank to within half a mile of the foreign settlement, when they met with a difficulty. They found it necessary to leave the bank of the river and to go across some rice fields and along a public road up the settlement. Of course they required new permission for this, which was accordingly sought. The mandarins feared it would excite a riot among the people and objected to granting the desired permission. This was an appropriate place for the British Consul to back out, which he virtually did, saying privately to the mandarins that it was not a British affair, and he didn't care to pursue it further. In spite of this disheartening circumstance, Mr. Delano persisted, and got a promise from the mandarins that the telegraph might take the route desired, provided the people were willing. He sent his linguist to talk to the people, secured their good will, and one day—in about twelve hours' time—the telegraph was completed, the much dreaded people actually helping to dig the holes and erect the poles. For several weeks now we have had telegraphic communication with the anchorage. The Taotai has inspected the operation of the telegraph and declared himself highly gratified with it. Six young Chinamen have been sent by the mandarins to learn the art of telegraphy. The "new era" is fairly launched, and "fung-shui" hasn't peeped a solitary objection.

Next comes Shen, the Imperial Commissioner to attend to Formosan affairs, all alive to the advantages of the telegraph, and makes a contract with the company to erect a telegraph from Ta-ka-o, at the southern end of Formosa, to a village at the northern end, thence to lay a cable to the mainland, and erect a land line up through Hingwer to Foochow. There is a little hitch just now, in regard to the terms; but it is not thought that any delay will be occasioned thereby.

Acting on the motto, "Strike while the iron is hot," the company made three distinct propositions to the mandarins for the construction of a line from Foochow to Amoy, there to be connected with the sea cable, and put Foochow in telegraphic communication with Europe and America. They wisely choose Mr. Delano to put it through for them—having had quite as much experience with the British Consul as they cared for. I am happy to say that he has again been completely successful. The high provincial authorities have accepted the second of the company's propositions, which was that they would erect the line at their own expense, and give the officials a separate wire for their own use, to be under their sole direction. A party has already started overland to survey the route; and as the mandarins are in earnest about it there is little doubt that the line will be completed in a few months, and "fung-shui" will be undisturbed.

Production of Electric Light.

THE London *Times* speaks of the new electric light apparatus, invented by Mr. Wilde, as a great success, enabling the type of that paper, on the beam of light being brought upon it, to be read at a distance of some two thousand yards.

From an extended description of this apparatus it appears that there is an electro-magnetic induction machine for producing the electricity, and an arrangement for regulating the light produced by the current, and projecting it upon distant objects, this electro-magnetic induction being founded upon a new and somewhat paradoxical principle discovered by the inventor—namely, that magnets and electric currents indefinitely weak can produce magnets and currents of indefinite strength.

Practically, the machine consists of a circular or cylindrical framing of cast iron, round the interior of which are arranged a number of electro-magnets at equal angular distances from each other. A cast iron disk is mounted on a driving shaft running in bearings fitted to each side of the framing, and carries a number of armatures revolving between the electro-magnets.

A slight charge of magnetism is imparted to the electro-magnets before the machine is used for the first time, by transmitting a momentary current through the wires surrounding the iron cores, or by touching their extremities with the poles of a permanent magnet. This initial charge is always retained by the electro-magnets, and is the basis of the augmentations of the electricity and magnetism produced by the rotations of the armatures. As the armatures revolve, they become slightly magnetized in their passages between the poles of the electro-magnets, generating weak currents in the insulated wires surrounding them, as must necessarily be the effect.

Now, these currents are transmitted by means of a commutator, through the wires surrounding the electro-magnets, so as to increase their magnetism until, by a series of actions and reactions of the armatures and electro-magnets on each other, the magnetism is exalted to the highest degree of intensity, and the

most powerful currents of electricity are produced—a small fraction of the current thus obtained being sufficient to sustain the power of the electro-magnets, while the major portion of the current operates to produce the light.

In the experiments made with this invention, to test its efficiency, a machine twenty-eight inches high, thirty-four inches in length, twenty-one inches in diameter, and weighing about eleven hundred pounds, was placed on board of a vessel, and the result of the test was, as stated above, that the light enabled a newspaper to be read at two thousand yards distance, and no boat could approach the light within a mile without being discovered.

Constants of Nature.

THE following circular has been issued by the Smithsonian Institution, asking the aid of chemists and physicists throughout the country in the preparation of a series of tables, the value of which, when completed, will be incalculable. No more important contribution to the sum of knowledge and to the advancement of science, both practical and theoretical, can well be imagined than the determination of some of these constants:

SMITHSONIAN INSTITUTION, }
WASHINGTON, D. C. }

The Smithsonian Institution has in view the publication of a series of tables of "Constants of Nature," such as the atomic weight of bodies, specific gravity, expansion, elasticity, specific and latent heat, conducting power, melting and boiling point, weight of different gases, liquids and solids, crystalline form, strength of different materials, index of refraction and dispersion, polarizing angle, velocity of sounds, of projectiles, of winds, of electricity, of light, of flight of birds, speed of animals, etc., etc.

The value of such a work in aiding original investigation, as well as in the application of science to the useful arts, can scarcely be overestimated. To carry out the idea fully, however, will require much labor and the united efforts of different institutions and individuals devoted to special lines of research.

The cooperation, therefore, of those who receive this circular is respectfully invited to the enterprise.

Since the different constants are to be carefully tabulated, even a single determination of any one constant for any one body may prove to be of great value by supplying some important omission in a series.

Every contributor will, of course, be credited with his determinations, when published.

JOSEPH HENRY,
Secretary Smithsonian Institution.

[From the *Journal of Chemistry*.]

The Origin of Weather Telegraphy.

THE nationality of "Old Probabilities" has been a matter of discussion, but there can be no reasonable doubt that he is a genuine Yankee. Some have tried to make him out a Frenchman, about twenty years of age. Leverrier, in 1854, called attention to the importance of systematic weather reports, and in 1855, Louis Napoleon authorized such an undertaking. The stations from which the reports were received were mostly in France, but in 1857 the net work was extended to foreign countries. In 1858 all the important cities of Europe were included, and on the 1st of January of that year began the publication of the *Bulletin Internationale*. Up to 1863 occasional weather warnings were issued by the French astronomer, but it was only in that year that the French system of daily probabilities of weather was inaugurated. In 1865 commenced the series of quarterly volumes of the *Atlas General des Mouvements de l'Atmosphere*. Since that time the progress of weather telegraphy in Europe has been very rapid.

But the proposal to use the telegraph for this purpose was made in this country at least eight years earlier than Leverrier made the suggestion in France. Professor Abbé, in *Silliman's Journal*, traces the first printed hint of the kind to Professor Redfield, who in 1846 wrote to that journal as follows: "In the Atlantic ports the approach of a gale may be made known by means of the electric telegraph, which probably will soon extend from Maine to the Mississippi." The next mention of the subject is found in the *Smithsonian Report* for 1847, in an article by Professor Loomis. "When the magnetic telegraph is extended from New York to New Orleans and St. Louis, it may be made subservient to the protection of our commerce, even in the present imperfect state of our knowledge of storms." But however frequently the suggestion may have been made, it is to Professor Henry and his assistants in the Smithsonian Institution that we must assign the credit of having first acted upon it; and the agitation of this subject in the United States probably stimulated the subsequent action of European meteorologists.

References to the subject may be found in the

Smithsonian Report for 1848, 1849, 1850, and 1851. In that for 1849, it is stated that "successful applications have been made to the Presidents of a number of telegraph lines to allow, at a certain period of the day, the use of their wires for the transmission of meteorological intelligence;" and in that for 1851 we are informed that, "since the date of the last report the system particularly intended to investigate the nature of American storms, immediately under the care of the institution, has been continued and improved." The system of weather reports thus inaugurated remained in regular operation till 1861, when the disturbed condition of the country rendered its continuance impossible. But even before peace had been proclaimed Professor Henry sought to revive the systematic daily weather reports; and in August, 1853, at the meeting of the North American Telegraph Association, a paper was presented by Professor Baird, on behalf of the Smithsonian Institution, requesting the privilege of the use of the telegraph lines, and more especially in order to enable Professor Henry "to resume and extend the *Weather Bulletin*, and to give warning of important atmospheric changes to our seaboard." The Telegraph Association, in response, offered the free use of their wires for the desired purpose, and the inauguration of the enterprise was fixed for 1865; but the fire in January of that year, which so seriously embarrassed the labors of the Smithsonian Institution, compelled a postponement of the work to a more favorable time.

Professor Abbé sums up the matter as follows:

"It will thus be seen that, without material aid from the government, but through the enlightened policy of the telegraph companies, and with the assistance of the munificent bequest of James Smithson 'for the increase and diffusion of knowledge,' the Smithsonian Institution first in the world organized a comprehensive system of telegraphic meteorology, and has thus given, first to Europe and Asia, and now to the United States, that most beneficent national application of modern science, the Storm Warnings."

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Telegraphs and Railroads in Oregon.—Resignation of Superintendent Plummer.—Superintendent Lamb to succeed him, etc., etc.

ALBANY, OREGON, Oct. 6th.

TO THE EDITOR OF THE TELEGRAPHER.

FOR some time past very little of interest to the telegraphic fraternity has been transpiring in Oregon and Washington Territories.

The boys on the new wires are able to draw their regular salaries, and some even complain of getting lazy over the light business this season; caused, as we presume, by the low price of grain, etc. The Oregon and California and Oregon Central boys, however, cannot complain, with propriety, of having nothing to do, as every train is running "chook fall" with grain to vessels in Portland, loading for Europe and other foreign shores. Mr. Charles D. Faling, the efficient superintendent of telegraph and train despatcher, still runs these two roads, with Mr. John J. Kenny as chief and Mr. Will. B. Rice as asst. chief operators on the former lines. A new office has been opened at Marion, on this line, with Mr. R. H. Rutherford as operator in charge. Several other changes in the telegraphic department have been made, which are recorded in the "Personal" column of THE TELEGRAPHER, which valuable paper, by the way, is taken by every officer and operator on the entire line, with the exception of two, and we have strong hopes of getting them as soon as they get coin enough—the lack of it being their excuse.

The Oregon Legislature is now in session at Salem, and its actions are watched by the different large corporations with considerable interest, as there are a good many "Grangers" in this session, and they swear they are going to regulate things considerably in the way of tariffs and rates. One thing which they have done will not be grumbled at by these same corporations, and that is the repeal of the "equalization of taxes" laws, the object of which was intended, as its title indicated, to equalize the taxes of the State, but in nearly every instance it equalized up instead of down; and in some cases, such as the O. & C. Railroad and the W. U. Telegraph, the rate was increased some four or five thousand dollars more than their regular assessment, of course, causing great dissatisfaction. In some instances the courts were resorted to, and every contested case was decided against the State, causing a good deal of merriment among the opponents of the law.

Two new railroad and telegraph enterprises have been incorporated within the last few days—the Ore-

gon Pacific Railroad Company, for the purpose of building a railroad and telegraph line from Portland, Oregon, up the Columbia river, through Washington, Idaho and Montana, to some point on the Central or Union Pacific Railroad. Among the incorporators are the names of J. S. Hallett and G. H. Thielson. Mr. Thielson was formerly General, and Mr. Hallett Asst. Superintendent of the Oregon and California Railroad, and Mr. Hallett is also well known all over the Pacific coast as a railroad contractor, having built the Oregon Central, Oregon and California, in Oregon, and the U. P. Railroad in Washington Territory; and whenever he takes hold of a thing *something has got to give*. The other enterprise is the Oregon Central Pacific Railroad and telegraph line, from some point at or near Winnemucca, Nevada, through the Humboldt and Goose Lake country, via Springfield, Oregon, down the west side of the Willamette via Portland, to some point on the Columbia river. Some of our most substantial citizens are the incorporators of this company, but are not experienced railroad men.

Speaking of railroad and telegraph business puts me in mind of the U. P. Railroad in Washington Territory, which company are now operating their road without a telegraph line of their own. Some two or three years ago the Western Union and this railroad company entered into an agreement to do a reciprocity business, whereby the railroad was to transport all men and material for the Western Union free, and the latter company was to build and equip two complete lines of telegraph, and furnish and keep one in order for the exclusive use of the railroad company. This arrangement worked all right until some two or three months ago, when they got into some kind of a squabble and the arrangement busted, and the Western Union Company gobbled both lines, leaving the railroad minus a telegraph wire. The Western Union boys charge the railroad company for every telegram, and the railroad boys, when they catch a telegraph man, "nip" him, you bet!

One of our boys here in Albany has been "feeling his oats" over being the means of saving the life of a poor melancholy individual, who entered his office and wrote a message to a party in Illinois, informing him that he was tired of life, and proposed transferring himself into a cold corpse. Now, Joe was not going to stand such conduct; so, after sending the message, he grabbed his tile and rushed frantically up the street and informed the police that the fellow was on a "laudanum lay out," and for them to watch him. So one or two M. Ps. were detailed, and pretty soon the would be suicide engaged a room at the Exchange Hotel and was discovered just after he had drank the poison, but a doctor soon had him pumped out dry as a bone, and he only got a good cussing for his pains from the worldly-minded, and when he found out the way our telegraph boy had acted in cheating him out of his job he was going to naturally murder him, but Joe felt pretty good over it till last Wednesday, when the same fellow was found dead in a bed in the Chemeketa Hotel in Salem, having made a *dead* thing of it that pop, and Joe says it's the last time he's going to exercise any solicitude upon such cases. If they want to kill themselves they can do it, and be hanged, too, if it does 'em any good.

We understand Dr. O. P. S. Plummer, Superintendent third district, Western Union Telegraph Company, has resigned, to take effect the 1st of November. "Doc" will be missed by many of the boys, but we are glad to hear that Superintendent F. H. Lamb is the "coming man" to succeed him. Col. Lamb has an enviable reputation already over in Washington Territory, where he was Superintendent a long time, and hope he will suit the boys as well as Superintendent Plummer has. Doc is going into the drug business in Albany, as we are informed. But—so long. WEBFOOT.

Western Union and Quadruple Transmission.

TO THE EDITOR OF THE TELEGRAPHER.

WILL you permit me, through the columns of THE TELEGRAPHER, to reply to a statement in regard to the "most erroneously" assumed advantages to accrue to the public by the use of an alleged new discovery referred to in the New York Tribune of the 9th instant—said new invention being called by the electricians of the Western Union Telegraph Company "The Quadruple Telegraph." By the use of which each wire now in daily use is not, and cannot, as stated, be made practically four; further, that by its use the traffic of the company cannot, as stated, be economically increased without the creation of any more wires. It being a well known fact, both here and in Europe, that specially large wires had to be erected for the "Stearns Duplex." This, taking the cost of construction or reconstruction into consideration, leaves practically the line working on the "old Morse status," at least until reconstruction is paid for.

Now, with regard to the so-called quadruple system said to be in use between New York and Boston; it is also a well known fact that it is being worked necessarily on a large line wire, for, by an apparently curious

"paradoxical law," the speed of duplex, as also the speed of quadruple transmission over even a large line wire, is "reduced with mathematical precision," and this reduction of speed progresses rapidly for quintuple transmission, and so onwards until finally speed will entirely cease altogether. This fact is also well known to telegraph scientists—in a succinct way it means that if we erect, say a number six line wire for quadruple transmission, there will be (when the state of the weather admits of its being worked) practically a gain of only one wire. But, on the other hand, if it be attempted to work quadruple transmission on an old Morse line wire the gain will be practically nil.

This "new discovery" by the way, for some twenty-five years known to all telegraph scientists, which fact must have inadvertently been overlooked by my scientific friend, Mr. George B. Prescott—being described in the works of that eminent electrician, General Sabine, and others in 1854-5-9. Nevertheless, to Mr. Prescott is due the credit of its first introduction in this country. Now, for the sake of argument, admitting the statement referred to to be correct, let us see what would be the gain to the company according to Mr. Prescott's book, p. 149. The average rate upon Morse lines does not exceed seventeen words per minute, and this is a fair average—add seventeen words more for quadruple transmission, leaving the same still subject to all of the old Morse difficulties, such as climatic changes, liability to interpretation by feel, taste, or by sound by any Morse operator, and may be so appropriated; and, in addition, the same is subject to the inevitable fourfold complication of the Morse apparatus when adapted to quadruple transmission, and over sixteen compensations in order to meet, among other difficulties, that of ever varying climatic changes constantly taking place throughout this vast extent of continent.

What the people of this country require is a reliable, cheap system of telegraphy, whereby they may feel sure at all times of obtaining telegrams during any state of the weather, and that is to be found in the one upon which the eyes of the whole scientific world is now centred—namely, the (my) American (electro-chemical) automatic telegraphic system of the first order, which is capable of transmitting and receiving five hundred words and upwards per minute; one automatic line wire above referred to being practically equal to twenty Morse line wires. Within the past four years my rapid American (electro-chemical) automatic telegraph has repeatedly been pressed into the service of the opposition company during such seasons of stormy weather when the electro-magnetic telegraph came to a stand still. I hope you will excuse my trespass on your space when I tell you that in the year 1846, on this very important question of telegraphy, I stood before a committee in the British Parliament cheek-by-jowl with Alexander Bain.

GEORGE LITTLE, *Cons. Elec. Aut. Tel. Co.*
PASSAIC CITY, NEW JERSEY, U. S. A., October 9, 1874.

In the Wilds of Jersey.—Paterson, N. J., Operators.

TO THE EDITOR OF THE TELEGRAPHER.

Now I have got a task before me, but I shall try to brave it through. It's hard to tell where to begin. I am afraid if I begin with one, another one will "squeal" because he was not first.

However, I'll take my chances and commence with the telegrapher highest in position, Mr. W. J. Holmes, Supt. Telegraph, Erie Railway and branches. Mr. Holmes is a short, good sized, pleasant looking gentleman. He is very kind to his deserving operators and is as all superintendents should be, very strict. He is a very able manager, and were it not for him the Erie wires would soon go down hill. His office is in New York, but his home is at Paterson—like a great many other Patersonians he finds it hard to stay away from such a beautiful business-like city as Paterson.

Next on our list comes Mr. Sampson, "N," he is chief operator of the Erie—he holds the same position Mr. Jos. Angell did before Mr. A. engaged as Superintendent of Telegraph to the Midland. Mr. A. we understand is now running a wire for the A. & P. Telg. Co. between Chicago and Omaha. But we must not drift out so or we shall get lost, so we will retrace our steps to Mr. Sampson, who, 'tis said, is the right man in the right place. He is pleasant, keen sighted, of medium height, muscular, and what he says he means most generally. He is a fine gentleman and the boys all like him, so I am told. Mr. Sampson lives in Paterson with his family, and I understand he has recently had a new *souander* in the shape of a little boy baby. We wish father, mother and child all manner of success, and hope many more will follow this one.

Next we have Mr. W. E. Tator, "W," who works the day truck at the Erie depot at present. To Mr. Tator I am obliged for some of my information. Mr. Tator is a gentleman in every respect, and a good man for this office; he works one week nights, the next week days, changing with his partner, Mr. G. W. Holbrook, "F. S," who is another of that large family of

telegraphers. He has a brother at Jersey City, train despatcher, office of the Midland, and another at West End station of the Midland Railway, and how many more brothers or sisters are in the ranks I know not, but they are all good operators.

Passing out into the ticket office between 2 P. M. and 10:45 P. M. we find our old friend Tunis Dougherty, "T." We don't know why he went into the ticket business unless it is because he made enough at telegraphing to retire from it.

Tune goes into the telegraph office once in a while and lets the fellows on the wires know he is alive.

For fear of occupying too much space at once we will close this by signing our usual "sig."

P'S AND Q'S.

The Use of Tobacco.

TO THE EDITOR OF THE TELEGRAPHER.

MANY suppose they have a right to use tobacco at any time and in any place, and such persons think they give up their rights when forced to stop. They take as infringement any move which curtails their actions in its use.

We will not discuss the moral side of the question. The science of physiology teaches that the use of tobacco is a positive injury. Let every man decide for himself as to whether he has a right to injure himself or to injure others through injury to himself, or to squander his means, which may result in injury to others. That is the moral side. The law does not as yet touch it, but is as applicable as to whiskey. I should think that little feet which go unclad in winter, and little stomachs which ache with hunger the year round, suffer no less because the deprivation arises from the use of tobacco.

There are three kinds of legal restraints against smoking and one against spitting (*i. e.* chewing). Boston has an ordinance prohibiting smoking in the streets. That is one kind of legal restraint. The law will stop smoking in any incorporated town if smoked on the ground of nuisance—which it is to many of those who do not smoke. Thus any man can be stopped smoking on Broadway, New York, by any policeman who is requested to stop him on the ground that it is offensive. That is another kind. Then we have the rules of private corporations, which are binding. Thus in a theatre one may not smoke, and you never hear any but a drunken man—an ass—insist that he has a right to smoke where it is forbidden.

Against chewing—we see notices hung up against spitting, which is the same thing, and can be enforced. It is only through and on account of the forbearance of non-users of tobacco that any one uses it off his own premises, and even there it must be given up if its use endangers his neighbor's property, or if he make it a nuisance and it is complained of as such.

If any man in charge of any office is not upheld in his right to stop entirely the use of tobacco in that office, then he is wronged, and, in addition to his wrong, all society is wronged; because in failing to sustain him his superiors do violence to the laws of etiquette, which is the only law *real* gentlemen and *real* ladies have anything to do with in their social and business intercourse. The very commonest etiquette demands that no one should indulge a habit in the presence of others which habit is known to be offensive to some folks, unless he have the unqualified permission of each; nor will politeness regard such permission as good for any other occasion, even among the same people. Really polite people are scarce.

F. A. STUMM.

Telegraphic Bull.

PHILADELPHIA, Oct. 13th.

TO THE EDITOR OF THE TELEGRAPHER.

ALTHOUGH many errors occur in messages through the carelessness of operators, I consider the following out of the usual order of that kind of business and exceptional. I will only give the body of the message. The following is the original copy as it was sent from a W. U. office, where, I dare not say. "Mailed your Ledger, examination Wednesday, look in special notices for particulars, Emma gets card Monday, come in time." When received at destination it read, "Mailed you Ledger examination Wednesday look in school not issued for particulars Emma get around Wednesday, come in time."

I think no more need be said on the above, it explains itself. D.

A Railroad Telegraph Superintendent Killed.

THE pioneer telegrapher, Ned McDill, Superintendent of Telegraph, fell beneath a train at Rosedale, Mo., yesterday morning, and was instantly killed. Over twenty years ago he was well known to the fraternity at Chicago and Cincinnati. His death will be regretted by hosts of friends among operators and railroaders throughout the West. He leaves a wife and four children. His parents reside at Zanesville, Ohio.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, OCTOBER 24, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST OF THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK ON ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

a No. 1 Telegraph Key, or a set of F. L. POPE & Co.'s popular NONPAREIL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. H. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

Publisher.

P. O. Box, 5503.

Getting up a Newspaper under Difficulties.

GETTING up a newspaper, with acute inflammation of the eye, and under a positive interdict from your physician of reading or writing, is a somewhat difficult matter to accomplish satisfactorily, and this is just the position we are placed in this week. An injury to one of our eyes on Sunday last, resulted in disabling us from editorial duty, or any other business in fact, until Thursday, and in order to get out THE TELEGRAPHER this week at all, we have been obliged to use such matter as was most convenient and easily arranged.

The illness of Mr. F. L. POPE, upon whom we do occasionally, in an emergency like the present, temporarily impose our editorial duties, leaves us in an additionally embarrassing position at the present time. We have endeavored to bear our affliction as patiently as possible, and trust, as our damaged optic gives decided indications, under skilful treatment, of speedy recovery, that by the time it shall become necessary to construct another number of the paper we shall be in order for a vigorous resumption of editorial duties.

The American Electrical Society.

WE learn by telegraph that the adjourned meeting for the purpose of completing the organization of the proposed Electrical Association was held in the Palmer House, at Chicago, on Wednesday afternoon last. There were present at the meeting forty or fifty telegraphers, including a number of the leading telegraphers in this country and many other prominent men interested in the science.

The meeting was called to order by Mr. CHARLES H. HASKINS, General Superintendent of the Northwestern Telegraph Company, who briefly stated its objects, as set forth in the circular which was printed in THE TELEGRAPHER of last week, namely: an interchange of scientific knowledge, the advance of electrical and telegraphic science, and the organization of a central association, which shall include in its membership all persons who are in any way interested in the objects of such a society. The committee appointed for that purpose at the preliminary meeting held on the 14th of September reported the Constitution which they had prepared, and which was unanimously adopted. This provides that an annual meeting of the society shall be held on the third Wednesday of October, at a place to be designated by the Executive Committee; that it shall be known by the name of "The American Electrical Society," and that its headquarters shall be in the City of Chicago.

A permanent organization was effected by the election of the following officers: President, Gen. ANSON STAGER, of Chicago; Vice-Presidents, C. H. HASKINS, of Milwaukee; G. B. PRESCOTT, of New York; H. P. DWIGHT, of Toronto; WILLIAM ORTON, of New York; JAMES GAMBLE, of San Francisco; JOHN VAN HORNE, of Louisville; and E. D. L. SWEET, of New York. Corresponding Secretary, I. N. MILLER, of Chillicothe, Ohio; Recording Secretary, C. S. JONES, of Chicago; Executive Committee, WILLIAM HENRY SMITH, J. J. S. WILSON, GEORGE H. BLISS, F. H. TUBBS, and C. H. SUMMERS. Directors, F. L. POPE, A. S. BROWN, of New York; W. W. SMITH, of Indianapolis; J. A. SWIFT, of Washington; S. D. FIELD, of San Francisco; GEORGE T. WILLIAMS, of Cincinnati; D. FLANERY, of New Orleans; C. O. ROWE, of Pittsburg; R. C. CLOWRY, of St. Louis; E. P. WRIGHT, of Cleveland; D. H. BATES, of Philadelphia; J. J. S. DICKEY, of Omaha; V. HUCKER, of Buffalo; G. G. DAVIS, of Baltimore; and J. R. DOWELL, of Richmond, Va.

We shall be able to furnish a fuller account of the proceedings of this important meeting and its action, from which we anticipate ultimately excellent results, with the provisions of the Constitution adopted, in the next number of THE TELEGRAPHER.

Resignation and Appointment of Supt. Am. District Telegraph Co.

MR. GEORGE F. DURANT, who for the last two years has been Superintendent of the American District Telegraph Company in this city, has resigned that position, having been appointed General Manager of the American District Telegraph Company at St. Louis, Mo., and left for that city on Wednesday last to enter upon the discharge of his new duties. Mr. DURANT is well known as a most capable and excellent telegrapher, and has discharged the duties of his late position to the general acceptance of the company and the employes, who regret to lose him. He is thoroughly posted in the District Telegraph system, and our St. Louis friends are fortunate in having secured his services.

MR. HENRY W. POPE, who has been Assistant Superintendent of the American District Telegraph Company for the past two or three years, has been promoted to the vacancy caused by the resignation of Mr. DURANT. He has labored faithfully and energetically for the interest of the company, and well deserves his promotion, not only for his past services but for his thorough knowledge of the requirements of the position, and for the signal ability which he has exhibited in the position previously occupied. He is an accomplished telegrapher, and his promotion will no doubt prove equally fortunate and advantageous to the company and himself.

Resignation of a Popular Telegraph Superintendent.

AS WILL be seen from the communication of our esteemed and attentive correspondent, WEBFOOT, of Albany, Oregon, Dr. O. P. S. PLUMMER, who has for several years past been District Superintendent for the Western Union Telegraph lines in Oregon, has resigned his position to engage in other business. Dr. PLUMMER has been a very popular and efficient Superintendent, and his retirement from the telegraphic service will be greatly regretted by the employes of his district. He will have their best wishes for his success and abundant prosperity in the business in which he proposes to engage, and throughout his future life.

It is understood that Dr. PLUMMER will be succeeded as Superintendent by Mr. FRANK G. LAMB, who is well known and deservedly popular on the Pacific coast as a telegraph superintendent. The company and the employes are both to be congratulated on securing the services of so capable and efficient a telegraphic official to replace Dr. PLUMMER. Mr. LAMB has been from his boyhood connected with telegraphy, and is thoroughly conversant with the requirements of the service, and in his care the interests of the company and the employes will be safely and satisfactorily attended to.

The Western Union Report.

FOR the reason which is elsewhere stated, we have been unable to prepare our review of the report to the stockholders of the Western Union Telegraph Company, made by President ORTON at the annual meeting held on the 14th inst.

We hope to be able to do this next week. In the meantime, our readers will find it interesting and profitable to closely study and analyze this report for themselves; it is one of the most interesting and important telegraphic documents which is issued during the year, and, like all of Mr. ORTON'S official reports, is readable and suggestive.

Annual Meeting of the Telegraphers' Mutual Benefit Association.

THE Annual Meeting of the Telegraphers' Mutual Benefit Association will be held at 145 Broadway, New York, at 7½ P. M. Wednesday, November 11th. There should be a large delegation of intelligent men at that meeting. Let the best men come, and let there be plenty of them.

Personals.

Mr. W. W. SKINNER, one of the "old boys," who has been for a long time agent and operator at Roseburg, Oregon, O. & C. R. R., has been promoted to the position of agent at Salem, Oregon, same Co. Good for "Sag."

Mr. J. L. WILLIAMS has been transferred from Gervais, O. & C. R. R., to Roseburg, as agent and operator, vice Mr. SKINNER, promoted.

Mr. J. H. WOODRUM has been transferred from Oakland, O. & C. R. R., to Gervais, vice Mr. WILLIAMS transferred.

Mr. G. A. TAYLOR has resigned his position in the U. repeating office, Yreka, Cal., to accept the position made vacant by Mr. WOODRUM's transfer from Oakland, O. & C. R. R. These changes suit all the boys, and we are "glad of it."

Mr. J. M. FISH, who has been acting as agent at Salem, Oregon, O. & C. R. R., has returned to his "first love," the telegraph office there, and pounds brass as of yore.

Mr. R. H. RUTHERFORD is operator and agent at Marion, Oregon, O. & C. R. R., a new office, just opened.

Mr. W. T. BODLEY, for a long time operator at Machine Shops, office O. & C. R. R., has resigned that office to accept a position as General Superintendent's clerk, same Co., at Portland, Oregon.

Mr. J. D. BODLEY has accepted the position lately resigned by his brother, Mr. W. T. BODLEY, at Machine Shops O. & C. R. R.

Mr. P. P. BODLEY is operator and agent at Comstock's, Oregon, O. & C. R. R.

Mr. THOS. R. SHERIDAN, formerly manager W. U. Tel. office, Albany, Oregon, concluded the Oregon Legislature could not be run without him, so he now fills the position of enrolling clerk to the Senate branch of that august assembly at \$5 per day. "Nothing like being a democrat"—is there TOM?

Mr. F. M. HUNTINGTON, ticket agent and operator N. J. M. Railway, at 68 Broadway, Paterson, has been transferred to the general office, same company, at 96 Liberty street, New York, as operator.

Mr. W. E. HUNTINGTON has resigned his position as manager of the A. and P. Telegraph Company, at Jersey City, to accept a more profitable situation with the American District Telegraph Company in New York.

The Telegraph.

By Cable.

HEAVY GALE AND TELEGRAPHIC INTERRUPTION.

London, Oct. 21.—A heavy gale prevailed on the North of England coast last night. Telegraphic communication in that section was interfered with, and up to this hour (2 A. M.) the trouble on the wires continues.

ADDITIONAL PARTICULARS.

London, Oct. 21.—A heavy storm of wind and rain prevailed last night and to-day throughout the north of England and in Scotland. All the rivers in that section are much swollen, the railway and telegraph lines interrupted, trees were uprooted in all directions, and chimneys and walls prostrated. Many persons were injured in Edinburgh by flying debris.

Three houses at Stockton-on-Tees were demolished and one person was killed.

Election of Officers of the Western Union Telegraph Company.

At a meeting of the newly elected Board of Directors of the Western Union Telegraph Company, held at the executive office, Thursday, Oct. 15th, the following officers were elected for the ensuing year:

- President.—William Orton.
- Vice-Presidents.—A. B. Cornell, Augustus Schell, George H. Mumford, Norvin Green, Harrison Durkee.
- Executive Committee.—William Orton, James II. Banker, Alonzo B. Cornell, Harrison Durkee, Norvin Green, Joseph Harker, Edwin D. Morgan, Augustus Schell, W. K. Thorn, C. Vanderbilt, Frank Work.

The American District Telegraph Company.

At a meeting of the Board of Directors held last week the following officers were elected for the ensuing year:

- President, E. W. Andrews.
- Vice-Presidents, A. B. Cornell and J. N. Gamewell.

Treasurer, A. W. Greenleaf.
 Secretary and Assistant Treasurer, C. B. Hotchkiss.
 Superintendent, H. W. Pope.
 Assistant Superintendent, F. D. Farrington.
 Superintendent Messenger Bureau, J. S. Ashurst.
 The following appointments have been made by the Superintendent, Mr. H. W. Pope:
 Mr. E. M. Fox, Manager, First, Third and Sixth Districts.

Mr. Jno. D. Frenor Manager Stock Exchange, vice Mr. Keeler removed.

Mr. John Hassard, Captain of Patrol.
 Mr. John F. O'Brien, formerly Manager of the Tenth District, roundsman, vice Mr. McNeely removed.

The company have organized a Bureau of Repairs, at 791 Broadway, for the repair, etc., of messengers' clothing which is furnished by the company. The company have also added to the construction department a horse and wagon to facilitate the movement of men and material. The wagon is neatly painted and lettered, and is ornamented on each side with a large medallion of a messenger in full uniform.

The police force employed by the company appeared in uniform October 23d, and excited general attention.

The several district offices are now being supplied with ample wardrobes to accommodate from 500 to 600 messengers, after the completion of which none of the force will be allowed to wear any portion of the uniform when not on duty.

The New Sandy Hook Telegraph Line.

The new telegraph line to Sandy Hook is rapidly approaching completion. The wires have been nearly all poled for sixty miles of the seventy-four required. The telegraph crosses the North River near 80th street by an armored cable, made in Europe, and consisting of a new compound of zinc, copper and platinum. The line runs through New Jersey to Bergen Point, where it crosses the Kill von Kull to the Staten Island shore near Port Richmond. From this point a branch runs to Tompkinsville, but the main line continues on across the island through Richmond, both quarantine stations, Roseville and Tottenville, and crosses the hill again at the southern point of the island to New Jersey, and extends to Amboy, then to the Highlands, and thence to Sandy Hook.

The Great Western Telegraph Company.—Receiver Appointed.

ON Tuesday, the 13th inst., Mr. O. H. Horton was appointed Receiver of the Great Western Telegraph Company, and has taken possession of the lines and property of the company. It is understood that at the expiration of sixty days the entire property of the company will be sold, and its affairs closed up as speedily thereafter as possible.

The Direct United States Cable.

THE Faraday and Dacia having been coaled, and the rudder of the Faraday, which had been injured, having been repaired, at the last advices received the expedition was about to start from Queenstown to renew the attempt to recover the lost cable, and if successful, to endeavor to complete the laying of the cable to the coast of Newfoundland, where it was to be connected with the section already completed to Torbay, N. S., and Rye Beach, N. H. The lateness of the season renders the success of this attempt extremely problematical.

Foreign Telegraphic Notes.

THE Government of the Cape of Good Hope have entered into contract with Messrs. Warden & Co., of Westminster, London, for the construction and equipment of several lines of telegraph in that colony and the Orange Free States of South Africa, which will place the Diamond Fields, and other remote parts of the colony, in connection with Cape Town. The construction of these lines will be attended with great difficulty, as the country through which the lines pass is, for the most part, uninhabited and without vegetation, food or water. The country is without roads, and forage and water for the cattle will have to be carried great distances. For some of the lines, we understand, iron poles will have to be resorted to, wood being unprocureable in the neighborhood, and its carriage from the coast fully four pence per pound.

Owing to the improved receipts of the Indo-European Telegraph Company, limited, for the half year ended June 30th, coupled with the certain amount of relief which the board have obtained from the Indian Government, and a reduction of the transit rates acceded to by the Imperial Russian Government, the board are enabled to declare an interim dividend at the rate of five per cent. per annum, free of income tax. The board also state that there is an early prospect of re-

duction in the present heavy payments made for the rent of special wire to the British Post Office.

A cable is to be laid from Callao to Islay, a distance of some 200 miles (over which soundings have already been made), and from thence another to Valparaiso. Following these the same company propose to lay a third between Callao and Panama, the whole to be completed by May 1, 1875, so as to place Valparaiso and intermediate points in daily communication with the United States and Europe. The company's agent has obtained very liberal concessions from the Governments of the countries interested. The Dacia and International are now fitting for sea, one of them to leave England with a working supply of cable early in October.

Telegraph Instruments on Trains.

THE Detroit Free Press says:
 "Colonel Wheaton, Superintendent of the Kalamazoo Division of the Michigan Southern Railway, has provided the train men with a new telegraph instrument, by which connection can be made with the main line at any place and despatches sent. The box is not large, but it affords room for train orders, stationery, one hundred feet of wire, etc. If a train breaks down, all that is necessary is to make connections with the main wire and orders can be sent or received at once."

A Great Telegraphic Feat.

ONE of the greatest feats in telegraphy upon record was accomplished last evening. By courtesy of the officers of the several telegraph lines communication was secured between St. Louis and Trenton, via New Orleans, thus making a continuous line of over two thousand five hundred miles, over which Colonel Robert Stewart, who sat at an instrument in the Southern Hotel, St. Louis, conversed with Mr. Charles Curtis, his Secretary, who sat in the Western Union office in this city. The arrangement was previously made that the two operators should meet at the wire at eight o'clock. Precisely at the hour stated Mr. Curtis was on hand. After waiting a half hour he asked St. Louis the time, and was told 7:30. Difference of time had not occurred to Mr. C. After another half hour's waiting, Mr. Curtis heard the Colonel ask the St. Louis main office if connections were all made, but before the main offices, only a few blocks distant, could reply, Mr. Curtis, 2,500 miles away, broke in with "O. K., Colouel, how are you?" The gentlemen conversed for over an hour, during which Mr. Stewart said, "Give my regards to everybody; I'm having a splendid time." A greater length of land wire, with one exception, when San Francisco and Boston were connected to ascertain the mean difference in time has never been secured, and though the difference was so unusually great there was no perceptible space of time consumed in the passage of the subtle current. The messages were not relayed or repeated, but passed direct from one end of the circuit to the other.—Trenton Opinion.

Resignation and Promotions in the U. S. Patent Office.

GENERAL M. D. LEGGETT has resigned the office of Commissioner of Patents, and intends to resume practice as Patent Solicitor.

Mr. Leggett's administration of the patent office has been able and faithful, and during his occupation of the position he has instituted several valuable reforms and improvements. His resignation will take effect November 1st.

Mr. John W. Thatcher, of Virginia, now assistant commissioner, has been appointed by the President commissioner to succeed Mr. Leggett; Mr. Ellis Speed, now examiner-in-chief, assistant commissioner vice Thatcher, promoted to commissioner; and Mr. Marcus L. Hopkins, examiner-in-chief, vice Speed, promoted to assistant commissioner.

The British man-of-war Seagull has visited Cienfuegos for the purpose of testing the practicability of laying a cable thence to Jamaica.

New Patents.

For the week ended September 22, 1874, and bearing that date.

155,207.—DISTRICT ALARM TELEGRAPHS.—William D. Snow, Brooklyn, N. Y. Filed June 18, 1874.

Normally closed line, to which is connected branch house circuits, a resistance being placed in main line between terminals of branches. Circuit closed to a magnet releasing gravitating circuit breaking and making bar.

1. The combination of a normally closed main line, one or more normally open branch circuits, and a resistance or resistances, placed on the main line between the points of union of the branch circuit or circuits with the main line, substantially as described.

2. The automatic signalling apparatus, consisting of the gravitating bar H, released by the closing of the circuit, operating in its descent a fan or regulator, and acting, at the same time, as a circuit breaker, to transmit signals or messages of any predetermined character to any desired point, as described.

3. In combination with the gravitating signal bar H, the cut off apparatus M, consisting of the divided arc N, non-conducting strip P, lever Q, and springs R R, constructed and operating as set forth, for the purpose stated.

4. In combination with the normally open house circuit, the thermostat E and signalling apparatus F, constructed and operating as specified.

5. One or more resistance cells, placed, as described, in the normally closed circuit of a telegraph line, in combination with a normally open house circuit, including automatic signalling instruments, as described.

6. The combination of an automatic signalling instrument with a governing thermostat, operating through circuits governed by outside resistance coils, substantially as set forth.

7. The cellar V, placed on the telegraph pole in a position to catch the resistance or helix when the wire of the main line is broken, and complete the circuit through a ground line connected with the cellar by a wire running down the telegraph pole, as described.

155,208.—ELECTRICAL THERMOSTATIC ALARMS.—William D. Snow, Brooklyn, N. Y. Filed June 2, 1874.

Sliding plate with external indicator, showing position of wire inside of thermometer tube. Whole alarm on portable stand for use in any place.

1. The sliding plate D, in combination with the thermometer tube, the indicator R, and the wire H, said wire forming part of an electric circuit operating an alarm, all constructed and arranged as described and shown, for the purpose specified.

2. As a new article of manufacture, an adjustable electro-magnetic alarm thermometer, having a battery, circuit wires, and alarm mechanism, mounted on a portable stand, all constructed and operating substantially as described.

155,209.—EARTH BATTERIES FOR GENERATING ELECTRICITY.—William D. Snow, Brooklyn, N. Y. Filed June 6, 1874.

Obtains current, having intensity as well as quantity.

1. The improved earth battery, consisting of a series of elements buried in the earth and connected together to form a battery, substantially as and for the purposes set forth.

2. The combination of two or more electric currents or circuits, when one of these is a current derived from an earth battery, substantially as described, and is employed to operate the other or others.

155,237.—MAGNETO-ELECTRIC MACHINES.—William Hechhausen, New York, N. Y. Filed June 1, 1874.

The stationary magnets, parallel, or nearly so, to each other, and placed in a circular range with their poles alternating, in combination with the circular range of induction coil armatures revolved within the annular space between the poles, and with the adjustable disk and commutator connecting the induction coils with the binding screws, substantially as set forth.

155,259.—SPLICES FOR ELECTRIC TRACK CIRCUITS.—William Robinson, Brooklyn, N. Y. Filed July 18, 1873.

The combination, with the adjacent rails of a track and splice or fishbars, of the curved metallic plate A, applied between a splice or fishbar and the rails, and electrically connecting the rails, substantially as described, and is employed to operate the other or others.

155,261.—ELECTRIC CLOCKS.—Rudolf Sayer, New York, N. Y. Filed August 6, 1874.

Operated and controlled by electro-magnets, one magnet, by the movement of its armature, causing escapement lever to impinge against spring, closing circuit to other magnet and breaking its own.

In an electric clockwork, the combination of the escapement wheel B, and its anchor or anchors with the pivoted bar H, arm C, insulated springs J K, and one or more armatures, all arranged for operation, substantially as specified.

155,192.—ELECTRIC ANNUNCIATORS.—W. R. Cole, Detroit, Mich. Filed May 22, 1874.

1. The weighted disk D, pivoted in the frame A, in combination with the armature C, provided with the weight B and shoulder C, arranged and operating substantially as set forth.

2. The rock shaft E, provided with the arm F, and journaled in the frame A, in combination with the weighted number disk D, as and for the purpose set forth.

Born.

PARSONS.—At Batavia, N. Y., Friday, Sept. 25th, 1874, a son to W. H. PARSONS, manager Western Union Telegraph. The fourth nine-pounder.

GEO. H. BLISS & CO., TELEGRAPH MACHINERY AND SUPPLIES, HOTEL ANNUNCIATORS, Electrical and Electro-Medical Apparatus, 41 THIRD AVENUE, Chicago, Ill.

OFFICE OF EUGENE F. PHILLIPS, 20 CONDUIT STREET.

PROVIDENCE, R. I., September 15, 1874.

GENTLEMEN: I take pleasure in calling your attention to my

PATENT FINISHED INSULATED TELEGRAPH WIRE.

I claim this to be the best braided wire manufactured, and I believe it is universally acknowledged so throughout the country by all the large Telegraph Companies and Telegraph Supply dealers. Its points of superiority are:

- 1st. Its excellence of outside finish.
2d. The toughness of the Patent Compound with which the braid is saturated.
3d. By its polished outside finish, its adaptability for shedding rain and sleet.
4th. On account of the nature of the compound it can be laid directly against any wall or paper without staining or greasing it, which cannot be said of any other paraffine wire.

It is the only braided wire made, which, after it has been up for any lengthtime, will, with ordinary dusting, like any piece of polished furniture, look bright and fresh as when first put up. All other wire, regardless of its color, when first put up, will, in a short time, become dusty and dirt color, making an unsightly thing in an office, where mine, with its brilliant, fresh color, is an ornament.

The toughness of the compound, which also makes it capable of taking this splendid polish, makes it the most durable braided wire made. It is especially desirable for outdoor use, as the rain cannot beat the compound off, and its smooth surface prevents the snow and sleet from sticking to it.

A grease streak along the wall or paper behind the wire running into a nicely fitted up Broker's office, does not make him feel—well, good natured. This can be avoided by using this wire.

I also make it in cables of any number of conductors at the regular price for a single wire.

It is finished in any desirable color or plaids, with a light or heavy insulation, at the following prices:

Table with 2 columns: No. and Price, per lb. for BROWNE & SHARPE'S GAUGE. Lists prices for gauges 8 through 20.

Finer numbers at special prices.

Galvanized Iron Wire.....\$125 00 per mile. American Compound Wire..... 3/4 cents per foot.

Each covered with three heavy linen braids, and well saturated for outside use.

Ten per cent. discount in quantities not less than 10 lbs. Fifteen per cent. discount in quantities not less than 20 lbs.

A liberal discount for larger orders.

Patented November 18, 1873.

I also manufacture plain cotton or linen covered wire, or will saturate the braid of the same with paraffine, shellac or paint. This may be covered with a wind and braid outside, or two braids, or a single braid, as the customer may wish.

This, if applied, is rubbed smooth on the outside, and I claim and believe is as good as any braided wire made, outside of my Patent Finished.

Table with 2 columns: No. and Price, per lb. for BROWNE & SHARPE'S GAUGE. Lists prices for gauges 8 through 20.

Finer numbers at special prices. Discount same as on Patent Wires.

I also manufacture a RUBBER COVERED WIRE, which will not grow stiff and crack off in cold weather, or grow soft in the hottest weather.

By my process of putting this rubber on the wire will be found in the exact centre every time. After the rubber is put on it is vulcanized, and then covered on the outside with a braid

and finished, and is suitable for under ground, under water, or any outside or other purposes.

Table with 2 columns: No. and Price, per foot for BROWNE & SHARPE'S GAUGE. Lists prices for gauges 8 through 20.

Finer numbers at special prices. Discount same as on Patent Wires.

I have also just put in new and the most approved machinery for the purpose of making Magnet Wires, and feel satisfied that I can furnish as good as any to be had in the market at the following prices:

MAGNET WIRES,

BROWNE & SHARPE'S GAUGE, EITHER PLAIN, PAINTED OR PARAFFINED.

Table with 3 columns: No., Price, per lb., and COTTON COVERED, SILK COVERED. Lists prices for various wire types and gauges.

Finer numbers at special prices. Discount same as on Patent Wires.

I also manufacture a PATENT ELECTRIC CORD, which is pronounced by all to be the most flexible of any in the market, and the best suited of any made for Switch Boards, Medical Batteries, etc.

Silk covered, price per foot.....\$0 06 Cotton or Linen covered, price per foot..... 0 05

Ten per cent. discount on 100 feet. Fifteen per cent. discount on 200 feet.

GENERAL REMARKS.

All wire used by me is made to my special order, and is the best that can be had in the market.

As one of the largest dealers told me a short time ago, "Your wires have come into the market on their merits alone, and we have been forced to keep them," so you may feel sure I shall feel chary of that honor, and shall be very careful to furnish none but the very best in my power.

I could give a long list of testimonials, but I will still depend on the "merits" of the wire, and respectfully solicit your patronage.

Your obedient servant,

EUGENE F. PHILLIPS.

These Wires can be had at my prices of

 tion for Superintendents and others interested in the Science of
 Telegraphy.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
 The undersigned having secured the exclusive Agency for
 manufacture and sale of the
EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.
 The Battery cell is made of lead, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.
 These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.
 Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.
 On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.
 No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to

F. L. POPE & CO.,
 38 VESSEY STREET, N. Y.

THE BALTIMORE BATTERY.

Acknowledged to be **SUPERIOR** to any other for Telegraph
 purposes.
 Every comparative test made the past year resulted in the
 adoption of our Battery.

A prominent Superintendent writes: "My impression is the
 Baltimore is to be the Battery of the future." He has others in
 circuit, to determine the value of each in service.
 It is now in use on commercial and railroad lines, stock report-
 ing telegraphs, private lines. Superintendents fire alarm tele-
 graphs recommend it as the most reliable they have used.
 Thousands furnished Gold and Stock Telegraph Co. of New
 York, who use no other.
 For closed circuit it is without a rival.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System
OF
**FIRE ALARM TELEGRAPH
IN THE WORLD.**

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THERE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 South Twenty-first Street. PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).
P. O. Box 496.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities.

A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

WATTS & CO., Baltimore, Md.

Send for catalogue.

THE AMATEUR'S TELEGRAPH APPARATUS.

(Patented April 16th, 1872.)

ONE CUP BATTERY, CHEMICALS, WIRE AND MANUAL WITH EACH INSTRUMENT.

Complete outfit for the Student or for short line use. 5

Price, \$7.50.

Key and Sounder only..... \$6 50
" " with Lightning Arrester 8 00

Five per cent. discount for cash in advance.

Sole Agents for the

EAGLES METALLIC GALVANIC BATTERY.

The demand for this Battery is rapidly increasing, and it is conceded by all who have used it to be the Best and most Economical Battery, for telegraphic and other purposes, offered to the public.

Send for New Catalogue and Price List.

F. L. POPE & CO.,

(P. O. Box 5503.) 38 VESEY STREET.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinhell, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,
SOLE AGENTS.

NEW YORK, Oct., 1873.

We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.

W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This **HOLDER** is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

Sent by mail on receipt of price.

Price per doz., \$1.80.

Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books, eighty pages, 8vo, sent to any address on receipt of ten cents.

D. VAN NOSTRAND, Publisher, 23 MURRAY STREET, N. Y.

THE ONLY PERFECT MAIN LINE SOUNDER.

Our WRECKING INSTRUMENT is still popular with managers of Railroad Telegraphs who find an attractive combination, giving loud sound without materially increasing the resistance beyond the standard of their relays.

We have rewound some of the old Box Sounders, in which we found the helices to have a resistance equal to 400 and 450 ohms. None of our Wreckers have over 175, while 150 is the standard.

Brass or nickel plated always on hand.

No local required. Always ready for temporary offices.

Just what is wanted for officers' cars.

Two sizes black walnut cases. Handsome leather cases, velvet lined, to order.

See our advertisement in other columns.

WATTS & CO., Baltimore.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

VOL. X. WHOLE No. 433.

Western Union and Automatic Telegraphy.—Mr. Little in Reply to Mr. Orton.

To the Hon. WILLIAM ORTON, Western Union Telegraph Company.

Sir: Having in your annual report to the stockholders of the Western Union Telegraph Company made some remarks relative to fast telegraphy, permit me to reply to your statements, and I would here observe that in so doing I am actuated by the most kindly feelings.

You say, of "fast" telegraphy: "This is a favorite designation given by its friends to what is better known as the automatic system. Why it should be called 'fast' I have never been able to comprehend."

I will now proceed to explain to you why this system of telegraphy is "fast," and works equally well, if not better, during such storms as would seem to render other systems unreliable, and sometimes useless.

You say that "before a message can be sent at all

the statement of that eminent electrician, Sir Charles Wheatstone, in his paper published in the Philosophical Transactions, "On the Laws which regulate the Transmission of Electric Currents," that the speed of the English automatic system of telegraphy depends entirely upon the rate at which successive currents of electricity can be transmitted through a conductor, "without coalescing." He fixed this limit of speed on fifty miles of line to be for practical business equal to twelve hundred letters (not words), per minute. Mr. Culley, the engineer-in-chief of the British Postal Telegraph Department, says: That the automatic system, as it is at present employed by the post-office, in its telegraphic correspondence between London and the principal cities, works at a speed of from twenty to one hundred and twenty words per minute. But when the land line is increased to three hundred miles, with sixty miles of cable in the circuit, the speed will be only from forty to eighty words per minute.

I was, during the year 1869, following up in the United States my experimental investigations in relation to the then supposed insurmountable difficulty, as demonstrated by Wheatstone, and which resulted in the discovery and introduction by myself of many new salient features, whereby the automatic speed was increased on lines of two hundred and fifty miles in length from forty to sixty words per minute in clear weather, up to five hundred words and upwards per minute in very stormy weather on lines upwards of one thousand miles in length, when other systems failed to work at all.

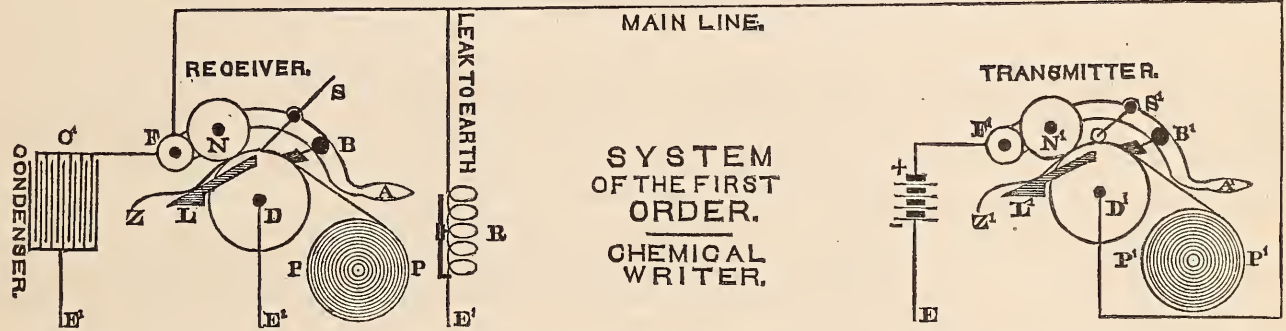

How I accomplished such large results permit me, with the aid of the accompanying plain "diagram," to render more clear to you. It being premised that, previous to my discovery, "Bain" and all other electricians directed the whole force of the line current on to the chemically prepared receiving paper, thereby al-

ferably my deliquescent "canary" or "yellow" colored preparation formula; S' is the transmitting rollers; L'L' the lifting blades, lying in a groove sunk in each of the drums and whose province it is to prevent overwinding and breaking of the paper. It should be observed that N S B are secured to one arm or lever A, so as to facilitate handling of the apparatus. is the battery, one pole of which is put to the earth E. R is an adjustable or a series of adjustable magnetic accumulator rheostats combined, or the accumulator or condenser may be used in a separate form as shown at C', also connected to earth, or in a shunt. E' E' E' E' shows earth connections. My shunted polarized relay or sounder used in connection with this system to give signals "go-ahead," "stop," etc., is not necessarily shown in the diagram.

In conclusion, you truly say, "the claim that anything essential to the operation of automatic telegraphy by the chemical paper plan of Bain, is covered by controlling patents, is without foundation." That being admitted, permit me to call your attention to the fact that by virtue of "controlling patents" in my possession (with the right of reissue), I claim the clearing of a main line of an electro-chemical automatic telegraph, by an overflow "rheostat dam" (single or compound), leakages, reversals, or by opposing currents, in order to produce rapid work in any state of the weather on any length of line, and signed by me in the following order (patents since issued)—August 6, 1870, August 26, 1870, August 4, 1871, December 12, 1871, June 20, 1872.

For preventing the attenuation of electro-chemical automatic telegraph writing by the use per se of condensers, helices, secondary batteries or opposing currents, signed by me (patents since issued)—Aug. 6, 1870, February 19, 1872, October 1, 1872, February 26, 1873.

LITTLE'S RAPID AUTOMATIC TELEGRAPH SYSTEM

more time must be spent in getting it ready for the transmission to begin than is required to send and deliver it in the ordinary way"—implying a loss of time, which more than offsets the advantages derived from rapid transmission. Permit me to suggest that this is a misapprehension of the facts and conditions of automatic telegraphy by the American system. On the contrary, as has been and is daily demonstrated in the practical operation of the system, the preparing the messages for transmission does not involve delay, and they can be prepared as rapidly as may be necessary for transmission; and there is none of the delay which is constantly experienced on Morse lines from the necessity of repetitions and errors arising from the imperfect condition of the wires. In the regular order of business while the line is occupied in the transmission of despatches, other messages are being prepared, and in a few moments the accumulation of an hour are transmitted and speedily prepared for delivery. In this connection the fact should not be ignored of the immense value which pertains to the electro-chemical automatic system, during such storms as sometimes prostrate all the line wires on a telegraph route; during such sudden stoppages of traffic, lasting sometimes for several hours, in the interval of repairs, Morse messages are being stacked up waiting for a line to be opened. And when a line is declared "O. K.," the accumulated Morse messages have to be sent in their regular order, and it sometimes happens that the last message is not got off the files until several hours have intervened. Now, in the case of the automatic system, the interval during the interruption of a line is occupied in perforating the accumulated messages in their regular order; and as soon as the line is signalled "O. K.," off goes every message in a few moments, possibly the accumulation of several preceding hours. This is of itself a valuable feature of the system, and your large experience in telegraphy will enable you to appreciate the importance not only to the telegraph interest, but also to the customers of such speedy delivery of unavoidably delayed business.

lowing the waves or pulsations of electricity to "coalesce," and to produce a continuous mark or line instead of clear and distinct marks or writing whenever it was attempted to produce over a very short circuit a greater speed than from forty to sixty words per minute. On the other hand, I was led by a train of reasoning to study, in connection with this problem, the operations of a "Mill-race," with its regulating sluices, which resulted in the introduction of the Overflow Magnetic or Accumulative Rheostat "Dam," and the Condenser, which allowed more or less of each electric wave to be changed or to escape to earth, permitting only just so much of each wave to pass on to the receiving paper to effect the writing, consequent upon keeping each succeeding electric wave from "coalescing" with its preceding wave, and so keeping each electro-chemical decomposing wave distinct, when transmitted at any rate of speed. In connection with this reply, I must not omit to mention the fact that the Bain chemical system had finally, in consequence of this "electric coalescence," to be operated by local circuits, thereby reducing the speed to the Morse average of seventeen words per minute (a very fair average), and was therefore subject to all the difficulties attending the ordinary Morse system—the receiving and counter current plan (of Snsini and Tainin, 1866) being for many reasons practically useless.

In the "American Automatic Electro-Chemical Writer," shown in the accompanying diagram, are flanged drums, which may be set in motion by any of the well known devices, but preferably by a small belt leading to a crank handle, to be worked by hand power—the labor required being very slight. PP is a roll of chemically prepared paper; P' P' a roll of paper having telegraphic symbols perforated or embossed on the same. The ends of the rolls of paper Z Z', is passed over the drums, and held in firm contact with their surfaces by the nipping rollers N N', and brushes or detainers B B', upon the arms or levers A A', which are secured or swung upon the fulcrums F F', and held down by a tumbler spring. The stylus S, is composed of a metal, the nature of which depends mainly upon the formula of the chemical solution employed, and through which the paper may have been passed (pre-

For preventing false signals by neutralizing extra currents set up when polarized relays or electro-magnets used as call apparatus, and connected to, or in the main line circuit of an electro-chemical automatic telegraph, by the use of "shunt helices," condensers, accumulators or secondary batteries, signed by me (patents since issued)—February 19, 1872, March 22, 1872, October 1, 1872, February 26, 1873.

For electro-chemical automatic telegraph vibrating or moving stylus, signed by me (patents since issued)—October 17, 1871, February 19, 1872, March 8, 1872, February 26, 1873.

For preventing the rupture or tearing of the paper, by the use of one or more lifting blades, or a cord or a wire line inserted in the groove of the drums or rollers, which carries the paper, signed by me (patents since issued)—December 22, 1871, February 19, 1872, February 26, 1873.

For "canary" or "yellow colored" deliquescent chemical, and other formula, signed by me (patents since issued)—two, May 24, 1872, one, August 31, 1872.

For securing the nipping rollers, stylus, and brush or detainer to one arm or lever, so as to facilitate handling of the "telegram"—signed by me (patents since issued)—May 22, 1872, July 20, 1872, February 26, 1873. Together with numerous patents for other "salient features"—including patents for simple perforators. I remain sir,

Yours most respectfully,
GEORGE LITTLE, Consulting Electrician,
Bloomfield Ave., Passaic City, New Jersey, U. S. A
October 15, 1874.

Original Articles.

The New Cincinnati, Ohio, Western Union Office.

By NIHL NAMELESS.

ON Saturday, October 24th, the Western Union Telegraph Company removed its main office in Cincinnati, Ohio, from the location which it had so long occupied, to the new building on the northwest corner

of West and Vine streets, lately occupied by Suire & Co. as a drug store, which has been fitted up expressly for its accommodation. The building is of five stories, and located as it is, in the centre of the business portion of the city, is well calculated to serve the interests of the company, and accommodate the principal customers. The company, as well as the public, has long felt the need of a more convenient and central location, and a more commodious and better adapted building for the accommodation of the large and increasing telegraph business in that city. This they have succeeded in securing.

Old associations and habits, too, frequently prove advantageous to a new business establishment, and it is generally conceded to be an indication of shrewdness on the part of a business man, who can successfully analyze the past history of a business and make the habits of the old customers turn honest pennies for him. As has been stated, the building just transferred to telegraphic use, was formerly occupied as a drug store. One may easily imagine that many a battery of "bottled lightning" has been unloaded into apparently innocent soda and mineral waters, and turned down aristocratic throats, in the past, at this store. Well, bottled lightning will still be found at the old stand, but the customers of the Western Union Company would not find it advisable to swallow it—it might possibly fuse their "helices." Many a paper of "Lightning Fly Killers" has been sold here, over which thousands of insect funeral processions have passed. Many a poor epicurean fly has revelled over the feasts so liberally provided, and found, too late, his temporary enjoyment turned to anguish and death. Lightning paper will still change hands by the thousands of sheets, but not to be used for the destruction of flies, though some of it, in the "Gold Room" may prove, pecuniarily, destructive to "bulls" and "bears."

The wires are conducted to the building down Vine street from Sixth street on the north, and up the same street from Pearl street on the south. Those coming down Vine street enter the building at the fourth story, at the fifth window, and those from the opposite direction at the fourth window from Fourth street, both on the same side of the building. From the windows at which they enter, the wires are carried along the ceiling of the rooms in the fourth story to the west side of the building, and through the floor to the switch board in the operating room. The wires pass through arches at the top of the windows, which have been pierced for the purpose, and insulated with Brooks insulators, and just inside the arches mentioned are placed the "lightning arresters." (The operators intend insisting on having them removed beyond the limits of the corporation, on the principle that if lightning is to be arrested at all the farther away it is the better. To wait until it gets inside the building and then undertake the arrest will be giving it an unnecessary advantage.) Through the city the wires are carried over a line of magnificent poles, straight, smooth and strong, solidly planted, and to make them more durable, and at the same time more sightly, they are painted white. Each pole has a carrying capacity of forty-three wires, making eighty-six entering the offices. The American Compound Wire is used, and being stretched taut, there is no unsightly and ungainly slack to swing and strike, interrupting currents of electricity and inducing currents of profanity among operators. The neat and substantial manner in which this part of the work has been done reflects great credit upon the Superintendent of Construction, Mr. M. C. Bristol. In the construction of these lines he has displayed excellent judgment, efficiency and taste, and well deserves the eulogiums bestowed upon him by your correspondent, "Yankee Abroad," in a recent number of THE TELEGRAPHER.

But to return to the building and its arrangement for the accommodation of the telegraph and its customers, which we are overlooking all this time. To commence at the lowest point will probably be the most advisable course, and the reader is, therefore, first taken to the basement. The basement has been fitted up with the necessary conveniences, and is divided off into supply and battery rooms and the room for the accommodation of the engine which works the elevator. It was at first intended to use the elevator for hoisting the operators to their room, which is in the fifth story, but, after mature deliberation, it has been decided to use the engine only for heating purposes during the winter, and for hoisting heavy articles, leaving the business of elevating the operators the sole and exclusive privilege of the Plug, our new telegraphic journal. It is to be hoped that it may not send them quite "as high as a kite."

The main battery consists of 1,400 cells of Callaud—the Grove battery having been discarded—and is connected to the switch in the operating room by improved insulated wires.

The first floor of the building is partly occupied by the passenger and freight departments of the I. C. and L., and C. H. and D. R. Railroads. The remainder of this story is used by the Receiving and Delivery departments of the Western Union Company. Much

taste and judgment has been displayed in the division of the room, and the arrangement and finish of the counters, and the accommodations furnished for the customers. The counters while making a neat and appropriate division of the space, produce quite an artistic effect.

Within the space assigned to the Receiving Department, the desks of the Superintendent, Mr. G. T. Williams, and of the Manager, Mr. F. A. Armstrong, will be located. The second and third floors of the building will not be used for the present for telegraphic purposes, but are to be rented for offices.

The fourth floor is divided into two rooms, besides furnishing closet and other accommodations. One of these is occupied by the bookkeepers and the other as a cloak, lunch and reception room. Visitors who call to see employes in the operating room will be received and seated here until the persons whom they desire to interview are at liberty to wait upon them. Should visitors happen in about lunch time they may, perhaps, be shocked at the disproportion between the demand of appetite and the supply of cold edibles.

We are now about as near heaven as we shall be likely to get at present, for we ascend to the fifth and highest story of the building, which is the exclusive domain of the operators, where, far above the turmoils and disturbances of the lower world, they may calmly and industriously perform their allotted term of service from day to day and night to night through winter's chills and summer's heats. It is understood that the determination not to use the elevator for their elevation was arrived at partly out of consideration for the pecuniary welfare of the operators, who will not be likely to descend and ascend many times a day to waste their time and pennies on things which are not necessary to existence. However that may be, situated thus above the earth, and isolated for so many hours a day from their fellow creatures who exist "lower down," they may handle the "forked lightnings" and think sulphurous thoughts to their heart's content, and none be affected thereby but themselves, or even aware of their existence.

The room occupied by the operating department is 104 feet long and 28 feet wide, exclusive of stairway and local battery room. In this (the local battery room) are located 106 cells of Callaud, which are connected with the switch and instruments by common office wires, which pass along the west side of the room to the switch and instruments on that side; thence through the switch across the centre of the floor, under a grooved and covered passage way to the instruments on the east side of the room. In their passage along the walls to the instruments they are let through slots into orifices in brackets, which again are covered by a neat paneling two and a half feet high, completely hiding them from view.

The switch used is of the style denominated "Jack Spring," and was on exhibition at the recent Cincinnati Industrial Exposition, and is of the same pattern as that used in the New York office of the company. It is placed in the middle of the room on the west side. Immediately opposite the switch on the east side is the desk of the chief operator. On the west side of the room are four tables, with accommodations for six instruments on each. On two of these will be used repeaters of the Hicks and the Grey and Barton patterns. On another of these tables the Louisville duplex and the Pittsburg wires are found. The others are at present unoccupied or occupied by single wires, and will be filled up as occasion may require hereafter.

On the east side of the room there are eight large tables, each of which will accommodate eight instruments. The further table, next to Fourth street, has four sets of duplex instruments, namely, Baltimore and Washington, New York, Chicago and St. Louis circuits. The rest of the tables are used for single wires.

The material of which the tables, switch board and chief's desk are made is Hungarian ash. They are handsome articles of furniture, and are each provided with two gas jets.

On the west wall, south of and near the switch, is situated the dummy elevator, which is connected with all the rooms used by the company, and communication between the different rooms is also furnished through the medium of Gilliland's Annunciators.

Forty-seven line wires enter the building besides three loops from the old Third street office, three from Adams' Express office, five from the Merchants' Exchange Hotel city wire and Depot city wire. The switch board is made to accommodate seventy-six wires.

Five registers for hot air from the furnace below are used, running up the centre of the room, and three ventilators have been opened in the ceiling. It will thus be the business of his Satanic majesty, the fireman below, to push heat up into the room from the basement in quantities sufficient to equal that which escapes at the roof, on the principle of a sausage machine, which disgorges at one end as fast as it is stuffed at the other. In case the ventilators should ventilate too much and discharge the warm air faster than it can be furnished below, it is proposed to "plug" them.

The ceiling is fifteen feet high, which will prevent any difficulty in regard to operators hurting their heads in moments of great exaltation of feeling, as over an increase of salary or reduction of labor, or *vice versa*—the *vice versa* being the most likely to happen.

The rooms lately silent with the ominous weight of potent drugs are now animated by the clicking of telegraph instruments. Where hnt a few months ago was furnished only poison for human stomachs is now distributed food for human brains. May the change benefit the world, and prove truly *pro bono publico*.

A New Yorker out West—with Notes by the Way.

BY GNUMMUC.

I LEFT the metropolis some weeks ago on the Hudson River day boat, and arrived in due time at Albany. Paid a visit to the new State capital building, called on friends in West Troy, and returning to Albany, dropped in to see Mr. Shelly and his able assistant, "jr." Early next morning I left for Saratoga, where my time was so occupied in sight seeing that I did not meet any of the fraternity. Next day found me at Niagara Falls, where I received kind attention from Mr. J. W. Murray, the International Hotel operator. Buffalo was my next objective point; here I met my old friend Tom Davidson ("Z"). I saw him last in Dayton, Ohio, several years ago, a frisky and festive youth. Now he is sobered down into steady going married life. I found the Buffalo boys very pleasant fellows, but very virtuous. Tares have no longer charms for them. At Dunkirk, next day, I met two very pleasant Erie Railway train despatchers, Messrs. Chase and Gross, who entertained me while waiting for connections. I was sorry not to have seen Mr. Connell as I passed through Salamanca. He rendered me several kind attentions that are appreciated highly. Here I took the palace car on the A. & G. W. R'y, and was soon soundly sleeping. I stepped into the railroad office at Mansfield, Ohio, next morning to send a message home, telling the operator who I was, but he refused my request in most ungentlemanly language—so afraid of being picked up, etc. I would not mention this were it not for the fact that it was the only incivility I received on my trip. That afternoon found me in the bosom of my family at Springfield, Ohio, a flourishing manufacturing city of about 16,000 inhabitants. Here are made the celebrated Champion Reapers and Mowers, Leffel's Turbine Water Wheels, Buckeye Grain Drills, besides many other agricultural implements. The Western Union office is presided over by the peculiar, philosophical and portentous Parsons, Jno. W. His assistants are his brother Charles and Frank Enoch. At the depot I found Jno. W. Hoak, the son of the veteran repairer. The A. & P. manager is the genial Martindall, the cigarist, formerly the P. & A. manager. The *Republic* is still flourishing like a Green Bay (Wis.) horse, as it were. I spent several days in Cincinnati, and of course was delighted with the magnificent Exposition. The telegraph department has already been noticed in your columns, so I will not dwell on it, but only say that the art gallery I have never seen equalled anywhere, and that the American Institute Fair in our city cannot compare to the Queen City's exhibition in any department. Cincinnati is to open its new office shortly in Snire's Building, corner of 4th and Vine streets. The receiving department is on the ground floor, very handsomely fitted up. The operating room is about 30 by 100 feet on the sixth floor, has a fine outlook over the city, and will have eight new octagon and four sextuple tables with plenty of room for more when needed. When I was there Mr. Charles Summers, the Chicago electrician, was fitting up the room, assisted by O. K. Newton and M. C. Bristol. The sisterhood have six or eight representatives who are at present working in a small room at the old office, but I understand that all will be together in the new. I observed many changes among the force since I left there nearly two years ago, but still quite a number of my old friends remain. I saw Bonnell, Selden, Mattoon, Armstrong, Johnson, Sr. and Jr., Gould, Madison, McCabe, Hamilton, the two Bakers, Wilson, besides many new faces. I had an offer of a pass to Indianapolis from T. O. Barbour, of the I. C. & L., but concluded to stay as long as I could in Clarke County with my relatives. In coming back I stepped off first at Delaware to see friends, then at Crestline, through compulsion in making or rather missing connection. It is a forlorn old town, and the office is in a miserable old shanty that is a disgrace to the railroad companies. Here I met the old vet. Hoyt, who is chief over some ten or twelve men. A fellow operator, by the name of McBradney, and I, paid a visit to the school, which we found in a flourishing condition. After spending a day at Massillon (I am indebted to Mr. Geo. S. Whitehead, of Pittsburg, for my P. F. W. & C. Railway pass), I went to Cleveland, having had time as the train stopped to chat with Delong, the P. F. W. & C. operator at Mansfield. The only operator I saw in the Forest City whom I knew was Powers, formerly of the

New York office. He is a recent arrival in Cleveland. Of course I saw the famous Euclid avenue, of which the city is justly proud; here may be seen miles of elegant residences with beautiful lawns and no fences to obstruct the view.

I took the sleeper that night for Elmira, where having an hour or so to spare I called on Davis, the night press man. Elmira W. U. office is certainly the neatest and prettiest office I came across on my journey. It is carpeted and has walnut and plate glass counters, etc. Indeed, the offices through New York State, as far as I saw, were much better than in Ohio. I spent that afternoon at Watkins, a beautiful village at the head of Seneca Lake, visiting the far famed Glen, and returned to New York on the night train, after an absence of four weeks, very pleasantly spent; but I received such a cordial welcome back from one and all, that I commenced duties refreshed in spirit.

Importance of Little Things in Telegraphy.

"TALL oaks from little acorns grow." We think it a duty, in a journalistic capacity, and a practically fraternal feeling, to keep impressing upon the minds of the boys the importance of carefully watching all the *simple and little things*. While it is a pleasure to applaud a good record and general work, it is also a friendly duty to remind one that he is not perfect, and that it is each one's part to modestly acknowledge that there is room for improvement. Without accuracy and speed the great telegraph would fail to be of special importance to the public. A very little mistake in sending or receiving, a few minutes late, or a little indifference to the desire of a patron, etc., etc., may, and often has produced an hundred fold disaster, financial and otherwise. The omission of an "e" or insertion of a "c" may put an op'r ill at "e's," and is something our employers or our patrons do not wish to "c." Of course we all know these things, but are we ever on the *qui vive* to avoid and correct them? "Accidents will happen," but we all feel that nine tenths of the errors made could have been avoided by using the care and attention which is expected, and for which we are employed. We are all apt to be somewhat conceited as to our capabilities, and thereby, in some unguarded moment, a "bull" sneaks in on us. We have the public welfare, to a great extent, in our hands, and we should exercise the same care in a message now as we did in our initial message.

The company expects us to be prompt, accurate and reliable, the public pay their ducats under that impression, and it behooves each and all to watch the little things for our own safety and that of others. This is an old subject, but is, nevertheless, an excellent one to harp on, and one which would gratify our employers greatly to see strict attention paid to.—*The Plug.*

Correspondence.

A Brief Summary of Events in Nebraska.

FALLS CITY, Oct. 22d.

TO THE EDITOR OF THE TELEGRAPHER.

I AM inclined to the belief, from the variety of contributions from this part of the west to THE TELEGRAPHER, that the craftsmen are derelict or else employed to their maximum capacity, and have not leisure to devote to an exchange of ideas and information through their acknowledged organ.

While such contributions continued to pour in I was content to passively read and digest the same in quiet meditation. I have the distinct recollection of hazarding a few comments and protests against the "Plug Mills," and called down upon my devoted head the fire of Nettie Bronson in a succession of sweeping broadsides; but as plugs are not my theme this time I have no fears of exposing myself to another *volley*.

Operators are a liberal, independent, self-contained class of thinkers, and their vivacious, spicy, acute contributions amply illustrate their wide range of thought, and depth of scrutiny, and vast resources of information. Scattered over the entire national domain, they can contribute a greater variety of observations and experiences than any other class. After all the correspondence through THE TELEGRAPHER about the practicability of forming an operators' union I am inclined to abandon the project for the present, on account of the existence of the above facts.

Many important changes have occurred in this region within the past month in line and road management, which I will briefly outline.

On the 1st inst. Mr. Fred H. Lawrence was succeeded as Superintendent of Telegraph and Train Master of the Atchison and Nebraska Railroad by Chill P.

Cochran, Esq. A general change in the management of the road prompted that change, as well as many others of equal importance. Mr. Lawrence leaves a great many warm personal friends among the operators of the west, and his departure is widely regretted. He was Superintendent of Telegraph of the L. L. and G. lines for about two years and a half. He is young in years but old in experience, and we wish him success in any future engagement.

Mr. Chill P. Cochran, who has filled the position of Train Despatcher for several years, is a wide awake, steady, enterprising craftsman, and can wear the ensign of authority without being spoiled, and fills his new position as meekly and humbly as an old stager.

I have not noticed any mention in THE TELEGRAPHER of the sad death of Mr. E. B. McDill, Superintendent of Telegraph of the M. R. F. S. and G. and L. L. and G. Railroad lines, which occurred about the 6th instant, briefly as follows: He got aboard a freight train at Kansas City to go down to Rosedale, his home, on the line of the M. R. F. S. and G. road, and on the arrival of the train opposite his house he started to go from a freight car over on to the engine, lost his balance, and fell on the track just behind the engine, and the whole train passed over him, mangling him in a frightful manner. He left a wife and four small children to mourn his sudden loss.

The operators held line meetings and passed appropriate resolutions of condolence.

Mr. McDill, during the war, was actively employed in constructing and managing the lines in Missouri and Kansas, in the Government service, and was one of the most expert operators in the west, and a skillful and experienced line manager.

The department of operating contains little that is new or startling out here. When business is light the artist fills his pipe and props himself back and seeks seclusion and ease, and calmly allows his eyes to peruse the telegraphic news in a daily published in an adjoining town with a secret purpose of detecting "bulls" in the copy furnished by some envied or hated colleague, and in doing so grimly allows some way office to call persistently and clamorously without a response. Local office grows impertinent and drops caustic insinuations about lazy operators, worthless or deaf, and said artist gives a few furious whiffs of his pipe and looks as though he would bite the stem off in his clenched teeth, and tears over the keys and makes a furious sputter of wrath-infused dots, and after a slur of impatient condensation signs and closes his key. And yet he is not happy! Operator at distant local office, with, perhaps, many other duties to attend to, condemns the unseen artist to oblivion, and, after a few hours, lays aside his wrath and smilingly opens his key and calls up said artist, and they are the warmest chums and long to embrace each other.

Line life is a secret *inside* life to the wondering outside world. It is astonishing what an insignificant number outside of the craft have the remotest idea how communication is transmitted through an electrical wire. The wild and simple questions of educated persons about this matter have furnished the overworked operators with a large part of their diversion. The ignorant are passed with more commiseration. The source is considered. With respects to the industrious craft, I bid adieu. AARON AROUND.

A Line Repairing Adventure in Oregon.

ALBANY, OREGON, Oct. 13th.

TO THE EDITOR OF THE TELEGRAPHER.

YEARS ago, just after the California State Telegraph Co. transferred their lines in Oregon to the Western Union, and before the latter Company made "Economy" their watchword, Webfoot was manager of the Albany office, on the immense salary of fifty per cent. commission on "local receipts," the Co. reserving unto themselves the "Eastern receipts," but of which, by the way, through a misunderstanding of instructions on my part, and oversight in the auditor's office, on the part of the Company, I for several months regularly appropriated half, and as the rates to Atlantic States were some three or four times as much as they are now it was "worth something," as one of the "old timers" here quaintly remarks. At this period of time the Company paid all bills without a dissent or any "cutting down," which has become so painful and frequent an occurrence in latter days. One day the line went down on my south "beat," and after getting a first class livery rig, and taking in a young fellow to do the "climbing of trees," if necessary, we started and made lively time for about six miles, when we found "it" in the shape of a big tree that some one had cut down over the line. On first discovering the place our helper shouted, "Here it is, Billy, just tie your horses—get out kit and tools and come over the fence." He cleared the fence with a single leap and lit right into the midst of the branches of the fallen tree. I stooped down to get the tools out from under the buggy seat and was just straightening up when the team commenced kicking and plunging and started up the road on

a keen jump, knocking me down in the bottom of the vehicle; and, as the road was over some freshly ploughed ground, it soon reduced me into such a state of bewilderment that I didn't know whether I was "one of these or one of those," and could not for some time regain my equilibrium sufficiently to get into the seat and gather up the lines which I found under the horses' heels, but soon managed to get the reins between my digits once more and "checked the team in their mad career"—that's the proper way to put it, ain't it?—and was shortly back to where I so unceremoniously left my friend Bob, on whom I contemplated getting off a pretty fair joke about leaving him; but he was not in a *joking mood*, for I found him laying, rolling and tumbling, all by turns, in the road, which was some five or six inches deep with dust, and, oh! he was swearing at a fearful rate, at the same time tenderly caressing different parts of his body, but principally the parts most commonly used in sitting, and on which he "lit" when he went into that tree. I suggested to him that "he need not be so demonstrative in his joy at seeing me, for I had no intention of leaving him." He mildly intimated that I could take my departure for a very warm place—which I thought was *not* very remote just then. He swore he would be even on "those yellow jacks" if it took all summer. We soon spliced in and hung a "stretch" or two around that tree. We were not afraid of the yellow jackets, oh, no! but we thought that they were there first and by priority of occupation *they had best right to that place*; and poor Bob, on the road home, was like the Dutchman's hen, "he sat standing," and for several days had no use for chairs.

Bear "Rises to Explain" Again.

TO THE EDITOR OF THE TELEGRAPHER.

"WHAT good will my testing do if I cannot explain the results?" asks the wordy and irrepressible Bear, who then "rises to explain" that "two like currents pass each other on same line in opposite directions!"—*Journal of the Telegraph.*

Unlike the *Journal*, I acknowledge my mistake. Should have said two unlike currents, or omitted the word "like;" but my reason for using the word was because *like poles* or plates of batteries are connected to line at ends. Although in this discussion I have used no more space than my worthy opponent I have not repeated a quarter column of *erroneous theory*, so I may be a little ahead in words. BEAR.

Miscellaneous.

STRAW LIGHTNING CONDUCTORS.—Straw is about the last material one would think of using for a "lightning rod," but according to a French journal it answers the purpose admirably. It had been observed that straw had the property of discharging Leyden jars without spark or explosion, and some one in the neighborhood of Tarbes got the idea of constructing lightning conductors, which were formed by fastening a wisp or rope of straw to a deal stick by means of brass wire, and capping the conductor with a copper point. It is asserted that the experiment has been tried on a large scale around Tarbes, eighteen communes having been provided with such straw conductors—only one being erected for every 60 arpents, or 750 acres, and that the whole neighborhood has thus been preserved from the effects not only of lightning but of hail also. *The Journal of the Society of Arts* says: "This statement comes from a respectable source, and the apparatus being extremely simple and inexpensive, it is at any rate worth a trial. Copper conductors are out of the question in ninety-nine cases out of a hundred, but every cottager almost could set up a straw one."

THE CORRELATION OF FORCES.—Of the various forms of energy existing in Nature, any one may be transformed into any other, the one form appearing as the other disappears. This is what is meant by "the correlation of forces." Thus the rotary power of a wheel, if applied to turn a magnet, is converted into electricity; and this electricity, if employed to drive a wheel, is changed back into rotary power.

PYROMETERS.—It appears from a report of a committee charged with examination of the above instruments, that, by means of the Siemens electric pyrometer, changes of resistance amounting to about $\frac{1}{10000}$ of the quantity of heat to be measured can be detected without much difficulty.

T. B. ALDRICH, in his pleasant sketch of Portsmouth, N. H., in *Harper's Monthly* for October, says that the lightning rod which protects the Warner House to-day was put up under the personal supervision of Benjamin Franklin in 1762, and is supposed to be the first rod put up in New Hampshire.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, OCTOBER 31, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

President Orton's Annual Report to the Western Union Telegraph Company's Stockholders.

THE report made by President Orton to the stockholders of the Western Union Telegraph Company, at the annual meeting held on the 14th instant, which was printed in full in THE TELEGRAPHER of the 17th instant, gives a *resumé* of the operations of the company for the fiscal year ended June 30th last, which, under all the circumstances, may be regarded as financially favorable. It is true that it shows a reduction of \$70,364 53 in gross receipts, and of \$251,942 54 in net profits from the preceding years; but this is explained by the reduction of rates which took place at the beginning of the year, the panic of September, 1873, and subsequent business stagnation, from which there has not been a full recovery. The report did not meet the expectations of the speculators in the shares of the company, who anticipated a much more favorable exhibit, and the immediate effect on the market price of the stock was unfavorable. It seems to dispose of the anticipations which had been current for several months of a considerable scrip dividend in addition to the quarterly cash dividends paid. From the exhibit made it is evident that the ratio of earnings for the fiscal year would not have warranted dividends at the rate of eight per cent. on the outstanding stock of the company; but for the first three months of the current year an increase of net profits of \$300,000 is reported, which, if continued at the same ratio, will enable the company to continue the quarterly dividends regularly at that rate. In the concluding paragraph of the report Mr. ORTON states that the directors have determined hereafter to divide the net profits quarterly, and provide otherwise for the payment of such property as it may be deemed advisable to acquire. This may be done either by the issue of bonds, or by disposing, as it may become necessary, of the \$7,287,735 of the capital stock of the company owned by it, and now in its treasury.

In addition to its own stock owned by the company, acquired at a cost of \$4,054,483 07, the company holds nearly three quarters of the stock of the Pacific and Atlantic Telegraph Company, nearly a million of dollars of the stock of the International Ocean Telegraph Company, about half of the stock of the Gold and Stock Telegraph Company, and stock to a considerable amount (about \$1,350,000, cash value) in other companies whose lines are leased to the Western Union, the Western Electric Manufacturing Company, etc.

These investments of the Western Union Company

in the stocks of other enterprises do not appear as yet to be yielding any considerable revenue, although Mr. ORTON is hopeful that some of them may become sources of direct profit at an early day. The net revenues of the Gold and Stock Telegraph Company, and of the International Ocean Telegraph Company, have been considerable, but have been absorbed in defraying expenses which it is expected will soon be largely reduced.

It is claimed by some who profess to understand the matters of which they speak, that under more economical management, and with a simplified system of doing business, the percentage of profit both of the Western Union Company and of its subsidiary enterprises might be largely increased; that there is too much expensive red tape in the management, and that in the endeavor to secure absolute responsibility and accuracy on the part of its agents and employes, the cost of doing the business has been largely increased, altogether out of proportion to the results obtained. These point to the management of the Northwestern Telegraph Company, and of the Montreal Telegraph Company, as evidences of the correctness of their opinion. Neither of these companies cover territory anything like as good, telegraphically, as that of the Western Union Company, and the financial results of their management are declared to be much more satisfactory. If the stockholders of the Western Union Company are satisfied, however, it can hardly be considered necessary for others to criticise in this respect.

At the close of the fiscal year the company had in operation 71,585 miles of line, against 65,757, and 175,135 miles of wire, against 154,471, at the end of the previous year; and had 6,188 offices—an addition of 448 during the preceding year. There does not appear to have been any very considerable extension of lines during the year by construction—a large part of the increase having been from the acquisition of the Pacific and Atlantic lines by lease, on the first of January preceding.

The number of employes of the company is not stated, but as it was 9,190 at the close of the previous year, probably not far from 10,000 persons are now employed in the service of the company.

It is in the statements in regard to the duplex, quadruplex, and automatic telegraph systems that we presume a majority of the readers of THE TELEGRAPHER will be most interested. Of the duplex apparatus of Mr. J. B. STEARNS Mr. ORTON states that its extensive introduction and use has fully sustained the opinion of its utility and value expressed in his last annual report. We shall not take issue with him on this point, our own opinion on that subject being well known, even when Mr. ORTON officially expressed a decidedly adverse opinion to that which he now so confidently, and with good reason, maintains.

We have been somewhat surprised at the moderation of the views and endorsement of the so-called quadruplex telegraph given in the report, as we have anticipated a much more enthusiastic expression on that invention. With a carefulness and wisdom which is commendable, it is stated that, although negotiations for the purchase of the quadruplex patents are pending, "the terms will not be settled until after the character and extent of its capacity for work have been more fully ascertained."

In treating of automatic telegraphy, we regret to notice that Mr. ORTON seems not as yet to have made any material progress towards an appreciation of its merits and advantages. He does not attempt to argue the question, and only states one objection, and that a very old, and at first sight, plausible one, relative to the time occupied in preparing messages for transmission. We had proposed to discuss this matter at some length, but as Mr. GEORGE LITTLE, the inventor of the American Automatic System, treats of it in another department of this paper, we will not weary our readers with a repetition of that part of his open letter to Mr. ORTON. It will be seen that Mr. LITTLE, while admitting Mr. ORTON's assertions in regard to the chemical paper system of BAIN,

or the later one of Prof. WHEATSTONE, not being covered by controlling patents, argues that his American system now used by the Automatic Telegraph Company is a very different and the only really fast telegraph system, and is completely covered by his patents. We are not personally or pecuniarily interested in any automatic system or patents, but believing that automatic telegraphy can alone completely solve the problem of cheap and profitable telegraphy in the future, we had hoped that Mr. ORTON would have received some new light on the subject since the preparation of his previous official documents. It seems, however, that he is still unconvinced, and is not yet prepared to recant his previously expressed opinions, as he has done so handsomely in the case of the duplex, and which we are confident he will yet do in regard to the automatic. For this, however, it is evident that we must yet wait a while longer, which we will do as patiently as possible.

The Page Patent Litigation.

ALTHOUGH we have not recently referred to the Page patent, and the legal proceedings which are in progress to determine its validity, the defendants in the suits which have been commenced by the Western Union Telegraph Company have not been idle. A great amount of testimony has been accumulated, which will show the invalidity and absurdity of this patent as applied to telegraphy. Prof. PAGE's own evidence, given in the United States Court for the Eastern District of Pennsylvania, in 1850, proves that at that time he had no idea of claiming for himself the invention of the devices which are essential in telegraphic apparatus. Besides this the evidence already obtained is conclusive against the validity of the patent, as will be shown if the cases are ever brought to trial.

The proceedings are necessarily expensive, and all who are interested in defeating the monstrous claims set up under this patent should willingly aid in defeating the attempt which is being made to enforce it.

Tillotson & Co.'s Philadelphia Establishment.

AS WILL be noted by the card of Messrs. L. G. TILLOTSON & Co., in the present number of THE TELEGRAPHER, that enterprising firm have already carried into effect the purpose which was intimated two weeks since by us of opening a branch of their establishment for the sale of telegraphic and electrical goods in Philadelphia. As will be seen, they have secured a central and excellent location, where will be kept on hand a full stock of goods of their own manufacture, and other telegraphic and electrical apparatus and supplies which may be required. This new establishment will prove very convenient to their customers in Philadelphia and the section which looks to that city for its supplies, and we have no doubt will result in largely increasing their trade.

We have so often spoken of the excellence of the instruments manufactured and furnished by this firm that a repetition is scarcely needed at this time. Their goods are the best recommendation they could have, and all who may favor them with their patronage may rely upon honest and fair treatment from them.

Chester's New and Superior Registers and Relays.

CALLING in at the establishment of Mr. CHARLES T. CHESTER, at 104 Centre street, recently, we were shown a new style of telegraph register just manufactured by him, which he calls the European register, being modelled in some respects after the style adopted by the best European manufacturers, but which is much handsomer and greatly improved. All superfluous complications are avoided, is noiseless in its action, with pivot guards, and is enclosed within glass, and has a self-adjusting fan, which is a new and excellent device, and is run by a spring instead of a weight.

We were also shown a new style of relay manufactured, which is very handsome and well made.

We understand that Mr. CHESTER'S establishment is

very busy in manufacturing instruments, etc., to fill domestic and foreign orders.

Col. STEPHEN CHESTER, who has been in Europe for several months past on telegraph business, has returned and may be found at 104 Centre street.

The American Electrical Society.

We have received from our attentive correspondent at Chicago, "Occasional," a full report of the proceedings of the meeting at which the organization of the American Electrical Society was completed, with a copy of the constitution and by-laws adopted, but, on account of the lateness of their reception and their length, we are reluctantly compelled to postpone until next week their publication. The next number of THE TELEGRAPHER will contain them in full.

Personals.

Mr. J. J. BARTON, late of the Montreal Telegraph Company, at Sackville, N. B., has been appointed operator for the Grand Trunk Railway at Vandreuil, Quebec, Canada.

Mr. W. W. ALLEN has resigned the position of train despatcher on the M. and O. R. R. at Macon, Mississippi, to accept a similar position on the International R. R. of Texas. Mr. ALLEN has been on the M. and O. railroad for several years, and has made friends of all who knew him, and has the best wishes of his late associates for his future success.

Mr. D. B. MITCHELL has accepted a position with the Western Union Telegraph Company at New Orleans, La.

Mr. C. E. WILKINSON, of Chicago, Ill., Western Union day force, has resigned, to engage in other business.

Mr. CHAS. B. BURCH, operator in the Gold and Stock Telegraph Co.'s Chicago, Ill., office, has resigned, intending to devote his whole time to the livery business. What CHARLIE don't know about "horses" is hardly worth knowing.

Mr. FRED. McMILLAN, for the past six years "check boy" on the Chicago, Ill., Western Union day force, and recently appointed assistant operator of the Gold and Stock Telegraph Company, Chicago, has been promoted to the position made vacant by Mr. BURCH's resignation. This is a deserved compliment to a faithful and worthy young man.

Mr. JOHN KERNS, for the past two years "check boy" on the Western Union, Chicago, Ill., day force, but more recently operator at the Exposition building, has been promoted to the position made vacant by Mr. McMILLAN's promotion. This is another excellent appointment.

Mr. GEORGE SHAW, chief check clerk, Western Union, Chicago, Ill., office, nights, has been doing the telegraphing at the Exposition, in connection with his other duties, from the date of Mr. Kerns' promotion until its close.

Mr. CYRUS COBB, formerly chief operator Western Union, Chicago, Ill., day force, who has been engaged in other business for the past five years, has returned to his old love, and accepted a position on the day staff in the Chicago Western Union office.

Mr. FRED. LITGOW, for four or five years a "check boy" in the Western Union Chicago office, has a very nice position as operator and assistant ticket agent in the general ticket office, corner of Lake street and Michigan avenue. FRED. played the role of a detective very successfully, on a couple of confidence men a short time ago. The rascals victimized him, and made away with the contents of the drawer, but, through his ingenuity, were captured the same evening.

The Telegraph.

By Cable.

THE LA PLATE TELEGRAPH CABLE CUT.—LONDON, Oct. 28.—A Montevideo despatch says the Argentine insurgents have cut the La Plate telegraph cable.

Foreign Telegraphic Notes.

THE total number of messages forwarded from the postal telegraph stations in the United Kingdom during the week ended the 3d inst. was 403,520, and dur-

ing the corresponding week of 1873, 360,093; increase, 43,427.

The Brazilian submarine directors state that from the 23d of June to the 25th of September, notwithstanding interruptions on the lines south of Pernambuco, the total receipts amounted to £24,471, equal to a profit of nearly 6 per cent. per annum.

A quarterly dividend of 3s. per share upon both the preference and ordinary shares of the Globe Telegraph and Trust Company is announced, being at the rate of 6 per cent. per annum.

The total earnings for the half year of the Eastern Extension, Australasia and China Telegraph Company have amounted to £115,753, against £106,778 for the corresponding period of last year; the working expenses to £24,404; defalcations at Shanghai to £3,183; and the repair and maintenance of the cables to £3,099. Income tax and interest on debentures absorbed a further sum of £1,215, leaving a balance of profit for the half year of £83,852. One interim dividend of 1½ per cent., amounting to £29,962, has already been distributed, and another of similar amount is now declared, payable on the 15th October, leaving the sum of £23,927 to be carried forward to the next half year. The debenture debt has been reduced by £3,200, leaving a balance of £9,900, which will be paid off as the bonds become due. An interruption occurred on the China section of the company's cables, about forty-six miles from Hong Kong, in April last, and lasted about fifteen days, owing to the distance from the headquarters of the ship. On proceeding to repair it, it was found that the cable had been wilfully cut and about one and a half miles stolen. A reward was offered by the Government of Hong Kong, which resulted in the detection of the offenders, who have been convicted and sentenced to fourteen years' imprisonment, and their junk has been confiscated. The directors have acknowledged with thanks the great assistance afforded them by the Government of Hong Kong in this matter. The company's cables are at present in good order, and working satisfactorily, with the exception of that between Saigon and Hong Kong, which is now interrupted. The maintenance ship Agnes is, however, proceeding to its repair. The directors have much pleasure in recognizing the efficient manner in which the land line connecting their terminus at port Darwin with Adelaide has been maintained by the South Australian Government.

The Parliament of Western Australia was opened on July 1st. A sum of £15,000 has been voted for a telegraph line to Eucla, contingent upon South Australia commencing a line to the West Australian boundary.

The Direct United States Cable.

THE following communication from the Manager and Electrician of the Direct United States Cable Co., to the London Telegraph, will be found of interest as stating definitely the accident and its cause which interrupted the laying of the cable, and what has been done and is proposed to be done toward the completing the enterprise the present season.

To the Editor of the Daily Telegraph.

SIR—I am instructed by my Board to inform you that on the 10th of September the cable forming the Ireland-Newfoundland section of this company's line was, after 600 miles had been successfully laid from Ireland, broken in a heavy gale, owing to the Faraday having to haul back for a slight fault. Grappling was immediately commenced, but a succession of heavy gales, and the unfavorable state of the bottom, prevented the success of the operations, although the cable was brought to the surface on the second day after the accident, but slipped again on account of the exceedingly heavy sea prevailing at the time. The Faraday and her two tenders, the Ambassador and the Dacia, subsequently put into Queenstown, having run short of coal and supplies, and for the purpose of refitting parts of the picking-up gear, which was injured owing to the rocky nature of the bottom during the operation of grappling. The coaling and the refitting of the three ships is now being pushed forward with the utmost despatch, and they will forthwith leave Queenstown and proceed to the place of operations, when the contractors intend to abandon that short part of the cable which has been found to lie on rocky ground, and which extends over about thirty miles, and to effect the splice at a more suitable point, which has already been ascertained by soundings, and then to proceed to Newfoundland, avoiding the unfavorable bottom, and thus finish the work of laying our cables. My directors are of the opinion, after having consulted with the contractors, that, taking all circumstances into due consideration, the laying of the company's Ireland-Newfoundland cable will soon be completed. You will be pleased to learn that the sections of our cable which were actually laid—viz., the New Hampshire, Nova Scotia, and the Nova Scotia-Newfoundland sections, of an aggregate length of about 1,100 nautical miles—show by the daily tests a per-

fect insulation and a high transmitting power, and are ready for use so soon as the company's deep sea cable shall have been completed. I am sir, yours faithfully,

G. VON CHAUVIN, Manager and Electrician.
The Direct United States Cable Company (Limited),
Palmerston buildings, London, E. C., Oct. 9.

The Telegraph between Great Britain and Ireland.

TELEGRAPHIC communication with Ireland is maintained by means of four submarine cables, submerged between different points in Great Britain and the Irish coast. These cables contain in all twenty-two separate wires.

One of the largest cables—that between Holyhead and Dublin—has been laid since the post-office acquired the control of the telegraphs, and all of them have been under repair during the same period. The rocky nature of the bottom along the Anglesea coast has, it appears, seriously affected the condition of the Holyhead and Dublin line, the newest of all the Irish cables; in many places the outer iron wires which form the chief protection of the core have been completely chafed through from constant friction. Quite a new feature has also developed itself in connection with this fault, namely, the eating away, by a kind of worm, of the gutta percha covering of the core, in much the same way as wood is bored and eaten away by these destructive insects. The post-office can hardly be congratulated on the possession of these lines to Ireland, as they have been a constant source of trouble and expense ever since the transfer of the telegraphic system to the government.—London Times.

Why the Wires Wouldn't Work.

ONE day last week, while the operators in the Western Union Telegraph office at Central Wharf were busily engaged transmitting gold and stock quotations from that office to the different banks in the city, the instruments suddenly, and without warning or apparent cause, refused to work. Consternation seized all the operators, and they simultaneously gave up the explanation of this break of the lightning. The office was searched; no breaks or crossing of the wires could be found. The entire force there were nonplussed, dismayed, and at a loss to understand the wherefore. The gold and stock quotations had to be carried around to the banks, for the instruments sternly refused to utter a single click. The wires were followed all along their route through the city by the disheartened and now frantic telegraphers. On top of a tall house in the lower part of the city, across which two of the wires run, on Tuesday afternoon was discovered a hoop skirt suspended from both of them. A remark tinged with more force than elegance was heard, and the obnoxious article of feminine apparel which had restored the equilibrium between the positive and the negative wire was dragged down and thrown over into the street. Gold and silver quotations can now be transmitted as formerly. We have heard it said that there is always a piece of crinoline at the bottom of every trouble into which a man gets. So it seems.—Buffalo Courier.

New Patents.

For the week ended September 29, 1874, and bearing that date.

155,376.—MAGNETO-ELECTRIC MACHINES.—Otto Heikel, Jersey City, N. J. Filed November 13, 1873.

1. The revolving induction coil made of the four or more arms or wings a, and heads b, upon all of which arms or wings a continuous insulated wire is wound in the successive layers, substantially as and for the purpose set forth.

2. An adjustable magnet applied to and combined with the revolving induction coil armature, made in the manner before set forth.

155,392.—ELECTRIC ANNUNCIATORS.—George B. Scott, Brooklyn, N. Y., assignor to himself and William H. Markland, same place. Filed December 18, 1873.

Plug circuit closer in room. Number on shield carried by a static needle, consisting of three needles deflected by coil when circuit closed. Display and alarm continuous till room be visited and circuit there broken.

1. The combination, with an annunciator apparatus, of a plug or switch circuit closer, a sounding apparatus, a relay, and main and local circuits, substantially as set forth, whereby the sounding apparatus is arranged to operate until the circuit is broken at the room, as specified.
 2. A galvanometer coil and three needles, constructed and arranged substantially as specified, in combination with the signal of an annunciator, as set forth.

Born.

McLAUGHLIN.—To THOMAS F. McLAUGHLIN, night receiver of the Atlantic and Pacific and Franklin Telegraph Company, 198 Broadway, New York, office, a son.

PHILADELPHIA.

PROVIDENCE, R. I.,

September 15, 1874. }

GENTLEMEN: I take pleasure in calling your attention to my

PATENT FINISHED INSULATED TELEGRAPH WIRE.

I claim this to be the best braided wire manufactured, and I believe it is universally acknowledged so throughout the country by all the large Telegraph Companies and Telegraph Supply dealers. Its points of superiority are:

- 1st. Its excellence of outside finish.
- 2d. The toughness of the Patent Compound with which the braid is saturated.
- 3d. By its polished outside finish, its adaptability for shedding rain and sleet.
- 4th. On account of the nature of the compound it can be laid directly against any wall or paper without staining or greasing it, which cannot be said of any other paraffine wire.

It is the only braided wire made, which, after it has been up for any lengthtime, will, with ordinary dusting, like any piece of polished furniture, look bright and fresh as when first put up. All other wire, regardless of its color, when first put up, will, in a short time, become dusty and dirt color, making an unsightly thing in an office, where mine, with its brilliant, fresh color, is an ornament.

The toughness of the compound, which also makes it capable of taking this splendid polish, makes it the most durable braided wire made. It is especially desirable for outdoor use, as the rain cannot beat the compound off, and its smooth surface prevents the snow and sleet from sticking to it.

A grease streak along the wall or paper behind the wire running into a nicely fitted up Broker's office, does not make him feel—well, good natured. This can be avoided by using this wire.

I also make it in cables of any number of conductors at the regular price for a single wire.

It is finished in any desirable color or plaids, with a light or heavy insulation, at the following prices:

BROWNE & SHARPE'S GAUGE.	
No. 8. Price, per lb.....	\$0 85

Fifteen per cent. discount in quantities not less than 20 lbs.

A liberal discount for larger orders.

Patented November 18, 1873.

I also manufacture plain cotton or linen covered wire, or will saturate the braid of the same with paraffine, shellac or paint. This may be covered with a wind and braid outside, or two braids, or a single braid, as the customer may wish.

This, if applied, is rubbed smooth on the outside, and I claim and believe is as good as any braided wire made, outside of my Patent Finished.

Finer numbers at special prices. Discount same as on Patent Wires.

I also manufacture a RUBBER COVERED WIRE, which will not grow stiff and crack off in cold weather, or grow soft in the hottest weather.

By my process of putting this rubber on the wire will be found in the exact centre every time. After the rubber is put on it is vulcanized, and then covered on the outside with a braid

and finished, and is suitable for under ground, under water, or any outside or other purposes.

Ten per cent. discount on 100 feet. Fifteen per cent. discount on 200 feet.

GENERAL REMARKS,

All wire used by me is made to my special order, and is the best that can be had in the market.

As one of the largest dealers told me a short time ago, "Your wires have come into the market on their merits alone, and we have been forced to keep them," so you may feel sure I shall feel chary of that honor, and shall be very careful to furnish none but the very best in my power.

I could give a long list of testimonials, but I will still depend on the "merits" of the wire, and respectfully solicit your patronage.

Your obedient servant,

EUGENE F. PHILLIPS.

These Wires can be had at my prices of

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense
and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running rotors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

(P. O. Box 5608.)

36 VESSEY STREET, N. Y.

THE BALTIMORE BATTERY.

Acknowledged to be **SUPERIOR** to any other for Telegraph purposes.

Every comparative test made the past year resulted in the adoption of our Battery.

A prominent Superintendent writes: "My impression is the Baltimore is to be the Battery of the future." He has others in circuit, to determine the value of each in service.

It is now in use on commercial and railroad lines, stock reporting telegraphs, private lines. Superintendents fire alarm telegraphs recommend it as the most reliable they have used.

Thousands furnished Gold and Stock Telegraph Co. of New York, who use no other.

For closed circuit it is without a rival.

Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,
TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street. PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

PATENT BATTERY INSULATOR.

"As near perfect as we can reasonably expect in a contrivance for this purpose."

The best Battery Insulator in use.

Over 4,000 furnished the Western Union Telegraph Co. up to this time. The Montreal Telegraph Co. have adopted them, and have 2,500 now in use in their principal offices. They thoroughly insulate the Battery, and save more than their cost.

Price, 40 cents each. Liberal reduction for large quantities.

A very superior Screw Glass Insulator cheap. All kinds of telegraph and electrical supplies on hand.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawkshee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinhell, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter.

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without **ANY ATTENTION** whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50

Two sets of Instruments, etc., 12.00

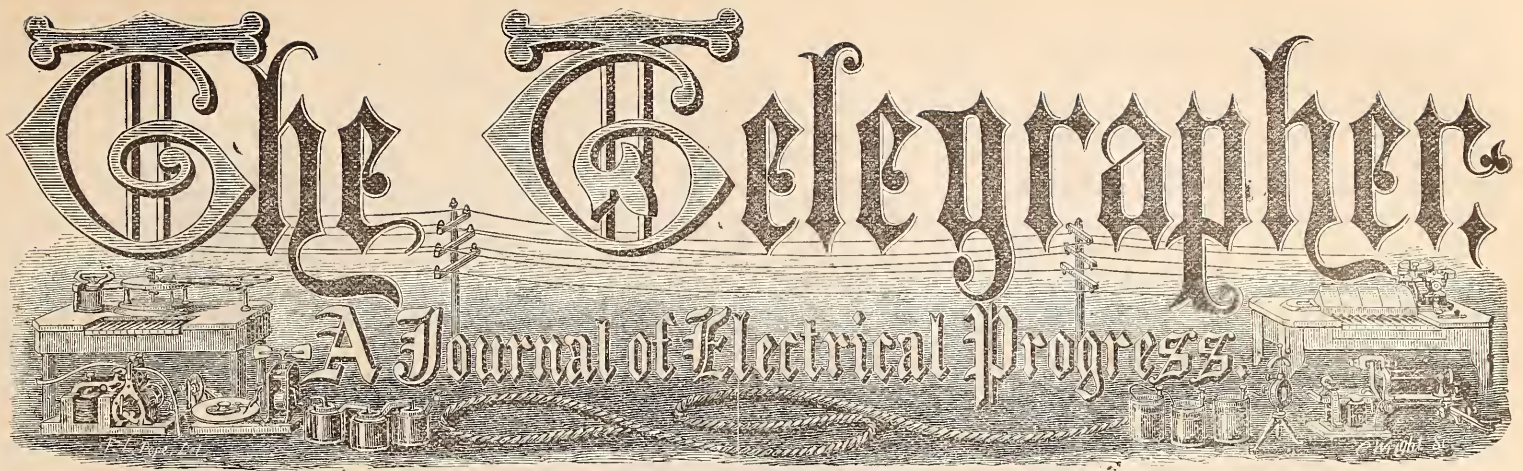

Send for our new Circular and Price List.

Elm St., cor. 5th. 409 North Third St.
Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES.
RELAYS, unequalled for beauty and strength;
COMBINATION SETS; BOX and POCKET RELAYS.
CHALLENGE, PONY and REPEATING SOUNDERS.
KEYS, various styles, including the SCHNEIDER KEY, just
out, no legs, wire connections above the table.
REGISTERS, with SPRINGS OF WEIGHT.
CUT OUTS, many varieties, including a new style of PEG CUT
OUT, with an adjustable LIGHTNING ARRESTER, just out.
REPEATERS—HASKIN'S AUTOMATIC, and others,
SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES
and LIGHTNING ARRESTERS.
ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also
SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANNUNCIATORS, FIRE and BURGLAR
ALARMS, and WATCHMAN DETECTORS.
ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHT-
ING APPARATUS.
MEDICAL INSTRUMENTS and APPARATUS on hand and made
to order. Second hand Instruments for sale cheap,
and repairing done at short notice.
BATTERIES in great variety, including the latest inventions;
also a full assortment of battery material.
WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE
WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED
LINE WIRES; SUBMARINE, SUBTERRANEAN and
HOUSE CABLES.
INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.
BRACKETS, PINS and SPIKES, TELEGRAPH POLES,
LINE BUILDERS and REPAIRERS' TOOLS.
TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANI-
FOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES,
ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and
AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are
elegantly finished and mounted on highly polished rosewood,
mahogany and walnut bases.

JOSEPH MOORE & SONS,

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, NOVEMBER 7, 1874.

VOL. X. WHOLE No. 434.

[Written for THE TELEGRAPHER.]

Joe Sanders.

BY I. C. EDWARDS.

THEY talk about their heroes,
Like "Jim Bladsoe," true and brave,
Who "held her nozzle agin the shore"
Till he sunk in the foam'n' wave,
And lots of other fellers
Who died while at their post,
But of all they write and sing about
Its engineers the most.

But I knew a *lightnin' jerker*—
(Now, you need not laugh at me)—
I'll tell you how *Joe Sanders died*
With his fingers on the key:
"A" was the end of the railroad,
With a junction just below,
And all the "runnin' orders"
Was shouldered on to Joe.

He was always prompt and easy,
And I've often heard him say
"There'd never be a smash-up
Cause things was slack at "A."
One fearful night in winter
The snow was pillin' high,
And the wind was just a screeching
As it went a tearin' by.

Two engineers with open throttles
Was a tearin' through the spray,
And each, by the orders in his fist,
Had got the right o' way;
Both were rushing for the junction,
On the train despatcher's word,
When Joe was roused from his nappin'
And this is what he heard:

"Go quick to the junction office—
Take along your signal light!
'S' has failed to deliver orders,
And both trains have got the right."
Two miles and a half to huff it
On such a fearful night,
And reach the junction office
With his crimson danger light—

And only thirty minutes
Before the trains would meet;
Joe never stopped for hat or coat,
But dashed out in the sleet,
Wild and fierce blew the wind,
And deeper piled the snow,
But Joe didn't think of either,
For he read his orders, "Go!"

He went, and how he suffered
Only God and angels knew,
But he reached the junction office
Before either train was due.
On came the rushin' engines
Till they saw the red light shine.
When two quick sharp shrieks told plainly
Joe had reached the spot in time.

He staggered to the office
To report his duty done,
Thanking God that he had saved them,
And he had the strength to come.
This is all he ever told them:
"Both trains are here with me,
And—" *He was dead, with his icy fingers*
A clutchin' the open key!

BELLE PLAINE, MINN., Oct. 24th, 1874.

Original Articles.

Organization of the American Electrical Society.—
The Constitution and By-Laws adopted.

BY OCCASIONAL.

EVER since the meeting held in Gen. Stager's room, at the Western Union office, in this city, some weeks ago, for the purpose of taking the preliminary steps for the organization of a society in this country somewhat similar to that of the Society of Telegraph Engineers in England, the adjourned meeting, to be held on the third Wednesday of October, has been an interesting and general topic of conversation among intelligent telegraphers and electricians in this section, and each seemed to realize its importance, and the necessity for doing everything possible to make it a success. Accordingly, nothing was left undone to make the permanent organization a great success.

As soon after the first meeting as practicable, the Chairman of the Committee on Constitution and By-Laws, Mr. C. H. Summers, issued a circular to the prominent electricians and telegraphers of the country, inviting their presence at the meeting, and any suggestions that they might see fit to make. Copies of this circular were also posted up in the larger telegraph offices in this city and elsewhere, and published in the leading scientific and telegraphic newspapers. The result of this united and persistent action was witnessed in one of the grandest gatherings of noted members of the profession that it has ever been my pleasure to witness since the days of the Conventions of the now defunct National Telegraphic Union.

The proprietors of the Palmer House kindly tendered the use of Parlor 27 of that spacious hotel for the meeting, and on Wednesday, October 21, at three o'clock P. M., Mr. Charles H. Haskins, of Milwaukee, Wis., the General Superintendent of the Northwestern Telegraph Company, called the meeting to order, by indicating on the table, with a pencil, "dot space dot, dot space two dots, dash, two dots, one dot, dot space, two dots."

Upon unanimous request of the gentlemen present Mr. C. S. Jones, of Chicago, acted as Secretary *pro tem*.

Mr. C. H. Summers, Chairman of the Committee appointed at the last meeting, presented a large number of letters and telegraphic despatches from gentlemen who were unable to attend, which were read by the Secretary.

Those from gentlemen east, with one exception, contained very few suggestions, other than that a more central location than Chicago be selected for the headquarters of the Society, and a name that would be more comprehensive than that proposed of "American Electrical Society." The exception referred to was from Mr. C. H. Small, of New York, who was in favor of placing the qualification for membership so high that none but the most eminent men of the country could become members, remarking that unless such was the status of the Society he should not consider it an honor to be a member. Lest the gentlemen present should suppose that he considered himself one of those eminent men, he added that, no doubt, this would exclude him, but he should immediately endeavor to fit himself, by close application, etc., to become a member. His views were not debated in open meeting, and did not accord with the ideas of those present.

The communications from gentlemen from other sections of the country contained no recommendations, simply requesting to be enrolled as members, and pledging themselves to abide by the decision of those who should be present and organize the Society.

Among the well known telegraphers and electricians who wished the Society well and desired to be enrolled as members was that operators' friend, Mr. J. D. Reid; Mr. F. J. Grae, Editor of the *Journal of the Telegraph*; Mr. J. N. Ashley, Editor and Publisher of THE TELEGRAPHER, of New York; and many others. Mr. Ashley's letter, which proffered the use of the columns of THE TELEGRAPHER in any manner that would further the objects and aid in the advancement of the Society, was very kindly received.

A telegraphic despatch from Chief Operator Johnson, of the Western Union Cincinnati office, giving his reasons for non-attendance, which was as follows: "It's a boy—ten pounds," created considerable merriment.

Mr. Z. G. Simmons, President of the Northwestern Telegraph Company, sent word that the Society could call on him for \$500 as an assessment.

The Constitution and By-Laws, which had been prepared by the committee appointed at the previous meeting for that purpose, were then read as a whole, and afterwards reread and adopted, section by section. Although no material changes were made in them, as reported, still it was deemed best to appoint a committee to retire and perfect them before final action.

During the absence of the committee for this purpose the names of those who merely acknowledged the receipt of the printed circular heretofore mentioned were read by the secretary, after which, until the committee's return, a general introduction and hand shaking was indulged in, and congratulations were heard upon all sides as the gentlemen one after another met old friends and former associates, some of whom they had worked with side by side, or over the electric cord, in "Auld Lang Syne." Some pleasant reminiscences were brought out, which, if they could be written up, would pleasantly fill many a column of THE TELEGRAPHER. The life of the gathering were, Messrs. H. C. Maynard, C. S. Jones and E. B. Chandler, of Chicago; C. H. Haskins, of Milwaukee, and N. Hucker, of Buffalo. They indulged in good natured passes at each other at every favorable opportunity, and kept others present convulsed with laughter. The meeting was throughout exceedingly pleasant and harmonious. Some fifty gentlemen were present, representing all sections of the country—many being from different cities in the

United States and Dominion of Canada. Almost every grade of the telegraphic profession was represented, from general superintendent to operators, linemen and battery men.

The sentiment expressed by the chairman at the opening of the meeting, that the object of the Society should be organization and concert to advance telegraphy, and to promote the cause thereof by the adoption of some means to distribute information gained by practical telegraphers, seemed to pervade the whole assembly.

The committee having reported the Constitution and By-Laws as amended, they were unanimously adopted, and the following officers elected for the first year:

President—General Anson Stager, of Chicago.
First Vice-President—C. H. Haskins, of Milwaukee.
Second Vice-President—George B. Prescott, of New York.

Third Vice-President—H. P. Dwight, of Toronto.
Fourth Vice-President—William Orton, of New York.

Fifth Vice-President—James Gamble, of San Francisco.

Sixth Vice-President—John Van Horne, of Louisville.

Seventh Vice-President—E. D. L. Sweet, of New York.

Corresponding Secretary—I. N. Miller, of Chillicothe, Ohio.

Recording Secretary—C. S. Jones, of Chicago.
Treasurer—E. B. Chandler, of Chicago.

Directors—F. L. Pope, A. L. Brown, New York; W. W. Smith, Indianapolis; J. A. Swift, Washington, D. C.; S. D. Field, San Francisco; George T. Williams, Cincinnati; D. Flanery, New Orleans; C. O. Rowe, Pittsburg; R. C. Clowry, St. Louis; E. P. Wright, Cleveland; D. H. Bates, Philadelphia; J. J. Dickey, Omaha; N. Hucker, Buffalo; A. G. Davis, Baltimore; J. R. Dowell, Richmond.

Executive Committee—William Henry Smith, J. J. S. Wilson, George H. Bliss, F. H. Tubbs, C. H. Summers, all of Chicago.

General Stager, having been conducted to the chair, made a few remarks thanking the members for the honor they had conferred upon him, returned thanks on behalf of the rest of the officers elect, and promised to leave nothing undone to further the interests of the Society.

It was resolved that a copy of the proceedings be furnished to THE TELEGRAPHER, the *Journal of the Telegraph*, and the press generally, for publication.

A resolution of thanks to the proprietors of the Palmer House for the facilities afforded was also adopted.

The following gentlemen came forward, paid their initiation fee and first year's dues, and thus signified their willingness to become members: F. M. Speed, M. C. Bristol, Geo. T. Williams, of Cincinnati; E. P. Wright, Cleveland, Ohio; I. N. Miller, Chillicothe, Ohio; R. B. Woolsey, Mattoon, Ill; Hugh Neilson, Toronto, Canada; Charles O. Rowe, Pittsburg, Pa.; E. S. Norcross, E. R. Parenteau, Terre Haute; W. W. Smith, Indianapolis, Ind.; N. Hucker, Buffalo, N. Y.; Charles W. Ross, Columbus, Ohio; J. J. Dickey, Omaha, Neb.; Charles Smith, Louisville, Ky.; C. H. Haskins, Milwaukee, Wis.; Anson Stager, J. P. Barrett, E. B. Chandler, James S. Dickinson, Thos. Orton, Geo. C. Felton, J. P. Towler, W. C. Long, H. Stanberry, C. H. Summers, C. S. Jones, E. P. Warner, H. C. Maynard, W. O. Hopkins, L. B. Firman, S. S. Robinson, F. W. Jones, A. B. Peck, Chicago.

The regular meetings of the Society were fixed for the third Wednesday in each month, the annual meeting to be held on the third Wednesday in October. The next meeting of the Society, it was understood, would be at the call of the Executive Committee.

The following is the Constitution and By-Laws, as finally adopted:

CONSTITUTION.

Art. 1.—This association shall be called the American Electrical Society.

Art. 2.—The object of the society shall be the interchange of knowledge and the professional improvement of its members; the advancement of electrical and telegraphic science, and the establishment of a central point of reference.

Among the means to be employed for attaining these ends shall be periodical meetings for the reading of professional papers and the discussion of scientific subjects; the foundation of a library; the collection of electrical instruments, models, drawings, maps, &c., and the publication of such parts of the proceedings as may be deemed expedient.

Art. 3.—This Society shall consist of members, corresponding, and honorary members, and each person, when duly elected and qualified, shall receive a certificate of membership, indicating the particular class which he represents.

Art. 4.—Candidates shall be proposed at one meeting and balloted for at the next regular meeting, and, to be

ected, must receive three fourths of the votes cast, but the society may, by the unanimous vote of the members present, elect any candidate at the meeting at which he is proposed.

Art. 5.—On being elected the candidate must subscribe to the Constitution and By-Laws, and pay the sum of five dollars, membership fee, before he can be entitled to receive his certificate.

If this is not done in sixty days from notification of election, said election shall be considered void.

Art. 6.—Persons residing out of America may be elected corresponding members in the same manner as hereinbefore provided for the choice of immediate members.

Art. 7.—Honorary members, having been nominated as required in article 4, may be elected by a unanimous vote of the members present. They shall not be required to pay any contributions. No person shall be considered as a corresponding or honorary member unless he signify, within three months of his notification of election, his acceptance of membership.

Art. 8.—Each member shall pay as initiation fee the sum of five dollars, as provided in article 5, and a further sum of two dollars per year toward the support of the association.

Art. 9.—No member whose dues are three months in arrears shall be entitled to vote, nor to receive the society's printed papers.

Art. 10.—Any member shall have the privilege of introducing strangers to the rooms of the society on writing their names in the visitors' register, or sending with them a card signed with his name.

Art. 11.—There shall be a fund, called the fellowship fund, devoted exclusively to the publications of the papers read before the society; any person, whether member or otherwise, may subscribe thereto.

Art. 12.—At any regular meeting of the society fifteen members shall constitute a quorum for the reception and consideration of applications for membership, and the transaction of such business as may be reported by the Executive Committee.

Art. 13.—The officers of the society shall be a President, seven Vice-Presidents, a Corresponding Secretary, a Recording Secretary, a Treasurer, fifteen Directors, and an Executive Committee of five resident members, who shall be elected by ballot, by a majority of votes at the annual meeting of the society, and shall hold their offices until their successors are chosen and qualified.

Any vacancy that may occur, by resignation or otherwise, shall be filled at the next monthly meeting after notice of such vacancy.

Art. 14.—The President, Recording Secretary, Treasurer and Directors shall be the trustees of this society.

Art. 15.—The President, and in his absence the Vice-Presidents in rotation, shall preside at all meetings of the society, and in case of their absence a President *pro tem.* shall be appointed.

Art. 16.—The duties of the Corresponding Secretary shall be to conduct all correspondence other than that relating to the local affairs of the society.

Art. 17.—The Recording Secretary shall keep an accurate record of all the transactions of the society, and of the Executive Committee, and shall issue all notices, and prepare all necessary blanks.

Art. 18.—The Treasurer shall have charge of the funds of the society, shall receive all assessments, and pay all bills and orders approved by the Executive Committee.

Art. 19.—The duties of the Executive Committee shall be to have a general care of the affairs of the society, examine and approve all bills and demands, audit the accounts of the Treasurer, certify to his annual report, and make report of their transactions for the year at the annual meeting.

Art. 20.—Initiation fees and annual dues shall be paid at the time the member elect subscribes to the Constitution and By-Laws, and regular dues at every annual meeting thereafter.

Art. 21.—The annual meetings shall be held on the third Wednesday of October in each year, at such place as the Executive Committee may designate. The headquarters of this society shall be the City of Chicago.

Art. 22.—Proposed amendments to this Constitution shall be first submitted to the Executive Committee, then sent by letter to the several members of the society, at least thirty days previous to the annual meeting; such amendments shall be in order for discussion, and shall be voted upon at such annual meeting in person or by proxy; votes shall be counted by the President and Secretary, and if two thirds of the votes cast are in favor of said amendment it shall be declared adopted.

BY-LAWS.

1.—The regular meetings of the society shall be held on the third Wednesday of each month, at which papers may be read relating to the theory and practice of telegraphy and electrical matters generally, or other subjects properly coming under the head of Article 2 of the Constitution.

2.—At the regular meetings of the society the fol-

lowing order shall be observed in the transaction of business, unless set aside by a vote of members present:

First—Record of the previous meeting to be read, approved and signed by the Chairman and Secretary.

Second—Proposals for membership.

Third—Candidates for membership to be balloted for.

Fourth—Communications received since the last regular meeting to be announced and read, if required.

Fifth—Communications from members present to be read.

Sixth—Communications from the Executive Committee to be brought forward.

Seventh—Report of committees to be called for.

Eighth—Unfinished business to be taken up

Ninth—New business to be proposed.

Tenth—Questions for debate to be discussed.

3. All decisions of the chair on points of order shall be conclusive, unless reversed on appeal to the meeting.

4.—Every motion shall be first stated by the President before debate, and every motion shall be reduced to writing if the President or any member desire it.

5.—Cushing's Manual for the Government of Legislative Bodies shall govern this society in its deliberations.

6.—If required by one fourth of the whole number of members present the yeas and nays upon any question shall be called and entered upon the journal.

7.—No motion for reconsideration shall be in order unless one of the majority shall move such reconsideration.

8.—The Executive Committee may call meetings of the society when they deem it expedient, and shall be bound to do so upon the written request of seven members, stating the object of such meeting. Seven days' notice shall be given to members of any special meeting, the purpose thereof to be stated in the notice, and no other business shall be taken up at that meeting.

9.—The rooms of the society shall be open at such hours of every day as the Executive Committee may prescribe.

10.—A record of all donations to the society, whether in money, books, maps, instruments, models or other articles of value, with the names of the donors, shall be entered by the recording secretary (in a book provided for that purpose) to be kept at the rooms of the society.

11.—The books, maps, instruments and other property of the society shall only be removed from the rooms under such rules and regulations as shall be prescribed by the Executive Committee.

12.—The records of the society shall at all times be open to members, and such books of accounts shall be kept in its rooms as the Executive Committee may designate.

13.—When a paper is presented to the society the recording Secretary shall report thereon to the Executive Committee, who shall then determine whether such paper shall be published or filed.

14.—No indebtedness shall be incurred for the society except under such rules as shall be prescribed by the Executive Committee.

15.—No bill shall be paid for the society until it has been certified by the person authorized to contract it and audited by the Executive Committee.

16.—Additions and amendments may be made to the By-Laws at any regular meeting, provided they have been proposed in writing and seconded at a previous regular meeting.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

The Plug and Nihil Nameless.

CINCINNATI, OHIO, Oct. 28th.

TO THE EDITOR OF THE TELEGRAPHER.

"Said the wind to the moon, 'I will blow you out!

You stare in the air,

Like a ghost in a chair,

Always looking what I am about.

I hate to be watched! I will blow you out."

You have so kindly opened your columns to me heretofore, that I have concluded to ask this one more favor of you, and I think I can promise you that it will be the last. Had the matter not developed itself into a case of self-defence, I would not ask to occupy your space again. I am aware that the personal concerns of men in general are not of much interest to any but themselves, and hence are only cumbersome to the columns of a journal. Your paper, too, is conducted in a manner which shows that great pains are taken to make it valuable to its readers. I may not be brief, but I will be to the point.

The first contribution, you will remember, had reference particularly to the unkind remarks made in the "Plug," concerning the operators in the room, to which its circulation is mostly confined. I objected then to the style of those squibs more than to the act of squibbing.

The editorial reply to my contribution came out in haste. The editors certainly lost no time in "rushing into print" with those ponderous brains of which he who writes under the caption "73" boasted so loudly at first. He scented his prey with the keenness of the eagle, and soared aloft wonderfully on the wings of his intellect, screaming with delight as he soared, in anticipation of the easy victory and the gory feast. He asserted that his quarry was a fool, but, nevertheless, whetted his beak and sharpened his talons that he might bury them the deeper in the quivering flesh of his hapless victim. No emotions of pity for the helplessness of his prey melted the iron fierceness of his heart. He would not be content to frighten the poor despicable object that crawled upon the earth beneath him. Not he. Nothing short of Nihil-ation would satisfy his royal eagle heart. He would Nihilate me—that he would. Well, he has had his editorial say. He has well nigh filled the columns of the paper he edits with his reply, and, I suppose, only sheathed his sword for lack of Plug room; and still the fool is cheerful as ever, in the full and free possession of his faculties, such as they are, and rejoicing in his usual health. A careful review of the controversy thus far may confirm him in his belief in his editorial capacity, as at first expressed, but will also develop the fact that with him resists the very questionable credit of having resorted to the use of such terms as fool and ass. These words, or such as these, are sometimes used, no doubt, by wits, but it is generally conceded that a resort to them is only evidence of a lack of better and more effective weapons—a sign of internal weakness. I am perfectly willing to abide by his own decision in years to come. When the buffetings of sorrow and misfortune shall have muffled his eagerness, when experience shall have taught him that confidence is not always knowledge, egotism not always wisdom, when his best laid plans and most cherished schemes shall have been dashed to pieces before his eyes, I say I shall be perfectly willing to submit to his own decision, at such time, of the question whether he has pursued the best and most gentlemanly course. I hope the day of his sorrow may be far off. I certainly wish him naught but good fortune and happiness, but I know that misfortune and sorrow are the common lot of us all. When death shall have entered his dwelling and taken his all; when he shall have had my experience with the world's bitter sorrows and its useless regrets, with its unsympathizing friendships and hollow hearts; if such time ever come—I hope sincerely it may not to him as to me—he will have learned that there are days, nay, even years, when the rude laugh and mocking jest fall harshly on the ear—when such ribald sneers as have filled the personal columns of his paper will have lost their pleasant sound—when the mind ceases to take pleasure in the vanities of the careless friends around. Should such time come, he will have learned that the dullest of us may have gentle feelings and tender sensibilities; he will have learned to think more kindly of him he so sneeringly names the "Melancholy Dane," little as he is able now to enter into his feelings.

I do not anticipate a very prolonged nor glorious career for the paper he edits, for the reason I gave in my first, viz: It is not properly conducted; the editors do not adapt themselves to the needs or capacities of the men for whom they publish; neither do I think, they apprehend them rightly.

Nor do I anticipate any very extended or glorious editorial career for him whose name appears first on the editorial staff, because I do not think he possesses the requisite mental poise necessary to make a shrewd, discriminating, judicious manager of a journal of that, or, indeed, and other kind. We have many men in Ohio who imagine themselves fully able to edit any paper, but those who really are able can be counted within a score.

I shall not prophesy as to how soon he will find this to be true; I shall not even predict that he will ever learn it, but that others, both now and in the future, will recognize it as a true prognostication, I do not at all doubt.

I say this with a kindness of feeling that the Managing Editor of the "Plug" will find is proof against a mountain of such puerile missiles as fool and ass; with a kindness of feeling that only smiles at his puny efforts to irritate into resentment by using the childish language of a wrathful boy; with an equanimity of temper totally unflurried by the windy storm of words which was to Nihilate me.

To the editorials of the elder of the two editors of the "Plug," I have made but brief references. It may not be amiss to say that there is a good and sufficient reason for this. His articles have been generally the best, by heavy odds, in the paper. Whatever of dignity

has belonged to the columns of the "Plug" has been the fruit of his brain. An older man than the other, life has taught him some lessons that are yet sternly in store for his younger brother, and the evidences of this are to be seen in the demeanor of the man, no less than in silver threads which are beginning to appear in his hair. For his kindness of heart and honesty of intentions I have the highest respect; for his sorrows and his cares, the warmest sympathy; and I would not, if I could, add a hair's weight to them. I hope, for his sake, for in his connection with the "Plug" may be brief, for in it he can win no laurels which it will not cause him shame hereafter to wear. His work as an operator has always been honestly and efficiently done, and that he does not occupy a more remunerative position to-day only adds proof to the well known truth that he who works best often gets the worst pay. The younger of the two makes the very common mistake of estimating his own wit, and is, perhaps, not to be blamed that he has set the figures a good deal too high. A slight idea of the coherency of things in regard to the publication of the "Plug" may be gathered from the singular (to say the least) fact that a clipping from the "Cincinnati Commercial" of October 15th occurs in the "Plug" of October 1st, published (by its own date) just two weeks before the "Commercial" went to press. Odd, isn't it? Would it not be well, while he is suggesting loops from one end of the building to the other, for the convenience of the operators, to take a "loop" in the paper, so as to enclose distant dates? They will not then be starting so continually into view from beyond the circuit; or, how would it do to switch in a repeater by putting in a "Plug," somewhere between dates, which would fill up an awkward blank, and not leave subscribers from the 15th of September to the 27th of October without a "Plug?" What sad calamities might have happened in all that time without the "Plug!" I can only account for it by supposing that the poor, overworked brain has wearied of its task and sank to needed repose, or that Nickel-ous gave out and Credit was low; by the way, is it not seldom the case with editors? I notice, too, that the "Plug," is not "wearing of the green" any more. One good result at least, then, has been accomplished; green is the complimentary color of red and blue—which means, I suppose, that when we have paid our money and read the paper we are a "Nickelo out of pocketo," and feel blue. In regard to the quotations from Shakespeare, I would say that, notwithstanding the fact that they are not quite literal, I certainly think them decidedly superior to the general matter of the "Plug," and I would suggest that the subscription list might be very largely increased if the editor would take up one of Will's plays and publish it in serial form. Adapted to the size of the paper, with its present type, it would furnish valuable reading for some years to come. Probably by the time Hamlet, for instance, shall be finished, most of the present subscribers will have gone to their graves at a ripe old age, and the W. U. Tel. Co. numbered with the things that were. So it will have answered a good purpose as profitable and cheap reading for the masses—of operators. Watts' hymns might be thrown into the corner as humorous poetry. And then, perhaps, in the distant future, when this play shall have been all published, some operator yet unborn may stand "in lonely contemplation" by the present editor's tomb in silent meditation on his merits and his fame, and thus soliloquize, "Alas, poor Yorick!" And is this he who once so bravely said—"Come again, Nihil, and we will nihilate you?"

At last he says "Farewell!" and I, feeling the tenderness of the occasion, though I cannot help thinking "Where ye ganging till," say also—Farewell, 'tis hard to give thee up.

"Here's a health to ye, Jamie, my dear,
Where'er ye may journeying gae;
May ye find monie friends,
Wi' muckle to lend,
For little your ain will ye hae.

Nihil NAMELESS.

Advantages of T. M. B. Association.—A New and Superior Relay.

CHICAGO, Nov. 2d.

TO THE EDITOR OF THE TELEGRAPHER.

THE excitement in consequence of the formation of the American Electrical Society being over, the next thing in order, and that which is taking up the attention of a portion of the fraternity, at least in this section, is the coming annual meeting of the Telegraphers' Mutual Benefit Association. The action of the meeting of this district, recently, seems to have met the approbation of those belonging in this district who were unable to be present, as no further meetings have been called. There is very little doubt but that Mr. F. W. Jones (the agent of this district, who was appointed as delegate to the annual meeting of the Association in New York the 11th of this month) will attend that meeting in person, and there present the

views of the members of the Association in this district.

The Association has long since become an established fact. It has done a great deal of good, and the members and those intending to join the Association should study to understand more fully the real principles of the Association. They should feel and know that the interests of each and every member are identical.

The Association is pledged to pay the heirs of the deceased members the proper amount, and the members by joining the Association pledge themselves to stand by it and pay their assessments.

A certain number are sure to die every year; no one is so gilded as to know what length his lease of life may be; we dare not look about us to see who will be the next to fall, for fear we should see the reflection of our own face.

The fact that the heirs of the deceased have at the proper time been paid what has been laid up for them by the thoughtful prudence and foresight of their dependence in life, should be a sufficient guarantee that the Association will deal as honorably with their loved ones. As assessments occur from time to time it illustrates the uncertainty of human life, and we should be taught thereby to be prepared in every way for the transition from this mundane sphere.

In regard to the cheapness of this mode of insurance, to look at it from no other standpoint, a review of the cost from year to year will show that it is one of the cheapest modes of insurance in existence. You pay only the amount necessary to pay the losses of the Association by death.

It is an absolute condition of your contract, if you are already a member, that the payment of each assessment when it becomes due is the only way to perpetuate your insurance and protect your family.

The necessity for such an Association is clearly demonstrated by the number of subscription papers being circulated for the benefit of families of deceased operators, who from some cause either did not join, or, if they joined, allowed themselves to become delinquent members, and died delinquent to the Association. As the Association is now pledged to pay a certain amount, the death of a delinquent results disastrously only to his family not to the Association. In concluding these remarks about the Association, I would like to impress upon every member of the fraternity all over our broad land who is still in good health, the duty they owe their families and urge them to join the Association at once. The larger the membership the lighter the assessments, as the ratio of deaths never increase in proportion to the ratio of new members; where one dies a dozen join.

I think the correspondent who keeps you informed as to the births, marriages, etc., in this vicinity, rather slighted our friend Ed. Whitford, of the W. U. office of this city, as he was made a happy father some three months since by being presented with a fine daughter, a regular "giant sounder." I have scanned the columns of THE TELEGRAPHER for some time in hopes of seeing an account of the *debut* into Chicago society of the aforesaid young lady, and cannot wait a "whit" longer.

Among the rising young men of our city, scientifically, I think should be mentioned the name of Mr. E. P. Warner, one of the original members of the American Electrical Society. He is at present employed as a mechanic in the Western Electric Manufacturing Company's shops in this city. His native modesty kept me from making his personal acquaintance until quite recently. Mr. Warner has for some time past been turning his attention to the perfection of a new style of relay, which I will call the "Warner Relay." It differs very materially from anything of the kind I have ever seen, not only in principle but in mode of construction. It has recently been tested on several of the Western Union wires in this city. On the St. Paul wire, where a Western Union relay of 640 ohms was required to work the circuit, Mr. Warner put in his relay, which he had not yet perfected, made out of pieces of old instruments, measuring but 140 ohms, and it worked better than the Western Union relay. The circuit was working very heavy, it being very difficult to send with the Western Union relay in circuit, but with the Warner relay it was almost as easy to send as on a short circuit. On the Buffalo circuit, where a 640 ohm W. U. relay was used, one of Warner's of 80 ohms worked very satisfactorily, and one of 150 ohms (Warner's) worked better than the 640 ohm Western Union.

One of 80 ohms was also worked on the Milwaukee duplex (Stearns bridge system) very satisfactorily.

I am sorry I cannot more fully enlighten you by a diagram of the relay. The following explanation will have to suffice for this time:

The retaining force of the iron cores are greatly reduced by making the electro-magnets but one half the length of the shortest used on the best style of horseshoe relays.

No armature has to be magnetized by induction from the poles of the electro-magnets. The cores (one of which acts as an armature) are simultaneously mag-

netized by the same current, and polarized in such a way as to attract each other. This arrangement is free from the difficulties experienced in magnetizing soft iron armatures, where they retain their polarity for a short time after the current ceases, and do not become fully charged at the instant the current passes through the coils. The permanent magnet induces the same polarity upon the extensions of the movable core as is done by the current through the coils, and when the magnetism induced by the current is in excess of that induced by the permanent magnet, the latter gives the movable core a repulsion in the direction of its movement, with a force proportionately to the excess. It is necessary that the line current should flow through the coils always in the same direction, in order to produce the best effects, and this direction is decided by the polarity of the battery. A little commutator, the arrangement of F. W. Jones, is attached to the base of the relay, so that one move to the right or left instantly reverses the coils in the circuit.

OCCASIONAL.

The New Western Union Office at Boston, Mass.

BOSTON, MASS., October 29.

TO THE EDITOR OF THE TELEGRAPHER.

THE main office of the Western Union Telegraph Company in this city had been located for so long a time at 83 State street that the location had come to be considered as permanently dedicated to telegraphic use. The increase of the business has, however, gradually outgrown the accommodations, and it has been evident for some months past that better quarters must soon be obtained, where more room and more suitable arrangements could be had. It would, perhaps, be interesting to write up the various telegraphic changes which have taken place since the upper story of the *Traveller* building at 31 State street sufficed for the accommodation of the companies and lines which were consolidated into the American Telegraph Company, but for this there is neither time or space at present. There are still in this office several who have been continuously employed here during all this time, who have witnessed the expansion and increase of the business as it has outgrown the quarters which have been from time to time provided for it, necessitating removals from premises which were originally supposed to be ample to accommodate it.

Several weeks ago preparations were commenced and have actively continued for the removal of the office from 83 to 109 State street, where it is in future to be located until such time as even more extensive accommodations shall be required.

The transfer was effected on Sunday, the 25th of October, much to the gratification of all parties concerned, especially the operators, to whom, for some time past, pure air in working hours has been unattainable.

As yet the finishing and ornamentation of the new office is incomplete, yet the improvement over our old quarters are evident to every one who may see the two places.

The receiving office is a large, beautifully fitted up apartment, heated, as is the building throughout, by steam, which is also the motive power of the establishment. The desks and counter are of New York manufacture, and are almost the counterpart of those in the main office in the metropolis. The messages are transmitted from the receiving office to the operating room by pneumatic tubes, which are placed conveniently for the use of the receivers, thus greatly facilitating the work of the office.

In the rear room, which fronts on Doane street, is the delivery department, where the delivery clerks and messengers are accommodated, and find their new quarters much pleasanter and more accessible than the cellar room which was allotted to them in the old building.

A portion of the second story will be occupied by the officers of the Associated Press, and the other rooms on that floor are let to other parties for offices.

On the third floor are the apartments for the lady operators, the office of the Superintendent, etc. The battery room, in which there are 1,750 cells of Callaud battery, is in the fourth story, where are also located the cloak rooms, etc.

In the fifth and topmost story the operating room is located, which has been remodelled for its present use, and the floor so laid with traps that any section of the wires may be easily reached.

The switch is of the ordinary plug pattern, and one of the most perfect and complete manufactured, while all the appurtenances of a well appointed office, printing and copying machines, etc., to be found in good working order. There are sixteen instrument tables in this room, with accommodation for four wires, with an extra table for the repeaters.

In a few days the new gas fixtures, and the other indispensable et ceteras not yet completed, will be in readiness for use, and then the Western Union will have a Boston office worthy of the city and the company.

O. P. R.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, NOVEMBER 7, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLELY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST OF THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH HOUND, or NOAD'S STUDENT'S TEXT-BOOK and CLARK ON ELECTROCAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

THE FAIRY ELECTRIC ENGINE, or a set of F. L. POPE & Co.'s popular NONPAREIL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

P. O. Box, 5503.

Publisher.

Excellent and Successful Telegraphic Management and the Result.

In the last number of THE TELEGRAPHER, in commenting upon the Annual Report of President ORTON, we incidentally alluded to the management of the Montreal Telegraph Company and its satisfactory results to the stockholders and the public. It has occurred to us that the subject could be profitably treated more at length, and the contrast to the management and results of telegraphic enterprises in the United States generally is so striking, that it may serve a useful purpose to present the matter for the consideration of those who may be engaged in initiating or managing similar enterprises here.

The Montreal Telegraph Company was organized in January, 1847, commencing business in July of that year, with a line between Toronto and Quebec, a distance of 540 miles. The amount of the original capital was \$60,000, which it will be conceded was by no means excessive for the length of the line. The company appears to have been carefully and economically managed from the start, Sir HUGH ALLAN, its President now, and Mr. JAMES DAKERS, its present Secretary, having been originally connected with its management. A definite policy, and, as it has proved, a very wise one, was adopted, which was to pay to the stockholders a reasonable dividend on their investment from the proceeds of the business, and devote the surplus, whatever it might be, to extending and strengthening the lines and furnishing additional facilities, as they were required. This policy has been steadfastly adhered to up to the present time, and under it the line has been exceedingly profitable to the fortunate holders of its stock; the public has been provided with adequate telegraphic facilities as they were needed, and the company has become one of the leading telegraphic organizations of the Continent. A dividend of ten per cent. has been paid to the stockholders every year since 1847, with the exception of two years, in which the dividends were eight and nine per cent., respectively. The surplus expended in extending the lines has been returned to the stockholders as a stock bonus, from time to time. In this manner the capital of the company has been increased from \$60,000 to \$1,750,000, and its lines have been extended throughout the present Canadian Dominion—the greatest length of line now worked by the company being 1,750 miles. The company now owns and operates 12,000 miles of poles, 18,000 miles of wire, and has 1,300 offices. It will be seen that the present capital of the company is by no means excessive, being only \$146 per mile of poles owned by the company. The lines and equipment are kept in excellent condition, and ready for any demand which may be made upon them. The tariff was reduced, from time to time, until January 1, 1870, when the low rate at present existing was adopted, and the company has now a uniform tariff to all Canadian points of twenty-five cents (gold) for a ten word message—date, address and signature free, as on United States lines—and one cent for each additional word. To this there is but one exception. When the distance is less than 12 miles the rate is 15 and 1 (gold). The American currency rate of the company is 30 and 2. At the time this reduction was made it was regarded by telegraph managers and others on this side of the line as a hazardous one, but the result has proved that the managers of the company acted intelligently, for the reduced rate has proved not only satisfactory, but profitable—the revenues having steadily increased.

In the management of this model company there is no expensive red tape, everything being simplified as much as possible, as we understand; and while the agents of the company are held to a rigid accountability, it is not considered necessary to expend a dollar to discover a possible discrepancy of ten cents.

The Montreal Telegraph Company has no debt, either bonded or floating, and it is hardly necessary for us to state that its stock is held in high estimation by investors. The shares, whose par value is \$100, are held

at \$195, and are seldom to be obtained even at the latter figure.

It should be remembered in this connection that the territory covered by the company is much inferior telegraphically, to that of the principal United States companies, being more sparsely settled, and embracing but few large cities or places, and none equalling many in our own country. It cannot be said either that the company has not had active competition to contend against. During its existence several competing telegraph companies have been organized, and the Dominion Telegraph Company, now in successful operation, is by no means a competitor to be despised, and is pursuing, under its present management, a policy similar to that of the Montreal Company, and with satisfactory results. The Dominion Company is yearly extending its lines, and the season now closing will have added 700 miles of line to that which it previously had. This company is also paying dividends regularly to its stockholders—that for last year, and we believe for the year previous, having been at the rate of 5 per cent. In fact, telegraphic enterprises that do not pay dividends are not much in favor with our Canadian friends.

We do not know of any existing telegraph enterprise in this country, with the exception of the Northwestern Telegraph Company, which can compare favorably with those of which we have been stating the simple facts. We do not desire or intend to make any invidious comparisons, but these facts and figures are certainly suggestive, and worthy of the earnest consideration of our telegraphic managers, and especially of those who may have in view the inauguration of any new telegraphic enterprises. We have frequently pointed out what have appeared to us to be errors in telegraphic management, which stand in the way of satisfactory pecuniary results. One of these is much too common, and cannot but be considered a very damaging one—that is starting companies with an inflated nominal capital, selling shares at a quarter to half their nominal price, and distributing large amounts of bonus stock to promoters and contractors for which in fact no equivalent is received. If the nominal capital of a telegraph company represented only the actual investment at the start, and was increased only as the property of the company was increased, by expenditure of revenue or by additional investments, it will be seen that a heavy load which most of our telegraph companies have to carry would not encumber it and prevent its pecuniary success, and the money would be more carefully looked after and economically expended. It is time that American investors should get over the fallacy which has seemed to possess so much attraction, and been believed in quite generally, that dividing a dollar into two or more parts will give the holder two or more dollars, as the case may be, while in fact the result is merely to impair or destroy its intrinsic value. Inflating the capital of a telegraph or any other corporation only decreases the ability to pay dividends on the nominal amount.

With a reasonable capital representing the actual value of the property, and economical management, there is no reason why telegraph companies in this country should not show results at least as favorable as that of the Montreal Telegraph Company. There must in such case be no "rings" to absorb the profits, either in extravagant salaries or profitable pickings to the officials or contractors, in which the shareholders do not generally participate. The lines must be managed for and in the interest of the investors and of the public, for whose service they are supposed to be constructed and operated. While remunerative prices should be exacted for the service rendered, these should be as reasonable as is compatible with the proper and adequate compensation of the employes, the maintenance and extension of the facilities, as required, and a reasonable return for the investment will permit.

We should very much like to see a national telegraphic enterprise thus established and conducted in this country, and have no doubt but that its success would be assured, even with all the odds that might

exist against it at the start. If the lines and companies now competing with the great telegraphic corporation of the country could be brought under one control and management, and consolidated on a fair and reasonable basis as regards capital, we have no doubt but that the additional capital required to extend and complete the system could be obtained with very little difficulty. The obstacles to such a consolidation, so far as the majority of their stockholders are concerned, are by no means so formidable or difficult to be overcome as is generally supposed, and we once more renew our oft repeated and urgent recommendation that they shall, in their own interest and for the general welfare, take such action as may be necessary to bring about the result which all concerned admit to be desirable and necessary, but which, up to the present time, very little effort has apparently been made to secure.

The Direct United States Cable.

WE learn by cable despatches that the contractors for the Direct United States Cable have succeeded in recovering the lost end of the cable, and have spliced it to the cable remaining on board the Faraday, and at the last advices were making good progress in laying the remaining section to the Newfoundland coast. Should no further misadventure occur, we shall probably have the pleasure next week of announcing the completion of the cable, and the inauguration of competition in Atlantic telegraphy.

The contractors deserve much credit for their enterprise and perseverance in recovering the cable at this late season of the year, and in completing the task which had been generally considered impracticable before another season. It is gratifying to know that the cable was found to be in perfect condition, and there was nothing to prevent the immediate completion of the task which had been so unexpectedly delayed.

The Fairy Electric Engine.

THIS beautiful electric toy, which is advertised by the ELECTRIC MAGNETIC Co. in the THE TELEGRAPHER, will be found worthy the attention of those who are looking for something which shall interest and amuse them, or for presents, etc. It is very simple in construction, and substantially built. It has the advantage of the small steam engines which have heretofore been so popular, in that it requires no fire or apparatus for generating steam, and that while they can be run but a few moments at a time, this will run continuously for weeks if required, without any attention. It is sold with or without battery, as may be desired. The battery furnished by the company is the celebrated and popular Eagle Metallic Battery, which is manufactured by Messrs. F. L. POPE & Co., and which is coming into general use.

As the holiday season is at hand when presents are in order, and to enable telegraphers to obtain these engines without expense to themselves, we have decided to offer it as a premium for FIFTEEN yearly subscriptions to THE TELEGRAPHER. It is not a difficult matter to obtain that number of subscribers for so useful and popular a journal as THE TELEGRAPHER on almost any circuit, and we hope to be called upon for many of these engines as premiums between this and New Year.

The Telegraph.

By Cable.

RECOVERY OF THE DIRECT UNITED STATES CABLE.—THE WIRE IN PERFECT CONDITION.

LONDON, Nov. 2.—The cable of the Direct United States Cable Company, which parted and was lost while being laid by the Faraday, has been picked up by that vessel in latitude 50 deg. 31 min., longitude 24 deg. 19 min., at a depth of 1,871 fathoms. The cable is in perfect condition. It was spliced to the portion remaining on the Faraday at eleven o'clock this morning, and the work of paying out again commenced.

Extension of the Gold and Stock Telegraph Lines.

THE lines of the Gold and Stock Telegraph Company in this city have recently been extended from Forty-first street and Lexington avenue to Forty-fifth street and across to Seventh avenue; also from Forty-fourth street and First avenue to Seventy-fifth street and First avenue. The poles are 50 and 55 feet in length, and are arranged to accommodate 25 wires.

The lines of this company now extend from Rector and Greenwich streets across the Battery Park to Water and Pearl streets, which is the main line, the poles being 65 feet in length, and carrying 74 wires. From Rosevelt street continuing on to the Jackson street cable, crossing to Brooklyn with forty-five Brooklyn wires. From Rosevelt street the Uptown line continues up the Bowery and Fourth avenue to Thirty-second street, and thence by Lexington avenue to Forty-fifth street. The poles on this route carry 25 wires.

Another branch leaves the main line at Oliver street, continuing along Henry and Allen streets to First avenue and up First avenue to Seventy-fifth street, crossing at Forty-fourth street to Lexington avenue, and thence on Forty-fifth street to Seventh avenue.

On the west side of the town the line commences at Canal street, on North River, and runs up to Thompson street, through Thompson street and Greenwich avenue to Seventh avenue and Fifty-ninth street to the North River again, with 25 wires.

Their Brooklyn system of wires is very extensive.

All these lines were constructed by the veteran contractor and line builder, Mr. Robert Brown, who has done more towards covering New York streets and avenues with telegraph poles, probably, than any other person extant.

Foreign Telegraphic Notes.

THE traffic receipts of the Eastern Extension, Australasia, and China Telegraph Company, for the month of September, 1874, were £18,163, against £19,128 for the corresponding period of 1873.

The Eastern Telegraph Company's traffic receipts for the month of September, 1874, were £28,208, against £33,172 for the corresponding period of 1873.

The traffic receipts of the Great Northern Telegraph Company for the month of September were: This year 427,121 francs; last year 334,781 francs. Total traffic receipts from 1st January to 30th September: This year, 3,341,583 francs; last year, 2,388,131 francs.

The number of messages (of twenty words) passing over the Barcelona-Marseilles cable for the month ending September 30, 1874, was 5,940.

The New Washington (D. C.) Police Telegraph Lines.

THE new police telegraph lines, constructed by the Board of Police Commissioners, under the superintendence of George C. Maynard, have been completed and put in operation.

The system is much more extensive and complete than the old one, and gives the Chief of Police direct and constant communication with all parts of the District. There are five separate circuits leading from headquarters, as follows:

Circuit No. 1.—To Lieutenant Eckloff's station, 9th and K streets; Lieutenant Green's, Twentieth and K streets; Lieutenant Hurley's, Georgetown and to Tenallytown.

Circuit No. 2.—To Lieutenant Noonan's, Seventh and Boundary streets, and to Brightwood.

Circuit No. 3.—To the Reform School on the Bladensburg road.

Circuit No. 4.—To Lieutenant Kelly's, First and F streets, and Benning's Station, on the Baltimore and Potomac Railroad.

Circuit No. 5.—To Lieutenant Skippon's, Central Guard-house; Lieutenant Gessford's, Four-and-a-half and E streets, southwest; Lieutenant Austin's, Fifth and E streets, southeast, and Government Hospital for the Insane.

The total length of line is about twenty-five miles. Substantial poles have been set on all the routes, the best American wire, and Brooks' patent insulators have been used, and the system is the most perfect of any police telegraph in the whole country.—*Washington Chronicle.*

The Telegraphers' Mutual Benefit Society.

AT a meeting of the members of the Buffalo, N. Y., District of the Telegraphers' Mutual Benefit Association, held October 24, 1874, of which Mr. Thomas A. Laird was chairman, and Mr. D. T. O'Reilly was secretary, the following resolutions were discussed and unanimously adopted:

Resolved, That J. W. Tillinghast, Esq., be appointed delegate to represent this district at the annual meeting, to be held at 145 Broadway, New York, Nov. 11th, 1874.

That it is the sense of this meeting that the reserve fund shall be increased to at least ten thousand dollars.

That the delegate from this district be authorized to bring forward such measures and reforms as in his judgment may be for the best interest of the association.

That the expenses of the delegate be defrayed by a per capita assessment on all members of this district. Adjourned.

Activity of Telegraphic Invention.

THE inventive genius of the country has for the past few months been directed to the improvement of telegraphy, particularly toward the improvement and invention of instruments to increase the facilities to cheaper transmission. About four hundred applications have been made for patents of various kinds of inventions in this line. A large number of experts are constantly engaged in experimenting, with a design to increase the rapidity of transmission, register signals by ocean cables, and for various other purposes.—*Washington Chronicle.*

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS UP TO AND INCLUDING OCT. 26, 1874.

ASSESSMENT No. 69.

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

Showing Lowest and Highest Prices each day during week.

Table with columns: OCT., WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. Rows for Oct 29, 30, 31 and Nov 2, 3, 4.

New Patents.

For the week ended Sept. 29, 1874, and bearing that date.

156,396.—ELECTRO-MAGNETIC ENGINES.—H. Van Hovenbergh, Elizabeth, N. J. Filed May 27, 1874.

The electro-magnetic motor composed of a four armed armature upon a vertical shaft, that is sustained between the poles of an electro-magnet by the cross bar e between the cores of the magnet, as and for the purposes set forth.

155,499.—ELECTRO-MAGNETIC STOP-COCKS.—Edward Coe and Homer W. Fiske, New Haven, Conn. Filed June 4, 1874.

The arms on the lever E, and projections on wheel A bear such a relation to each other that a full make and break must be had to cause an operative movement of the cock.

The combination of the shaft B, connected to the plug of a cock, the spring D, the toothed wheel A, and the reciprocating bar E, provided with an arm a above and an arm b below the wheel, and armature F, the said arms arranged relatively to each other, and to the teeth of the wheel, as described, so that one arm will come within the circumference of the teeth of the wheel before the other arm leaves it, substantially as specified.

Born.

ANDERSON.—October 25, 1874, to D. S. ANDERSON, of the Western Union Chicago, Ill., day staff, a daughter. First edition, good sounder, regular snapper and rattler combined.

GOODING.—October 27th, 1874, to C. F. GOODING, of the Western Union Chicago, Ill., night force, a daughter. Good-ing nuff.

Married.

ADAMS—DIRSTINE.—At the residence of the bride's mother, Alexander, N. Y., at ten A. M. October 6th, 1874, by the Rev. Dr. Hunt, EDGAR G. T. ADAMS, for many years manager of the W. U. Batavia, N. Y., office, to MISS ELLA A. DIRSTINE.

To Milwaukee, Wis., and return, all beaming with love. Both in luck. One has secured an amiable, beautiful and accomplished lady as a wife, the other has a husband with few vices and many virtues. Bring to mind all that has been said about currents, connections, splices, crosses, etc., matrimonially, and you can imagine just what we would say here: "Long life and happiness."—Ed.

Died.

MINER.—At the residence of his father, New Albany, Indiana, October 15, 1874, of hemorrhage of the lungs, CHARLES T. MINER.

Obituary.

MR. CHARLES T. MINER, whose decease occurred at New Albany, Indiana, on the 15th of October last, was an operator of more than ordinary ability, filling for more than a year with brilliant success the position of manager of perhaps the busiest railroad telegraph office on the Michigan Central Railroad at Jackson, Mich.

A Southerner by birth, our northern climate proved too rigorous for him, and entailed upon him a difficulty of the lungs which only ended with his life. He sought relief and renewal of his lease of life in the far West—his gentlemanly exterior and courteous manner, added to his attainments as an operator, quickly influencing Western superintendents in his favor, so that at once they gave him good offices, such as Colorado Springs and Central City, Colorado, in order to facilitate his pursuit of health. The result was so encouraging that last January he thought himself well enough to return, and so took a position in the despatcher's office at Kalamazoo. A renewal of his disease sent him back to the territories, where he accepted a position in the employ of the Union Pacific R. R. at Laramie, Wyoming, but it was then too late, and realizing that there was no escape he came to his friends in the east, to give them the

comfort of his presence, and to find rest and comfort while abiding the hour when he should seek his heavenly Father's house and face.

He was a man of education, culture and refinement, and evinced much tenderness and mildness of disposition to those who could perceive and appreciate it. In short, he was every thing that is implied in the "grand old name of gentleman." What better tribute can I pay to him? What more could any one have said of us, when of us "there is left but a handful of dust and a memory?" Homer, Michigan.

F. L. POPE & CO., 38 Vesey street.

OFFICE OF EUGENE F. PHILLIPS,

20 CONDUIT STREET.

PROVIDENCE, R. I.,

September 15, 1874.

GENTLEMEN: I take pleasure in calling your attention to my

PATENT FINISHED INSULATED TELEGRAPH WIRE.

I claim this to be the best braided wire manufactured, and I believe it is universally acknowledged so throughout the country by all the large Telegraph Companies and Telegraph Supply dealers. Its points of superiority are:

- 1st. Its excellence of outside finish. 2d. The toughness of the Patent Compound with which the braid is saturated. 3d. By its polished outside finish, its adaptability for shedding rain and sleet. 4th. On account of the nature of the compound it can be laid directly against any wall or paper without staining or greasing it, which cannot be said of any other paraffine wire.

It is the only braided wire made, which, after it has been up for any lengthtime, will, with ordinary dusting, like any piece of polished furniture, look bright and fresh as when first put up. All other wire, regardless of its color, when first put up, will, in a short time, become dusty and dirt color, making an unsightly thing in an office, where mine, with its brilliant, fresh color, is an ornament.

The toughness of the compound, which also makes it capable of taking this splendid polish, makes it the most durable braided wire made. It is especially desirable for outdoor use, as the rain cannot beat the compound off, and its smooth surface prevents the snow and sleet from sticking to it.

A grease streak along the wall or paper behind the wire running into a nicely fitted up Broker's office, does not make him feel—well, good natured. This can be avoided by using this wire.

I also make it in cables of any number of conductors at the regular price for a single wire.

It is finished in any desirable color or plaids, with a light or heavy insulation, at the following prices:

Table with columns: No., BROWNE & SHARPE'S GAUGE, Price per lb. Rows 8-20.

Finer numbers at special prices.

Galvanized Iron Wire.....\$125 00 per mile. American Compound Wire..... 3 1/2 cents per foot.

Each covered with three heavy linen braids, and well saturated for outside use.

Ten per cent. discount in quantities not less than 10 lbs.

Fifteen per cent. discount in quantities not less than 10 lbs.

A liberal discount for larger orders.

Patented November 18, 1873.

I also manufacture plain cotton or linen covered wire, or will saturate the braid of the same with paraffine, shellac or paint. This may be covered with a wind and braid outside, or two braids, or a single braid, as the customer may wish.

This, if applied, is rubbed smooth on the outside, and I claim and believe is as good as any braided wire made, outside of my Patent Finished.

Table with columns: No., BROWNE & SHARPE'S GAUGE, Price per lb. Rows 8-20.

Finer numbers at special prices. Discount same as on Patent Wires.

I also manufacture a RUBBER COVERED WIRE, which will not grow stiff and crack off in cold weather, or grow soft in the hottest weather.

By my process of putting this rubber on the wire will be found in the exact centre every time. After the rubber is put on it is vulcanized, and then covered on the outside with a braid

and finished, and is suitable for under ground, under water, or any outside or other purposes.

I also manufacture a **PATENT ELECTRIC CORD**, which is pronounced by all to be the most flexible of any in the market, and the best suited of any made for Switch Boards, Medical Batteries, etc.

Silk covered, price per foot.....\$0 06
Cotton or Linen covered, price per foot..... 0 05

Ten per cent. discount on 100 feet. Fifteen per cent. discount on 200 feet.

GENERAL REMARKS.

All wire used by me is made to my special order, and is the best that can be had in the market.

As one of the largest dealers told me a short time ago, "Your wires have come into the market on their merits alone, and we have been forced to keep them," so you may feel sure I shall feel chary of that honor, and shall be very careful to furnish none but the very best in my power.

I could give a long list of testimonials, but I will still depend on the "merits" of the wire, and respectfully solicit your patronage.

Your obedient servant,

EUGENE F. PHILLIPS.

These Wires can be had at my prices of

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.
PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

THIS SYSTEM OF

FIRE ALARM & POLICE TELEGRAPH WITH A CENTRAL OFFICE,

OR

UPON THE AUTOMATIC PLAN,

is now in operation in the following Cities, to which references made for evidence of its great

SUPERIORITY, VALUE

AND

UNIFORM RELIABILITY.

Albany, N. Y., Alleghany, Pa., Boston, Mass., Bridgeport, Conn., Buffalo, N. Y., Baltimore, Md., Chicago, Ill., Cincinnati, Ohio, Columbus, Ohio, Cambridge, Mass., Charlestown, Mass., Covington, Ky., Detroit, Mich., Dayton, Ohio, Elizabeth, N. J., Fall River, Mass., Fitchburg, Mass., Hartford, Conn., Indianapolis, Ind., Jersey City, N. J., Louisville, Ky., Lowell, Mass., Lawrence, Mass., Lynn, Mass., Mobile, Ala., Montreal, Canada, Milwaukee, Wis.,

New York City, New Orleans, La., New Bedford, Mass., New Haven, Conn., Newark, N. J., Omaha, Neb., Philadelphia, Pa., Pittsburg, Pa., Portland, Maine, Peoria, Ill., Providence, R. I., Quebec, L. C., Rochester, N. Y., Richmond, Va., St. Louis, Mo., St. John, N. B., Springfield, Mass., San Francisco, Cal., Savannah, Ga., Syracuse, N. Y., Troy, N. Y., Taunton, Mass., Toledo, Ohio, Toronto, Canada, Washington, D. C., Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER, 104 Centre Street, NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAYS

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDER made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employés, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
20 CONDUIT STREET,
PROVIDENCE, R. I.,
Manufacturer of
Patent Finished Insulated Wire, Patent Rubber
Covered Wire, Magnet Wire, Patent
Electric Cordage, Cables, etc.

I claim to furnish the best Braided Wire in the Market, and I believe it is acknowledged as such by all large Telegraph Companies and Telegraph Supply Dealers.

My Wires were awarded the first premium at the Cincinnati Exposition of 1874, both for best "Office" and best "Insulated Line Wires."

These Wires are furnished in any desirable color or plaids.

My Rubber Covered Wire will not crack, and is not affected by ordinary extremes of heat or cold. The rubber covering is of uniform thickness, and the wire will be found in the exact centre—a result not heretofore produced.

I also make cables of any number of conductors at the regular price for a single wire.

With new and improved machinery I feel satisfied that I can furnish magnet Wires as good as any to be found in the market.

All Wire used by me is made to my special order, and is the best that can be procured in the market.

I could give a long list of testimonials, but depend on the merits of the Wire for patronage.

Please send for sample card and price list.

These Wires can be had at my prices of

(Below Green St.) PHILADELPHIA, Pa.,
MANUFACTURERS OF

INSULATED WIRES.

- OFFICE WIRE—Plain, Braided, Prepared, &c.
- INSTRUMENT WIRE—Cotton and Silk Covered, &c.
- FLEXIBLE CORDS, all kinds, &c., &c.

We warrant all Wire to be of the highest conductivity, tested by our Galvanometer, which compares with the tests of the highest authority in this country.

TILLOTSON'S EXCELSIOR TELEGRAPH INSTRUMENT

(PATENTED JUNE 24, 1873.)

This apparatus is constructed of the best material, and finished equal to any Telegraph Instrument, and is warranted first class in every particular. It is especially adapted to the requirements of Students of Telegraphy and the operation of Private Telegraph Lines.

- Price, complete, Sounder and Key mounted on finely finished Mahogany Base, with one Cell Hill's Patent Battery, with Chemicals, eight feet of Office Wire, and "Smith's Manual of Telegraphy"..... \$7 50
- Two sets..... 14 50
- Price of Sounder and Key only..... 6 50
- Arrester attached..... 7 50

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order, SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE, AND FOR

BLASTING AND MINING PURPOSES,

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,

has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

A Cry from Macedonia.

BY OWTON A FLYE.

WHERE is the immortal Nibbs?

He came to us when the first robin warbled its notes in the ethereal mildness of a springtime long ago. Nobody shuddered at the awful immensity of his avoirdupois, because from out the polished dome which surmounted it all there beamed two lustrous orbs, giving evidence of a soul within whose dimensions were in delicious accordance with the whole.

Nobody lost faith because the subject of this paper never had any tobacco, inasmuch as all his propositions came to us, burdened with such an air of patronage that they seemed sufficient in themselves to fill our waiting hearts to overflowing, and even to bubble over, and out, and around, filling as it were, eternal and incomprehensible space.

Nobody smiled derisively, sardonically or otherwise, when the person who is the burden of my song to day opened his key to the tune of once in every five words, because the manner in which it was performed and the object sought to be obtained bore upon their very faces the essential elements of plausibility to such an extent that our doubting hearts were converted to his method on the spot.

Nobody drifted on to the ragged edge of remorse when it became known that he for whom we mourn to-day gave no symptom of unimpeachable veracity. We realized then for the first time how easy it was to lie, and, heaven save the mark, how easy it was to listen. Whether modesty had grown up in him to be part and parcel of his being, or whether the intents and purposes of his life were directed against our susceptibilities, we can never know; but the fact remains that he never presented the truth to us in its nakedness, but always brought it decked out in the glitter and glare of perversion and doubt, and our souls adapted themselves to the occasion, and believed. This demonstrates clearly enough that, of all things, lying is the easiest, except—believing. Debtor and creditor were never nearer, and, perhaps, dearer to each other than the weary, toiling and aspiring art nimbles of that day were to this new departure—if the expression may be allowed—of our lives.

But a shadow came—the first great overwhelming disaster of our times. A principle was to be confirmed or abandoned. It was the strike of '70. Our hero, true to conscience, or necessity, went with us, and oh! shades of Gilligs! the principle was lost, and so was our idol; gone from us, it may be, forever!

Speaking for myself, I can never forget how he appeared to me as the first and only distinct embodiment of my ideal of Scipio at Carthage.

However, there's a fragrant air of memory about these musty walls; we have many mementoes of his virtues still left to us; we cling tenderly and tenaciously to every token of his whilom glory, yet we all cry out in the agony of our souls, where, O! where is his Nibbs?

Duplex, Quadruplex and Fast Telegraphy.

THE following extracts from a communication of Mr. D. H. Craig, in a recent number of *The Graphic*, will be of interest. It will be noticed that he intimates that the "Quadruplex," even if successful, is not available to the Western Union Telegraph Company:

In President Orton's recent annual address to the shareholders of the Western Union Telegraph Company much stress is laid upon the "Duplex" and high hopes placed upon the "Quadruplex" systems of telegraphing. Those systems are doubtless improvements upon the Morse system in the number of words which can be transmitted over a single wire in a given time in fair weather, but the claim of the inventors and their friends that the capacity of the wires of the Western Union Company can be doubled by the "Duplex" or quadrupled by the "Quadruplex" system may answer very well to bolster up the stock of the "monster" company amongst the speculators in Broad street and the curbstone philosophers in New street, but there is

not a practical operator who values truth in the employ of the company who will say that 1,500 words per hour can be averaged, one hour and one day with another, by "Duplex," nor that 2,500 words can be averaged by the "Quadruplex." If the same operators had independent wires, the first four would prefer to send 2,000 words (instead of 1,500 by "Duplex"), and the eight operators would prefer to send 4,000 words instead of 2,500 by "Quadruplex"), one hour and one day with another. A moment's consideration, therefore, will show the utter fallacy of the claim of the President and Electrician of the Western Union Company, either that the capacity of their wires can be doubled or that the business of telegraphing can be at all cheapened by the "Duplex" or quadrupled or "cheapened" by the "Quadruplex." So far are these statements from being correct that it is quite within the truth to say (and the practical telegraphers of the Western Union Company will confirm my statement) that it would cost the company at least twenty per cent. more—labor and wires included—to do their business by the "Duplex" than it would by the Morse system, and it would cost at least twenty-five to thirty per cent. more to do the business by the "Quadruplex" than it would by the "Morse." As I have a large and direct interest through the Automatic Telegraph Company (who own all the so-called inventions of Edison in the too much commended "Quadruplex" system), my judgment is not likely to err on the wrong side. I may also say that no one having authority has ever proposed to give the Western Union Company permission to use the "Quadruplex" system; and it is difficult to imagine what purpose Mr. Orton had in his extravagant allusions to it, unless it was to lead support to some of his "lameduck" friends in Broad and New streets.

The well affected enthusiasm of the managers of the Western Union Company in favor of "Duplex" and "Quadruplex" telegraphy is by many supposed to be for the purpose of hiding their ignorance and brazen effrontery in 1869-'70 in denouncing my "Automatic" or "Fast" telegraphy. At that time the President and Electrician of the Western Union Company insisted that there was no system of telegraphy equal to Morse (and this in the face of the fact that "Duplex" telegraphy was then thoroughly established upon the Franklin Boston line), and that my Automatic system was utterly valueless, because, as they said, it could not be worked at a faster speed than about sixty or seventy words per minute in a circuit of 250 miles, whilst the fact is that over 1,000 words per minute have been and can at any moment be transmitted by that identical Automatic system over 300 miles of wire. Those gentlemen are too proud, or too conceited, or both, to acknowledge their error, and they have been raising a furious dust ever since, first about one trumpet blowing or another, like "Duplex," "Wheatstone's Automatic," and now about "Quadruplex" telegraphy, and all the time, in place and out of place, through thousands of addresses, reports and "official journals," and through their legions of subservient tools all over the country, a steady stream of misrepresentation has been carried on against my system of Automatic telegraphy. The effect has been thus far, coupled with the ridiculous mismanagement of the Automatic Telegraph Company, to deter capital from taking up the "Fast" or "Automatic" system, and Mr. Orton complacently points to the fact that the Automatic Company has done nothing since 1870-'71, as evidence that his original statements were true, and that the "Fast" system is of no account in comparison with his second-hand pet "Duplex."

[From *The Telegraphic Journal*.]

The Telegraphs of the Argentine Republic.

NOTHING impresses one more with the progress of telegraphy than the growth which it has acquired, and the rapid advances which it has made in countries where, until within the last few years, it was altogether unknown, and where the establishment of a telegraph system was till then a subject not even dreamt of.

The official report of the telegraphs of the Argentine Republic by the Director-General, Mr. Charles Burton, has just reached us.

The Government telegraph system dates from the year 1870. In that year 129 miles of line were erected, and this has year by year gone on increasing until it now reaches 2,618 miles of line, carrying a total mileage of wire of 5,218 miles. Siemens's iron posts are employed on 1,448 miles; wooden poles of the country, in their natural state, have been made use of on the remaining 1,170 miles. In addition, however, to this, there are various private undertakings, which have either been "subventioned" by the National Government, or belonging to the various railway companies in the State. These, including a two wire line of 32 miles (belonging to the River Plate Telegraph Company), have 1,523 miles of line, carrying 2,841 miles of wire, which, added to the purely national telegraphs,

give a grand total for the Argentine Republic of 4,146 miles of line, and 8,059 miles of wire.

These lines have been erected by private contractors, at a cost ranging from 500 "hard" dollars per mile for lines with iron posts, to 384 "hard" dollars per mile for those with wooden poles.

The national lines are maintained by the Government with a staff at present of one director-general, one mechanic, three inspectors, six "line repairers," and fifty-seven linemen. The latter seem to be but poorly paid; their actual salary is forty hard dollars per month, "with which (we quote the words of the report) they have to buy and maintain a sufficient number of horses, pay their extra expenses when they are out, besides rent and ordinary cost of living at the point where the office is situated, and where they must fix their residence."

Mr. Burton on this subject pertinently remarks, "It is false economy to allow a practical lineman accustomed to the specialties of his section, and acquainted with the nature of the ground in which it is situated, to leave the service, instead of giving him a salary with which he could satisfy the ordinary necessities of life."

The Morse instrument is universally employed throughout, and the alphabetical signs are those adopted by the European International Convention, with the exception that — — — is used for ll, a combination of frequent occurrence in all the dialects of the Spanish language.

The instrument is not, however, equal to the pressure which from time to time suddenly arises on the trunk lines, and some other system must be introduced to augment the rate of working of the ordinary Morse. The only instrument which has hitherto been tried in addition to the Morse is the Hughes, which, as one would naturally expect, has failed to accomplish the end in view. Without special instruction in its management, and perfect familiarity with all the mechanical details, Hughes's apparatus cannot be considered in any way superior to the Morse for the despatch of traffic. Mr. Burton accordingly urges upon the Government the necessity which exists for his proceeding either to England or the United States, and personally inspecting the improvements which have been made in the transmitting apparatus of these countries during the last five years. We doubt not that the wants which are felt could easily be satisfied. The introduction of duplex working, or the establishment of an automatic system on the trunk lines, would, we are sure, do all that for several years to come could possibly be required of them.

There are in all sixty offices, which are manned by a staff of 114 telegraphers (including clerks in charge), five counter clerks, and sixty-seven messengers. At the great majority of these only one instrument is fixed. Rosario can boast of seven. They are kept open to the public up to 4.30 P. M., although telegrams proceeding from other lines, or from the press, are received up to 7 P. M. Government telegrams are of course received at any hour when there are clerks at the offices.

The qualifications for the appointments of telegraphers are good penmanship and a perfect knowledge of orthography. The minimum age at which they are admitted—eighteen years—might with advantage be reduced; the mechanical art of telegraphing does not require the mental powers to be matured; a healthy lad commencing at, say, from fourteen to sixteen, will, when he has reached the age of eighteen, be found, if at any period of his career, an expert manipulator.

We are glad to observe that, as in the postal telegraph department of England, an outlet is afforded in this direction for the employment of female labor. The first female telegrapher, we read, was appointed to the service on January 1, 1873, but since then no addition to the number has been made. This, however, must not be attributed to any idea as to the inaptitude of female labor for telegraphy; Mr. Burton is, on the contrary, convinced that the reverse is the case; yet, although several competent clerks have presented themselves, the difficulty of procuring vacancies in the towns where the necessary conveniences and security could be found, has prevented them from receiving appointments. The telegraphers appear to have been at first trained in the large offices, but the practice has been discontinued at the two largest—Rosario and Panama—"on account of the many errors which were incurred in the retransmission of telegrams being chiefly committed by learners who were not sufficiently competent." They are now educated either at the school of instruction which has been instituted at Buenos Ayres, or they are placed at one of the minor stations in the interior.

A uniform tariff is adopted betwixt all the National Telegraph offices, and is at present 25 cents (about 1s. 0½d.) for every ten words, not including the address,

* The hard dollar (peso fuerte) is worth about 4s. 2d., and should not be confounded with the paper dollar (moneda corriente) which is only worth 2d. The former is always used in national and the latter in provincial accounts.

and signature, which are sent free; each figure is counted as a word. For press messages 25 cents are charged for the first twenty-five words, and 1 cent for each succeeding word. It is now proposed to abandon this tariff, and adopt in its place the system of the International Convention. Should this be carried out the minimum charge will then be 40 cents (about 1s. 8d.) for any number of words up to twenty, including the addresses and signature; 20 cents for every succeeding ten words; each group of figures up to five to be considered as one word.

During the first three years—1870, 1871, and 1872—the traffic went on rapidly increasing; but in 1873 there was a marked decrease in the number of messages, although the actual value was considerably over that of those dealt with in 1872.

The following returns show the progress of the telegraphs from the commencement:—

Year.	No. of Telegrams.	Value in Hard Dollars.	Total Cost of Maintenance.
1870	6,440	1,511.05	14,532
1871	61,429	21,490.78	81,361
1872	181,773	78,560.67	111,243
1873	170,823	81,827.80	193,870

This falling off is accounted for, first, by the destruction of the telegraph lines through inundations in the Northern provinces; and secondly, by the Rebellion which broke out in the beginning of May in the province of Entre Rios, and continued until the close of the year. The natural consequence was, that although the number and value of private messages decreased, yet those sent upon Government business were considerably in excess of the previous year. The following comparison of private telegrams with official during the years 1872 and 1873 is interesting:

Year.		Value in Hard Dollars.
1872.	Private.....	166,802
	Official.....	14,971
1873.	Private.....	150,424
	Official.....	20,399

From the figures which are published above it will be seen that the receipts from private telegrams by no means cover the expense of maintaining the service, and this it is which has mainly led to the contemplated revision of the tariff already alluded to.

An interesting section of the Report is occupied with a narrative of the difficulties which the Staff had to contend with during the year 1873; the Rebellion in Entre Rios "left behind it about 700 miles of line in the most deplorable condition." During the war, also, large sections of the wire were stolen, on account of its intrinsic value, by the neighbors to the line, and used for fences or other domestic purposes.

Great difficulty was experienced frequently in securing the delivery of telegrams to the National army. In one town, occupied by the rebels, a clerk resided in the telegraph office, and the other employes being prohibited entrance, a lady—who was made aware of the circumstances—entered the office, and, by secreting the telegrams in her dress, succeeded in delivering them.

The working of the lines is frequently interrupted by faults, in many instances ingeniously devised, evidently by those acquainted with the science, in others apparently prompted by pure mischief. Upon one occasion, for instance, "a wire was totally disconnected betwixt Rosario and Cordoba. The linemen examined the section several times without succeeding in detecting the fault, until finally it was discovered that a portion of the wire had been cut out and replaced by a curtain cord of the same gauge, and painted so as to resemble in appearance, as closely as possible, the line wire. Guitar strings are frequently placed so as to connect the wires with the iron posts, at points where they can with difficulty be seen from the road. In one instance one of these guitar strings had been employed to bring two wires, running upon the same line of poles, into contact with each other, and was then covered over with a piece of raw hide in such a manner that the linemen, knowing that the hide alone could not cause the fault, passed and re-passed the place without suspecting what was wrong."

The assistance which the telegraphs of the Argentine Republic have rendered to the Government can not well be overestimated. Their value in stamping out rebellions, and preventing the needless effusion of blood, is acknowledged, and one may be permitted to indulge the hope that, when the enormous power which they wield comes to be more generally recognized, they will prove a still more valuable ally to the cause of order, and become one of the most powerful agents in effectually putting an end to the anarchy to which this vast and rich country has been so long a prey.

The number of messages passing over the Cuba Submarine Telegraph Company's line during the first fortnight of September was 916, estimated to produce £1,000, against 641 messages producing £650, for the corresponding period last year.

The Fire Alarm Telegraph on the Central Pacific Railroad.

A CORRESPONDENT of the *Railroad Gazette* sends to that paper the following interesting account of the introduction of Gamewell & Co.'s system of fire alarm telegraphs for the protection of the snow sheds on the Central Pacific Railroad:

FIRE ALARM TELEGRAPHS ON RAILROADS.

You will notice from the inclosed circular that the Central Pacific Railroad has adopted the fire alarm telegraph in the snow sheds of the company over the Sierra Nevada Mountains, which strikes me as a wise precaution, and worthy of imitation under similar circumstances. The idea (so far as I know) is a new one, and perhaps a publication of the circular might lead to its useful employment for the protection of bridges and wood piles on other roads. Thousands of dollars might have been saved last fall and spring on roads in this section if a small gang of men could have been dispatched to the burning wood piles before the fire reached a point beyond control. Fires in the great woods of this region travel fast, and assume immense proportions in a very short time, so that a single watchman at a wood pile is almost powerless to avert the flames, and he must wait for some approaching train, which may not be due for several hours, or walk to the nearest station, before he can give the alarm. The fire alarm would (it seems to me) in such cases be a useful and economical thing.

[The following is the circular of Mr. A. N. Towns, General Superintendent of the Central Pacific, to which our correspondent refers above. It was issued September 1:]

NOTICE TO EMPLOYEES.

"For a more thorough protection against fire in the snow sheds and galleries between Blue Canon and Truckee, the company has introduced the fire alarm telegraph system for use in connection with the fire trains at Blue Canon, Emigrant Gap, Summit and Truckee, at which places large electrical gongs are located. There are also 26 signal stations or boxes, varying in distance and placed in convenient situations, according to local circumstances. The locations of the boxes are indicated by small sign boards marked 'Signal Box.'

The following rules and regulations must be strictly observed by all:

"Agents, train men and track men must be provided with switch keys (which will unlock the boxes), and, upon the discovery of a fire in the snow sheds, galleries, bridges or buildings, unlock the signal box, *pull down the hook*, let go and then *listen*. If you hear a little bell strike inside the box, you may be sure the alarm has been correctly sent in. Should you fail to hear the bell strike, go to the next nearest box and try that. Should you again fail to hear the bell, proceed with despatch to the nearest telegraph office and give the alarm.

"If, on approaching a box, you hear the little bell strike, you may know that the alarm is being sent from some other box, and no action on your part is necessary. Pulling down the hook in one of the boxes will sound the signal on the large gong at the fire stations, and will also sound the little bell in all the other stations or boxes.

"Each signal box, on being started, will give its number four times—a pause intervening between each repetition. These signals are announced through a repeater on the Morse Telegraph Circuit by a repetition of the word 'Fire,' each time that it appears, being counted in the same manner as the blows on the gong.

"The signals as received on the gongs will be counted as follows, viz., from box No. 3, three consecutive blows, one, two, three; box No. 12, one blow, pause, then two blows in succession; box No. 23, two blows, pause, then three blows in succession; and so on, the pause being a space of time equal to three blows in succession. Nos. 1, 10, 11, 20, 22 and 30 are omitted.

"Agents at Blue Canon, Emigrant Gap, Summit and Truckee are required to see that the gongs at their respective stations are kept properly wound up, and at all times in readiness for the reception of an alarm.

"TESTING SIGNAL.—One blow will be struck upon each gong in the system immediately after 'taking the time' at twelve o'clock noon. Those in charge of fire stations will promptly report any failure to receive the signal. When received it signifies *all in working order*. At any other time, or on hearing the irregular striking of the gongs, it signifies that it may be occasioned by atmospheric electricity, defective or broken wires, or some other cause requiring the attention of the foreman of telegraph repairs having the fire alarm system in charge.

"CAUTION.—Avoid all tampering with the gongs or boxes; avoid, if possible, giving signals for a fire seen at such a distance as to leave any uncertainty as to its location.

"Those in charge of fire trains should approach the

station or box from which the alarm is sent with great caution, keeping full control of the train on the grade.

"When the signal for the fire alarm circuit is turned upon the division wire through the repeater, all operators on the division wire will immediately close their keys and await orders from the Train Despatcher at Sacramento. Should he fail to hear the alarm, and there should be no response from that office, then the operator on duty at either of the fire stations will call "H" office (Sacramento) on one of the other wires, using signal No. 9."

Then follows a list of fire alarm boxes or stations, with their locations.

In this connection the following account of the "fire trains" on the Central Pacific, given by a California paper, will be found interesting:

"The Central Pacific Railroad Company employ no less than four fire trains on the mountain route across the Sierra. The first is stationed at Blue Canon, the second at Emigrant Gap, third at the Summit, and the fourth at Truckee. Each train consists of a locomotive and three or four water cars. These cars are about the same length as an ordinary freight car, and formed of two-inch plank; they are strongly put together, as nearly water-tight as possible, and are elevated above the track about four feet. Each car will hold 3,000 gallons of water, or not far from 100 barrels—equal in weight to 24,000 pounds. The locomotives are arranged with powerful pumps that throw a steady stream, and do equally as good work as the best steam fire engines used in any of the large cities. Leather hose three inches in diameter is used, which, when not in use, is wound upon a large reel mounted on one car of each train. These trains are kept in constant readiness to proceed with all possible speed to the locality of the fire upon the first alarm. All of the 25 miles of shedding between Emigrant Gap and Truckee is thoroughly deluged with water once a week. In sprinkling the sheds the pipe man stands on the pilot in front of the engine, which moves slowly along at the rate of two miles an hour. In this work five men are sufficient to manage a train. Since the introduction of the fire alarm telegraph, with 32 different stations between Emigrant Gap and Truckee, the danger of any very disastrous conflagration in the sheds is nearly or quite obviated.

Telegraphic Cables.

It is evident that a new invention, in connection with the manufacturing of telegraph cables, is needed, and a good opportunity for the exercise of ingenuity in this line now exists. *Engineering* says that portions of a cable laid in 1860, between France and Algiers, were dredged up in 1871 in 400 fathoms off Minorca, and the outer covering of steel and hemp, similar to the Atlantic cable, found to be completely destroyed, so that the piece would only bear a few fathoms of its own weight. This was on a soft, muddy bottom. The Falmouth and Gibraltar, laid in 1870 and repaired this year, was found chafed through at a depth of 1,000 fathoms. The Direct Spanish cable failed suddenly in the Bay of Biscay, and was found for a mile to be swallowed up in the ground at a depth of 1,300 fathoms, as if by volcanic action, the bottom being stiff blue clay.

If there is any part of the Atlantic crossed by the Atlantic cables having the same species of bottom as that where the Algiers cable of 1860 was dredged up, there would be a certainty of the cable decaying to such an extent that, if lying also over a ridge, it would eventually break. Nor does it seem so entirely improbable that volcanic action or movements of the ground, similar to that which undoubtedly occurred in the Bay of Biscay and also in the Persian Gulf, may occur on some portions of the route. The question of the *teredo*, also arises. Cables in the Mediterranean have been found attacked by these insects at great depths; but in these cases, probably from the cables thus examined not having been submerged long enough, the boring was only slightly into the surface. In shallow water, cables have been found with holes bored through the gutta percha down to the copper wire, thus entirely destroying the insulation.

Thus, a piece of cable laid in Kurrachee harbor was found bored down to the copper, the insect having got in in places where the outer protecting wires were a little open; more recently, too, the cables in the Irish Channel have been found attacked. Two wires in the Dublin and Holyhead cable, laid in 1871, have just been found thus injured, and are rendered useless. This cable has each of its outer sheathing wires covered with a coating of tape, and thus the actual iron wires do not touch each other, so that the insect is able to pass between them. The Atlantic pattern of cable is still more open to the attack of the insect, as the outer steel wires, being each covered with a thick coating of Manila hemp, are separated from one another by more than their own diameter. We have no experience yet of this insect having attacked an Atlantic cable; and should this ever occur, the pattern of all future At-

lantic cables will have to be entirely revised. The pattern of the cables used on the principal lines in the Mediterranean and on the Direct Spanish, where the steel wires touch each other, would be a much safer one in localities where the attacks of this insect are to be feared.

But should the danger be found to extend to the Atlantic, it is doubtful whether the insulation of such important lines should depend even on the certainty of the outer wires touching one another throughout. In the case of the Wexford cable, where the outer covering consisted of iron wires, supposed to touch throughout, the insect has found out places where they are a little open, and has thus been enabled to insinuate itself, destroying the insulation by boring through the gutta percha. It is evident that, in these localities at least, a more certain protector than the iron wire is required. Some four years ago Mr. F. C. Webb devised the application of a thin steel armor to the insulated wire, but it has never yet received any practical application. Something of this sort must, however, be adopted wherever the attacks of the *teredo* have to be resisted.

Improvements in Military Telegraphy.

THE *Journal Télégraphique* describes the system recently patented by M. Lemasson in France. Its chief feature is the capability of being rapidly set up, an all-important requirement for military telegraphy. The posts are each made in two or three sections, fitting into one another, thereby allowing them to be reduced to a half or a third their greatest height. The lowest section, in order to facilitate erection, is provided at its extremity with a steel point; the upper section is furnished with ebonite insulators, which screw on to the ends of the posts. Steel fastening collars, or rings, fitted with screws to press and contract the collars, bind together the sections and permit the height to be regulated according to the exigencies of the service. On a march the posts may be taken to pieces, and, therefore, more easily handled than is the case otherwise, especially when, as in steep and rugged roads, they have to be transported on the backs of mules. The construction of a line on ground open to fire can be carried out at the height of a man without need of ladders or exposure of men. Once so constructed, it is simply necessary to raise by hand the different sections, and fix them to the lower sections by means of the steel collars at the desired elevation. Similarly in the case of breakage the broken portions can be easily lowered and repaired. Experiments on different grounds prove that by this system lines can be erected at the rate of two kilometres the hour, or quick enough to follow the movements of a *corps d'armée*.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS UP TO AND INCLUDING NOV. 7, 1874.

ASSESSMENT No. 69.

- 13, 52, 59, 61, 65, 67, 72, 80, 89, 90, 93, 121, 122, 129, 131, 134, 140, 215, 220, 235, 244, 247, 254, 257, 267, 278, 279, 280, 282, 283, 285, 351, 367, 380, 381, 406, 414, 416, 425, 426, 463, 526, 533, 548, 553, 554, 576, 577, 579, 587, 594, 600, 603, 678, 680, 703, 714, 715, 721, 735, 740, 791, 825, 830, 832, 876, 952, 978, 995, 998, 1001, 1023, 1055, 1074, 1076, 1081, 1088, 1090, 1093, 1144, 1148, 1167, 1173, 1182, 1200, 1248, 1259, 1260, 1267, 1292, 1329, 1364, 1365, 1368, 1394, 1425, 1431, 1453, 1470, 1482, 1532, 1560, 1564, 1590, 1601, 1615, 1619, 1625, 1626, 1630, 1632, 1634, 1635, 1692, 1695, 1728, 1809, 1811, 1812, 1817, 1831, 1869, 1874, 1911, 1913, 1914, 1965, 1999, 2000, 2001, 2028, 2029, 2036, 2038, 2048, 2057, 2082, 2118, 2192, 2194, 2195, 2199, 2203, 2204, 2205, 2206, 2213, 2216, 2223, 2224, 2262, 2302.

ASSESSMENT No. 68.

- 22, 273, 294, 347, 481, 482, 527, 692, 725, 766, 869, 899, 908, 920, 1134, 1135, 1136, 1485, 1559, 1605, 1610, 1611, 1612, 1639, 1653, 1655, 1657, 1690, 1691, 1722, 1778, 1827, 1978, 1995, 2063, 2066, 2182, 2200, 2265.

MISCELLANEOUS.

- 67.—883.
- 66.—19, 1502.

Members of the Association who look to THE TELEGRAPHER for receipt of the assessments paid, will please take notice, that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

THE TELEGRAPHER will be furnished one year for TWO DOLLARS, or six months for ONE DOLLAR. Send in your subscription.

WANTED—A line to fill out this column.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Cable Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

In an issue of the *Scientific American*, under date November 7, 1874, appears a communication from one T. A. Edison, Newark, N. J., referring to a paper read before the British Association by W. H. Winter, on an improvement in cable telegraphy.

T. A. E. says that the principle shown was invented by himself, and patented both in England and in this country some three years ago, and that it is used by the Automatic Telegraph Company.

Permit me as the consulting electrician of that company, and as owner of all of the electro-chemical automatic telegraph patents used by said company, to deny in toto the above assertion; and to show how the case really stands, in order that T. A. E. may, as well as other parties, "know how it is himself."

In the first place, the party referred to, W. K. Winter, does not claim any improvement in automatic telegraphy, but simply an improved method of operating a "Galvanometer," or other receiving instrument, by means of the induction coil and earth contact, wherein he uses the primary and secondary wires of an induction coil as a "balance," or Wheatstone bridge, whereby the increase of the current through the primary wire not only induces a current in the secondary wire, but causes a self-induced current to "flow," being, in fact, an equivalent to a "condenser" with a shunt helice. Mr. Winter's patent bears date December 6, 1872.

In the second place, T. A. E. professes to claim in an English patent under date April 25, 1873, one or more electro-magnets in the shunt circuit, to neutralize the attenuations of the pulsations in the main line circuit, and bring the line to a normal condition to prevent tailing upon the chemical paper of a chemical telegraph, in fact, an equivalent for a "condenser" with a shunt helice.

In the third place, I claim, under patents of dates October 18, 1870; August 29, 1871; April 9, 1872; April 22, 1872; September 10, 1872; September 2, 1873, the use of electro-magnet rheostats, rheostat overflow dams, condensers with shunt helices or accumulators *per se*, in shunt or branch circuits, in combination with an electro-chemical automatic telegraph, to bring the line to a normal condition, prevent tailings, and to produce rapid work.

GEORGE LITTLE, C. E.,

Passaic City, N. J., U. S. A.

Paterson, N. J., Operators.

IN THE WILDS OF JERSEY, }
October 9th. }

TO THE EDITOR OF THE TELEGRAPHER.

OUR next Paterson operator on the list is Mr. C. H. Christie, "C," a retired Erie operator. He is ticket agent in the same office with Dougherty, his (C's) hours are from six A. M. to two P. M.

Among the operators who work in New York and live in Paterson are the following:

First on the list is Mr. Reeve Westcott, "R. E.," who works at Long Dock, Jersey City. Reeve learned from his brother at the Western Union office here, then went to 145 Broadway, N. Y., afterwards on the Erie as operator, then ticket agent at the depot in this city, from which place he left to go to Long Dock. He is a first class fellow.

Next comes Mr. John Hayes, "H.," who works at Pier 8, East River, 23 South street, N. Y., for the Western Union Telegraph Company.

Next is Mr. Monroe Labourg, "R.," who works at 145 Broadway, N. Y., for the Western Union Telegraph Company. He is one of the boys. "R." was married about the first of October, and goes to housekeeping in a few days, on the east side, near Broadway and Twenty-fifth street, Paterson.

Last, but not least, is Mr. Will McGill, "W. M.," who works in "P. R." office of the Western Union, on the dock, near Twenty-third street depot, of the Erie railroad.

These four all come up every night and go down every morning, and from what I hear they have it quite easy.

We will now leave the Erie for a short time and walk over to the D. L. and W. depot, which is almost out of town, where we find Mr. S. J. Tinsman, "S. M.," to whom we are much obliged for information in regard to D. L. and W. (Boonton Branch) operators. Mr. T. is a rather tall, pleasant looking gentleman; he is both ticket agent and operator.

Mr. Morris Bixby, "B.," and his brother, Eddie, are

old timers from the D. L. and W. Are not at work at present, but can be seen at this depot once in a while. Their father is secretary and treasurer of the Danforth Locomotive Works of this city.

At West Paterson, on D. L. and W., during the day, we find Mr. B. K. Van Norwick, "V.," an old Erie operator. He is agent and operator.

At night we find Mr. C. Koch, "K. O.;" he is a young beginner, "just over."

We now walk down to 68 Broadway, where a week ago we could have found Mr. F. M. Huntington, who is agent for N. J. M. Railway, and manager of the Midland telegraph. He has quite a run of custom, but the company, he says, don't give him facilities enough to compete with the Western Union. Frank came from the west—Michigan, we think—and he is known quite well throughout the Western States—some of them. He has left the N. J. M. Railway to seek a position elsewhere, and Mr. Sidney S. Colton fills his place. We have mentioned this gentleman once before when on our trip over the N. J. M. Railway.

We will finish our "Paterson operators" in our next. P'S AND Q'S.

Practical Advice.

NEW YORK, Nov. 10.

TO THE EDITOR OF THE TELEGRAPHER.

THERE would seem to be, judging from the columns of THE TELEGRAPHER, and the communications from Messrs. Little, Craig and Edison in other newspapers not specially devoted to telegraphy, a perpetual wrangle going on in regard to the invention and ownership of automatic telegraph apparatus and devices. Is there not some way in which these personal claims and interests can be settled, and the telegraphic and general public, who really care very little about them, can be relieved of the everlasting din of the claimants? It is much more important to the public that the automatic telegraph, if it is what is claimed for it, should be more generally introduced than that Little, Wheatstone, Edison, or any other man should have the credit or emolument arising from the invention or inventions.

Mr. Orton makes a telling point when he states what is obviously true, that the single line constructed for the Automatic Telegraph Company in 1869, between New York and Washington, is, after four years, the only one on which that system is used in this country. It is true that automatic instruments have been temporarily used on other lines in connection with the Morse, but the Automatic Telegraph Company is still dingling away on its solitary Washington wire, and so far as outsiders can perceive, with no prospect of ever adding to it.

It is evident that there has been bad management of automatic interests somewhere, or else automatic telegraphy is, as the Western Union people claim, a delusion. If it is a practical and valuable system, for heaven's sake stop quarreling over it and put it before the people in a proper light.

It is folly to suppose that capitalists or existing telegraph companies are going to invest or adopt a system, the ownership of which is likely to be the subject of protracted dispute and legal proceedings. The course which is being pursued is likely to render it, however great may be its merits, utterly worthless practically, and prevent indefinitely its farther introduction. While Little, Craig, the Automatic Telegraph Company and others are quarreling over the shadow the substance is likely to disappear and no one be benefited by it. I do not take any side in this many sided quarrel, but if there be any sense left in the belligerent parties, I desire that they shall manifest it. A DISGUSTED TELEGRAPHER.

The Mobile and Ohio Railroad Telegraph.

MISSISSIPPI, Nov. 1.

TO THE EDITOR OF THE TELEGRAPHER.

AS I see nothing from this part of the country in THE TELEGRAPHER, I thought I would write you a few lines, and I will begin at Macon, "S" office, first. Mr. T. F. Dunaway, our worthy chief operator, he is a good man, and has the esteem of every operator on his division. Mr. C. E. Mayne, one of the train dispatchers is a good man, and a lightning operator. He was up the road the other day, and I had the pleasure of a shake with him. I think Cliff is a "bully boy."

Mr. J. W. Ellsworth, dispatcher, is a new man on the line, and I can say nothing for or against him, but so far I think he is a nice man. "S. has a good crew." Next is Brooksville. Mr. W. F. Lockard holds forth there. At Crawford we find Mr. N. S. Carr; Artesia, Mr. Wm. Meader; Tibbee, Mr. O. J. Stovall; at West Point, Mr. J. K. Garner, and at Mldon, Mr. J. A. Lockard. All good boys. Well, I guess I have written enough this time. Will finish in my next. L.

THE TELEGRAPHER is the only recognized independent telegraphic and electrical journal in this country.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, NOVEMBER 14, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

Any person who may procure four new yearly subscriptions, or their equivalent in shorter subscriptions, will be entitled to receive a copy of the paper for one year free.

In lieu of the above, or any other premiums that may be offered from time to time, telegraphers, or others, who may act as agents and canvassers in obtaining subscriptions, if they so desire, will be allowed twenty per cent. commission on the amount collected, which may be deducted from the remittances for such subscriptions.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST of THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS, -

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH FOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK on ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

THE FAIRY ELECTRIC ENGINE, or a set of F. L. POPE & Co.'s popular NONPAREIL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

P. O. Box, 5503.

Publisher.

Telegraphic Construction and Management in the United States.—Their Errors and Defects.

In presenting to our readers in the last number of THE TELEGRAPHER a statement of the management of the Montreal Telegraph Company and its excellent results we alluded to the contrast which it presented to that which has heretofore been common in the United States. And in referring to the competitor of the Montreal Telegraph Company, the Dominion Telegraph Company, we understated the amount of the dividend paid last year by that company, which was seven instead of five per cent. The latter company has also constructed the present season about 700 miles additional of poles, and 1,000 miles of line, and we are informed, notwithstanding the general depression in business, it will show a favorable result to the stockholders of its business for the current year.

The policy adopted in the construction of most of the American telegraph lines has been such as to enrich the contractors and promoters, while it has left a legacy to the actual stockholders and the public anything but profitable or encouraging. Instead of the lines being built by the company, substantially and economically, they have been put up by contractors whose interest and policy it has been to obtain the highest price possible and construct the cheapest line that could be made to pass muster. The inevitable result of this has been that in most cases the original line has been poorly constructed, often of inferior materials, and, of course, has rapidly deteriorated, and required heavy additional expenditures within a comparatively brief period for repairs and reconstruction. Generally, pretty much all the original capital has been expended before this stage was reached, and the additional capital required has had to be provided by issuing more stock at a small percentage on its nominal value, or the company is subjected to an indebtedness which hampers and not unfrequently ruins it.

Those who have been familiar with telegraphic enterprises in this country in the past are well aware of the manner in which they have usually been inaugurated. Instead of a company being organized to build the line, and making a careful investigation into the proper, most substantial and economical method of doing the work, certain persons select a territory which they consider favorable for their purpose, organize a company themselves, with a few others, who, for a certain amount of bonus stock, allow their names to be used as officers, directors and stockholders. The next step is for the originators of the scheme to make a contract with themselves at exorbitant prices for the construction and equipment of a certain extent of line. Usually these contractors agree to take stock and bonds of the company for their compensation, and this is the excuse for the nominally exorbitant price contracted for. The enterprise having proceeded thus far, the next step is to dispose of the stock to actual investors. Attractive circulars are issued in which extravagant statements and estimates as to the prospective business of the company and the profits to be derived from it are made, and to induce bona fide subscriptions the stock is offered at from 25 to 50 per cent. of its nominal par value. Many have been induced by these means to invest in enterprises which, as managed, had not the slightest chance of reimbursing their investment or paying even a nominal dividend upon it. We do not propose to be personal in these articles and, therefore, only make general statements which, we have no doubt, many of our readers can easily verify by instances within their own knowledge.

When the lines are actually built they are represented by an absurd nominal capital, which has been created by the issue of bonus stock to promoters and contractors, and those who, whether they realize the fact or not, are neither more or less than stool pigeons for entrapping unwary investors, and by issuing two to four shares for the actual price of one. Then they are turned over to the stockholders, who, after a brief season of self-congratulation, find that they have a very hard task to make them pay working expenses and

cost of maintenance, leaving out of question any prospects of dividends. Usually the ultimate fate of such lines is either to be sold out by mortgagees or at sheriff's sale and purchased by some solvent concern, or consolidated into the organization with which they were ostensibly established to compete.

We hope and believe that the time for the establishment of telegraph companies and the construction of telegraph lines in this manner has passed away, never more to return. Telegraphic enterprise has suffered most severely and justly in the estimation of capitalists from this policy, and we doubt whether much money could now be obtained for any further similar experiments.

The cost of telegraphic management and operation in this country is out of proportion to the amount of business done, and too often the net proceeds are absorbed by "rings," which are enriched at the expense of the stockholders and the public. The complicated system of doing business adopted by some telegraph companies entails large additional expense without any adequate result, and if, even after all some profit remains it looks very inconsiderable when divided among the shareholders, on the nominal value of their stock. The amount of money which is annually wasted in carrying on the telegraph business in this country is very large, and if it could be definitely got at would astonish, perhaps, the managers of telegraph companies themselves.

It is time that there should be a thorough and radical reform in telegraphic management in this country; and we hope that the time is not distant when there shall be established a telegraphic organization which shall include the lines and companies now competing with the Western Union combination, and which, organized upon a fair and reasonable basis as regards capital, managed efficiently and with real economy, national in its character, shall, by pursuing the policy which has resulted so favorably in Canada, demonstrate the practicability of permanently successful and remunerative telegraphy in this country. That this is feasible and practicable there can be no doubt.

Every person who is connected with the telegraphic business, however humble may be the position occupied, is personally and directly interested in this matter. THE TELEGRAPHER, in the interest of the employes as well as of the investors in telegraphic property and the public, has consistently advocated such a policy as that above reiterated. The present seems to us to be a favorable time to bring this matter forward and urge it upon the attention of those who have telegraphic interests in their charge. It is evident that there must soon be some change in the present telegraphic situation, and we are desirous that it should be a change for the better and not a repetition of the errors of the past.

It is improbable now that the telegraphs of the country will be interfered with or taken over by the Government as a part of the postal service. The management of the telegraphs will be left, as it should be, to private enterprise, and it is desirable that this management should be efficient, comprehensive and economical, so as to properly satisfy the public and leave no excuse for the clamors for Government telegraphy, which have for the last two or three years obstructed to some extent telegraphic progress.

The telegraphs, while furnishing adequate facilities to the public, should and could be reasonably remunerative to those engaged in their administration and operation, and to those who have or may invest their capital in it.

The Direct United States Cable.

AS WILL be seen from the cable despatches published in another column, after laying the new cable to within less than 200 miles of the point off Newfoundland, where it was to be spliced to the sections previously laid, a fault was discovered in the cable too late to stop it before it had been paid out from the Faraday, and, in consequence of a heavy gale prevailing, the cable was cut and buoyed. This will, perhaps

cause a delay of some days in completing the work, but it was intended, as soon as the gale had subsided, to recover the cable, cut out the fault, and finish laying it. We trust that this may be accomplished in season to enable us to announce that the cable is in successful operation in the next issue of THE TELEGRAPHER.

Up to the time the fault above mentioned was discovered the expedition had made good progress, notwithstanding the weather had much of the time been unfavorable.

Departure for California of Dr. L. Bradley.

On Tuesday last our esteemed scientific friend, Dr. L. BRADLEY, left this city for California, where he will spend the winter for the benefit of his health, which has been in an unsatisfactory condition for some months past.

Dr. BRADLEY takes with him a set of his latest and most improved apparatus for electrical measurement, which he intends to introduce to the notice of the electricians of the Pacific States. As now constructed this is by far the most convenient, accurate, and generally useful apparatus for this purpose in use either in this country or abroad. Dr. BRADLEY has succeeded in largely reducing its size, weight and cost, so that the complete apparatus, comprising a four coil tangent galvanometer and rheostat of over 10,000 units, is packed in a cylindrical box six inches in diameter and seven inches deep. For general telegraphic line work the value of Dr. BRADLEY's invention can hardly be overestimated.

Our California friends are no doubt familiar with the Doctor's reputation as a scientific electrician and inventor, and it is perhaps hardly necessary for us to bespeak for him a kind and cordial reception from them.

He has arranged for carrying on his business, during his absence, as usual at his Jersey City establishment, by thoroughly competent assistants, who have been with him for a long time. Dr. BRADLEY's address, during his absence, will be Oakland, California.

Personals.

Messrs. I. D. PURKIS and HUGH NELSON, the Superintendent and Assistant Superintendent respectively of the Dominion Telegraph Company, were in New York on business of the company this week.

Mr. FRANK L. POPE is recovering from his late severe and protracted illness, and it is hoped in a few days will be able to resume his labors.

Mr. JAMES GAMBLE, General Superintendent of the Western Union Telegraph Company, Pacific Division, has recently been on a visit East, and was in New York a few days since.

Gen. ANSON STAGER, General Superintendent of the Western Union Telegraph Company, Middle Division, favored New York with his presence a few days since.

The Telegraph.

By Cable.

THE DIRECT UNITED STATES CABLE.—PROGRESS OF THE FARADAY IN LAYING THE CABLE.

LONDON, Nov. 5.—The following despatches have been received from the steamship Faraday, engaged in laying the Direct United States Cable:

STEAMSHIP FARADAY, Nov. 3—1 P. M., }
Lat. 50 14, lon. 28 07. }

Paid out 776 knots of cable. A heavy northwest gale prevails.

STEAMSHIP FARADAY, Nov. 4—8 A. M., }
Lat. 50 03, lon. 30 59. }

The gale is abating, but there is a very high sea. Have shifted paying out from the fore to the aft tank successfully. Paid out 871 knots.

STEAMSHIP FARADAY, Nov. 4—1 P. M., }
Lat. 50 03, lon. 30 59. }

Paid out 893 knots. A strong gale and high cross sea prevail. Going at full steam with fore and aft canvas set.

STEAMSHIP FARADAY, Nov. 5—8 A. M.

Paid out 129 knots of cable since last report. There is a heavy swell.

LONDON, Nov. 6.—A despatch from the steamer Faraday, dated one o'clock this afternoon, reports the steamer in latitude 49 1 and longitude 37 47, and announces that 1,197 knots of the cable have been paid out.

LONDON, Nov. 9.—The following despatches have been received from the steamship Faraday.

ON BOARD THE FARADAY, Nov. 7, }
Lat. 48 57 N., lon. 40 16 W. }

We have paid out up to this time 1,319 miles of cable. Operations have been retarded by a heavy storm.

NOVEMBER 8—8 A. M.—Up to this time we have paid out 1,461 miles of cable. The weather is favorable.

A FAULT DISCOVERED.—THE CABLE BUOYED.

NOVEMBER 8, 6 P. M.—A fault has been discovered in the cable, but too late to prevent it from being passed overboard. The wind is blowing a gale. We shall buoy the cable.

THE POSITION OF THE FARADAY WHEN THE CABLE WAS BUOYED.

LONDON, Nov. 9.—The Messrs. Siemens conclude that when the cable was buoyed the Faraday was in latitude 48 deg. 37 min. north, longitude 44 deg. 55 min. west. The depth of water was decreasing, the ship being 180 miles from where it was intended to splice on the shore end.

THE BRITISH GOVERNMENT HAS NO INTENTION OF PURCHASING THE OCEAN TELEGRAPH LINES.

LONDON, Nov. 11.—The Right Hon. Sir Stafford Northcote, Chancellor of the Exchequer, replying to a communication from the Chairman of the Board of Directors of the Direct United States Cable Company, says the English Government has no intention of purchasing the Direct Cable or any other ocean telegraph line.

Consolidation of the Atlantic and Pacific and Franklin Lines.

At a meeting of the stockholders of the Franklin Telegraph Company, held at Boston, Mass., last week, a resolution was adopted to lease the entire lines, etc., of the company to the Atlantic and Pacific Telegraph Co. for 99 years, at a rental of not less than \$25,000 per year. The lines of both these companies have been under one management for the last two or three years, the Atlantic and Pacific Company owning a majority of the stock of the former company. The lease has not yet been completed, but will be at an early day.

The Dominion Telegraph Company.

THE Dominion Telegraph Company of Canada has, during the past season, completed a second line from Toronto to Montreal by another route from that of the first line, which increases the facilities for their growing business, and decreases the chances of interruption from storms or other causes.

This company has now about 6,000 miles of line and 300 offices, and, notwithstanding the depression in business, have paid their usual semi-annual dividend of 3½ per cent. for the first six months of the current year, and will be able to pay a similar dividend for the balance of the year. Their stock is selling at 107 to 108 for the \$100 shares, and is considered a good investment at that price.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended October 17, 1874, was 406,067, an increase of 45,279 on the corresponding week of last year.

The Eastern Extension, Australasia, and China Telegraph Company announce that communication has been restored with Hong Kong on their line, and that messages can now be forwarded to China and Japan "via Falmouth."

At the half yearly meeting of the Anglo-American Telegraph Company, recently held in London, the chairman stated that the cable of the Direct United States Cable Company had been buoyed off Newfoundland on what they believed to be a portion of their monopoly; they had accordingly applied for an injunction to prevent the landing of the cable, which had been granted.

He also stated that the decrease in receipts this year was £87 per day, and not £500 as had been stated by a shareholder, and latterly they had begun to increase. The cost of laying the last cable had been £475,000.

They had from last year resources amounting to £235,000; the balance had been defrayed from this year's revenue.

The interruption which occurred on the China section of the Eastern Extension, Australia and China Telegraphs, about forty-six miles from Hong Kong, was found to have been caused by the cable having been wilfully cut, and about a mile and a half of it stolen. A reward was offered by the Government of Hong Kong, which resulted in the detection of the offenders, who have been convicted and sentenced to fourteen years imprisonment, and their junk has been confiscated.

THE Indo-European Telegraph Company announce the restoration of the Singapore-Saigon Cable. Messages for Saigon, Hong Kong and Amoy can, therefore, be forwarded via Teheran.

The Canadian Pacific Telegraph Line.

ACCORDING to a telegram published in to-day's issue, the contract for the construction of the western section of the Canadian Pacific Telegraph Line has been finally awarded to Mr. F. J. Barnard for \$750,000—\$1,000 per mile for construction, and \$50,000 per year for five years for maintenance. The contractor is bound to fulfill the following conditions: To furnish all materials, labor, instruments, and everything to put the line into operation; to maintain the line for a period of five years after its completion; and in the wooded section the land is to be cleared to the width of 132 feet, or such greater width as may be necessary to prevent injury to the line from fires or falling trees. The Canadian Pacific Telegraph Line is divided into six sections, covering an approximate distance of 3,200 miles, and according to the Ottawa Free Press, the highest tender for the construction of the whole line was \$5,000,000, the lowest \$1,250,000.—The Cariboo Sentinel.

Increase of Telegraph Lines in Russia.

We learn by a letter from St. Petersburg that the Russian Government, owing to the enormous increase in the number of telegrams, as the necessary consequence of the reduction of charges, has resolved to augment the present facilities for telegraphing by laying down the following auxiliary and branch lines: From St. Petersburg to Tschudovo, from St. Petersburg to Novaya Ladoga, from Moscow to Orel, from Moscow to Wjasna, from Moscow to Kolomna, from Wilna to Minsk, from Nishni-Novgorod to Kasau, from Ssyfran to Samara and from Sympheropol to Berdiausk. For the execution of these works, which are all to be completed in the course of next summer, the capital required is estimated at 147,000 roubles, which are to be raised by legislative Act of the Council of State. At the same time the administration of the telegraphs asks for a credit of 86,000 roubles to purchase the materials for putting up the wires and posts next year on the line between Tomsk and Irkutsk, which must be completed and opened for public use in 1876.

We learn further from the same source that a request has been made by the British Ambassador at the Russian Court, as also by the Commander-in-Chief of the fleet and ports of the Black Sea, for an extension of the telegraph by a new land line from Nicolayef to Otchakof, and that the subject is under the consideration of the Administration. This new electro-magnetic line is intended to replace the present optical telegraph, which is found not to answer its purpose, its working powers being so frequently interrupted by the fogs prevalent in the Black Sea. The line acquires importance as being the means of reporting the state of the weather and the sea, the navigation of the River Bug, and for communicating instructions for vessels arriving for orders, and sending assistance to ships in distress. The English Government wish to see the line made in the interests of general commerce and navigation.

[From the Sydney Herald, Sept. 7.]

The Telegraph in Australia.

An experimental message was sent yesterday to Java from Sydney, and a reply received in two minutes and thirty-five seconds. The distance travelled by the electric current was 8,700 miles. The rapidity of manipulation in so short a time is proof that we have good operators. The current of electricity from Sydney to Port Darwin was instantaneous.

The Western and Brazilian Telegraph Company.

THE Western and Brazilian Telegraph Company announce that telegraphic dispatches, in any language, can be prepaid to Buenos Ayres, the charge for twenty words being £12 3s. 8d., and half that rate for every additional ten words. Messages for places beyond, and the west coast of South America, should be ad-

dressed "Oldham, Buenos Ayres," the further charges being collected from the receiver.

The traffic returns of the above company have been as follows:—From opening of line to end of June, 1874 (for local traffic only) £16,000; since opening of Brazilian submarine line, giving communication with Europe, the returns show for July £7,668; for August £8,506; and for September £6,957. During September there was an interruption between Bahia and Pernambuco for seventeen days. Communication with the River Plate and west coast of South America (save by land lines), also with the West Indies and North America is not yet established, but vessels with completing sections leave England in November.

New Patents.

For the week ended Oct. 6, 1874, and bearing that date.

155,596.—ELECTRIC SIGNALING APPARATUS FOR RAILWAYS.—Richard A. Stuedell, Chicago, Ill., assignor of one half his right to Hermann G. Nuscheler, same place. Filed May 11, 1874.

Electro-magnetic engine running on track in advance of regular train, and connected therewith by electrical conductors. The magnetic engine, meeting with any obstruction or danger, causes the circuit to the train to be broken, and an alarm given by apparatus carried on the train.

1. The combination, with a signalling instrument situated upon a railroad train, of an electro-magnetic engine, running in advance of such upon the same track, and of conductors electrically connecting such engine and signal apparatus, the latter being controlled by the electro-magnetic engine, and caused to signal an approach of danger, substantially as herein shown and described.

2. The combination of the signalling magnets H and I with the armature lever J and brake-arm K, constructed and operating substantially as set forth.

3. The combination, in a magnetic engine, of the driving magnets E, F and G, with the signalling and brake magnets H and I, all connected with and operated by a single battery, substantially as specified.

4. The outrunner or broken rail detector, composed of the bars V W, supported and kept in contact by the rail, in combination with the wire i and magnets H and I, substantially as described.

5. The bar z in combination with the head block w or other support, the spring r and plates q for indicating obstructions, substantially as specified.

For the week ended October 13, 1874, and bearing that date.

155,858.—ELECTRIC CAR DETACHING DEVICES. William W. Carson, High Bridge, N. Y. Filed March 28, 1874.

Coupling bar held to frame of car by a latch, which can be thrown off by the explosion of a small cartridge. Cartridges exploded by an electrical circuit from a frame hung between trucks; car jumping track causes frame to bump on track and operate the circuit closers.

1. The improved electric car detaching device, consisting of the pivoted lever frames of the trucks, the mechanism for releasing the draw head, and an automatically closed electric circuit, substantially in the manner and for the purpose set forth.

2. The pivoted lever frame B, composed of pendent rod a, with pivoted bottom rods d, combined by intermediate lever connection and tongue piece h, with spring h' and contact h², for closing the circuit automatically when the car wheels leave the rails, substantially as specified.

3. The combination latch D, cartridge chamber C', pivoted to guide frame E, band spring D', and pivoted cross bolt F, and an electrical circuit for firing the cartridge, all operating substantially in the manner set forth, for releasing the draw head.

4. The combination of pivoted latch D, having cartridge chamber C', with connecting channel l, and recess m, frame E, having projection or piston m', and an electrical circuit for firing the cartridge, substantially as and for the purpose set forth.

155,900.—ELECTRIC RAILWAY SIGNALS. P. Tesse, H. Lartigue and P. D. Prud'homme, Paris, France. Filed May 6, 1874.

Relates to devices for system in which the setting of a signal indicating that a train has entered on a certain section changes the electrical circuits, so that a signal is set at the far end of the section, which, being set, causes a secondary signal to be given at the point of setting of the original signal, indicating that the signal has been received at such far end.

1. The combination of the large arms of a semaphoric mast of one station with the smaller arms of a similar mast at another, and their respective electrical apparatus E, as hereinbefore described, all constructed and arranged substantially as and for the purpose set forth.

2. The combination of the arms A B' and a b, the chime bells, and the electrical apparatus E, substantially as and for the purpose described.

3. In the electrical apparatus E, the commutator O, provided with the connections set forth, in combination with the crank B, spring contacts E', L' L', and —, and a battery, substantially as and for the purpose described.

4. The combination of the arm D, cam C, and pawl W with the movable arm B for locking the arms of the mast, the large

arms in a horizontal and the small arms in a vertical position substantially as and for the purpose specified.

5. The combination of the electro-magnet E', the armature P', levers R and J, and counter-weight G, for unlocking the arms of the mast, substantially as and for the purpose specified.

6. The combination of the electro-magnet H, the armatures f and g, the spring Q, the annunciator V, rod S, lever J, and bell T, for acknowledging the receipt of the signal substantially as and for the purpose specified.

7. The combination of the treadle C, swan neck j, abutment V, drum E', pin a, and weight cord with the axis X of the electrical apparatus E, for the purpose of allowing the passing train to operate the signals automatically, substantially as and for the purpose described.

Died.

CREIGHTON.—At Omaha, Nebraska, Friday, November 6, 1874, from a stroke of paralysis received on the 3d instant, EDWARD CREIGHTON, the contractor for and builder of the first telegraph line to California.

Obituary.

EDWARD CREIGHTON.

We are frequently reminded by the announcement of the decease of persons formerly prominently connected with early telegraphic enterprises that the generation which assisted in establishing and developing the electric telegraph in this country are rapidly passing away.

EDWARD CREIGHTON, whose decease at Omaha, Nebraska, of which place he had been for several years a leading citizen, was announced in a brief despatch from that place on Friday, of last week, will be well remembered by many of our telegraphic readers as the contractor for and builder of the first telegraph to California.

He was born in Belmont County, Ohio, August 31, 1820, and was but a little more than 54 years old at the time of his death. His first connection with telegraphic enterprises was in 1847, he supplying the poles between Springfield and Cincinnati, for the Pittsburgh, Cincinnati and Louisville telegraph line. He also provided the poles for the line between Cincinnati and Louisville. In 1848 he engaged in telegraph construction, under Mr. Henry O'Reilly, and built part of the People's Telegraph Line from New Orleans, La., to Aberdeen, Miss. From that time until 1852 he was engaged in the construction of various telegraph lines, among them the House Printing Telegraph Lines from New York to Buffalo, and the line of the Mississippi Valley Printing Telegraph Company from Buffalo to Louisville, Ky. For the next seven years Mr. Creighton was employed as the general agent of the Western Union Telegraph Company, laying cables across the principal streams, and generally surveying and pioneering their enterprises.

In 1859-60 he examined the different routes proposed for the line to the Pacific Coast, and finally reported in favor of the route from Omaha to California via Salt Lake, which, on his report and his expressing his willingness to undertake its construction, was adopted. The energy with which this great work was pushed through under Mr. Creighton's personal superintendence is shown from the fact that it was commenced July 4th, 1861, and communication established October 24th of the same year. Of this line the 700 miles west of Omaha, via Julesburg, was constructed by the party under Mr. Creighton, connecting with another party under Mr. Stebbins, who built 400 miles of the line from Salt Lake east. After the California line was built, Mr. Creighton was appointed superintendent of the lines west of Chicago, until February 1, 1867, when, on their being consolidated with the Western Union Telegraph Company he resigned. He continued to be engaged in the construction of telegraphs west of Omaha until 1869.

Mr. Creighton was largely interested in various enterprises in Omaha, and west of that point, which were very remunerative, and had acquired a fortune which entitled him to rank as a millionaire. He was a valuable citizen to Omaha, and his loss is greatly felt there. Personally he was a genial, kind hearted man, a faithful friend and excellent companion.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS

of every description, at

No. 54 SOUTH FOURTH STREET,
(Corner Chestnut street.)

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

WATTS & COMPANY,

No. 47 HOLLIDAY STREET.

BALTIMORE, MD.

SUPERIOR TELEGRAPH INSTRUMENTS, RELAYS,
SOUNDERS, KEYS, OFFICE WIRE, BATTERIES
OF EVERY DESCRIPTION,
SWITCHES, GALVANOMETERS,
RESISTANCE COILS.

A COMPLETE STOCK of EVERYTHING for the TELEGRAPH OFFICE or ELECTRICAL LABORATORY.

Special attention given to repairing Scientific Instruments. Several of our workmen having served their time in the most prominent European manufactories, enables us to guarantee satisfaction.

SEND FOR CATALOGUE AND PRICE LIST.

MANUFACTORY OF THE SPENCERIAN STEEL PENS, BIRMINGHAM, ENGLAND.

**SPENCERIAN
DOUBLE ELASTIC
STEEL PENS.**

The superiority and excellence of these justly celebrated Pens are appreciated, as is shown in their constantly increasing sale. They are comprised in fifteen numbers, of which one number alone has an annual sale of more than

5,000,000.

The SPENCERIAN PENS are manufactured of the very best material by the most expert workmen in Europe, and are famous for their elasticity, durability and evenness of point.

THE SPENCERIAN PENS ARE FOR SALE BY ALL DEALERS.

We make Fifteen Numbers of Pens, differing in flexibility and fineness of point, adapted to every style of writing, as follows:

- No. 1. COLLEGE PEN. *Point Fine; Action Perfect.* This is a great favorite with our leading penmen, is largely used in the Schools and Commercial Colleges throughout the country, and gives better satisfaction than any Pen before the American Public.
- No. 2. COUNTING-HOUSE PEN. *Point Fine and Flexible,* well adapted to the use of Correspondents and Accountants.
- No. 3. COMMERCIAL PEN. *Point Medium.* An Easy Writing Business Pen.
- No. 4. LADIES' EXTRA PEN. *Point Extra Fine and Flexible.* For Delicate Fine Hand Writing this is a very superior Pen.
- No. 5. SCHOOL PEN. *Point Fine, Medium in Flexibility.* For a durable School Pen it has never been equalled.
- No. 6. FLOURISHING PEN. *Point Long, Flexible and Medium in Fineness.* For Off-hand Flourishing.
- No. 7. QUILL PEN. *Point Medium, Quill Action.* A smooth, Easy Writing Pen. Its name well represents its qualities.
- No. 8. CONGRESS PEN. (New.) *Medium Flexible Point.* A very superior Pen for all styles of writing. This Pen undergoes a process that renders it non-corrosive and three times more durable than any ordinary Steel Pen.
- No. 9. BANK PEN. *Point Long and Flexible.* A great favorite with Accountants, Tellers, etc.
- No. 10. CUSTOM-HOUSE PEN. *Point Medium.* Well adapted to all styles of Bold Free Hand Writing.
- No. 11. UNIVERSITY PEN. *Point Medium, very Smooth and Flexible.* The action of this celebrated Pen is very fine.
- No. 12. EPISTOLAIRE PEN. *Point very Fine and very Flexible.* This is the finest Pointed Pen made, and, for very Delicate Writing, Map and Fine Pen Drawing, it has no equal.
- No. 13. ENROSSING PEN. *Point Blunt and Smooth.* Particularly adapted to Coarse Hand Writing and Enrossing.
- No. 14. ARTISTIC PEN. *Flexible, with extra fine point.* This Exquisite and Truly Celebrated Pen is the Best Pen extant for Fine Ornamental Writing.
- No. 15. THE QUEEN. *Point extra fine.* Admirably adapted to all kinds of Fine Writing.

Sample Cards containing all the FIFTEEN Numbers, securely inclosed, will be sent by mail on receipt of 25 cents.

IVISON, BLAKEMAN, TAYLOR & CO.,
138 & 140 Grand street, N. Y.

**LECLANCHE
BATTERIES.**

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

A NEW GALVANIC BATTERY.

**Durability, Efficiency, and Economy of Expense
 and Labor at last Secured.**

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for
 manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.

These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above,

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERs made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

Siemens' Universal Galvanometer,

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,

22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,

AND

Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,

FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer.

For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,

No. 50 BROAD STREET (Rooms 12, 13 & 14).

by Mr. WALTER O. LEWIS, remaining, may be had of F. L. POPE & CO., 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

THE

TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"

"History of America," "Civil War in America;" Member

of many Scientific and Learned Societies of Europe

and America; Commander of the Order of Dan-

nebrog, Denmark; Order of St. Olaf,

Norway, and of the Sword Order,

Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbreeck, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstones, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

L. G. TILLOTSON & CO.
8 DEY STREET, NEW YORK,
SOLE AGENTS.

New York, Oct., 1873.

has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fanoy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
20 CONDUIT STREET,
PROVIDENCE, R. I.,
Manufacturer of
Patent Finished Insulated Wire, Patent Rubber
Covered Wire, Magnet Wire, Patent
Electric Cordage, Cables, etc.

I claim to furnish the best Braided Wire in the Market, and I believe it is acknowledged as such by all large Telegraph Companies and Telegraph Supply Dealers.

My Wires were awarded the first premium at the Cincinnati Exposition of 1874, both for best "Office" and best "Insulated Line Wires."

These Wires are furnished in any desirable color or plaids.

My Rubber Covered Wire will not crack, and is not affected by ordinary extremes of heat or cold. The rubber covering is of uniform thickness, and the wire will be found in the exact centre—a result not heretofore produced.

I also make cables of any number of conductors at the regular price for a single wire.

With new and improved machinery I feel satisfied that I can furnish magnet Wires as good as any to be found in the market.

All Wire used by me is made to my special order, and is the best that can be procured in the market.

I could give a long list of testimonials, but depend on the merits of the Wire for patronage.

Please send for sample card and price list.

These Wires can be had at my prices of

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, NOVEMBER 21, 1874.

VOL. X. WHOLE No. 436.

[From the Journal of the Society of Telegraph Engineers.]

Indian and American Telegraphs.

In March, 1873, Mr. W. E. Ayrton read a paper entitled "On some points in connection with the Indian Telegraphs" before the Society of Telegraph Engineers. This paper is published in No. 5, vol. ii, of the Journal of the Society.

Mr. Ayrton first refers to the application of Mr. Schwendler's formula for reducing the apparent or observed resistance of either insulation or conductivity to its true value. Soon after the publication of Mr. Schwendler's formula I applied it in the measurement of insulation and conductivity of overland lines, but never found it to agree, or even approximate to the result of a careful measurement, taken under circumstances where the insulation resistance was so large as not to affect the result, as measured in the ordinary manner; that is, to take the mean of the observed resistance with alternating poles of the battery.

Mr. Schwendler's formula is based upon the supposition that the insulation conductivities are uniformly distributed throughout the line—a condition of affairs that never exists in this country except in clear or cold weather, and when the escape of current by the insulators is so small as not to enter into the result.

In summer long lines are often affected by local showers—it may be clear on some portions and raining at others. During general rains, "northeast storms," humidity that affects insulators is very unevenly distributed—raining in some portions and only cloudy in others. The conductivity of insulation is never stationary under these circumstances, but as varying as the amount of rain fall at different intervals. I refer to the ordinary glass insulators of this country.

On very old wires, whose resistance is great through bad joints, conductivity is immensely improved by rain or dampness; so that, in my experience, it is idle to attempt the measurement of wire resistances or line conductivities, except by short sections or under favorable conditions of weather.

Mr. Ayrton says, "We have learned two very important facts," one of which is, "that the insulation of sections varies enormously under the same climatic influences." If this be true, how do they arrive at the real conductivity of the wire? It also speaks badly for the insulators, provided we are to understand by the term "same climatic influence" that there is sensible leakage on any portion in clear weather.

A porous porcelain insulator conducts in clear weather; a glass insulator under same circumstances does not. By this is meant, when both are exposed to the sun's rays and not affected by moisture on the surface.

Mr. Ayrton enters into a calculation by which he is led to believe the consumption of battery material is increased in his particular case 60 per cent. by the introduction of the 1 per cent. of bad insulators. This calculation leads to erroneous results, inasmuch as it is based upon the supposition that there is no consumption when the circuit is open or the exterior resistance is infinite. Consumption of material is going on when the circuit is open, and this is particularly the case with the kind of battery he refers to as used in India—the Menotti.

In our country this battery, without the intervening layer of sand or sawdust, is most used. It is best adapted to our mode of working the closed circuit system. The size of the elements is sufficient to bring the resistance down to five, and sometimes two Siemens units per cell. If the battery is much worked this fact tends to keep the solutions separate. The more wires worked from the same battery, or the less the exterior resistance, the less the local action, and in this sense the more it is worked the greater the economy.

It answers admirably for working many lines from the same battery.

This battery is called the Callaud, and is essentially the same as used by the French at their central station in Paris.

Mr. Ayrton describes the manner of testing insulators at the factory and upon their arrival in Bombay, showing the great care bestowed upon the insulation.

Are the benefits derived commensurate with the care bestowed?

This question was put in another form by Mr. Preece,

and the answer of Mr. Ayrton is, "In dry weather the insulation varied from five millions a mile to over three hundred; in wet weather it was as low as half a million;" and that "the average was two to three millions in wet weather."

I infer that better results are obtained in this country with our poorest insulation. In measuring say 100 miles, we seldom find it as low as one million per mile in rain. Leaving out the city portions, it will run as high as eight, and seldom as low as four millions.

If we desire the insulation from this city to New York, the insulation of the same wire will measure twice as high when taken from the outskirts, and say six miles of city lines excluded, as compared to the entire line, including city portion, where the measure is taken from the central station.

The insulation in cities is greatly reduced by smoke and gases of combustion, which "short-circuits" the insulation, making the result appear below the average. Again, measuring from the country into a city, where the insulators are thus affected, the results appear above the average. Comparing the insulation of the lines in India, I should infer they could be improved by using the common insulator of this country.

As regards progress in insulation, are they to be compared with many lines in this country that average at least one hundred millions per mile in rain? We have thousands of miles of such lines in which I have a personal interest, and it would be out of place for me in this article to refer to them in detail.

EARTH PLATE.

The second "important fact" developed by the mode of testing in India, was that the earth plates had "a high resistance and were intensely polarized." "This was remedied by using large copper earth plates with leading wires insulated from the ground."

Many people think copper better for ground plates than iron, in an electrical sense, but copper, on account of its better conducting qualities, possesses no advantage over iron, and zinc coated iron is more economical and equally durable.

What advantage copper possesses over iron for ground plates I am unable to see. A ground plate is simply a joint between two conductors—the wire and the earth—the latter specifically being a very poor conductor. If the sections of an iron and copper wire were joined, the iron being six times as large as the copper to insure equal conductivity, the section of iron in contact with the copper would not conduct sufficiently to make a joint equal in conductivity with a section of either the iron or the copper wire. But if we enlarge the end of the copper so as to cover the section of the iron, then the joint has a capacity for conduction equal to a section of either. We can, after understanding the nature of this joint, draw upon the imagination to form an idea how immensely an iron wire must be enlarged, and the extent of surface exposed, to fulfil the conditions of a joint with the earth. Supposing the earth in contact with the plate to be one fourth saturated or contain one-fourth moisture, the plate would require at least ten thousand square feet of surface in contact with the earth to ensure a joint electrically perfect, or equal to a section of No. 8 iron wire.

With perfect joints the immense suction of the earth, considered as a conductor, adds nothing to the resistance; or, in other words, if we make two perfect joints with the earth, there is nothing added to the resistance of the circuit.

The defects of ground plates in connection with lightning rods have been much discussed by the meteorological section of the Franklin Institute of this city lately. It has been the custom to terminate lightning rods in dry earth, often without any plate attached. It is the belief of those who have given the subject much attention that rods thus constructed are the cause of more harm than protection.

Every summer many valuable barns with their contents are destroyed, and in a majority of cases these barns are supplied with rods improperly connected with the earth. These rods draw the discharge from the clouds, and, there being insufficient means of getting from the rod to the earth, the charge flies to neighboring conductors, often log chains, ploughs, cart tires, or other metallic substances, igniting the combustible material with which these buildings are stored.

As an experiment, two plates, containing nine square feet of surface each, were buried fifty feet from each other, using the two plates and the earth as a portion of the circuit. They gave a resistance of 150 Siemens units. Allowing a stream from a hydrant to flow directly over each plate, with holes in the ground above, so as to completely saturate, the resistance of these plates, or rather the earth in contact, was reduced to 32 units, or 16 units each, compared to an entire metallic circuit of No. 10 wire, 100 feet in length. By substituting 50 feet of wire in place of the earth, total resistance was reduced 32 units.

Instead of lightning rods being connected to the earth in an electrical sense, they are, in truth, insulated from the earth.

People have often found it difficult to work short

lines of telegraph in this country where the earth was used as a portion of the circuit, and connection was made or attempted by an ordinary ground plate, exposing insufficient surface.

The writer was called to explain a difficulty of this kind about two years ago. A line, one mile and a half in length, connecting a factory with the proprietor's residence, was constructed with type-printing instruments. They failed to work, from insufficient current. The battery had been increased to 100 cells, the ground plates overhauled and replaced with pure copper of increased surface, but all to no purpose, the apparent current was feeble.

The resistance of this line, including the earth connections, was found to be 1,600 units. Owing to the dryness of the soil the earth plates made poor connectors. Within a hundred yards of each terminal there happened to be a railway track; connection was made to this track, and the strength of current increased thereby to the extent that ten cells were ample to work the line.

A railway track, as the rails are joined in this country, makes a perfect ground even when the earth is dry, owing to the immense surface in contact.

A ground plate, as usually constructed in this country, seldom interposes sufficient resistance to affect ordinary lines. The longer the wire or the greater the resistance the less the effect in the proportion this resistance bears to the total resistance of the circuit.

In this sense also the polarization of the ground plates is small in proportion as the resistance of the line wire and instruments is large. In the case of the India lines or circuits of 500 miles, I am unable to see how its effects are even appreciable. Insulating the wire leading to the plate to prevent it would do so, so far as this action is local, or confined within the limits of the plate and its connecting wire.

How this effect could now be shown on the instruments of the line were the leading wires uninsulated, I am unable to comprehend.

SIGNALING.

The portion of Mr. Ayrton's paper that elicits most remark in this country is as follows: "To facilitate this reading by sound the receiving signaller gives an acknowledgment by sending a dot at the end of every word, and the sending signaller continues repeating the word until he gets this acknowledgment."

By this method, the receiving "signaller" would be obliged to drop his pen to acknowledge every word as transmitted, or at least work under great disadvantages. We are unable to see how two good operators could by this method get more than twenty messages per hour over a line, these messages to average twenty words each, while by our method of closed circuit forty messages per hour is a moderate rate of speed. The sounder, by the American plan, responds to every touch of the sending operator. Any accident or change in the condition of the line involves a change of adjustment of his relay. If such change takes place either by increase or decrease of current, the sending operator pauses for a reply from the receiving operator. On the circuits where much business is performed the operator sends for hours without a reply, yet he has assurance that every word is being correctly received. Especially is this the case when despatches are going in the other direction from the same station. The sending operator is assured of their correct transmission, otherwise he would be advised by the other wires. So it is not the custom in this country to stop sending merely for the purpose of ascertaining whether the despatches are correctly received. Whenever the sending operator stops and closes the circuit, then the receiving operator replies or acknowledges.

By the duplex system, lately introduced, this method is increased. We may say the average is from 60 to 70 messages per hour on a single wire.

I would like to hear from Mr. Ayrton how this speed of transmission compares with that of the Indian lines.

Perhaps a more pertinent question would be, Do those interested in the Indian lines get as great a return for their expenditure in erecting and operating a No. 1 or No. 3 wire by their method as obtained in this country with lines of equal length, but of less than one third the size, and the American method?

If I am able to judge fairly I should say lines in this country, costing half as much as the Indian lines, do twice or more than twice the business.

The methods of operating and maintaining the Indian lines are referred to in the light of progress or advancement in telegraphy—we are considering them in that sense from an American standpoint.

In the discussion following Mr. Ayrton's paper, Mr. Preece states "that sounders had been introduced almost entirely in America."

As early as 1860, nine tenths of the instruments in the larger and more important stations were sounders, and now there is scarcely a Morse recorder to be found in any of these stations.

The recording instruments are used only to a very limited extent, in the way stations of railway lines where the least business is performed. They are used by

operators who are learners until they are able to read by sound.

In the year 1850 "Jemmy" Leonard, of Louisville, got the reputation of being the most expert "receiver" in the country, and entirely by ear. Since that time, or soon after, it became the ambition of operators to emulate Leonard, and receiving by sound from that date has been popular.

In 1852 I designed the first sounders used upon the lines of which I had charge. They are now made with from 4 to 8 units resistance, and usually worked by two cells Callaud battery.

In the years 1867-8 Mr. Varley made a report on the lines of the Western Union Company. In speaking of relays he says, "Keep down the resistance of everything is a golden rule in telegraphy." He found the relays in the New York office "to vary from 69 to 1182 ohms," and that "the 69 ohm relay is, where it should be, on a long line No. 2 Chicago;" and further, "The resistance should not exceed 130 ohms per relay, and it will pay you to have them all re-wound." Acting upon this advice the resistance of the relays was reduced.

For circuits of one hundred to two hundred miles they averaged about 50 units, and from 100 to 200 cells of Grove battery were required to work the lines.

Mr. Ayrton says, in speaking of relays, "We have not, however, used any relays having more than about 3,600 or 4,000 ohms resistance." I merely refer to these opinions to show that "doctors disagree," and that there is no question upon which we have such a diversity of opinions as upon the proper resistance of the relay. I would like much to see a relay made to fulfil the requirements as demonstrated by Eisenlohr, Du Moncel and others.

The resistance of the relay, I will venture an opinion, has much less to do with the good working of lines, practically, than other conditions.

The Philadelphia and Reading Railroad work a circuit of 140 miles with 40 relays, average resistance 100 units each. This line is used in connection with its traffic and the running of trains. It works well in all weathers, and would were the resistance of the relays twice as large or twice as small.

The Pennsylvania Central Railroad has three similar circuits, with relays averaging 150 units each, at intervals of about five miles; this resistance is larger than necessary, but the excess, whatever it may do, occasions no inconvenience.

With ordinary insulation, or say an insulation resistance of two million units per mile, these lines could not be worked by our American system of closed circuits, with a battery at each terminal and the currents from both flowing when the circuit is closed.

When the sender opens the line the receiver's battery still sends a current through his relay over the line and insulators, which is greater or less as the insulation is good or bad; the effective or working margin is the difference between this "escape" and the whole line current. When the line current is small, owing to the resistance of wire and relays, this margin is small, and the "escape" must be kept at a minimum.

The wire in connection with all stations on the main trunk of the Philadelphia and Reading Railroad before referred to has a resistance, including relays, of over 8,000 units; with such a resistance the current passing over the line is unavoidably small, and to be able to work such circuit the current escaping by the insulators must be small in comparison to that passing through the line.

The Philadelphia and Reading Railroad Company makes a more extensive use of the telegraph than any other railway in this country; they employ ten wires on the main line, with branches in all directions, as soon as they enter the coal regions, 130 miles distant from Philadelphia.

I refer to the railways in this country because they are the only parties operating the telegraph upon anything approaching what is usually termed scientific principles; and further, all that Mr. Ayrton says of the railway telegraphs in India is of a negative character. The foregoing are suggestions upon reading Mr. Ayrton's paper, and the remarks in connection therewith of the other members of the Society.

The Chairman said that the Indian telegraphs of one period were "the roughest thing possible." "He believed at the present time the Indian telegraphs were among the most scientifically worked telegraphs in the world."

In a free and open discussion I should say it was more scientific than practical.

Real advancement in telegraphy is best shown by comparing the results obtained with the means employed.

In this connection it is proper to refer to the Automatic Telegraph Company, that operates a single wire extending from New York to Washington, a distance of about 300 miles, and doing a local business with stations at New York, Newark, Trenton, Philadelphia, Baltimore and Washington.

In this circuit there are fifteen relays. The line is

worked in one circuit; or, in other words, while transmission is going on between any two stations, the balance of the line is unemployed so far as transmission of the business of the other stations is concerned.

This company does an average daily business of upwards of 700 paid despatches. They have secured this business simply by promptness and efficiency, in competition with the old company, having its wires extended to every considerable town in the country, with hundreds of branch offices in the cities mentioned. Ninety per cent. of this business is done during the six active business hours of the day, that is, between 9 A. M. and 3 P. M.

The last annual message of the President, containing 12,000 words, was transmitted from Washington to New York in twenty-two minutes by this single wire. Is there anything in any other part of the world (including India) that can make so favorable a showing?

From 1845 to 1867 I was connected with the telegraphs in this country, except in 1851, when I constructed the first line of telegraph in Mexico, connecting the City of Mexico with Vera Cruz.

In 1867 I visited Europe, and examined the different systems with much interest; and again last year, in the capacity of United States Commissioner to the Vienna Exposition. I was appointed to make a report upon Electricity and Telegraphy. This report is now in possession of our Government. My chief purpose was to gather information of processes and methods of value and interest to our people. In the discharge of this duty I was afforded every facility at Brussels, Berlin, Vienna, Berne, Paris and London.

On the Continent we find the Hughes printing instrument largely in use at all the central stations. The speed of this instrument is given as twice that of the Morse, which is also used to a less extent. The telegraphic journals are now discussing very freely the duplex transmission system, which is more in use in this country than any other, and with great advantage. The capacity of a wire, however, is not and cannot be doubled by its use. If there were no alterations or adjustments in connection with the compensating resistances and condensers required, it might approach it, but time is necessarily lost in obtaining and preserving the balance, more especially in wet and unfavorable weather. Under no circumstances is there as much performed in this country with four operators and one wire with the duplex system as is performed by two operators and one wire with the Hughes printer in Belgium, Germany and France.

In the central station at Paris we see them working the Hughes instrument at full speed on the long circuits, Paris to Havre, Paris to Brest, Paris to Marseilles, Paris to Lyons; also on the International, Paris to Brussels, Paris to Berne, Paris to Berlin, Paris to Dover, England. When I see this instrument worked to its full capacity, or say twice ordinary Morse speed, upon those circuits, in rain or unfavorable weather, I am forced to make comparisons as to the economy and efficiency of their systems with the manner in which the business is performed in my own country and in England.

My report refers to the amount of business performed or handled in London and Paris, the number of operators required to perform the service in each of those central stations, and the number and kind of instruments used.

If the French can perform, and well perform as much on one wire as the English on four wires of the same length and resistance, with proportionately less operators, and say one twentieth the battery power (using one and the same battery for five or six lines), it cannot be denied that practically the French system of telegraphs is not to be despised, and that it might be substituted even in England or India with profit.

I could go more into details upon this subject, but I do not in any way wish to forestall an official report.

DAVID BROOKS.

Philadelphia, Aug. 21, 1874.

The Telegraphers' Mutual Benefit Association Annual Meeting.

THE annual meeting of the Telegraphers' Mutual Benefit Association was held on the evening of the 11th inst., at 145 Broadway, New York. Among the delegates present from a distance were Messrs. A. Wilson, Jr., of Baltimore; J. W. Tillinghast and N. Hucker, of Buffalo, and F. W. Jones, of Chicago, and a good representation of the members in this city and vicinity were also in attendance.

Mr. R. H. Rochester was elected Chairman, and Mr. Wm. Holmes acted as Secretary.

The report of the Treasurer and Secretary for the past year was read and accepted, as follows:

REPORT OF THE OFFICERS.

During the year ending November 1 the number of deaths has reached 18, and have occurred in 10 different States, as follows:

Alabama.....	2	Ohio.....	1
Massachusetts.....	1	Illinois.....	1
New York.....	5	Michigan.....	1
Pennsylvania.....	1	Louisiana.....	3
Kentucky.....	2	Kansas.....	1

Assessments for the two last deaths have not yet been issued, but are included above.

The five deaths which have occurred in New York were, with one exception, of those who came into the Association during the first two years of its existence. This is true also of those which occurred in Alabama and Pennsylvania. No death has occurred among those received into membership during the past year, with the exception of Mr. McDill of Kansas, who was accidentally killed.

Accompanying this report will be found a list of all deaths since the organization of the Association, with the dates, causes and places, for the information of all parties. These deaths occurred in the different States, as follows:

Alabama.....	4	Minnesota.....	1
Arkansas.....	2	Maryland.....	1
Connecticut.....	1	Missouri.....	1
Georgia.....	2	New Jersey.....	1
Illinois.....	3	New York.....	23
Indiana.....	2	Nova Scotia.....	1
Iowa.....	1	Ohio.....	7
Kentucky.....	11	Pennsylvania.....	2
Kansas.....	1	Tennessee.....	6
Louisiana.....	5	Virginia.....	1
Massachusetts.....	1	W. Virginia.....	1
Michigan.....	3		

CAUSES OF DEATH.

- 28 died of consumption.
- 9 died of fevers.
- 5 died by accident.
- 4 died of heart disease.
- 3 died of pneumonia.
- 3 died of congestion of brain.
- 20 died of various other causes.

Of the 23 deaths in New York 8 were residents of the City of New York, and 7 of these were members in the first year of the existence of the Association. The average membership of all who have died is 2 years and 4½ months.

The number of members at the time of your last annual meeting was.....	1,230
New members since that time.....	188

Certificates cancelled during the year.....	1,418
	212

Present membership..... 1,206

It may seem to some discouraging thus to report a decrease in the membership. We cannot so regard it. The year has been one of great trial. Many members have dropped out simply because they could not obtain their small incomes from the companies by which they were employed. Others needed their whole income to help to mitigate the disasters of others whose needs seemed to demand their first care and provision. And when five members died within a few days of each other, very few, indeed, felt certain that they could retain their membership were these harvests of death to repeat themselves with a sweep so often and so wide. That we stand to-day with almost unbroken ranks, and with so slight a decrease, is a subject for congratulation. It should be remembered, also, that under existing conditions, delinquency, even for imperative causes, and for a very brief period, almost necessarily closes the gates against restoration, and practically excludes hundreds, once members, as devoted and worthy as ourselves.

The condition of the finances is as follows:

Balance, November 5th.....	\$8,435 15
Received for Assessments.....	22,893 30
Received for Applications.....	297 50
Fines for Readmission.....	72 00
Gift A. D. Cunningham, of Texas.....	1 00
Interest to July 1st, 1874.....	461 24
	<hr/>
	\$32,160 19

<i>Paid to heirs of</i>	<i>Assessment.</i>	<i>Amount.</i>
Th. Wilcox.....	44	\$1,229 00
E. Wade.....	45	1,217 00
R. S. Fowler.....	46	1,230 00
W. P. Tuites.....	47	954 00
John A. Conley.....	48	1,178 00
M. H. Bacon.....	49	1,135 00
E. S. Keep.....	50	1,130 00
A. Saville.....	51	1,135 00
C. W. Hills.....	52	1,112 00
C. McCarthy.....	53	1,013 00
J. M. Worden.....	54	1,000 00
F. E. Curtis.....	55	1,000 00
G. M. Simmons.....	56	1,000 00
W. H. Kelly.....	57	1,000 00
C. P. Rasser.....	58	1,000 00
S. Porter.....	59	1,000 00
G. H. Everett.....	60	1,000 00
E. P. Reardon.....	61	1,000 00
M. C. Hart.....	62	1,000 00

Balance—Amt. of Surplus Fund.....\$3,425 98
To which is to be added interest from July to November 1st, making a total of about \$3,700 00.

Although some dissatisfaction has been expressed at the limitation of the amount of payment at death to \$1,000, yet it has been very limited, and we believe there has been a very general acquiescence in its wisdom. It has enabled the Association to pay an assessment out of its surplus funds, and yet now to report a very handsome balance on hand.

It is suggested that if the funds be allowed to accumulate until the interest of the surplus fund meets the current expenses it would greatly strengthen the Association. A like approval of the resolution to tax delinquent members a second initiation fee on their restoration has not been manifested, and your Executive Committee, after consultation, deemed it their duty to call for an expression of opinion on that subject and finally to suspend its operation. There seems needed a careful and prudent revision of the whole subject of delinquency and the privileges of resignation and restoration.

The policy of the Association is impliedly benevolent, and its rules should be generous as well as just. Delinquents are now restored only on a new certificate of health and the payment of all back dues. It seems to be the wish of many to modify these conditions so as to restore to membership many whose necessities drove them to resignation or delinquency under the pressure of poverty or personal calamity, and yet avoid encouraging the easy shedding of the duties of membership.

It is suggested whether some definite amount of initiation fee, the whole of which shall be placed as a part of the permanent fund, may not take advantageously the place of the present sliding scale, however just it is acknowledged to be.

It is further suggested that, to members residing beyond the Rocky Mountains, the term of payment of assessments be increased from 30 to 60 days. To all these points your intelligent attention is directed.

The Association reaches its seventh anniversary with what we believe to be a worthy record, and with all the conditions by which its future success and usefulness seems assured. The few faults which now impede its more enlarged and acceptable membership once removed, and the terms of connection made generous, the Association should find a friend in the entire brotherhood of the telegraph, and go on with renewed vigor and widened usefulness and value. We are happy to report that Mr. W. B. Hibbard, of Salt Lake City, and Mr. C. H. Haskins, Superintendent of the Northwestern Telegraph Company, have recently signified their design to take an active interest in securing members in their respective regions. At the suggestion of the latter gentleman, Mr. F. B. Gibson, of St. Paul, is addressing the operators of Minnesota on the subject, while he personally gives his attention to Wisconsin. From these and other indications of good will on many hands, there is every reason to believe that nothing is now needed to render the Association fruitful and permanent but discreet counsels and loyalty to the sentiments upon which it was originally organized.

WILLIAM HOLMES, Sec.

The following addition to Section II of the By-Laws was proposed by Mr. Thos. P. Scully, of New York, and adopted:

"Any member desiring to withdraw from membership of this Association may do so by paying all indebtedness to the Association and receiving from the Secretary a certificate of withdrawal." Approved.

On motion of A. S. Brown:

Resolved, That delinquent members shall be eligible to renewed membership on payment of back dues to an amount not exceeding five dollars, and without other initiation fee. Approved.

The resolution, of course, contemplates that the status of health shall be satisfactory, as at the first, and so certified in due form.

Mr. A. S. Brown offered the following amendments to the Constitution:

"At the next and all following annual elections of officers of this Association, delegates from districts outside of the City of New York shall be entitled to cast as many votes as the number of members they represent, provided such delegates shall bring written evidence of their authority so to act. No person shall be allowed to act as delegate or representative of any district who is not himself a member of the district he represents." Approved.

On the motion of A. S. Brown:
Resolved, That in Section VIII of the By-Laws, after the word "Association," insert "audit all claims and accounts." Approved.

On motion of D. R. Downer:
Resolved, That the amount of the initiation fee be hereafter two dollars. Approved.

On motion of J. W. Tillinghast, of Buffalo:
Resolved, That during the fiscal year commencing November 11, 1874, the Reserve Fund shall be increased to \$5,000, and during each of the two following years the sum of \$2,500 shall be added, and that thereafter the minimum of the Reserved Fund shall be \$10,000. Provided, that in case of extraordinary death rate, the amount may be temporarily reduced by unanimous vote of the Executive Committee. Approved.

On motion of F. W. Jones, of Chicago:
Resolved, That the Executive Committee be enlarged to seven members. Approved.

The following officers were elected for the ensuing year:

Mr. James D. Reid, Treasurer; Mr. Wm. Holmes, Secretary.

EXECUTIVE COMMITTEE.

Messrs. J. M. Crowley, Augusta, Ga.; C. H. Summers, Chicago, Ill.; R. H. Rochester, D. R. Downer and A. S. Brown, New York.

Adjourned.

Departure of Mr. Albert L. Baker.—A Case in Point.

SAN FRANCISCO, CAL., Nov. 5.

TO THE EDITOR OF THE TELEGRAPHER.

"BAKER leaves to-day" passed so often from mouth to mouth in our office that I thought a few words in THE TELEGRAPHER would not be inappropriate. Two years and some months ago Mr. Albert L. Baker came to this coast, having been attracted hither by the patent medicine puffery about California. He leaves the telegraph business to-day to visit his parents in Michigan and remain with them all winter, to study scenery and other branches of painting. Every one who knows Mr. Baker telegraphically will be sorry to hear that he has left a profession in which he had no superior and few equals. He was one of those operators, now very seldom to be found, whose intelligence kept pace with his fingers—none of that illiterate, mechanical, commercial colleigeism characterized his work. It was done ably and with judgment. None of his associates ever found him other than a gentleman of the finest order. Quiet and unostentatious in demeanor, affable and polite to a degree, yet firm in upholding what he considered right, and ever ready to embrace the cause of justice. Hence, we find him a "private still" in the ranks; while men of less ability, less judgment, and a thousand times less principle have been raised above him. Why is this? Because it illustrates clearly (what has been so often agitated through the columns of THE TELEGRAPHER) that a man must not be a man to be promoted now. There are, however, a few exceptions. Had Mr. Baker been more of the "Uriah Heap," or Michael Feeney, and less of the gentleman that he is, I am confident that he would have occupied a high position in the Western Union telegraph service. I hope he will pardon me for making his case an example, but I may live my life over again before I would have a better case in which to show the fraternity that our profession is no profession—wholly unworthy of the name of profession. If fifteen years ago Mr. Baker had embarked in any other business, with the same natural endowments, and possessed the same ability therein as he does in telegraphing, I ask you where would he be to-day? Ask yourselves. Would he be leaving it after so long a period to learn another? or would he be allowed to leave by his employers without some substantial mark of their esteem for so able and so faithful a servant? Now, had Mr. Baker been a plug, a sneak, a liar and a two-faced hypocrite, willing to traffic on the faults of his honest but sometimes foolish associates, I am inclined to believe that after fifteen years' service, even in telegraphing, he would have at least been a kind of an assistant chief operator; but, preferring a manly, upright, honorable course and an untarnished name, he leaves us, and we are deeply grieved at his departure. He has made hosts of friends—real, honest, warm-hearted friends, who will ever be glad to hear of his prosperity—of which may bounteous heaven shower a plenitude upon him.

"We know your heart, good Albert,
We know your mind and will;
A greyhound ever at the start
To run for honor still."

And may you ever continue to do so, is the honest wish of one who found in you what was to be most admired in a man. Farewell.

FIAT JUSTITIA, RUAT CÆLUM.

Paterson, N. J., Operators.

IN THE WILDS OF NEW JERSEY, October 15.

TO THE EDITOR OF THE TELEGRAPHER.

I THINK in my last communication we left off with Mr. Colton, of the Broadway office of the Midland Railroad, at Paterson. In this office also we find Willie Fliteroft, "O," who, although but twelve years old, handles the key like an experienced operator. Willie is a brother of Mr. J. E. Fliteroft, who is agent at Wortendyke, N. J., but has his residence in Paterson. There is but one wire in the Paterson, Broadway, office, and, for its length, it is the busiest wire I ever saw.

Jumping into the Midland horse car we ride up to the York avenue station, where we find Mr. G. W. Post, "Q," who has his hands full in attending to the ticket business and telegraphing. This is the repeating office for the N. J. Midland Railway offices. Mr. Post has lately been off on a visit to Oswego, not forgetting to step off at Deckertown. George is a lady's man, and is noted for his attentions to the fair sex. He is also a great dog and bird fancier.

Here may also be found Mr. S. W. Harris, who is the agent, and also makes himself useful at the key occasionally when it is necessary. Mr. Harris is a Hackensack boy, but came to Paterson from Johnston, N. Y., and succeeds Mr. J. J. Demarest, who goes to the head office.

Having completed the inspection of the Midland offices we will travel back down town to the Western Union office, which has been left to the last, as I design to give it a more extended notice. That prince of good fellows Mr. Wm. D. Westcott, "W," is the manager of the Western Union Company here. He is well qualified for the position, and manages the business and the wires in an efficient and satisfactory manner. He has recently been *dimpled* to the prettiest young lady in Paterson—Miss Christie. They have my best wishes for their future prosperity and happiness. Mr. Westcott has taught both his book-keeper and a student to operate. The student, Mr. Elias Carpenter, "C," is an excellent young man, and has become quite an expert telegrapher, somewhat to the envy of the book-keeper, Mr. Jacob Van Kiper, who tries hard to "frite gerse" on that Newark wire. This is the only wire he dares to go on as yet, because it's annoying to have New York say "Go West" to him. Jake tries hard to get along, but is like some others, who want to get through in a hurry, and think they know it all, while they have yet much to learn. He will, however, come out all right after sufficient practice on that old brass camel back key.

There are two messengers in this office who eye the instruments with suspicion. There are four wires running into this office, with as many sets of instruments and tables. Manager Westcott can pride himself on a good office and good location. The business of the office amounts to about \$700 per month, which is between \$100 and \$200 less than before the panic of last fall.

Of the wires in Paterson three are Midland, one Del., Lackawanna and Western, ten Erie Railroad, and I don't know how many fire alarm wires.

The fire alarm sounds every day at one o'clock, P. M., and an enterprising jeweller on Main street is out in on the W. U. wires to New York every week day at noon by Mr. Westcott, so as to receive the standard time.

Hoping that I have done justice to all, I will close this communication. My next will give an account of the D. L. and W. (Boonton branch). Operators, look out for P's. and Q's.

A New Theory of Electricity.

Professor EBLUND, a Swedish physicist, expounds in a recent work a new theory of electricity, the substance of which is as follows: He supposes the existence of a highly subtle and elastic ether, everywhere present both *in vacuo* and in ponderable matter. Two molecules of this ether are mutually repelled along the line of their connection and in inverse ratio to the squares of the distances. In good conductors the molecules are displaced easily from point to point, it being presumed that they can be moved with little force. If the body be a non-conductor, this mobility is arrested and depends on the molecules of the material body. A molecule is at rest from the moment when it is equally repelled on all sides. If the repulsion be less at one side than at the other the body will move if it be free in the direction of the resulting forces.

Automatic Telegraphy not Inimical to the Interests of the Telegraphic Fraternity.

THE impression has obtained to some extent among the telegraphic fraternity that the general introduction of automatic telegraphy would be likely to diminish the demand for skilled telegraphic labor, and thus affect unfavorably their interests. For this impression some of the advocates and promoters of the automatic telegraph system are to a certain degree responsible. It has been urged as an argument in favor of the system that such would be the case, and that certain portions of the work was so simple that even a child of ordinary intelligence could perform it, and that most of it could be done by a class of labor relatively much cheaper than that now engaged in telegraphic service.

Any person who has attentively read THE TELEGRAPHER during the last four or five years will bear witness that no such argument or statement has been editorially endorsed in its columns. We do not regard it as substantially correct, nor do we believe that the interests of telegraphers would be unfavorably affected by the general introduction of automatic telegraphy.

The chief advantage to be derived from automatic telegraphy, and the way in which it is to be utilized in the reduction of the cost of telegraphic service, is in increasing very largely the capacity of telegraph lines for the transmission of business. It has been well said by Mr. ORTON, in his official reports to the Western Union Telegraph Company, that the demand for telegraphic service increases so rapidly that it has become a serious problem how this demand was to be met without such a constant addition to the wires as is not only difficult to be made, but which seriously diminishes the profits to be derived from the business. The duplex has for a time met this demand with that company, and they are now striving to still further solve the problem with the quadruplex. It can, however, in our opinion only be fully solved by the automatic system, and this will eventually become a leading telegraph system in this country.

To work the automatic system efficiently skilled telegraphic labor will be required, whatever may be said to the contrary by either friends or foes. The reduction of cost will naturally and inevitably increase very largely the amount of telegraphic business done, and this will necessitate the employment in the various branches of the service of as many or more persons as are now engaged in it.

The proportion of skilled operators required, and the rates of compensation, will be as great as at the present time. Another point which should be borne in mind is that we have never claimed or advanced the idea that the automatic, pure and simple, would be likely to become the telegraphic system of the future. The best conditions will no doubt be obtained by a com-

bination of the automatic and other systems in the working of telegraph lines. This, we have always believed, would ultimately be the plan adopted, and have so stated repeatedly. It is not probable in any event that our Morse or printing telegraph operators are likely to be reduced to the dire necessity of abandoning their profession, or that they will be forced to accept starvation compensation, any more than they would be otherwise, even if automatic telegraphy were generally introduced upon American telegraph lines. The attempt to make it appear otherwise is mischievous, and usually is resorted to for sinister and unfriendly purposes and motives.

The history of other inventions and business, however, shows that even if it were true that the introduction of the automatic system, if it possesses the merits and advantages claimed for it, would enable the substitution of cheap for more expensive skilled labor, that that would not ultimately prevent such introduction and general use, whether THE TELEGRAPHER and other telegraphic journals advocated or opposed it. In no instance on record, however violent, forcible and persistent has been the opposition of those who supposed themselves interested in preventing the use of labor saving or economical inventions, has it been permanently successful. If certain work can be done for fifty cents, the public will not permanently pay a dollar for it, even if, by the reduction, individuals are injuriously affected. This is a law as immutable as that which governs the planetary system, and those who shut their eyes to the fact are no wiser than the foolish bird who merely hides his head and believes that because he cannot see the enemy the enemy cannot see him. When the public is fully convinced that automatic telegraphy is what its friends and advocates claim it to be, despite opposition of interested or ignorant parties, whether telegraphers or others, it will take the position to which its merits and advantages entitle it.

Quarrels and lawsuits over the ownership of patents may postpone this for a time, but these must eventually be settled or decided, and when they are the means will be provided for bringing the best automatic system, as a whole, into general use.

We seek to advance the interests of telegraphers and the telegraphic profession not by flattering or deceiving them, but by telling them the truth and keeping them informed in regard to matters in which they are interested. We have no personal interests or aims to serve in advocating, or otherwise, automatic or any other telegraphic system, for we have not personally a dollar invested in either of them. Independence in this as in all other telegraphic matters is our aim, and we propose to treat of all such as in our opinion they merit.

The New Law in Regard to Postage on Newspapers.

UNDER the provisions of the new postal law passed at the last session of Congress, on and after January 1st, 1874, publishers are required to prepay the postage on newspapers and other periodicals sent to subscribers. The fact that a paper is transmitted through the mails will, therefore, after that date, be sufficient evidence that the postage on it has been paid, and no postage can legally be collected of the party to whom it is addressed.

Although this necessarily adds to the expense of publication, we have decided not to increase the price of THE TELEGRAPHER, which will remain as heretofore at TWO DOLLARS per annum, and rely upon increased circulation to recompense us for the additional outlay required. We trust that our friends will bear this in mind, and will endeavor to secure such an addition to the number of our subscribers as shall prove that not only is the fact of prepayment of postage, but also the acknowledged merits of THE TELEGRAPHER, and its position as the only recognized independent telegraphic journal and representative of the telegraphic profession in the country, appreciated. The prepayment of postage makes the net cost to subscribers only two

dollars a year, which, for a weekly publication of the size and character of THE TELEGRAPHER cannot certainly be deemed excessive.

It will not be necessary, hereafter, for subscribers in Canada and other North American British Provinces to remit the additional twenty cents for postage, heretofore required to prepay United States postage. Our friends and agents in these provinces will please bear this fact in mind in procuring and forwarding subscriptions to us.

Our New Advertisements.

As will be seen, advertisers have this week occupied our columns to a larger extent than usual. The demands of advertisers for room increases so steadily that it seems likely that we may be compelled to enlarge THE TELEGRAPHER at no distant day, in order to give our readers a fair show. We have for some time contemplated such an enlargement, but for certain reasons of a personal nature, have not been able to make it, or fix a definite time when it could be done. The pressure not only of advertisements but also of telegraphic and electrical matters is constantly increasing and demanding more space than can now be afforded. The telegraph increases in importance and extent rapidly, and naturally requires more space for proper presentation and consideration.

In the present number Messrs. L. G. TILLOTSON & Co. have taken two columns, in addition to their regular advertisements, in which to call attention to their Railroad Sounder, which is recommended highly to those who may have occasion to purchase and use such an instrument. These may be obtained either at their New York establishment, No. 8 Dey street, or their New Philadelphia branch, 54 South Fourth, corner of Chestnut street, or at 22 West Fourth street, Cincinnati, Ohio. The honorable record and established reputation of this house from many years' business is a sufficient guarantee of honest and fair dealing. The name of L. G. TILLOTSON has been a household word amongst telegraphers and telegraph managers for the last ten or fifteen years.

MESSRS. LENNET & DECKER, of Cleveland, Ohio, also avail themselves of our columns to show purchasers of telegraph apparatus how to economize. And Messrs. SHERMAN & LYMAN, of Oberlin, Ohio, also advertise a complete stock of telegraphic goods. It is evident that the value of THE TELEGRAPHER as an advertising medium is generally appreciated by manufacturers and dealers in electrical and telegraphic apparatus and supplies.

The Metallic or Lead Battery.

THE rapidly increasing demand for the metallic or lead battery (commonly known in this country as the Eagles metallic battery), introduced by Messrs. F. L. POPE & Co., and which is still manufactured and sold by them, demonstrates the fact that its merits and advantages are becoming generally known and appreciated. It is undoubtedly the best battery for telegraphic and most other purposes for which galvanic batteries are required, offered to the public. It is economical, and from its peculiar combination of elements, will work for months after being set up without renewal or attention, either on open or closed circuit.

This battery can be obtained either from the manufacturers, Messrs. F. L. POPE & Co., or from Messrs. L. G. TILLOTSON & Co., of this city, who are agents for its sale.

Personals.

Mr. E. M. FOX, Manager Third District American District Telegraph Co., has resigned, and accepted a position on the staff of the *New York Herald*.

Mr. J. B. McDONALD has been appointed to fill the vacancy as Manager of the Third District A. D. T. Co., caused by the resignation of Mr. E. M. Fox.

Mr. E. V. ELLIOTT, formerly Manager of the Tenth and Fifteenth Districts of the Amn. District Telg. Co., has been appointed Supt. of the Amn. Dist. Telg. Co., at Jersey City, N. J.

Mr. JAMES NEWELL has accepted a position as reporter in the Stock Exchange with the Gold and Stock Telegraph Co., New York.

Mr. M. B. MEDLER has accepted a position in the Marine News Department of the Gold and Stock Telegraph Co., New York.

The Telegraph.

The Southern and Atlantic Telegraph Company.

BUSINESS on the lines of the Southern and Atlantic Telegraph Company, so far as completed, is reported as much improved, and now very good. The construction of the line South is proceeding in spite of the obstacles thrown in the way by parties interested in opposing the building of a competing Southern line, and the extension to New Orleans cannot much longer be delayed.

The American District Telegraph Company.

THE off force of Messengers of the American District Telegraph Company, about 200 in number, will parade from the Thirty-eighth District to Grand street ferry, and assemble at Myrtle Avenue Park, Brooklyn, for various exercises, on Thanksgiving day. A number of valuable presents have been provided.

An Offer to Lease the Franklin Telegraph Lines.

AN offer of \$35,000 a year on a lease of the lines, etc., of the Franklin Telegraph Company, was made on Friday of last week by Boston capitalists, who are interested in the lines. The offer was made by them mainly in consequence of an effort made at a recent stockholders' meeting by the Atlantic and Pacific Telegraph Company, who own a controlling interest in the stock, to lease the property of the company to themselves for \$25,000 per year.

As the company at its recent meeting adopted a resolution to lease the property to the Atlantic and Pacific Company, it is difficult to understand how the above proposition, even if made in good faith, can be available.

The American Fire Alarm Telegraph in Pawtucket, R. I.

THE following account of the completion of the Fire Alarm Telegraph at Pawtucket, Rhode Island, which has been put up by Messrs. Gamewell & Co., is from the *Providence Journal*:

"The final test of the fire alarm telegraph was made on Saturday. Dr. Munroe, the contractor for putting up the telegraph, was present to witness the trial, and see that everything was in complete order before its acceptance by the authorities of the town. The work of putting up the telegraph has been done under the direction of Mr. James Wilkinson, superintendent of construction. There are thirty-four boxes from which alarms may be given, eight of which are private, to be used only when a fire occurs on the premises or the property of the owners is in danger. Everything connected with the alarm is of the latest improvement. The battery is an improved kind, which it is claimed will run a year without replenishing. The boxes are provided with an improvement whereby but one alarm can be sent over the wires at one time. Should an alarm be pulled while another is being sent, over the wires, the box last pulled would not strike its number, but would run down and have to be pulled after the other had finished striking, in order to get an alarm from the box last pulled.

At the trial Saturday all the boxes were pulled and everything was found to be correct. Chief Engineer Greene, of Providence, and several other out-of-town firemen were present to witness the test: quite a number of our citizens were also present and had the working of the apparatus explained to them. We are informed that Pawtucket is the first town in the United States that has adopted the fire alarm system—in every other instance it has been a city government before a fire alarm has become one of the necessities of the place.

Mr. Wilkinson and some of his assistants departed for Nashville, Tenn., Saturday evening, where they are to erect a fire alarm telegraph."

Foreign Telegraphic Notes.

THE Hamburg steamer *Vandalia* picked up the Colon telegraph cable on the 4th inst., in the port of Panama, and caused it some slight damage, but not sufficient to seriously interrupt the business of the line. The necessary repairs were speedily made, and messages were soon being received and forwarded as usual.

The recent stormy weather in Great Britain not only affected seriously the land lines in the postal telegraph

system, but the submarine lines as well—there having been three cables, the Channel Islands, the Isle of Wight and the Isles of Arran, broken.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended Oct. 31, 1874, was 330,428—an increase of 44,569 on the corresponding week last year.

The Columbian, C. A., Government has made a contract which, if ratified in London, will secure to that country a submarine cable between Aspinwall, Cartagena, Savanilla and Santa Martha. The Government is to give an annual subsidy of \$25,000 for eight years. The Government has also agreed to give the company which undertakes it an annual subsidy of \$10,000 to maintain telegraphic communication between Panama and Peru, touching at Buenaventura.

The traffic receipts of the Direct Spanish Telegraph Company for the month of October amounted to £1,386.

The Indian Government land lines, which were interrupted by the cyclone have been repaired and messages are again being forwarded from Calcutta, via Suez and Falmouth, with regularity.

The traffic receipts for the month of October of the Eastern Extension, Australasia and China Telegraph Company, amounted to £16,584—a decrease of £1,002 on the corresponding month of 1873.

The traffic receipts of the Eastern Telegraph Company for the month of October last, amounted to £32,853—an increase of £3,624 on the corresponding month of 1873.

Presentation to J. A. Noble.

ON the night of Sept. 30th a pleasant party met in the parlors of the McMeeken House in Topeka, Kansas, and presented Mr. J. A. Noble, who has resigned the position of train master and despatcher, which he had held for three years past on the Kansas Pacific Railroad, to accept the position of Division Supt. of the Texas Pacific Railway, with a handsome gold watch and chain.

Telegraphing Extraordinary.

WE have heard much of the wonders of cable telegraphy in outrunning time and annihilating space, but an anecdote related to us by Mr. W. P. Phillips, assistant agent of the State Associated Press in New York, who is on a visit to this city, surpasses anything we have ever heard.

A gentleman of the Western Union Telegraph office at No. 145 Broadway, New York, was sitting in the cable room when a telegram from Philadelphia destined for Paris came over the wires. This message, like all others for France, was to go over the cable via Duxbury, Mass. The operator called Duxbury a few times, and then said: "That fellow is asleep, evidently; but the cable men are always awake—I'll have to get one of them to go in and wake him up." So he stepped to another desk, called Plaister Cove, in Newfoundland, and sent the following message: "To cable operator, Duxbury: Please go in and wake up my own true love." This message Plaister Cove hastened to send across the ocean to Valencia, Ireland, who in turn "rushed" it to London; thence it was hurried to Paris, and still onward to the European end of the French cable at St. Pierre; the operator there flashing it back to Duxbury. In less than two minutes by the clock the message had accomplished its journey of some 8,000 miles by land and sea, as was evidenced by the clicking of the instrument on the Duxbury desk, which ticked out in a manner a little more petulant: "That is a nice way to do; go ahead. Your own true love!"—*Troy Whig*.

The New Postmaster General and the Telegraph.

POSTMASTER GENERAL JEWELL is now engaged in the preparation of his annual report. It has been stated that he is opposed to the proposed postal telegraph system. This assertion is premature, as he has not determined what position he will take on the subject. The system has succeeded in other countries, and it might be successful here, but there are circumstances, he thinks, which makes the acquisition of established lines a matter of doubtful wisdom, and the construction of new ones would be unadvisable. As to the subject of postal savings banks, the Postmaster General does not seem to favor such an aggressive movement on the banking and financial institutions of the people. These subjects will not, it is likely, be treated in the report. The receipts and expenditures, and internal administration of the Department, will be considered at length. The Postmaster General is evidently amazed at the seven million deficiency this year—the expenditure of thirty-two millions against receipts of twenty-five millions. He will recommend either retrenchment in expenses or increase in postage. He thinks there are extravagances in many branches,

which he will endeavor to suggest remedies for. The Postmaster General, it should be understood, does not advocate high rates of postage. He does not believe in attempting a revenue from this source, but he does think that it is poor financing of the Government to make up such large deficiencies. If a reduction of expenses will cover the excess this would be preferred, but as the cost of transportation is constantly going up, it cannot be seen how much aid can be expected from that quarter. The report will be one of unusual interest and importance, as it strikes out on a new path.—*Washington (D. C.) Chronicle*.

[From the London, Ont., *Free Press*.]

Fire Alarm Telegraph.

THIS very important work, which is to be used as an auxiliary in connection with the proposed change in the working of the Fire Brigade, is being pushed vigorously forward by Mr. George MacDonald, the contractor. The poles and wires are nearly all up. The instruments are being tested in the manufactory of Mr. E. Chanteloupe, in Montreal, and will be in operation in less than a fortnight from now. This evinces an enterprise that few cities in America can boast of.—*Ottawa Times*.

It is certainly very enterprising; but we do not see why London should be outstripped in this particular. The proposed Fire Alarm Telegraph is popular enough here. No class of our citizens would begrudge the necessary outlay, deeming the advantage gained a good equivalent therefor. It only remains for our civic representatives to take the matter up in the right spirit to enable London to make the same boast as Ottawa.

New Patents.

For the week ended Oct. 13, and bearing that date.

155,936.—TUBES FOR UNDERGROUND TELEGRAPH LINES. Townsend Fell, Bristol, Pa. Filed May 9, 1873.

In the tube a series of disks are placed at suitable intervals, connected by a central hub or rod. The wires are supported and held in place by the notches in the disks.

The combination of tubes A of non-conducting material, and a series of internal notched disks, arranged at intervals so as to support a series of wires throughout their entire length, as set forth.

155,940.—WATCHMAN'S ELECTRICAL TIME RECORDERS. E. T. Gilliland, Cincinnati, Ohio, assignor to himself and C. Seiden. Filed June 26, 1873.

Clock dial rotated by clock work, and marked on by a pencil vibrated by an armature placed between two sets of magnets in branch circuits from one battery. Switches are interposed to close and break the branch circuits, closing one as the other is broken, the closing, however, of either being incomplete until the other is completely broken, necessitating a visit to each post to complete the record.

The combination, in a watchman's time register, having two sets of magnets with an interposed armature operating the marking mechanism of the two circuits B B', each connected to one pole of the battery at one end, and to different magnets at the other, and the switches g g, arranged to break circuit through one and close circuit through the other set of magnets the closing of the one circuit being incomplete until the last switch of the series be manipulated, all substantially as and for the purpose specified.

Married.

HOWDEN—READ.—At the residence of the bride's father, Louisiana, Mo., November 5th, Wm. J. HOWDEN, of London, England, and Miss MATILDA READ, of Louisiana.

Mr. Howden was formerly connected with the train despatcher's office at Bloomington, Ill., and for about one year has been the manager of the Western Union office at Louisiana, Mo.

This wedding was one of the most brilliant and enjoyable events of the season where it occurred, calling together about one hundred guests from among the friends of the groom and his beautiful and accomplished bride, many attending from a distance. The high position which the parties to this happy union hold in the esteem and affection of the whole people, and the rare beauty and virtues of the bride, gave zest to the enjoyments of the occasion, and secured many a "God bless you" from the assembled guests. Miss Read has long been the organist of the church, while Mr. Howden has been the efficient superintendent of the Sunday school. The bride was the recipient of many rare and beautiful gifts from partial friends, and the groom appeared in a complete wedding outfit of elegant fit, presented by his brother in London. His brothers will pass the word, "Well done," all along the line.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Descriptive circulars and price list forwarded upon application to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES,

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street. PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior
PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employés, &c., for the introduction of the Printer.

For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

 Chicago, Ill.

MANUFACTORY OF THE SPENCEREAN STEEL PENS, BIRMINGHAM, ENGLAND.

SPENCEREAN DOUBLE ELASTIC STEEL PENS.

The superiority and excellence of these justly celebrated Pens are appreciated, as is shown in their constantly increasing sale. They are comprised in fifteen numbers, of which one number alone has an annual sale of more than 5,000,000.

The SPENCEREAN PENS are manufactured of the very best material by the most expert workmen in Europe, and are famous for their elasticity, durability and evenness of point.

THE SPENCEREAN PENS ARE FOR SALE BY ALL DEALERS.

We make Fifteen Numbers of Pens, differing in flexibility and fineness of point, adapted to every style of writing, as follows:

- No. 1. COLLEGE PEN. *Point Fine; Action Perfect.* This is a great favorite with our leading penmen, is largely used in the Schools and Commercial Colleges throughout the country, and gives better satisfaction than any Pen before the American Public.
- No. 2. COUNTING-HOUSE PEN. *Point Fine and Flexible,* well adapted to the use of Correspondents and Accountants.
- No. 3. COMMERCIAL PEN. *Point Medium.* An Easy Writing Business Pen.
- No. 4. LADIES' EXTRA PEN. *Point Extra Fine and Flexible.* For Delicate Fine Hand Writing this is a very superior Pen.
- No. 5. SCHOOL PEN. *Point Fine, Medium in Flexibility.* For a durable School Pen it has never been equalled.
- No. 6. FLOURISHING PEN. *Point Long, Flexible and Medium in Fineness.* For Off-hand Flourishing.
- No. 7. QUILL PEN. *Point Medium, Quill Action.* A smooth, Easy Writing Pen. Its name well represents its qualities.
- No. 8. CONGRESS PEN. (New.) *Medium Flexible Point.* A very superior Pen for all styles of writing. This Pen undergoes a process that renders it non-corrosive and three times more durable than any ordinary Steel Pen.
- No. 9. BANK PEN. *Point Long and Flexible.* A great favorite with Accountants, Tellers, etc.
- No. 10. CUSTOM-HOUSE PEN. *Point Medium.* Well adapted to all styles of Bold Free Hand Writing.
- No. 11. UNIVERSITY PEN. *Point Medium, very Smooth and Flexible.* The action of this celebrated Pen is very fine.
- No. 12. EPISTOLAIRE PEN. *Point very Fine and very Flexible.* This is the finest Pointed Pen made, and, for very Delicate Writing, Map and Fine Pen Drawing, it has no equal.
- No. 13. ENROSSING PEN. *Point Blunt and Smooth.* Particularly adapted to Coarse Hand Writing and Engrossing.
- No. 14. ARTISTIC PEN. *Flexible, with extra fine point.* This Exquisite and Truly Celebrated Pen is the Best Pen extant for Fine Ornamental Writing.
- No. 15. THE QUEEN. *Point extra fine.* Admirably adapted to all kinds of Fine Writing.

Sample Cards containing all the FIFTEEN Numbers, securely inclosed, will be sent by mail on receipt of 25 cents.

IVISON, BLAKEMAN, TAYLOR & CO.,
 138 & 140 Grand street, N. Y.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,
 BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

WESTERN ELECTRIC
MANUFACTURING COMPANY
FURNISH ALL DESCRIPTIONS OF
Copper Office and Magnet Wire,
OF OUR OWN MANUFACTURE,
WITH
EVERY VARIETY OF INSULATION,
FINE RESISTANCE WIRE and DOUBLE and
SINGLE CONNECTING CORD.
Western Electric Manufacturing Company,
CHICAGO.

CHARLES WILLIAMS, JR.,
(ESTABLISHED 1856.)
109 Court Street, Boston,
has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
20 CONDUIT STREET,
PROVIDENCE, R. I.,
Manufacturer of
Patent Finished Insulated Wire, Patent Rubber
Covered Wire, Magnet Wire, Patent
Electric Cordage, Cables, etc.

I claim to furnish the best Braided Wire in the Market, and I believe it is acknowledged as such by all large Telegraph Companies and Telegraph Supply Dealers.

My Wires were awarded the first premium at the Cincinnati Exposition of 1874, both for best "Office" and best "Insulated Line Wires."

These Wires are furnished in any desirable color or plaids.
My Rubber Covered Wire will not crack, and is not affected by ordinary extremes of heat or cold. The rubber covering is of uniform thickness, and the wire will be found in the exact centre—a result not heretofore produced.

I also make cables of any number of conductors at the regular price for a single wire.

With new and improved machinery I feel satisfied that I can furnish magnet Wires as good as any to be found in the market.

All Wire used by me is made to my special order, and is the best that can be procured in the market.

I could give a long list of testimonials, but depend on the merits of the Wire for patronage.

☞ Please send for sample card and price list.
These Wires can be had at my prices of

- L. G. TILLOTSON & CO., New York.
- CHARLES T. CHESTER, New York.
- F. L. POPE & CO., New York.

JOSEPH MOORE & SONS,
(Established 1820.)
535 & 537 CHINA STREET,
(Below Green St.) PHILADELPHIA, Pa.,
MANUFACTURERS OF
INSULATED WIRES.

OFFICE WIRE—Plain, Braided, Prepared, &c.
INSTRUMENT WIRE—Cotton and Silk Covered, &c.
FLEXIBLE CORDS, all kinds, &c., &c.
We warrant all Wire to be of the highest conductivity, tested by our Galvanometer, which compares with the tests of the highest authority in this country.

TILLOTSON'S EXCELSIOR
TELEGRAPH INSTRUMENT

(PATENTED JUNE 24, 1873.)

This apparatus is constructed of the best material, and finished equal to any Telegraph Instrument, and is warranted first class in every particular. It is especially adapted to the requirements of Students of Telegraphy and the operation of Private Telegraph Lines.

Price, complete, Sounder and Key mounted on finely finished Mahogany Base, with one Cell Hill's Patent Battery, with Chemicals, eight feet of Office Wire, and "Smith's Manual of Telegraphy"..... \$7 50
Two sets..... 14 50
Price of Sounder and Key only..... 6 50
" " with Cnt Out and Lightning
Arrester attached..... 7 50

TELEGRAPH PRINTING A SPECIALTY.

SPECIAL NOTICE.

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS

for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
Instrument with Office Outfit..... 7 50
Two Instruments and Outfits..... 14 50

THE BISHOP GUTTA PERCHA WORKS,
422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
ONLY MANUFACTURER
OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED
WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE
and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground
and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors
required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS,
ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors
GUTTA PERCHA has been universally adopted by all scientific and
practical Electricians and Manufacturers of Telegraph Cables and
Wires in this country and Europe, and has sustained, with increasing
superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated
with Gutta Percha, as low as they can import Cable of the same
style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered
at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any
Telegraph Cable or Wire manufactured at the Works in New York,
at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods manufactured
by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale
in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway,
D. HODGMAN & CO., 27 Maiden Lane,
SHEPARD & DUDLEY, 150 William St.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, NOVEMBER 28, 1874.

VOL. X.

WHOLE No. 437.

Original Articles.

The American Electro-Chemical (Automatic) Telegraph System and Condensers.

TO PROFESSOR HENRY we are indebted for his very elaborate investigation (many years since) in relation to the effects of induced currents of electricity in variable coils or helices of wire. His experiments extended in so far as to develop alternate and counter currents in coils or helices up to the seventh order. Prof. Henry announced to the scientific world, in 1832, his important discovery. (See *Silliman's Journal*, July, 1832.)

Prof. Dal Negro, in 1833, discovered that iron cores augmented the power of the coils (see *Annali del Scienza*, March, 1833); as a consequence smaller helices could be used.

Prof. Faraday, in 1834, announced the same remarkable phenomena as previously discovered by the distinguished American scientist, Prof. Henry. (See *London and Edinburgh Philosophical Magazine*, November, 1833.)

Prof. Henry, in 1835, made his extended communication on the influence of a spiral conductor in increasing the intensity of electricity. (See proceedings of the American Philosophical Society, January, 1835.)

Prof. Fizeau discovered, in 1853, the action of the coil or helix when used as a condenser or accumulator in suddenly arresting, and absorbing after currents. (See *Comptes Rendus*, vol. 36, p. 420.)

The first application to the purposes of electro-chemical (automatic) telegraphy was made by myself on the 20th June, 1869. (See, also, extracts from my patents, as follows:—)

No. 108,496.—October 13, 1870. "Variable coils or helices in a branch or shunt circuit of an electro-chemical (automatic) telegraph. To clear the main line with much greater rapidity than the arrangements heretofore employed."

No. 2,286.—August 30, 1871. "Helices in a branch or shunt circuit of an electro-chemical (automatic) telegraph."

No. 125,527.—April 9, 1872. Electro-magnets in a branch or shunt circuit of an electro-chemical (automatic) telegraph.

No. 1,207.—April 22, 1872. Electro-magnets in a branch or shunt circuit of an electro-chemical (automatic) telegraph.

No. 131,171.—September 10, 1872. Adjustable or variable helices to regulate the relative force of branch or shunt circuits in an electro-chemical (automatic) telegraph.

Finally, its several junctions in connection with my electro-chemical (automatic) telegraph are as follows:

First, as an "overflow dam," by passing to earth excess of incoming waves of high potential. Second, in its adjustment of the decomposing force. Third, its use in preventing the total escape from the stylus of waves of low potential. Fourth, its use as a "condenser" or accumulator, by its sudden absorption of the lingering charge left in the branch or shunt circuit and stylus, or breaking the main line circuit by the intervention of the paper of the perforated telegraph at the transmitting station. Taking into consideration (in this case) its varied functions, I term the same my *Condenser Overflow Rheostat Dam*.

GEORGE LITTLE, C. E.,
Passaic City, New Jersey, U. S. A.

The Characteristics of Telegraphers and the Condition of Telegraphic Service.

BY OLD TELEGRAPHER.

IN the early days of the magnetic telegraph in this country the operators were essentially a migratory class, here to-day and gone to-morrow. They were then, as is to a considerable extent the case now, mostly young men, and usually without the domestic ties which made it necessary that they should have permanent settled places of residence. Most of them were always in light marching order, so to speak, and ready at a moment's notice to remove from one place to another,

and the distance between their temporary locations made but slight difference to them. They were at home wherever they chanced to stop for a shorter or longer period, and being usually jolly, happy-go-lucky individuals, were for the time contented, provided they were not required to remain too long in one place.

Although scarcely the ordinary lifetime of a generation has passed since the construction of the experimental line between Baltimore and Washington, many and radical changes have taken place in the characteristics of those engaged in telegraphic service. The rapid development of the telegraph business has necessitated more stringent discipline and supervision of the employés, and the looseness and lack of system in the administration of the telegraphs which were considered as at least not reprehensible, would not now be tolerated on any respectable or important telegraph line. The proportion of the telegraphic fraternity who drift about from place to place has steadily decreased, and the profession has come to be recognized as one in which the principles which govern the employés in any extensive and regular business must be applied. The advantage and importance of permanence in the main body of the employés of any telegraph company is recognized, and those in whom the gipsy element is strongly developed are not considered as the most desirable. Formerly, the fact that an operator did not remain for any considerable time in one place, but was ever looking out for "fresh fields and pastures new," was not regarded as seriously detrimental to his chances of obtaining employment; but this is not so now. The old condition of things applies more generally to railroad than to commercial telegraph lines and operators at the present time. This arises in part from the fact that, as a rule, railroad telegraph operators, who may almost be considered a class by themselves, are not as well paid as operators on commercial lines, and from the facility of transportation incident to their employment upon such lines. And even upon the more important railroad telegraph lines this characteristic is gradually being changed, and the necessity of employing a more reliable and responsible class of operators is coming to be more generally recognized. Many of the most intelligent and best qualified telegraphers are now engaged in the railroad telegraph service, and their number is constantly increasing. Such electricians and telegraphers as F. H. Tubbs, I. N. Miller, C. S. Jones, and others who might be named, who occupy prominent and responsible positions in the railroad telegraph service, would do honor to any telegraph line, and it would be for the advantage of railroad companies if they had a larger proportion of such talent in the conduct of that branch of their business. It has become a well recognized fact (outside of New England) that no railroad can be operated efficiently without the coöperation of a good telegraph system, specially employed and devoted primarily to the railroad service—and most important railroads, not located in New England, have a telegraph department which is part and parcel of its regular system. Day and night the telegraph operator is on duty and keeps ceaseless watch, and facilitates the passage, obviates delays, and guards against accidents the trains which traverse the iron rails continually. But few who are not engaged in railroad service have any idea of the vital importance and necessity of the telegraph in the safe and efficient management of that service. Such a service should employ the best possible material and compensate accordingly, and as railroad managers come to recognize this fact the character of their telegraphic employés will be improved and elevated.

It is unquestionably a drawback upon the telegraph service that in this country there is such facility for changing from one profession or business to another. The inducements held out by other pursuits are constantly depleting the telegraphic ranks, and usually take the better, more intelligent and efficient telegraphers from the service. Young men who engage in telegraphy with bright anticipations of future promotion and success, after a time become discouraged at the slow progress made, and are ready to abandon it for other occupations, which they believe promise more speedy and satisfactory results. The columns of THE TELEGRAPHER almost weekly contain the announcement of the resignation of telegraphers to "engage in other business." If by some means this could be prevented, it would, no doubt, prove advantageous to the service. It might be, to some extent, by a better system of classification of positions and of promotions as vacancies occur, but it is impossible at present, or to entirely remedy the evil. It is one which is not singular to the telegraphic service in this country, but is experienced in almost every business where skilled labor is employed, and is incident to the character of the country, its rapid development, and to our people, who are not content, as in older and more densely populated communities, to plod on year after year, and from youth to age, in one employment, when so many others hold out inducements to lure them into trying experiments, which they hope and believe will result in bettering their condition.

Year by year the telegraph is increasing its demand for employés, and where but a few years since hundreds sufficed to meet this requirement, thousands now find employment, and the telegraphers of the country already constitute a great army, whose numbers are constantly augmenting and must continue to augment for many years to come. It is then of the first importance that these persons who are necessarily intrusted with such vital interests should be worthy of the trust reposed in them, and should be reliable, intelligent, and properly trained for the discharge of their duties.

It is the interest not only of telegraph companies and the public, but also of the telegraphic fraternity themselves, to discourage the employment of the Bohemian class, who once constituted so considerable a portion of their number—good fellows, perhaps, in the main—but whose characteristics unfit them to be either creditable or advantageous to themselves, their employers or the profession which they have adopted, or into which they have drifted. The time, it is to be hoped, will come eventually, in which there shall be some standard of ability, qualification and character, which shall be recognized by telegraph managers and the fraternity, which shall regulate the employment and position of telegraphers. This might be and can only be effected by the cordial coöperation of telegraph employers and telegraphers themselves. Such a coöperation THE TELEGRAPHER has heretofore advocated, and it is to be hoped will continue to urge, however remote may seem the probability of its being adopted.

If the much talked of and written about telegraphic association could take this shape, and be inaugurated by the more reliable, cool headed and intelligent telegraphers of the country, it might be expected to effect something beneficial to all parties concerned. The fear on the part of telegraph employers that it might become a sort of trade union, and result in strikes and disarrangement of the relations between employers and employés, doubtless is the cause of their discouraging such an association or any association of telegraphers. This may be in time overcome, and it is to be hoped will be, and that, with an intelligent appreciation of the advantages to be derived, they may favor such an organization, which, representing the main body of employés, can deal authoritatively with the questions which are now in abeyance, and which ought to be definitely settled and arranged for their mutual benefit. Unless this can be done it is inevitable that in time another telegrapher's league will arise, and perhaps become more powerful and effective than that which was brought to an untimely end by the premature strike which has become historical.

Jack Allison.

BY O. H. KAY.

HAS "the gentle—" etc., ever travelled? "The gentle—" has! But do not answer too impulsively; consider what is asked. You may have been about a good deal and still never have travelled—that is, if you are a telegrapher. There is a difference in defining "travelled," as applied to the telegraph operator and to almost everybody else. For an operator to have travelled it is necessary that he should have been kicked out of Chicago (using a term of less eloquence than comprehensive expressiveness), watched the repeater at Memphis, taken report in New Orleans, stayed a little while in Omaha, and been in San Francisco, though not absolutely necessary that he should have worked in the latter place. Then, too, it will be found a great convenience to him, if he has read enough of Richardson, to be able to talk calmly of the "plains" and the hardships his fertile imagination can picture for one's endurance there.

Then you have never travelled? neither have I; nor neither has Jack Allison. Jack Allison is an old and very intimate friend of mine. But I say Jack has never travelled, notwithstanding he has made three voyages to Europe, and visited France, Spain, Egypt, Rome, the Holy Land, China, Australia and the Indies, besides skirmishing about the United States in every conceivable direction for three years, and having seen everything worth seeing. Jack is an operator, and before his grandmother died and left him pretty comfortably circumstanced, he used to work with me, but he has not worked any since. He simply goes around and has a good time generally, and then comes back periodically and tells me all about it. Still, I again repeat that Jack has never travelled; he has never "watched the repeater at Memphis," etc. When Jack gave up the key he did not give up his friendship for his old associates (very foolish of him, too), but he comes in just as slouchily, and throws himself in a chair and his great feet on the table just as familiarly, and tenders a segar just as generously as he ever did, and he is just as ready and as satisfied to tell yarns until midnight as he ever was. I say this is foolish of Jack. I will leave it to the reader if it is not preposterous. Wait till my grandmother dies, or my aunt or pet cousin, and lavish their hoarded shrek-

els upon me. I do not presume I shall remember my old acquaintances. I shall forget all my former social relations, and my previous existence, if possible, and remember only that I have lived in vagabond idleness and luxury. My friends shall be new ones, and of a higher order than Bill Darby and Nat Blinker, and those of that stripe. They shall comprise counts (and may be countesses), and princes (and perhaps their sisters), and major generals and brigadier generals, and captains—no, let's see—will I familiarize with captains? Well, leave that blank; but we will take the generals and their daughters, their wives and younger sisters and aspire even to royalty. Otherwise, though, I shall do just as Jack does. I shall roam about but never "travel."

And I will pause to say that I concur in my belief with the world, that a telegrapher knows nothing until he has travelled.

He is not educated, and sophistry is too foreign to him. I know just how contemptibly I would regard the inexperienced if I myself had been favored, and how I would glory at the know-nothingism of the balance of creation, and in the feeling of inexpressible meanness and comparative cheapness and worthlessness which my presence, and calm conversation of matters and things uncommon, would inspire in the minds of common operators. Jack is different from all this, but, as I remarked, Jack is foolish. He is insane, and thus it is that we get so much entertainment out of him, and love to see him come in and proffer the acenstomed segar. I have seen one or two other cases where sanity was less desirable than its opposite.

Jack never talks excitedly, nor even earnestly. He assumes more of a listless and disinterested mood, and while talking of one thing happening seems to be ruminating upon another. He told us the other evening of an eccentric character he met one morning, in the State of New Jersey, in the person of a night operator at a railroad station. Jack had gone very early in the morning to the station in question, to take the morning express, which train happened to be half an hour late. Approaching the window of the telegraph office, he saw its occupant, a man of perhaps twenty-two years of age, with his eyes but partially open, climbing down off a table where he had evidently been sleeping, and proceed to fold up three or four newspapers which he had spread upon it, after which he put them carefully away in a drawer, locking the same.

Jack approached him with "Well, how have you rested?" "O, pretty fair last night—a good deal better than usual," he replied, turning around as he finished to see who had addressed him; and then, after a quizzical glance, he continued off-handedly, "You see, I had a better bed last night than I get sometimes—mattresses the boys call them. Anyhow, there's a big lot of difference whether you have all *Tribunes* or the whole lot is *Christian Unions*, or you make your bed out of a quadruple sheet edition of the *Herald*, or whether you mix these all up and get your head, maybe, and your left ear on an execution in the *Herald* and a piece of your body on THE TELEGRAPHER, and part of your legs and one foot on the *Christian at Work* and the other foot on the *Scientific American*—the foot with the tender corn, too—and then have other literature and trash of all sorts strewn about under you promiscuously. Yes, indeed, big difference. It mixes up things and disturbs one's dreams somehow, besides it don't lay nowise comfortable. Now, the very best kind of a bed and the most comfortable is when you can get two or three of our papers—THE TELEGRAPHER. That seems to rest me the best of anything I ever got a hold of. I just subscribed for it last week, and haven't got enough to go all under me yet, so I splice out with *Christian Unions*. That comes next to it. It was a good while before I came to realize that it did make a difference that way. I used to be troubled with awful dreams and vicious of plugs. You don't know what plugs are—oh, do you? Maybe, then, you are an operator?"

"Ah! well, come in. There, sit down. I was going to say I used to dream about plng factories and all that, and get mixed up on some of the infernal scientific problems—machines for sending three ways at a time, and enabling one man to send fourteen messages all at once, with the same key. I say I used to see phantoms, or ghostly skeletons, which suggested these things, but never brought anything into tangible shape, and I always awoke from a confounded nightmare after the goblins had pranced around long enough and mixed up all my ideas, so that it would require half an hour to straighten them. Well, this run along for a week, and I was growing frantic. I got to sitting up in my chair, until I happened one night to be blessed with an idea. I always used to spread out two or three *Journals of the Telegraph* to keep from soiling my clothes (slept on a bench outside then), and I just thought to myself I would change; so that night I put down a couple of copies of the *Hawkinsville Times*, and I slept better and dreamed about agriculture and pumpkin pies and patent hen coops. So after

that I never used any *Journals*, but I have experimented with everything else with more or less satisfaction, until I happened to borrow some back numbers of THE TELEGRAPHER down at Slimmersville, a month ago. I found that was just what every honest telegrapher wants to sleep on. My dreams are pleasant and peaceful, and Fisher, down at Ux, swears he can't raise me in all night.

"But I found something worse than the *Journal* a spell ago. They sent us a little sheet called *The Operator*, and Blummer, the day operator, subscribed for it six months, and after he had accumulated enough I made a raid one night and thought I'd try them. Well, I can't describe what it was like, only I didn't get over it for two days. I seemed to have little mustachios sprouting out all over my face, and I was whirled in a giddy maze of frivolous and silly nonsensicalities, with neither point nor application, until I lost all reckoning, and in kicking about for something solid and substantial I kicked myself off on the floor, for which I was thankful anyhow. I don't want any more *Operator* for me; but so long as I can get TELEGRAPHERS I don't care if Ux never raises me, for (confidingly) they only give me thirty-five dollars a month here."

Jack said he heard the locomotive whistle, and he bid his odd and newly made friend adieu; and then, as he always was, Jack was reminded of an incident which occurred once in India just like this, and so he began talking about the natives, and a row he and a chum named Spriggings kicked up in camp once; and so kept diverting further and wider until I should be afraid to tell anything that followed as being in keeping, or appropriate to tell in connection with this sketch.

The Great American Telegraph Traveller.

BY CENTRIPETAL.

THE Morse operator of the old school was an inveterate traveller. The facilities for obtaining passes in those "good old days," and the necessity for sending out teachers to "break in" new recruits, were among the causes which instilled this roving disposition into the pioneers of the profession.

A tonr of the country years ago was something of a triumphal march, for in those days the telegraph was more of a wonder than materialized spirits are at the present time. The advent of the telegraph operator was the sensation of the hour, even in towns so large that the first incumbent experienced some difficulty in ascertaining the address of L. E. Phant, to whom his first message was very probably addressed.

Free drinks, free grub, and free rides were an every day affair, and when the novelty of the new institution wore off, and the hero descended to the level of common mortals, very likely he thought the proper time had arrived for him to "dig out."

If some of the natives, in the innocence of their hearts, had allowed him credit for a new suit, or permitted his wash bill to assume gigantic proportions, his anxiety to seek new quarters increased as the end of the month approached, at which time he had probably remarked that his check would come. It was not to be supposed that a man who was entrusted with the responsibility of manager, would be guilty of so base an act as to close his office and leave for parts unknown without pausing a few moments to bid his friends "good bye." The brief notice hastily scrawled on a blank and pasted on the door, to the effect that the operator had gone out to fix the wire and would return before night, would have been considered "too thin" by bash vendors of the present day. The good deacon, who carefully adjusted his "specs" and perused the placard, would not believe for a moment but that his boarder would return in due season. His faith weakened as time elapsed, and the succeeding manager, having heard the story of his predecessor, did not deem it wise to apply for board at the same place.

Although the proportion of these birds of passage, as compared with the whole fraternity, may have diminished, many of the telegraphic fraternity are still an unsettled part of the community. There are some who still contrive to "bilk" their creditors, and that cases of this kind are no more plenty is owing fully as much to the growth of acuteness in the citizen as of honesty in the migratory telegrapher.

Laying aside the baser motives for change, there may be found other reasons, usually left unexplained, which have no little bearing upon the average operator. His life is often a continual grind, and he would not perhaps object to the work, were it not for the enforced confinement, which he imagines to be steadily gnawing at his vitals, and causes him to sigh for shorter hours, or, in the language of the worldly, "a soft thing."

Notwithstanding this feeling his love for the almighty dollar will not permit him to forego the opportunity to "scoop" in an extra whenever a chance is open. When he tears away from his old haunts he often goes it blind, but within a few years circumstances have changed, and he now uses more caution in shifting his base. If he has been many years in one place and a

good operator, he knows that in securing a new position he must submit to a reduction of 10 or 15 per cent., so at the present time a man feels like hanging on to a good thing until he sees something better within his grasp. This growing stability might easily be encouraged by employers, if some judicious system of promotion could be established. It is as true to day as in the olden time, that "a prophet is not without honor save in his own country," and often a young man grows up in an office, patiently waiting for some one to die or resign, until discouraged in his expectations he goes West, sometimes for the better, but just as often for the worse. The "opposition" was at one time a popular resort for the discontented, but a few years' experience has shown that this is too often a leap from the frying pan into the fire. Inferior or irregular pay, bad wires, long hours and hard work, soon cool the ardor of the young man who sets out with the intention of bucking against the monopoly.

The earliest ambition of the young American is to see the world, and if he is determined to do this before he dies, it may be best that he should start on his expedition early in life. Impressions upon the youthful mind are more enduring, and his responsibilities are less; and the telegrapher who has thoroughly learned his trade, is perhaps as sure of a job that will at least give him a living as a member of any other craft. We can hope for no change in the latter characteristic, even if it were desirable.

Boys will be boys, and the mantle of kite flying and ball playing will descend from generation to generation in the future, as in the past, and so long as the telegrapher can "raise the wind" or "beat his way," he will still remain "The Great American Traveller."

Lectures by Professor Trowbridge at the Lowell Institute, Boston.

THE second lecture of the course before the Lowell Institute, Boston, on Electricity and its Modern Practical Applications, was given on Friday evening, November 20, by Professor J. Trowbridge, of Harvard University. In his first lecture Professor Trowbridge, referring to the characteristics of modern science, said that perhaps the most important of them was exact measurement. The advances in electrical science, though very great, were not striking to the casual observer. The successful operation of the Atlantic cable, and the modern methods of correcting the variation of the compass in iron ships, were due to the use of knowledge gained by exact measurement. A second marked feature was the advance in the methods of minute measurement, of which the use of the mirror, as in the reflecting galvanometer, was an example. The lecturer also referred to the determination of the mechanical equivalent of heat, and the development of the molecular theory as a third direction in which great advances had also been made.

In his second lecture Professor Trowbridge said that he should treat first of dynamic electricity instead of static, which, although contrary to the usual order of arrangement, was, in many respects, more convenient and perhaps more logical. The manner in which two kinds of electricity, or, as he preferred to say, two opposite electrical conditions, were produced, was explained and illustrated. The first discovery in relation to dynamic electricity was made by Volta in 1800. He discovered that if two plates or discs of different metals were pressed together, that they assumed opposite electrical conditions, and he soon after found that the interposition of moistened paper between the plates increased the effect. The arrangement was soon still further improved by placing the two plates of metal in a cell of liquid, which is substantially the Voltaic battery of to-day. The next advance was made by Ersted, of Copenhagen, who discovered that a suspended magnet was deflected from its normal position by the passage of an electric current in its immediate vicinity. Shortly afterwards Arago constructed the electro-magnet, in which a bar of soft iron was rendered magnetic by the passage of the electric current through a wire coiled heliacally around it. Subsequently, and almost simultaneously, Steinheil and Cook, in Europe, and Morse in our own country, invented the electric telegraph. The present century, therefore, may be termed the century of electricity. It has witnessed a complete revolution in our methods of conveying intelligence.

In order that the phenomena of electricity may be manifested, two things are necessary—a means of generating the electricity and a means of conveying it—or, in other words, a battery and a conductor. The electro-motive force of a battery might perhaps be understood by comparing it to a vertical standpipe or tower filled with water, from the bottom of which a stream issued with a force due to the pressure or head of water in the standpipe. If by some means water was forced up to the top of the tower in sufficient quantity to maintain its level, notwithstanding the outflow at the bottom, as, for example, by a steam pump, this pump might be compared to the electro-

motive force of a battery, which maintains a constant difference of electrical condition, called tension, between the two opposite poles or plates of a battery, which causes a current of electricity to flow. By means of an oxyhydrogen lantern the image of a transparent galvanometer dial and its needle was projected upon the screen. The deflection of the needle by the passage of the current through a neighboring conducting wire was shown in a very striking manner. The decomposition of water into its elements, oxygen and hydrogen, by means of the voltometer, was shown on the screen in a similar manner, illustrating the chemical effects of the voltaic current. The manner in which heat is produced by the voltaic current was next shown by turning a fine steel wire in a vessel filled with oxygen gas, producing a brilliant light. Another very striking illustration of the same effect consisted in connecting two horizontal parallel copper strips, about two feet long and an inch apart, with the opposite poles of a powerful battery, and placing a brass ball upon them, so as to complete the circuit between the strips. The expansion of the strips caused by the heating of the metal at the points of contact with the ball, owing to the flow of the current, caused the ball to oscillate, and finally to roll back and forth through a distance of a foot or more. In conclusion the lecturer illustrated the magnetic influence of the current by means of a hollow helix, having a soft iron rod within it. The lines of magnetic force, discovered by Faraday, were beautifully and strikingly shown by means of iron filings sprinkled upon a sheet of glass, the whole being projected upon the screen in full view of the audience. The effect of a bar magnet was first shown, and then that of a conducting wire conveying an electric current, the analogous action in the two instances being at once apparent. The lecture was attended by a large and appreciative audience.

The Camacho Electro-motor.

SEVERAL scientific men at Havana have been appointed to examine the electro-magnetic engine invented by J. S. Camacho, and to report on its advantages for industrial purposes in general, and especially as motive power. So says the *Revista de Telegrafos*. In the Camacho electro-magnet each limb is formed of four hollow concentric iron cylinders, the inner one half an inch in thickness, and the three remaining one quarter inch. The interior diameters of the tubes are, respectively, 2, 3, 4 and 5 inches. Each of them is surrounded with a coil of copper wire, covered with cotton, and is one eighth inch in section, forming, on the three inner tubes, two complete layers with 180 turns, and on the outer tube seven layers with 630 turns.

The copper wire on each tube is coiled in the same direction, passing at its ends across the armature of the magnet, and uniting them, therefore, in the natural order, so as to form a single conductor through which the current from the battery may travel, magnetizing each tube, and endowing them all with magnetism of an equal nature. The length of the limbs of the magnet is 8 inches, the weight 77 lbs., and that of the copper wire 47 lbs., with a total length of 2,600 feet.

Repeated experiments have shown that this magnet requires the current produced by seven bichromate of potassa elements, and its power of attraction at a distance of one twelfth of an inch is more than 1,250 lbs. An electro-magnet of the ordinary construction, of equal exterior diameter, and placed in the same conditions, is only able to support 25 lbs.—a weight of 50 times smaller.

Repeated experiments of physicists as eminent and well versed in electro-magnetism as De la Rive, have shown that the main difficulty which has opposed the industrial application of the electro-magnetic force has been that hitherto it has proved from 25 to 30 times dearer than that of steam. If, therefore, M. Camacho has succeeded in obtaining electro-magnets so powerful, the following proposition cannot be pronounced too venturesome: "The new electro-magnets offer to industry a source of power much cheaper than animal labor, and capable of immediate application to urban railways. The same power is further destined, at no remote epoch, to replace advantageously that of steam."

The report is signed by D. Francisco Clerch, Professor of Physics and Chemistry at the College of Guanabacoa; D. En. de Aianlave, Inspector General of Telegraphs for Cuba; D. Antonio de Molina, Engineer in Chief on the staff of the roads, canals and harbors, and of public works; and D. Alberto de Castro, Civil Engineer.

Curiosities of the Telegraph.

THE readers of a daily newspaper do not, as a general thing, sympathize with those luckless journalists whose duty it is to grope through the tedious intricacies of the telegraph despatches and arrange them for the inspection and delectation of the critical

reader; and it is for the purpose of demonstrating in what a hopelessly confused shape the telegrams sometimes drop from the nimble wires that we copy the following despatch from an exchange. Those who have gnashed their teeth, and tore their hair, and raved over the unintelligibility of midnight telegrams will shed a tear just here, while the general public will wonder at the unusual occurrence related, or accept it with the bland confidence of innocence. This telegram is dated New Orleans, 21st:

"Gen. Store, of Bawron, a foreigner, was gutted by a mob on March 5th, and has sued the city for \$31,000 damages."

Referring to the *Republican* of Thursday, we find a despatch from New Orleans to the effect that the "Gun store of Bouron, a foreigner," having been gutted, etc. —*Lynchburg Paper*.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Fast Telegraphy and the Interests of the Telegraphic Fraternity.

TO THE EDITOR OF THE TELEGRAPHER.

WITH your permission I will make a few remarks in reference to your editorial of the 21st inst., on the fact that automatic telegraphy is not inimical to the interests of the telegraphic fraternity. In the course of your very pertinent remarks in regard to the impression that has obtained to some extent among telegraphers, that the general introduction of automatic telegraphy would be likely to diminish the demand for skilled telegraphic labor, and thus affect unfavorably the interests of practical telegraphers, you say, "For this impression some of the advocates and promoters of the automatic telegraph system are to a certain degree responsible." Now, I hope you did not intend to include me as one responsible for this impression, after the firm stand you know I have ever taken from the first day of the introduction of my American automatic telegraph system, in regard to the imperative necessity that always must exist for the employment of the best operative talent as aids to the (in the future) leading telegraphic system in this country.

You truly say, "The reduction of cost will naturally and inevitably increase very largely the amount of telegraph business done, and this will necessitate the employment in the various branches of the service of fully as many persons as are now engaged in it. The proportion of skilled operatives required, and the rates of compensation, will be as great as at the present time."

We shall indeed be no wiser, figuratively speaking, than "the foolish bird who merely hides his head, and believes that because he cannot see the enemy the enemy cannot see him," if we overlook the fact that for telegraph or any other service the public will not pay a dollar for what can be supplied for a less sum; "a law as immutable as that which governs the planetary system." GEORGE LITTLE, C. E.
Passaic City, N. J., Nov. 23, 1874.

Delaware, Lackawanna and Western Railway (Boonton Branch) Telegraphers.

IN THE WILDS OF NEW JERSEY, Oct. 30.

TO THE EDITOR OF THE TELEGRAPHER.

IT will be more of a task for me to write up this line than those previously attended to, as I am not very well acquainted with the operators employed upon it, but will try to do them justice, nevertheless. I am under obligations to Mr. Morris Bixby for information, and also to Mr. Tinsman, operator at Paterson, for similar favors.

On this branch there is but one wire, which extends from Hoboken to Dover, New Jersey. The Supt. and Chief Train Despatcher's office is located at Hoboken. In this office we find the Chief Operator, Mr. F. W. Coolbaugh, "C." He is not perhaps quite as pleasant a gentleman as might be desired, which is probably owing to his arduous duties, but he keeps things moving lively on the line. He has for his first assistant Mr. F. Bristol, "F," who is in some respects like his superior officer. The third assistant, Mr. J. M. Dalrymple, "D," is a very young gentleman, and quite the opposite of his two superiors.

Leaving Hoboken, we pass on through the Erie tunnel, under the Midland and Montclair roads, to the Meadows, where we leave the Morris and Essex division, and go on the Boonton Branch. The first stop is at Bergen Siding, "B. S." At the office Mr. M. Bristol, "B," officiates as day operator, and Mr. C. T. Borland, "R," as night man. They are both very

pleasant young gentlemen, and do not seem to have been unfavorably affected even by being obliged to stick it out all alone on the meadows.

We next stop at Kingsland, "K." At this place the company are following the example of the Penn. R. R. Co. in the erection of monstrous shops and engine houses. In the office Mr. E. T. Galloway, "G," who is a very accommodating and pleasant gentleman, attends to the telegraphic interests of the road without assistance.

Continuing our journey we next reach Passaic, the residence of Mr. George Little, the well known electrician, and inventor of the American automatic telegraph system. The telegraphing here is done by Mr. H. S. Dean, "N."

At Paterson, which is next reached, is Mr. S. J. Tinsman; at West Paterson, Mr. B. K. Van Norwich and Mr. C. Koch, who have been mentioned in my previous letter on Paterson operators, and it is not therefore necessary to give them more than a passing mention at this time.

We next reach Suiquack, "Sy," where may be found Mr. S. H. Garris, "G," and Mr. S. E. Lamourax, "Z." At Lincoln Park, "B. N," may be found Mr. R. A. Crater, "R. N," and Mr. R. Lillybridge, "R. A," on hand for telegraphic business; and at Martville we are greeted by Mr. J. S. Strunk, "S," and Mr. W. J. Davis, "X."

Our next stop is made at Denville, which is noted for its camp meetings and pretty young ladies. Mr. P. H. Crane, "C," officiates telegraphically here during the day; and at night is relieved from duty by Mr. E. M. Smith, "S." The latter is represented to be a nobby sort of fellow, and as given to flirting with the city girls who come out from New York to pass the summer in this part of the country.

Not being able to learn the names of the Western Union operators at Boonton, we will pass on, without further remark, to the terminus of the road and line, Dover, "P," where Mr. George Raymond "Ra," holds forth as day operator, and Mr. John H. Hulshizer, "H," as night man. They are both very pleasant and accommodating young men, but have their hands full in attending to both the main line and Boonton branch wire.

Hoping that I have so far done justice to the telegraphers who have come within my observation and notice, I will close this communication. Look out for my next.
P'S AND Q'S.

Bereaved Telegraphic Artists.

CALIFORNIA, Nov. 12th.

TO THE EDITOR OF THE TELEGRAPHER.

IT was a long time before the citizens of Sacramento became enterprising (?) enough to build and maintain a city telegraph line, but at last two or three of the most energetic young men of that city concluded to try this herculean task, and as to how they have succeeded I will leave it to the large number of perspiring operators under their control to say, and I am sure their answer will be, "they have done nobly; for are we not all to be successful candidates for lucrative positions on some one of the telegraph lines in this State?"

Not long since the monotony and dulness of their working with men exclusively was relieved by the appearance on the line of one destined to create a flutter in the breast of more than one masculine Morse manipulator. The fair student signed "S."

Things were red hot for some time on the "peanut." Business had never been so lively there before. His office was well represented, there being three day men and one owl, who kept the local buzzing all the time, to the almost entire exclusion of the students who paid dues. The boys in H hadn't paid any, as the "Superintendent," looking favorably upon their efforts to advance his telegraphic subjects in the ways and mysteries of the "art," had, in his magnanimity, declined to charge them the customary dues. X and Q each purchased a pocket edition of Webster, and tried their best, by the use of large words, to entice the young lady into the belief that they were A 1 in the telegraphic business. Q, the owl, might be seen approaching the office regularly every day at 5 P. M., one hour before his time on duty, so that he could have a pleasant chat with the dashing female before commencing his telegraphing in earnest.

But at last their fun came to an abrupt termination, for on "B" calling "S" one morning he received no response but the echo of his attempts to rival "Q" in rapid calling. Next day the sad news that "S" had departed for some watering place was gently wafted over the line.

Now, if you want to see a lot of sad eyed young men, step into the office at the depot and inquire for "O," "B," "Nd," "R," "S," of H.
SUTRO.

THE TELEGRAPHER is no ephemeral affair, but a well established and permanently successful independent telegraphic journal.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, NOVEMBER 28, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST of THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK on ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

THE FAIRY ELECTRIC ENGINE, or a set of F. L. POPE & Co.'s popular NONPARELL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

P. O. Box, 5503.

Publisher.

Special Notice.

FROM and after January 1st, 1875, the United States postage on THE TELEGRAPHER will be prepaid by the publisher. Notwithstanding the additional expense the price of subscription will remain as heretofore, Two Dollars per annum, payable in advance.

Hereafter it will not be necessary for subscribers in the British North American provinces to remit the additional twenty cents heretofore required for the prepayment of the United States postage.

The New Postmaster General and the Telegraphs.

SINCE entering upon the duties of his office our new Postmaster General, Mr. JEWELL, has been actively engaged in investigations into the affairs of the Post-office department, with a view to instituting such reforms as are needed to render it more efficient and economical. Himself a successful business man, he manifests a disposition to introduce into the management of his department the rules and principles which would govern him in conducting it if it were a private enterprise of his own instead of a great political institution, as has hitherto been the case. He finds that the revenues of the department for the last fiscal year show an excess of expenditures over receipts of some seven millions of dollars, and that this deficit, which has to be made good from the general treasury, is annually increasing. As a business man he considers such a condition of the business contrary to good business management, and the problem which he is attempting to solve is how it can be remedied. There are apparently but two ways in which this can be done, the first by increasing the rates of postage and thus obtaining additional revenue, the other by decreasing expenses. While he does not consider that the Post-office should be a source of revenue to the Government, he does think that in some way it should be made to defray its own cost, and not be a financial burden upon the Treasury.

We are not advised as to what recommendations he will make to Congress in his first annual report, which is to be presented at the session that commences on the first Monday of December next, to effect an equalization of the receipts and expenditures, but are confident that they will be eminently sensible and practical.

His predecessor, Mr. CRESWELL, never seemed to be in the least troubled by the rapidly increasing deficit in his department, but rather the reverse, and inclined to advocate schemes which should augment the deficit more rapidly. But then it must be remembered that he was not a business man, but a politician and a lawyer, and naturally regarded it as more desirable to add to the power and importance of his department than to make it self-supporting. To this end he persistently urged upon Congress the adoption of the scheme of adding the telegraphs of the country to the legitimate postal business, and also desired to secure the transfer of the business of the Savings Banks of the country, as an additional branch of the public service under the management of the Post-office department. He, however, failed to secure Congressional approval of either, and was finally compelled to abandon the office without realizing his desires in regard to either of his pet projects.

In selecting his successor the President appears to have acted wisely, and so far as can be judged from the brief time which has elapsed since he entered upon the duties of his office, Mr. JEWELL is the right man in the right place, and is likely to make a model Postmaster General.

In regard to the question of a postal or Government monopoly of the telegraphs, the new Postmaster General, when interviewed on the subject, which he has been repeatedly, has been rather non-committal, alleging that he has not yet had time to fully examine into the matter, and that until he has thus carefully inves-

tigated, it he will not, privately or officially, assume any position either for or against it. It is evident, however, that until the legitimate business of the Post-office can be made self-supporting, he does not favor entering upon any new and doubtful experiments in a pecuniary point of view. As Mr. JEWELL has himself been a practical telegrapher, he can judge better upon matters connected with telegraphs than one who, like his predecessor, only theoretically understood them, and depended upon his assistants and others, who had axes to grind in the adoption of a Government telegraph monopoly, for his statistics (which were repeatedly shown to be entirely unreliable), and his arguments based upon them. As the President has repeatedly endorsed in his official communications the postal telegraph scheme, and urged its adoption upon Congress, it would not perhaps be becoming in the Postmaster General to strenuously oppose it, but he certainly is under no obligation to lend his official and personal influence, as Mr. CRESWELL did, to induce Congress to adopt and carry out the idea, regardless of the cost and the additional burden upon the public treasury.

From such information as we have been able to obtain we are confident that in the coming session of Congress the Government telegraph monopoly scheme will lack the aid which it has hitherto received from the Postmaster-General, and doubt whether any very serious attempt will be made to carry the project. The change in the political complexion of the next House of Representatives is also unfavorable to the scheme, and would probably defeat it in any event, even if it had had before a better show of success. This is the last session of the present Congress, and the short session, expiring on the fourth of March next, and as it is to be succeeded by a House of an opposite political character, there will be too much other business and matters of moment requiring attention to permit of much time being devoted to the postal telegraph. It will no doubt be passed over to the incoming Congress, which does not meet for a year to come, and it is scarcely necessary as yet to discuss the question "What will they do with it?"

Those who have been so urgent in advocating a Government telegraph monopoly for this country are likely in future to lack the support hitherto derived from the Post-office department, and to find that however rich and generous Uncle Sam may be, it will be considered a sufficient evidence of his wealth and generosity to assist in paying for the transportation of the mail matter of his numerous relatives and dependents without being additionally burdened with a considerable percentage of their telegraphic expenses as well.

In the interests of the public, the telegraphs and the telegraphic fraternity, and of the Government, THE TELEGRAPHER has steadily combatted the postal telegraph projects of every description, and we may be pardoned some satisfaction at finding that most of those even who originally differed from us on the subject are now convinced that we were right.

The Holiday Season.

THE holiday season has once more come round, and we hope that telegraphers as well as others will be able to enjoy the customary festivities of the season. Thanksgiving Day, which, originating in New England, has become a national holiday, has just passed, and Christmas and New Years are at hand, when we are expected to close the old year and inaugurate the new with festivities, mutual good will and wishes and rejoicings. This is the season of gifts and presentations to friends and relatives, and it is sometimes difficult to decide what these shall consist of. To telegraphers no gift can be more appropriate or better appreciated than that of a year's subscription to THE TELEGRAPHER. It will every week during the coming year bring to the recipient of such a gift the remembrance of the kindness of the giver. It will be a double benefit and token of good will—to the friend who receives it and to the publisher, whose subscription list is increased thereby.

For ourselves, we ask no better Christmas or New Year's remembrance than a new list of subscribers, and those who may desire to aid and cheer us in our labors, are requested to bear this in mind, and exert themselves accordingly. Now is the time to commence making up your lists, and we hope and expect that our Christmas and New Years will be made merry and happy by such notable additions to our readers and subscribers as shall excel that of any previous year. No telegrapher should be without the weekly visits of his paper, THE TELEGRAPHER. It is no temporary or trumpery affair, but an established and successful journal, almost in its teens, but we trust very far from its dotage.

The Atlantic and Pacific Telegraph Company.—Executive Changes.

FOR some time past reports of changes in the executive of the Atlantic and Pacific Telegraph Company have been current, and we have ascertained the facts in the matter, which are as follows: About three weeks since Mr. JOHN DUFF, the President of the company, sold all of its stock which he held, and resigned the presidency and his position as one of the trustees, and is consequently no longer interested in or connected with it in any way. As yet there has been no election of a President to succeed him, there having been no meeting of the trustees since Mr. DUFF's resignation was made. In the meantime the Vice-president, Mr. WM. H. GUYON, is, *ex officio*, acting President. Mr. L. P. MORTON, a trustee, and one of the executive committee, has also resigned, and is no longer connected with the company.

At the annual meeting of the Western Union Telegraph Company, held October 14th, Mr. MORTON was elected a director of the Western Union Telegraph Company, and as he could not well serve two companies engaged in active competition with each other, his acceptance of the latter position, of course, involved his retirement from his former connection with the Atlantic and Pacific Company.

These changes are undoubtedly favorable to the future of the Atlantic and Pacific as a competing telegraph company. It will be recollected that rumors and reports have been circulated, from time to time, that the Atlantic and Pacific Company was either already under the control of the Western Union interest or was to be absorbed by that company at an early day. There was, undoubtedly, a scheme arranged to effect this, but we know that this has been defeated, and that the position of the Atlantic and Pacific, as the leading company competing with the Western Union for the telegraph business of the country, has been assured and strengthened, and that the changes in the executive of the company indicate the success of the efforts to prevent its being thus turned over to its competitor.

We make this statement on the best possible authority, and to explain exactly the position occupied by the company, and reassure those who have been in doubt as to its actual and present status. The recent advance in the price of its stock is the result of this settlement, and of the favorable character of its business, and the contracts and arrangements which have been made for the future. The business of the company is constantly increasing, and is larger for the last two months than ever before in its history, and its prospects for the future are encouraging.

The Direct United States Cable Fleet.

THE Direct United States Cable fleet, comprising the Faraday, Dacia and Ambassador, were, on the 12th instant, at Harbor Grace, Newfoundland, waiting for suitable weather to complete the laying of the cable. As nothing has been heard from them since up to the time this is written, it is to be presumed that the weather has continued to be unfavorable for the purpose. It is still hoped that the work may be completed this season, but as the Atlantic at this season is seldom in a congenial mood for cable laying, this

hope grows fainter as time passes. The contractors and officers of the fleet show good pluck in adhering to their purpose of completing the work, but it is to be feared that notwithstanding only about 200 miles of the cable remain to be laid, the task will be found impossible. We are assured, however, that whatever can be done will be to effect the purpose, and until the attempt is definitely abandoned shall continue to hope for the best.

The Telegraphers' Mutual Benefit Association.—A Liberal Contribution to its Reserve Fund.

WE have been furnished with a copy of the following official communication of President ORTON, on behalf of the Western Union Telegraph Company, to Mr. JAMES D. REID, Treasurer of the Telegraphers' Mutual Benefit Association, making, on behalf of the company, a contribution of \$1,000 to the Reserve Fund of the association.

This liberal action on the part of Mr. ORTON and the Executive Committee of the company will, doubtless, be fully appreciated by the members of the association, and will materially aid in increasing the fund to \$5,000, as provided by the action of the association at its recent annual meeting.

EXECUTIVE OFFICE, WESTERN UNION TELE-
GRAPH COMPANY, NEW YORK, Nov. 21, 1874. }

JAMES D. REID, Esq., Treasurer, etc.

Dear Sir—I regret that I was unable to attend the annual meeting of the Telegraphers' Mutual Benefit Association, and I hope my absence was not construed as indicating indifference on my part to the objects of the association. I have read the published accounts of the proceedings, and have also conversed with some of those who attended the meeting, and I take the liberty to say that I cordially approve all that was done.

And now, in testimony of my desire to increase the usefulness of the association, by encouraging present members to continue the good work, and others to come to their assistance, I have the pleasure to contribute to the Reserve Fund of the association the sum of \$1,000, which has been placed at my disposal by the unanimous vote of the Executive Committee.

I am, very respectfully, etc.,

WILLIAM ORTON, President.

The Approaching Session of Congress.

A WEEK from Monday next the present Congress will assemble for its last session. Although this is a short session, lasting but three months altogether, it is not probable that much important business will be done until after the Christmas and New Year's holidays. We do not expect that anything definite will be done at this session in regard to the telegraph schemes, for the reasons which have been stated in another article, but our readers will be fully informed in regard to all matters of telegraphic interest which may transpire in Congress or at Washington during this session.

It will be a melancholy session in some respects, especially for the House of Representatives, for an unusually large number of members will, on the fourth of March next, leave the Capitol to return to it no more for two years at least, as members. They will have the satisfaction in retiring to private life, whether temporarily or permanently, of knowing that as regards the telegraph they are guiltless of having sacrificed it by consigning it to official and political management, as they have been so persistently importuned and urged to do.

A Journalistic Nuisance.

MOST of our readers have no doubt seen a very insignificant cur, inflated with an overweening idea of its own importance, vociferously barking and alternately snapping and snarling at the heels of some larger and more dignified member of the canine race, who treated his Lilliputian adversary with the disdain to which its insignificance entitled it. Such a cur is unquestionably a nuisance, but it is impossible that it should be considered in the light of an adversary worthy of being seriously regarded.

Those of our friends who have been solicitous that we should notice the personalities and attacks of a certain *nondescript* publication, will understand from the above why we refrain from doing so. The young men who are its nominal publishers and editors are no doubt personally very decent and respectable individuals, but if they permit such fellows as now evidently control its columns to make it a sewer for the discharge of their mental and personal filth, they must as journalists be judged by their course in that respect.

The American District Telegraph Company Volunteers.

WE are under obligation for an invitation to attend the first annual target excursion of the American District Telegraph Company Volunteers, which came off at Myrtle Avenue Park, Brooklyn, on Thanksgiving Day. Previous engagements prevented our attendance, but the excursion was a very pleasant one, and very much enjoyed by all who were present.

The company is composed of the messengers of the American District Telegraph Company, all of whom not on duty participated in the excursion.

A bountiful Thanksgiving dinner was served at the Park for the Volunteers and their guests, which was heartily appreciated and enjoyed.

Champion Burglar Alarm and Annunciator.

THE attention of telegraph managers and operators is called to the advertisement of the CHAMPION BURGULAR ALARM AND ANNUNCIATOR COMPANY, which will be found in our advertising columns.

The Burglar Alarms and Annunciators of this company were awarded the *first premium* at the recent Fair of the American Institute in this city. Liberal inducements are offered to telegraph managers and operators to act as agents of the company in securing the introduction of these alarms and annunciators into private houses, hotels, etc.

Personals.

MR. JOHN W. GALBRAITH has resigned his situation as Manager of the Dominion Telegraph, at Guelph, Ont., Canada.

MR. A. BURROWS has been appointed Manager of the Guelph, Ont., office of the Dominion Telegraph Co., *vice* Mr. GALBRAITH, resigned.

MR. AUGUSTUS L. HECKLER, who so ably represented the New York Associated Press at Long Branch, N. J., during the last season, has accepted a position as reporter in the Stock Exchange with the Manhattan Quotation Telegraph Company, New York.

The Telegraph.

By Cable.

THE DIRECT UNITED STATES CABLE REPORTS FROM THE FARADAY.

LONDON, Nov. 25th.—A despatch from the cable steamer Faraday, dated yesterday, says operations were delayed by unfavorable weather.

Another despatch, dated to-day, says the gale is not abating. We shall buoy the cable. Depth of water, 834 fathoms.

Preparations for the Direct United States Cable.

A NEWS despatch from Portsmouth, N. H., of Wednesday last, states that Mr. Oliphant, of the Direct United States Cable Company, was there awaiting the arrival of the steamship Faraday at Torbay, in order to make a final completion of the enterprise.

Plans have been prepared and proposals issued for a building for a cable station two stories high. In addition to the operating rooms there will be accommodation for the manager and some of the principal electricians. The building is to be completed by January 15th.

THE chief difficulty met with in acquiring scientific knowledge consists not so much in failing to comprehend language as in failing to grasp ideas.—*W. H. Precca.*

Are Earthquakes an Electrical Phenomenon?

REFERRING to the account of the singular freaks of lightning upon the house of Mr. E. W. B. Canning, at Stockbridge, printed by the *Republican* last summer, a San Francisco electrical engineer writes as follows concerning some interesting phenomena connected with the California earthquakes: You may, perhaps, be aware that until very recently we have been very free from any manifestations of atmospheric electricity, but have every year had some three or four earthquakes of more or less damaging nature, usually occurring in the fall of the year—October being the most favored month. At periods of about three years these earthquakes have become rather alarming in their violence, and on more than one occasion have completely demolished buildings. The damage in San Francisco has been in many instances the most severe along the lines of the street car tracks, and the last heavy one experienced apparently followed up the line of the Alameda Railroad, and at its terminus completely turned the railroad station around without throwing it down, and entirely demolished a grain warehouse adjoining—the shock being most severe at this point of any place in the State. Since the completion of the Central Pacific Railroad we have had no shake up sufficiently severe to notice, but the October of the year of its completion an earthquake shook you up all over New England. The question now arises, Are not earthquakes an electrical phenomenon? Professor Noad, in his excellent work, "Student's Text-book of Electricity," advances a great many excellent points to prove that such is the case, and my own observations seem to tend that way. We have had earthquakes in the State since the railroad's completion, but they were far removed from any iron railroads. Do not the roads act as gigantic lightning rods, equalizing the electrical tensions in various parts of the country?—*Springfield Republican*.

THERE is no mode so effectual to impress ideas on the mind as that of experiment aided by reflection.

Obituary.

ISAAC BUTTS.

A DESPATCH from Rochester, N. Y., on Friday, Nov. 20th, announced the death, after a painful illness of two weeks, of Mr. Isaac Butts, a prominent and worthy citizen of that place, and at one time well known in telegraphic circles. He was twenty-two or three years ago connected with the telegraph interest as one of the Rochester party who originated what is now known as the Western Union Telegraph Company. He, however, disposed of his telegraph interests many years since, and realized handsomely upon them. He was one of the original promoters of the House Printing Telegraph Lines, and was prominently connected with the New York and Buffalo, and the Mississippi Valley Printing Telegraph Companies, until they were sold out to and consolidated with the Morse lines. Subsequently, he started the Rochester *Union and Advertiser* newspaper, and was connected with its management for several years. Afterwards he engaged in the paper manufacturing business. Mr. Butts was a shrewd and enterprising business man, and was usually successful in his business ventures, and accumulated a large fortune.

New Patents.

For the week ended November 3, 1874, and bearing that date.

156,560.—ELECTRO-THERMOSTATIC FIRE ALARMS. Edward J. Frost, Philadelphia, Pa., assignor of one half to J. Haehulen, same place. Filed September 4, 1874.

Constantly closed main line through signal apparatus; a thermostat normally keeping closed a shunt to the magnet of the signal apparatus, rendering the same inactive till the shunt be broken by the action of heat on the thermostat, when, the current being obliged to traverse the circuit through the magnet, it releases the signal mechanism.

1. The thermostat, consisting of the U tube with ball A, in which a partial vacuum is created, and mercury balance, substantially as described.

2. The combination, with the thermostat described, of a conductor, H, the series of conductors D D' D', and switch F, substantially as and for the purpose set forth.

3. The combination, with a closed main line circuit and an electro-magnet placed therein, and controlling a signal or alarm mechanism, of a shunt circuit normally closed and controlled by a thermostat, substantially as and for the purpose set forth.

4. The combination, with a closed main line circuit and an electro-magnet placed therein and controlling a signal or alarm mechanism, of a shunt circuit formed by and through the signal or alarm mechanism controlled by the electro-magnet, substantially as and for the purpose set forth.

5. The combination, with a closed main line circuit and an electro-magnet placed therein, of two shunt circuits, as described, the one through and controlled by a thermostat, the other through the alarm or signal mechanism, and brought into operation by the action of the magnet when the first is broken by the thermostat, substantially as and for the purpose set forth.

For the week ended October 20, 1874, and bearing that date.

156,015.—ELECTRIC LIGHTS. Mathias Day, Jr., Mansfield, Ohio, assignor to Seeley & Stevens, N. Y. Filed May 23, 1874.

Improvement of his patent of February 24, 1874. Frame used as part of circuit. Both electrodes caused to approach each other when current through holding magnets M M is weakened by increased distance between electrodes. Series of points relatively adjustable to each other by means of universal joint e.

1. In an apparatus for producing electric light, the combination, with the motor I, and the carbon-electrodes a a', of sliding bar E, the magnet M M, the gear J, the standard C, as and for the purpose specified.

2. The combination in an electric light apparatus of the circuit wires, and the pillar and standard A C, the arm L, the spring b, the bar E, the arm F, whereby the metallic parts of the apparatus itself are employed in place of line wires for the transmission of the battery current over the carbon points, as specified.

3. The combination in an electric light apparatus of the carbon points, arranged point to point, and made relatively adjustable by means of a universal joint, as and for the purpose specified.

156,114.—FIRE ALARM REGISTERS. John O. Alley, Detroit, Mich. Filed July 24, 1874.

Two trains, one actuating register wheels, the other shifting the pawl turning the register from one register to another. Lever E attached to hammer tail releases first clock work, allowing pawl to turn register wheel as often as signals composing one unit of the signal are given. Six seconds, without a stroke elapsing, the second clock work, through K, L and M, allows slide bar N to move, which carries the pawl to next set. The signal being complete, and a portion of the time between two signals elapsing, the pawl is carried on to face of smooth wheel C', leaving record of signal struck in the wheels.

The combination of a counter or register actuated by a clock work controlled by the gong hammer or other mechanism of a fire alarm telegraph, with a clock train which will permit the said counter to operate at fixed intervals of time, substantially as described.

156,175.—INSULATED ELECTRIC CONDUCTORS. Thomas L. Reed, Providence, R. I., assignor of one half his right to E. F. Phillips, same place. Filed July 6, 1874.

One or more electric conductors, enclosed, insulated and protected by one or more seamless braided jackets and intervening seamless jackets of elastic vulcanized caoutchouc, substantially as described.

For the week ended October 27, and bearing that date.

156,242.—ELECTRICAL THERMOSTATS. Wm. B. Watkins, Jersey City, N. J. Filed November 29, 1872.

Thermostat inclosed in tight cylinder.

1. The combination of an insulated metallic strip circuit closer, with a closed or capped tabular box case, substantially as and for the purposes set forth.

2. In combination with the tabular case B, the dial plate M, pointer N and set screw R, all arranged and operating as hereinbefore described.

156,339.—TELEGRAPH CABLES. Germaniano Zanni, Highbury, England. Filed August 22, 1874.

A cable consisting of one or more conductors, each surrounded, first, by spirally twisted wires; second, by a coating of tin applied thereto by passing the twisted wire cable or cables through a bath of molten tin; and, third, by a wrapping of fibrous or other insulating or projecting material, substantially as shown and described.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY, 40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skillful mechanics to estimate upon work, or will give any information in writing that may be required, *Liberal commissions will be paid upon any orders that may be secured for us.* Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute Fair.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON, *President.*
CORNELIUS ROOSEVELT, *Secretary and Treasurer.*
40 West 18th Street, New York.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS of every description, at

No. 54 SOUTH FOURTH STREET,

(Corner Chestnut street,)

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

ECONOMIZE!

Procure the best and cheapest Telegraph and Electrical Instruments and supplies of all kinds from,

LANNERT & DECKER, 31 1/2 Prospect St., Cleveland, O. Send for circular.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET;

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

AMERICAN COMPOUND TELEGRAPH LINE WIRE.

COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE compared with Iron, consists in its LIGHTNESS, relative TENSILE STRENGTH, CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.

Address, American Compound Telegraph Wire Co.

Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES.

- RELAYS, unequalled for beauty and strength;
 - COMBINATION SETS; BOX and POCKET RELAYS.
 - CHALLENGE, PONY and REPEATING SOUNDERS.
 - KEYS, various styles, including the SOHNEIDER KEY, just out, no legs, wire connections above the table.
 - REGISTERS, with SPRINGS or WEIGHT.
 - CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
 - REPEATERS—HASKIN'S AUTOMATIC, and others.
 - SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
 - ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
 - ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
 - ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
 - MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.
 - BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
 - WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
 - INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON. BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
 - TELEGRAPH STATIONERY—REGISTERS, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
 - PRICE LISTS FURNISHED FREE ON APPLICATION.
- Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

SOMETHING NEW!

[PATENTED SEPT. 29, 1874.]

THE FAIRY ELECTRIC ENGINE.

A perfect working model of an engine
Run by Electricity!
 It will work well with an ordinary local battery.

Price, with two cells' Eagles' Metallic Battery.....\$6 00
 " without Battery..... 4 00

May be seen working at the office of the THE TELEGRAPHER.

For sale by
The Electro-Magnetic Manufacturing Company,
 26 BROAD STREET, NEW YORK.
 P. O. Box 1804.

Also for sale by
L. G. TILLOTSON & CO., 8 Dey street.
F. L. POPE & CO., 38 Vesey street.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.

No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Descriptive circulars and price list forwarded upon application to

Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The **Electro-Mechanical Gong Striker**,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the
original *FARMER & CHANNING PATENTS*, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS.

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been ENORMOUS, THREE
CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its in-
troduction into their localities is cordially invited, and

their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that
will work practically with a single DANIELL cell, a **BATTERY**
that does not require to be taken down but once a year, and the
very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be produced in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

MANUFACTORY OF THE SPENCERIAN STEEL PENS, BIRMINGHAM, ENGLAND.

SPENCERIAN DOUBLE ELASTIC STEEL PENS.

The superiority and excellence of these justly celebrated Pens are appreciated, as is shown in their constantly increasing sale. They are comprised in fifteen numbers, of which one number alone has an annual sale of more than

5,000,000.

The SPENCERIAN PENS are manufactured of the very best material by the most expert workmen in Europe, and are famous for their elasticity, durability and evenness of point.

THE SPENCERIAN PENS ARE FOR SALE BY ALL DEALERS.

We make Fifteen Numbers of Pens, differing in flexibility and fineness of point, adapted to every style of writing, as follows:

- No. 1. COLLEGE PEN. Point Fine; Action Perfect. This is a great favorite with our leading penmen, is largely used in the Schools and Commercial Colleges throughout the country, and gives better satisfaction than any Pen before the American Public.
- No. 2. COUNTING-HOUSE PEN. Point Fine and Flexible, well adapted to the use of Correspondents and Accountants.
- No. 3. COMMERCIAL PEN. Point Medium. An Easy Writing Business Pen.
- No. 4. LADIES' EXTRA PEN. Point Extra Fine and Flexible. For Delicate Fine Hand Writing this is a very superior Pen.
- No. 5. SCHOOL PEN. Point Fine, Medium in Flexibility. For a durable School Pen it has never been equalled.
- No. 6. FLOURISHING PEN. Point Long, Flexible and Medium in Fineness. For Off-hand Flourishing.
- No. 7. QUILL PEN. Point Medium, Quill Action. A smooth, Easy Writing Pen. Its name well represents its qualities.
- No. 8. CONGRESS PEN. (New.) Medium Flexible Point. A very superior Pen for all styles of writing. This Pen undergoes a process that renders it non-corrosive and three times more durable than any ordinary Steel Pen.
- No. 9. BANK PEN. Point Long and Flexible. A great favorite with Accountants, Tellers, etc.
- No. 10. CUSTOM-HOUSE PEN. Point Medium. Well adapted to all styles of Bold Free Hand Writing.
- No. 11. UNIVERSITY PEN. Point Medium, very Smooth and Flexible. The action of this celebrated Pen is very fine.
- No. 12. EPISTOLAIRE PEN. Point very Fine and very Flexible. This is the finest Pointed Pen made, and, for very Delicate Writing, Map and Fine Pen Drawing, it has no equal.
- No. 13. ENGRASSING PEN. Point Blunt and Smooth. Particularly adapted to Coarse Hand Writing and Engraving.
- No. 14. ARTISTIC PEN. Flexible, with extra fine point. This Exquisite and Truly Celebrated Pen is the Best Pen extant for Fine Ornamental Writing.
- No. 15. THE QUEEN. Point extra fine. Admirably adapted to all kinds of Fine Writing.

Sample Cards containing all the FIFTEEN Numbers, securely inclosed, will be sent by mail on receipt of 25 cents.

 138 & 140 Grand street, N. Y.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE

TELEGRAPH MANUAL,

BY

TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, scaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without **ANY ATTENTION** whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

has for sale the various kinds of Office and Magnet Wires, in-
cluding Cotton Covered, Silk, Gutta Percha, Painted, Fancy, and
DAY'S KERITE COVERED WIRE.

EUGENE F. PHILLIPS,
20 CONDUIT STREET,
PROVIDENCE, R. I.,
Manufacturer of
Patent Finished Insulated Wire, Patent Rubber
Covered Wire, Magnet Wire, Patent
Electric Cordage, Cables, etc.

I claim to furnish the best Braided Wire in the Market, and I believe it is acknowledged as such by all large Telegraph Companies and Telegraph Supply Dealers.

My Wires were awarded the first premium at the Cincinnati Exposition of 1874, both for best "Office" and best "Insulated Line Wires."

These Wires are furnished in any desirable color or plaids.

My Rubber Covered Wire will not crack, and is not affected by ordinary extremes of heat or cold. The rubber covering is of uniform thickness, and the wire will be found in the exact centre—a result not heretofore produced.

I also make cables of any number of conductors at the regular price for a single wire.

With new and improved machinery I feel satisfied that I can furnish magnet Wires as good as any to be found in the market.

All Wire used by me is made to my special order, and is the best that can be procured in the market.

I could give a long list of testimonials, but depend on the merits of the Wire for patronage.

Please send for sample card and price list.

These Wires can be had at my prices of

VOL. X. WHOLE No. 438.

Atlantic Telegraphs.

THE past week has been one of considerable interest to the shareholders of Anglo-American, and to those of the United States Direct Cable Companies. Early in the week it was announced that the Direct Cable had again developed a fault, that the progress of paying out had to be again arrested and the cable itself buoyed.

Next came the publication of a correspondence in which the chairman of the Direct Company, referring to some vague report that her Majesty's Government was about to purchase the Atlantic cables, wrote to the Chancellor of the Exchequer to know if such was the case. That right honorable gentleman's secretary, replying in the name of his official chief, tells the inquirer—"The Government cannot be responsible for any reports which may have reached you. They have taken no steps and have no intention of taking any for the purchase of the Atlantic Telegraph or any other ocean line." This, we may presume, may be considered as finally disposing of rumors which took their origin out of the circumstance that a paper embodying that proposal was read and discussed at a recent meeting of the Society of Arts. Had the Government decided to obtain possession of the existing Atlantic cables they might have obtained them on terms which would admit of the Chancellor of the Exchequer obtaining a large net income from the working of them, while at the same time he might extend telegraphic communication with the British colonies on the principle of a uniform rate of charge which at present works so well upon the land lines of the Three Kingdoms. This, however, is just one of those questions which admit of a great deal of argument *pro* and *con*, and it is probable that, considering the present state of ocean telegraphy, her Majesty's Government has exercised a wise discretion in declining to entertain such a proposition. It, however, remains to be seen whether Government may not at some time hereafter show a disposition to adopt the plan, or some modification of it which may secure to the shareholders a guaranteed dividend, should they consent to have their lines worked at a uniform rate of charge—a policy which, however desirable in a social point of view, no body of shareholders could feel themselves justified, on economical and commercial grounds, in adopting. At all events, whenever a plan of the sort may be proposed we hope the shareholders will not show any precipitancy in their negotiations with the State, that they will not part with their property merely for what is called an adequate price, but will hold out for that premium to which their enterprise and public spirit is entitled in having had the courage to invest their capital in an undertaking surrounded by formidable difficulties, but fraught with inestimable advantages to the whole human race. They succeeded in their work, and their success entitles them to the consideration we have mentioned.

However, as regards the interests of the Atlantic Telegraph Companies, the most important event of the week has been the publication of the decision of the Imperial Government with respect to the Canadian Telegraphs Bill. As our readers will recollect, it was some time ago announced, on what appeared to be authoritative grounds, that the measure in question, notwithstanding the hurried manner in which it had been carried through the Canadian Parliament, had, upon its arrival in this country for the approval of her Majesty's Government, secured the royal sanction. At that time we ventured to doubt the report in question, and we intimated our belief that no Government, especially a Conservative Government, would countenance a piece of legislation the direct object of which was the confiscation of the rights of the shareholders in the Anglo-American Company. Recently we gave a particular account of the means resorted to by the promoters of this measure of confiscation in order to get it passed through the two Houses of the Canadian Parliament, and we at the same time expressed the opinion, which has been endorsed by the Opposition press in Canada, that if such a measure were to become the law of the Dominion the passing of it would deprive Canada of the confidence of capitalists and arrest her material progress. It appears from the letter of Lord Carnarvon that he has not only

fully appreciated what would be the effects of the bill, but that he has obtained a keen insight into the motives of its advocates and promoters. He states "that, after a careful consideration of all the very 'peculiar circumstances' of the case, he has arrived at the conclusion to tender no advice to her Majesty upon the present bill. Legislation on this subject being, in Lord Carnarvon's opinion, strictly within the competency of the Dominion Parliament, the fact that this measure has been, for certain special reasons, reserved does not appear to his lordship to be a sufficient ground for his doing more than leaving it in abeyance with a view to a further examination of the whole subject in Canada, which he has recommended."

Now, the fact of his lordship remitting the bill to the Legislature of the Dominion for further examination is the strongest possible intimation that her Majesty's Government considers that it has been passed without that due examination which a measure of such importance demanded at the hands of the Dominion Government. His reference to the 'peculiar circumstances of the case' may be taken as amounting to something more than a hint to the Canadian Government that measures which are expected to meet with the approval of the Imperial Government must be founded upon some other basis than such motives as appear to have actuated the promoters and wirepullers of the discarded measure in question. His lordship's opinion, that the measure is one strictly within the competency of the Dominion Parliament, shows that, should that body enact measures of confiscation and repudiation, they must take upon themselves the whole odium and responsibility of such dishonest legislation. The Imperial Government will have nothing to do with it.

As our readers will remember, the object of passing the bill was to bring such an amount of pressure to bear on the Anglo-American Company as to force them to waive the privilege which they exclusively enjoy of landing cables on the coast of Newfoundland. The effect of Lord Carnarvon's decision in refusing to sanction the bill is that it becomes abortive, and has no legal force, since it appears that, according to the 27th section of the British North American Act, 1867, "a bill reserved for the signification of the Queen's pleasure" cannot have "any force" until the Governor General signifies, either by message to Parliament or by proclamation, that it has received the assent of the Queen. We take it, therefore, that nothing more can be done in the matter until the next session of the Dominion Parliament, and we trust that by that time the further examination of the question recommended by Lord Carnarvon will open the eyes of Canadian Cabinets and Canadian Legislatures to the real character of the measure; and that they will consign it to the limbo set apart for such measures as are corrupt, dishonest, and destructive of national credit and national honor.—*The Railway News.*

Canadian Telegraphs Act.

We have received the following communications from the Anglo-American Telegraph Company:

"Sir—With reference to an act passed by the Dominion Parliament in May last, entitled 'An Act to regulate the Construction and Maintenance of Marine Telegraphs,' and reserved by the Governor General of Canada for her Majesty's pleasure, I beg to send you a copy of a letter received by the company from the Colonial Office this day, in which Lord Carnarvon's decision upon this act is communicated to the company. I think it desirable to draw your attention to section 27 of the British North American Act, 1867, which enacts that 'a bill reserved for the signification of the Queen's pleasure' cannot have 'any force' until the Governor General signifies, either by message to Parliament or by proclamation, that it has received the assent of the Queen. I am, dear sir, yours faithfully,

"H. WEAVER, General Manager."

"DOWNING STREET, Nov. 10.

"Sir—With reference to previous correspondence with regard to the reserved bill of the Canadian Parliament 'to regulate the construction and maintenance of marine electric telegraphs,' I am directed by the Earl of Carnarvon to inform you that, after a careful consideration of all the very peculiar circumstances of the case, he has arrived at the conclusion to tender no advice to her Majesty upon the present bill. Legislation on this subject being, in Lord Carnarvon's opinion, strictly within the competency of the Dominion Parliament, the fact that this measure has been for certain special reasons reserved does not appear to his lordship to be sufficient ground for his doing more than leaving it in abeyance, with a view to a further examination of the whole subject in Canada, which he has recommended. Lord Carnarvon had already announced this decision to the Governor General of Canada and to the Governor of Newfoundland. I am, sir, your most obedient servant,

ROBERT G. W. HERBERT,

"The Secretary of the Anglo-American Telegraph Company."—*The Railway News.*

The United States Signal Service.—Its Telegraphic Connections.

THE report of Gen. A. J. Myers, chief signal officer of the United States army, for the year 1874, has been presented to the Secretary of War, and is an interesting document, showing the great extent of the operations of the signal service, and the thoroughness and efficiency with which they are prosecuted.

From a synopsis printed in the New York daily *Tribune*, the following extracts have been made for THE TELEGRAPHER:

The satisfactory nature of work now done by the Signal Service, in connection with the Department of Meteorology, has induced Prof. Henry to relinquish into its hands the great system of meteorological operations carried on for so many years by the Smithsonian Institution, and its hundreds of observers, resident in nearly every county in every State in the Union, have been requested to transmit their communications to the War Department. A similar service, which has been conducted satisfactorily by the Medical Department of the army, has also been transferred to the Signal Office, so that that establishment now controls the entire meteorological interests of the United States.

The daily publications of the Signal Office consist, in addition to the "probabilities" furnished to the papers, of a review of the weather for the preceding seven days, and of a map showing graphically the conditions of the atmosphere at 7:35 A. M. of each day. There is also a review monthly of the weather, with several maps, showing the mean barometric pressure, the temperature, the rainfall, etc., together with several other series of more or less varied interest.

* * * * *

Another extremely important feature of the Signal Service operations during the past year has been its connection with the Life Saving Service. It may be remembered that Congress has authorized the establishment of a certain number of life saving stations at different points on the coast, where crews are to be placed permanently for the relief of vessels in distress. With each such station there is combined a telegraph station supplied by an observer of the corps, not only for the purpose of giving the meteorological indications at the station, but also to furnish information in reference to threatened or actual wrecks, and the measures necessary for their relief. At present these stations extend from Sandy Hook to Barnegat, and from Norfolk to Cape Hatteras, and others are being constructed as rapidly as possible. Connected with this system is a series of telegraphic signals by which passing vessels can report at any point off the coast and have information conveyed from the station to their owners.

The men engaged in this are all skilled telegraphic operators, and are familiar with the system of international codes, so as to telegraph properly the vessels of any nationality. The cautionary signals are also displayed at all of these stations, so that a vessel approaching the coast is first warned of a storm, if one is impending within the scope of the observation of the central office; if shipwreck is imminent, assistance can be summoned to come on steamers from ports far and near, perhaps in time to avert the disaster. If aid fails and the ship must strike, the life saving service can be concentrated from other stations and in any force needed. If the vessel is actually wrecked, notice can go to all parties interested, while lists of passengers and crews saved or lost can be made known and provision sought for the necessities. Throughout all the course of the occurrence the central office can be constantly informed. A naval vessel appearing off one of the signal stations can transmit a communication to Washington or receive orders in cipher or by signal. In time of war, with the system completed, no part of the coast could be menaced without knowledge at the great centres, at headquarters, along the coast, or throughout the country, if need be, of the character of the menace and the locality. In time of peace, if desirable for commerce, a record can be kept of passing vessels, showing their signals, or brief messages can be signaled to or from them. It is contemplated to equip each station with a semaphore for uses of this kind, when flags may fail, and for the purpose of enabling them better to communicate with foreign vessels.

Another subject in charge of the Signal Service has been the building of United States lines of telegraph in Texas and Arizona, the first mentioned being about 1,200 miles in length. Much progress has already been made in this enterprise, the entire work being performed by the enlisted men of the army, under the direction of the Signal Service. It is proposed ultimately to connect all the military posts by lines of telegraph, and thus greatly to enlarge the efficiency of our small army, and to reduce the cost of its operations.

The chief signal officer calls the attention of Congress to the importance of providing for a more permanent organization of the corps, especially in the way of promotion within the service, so that as soon as thoroughly trained an officer may be continually carrying his experience and abilities into a higher and higher position.

The duties of this branch of the army are equally important both in peace and war, and Gen. Myer sees no impropriety in providing that these duties shall be continuous, as in the engineer corps, the ordnance, and the artillery, and that if thought expedient the Signal Bureau may be added as a permanent branch of the service in the same manner. He also asks that the President be authorized to detail or appoint as assistants to the chief signal officer eight officers, with the rank and pay of captains, and eight with the rank and pay of first lieutenants while so serving. The additional expense would be but a few hundred dollars; the benefits to result to the service would be worth many times the expenditure.

Electric Headlight for Locomotives.

A NEW method of illuminating railways was tried for the first time in Russia on the Moscow and Kursk Railway on the occasion of the Emperor's recent journey over that line, and the experiment proved to be a perfect success. The apparatus consists of a battery composed of forty-eight elements, which, when fixed on the locomotive, lights up the railway for a distance of 500 yards with electric light. It is the invention of Herr P. N. Jablotschkoff, the head of the telegraph department of the above named railway. On the occasion alluded to he conducted the experiment in person, and the Czar was pleased to express his full approbation of the invention as one calculated to prevent accidents by collision in the dark.

Original Article.

Bear's Principle of Balancing Batteries.

IN my three published methods of duplex telegraphy the only objection I have been met with is that the opposing, diverting or balancing battery affects the relay at the sending end or on the sending side. In order to entirely obviate this difficulty, if possible, I was led by a chain of theorizing something like the following to test the matter practically several years ago. All the authorities I have been able to find on this subject declare that the addition of ever so much "quantity" of a current does not increase its "intensity," nor will the addition of "intensity" increase the "quantity" of electricity generated in battery. This being true, it is very probable that the reduction of "quantity," even to nil, will not in the least reduce the "intensity" or potential of the battery. Indeed, this seems to be proven by the experiments described in an article on "The New Contact Theory," copied in two numbers of THE TELEGRAPHER last summer.

In the experiment I found that although the metallic plates were ever so small, there was in a similar main battery sufficient current to work the relay, unless adjusted up, on account of short circuit, without including an opposing battery, as in my third plan; and further, the resistance of these small plates was too great an objection.

How, then, can quantity be disposed of entirely? Simply by omitting the sulphate of copper or zinc consuming acid. And just here I would say that my experiments have taught me that in the blue vitriol battery action does not depend upon the zinc being in contact with the acid, although this fact may be old to others.

But we will then practically have no battery at all! Here are two conflicting ideas. First, if reducing the quantity does not in the least change the "intensity" or potential, then by having the battery entirely inactive will not change its potential. Second, an inactive battery has no difference of potential at all between its poles. But theories weighed in the balance with experiments are often found wanting. The best method of proving the truth of this matter that I could think of was to connect similar poles of large plates of one cell to small ones of another, to see if the greater current would not overcome the lesser and operate the delicately adjusted instrument, but it would not, even by adding several more similar large plates to increase the quantity on one side, and only one small cell on the other side of the instrument. Thinking that the connections perhaps, through small cups were imperfect, I changed the poles, and the instrument worked as strongly as I could expect. I then put two new small plates that had never been used into a cell of common salt and water, and used it in place of a small active cell, trying it the same with the same result. But it occurred to me that perhaps the brine caused a slight galvanic action, therefore I again made the same tests with two large plates in a large cell of pure water, being careful to prove its conductivity by connecting opposite poles and working the instrument after having first had similar plates connected and delicate adjustment, with the same result again. Yet, again I apprehended some current might exist by the contact of the copper and zinc plates in the inactive cell, too weak for my instrument to indicate; therefore I connected a large number of inactive cells in a main battery for the purpose of increasing the

intensity of the small quantity (if any) of current in the inactive cells, until it should affect the instrument, but it failed to do so. Still not satisfied, I passed the current from my experimental active main battery through the inactive main battery, with opposite poles connected, of course, and then connected the same inactive battery alone in short circuit through delicately adjusted instrument; but not the least perceptible effect from any residuary current left by the active battery. Therefore I claim that an inactive plate element cell or battery has the same powers of resistance, repelling, neutralizing, diverting or balancing as the active battery. I used as high as ten cups on a side in these experiments, thus:

and connected in opposition, thus:

Finally, I arranged the connections as follows:

In this arrangement, each of the three batteries consisted of the same number of elements, the active battery being composed of Hill's and Daniell's cells (sulphate of copper).

In this last method, relay No. 1 responded promptly upon closing key, while relay No. 2, with the most delicate adjustment possible, remained invariably unaffected. S. J. M. BEAR.

The Telegraphers' Mutual Benefit Association.

ASSESSMENTS NOS. 70 AND 71, ISSUED NOV. 30TH, 1874 DEATH OF E. B. MCDILL AND W. C. HAVENS.

E. B. McDill (Certificate No. 2,235, issued April 7, 1874), died at Rosedale, Ks., October 7, 1874. Mr. McDill fell between the cars of a train upon which he was travelling from Leavenworth to Rosedale, and was almost instantly killed.

W. C. Havens (Certificate No. 133, issued Nov. 23, 1867), died at Brooklyn, N. Y., October 29th, 1874, of Bright's disease of the kidneys.

Two dollars are due on above assessments from members whose certificates are numbered not above 2,312; one dollar from those holding certificates between 2,311 and 2,340.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS UP TO AND INCLUDING NOV. 24, 1874.

ASSESSMENT No. 69.

- List of numbers from 8 to 1358, representing assessed members.

- Long list of numbers from 1366 to 2258, representing assessed members.

ASSESSMENT No. 68.

- List of numbers from 27 to 2177, representing assessed members.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice, that the acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

An Excursion of Telegraphers.—Their Tribulations and Adventures.

CINCINNATI, O., November 16.

TO THE EDITOR OF THE TELEGRAPHER.

DURING the recent meeting of telegraphers at Chicago an invitation was extended by Mr. C. H. Haskins, of the Northwestern Company, and Supt. Thayer, of the C. & N. W. R. R. Telegraphs, to take an excursion fifty miles up the Lake. Quite a number accepted the invitation, and accordingly all were to meet at the C. & N. W. Depot at eight o'clock A. M.

Owing to the high degree of entertainment given at the Palmer House it was quite difficult to induce some of the party to quit the breakfast table in time to reach the depot at the appointed hour. In fact, there was a Row(e) at the table. Some started—some didn't. Those who did start were again delayed by one of the party discovering that he had folded his morning paper with a wrinkle in it. Some time was lost in correcting this blunder. A forced march was then ordered, and all struck out handsomely, but soon came to another halt. A drawbridge was found perpendicular to our line of march. This was soon righted, and on we went with increased Speed (better known as F. M.) Each one carried his watch in hand, counting the seconds as they flew; all declaring their time was too fast, and no use of being in such a hurry. The depot was finally reached in good time—to see the train pass out at the distant end. A heated discussion here arose as to whose watch was right and whose wrong. This was soon settled by Wright claiming that he was the only Wright one in the party. Claim allowed without further debate.

It was then unanimously decided not to go on the eight o'clock train. At this juncture steam was discovered in the distance, supposed to emanate from a tug boat. This was our chance; we would charter this tug and make our own time card. Again we were doomed to disappointment; instead of a tug it proved to be Colonel Wilson, trying to make the train on the last second. When he discovered our sorrowful looking crowd he suddenly remembered he had city time instead of railroad time, and, consequently, was several minutes too late.

Another parley followed, and it was decided to go or "bust." Our sorrows all vanished when we were informed that another train left at nine o'clock. We

fooled this train by setting our watches fast. When it left we weren't left.

The C. & N. W. R. R. is too poor to buy iron rails, so they have to content themselves with steel ones. It was a most delightful ride, which I presume was due to the fact that we *steeled it*. Kenosha was our objective point. On reaching there we donned a sanctimonious air and took carriages (speed being exhausted) for the headquarters of the Northwestern. After making the acquaintance of our genial friend, President Simmons, and taking a side squint at the good looking lady operators, we were conducted to the Kenosha Insulator Works. Our previous experience with Pond insulators had been such as to encourage profanity, and I, for one, didn't care about fooling my time away looking after them. I decided to go along, however, and after viewing the establishment a few minutes, was impressed with the idea that "a fellow can't most always exactly tell that which he least expects the most."

The Kenosha insulator is entirely different in construction from the Pond. The former strong and substantial, the latter a failure, mechanically and insulatively. After passing through the establishment and examining the various processes through which the rude block of wood passes before it becomes a complete insulator, we were shown into the testing room, where every insulator is subjected to the most thorough test, as follows:

A large vat, capable of holding two hundred insulators, is filled with acidulated water and connected to one pole of a five hundred cell carbon battery. Into this vat the insulators are placed in an inverted position, so that the upper edge of the cup is above the water. The cups are next filled with water and connected successively to the other pole of the battery, a very sensitive Varley galvanometer being in the circuit. If the slightest moisture penetrates the wood the galvanometer will at once show it, and the insulator is condemned. Moisture will not collect upon the outside of this insulator as it does on glass. Each one being immersed in water before being tested, if any moisture adhered to the outside it would be detected when tested with such a powerful battery and delicate instrument. The wood is prepared in such a manner as to render it tough; you can pound it up like an old oyster can but it won't split. They are not easily damaged by being struck with missiles; this is a great advantage they have over the glass. They are rapidly coming into use in the West, and are destined to supersede the glass. The Kenosha Company also manufacture a peculiar style of telegraph pole intended for use over the prairies where fires destroy the ordinary cedar poles. The wood is prepared similar to that intended for insulators, and will stand a high degree of heat without being destroyed. Their shape is that of a tripod, with a central shaft about twelve feet high, the tripod being about eight feet high, buried two feet in the ground. The poles are made for but one wire and are very substantial and durable, notwithstanding the shafts and tripods are but two or three inches in diameter.

After completing our inspection of the insulator works we repaired to the residence of President Simmons and partook of his hospitality.

The amount of oysters and other edibles that the party insulated no doubt astonished our host, and he will in the future be more careful in his invitations. If there is any one thing more than another that a party of telegraphers on a bender are expert at its *tucking away grub*.

The return to Chicago was effected in good style. The first thing worthy of mention after our arrival there was a despatch from Stum-body at Cleveland, informing us where he had, before starting homeward the previous day, found an extra good article of W—I am perfectly willing, as far as I am concerned, to continue this narrative, but have decided not to do so until after consulting the other fellows. The subject of spiritualism as performed through magnetic agency will form a subject for another article. M.

Uncalled for Criticisms of a Social Club.—Chicago District T. M. B. Association.—Report of Delegate Jones.—Proceedings of the American Electrical Association.

CHICAGO, Nov. 30.

TO THE EDITOR OF THE TELEGRAPHER.

CONSIDERABLE excitement was occasioned among those of the fraternity here who belonged to the Merry Meeting Club in regard to the showing up "Cameo" gives them in a recent number of the *Operator*. They are rather of the opinion that as long as it was not strictly a telegraphers' club, but really composed of ladies and gentlemen outside the ranks, that is was rather small business in the aforesaid correspondent to write them up. Quite a premium could be obtained no doubt for the real name of "Cameo."

A meeting of this District of the Telegraphers' Mutual Benefit Association was called for Sunday,

Nov. 22d, at the Gold and Stock Rooms in this city, for the purpose of hearing the report of Mr. F. W. Jones, the delegate to the annual meeting in New York, the 11th ult. There were but five members present, the day being very wet and disagreeable, and there not being a quorum the meeting adjourned indefinitely. Through the kindness of one of the members, I was permitted to see Mr. Jones's report, which had been placed on the Secretary's desk, which reads as follows:

CHICAGO, Nov. 21, 1874.

To the Members of the Telegraphers' Mutual Benefit Association—District of Chicago.

Your delegate to the seventh annual meeting of the Telegraphers' Mutual Benefit Association, held in New York City on Wednesday the 11th Nov., begs leave to present the following report:

The instructions received from you at your previous meeting in regard to the restoration of delinquent members of our Association were fully observed, and your views were advocated before the annual meeting with all the ability at my command. A very generous policy was adopted, allowing persons who had forfeited membership to become eligible to membership by the payment of back dues to an amount not exceeding five dollars. It was considered to be fair that whatever assessments were made upon a member during the life of the policy held by said member should be honorably paid, in case of delinquency and restoration; but to prevent complication of accounts and an increase of clerical labor, it was resolved to make a fixed maximum sum for readmission. This seems entirely right and I think it will amply protect our Association. From the fact that but 188 applications for membership were made during the past year, against 475 the previous, the initiation fee was cut down to two dollars.

Mr. Tillinghast, the Buffalo representative, introduced a measure to increase the reserve fund to ten thousand dollars, to be accomplished in three years, by raising it to \$5,000 this year, \$7,500 next, and \$10,000 the third. It was almost unanimously adopted. The arguments for an increase of reserve fund were, that it would give greater stability to the Association, and the members would have a better guarantee that their claims would be promptly met in case of death. Should any fatal calamity visit seven or eight of our members at the same time, our Association will have the ability to extend instant aid to their families without depending on the uncertainty of assessment collections. In any case the interest of \$10,000 will be a welcome addition to our reserve fund.

Your delegate suggested the propriety of the West having a voice in the Executive Management, and the favor was granted with exceeding unanimity and good will. Mr. C. H. Summers, holding certificate No. 171, was elected upon my nomination. The South taking advantage of the opening, also asked for an Executive officer, whereupon Mr. J. M. Crowley, of Augusta, Ga., was elected.

A resolution was adopted to allow members to withdraw from the Association by paying all dues and receiving from the Secretary a certificate of withdrawal. It was also agreed to allow delegates at all coming annual meetings to cast as many votes as the number of members they represent. Such delegates must have written evidence of their authority to act.

I hope to be able to place a full report of the Secretary and Treasurer in your hands. Our members at present number 1,200. Cash on hand \$3,700.

Colonel J. J. S. Wilson kindly furnished passes for me from Chicago to Buffalo and return. N. Hacker, of Buffalo passed me from Buffalo to New York, and Genl. T. T. Eckert, Gen. Supt. East. Div., passed me back to Buffalo. The many courtesies I received at the hands of the officials in New York must have been extended more to the western members than to me personally, as they were beyond my merit. I accepted their many courtesies as an evidence of their desire to stand on brotherly footing with the great west, and to show their appreciation of our unflagging support and cordial cooperation in the affairs of the Association. Thanking you for the honor of representing you, I trust my feeble efforts are not disapproved. May we all do our part unselfishly to promote the good of those with whom we associate.

The sixteen dollars paid for assessments by each of us during the past year is not missed from our purses, but who can tell the good done by the aggregate amount. Unspeakably keen and crushing is the woe caused by the death of a husband, yet add to it the weight of cold penury when the last support of the household is removed, and what can befall us worse? Storied urn or animated bust cannot recall the fleeting breath to its mansion, but little acts of kindness, punctuality in meeting our assessments, may make lighter many heavy burdens of sorrow that the future holds locked up for some of our families during the coming year.

I fervently hope they may be few and far between,

but in any case I will always be found at my post of duty, lashed there with a rope when my legs fail.

Very respectfully, your obedient servant,
F. W. JONES.

The regular monthly meeting of the American Electrical Society was held at General Stager's room on the 18th inst, at 7.30 P. M. The following members were present: C. H. Summers, H. C. Maynard, J. C. Fowler, W. C. Long, G. H. Bliss, H. Stanbury, C. S. Jones, J. J. S. Wilson and F. W. Jones. In the absence of the President and Vice-President, Mr. C. H. Summers was called to the chair. Rec. Secretary C. S. Jones read proceedings of the previous meeting. The Executive Committee were asked for a report, but were not ready, as several sub-committees that have special work assigned them had not completed their labors and reported to the Executive Committee yet, especially one which was to confer with the managers of the Academy of Science in regard to renting a hall, etc.; but it was thought that in a week they would be able to report in full. The Recording Secretary, who had in charge the preparation of blank forms, submitted a formal report, and those present manifested acquiescence in all he had done.

The printing for the society had been contracted for, and all the blanks, with the exception of one, was well under way. This one—that of a certificate of membership in the society—the secretary had thought best to confer with the members in regard to in open meeting, as it should be, in his opinion, something emblematical of the society. Col. Wilson thought it should be something that would demonstrate the word "electrical" in all its meanings. After considerable friendly discussion, it was decided to invite all the members of the telegraphic profession who could draw and make designs to get up something in their judgment emblematical of the society, and have them forwarded to the Recording Secretary, and if no particular one happened to strike the idea, probably out of the whole, by taking parts of each one's contribution, something very fine could be gotten up. The meeting then adjourned at 8.45 P. M., to meet at the same time and place the following Wednesday evening, when a larger meeting was anticipated.

The adjourned meeting, however, was a failure, as I am informed there were but three members present, viz: Recording Secretary C. S. Jones, night manager; H. C. Maynard, of the W. U.; and W. C. Long, one of the operators of the day force W. U. main office. Can it be possible that the American Electrical Society is so soon dead? Let us hope not, and see a proper representation at the next monthly meeting on the third Wednesday of December.

After "Occasional" called attention to my negligence in slighting Whitford's daughter by failing to notice her *debut* into fashionable society, the leading question here was, "Well, how old is Whit's baby anyhow?"—Answer. Over five mouths. Now, "give us a rest." DOCTOR.

Parade and Festival of American District Telegraph Messengers.

THE parade of the American District Telegraph Volunteers, composed of the messengers of that company not on duty, came off, as announced, on Thanksgiving day, and was a very successful affair, and one very heartily enjoyed by all who had an opportunity to participate.

After the parade was organized the boys marched down to the City Hall, in front of which they were reviewed by the President of the company, Mr. E. L. Andrews. At this point there was a competitive drill and marching match between the messengers of the several districts, the prize for which was awarded to the company of the Twenty-eighth District. The boys then marched to Fulton Ferry, and, arriving at Brooklyn, they took the cars to Myrtle Avenue Park. Here they competed for prizes in foot and sack races and target shooting. The prizes were vacuous of from one day to one week, with pay, and in some cases silver medals were also awarded. The first prize in the foot race was won by John Moran, of the Thirty-first District. The first prize in the sack race, which afforded a great deal of merriment to the boys, was won by Weiss, No. 282. The shooting match followed, but as the judges were unable to ascertain the points scored by each contestant before the party left the park no decision was made. The distance was 140 feet, position standing, two rounds being allowed each boy. One boy made two bull's-eyes, but one shot was protested, the boy having rested his arm in taking aim. A plentiful dinner was prepared for them, and they enjoyed it heartily. After the festivities the boys walked back to the Ferry and returned to the city.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended November 7, 1874, was 364,306, an increase on the corresponding week last year of 6,245.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, DECEMBER 5, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.
INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST of THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK on ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

THE FAIRY ELECTRIC ENGINE, or a set of F. L. POPE & Co.'s popular NONFARL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. B. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

P. O. Box, 5503.

Publisher.

Special Notice.

FROM and after January 1st, 1875, the United States postage on THE TELEGRAPHER will be prepaid by the publisher. Notwithstanding the additional expense the price of subscription will remain as heretofore, Two Dollars per annum, payable in advance.

Hereafter it will not be necessary for subscribers in the British North American provinces to remit the additional twenty cents heretofore required for the payment of the United States postage.

The Inducements to Engage in, and the Objections to Telegraphic Service.

AS THE TELEGRAPHER is naturally supposed to be fully informed in regard to telegraphic matters, we frequently receive letters, the writers of which are desirous to know the length of time required to enable them to become telegraph operators, and the inducements in the way of emolument, etc., that may be expected to reward their efforts to qualify themselves for the service.

There is a kind of fascination in the idea of becoming a telegraphic operator, to the mind, of youthful persons especially, which is calculated to attract them to the business, more particularly if they have little personal knowledge of its conditions and requirements. The ability to communicate instantaneously with individuals hundreds and, perhaps, thousands of miles distant, practically annihilating time and space, seems marvellous, and the desire to enter the apparently charmed circle where such wonderful performances are habitual and constant is not matter of surprise, when viewed from the ordinary standpoint. This has been demonstrated from the first introduction of the telegraphic art, by the fact that there has never been a lack of telegraphic students.

This has been taken advantage of by the proprietors of the so-called telegraph schools, institutes and colleges, and their advertisements and circulars are filled with glowing and, sometimes, rhapsodical statements of the pleasure and advantages to be derived from becoming telegraph operators, which the readers are assured any person of ordinary ability and acquirement may become by a longer or shorter term of instruction at their institutes, and the payment of some ridiculously small sum, compared to the advantages to be derived. According to these veracious circulars there is always a chronic scarcity of telegraphic labor, and telegraph managers and superintendents are eager to engage the graduates at almost any salary whenever they have completed the prescribed course of instruction.

How different the reality is from either the imagination of those who aspire to become telegraphers, or the lying statements and assertions of the circulars mentioned, those of our readers who are actually engaged in telegraphy do not require to be told. We have so often exposed the falsity of the statements made for the purpose of entrapping ignorant and confiding boys and girls into patronizing these manufactories of telegraphic plugs, that it is scarcely necessary to attempt the task anew, and such is not our purpose in the present editorial. We propose merely to state plainly what the real inducements are to engage in telegraphy as a business, the objections to, and disadvantages of the telegraphic service, and the present condition of the service as regards the supply of operators. No doubt a majority of those who read THE TELEGRAPHER have friends and acquaintances who are considering the question of engaging in telegraphy, and we hope to be the means of enabling them to give such information and advice in reference thereto as may in some cases prove satisfactory and advantageous in the final decision arrived at.

The ability to communicate instantly with persons and places widely separated is at first a great attraction and satisfaction to most telegraphic neophytes. It is something so out of the common experience that for a time it undoubtedly has a tendency to elevate us

in our own conceits, and cause us to regard ourselves as a little above the unfortunates who are unacquainted with practical telegraphy. This, however, soon wears off, and by the time the operator has settled down into regular telegraph service, he finds that, like any other mode of working for a livelihood, it is one of labor and toil, and the hour which releases from duty is as welcome as to any other of the working classes. As before stated, it is sufficient to attract constantly an over supply of new students, and keep the telegraphic ranks not only filled up, but generally more than adequately supplied with recruits.

The popular idea is, and this is assiduously fostered and encouraged by the proprietors of the so-called telegraph schools, that there is always a great demand for telegraph labor. That such is not the case at the present time, and that it has never been more than exceptionally true, all who are familiar with the telegraph business will bear witness. About the only time within our recollection when the demand for telegraph operators exceeded the supply, was for a period during the late war, when the Government took up a large number of them for military lines, and the telegraph business, from causes arising from the war, was very active. When peace was restored, and the Government no longer required the services of military telegraphs and telegraphers, those who had been thus engaged returned to the commercial lines, and there has been no scarcity of operators at any time since. During the past fifteen months there has been but comparatively little, if any, addition to the aggregate of telegraph lines and offices, and fewer operators are probably now required than before that time. If there were no additions to the telegraphic ranks for the next year or two we do not believe there would be any lack of operators to supply the demand. Were it not for the fact that so many are annually withdrawn from the telegraph service to engage in other employments, the pressure for situations would be even greater than it is at present.

As regards the compensation of telegraphers very extravagant ideas are apt to be entertained, and on this point the representations of proprietors of telegraph schools are vilely deceptive. They quote salaries of operators at anywhere from \$75 to \$150 per month. As a matter of fact we doubt whether the pay of operators will average more than \$40 per month. It is true that in some of the larger cities, and in the main offices, there are operators who receive from \$75 to \$100 per month for their services, but this is exceptional. In common with all classes of labor, the tendency of telegraphers' compensation is to a lower scale, and while there is so great a supply of operators and a comparatively limited demand, we cannot see a prospect for improvement in this respect.

In telegraphy as in other business, there are some positions which are better paid, but these are comparatively few in number, and usually require years of service and personal influence, which a majority of telegraphers lack, to secure. And it must be confessed that if the higher and better paid positions are few the number of those qualified to fill them is limited. We do not mean to say that these positions are always awarded to those best qualified for them, for we are aware that too frequently such is not the case. But lacking ability, or even with it, usually personal influence, in telegraphy as in other descriptions of business employing skilled labor, is requisite to secure what are generally regarded as the more desirable positions.

It may be taken for granted that, as regards the employés, telegraphy is not essentially different from any other occupation, except that it attracts a larger number of young persons to it, and a sufficient smattering of the knowledge requisite may be acquired to enable a person to occupy some sort of a telegraphic position. To become a good, or what is commonly understood as a first class operator, capable of filling creditably a first class telegraphic position, requires long practice and hard work. Telegraphy is no business for a lazy person. One who is ambitious of being a successful telegraph operator must be willing to labor hard, and if he

aspires to fill the higher positions in the business, which require something more than mere mechanical facility of manipulation, must study the science which underlies the telegraphic art.

It is not our desire or purpose to prevent any person who may desire to do so from engaging in the telegraphic service, and we do not flatter ourselves that we should meet with much success even if it were. We only wish that those who are considering the question should understand exactly what they are about to do, and should decide understandingly in the matter. What we do desire, and what we wish to impress upon not only those who are about engaging in telegraphic service, but also of many who already consider themselves and are considered telegraph operators, is the necessity, if they wish to become creditable members of the telegraphic fraternity, of understanding the principles, and at least the rudiments of electrical science, as well as of the telegraphic art. What is wanted is not mere telegraph operators, but better qualified and educated ones. There is no room in the service for mere plugs. There are already some thousands more of these than are required, but of what should properly be regarded as really first class capable operators, there is and never has been an over supply.

It would undoubtedly be to the advantage of telegraph employers and managers if they would systematically offer more inducements in the way of promotion and compensation to employes who seek to become something more than mere mechanical manipulators. When they shall realize this fact and act upon it, we shall regard it as the most important step which has yet been taken towards elevating the telegraphic profession to a higher standard than it has yet attained.

Our Washington Correspondence.

THE session of Congress commences on Monday next and will terminate the 4th of March. The report of the Postmaster General has been made public and contains no recommendation on the telegraph question.

As we have before stated, we do not anticipate any very important action in regard to telegraph matters at this session. We have, however, made arrangements to have THE TELEGRAPHER kept fully informed as to all telegraphic matters of interest that may come up during the session. The communications of our Correspondent CAPITOL will be resumed, and will as heretofore contain the latest and fullest information to be obtained in regard to all telegraphic matters of interest in connection with Congress, not only of the public action but of the secret and private manœuvring which usually, to a greater or less extent, governs such action.

Personals.

Mr. CHARLES H. COTTRILL, recently of the Cable Room at No. 145 Broadway, New York, is engaged at New Orleans, La., with the Associated Press.

Mr. SAMUEL WALLACE is working for the Western Union in Chicago.

Mr. C. H. DAVIS has resigned his position as night report operator at Elmira, N.Y., and gone to Duxbury, Mass., *vice* PERKINS, resigned.

Mr. M. J. LANDY has joined his brother "Billy" in the Cable Room at No. 145 Broadway, having resigned with the A. & P. at No. 197 Broadway, for the above named purpose.

Mr. HARRY GARNER, who has been travelling some time in Canada and through the Eastern States for his health, has accepted a position in the Superintendent's office, Middle Division of the Phila. and Erie Railroad, at Renovo, Pa.

Mr. A. KIMBALL, formerly repairer and battery man for the now defunct P. and A. Telg. Co., and who has been building lines all summer for the Western Union Telg. Co. on the Pacific Division, from Colfax, Colorado, to Sacramento, California, is now acting as repairer at Emigrant Gap, Colorado.

Mr. P. A. ROWE, of the Western Union, Chicago, Ill., night force, and Mr. CHARLES HASELTON, of the Peoria, Ill., Western Union day force, have exchanged situations.

The Telegraph.

By Cable.

STEAMSHIP LA PLATA WRECKED.—HEAVY LOSS OF LIFE.—BRAZILIAN CABLE SUNK.

LONDON, Dec. 2.—The Anglo-Brazilian mail steamship La Plata has been wrecked off the Island of Ushant. Attempts which were made to save the crew and passengers were unsuccessful. Some of the crew had taken to the boats, and one boat, containing fourteen men, has been picked up.

Sixty lives are supposed to be lost.

The La Plata had on board 300 miles of telegraph cable destined for the coast of Brazil.

The Lease of the Franklin Lines to the Atlantic and Pacific Telegraph Company.

THE lease of the lines of the Franklin Telegraph Company to the Atlantic and Pacific Company, as directed at the meeting of the Franklin Company in Boston, already reported in THE TELEGRAPHER, for the term of ninety-nine years, has been completed, and they were turned over to the latter company November 21st. The annual rental finally determined upon was \$27,500.

Some of the stockholders of the Franklin Company appear to be very much dissatisfied with this action of the company, and threaten legal proceedings to attempt to have the lease set aside. It is not probable, however, that anything will be done in the matter.

Removal of the Gold and Stock Telegraph Co. to the new Western Union Building.

THE removal of the Gold and Stock Telegraph Company, from its present quarters at 61 Broadway to the new Western Union building, has now been authoritatively decided upon. This change is a most important one, involving, as it does, the extension of over four hundred line wires, the running of the accompanying inside wires, and the removal of some 4,000 cups of carbon and 2,500 of gravity battery. As the lease of their present premises does not expire until May 1st, the change will probably not be made much before that date. The new location at the corner of Dey street being at so great a distance from the stock and gold markets, it will doubtless be necessary for the company to establish a branch office on Wall or Broad streets, which will be more accessible to subscribers than the main office now is.

New Police and Fire Telegraph Lines in Brooklyn.

A NEW and superior telegraph line has recently been constructed in Brooklyn for the Police and Fire Departments, extending from Fulton avenue, through Reid avenue, to Bushwick avenue; from Reid and Green avenue on Green to Broadway; and from Reid and De Kalb avenues to Nostrand avenue on De Kalb, two and three quarter miles long.

Another line has also been built from the Fifth Precinct Station House through Ten Eyck, Hope, Ewen and Second streets, to Wyckoff street, Williamsburgh (where it connects with their other line), one and a half miles long. The total of new line is five and a quarter miles.

The poles are thirty-five feet in length, with No. 9 English galvanized wire, and screw glass insulators on cross-arms.

Mr. Robert Brown was the contractor and builder, and he is still engaged in filling the streets of New York and Brooklyn with huge telegraph poles.

The Owl Telegraph Company.

PROBABLY few of the readers of THE TELEGRAPHER have ever heard of the "Owl Telegraph Company," and would be puzzled to locate it. It was organized Dec. 27th, 1873, and is in very successful and satisfactory operation. The operators never complain of inadequate salaries, and the stockholders are entirely satisfied with the financial results. This company is composed of a number of citizens of Newark, N. J., and connects the residences of its members, who are thus enabled to communicate with each other for social purposes. The stockholders are the operators, and it is strictly a coöperative concern.

The officers of the company, of which it has as complete a list as more pretentious telegraph organizations, are Mr. Geo. W. Ketchum, President, Mr. J. A. Seaver, Vice-President, Mr. A. D. Chambers, Secretary and Treasurer; Mr. Thos. V. Johnson, Jr., Gen'l Superintendent; and G. A. Van Wagoner, M. D., Electrician.

Mr. Robert Brown, the veteran telegraph constructor of this city, has recently put up for the Owl Company a line commencing at Railroad avenue, Newark,

extending to Broad street: thence with two wires on a four wire cross-arm put up by the company over poles of the Franklin Telegraph Company to corner Central avenue and Summit street, where a new pole line with two wire cross-arms, glass insulators, and best quality No. 11 iron wire, runs to Roseville. A loop leaves the main line in Bank street, extending one and a third miles, and another of half a mile from Summit and Bleecker streets.

The instruments used are the ordinary Morse, which, as before stated, are worked by the parties interested.

Accident to a Cable.

ABOUT one o'clock Saturday morning, at New Brunswick, N. J., a propeller on the Raritan Canal, while passing the draw at the railroad bridge, got caught in the cable laid along the bottom of the canal, and so damaged it as to cut off communication by several wires between New York and Philadelphia. The propeller wheel became so entangled, also, that she was unable to proceed for nearly two hours after the mishap, during which time it was necessary to keep the draw open. The towpath, under which the cable was laid, was considerably torn up. The cable is so badly damaged that it must be replaced by a new one, and meanwhile an extra force of operators are kept on the watch to prevent accidents arising from the difficulty experienced in telegraphing the arrival and departure of trains from the different stations along this portion of the Pennsylvania Railroad.

Foreign Telegraphic Notes.

THE traffic receipts of the Direct Spanish Telegraph, for the month of October last, had amounted to £1,387.

The traffic receipts of the Submarine Telegraph Company, for the month of October last, amounted to £9,509 against £9,565 for the corresponding month of 1873.

The number of messages (of twenty words each) passed over the Barcelona-Marseilles Cable, for the month of October last, was 6,731 against 5,940 messages in the month of September.

Negotiations are in progress for the purpose of establishing an independent cable telegraph line between Australia and Europe. The route suggested is *via* Kimberly, at the south of the Gulf of Carpentaria to Singapore—Sumatra and Java being avoided altogether. The proposal has already received the sanction of the Parliaments of New South Wales, New Zealand and Queensland, and a guarantee of five per cent. per annum on the cost of constructing the lines has been promised by them. The immediate effect of this new line will be to reduce the cost of messages about 33 per cent. between the United Kingdom and her Australian colonies, and, in his last report, Mr. Cracknell, the Superintendent of Telegraphs in Queensland, states that this important work will be commenced without delay.

The traffic receipts of the Great Northern Telegraph, for the month of October, was 438,817 francs, against 360,437 francs for October, 1873. Total traffic receipts, from January 1st to October 31st, 3,770,400 francs, against 2,748,568 for 1873.

The Eastern Telegraph Company's traffic receipts for the month of October, 1874, amounted to £32,858, against £29,229 in the corresponding month of 1873.

The traffic receipts of the Eastern Extension, Australasia and China Telegraph Company (limited) for the month of October, were £16,584, against £17,586 for the corresponding month of 1873.

The Anglo-American Telegraph Company have established themselves in new offices in Throgmorton street, London. The main feature of the new arrangement is that the central office is now connected by special wires with Valentia, and messages handed in at Throgmorton street will be instantly transmitted to the Valentia station, to be despatched thence at once through the cables to America. Messages for New York, the West Indies, and other places on this side of the Atlantic, will now be free from any delay which might naturally arise from their having to take their time with the ordinary business of the English inland postal telegraphic service. The messages received from America in London are at once delivered at their destination by the special messengers employed by the Anglo-American Telegraph Company.

In Bolivia, South America, the telegraph to the North is now working through to Pacasmayo and Payta.

Suicide of a Telegraph Operator.

ON Monday night last Mr. William H. Clark committed suicide at the Hanfield Hotel, Nos. 620 and 622 Grand street, by shooting himself. He was a telegraph

operator, and one of those who had been longest in the service in this city.

He was originally employed on the Erie Railroad lines, under the superintendence of Mr. L. G. Tillotson. Subsequently, however, he succeeded Mr. Henry Bentley in the management of the Madison square office in this city, which position he held until his decease. He was about thirty-six years of age, and leaves a wife and two or three children in Brooklyn. A few months since he lost a daughter, excessive grief for whom may have led him to the tragical termination of his existence.

The Taxation of Telegraph Companies.

THE Supreme Court of Indiana has decided that the tax on \$800,000, assessed on the capital stock of the Western Union Telegraph Company by the State Board of Equalization, cannot be collected. In their opinion, the court say they see no reason why the whole amount of the company's capital stock (\$40,000,000) should not be taxed in Indiana if the \$800,000 assessed can be legally taxed—intimating that the Legislature cannot provide for the taxation of the stock of foreign corporations. From so much of the opinion Judge Buskirk dissents, holding that the Legislature has this power, but that the law under which the assessment is made does not fully cover the necessary ground to be taken.

Statistics of Government Telegraphs for 1873.

THE following table shows the results of the operation of the telegraph in Germany, Hungary, Belgium, Denmark, France, Holland and Switzerland, for the year ending December 31, 1873, being all the reports which have come to hand. It will be observed that the expenditures in these seven countries alone exceed the receipts by \$1,075,510.

Object of Statistics.	German	Hungary.	Belgium.	Denmark.	France.	Holland.	Switzer-land.

Train Telegraph Instruments on the Lake Shore Road.

In our issue of October 3d we published the following from the Detroit Free Press:

"Colonel Wheaton, Superintendent of the Kalamazoo division of the Michigan Southern Railway, has provided the train men with a new telegraph instrument, by which connection can be made with the main line at any place and despatches sent. The box is not large, but it affords room for train orders, stationery, one hundred feet of wire, etc. If a train breaks down all that is necessary is to make connections with the main wire, and orders can be sent or received at once."

In relation to this an officer of the road kindly corrects and enlarges the information as follows:

"Each division has been supplied lately with an instrument case, containing telegraph key and box relay connected to posts in the outside of the case, to which wires can be instantly attached. The front of the case forms, when opened, the desk to write on, and there is a drawer for pencil and paper. This case is kept for the use of the telegrapher who accompanies a wrecking train, and enables communications to be established at once. That is all the foundation there is for this puff. Our Superintendent of Telegraph is the person to whom this sensible provision is due, and his modest name is William Kiene, Jr.—The Railway Gazette.

THE telegraph is being introduced into Turner's Falls, Mass. The other day hardly five minutes had elapsed after the erection of one of the posts before some enterprising genius posted a bill thereon, and soon two street Arabs were attracted to the spot, when the following dialogue ensued: "I say, Mickey, what an invention the telegraph is." "Yes, an' here's a dispatch broke out on the post."

THERE is a great difference between an art and a science: an art teaches us to do, a science to know. The object of science is knowledge; the objects of art are works. In art truth is means to an end: in science it is the only end.—W. H. Precece.

Married.

ROWE—WASHBURN.—At South Haven, Michigan, Nov. 5, 1874, at the residence of the bride's parents, Mr. P. A. Rowe, of the Western Union Chicago, Ill., night force, to Miss CARRIE E. WASHBURN, formerly manager of the Saginaw, Mich., Western Union office, and more recently, and up to within the last year, manager of the South Haven, Mich., Western Union office. May they Rowe smoothly over life's too often troubled sea, and all the squalls experienced be only local ones, and any additional sounders only prove harmonious in the din that generally drowns out the old relay's noise. Adjust, Pete.

THAYER—PRAY.—At Philadelphia, Pa., Nov. 12, 1874, Mr. C. W. THAYER, of the Chicago Western Union night force, to Miss HATTIE PRAY, of the former place. We do not anticipate too much when we say that Charlie will always be Thayer (there) as of old, and it will not be necessary to Pray that he work extra any more.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY, 40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required, Liberal commissions will be paid upon any orders that may be secured for us. Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

CORNELIUS ROOSEVELT, Secretary and Treasurer, 40 West 18th Street, New York.
L. G. TILLOTSON, President.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS of every description, at

No. 54 SOUTH FOURTH STREET, (Corner Chestnut street), PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

ECONOMIZE!

Procure the best and cheapest Telegraph and Electrical Instruments and supplies of all kinds from, LANNERT & DECKER, 31 1/2 Prospect St., Cleveland, O. Send for circular.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET; or to L. G. TILLOTSON & CO., 8 Dey street, sole Agents.

AMERICAN COMPOUND TELEGRAPH LINE WIRE.

COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE compared with Iron, consists in its LIGHTNESS, relative TENSILE STRENGTH, CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.

Address, American Compound Telegraph Wire Co.

ALANSON CARY, Treasurer,

Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES,

RELAYS, unequalled for beauty and strength;
 COMBINATION SETS; BOX and POKET RELAYS.
 CHALLENGE, PONY and REPEATING SOUNDERS.
 KEYS, various styles, including the SCHNEIDER KEY, just
 out, no legs, wire connections above the table.
 REGISTERS, with SPRINGS or WEIGHT.

CUT OUTS, many varieties, including a new style of PEG CUT
 OUT, with an adjustable LIGHTNING ARRESTER, just out.
 REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES
 and LIGHTNING ARRESTERS.
 ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also
 SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR
 ALARMS, and WATCHMAN DETECTORS.
 ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHT-
 ING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made
 to order. Second hand Instruments for sale cheap,
 and repairing done at short notice.

BATTERIES in great variety, including the latest inventions;
 also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE
 WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED
 LINE WIRES; SUBMARINE, SUBTERRANEAN and
 HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON.
 BRACKETS, PINS and SPIKES, TELEGRAPH POLES,
 LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MAN-
 FOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES,
 ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and
 AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are
 elegantly finished and mounted on highly polished rosewood,
 mahogany and walnut bases.

SOMETHING NEW!

[PATENTED SEPT. 29, 1874.]

THE FAIRY ELECTRIC ENGINE.

A perfect working model of an engine
Run by Electricity!
 It will work well with an ordinary local battery.

Price, with two cells Eagles' Metallic Battery..... \$6 00
 " without Battery..... 4 00

May be seen working at the office of the THE TELEGRAPHER.
 For sale by
The Electro-Magnetic Manufacturing Company,
 36 BROAD STREET, NEW YORK.
 P. O. Box 1804.
 Also for sale by
 L. G. TILLOTSON & CO., 8 Dey street.
 F. L. POPE & CO., 38 Vesey street.

A NEW GALVANIC BATTERY.

**Durability, Efficiency, and Economy of Expense
 and Labor at last Secured.**

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.
 The undersigned having secured the exclusive Agency for
 manufacture and sale of the

EAGLES METALLIC BATTERY,
 now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.

These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.
 Two sizes are made at present, but others will soon be ready.

No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.
 On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to

Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter, and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,
 22 South Twenty-first Street. PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).

GEO. H. BLISS & CO.,
 41 THIRD AVENUE,
 Chicago, Ill.

MANUFACTORY OF THE SPENCEREAN STEEL PENS, BIRMINGHAM, ENGLAND.

SPENCEREAN DOUBLE ELASTIC STEEL PENS.

The superiority and excellence of these justly celebrated Pens are appreciated, as is shown in their constantly increasing sale. They are comprised in fifteen numbers, of which one number alone has an annual sale of more than 5,000,000.

The SPENCEREAN PENS are manufactured of the very best material by the most expert workmen in Europe, and are famous for their elasticity, durability and evenness of point.

THE SPENCEREAN PENS ARE FOR SALE BY ALL DEALERS.

We make Fifteen Numbers of Pens, differing in flexibility and fineness of point, adapted to every style of writing, as follows:

- No. 1. COLLEGE PEN. Point Fine; Action Perfect. This is a great favorite with our leading penmen, is largely used in the Schools and Commercial Colleges throughout the country, and gives better satisfaction than any Pen before the American Public.
- No. 2. COUNTING-HOUSE PEN. Point Fine and Flexible, well adapted to the use of Correspondents and Accountants.
- No. 3. COMMERCIAL PEN. Point Medium. An Easy Writing Business Pen.
- No. 4. LADIES' EXTRA PEN. Point Extra Fine and Flexible. For Delicate Fine Hand Writing this is a very superior Pen.
- No. 5. SCHOOL PEN. Point Fine, Medium in Flexibility. For a durable School Pen it has never been equalled.
- No. 6. FLOURISHING PEN. Point Long, Flexible and Medium in Fineness. For Off-hand Flourishing.
- No. 7. QUILL PEN. Point Medium, Quill Action. A smooth, Easy Writing Pen. Its name well represents its qualities.
- No. 8. CONGRESS PEN. (New.) Medium Flexible Point. A very superior Pen for all styles of writing. This Pen undergoes a process that renders it non-corrosive and three times more durable than any ordinary Steel Pen.
- No. 9. BANK PEN. Point Long and Flexible. A great favorite with Accountants, Tellers, etc.
- No. 10. CUSTOM-HOUSE PEN. Point Medium. Well adapted to all styles of Bold Free Hand Writing.
- No. 11. UNIVERSITY PEN. Point Medium, very Smooth and Flexible. The action of this celebrated Pen is very fine.
- No. 12. EPISTOLAIRE PEN. Point very Fine and very Flexible. This is the finest Pointed Pen made, and, for very Delicate Writing, Map and Fine Pen Drawing, it has no equal.
- No. 13. ENGRASSING PEN. Point Blunt and Smooth. Particularly adapted to Coarse Hand Writing and Engrassing.
- No. 14. ARTISTIC PEN. Flexible, with extra fine point. This exquisite and Truly Celebrated Pen is the Best Pen extant for Fine Ornamental Writing.
- No. 15. THE QUEEN. Point extra fine. Admirably adapted to all kinds of Fine Writing.

Sample Cards containing all the FIFTEEN Numbers, securely inclosed, will be sent by mail on receipt of 25 cents.

IVISON, BLAKEMAN, TAYLOR & CO.,
 138 & 140 Grand street, N. Y.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE TELEGRAPH MANUAL,

BY TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawkshee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Volta battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacohy and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, scaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given. The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.
This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for
POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is
NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current. The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. *Send for Circular.*

EUGENE F. PHILLIPS,

20 CONDUIT STREET,

PROVIDENCE, R. I.

Manufacturer of

Patent Finished Insulated Wire, Patent Rubber Covered Wire, Magnet Wire, Patent Electric Cordage, Cables, etc.

I claim to furnish the best Braided Wire in the Market, and I believe it is acknowledged as such by all large Telegraph Companies and Telegraph Supply Dealers.

My Wires were awarded the first premium at the Cincinnati Exposition of 1874, both for best "Office" and best "Insulated Line Wires."

These Wires are furnished in any desirable color or plaids.

My Rubber Covered Wire will not crack, and is not affected by ordinary extremes of heat or cold. The rubber covering is of uniform thickness, and the wire will be found in the exact centre—a result not heretofore produced.

I also make cables of any number of conductors at the regular price for a single wire.

With new and improved machinery I feel satisfied that I can furnish magnet Wires as good as any to be found in the market.

All Wire used by me is made to my special order, and is the best that can be procured in the market.

I could give a long list of testimonials, but depend on the merits of the Wire for patronage.

Please send for sample card and price list.

These Wires can be had at my prices of

That "THE BEST IS ALWAYS CHEAPEST" is demonstrated by the unprecedented demand which has arisen for our

EXCELSIOR TELEGRAPH APPARATUS
for Students and Amateurs.

The custom introduced by us of making Agents of managers and operators, and sharing the profits from the sales of these Instruments with them, has also assisted in increasing our sales to such an extent that we have been compelled to enlarge our facilities for their manufacture.

We are now prepared to furnish these unrivalled Amateur Instruments, with or without Office Outfits, in any quantity and at a moment's notice. Our Agents may now send in their orders as rapidly as they please, and can rely upon their being promptly executed. Prices as heretofore.

Instrument complete, Key and Sounder..... \$6 50
Instrument with Office Outfit..... 7 50
Two Instruments and Outfits..... 14 50

ENGINEER TO THE

ELECTRIC AND INTERNATIONAL
TELEGRAPH COMPANY.

Published with the sanction of the Chairman and Directors of the Electric and International Telegraph Company, and adopted by the Department of Telegraphs for India.

FOURTH EDITION,

REVISED AND ENLARGED.

1 Vol. 8vo, cloth..... \$5 00.
Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books, eighty pages, 8vo, sent to any address on receipt of ten cents.

D. VAN NOSTRAND, Publisher,
23 MURRAY STREET, N. Y.

THE REASON WHY

THE TILLOTSON BOX SOUNDING RELAYS

are declared better than all others for Office and Wrecking purposes, is because the devices for increasing the volume of sound are all patented, and cannot be found in ordinary Box Instruments.

We are offering 20 per cent. discount from list prices on all Instruments of our manufacture.

Quality will be strictly maintained.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE, AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable. Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,

8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,

has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

SARGENT & STUDLEY, 26 Park Place,
RUBBER CLOTHING CO., 363 Broadway.

VOL. X. WHOLE No. 439.

Special Meeting of the Direct United States Cable Company.—Proposition to Lay a Second Cable.

A SPECIAL meeting of the shareholders of the Direct United States Cable Company was held at the City Terminus Hotel, Cannon Street, London, on Monday, Nov. 16th.—Mr. E. H. Lushington in the chair.

In his opening remarks the Chairman said he wished to state the present condition of the cable. The first two sections, namely, between Newfoundland and Nova Scotia, and Nova Scotia and the United States, were both laid down and in excellent working order. The deep sea section was in this position: the Faraday had over 160 miles of deep sea cable to lay, and the Ambassador 150 miles of sbore line. Therefore, he thought they might say that the deep sea line was practically completed, and the observations he might make were based upon that assumption. Dr. Siemens was present, and would be able to answer any question as to the exact position of the cable. He then put the following resolution:—"That this meeting, having in view the importance of duplicating the company's deep sea cable, and in order to enable the directors to provide the funds for that purpose, and for the general occasions of the company, resolved, in lieu of Section 13 of Article 69 of the articles, such section is hereby abrogated, and the following section shall be, and is hereby substituted, viz: No. 13.—"To raise from time to time, in the name and for the purposes of the company, by the issue of debentures upon such terms and conditions as to price of issue, rate of interest, time of repayment and commutation of shares and stocks, and all other respects, as they may think fit, by way of loan, or in any other manner, the sum or sums not exceeding the present capital of the company, with power, however, to reborrow from time to time, in like manner, and within the like limits, for the purpose of redeeming existing debentures or loans, and also to make such payments by way of commissions or otherwise as they may think proper with reference to raising any such sums." He (the Chairman) proceeded to enlarge upon the importance of duplicating the company's deep sea cable. It would be impossible to transmit save from one end at a time. In case of an accident they were not in possession of sufficient funds to conduct the repairs. Then, again, their cable was laid down alongside five other cables, backed by monopolies, concessions and privileges of no ordinary value, to which the public were fully alive, and it would require the utmost punctuality on the part of the Direct Cable Company to carry on a business. Their customers being men of business, whose success depended upon the earliest possible receipt of replies on matters connected with their trading, they would naturally support that company on which they could rely, even at high rates. He was not depreciating the property, he was in favor of conducting the company's affairs with extreme prudence, and that would best be shown by duplicating the line. When they had two deep sea cables they would be able to divide the business with the Atlantic Telegraph Company, and the Anglo-American Company, and make a much handsomer profit, because working with so much less capital. With regard to the more immediate part of the resolution—the raising of the money—he felt sure the meeting would not expect him to state on what terms they should get the money. They must still repose confidence in the board. The money would be raised at the very lowest possible rate of interest, and with every regard to the interests of the original shareholders. The working expenses of an additional cable would be a very small increase on the present cost.

Mr. LEMME said the proposition of the directors had taken the shareholders by surprise, and they had hardly had time to consider the matter. The directors desired to have power to raise money on debentures on the cable which they choose to consider was laid. The shareholders, after the many misfortunes which the cable had experienced, could not take this view of it, and he thought the directors would be asking for money on a cable which was not yet laid. They ventured to suggest that the meeting be adjourned for a month.

Mr. CACQUILLA seconded the amendment.

The CHAIRMAN said that it would then be quite impossible to get the duplicate cable next year. He would suggest the passing of the resolution at once, and the shareholders could then reject it at the confirmatory meeting which would be held in a fortnight, if they found that the cable was not then completed.

Mr. LEMME said he should prefer to adhere to his original amendment, but if the directors desired a fortnight he had no objection.

A SHAREHOLDER expostulated against the inexpediency of raising money at the high rates which they would have to pay till the cable was finished. He should oppose the resolution, and, if necessary, should ask for a poll.

The CHAIRMAN said that no attempt would be made to raise money until such time as the cable was laid. They had deferred holding the meeting as long as possible because they were in hopes that before this time it would have been laid.

Mr. LABOUCHERE said that he was not a scientific man, but that, so far as he understood the question, it was now essentially one of test. He should never, as a member of the board, advocate 15 per cent. being given to raise the money. He thought, with Mr. Lemme, that it would meet their views to take the discussion upon the adjourned meeting, supposing it to be a fortnight, and to lay before them in the meantime all the information for it was very difficult to discuss these matters *coram publico*. The interests of the board and the shareholders were identical, viz., to make the company a great financial success. They had no object with Dr. Siemens, he was only the contractor. He believed that in a fortnight they should be able to lay before the shareholders a good case; then, if they did not like it, they need not confirm the resolution. Then they could consider the steps which should be taken. It would not prejudice matters to pass the resolution at once.

Mr. LEMME replied that he could not withdraw his motion. He had several arguments on his side which he preferred not using at that time.

The amendment for a fortnight's adjournment was then put and carried.

Mr. LABOUCHERE said that if the meeting refused to give the directors the power they asked the directors distinctly stated they were not in the least responsible for the consequences. The object was to get the company in a good position. Their opinions in the matter might be wrong, but if power were refused them the directors would wash their hands of the consequences.

A SHAREHOLDER said that he thought Mr. Labouchere's remarks were uncalled for. The object in postponing the meeting was a very cogent one. If the meeting had been held two months ago the cable would not have been laid. He should hardly fancy that the required delay should have called for the rather threatening remarks from Mr. Labouchere.

Mr. LABOUCHERE explained that his remarks were not intended as threatening. The directors were only anxious to lay the second cable next year.

A SHAREHOLDER asked whether any information had been sought as to whether any other telegraph contractors would or could lay the second cable besides Messrs. Siemens.

The CHAIRMAN said the company was bound to Messrs. Siemens for the second cable.

Dr. SIEMENS said he should confine what he had to say to the remarks which had fallen from the several speakers in reference to the delay which had occurred in laying the cable. It was true that the first cable was ordered rather before that time last year and was not yet handed over to the company. This was owing to circumstances hardly to have been foreseen. The manufacture of the cable was completed to the day at the works. Its insulation was not only equal to specification, but just about double, for instead of the stipulated 160 millions of units per knot it gave 300 millions of units. The steamship Faraday had left within a fortnight of the time intended, but had been delayed at Newfoundland by heavy fogs, and was lost sight of for three weeks, and a report had circulated of her total loss. They were obliged to send the attendant ship to search for her, and the two ships missed, and this had caused much delay. It might be said that the cause of the breaking away of the end of the cable was a fault going overboard, but no cable was ever made without a fault. Every effort had been made to turn out this cable so that it should be surpassed by none. He should not be satisfied unless he handed over the cable to the company in a perfect condition. The delays had been inevitable.

The General Manager confirmed what Dr. Siemens had said as to the care taken in the manufacture of the cable, and the meeting then broke up.—*The Railway News.*

STEADY attention to detail lies at the root of human progress.—*Smiles.*

The National Academy of Science.

THE second session of this body met on November 3, at Philadelphia. The attendance has been large, and includes the names of many of the most distinguished scientists and scholars in the country. We give below brief extracts of such of the papers read as would be likely to interest our readers.

Professor Mayer spoke of the change in dimensions of solid and hollow iron cylinders on their magnetization, and described experiments made on solid and hollow cylinders of iron three feet in length and five or six inches in diameter. He found that solid cylinders elongate on being magnetized, but at the same time so contract in their transverse dimension that the volume of the cylinder remains constant. In the case of hollow cylinders, however, it was found that their interior capacity increased on their magnetization.

Professor Rogers described a simple method of generating positive electricity wherever a steam boiler exists in the building. He attached a pipe to an ordinary boiler used for heating purposes, and carried it through the window to the outer air. To the end of the pipe where the steam escaped he attached what are known as Faraday's nozzles—fifteen of them—with applewood apertures. In front of these nozzles he suspended, by a brass rod, a piece of brass foil, cut so as to present a bristle of points to the escaping steam. He had only to provide an insulating support for the rod, and carry a wire through a pane in the window to a long rod held by ribbon silk in the room where he desired to use the electricity, to have a strong positive current. A tube inserted in the steam pipe, with a valve opening inwardly, admitted air sufficient to produce a uniform condensation of the steam.

Professor Mayer also read an interesting paper on the composite nature of electrical discharges.

Professor Henry read a eulogy upon Joseph Saxton, the inventor of the magneto-electric machine, who died October 26, 1873. Mr. Saxton also invented the locomotive differential pulley; an apparatus for measuring the velocity of vessels; and a metal ruling machine, a contrivance for tracing lines on metal or glass at a minute distance from each other. Mr. Saxton returned to Philadelphia, in 1837, and during his connection with the United States Mint constructed the large standard balances still used in the annual inspection of the assays and the verification of the standard weights for all the Government assay and coining offices of the United States. Mr. Saxton's inventive powers were exercised rather for the pleasure their employment gave him than for any gain to himself. Others reaped the profit from many of his most valuable inventions. He rarely sought to bring into use his devices and discoveries. Among a great many valuable inventions, for which he never received proper credit or any pecuniary return, was that of metallic cartridges.

The meeting adjourned on November 5.

The New Western Union Building.

AS THE New Western Union Telegraph Building approaches completion telegraphers naturally feel much interest in regard to the place which is hereafter to be the business home of so many of them. It is only by a personal examination of the interior of the building that an adequate idea can be obtained of its great extent, and the amount of room which its walls comprise.

The means of reaching the several stories are provided, in addition to the usual stairs, by three large elevators, two of which are operated by steam, and the third is the new elevator, the motive power of which is furnished by water supplied from a tank in the upper part of the building.

It is not necessary at this time to enter into a detailed description of the uses to which the different stories are to be devoted. The receiving department, in which the public generally are most interested, will be in the basement story, which is reached by descending two or three steps from the sidewalk. A large and handsomely fitted up room is being made here for the use of the customers and the accommodation of the numerous persons connected with that department.

Ascending from the street, the first, second and fourth floors are being fitted up and will be rented for offices. A large number of offices will be for rent on these floors.

In the third story are located the executive offices, and from a hasty inspection of them in their present unfinished condition, it would appear as though they would be very comfortably and handsomely provided for.

The operating room, which is in the sixth story, is a very large and excellently well lighted room. All the operators, male and female, are to be located here, and the room is arranged so as to give opportunity for the manager and chief operators to see at a glance every part of the room, and every person employed at the

numerous desks and operating tables. The ventilation of the operating room will be excellent.

The Gold and Stock Telegraph Company will occupy a considerable portion of the fifth floor, and the offices of the New York Associated Press are also to be in one of the upper stories.

The building is thoroughly fireproof throughout, and will be entirely heated by steam, which, for this purpose and for working the elevators, will be generated in immense boilers located in the sub-basement of the building.

It is undoubtedly the handsomest, most extensive, and costly building ever erected for telegraphic uses in the world, and indicates the immense progress and extent of the telegraph business in this country.

It will probably require at least two or three months yet to complete the interior work on the building, and fit it up properly for occupancy by the Western Union Company and the Gold and Stock Company.

New Zealand Telegraphy.

The report of the telegraphs of New Zealand for 1873-74 show continued success and constant progress. The revenue, estimated at £45,000, exceeded that amount by £2,000.

On the 1st November, 1873, the tariff for private messages was reduced to 1s. for ten words, and 1d. for each additional word—address and signature up to ten words being transmitted free of charge. At the same time the Press rates between 8 A. M. and 5 P. M. were made one half the private rate, the charge after 5 P. M. being reduced to 6d. for the first twenty-five words and 3d. for every additional twenty-five. As the alterations in the Press rates involved an advance on the former day rates, provision was made in the new tariff to enable evening papers to receive during the day 200 words of interprovincial news at evening rates, and also to receive, on the arrival of an English or Australian mail, an additional 200 words of either or both at the same rates.

The number of Press messages sent during the year at the reduced rates exceeded those of the previous year about 50 per cent., while the cash receipts for them were nearly £600 less than the corresponding receipts of the previous year.

During the year 752,899 messages of all kinds were transmitted—an increase of 183,939, or more than 24 per cent. over 1872-73.

During the year 8,001 money order messages were sent, representing a total value of £38,052 14s. 9d.—an increase of 2,210 messages and of £9,945 18s. 1d. as compared with the previous year.

The length of line maintained was 2,530 miles, at a cost of £6 3s. 11d. per mile. During the year twelve new offices were opened.

The total earnings of the department for the year were £59,875 0s. 11d., which, deducting the cost of the Signals Department and maintenance of lines, leaves £6,026 6s. as interest upon the capital expended, £249,594 12s. 9d. This result is regarded as highly satisfactory, when it is remembered that it has been secured after reductions in the tariff, as before stated.

At the close of the year 2,530 miles of line, carrying 5,182 miles of wire, were in circuit. It is contemplated to make, during the present year, large additions to this mileage, which is rendered necessary by the increasing business of the department.

Duplex telegraphy has, through the skill and perseverance of Mr. C. Lemon, been successfully adopted, though no details of the system used have been given in the report. It is said to have saved the costly necessity of laying a second cable across Cook's Strait, and to differ, in some important details, from all arrangements for a similar purpose yet worked out in Europe or America.

Mr. Lemon has received the thanks of the Colonial Government.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Congress and the Telegraph.—Telegraph Matters in Washington.

WASHINGTON, D. C., Dec. 9.

TO THE EDITOR OF THE TELEGRAPHER.

THE second and final session of the Forty-third Congress commenced on Monday last, and attracted a very large attendance in the galleries, as well as upon the floors of the House and Senate. The members appeared to be in the best of temper and spirits, and the usual congratulations were heartily exchanged. Precisely at noon Vice-President Wilson in the Senate, and Speaker

Blaine in the House of Representatives, called their respective houses to order, and the business of the session commenced.

The reading of the annual message of the President was attentively listened to. There was an absence of any allusion to telegraph matters in it, and, of course, the columns of THE TELEGRAPHER are not the place to discuss its other features.

There seems to be very little interest felt in regard to telegraph matters in Congress, and the postal telegraph schemes are not regarded as likely to occupy much time at this session. They have met with so little popular support, and the financial results in other countries have been so unfavorable, that there is little disposition now to enter upon any such hazardous experiments here.

The only allusion or reference to telegraphs in either House thus far has been the introduction in the Senate yesterday by Mr. West, of Louisiana, of a bill providing for the construction of United States Government telegraph lines between Washington, D. C. and Boston, Mass. The bill directs the Postmaster General without delay to construct a line of telegraph from Washington to Boston, via Baltimore, Philadelphia, New York and Hartford, to be operated in the post-offices of these cities by appointees of the Postmaster General, under such regulations and such rates of tariff as he may prescribe, provided that the rates shall be uniform to all persons, with such uniform reduction to the newspaper press as may be deemed advisable, and provided the rates shall be adjusted to meet and not to exceed the expenses of operating and maintaining the said line, and providing a net income equal to five per cent. interest on the original cost of the same. The bill proposes to appropriate \$600,000 for this purpose. The Senate committees not having been appointed as yet, this, with other bills introduced, was ordered to be printed, and to lie upon the table for reference to the Post-office Committee when appointed.

The Western Union, Franklin and Automatic telegraph companies opened their offices in the capitol, and their location and personnel are about the same as at the last session.

The Western Union offices at the capitol are under the management of Mr. R. W. Bender. The office on the Senate side is in the rear of the reporters' gallery, and Mr. George L. Diven is the operator. On the House side Mr. C. K. Hambricht is operator, and the office is in the rear of the reporters' gallery. The general office of this company is in the main hall in front of the entrance to the House, with Messrs. E. C. Stewart and W. H. Young, Jr., as operators, and Mr. F. T. Avery, clerk. The Western Union Company have altogether twelve instruments in their capitol offices, which are operated by details from the main office as occasion requires. Also have a stock instrument in direct connection with New York.

The Franklin office is in the main hall near the House entrance, and Mr. T. W. Milburn is the operator. The Automatic Company also have an office in this location, with Mr. Hugh Coyle as operator.

Besides these offices there is an office of the Government Departmental Telegraph line in each wing and the main hall of the capitol. That in the Senate wing is operated by Mr. S. W. Conrad; in the main hall by Mr. W. L. Ives; and in the House wing Mr. J. F. Knapp.

In the main office of the Western Union Company here the only additions to the operating force as yet, consequent upon the reassembling of Congress, are Messrs. Del. Marean, Robert Wynne and — Henneburg—the last two from Philadelphia.

So far, I am informed, the business of the telegraph lines has not been anything like what it has been at former openings of the sessions of Congress. The special correspondents of the press are generally using the mails for the bulk of their matter. A train leaves Washington at one o'clock P. M. daily, which arrives at New York about 10 P. M., and this enables the correspondents to forward by it much of the matter which was formerly telegraphed.

The President's message (10,180 words) was sent to the Associated Press by the Western Union lines, and another copy to the Philadelphia Bulletin—the former using seven and the latter eight wires. Time of transmission, one hour for the former and about one hour and ten minutes for the latter. The message was also telegraphed over the Western Union wires to New Orleans, and dropped at several cities on the route.

The Automatic Telegraph Company have extended their line from this city to Georgetown, D. C.

CAPITOL.

Prompt Telegraphing.

TO THE EDITOR OF THE TELEGRAPHER.

WITHOUT any special effort the following was done on the Great Western to-day, Dec. 1st:

At 11:53 A. M. I received a message from Pontiac, Ill., from L. E. K. to C. and M., Joliet, requesting a bid on two cars of new corn. This was taken one block and a half, where one of the firm was met. He came

back to the telegraph office, and at 11:56 A. M. a message had been written by him and O. K. by "Ex." Chicago. At 12:04 P. M. answer came back from Chicago, and at 12:08 P. M. the bid was made to M. K. at Pontiac.

The transmission of the four messages (two of which required delivery) occupied fifteen minutes.

The correspondent at "Ex." was J. P. Cogwin, and at Joliet, Frank Marsh, formerly an operator, now junior partner of the firm of Carpenter & Marsh. S.

Telegraphs and Telegraphers in Chicago.—The Quadruplex, etc.

CHICAGO, Dec. 7th.

TO THE EDITOR OF THE TELEGRAPHER.

ALTHOUGH telegraph business is a little lighter than usual at this season of the year, still the two leading telegraph companies here seem to be doing a good business, working their several forces to their full capacity. The A. and P., under the efficient management of supt. and manager Towler, is daily reaching out and gaining a firmer foothold with the business public.

It is rumored that they (the A. and P. Co. here) sustained quite a loss recently, by their cashier and delivery clerk decamping short twelve or thirteen hundred dollars.

I have good reason to believe this report is well founded, and it is only out of respect for their relatives, who are honorably connected, that I withhold the names of these two young men. Their course has been rather checkered lately, and they must mend their ways mighty fast or they can't expect to "train" with the Chicago boys much longer. We like fun and generosity but no dishonesty.

Despite the large amount of telegraphing done by the A. and P., the Western Union still seem to have lost none of their immense custom, which fact clearly demonstrates that there is business enough for two companies, if rightly managed.

The Great Western Company seems to be on its last legs—no signs of life or business activity around their headquarters. Mr. A. H. Bliss has resigned the general superintendency, which looks very much as if the company was "about played out." An old and well known telegrapher by the name of Knapp has accepted the superintendency.

Mr. Gerritt Smith, assistant electrician of the Western Union Telegraph Company at N. Y., was in town last week, having something to do in connection with the Quadruplex.

Mr. Sam Wallace, who came here recently from Cincinnati, is making hosts of friends, and is in every sense of the word a first class telegrapher, and more—"a gentleman."

Among the rising young telegraphers of our city is Mr. Patsy Tracy, who learned the art in your city at 145 Broadway. He came here from Omaha. He is destined to be one of the finest telegraphers in the country.

Mr. Halligan, of the W. U. office here, who was promoted from "check boy" about nine months ago, bids fair to rank foremost in the profession.

Mr. Hazleton, of the W. U., who came here lately from Peoria, and Mr. Minor C. Gross, of the A. and P., by their gentlemanly deportment and fine talent, are becoming very popular among the fraternity.

Mr. Warner, the inventor of the Warner Relay, has lately been taking unto himself a wife. I was not able to learn the name of the lady.

Charley Robinson, one of the old timers, can be found on the W. U. night staff here.

A week ago to-day Messrs. Jones, electrician, and Plum, chief operator of the W. U. office, finished setting up the quadruplex in the W. U. office here, and began making tests with it. About 4 P. M. Messrs. Plum and Richardson sat down to the receiving side, and French and Drandorf to the sending side, when it worked splendidly to Buffalo. The same evening, I am told, actual business was done—night manager Maynard and Mr. Burton sending, while Messrs. Pettit and Strong worked the receiving side. It worked for about five minutes nicely; after this time, up to Dec. 4th, the tests were very unsatisfactory. Mr. Gerritt Smith, of New York, and Mr. F. W. Jones, of Chicago, worked assiduously to overcome the difficulties manifested at the various tests, and late in the afternoon of the 4th a balance was struck, and Messrs. French and Hurd, on the sending sides, and Bale and McCreesh on the receiving sides, done about sixty messages, taken promiscuously out of the business of the day, in fifteen minutes. In the evening of the same day it was worked continuously from 9 until 12 P. M., and the business of nearly four Morse wires, worked up to an ordinary capacity, was transacted; Messrs. Root and Whitford sending and Stone and Francis receiving. Those having the matter in charge consider it a success.

The 4th night, with propriety, be called a gala day in the W. U. office here, as, besides the successful working of the quadruplex, they were honored by Kalakaua, King of Hawaii, talking from San Francisco

through the office here with President Grant and Secretary Fish at Washington, D. C.

It was quite amusing, I am told, to see the long faces and hear the pitiful excuses poured into manager Maynard's ears a few nights ago by the night men on the W. U. night force who thought they were late. The joke was played on them by the Howard electrical clocks in the office, all of which, about 5 P. M., took a jump of about seven minutes. A great many of the electricians in this section consider the Howard clock, as at present constructed, very unreliable. It seems to work on the principle that it is one minute only past any given time until it is five minutes past. When the hands do move they move two minutes at a time. The New York electrical clock seems to be more favorably thought of, as it shows a second hand on its face and keeps accurate time to the second.

OCCASIONAL.

The Pursuit of Pleasure Under Difficulties.

WISCONSIN, Dec. 2.

TO THE EDITOR OF THE TELEGRAPHER.

THE following experience of a telegrapher in the pursuit of pleasure under difficulties may interest some of your readers:

At 8:30 o'clock P. M. five gentlemen met at the rooms of one of our party (of whom the writer was one), for the purpose of going to a country sociable, a few miles from the city, as had been arranged between the ladies and ourselves. When ready to go for our conveyance, which, by the way, was to be an omnibus, we found that two of the proposed party, a gentleman and lady, had calculated to remain at home and have a little private sociable of their own. Probably some of your readers know by personal experience the pleasures of a private sociable of that kind, and those who do not would do well to come here and learn.

Well, now that our party consisted of but four couples, we concluded to take two double carriages instead of the 'bus. Accordingly, we hurry off to the livery stable to make the change, as it involved no additional expense. Arrived at the stable we find the horses hitched to the 'bus, ready to start, and hold another consultation as to whether we shall put the proprietor to the trouble of disconnecting the horses from the 'bus, and fix up two separate carriages for us. We finally decided (as it proved a painful mistake) to take the 'bus, as we could have a much jollier time, as we supposed, by all going together in one conveyance. At 9 o'clock P. M. we four gentlemen pile into the 'bus, and proceed to collect the ladies of the party from their several abodes, and by the time all are gathered in, and we are fairly on our way to the scene of our proposed festivities, another half hour is gone, and the windows of our vehicle are fast getting loosened, and rattling away at the rate of fifty words (I should guess) to the minute, with nary a space.

Have any of the readers of THE TELEGRAPHER ever rode in an omnibus over a rough country road? If so then they can perhaps sympathize with us. Those who have not can get a faint idea of the tremendous din those windows were making by putting a few hundred tin cans into a large box and shaking them up pretty lively; and then imagine us trying to entertain the ladies amidst the noise! Oh! how I sighed for an ear trumpet and a speaking trumpet. But, unfortunately, the noise was not the worst that we had to endure on this memorable excursion. It was the road. Oh, that road! It makes me sympathetically caress my sitting down place even now when I think of it. It was up hill and down, out of one rut and into another, until I thought I should certainly need a half sole on my stern by the time we got out of that 'bus. And, oh, our poor fingers! I say our because the young men all asked me if my fingers were as sore as theirs, and they were, I think, if anything, a little more so. Does the reader ask what made our fingers sore? It was digging them into the cushions of the seat to keep from sliding off when crossing those execrable ruts. When we could not conveniently get hold of the cushions we did the next best thing—that is, caught hold of the ladies. They, however, did not take kindly to that, and we could not make them believe that it was to help hold them from sliding off the seats, so after a few attempts we had to abandon that attempt.

Finally, we got to our destination, and had a very pleasant time, and with a repetition of our former experience ultimately reached home again; and all tried to think that we had enjoyed ourselves very much, but for the next few days I could not use my fingers with much comfort, and, in fact, every time I sat down for a week afterward was painfully reminded of my ride in a 'bus to the sociable in the country.

The driver informed me next day that he found a couple dozen of hair pins and four newspapers in the 'bus, one of which was THE TELEGRAPHER. How they got there I will not endeavor to conjecture, but they certainly were not in the omnibus when we started from the livery stable.

OWTON A. FOUL.

Coil for the Sine Galvanometer.

TO THE EDITOR OF THE TELEGRAPHER.

In order to render the needle of the Sine Galvanometer more easy to balance I construct a narrow coil in the shape of an elongated ellipse, its least diameter being a little more than the length of the needle, and its greater diameter about three times the length of the needle. The accompanying figure shows a coil and

needle of about these proportions. The object of the arrangement is to consolidate the magnetic field of the coil so that the needle will swing nearly out of its influence at each oscillation. No part of the coil has any influence on the needle except the parts directly opposite the ends of the needle, the other parts being too distant.

R. J. HEWETT.

Osage City, Mo., Nov. 24th, 1874.

Mr. Bear on Verbal Jugglery.

MITCHELL, IOWA, Nov. 12.

TO THE EDITOR OF THE TELEGRAPHER.

"Mr. BEAR now explains that he was mistaken in stating that 'two like currents pass each other on same line in opposite directions,' and says he 'should have said two unlike currents, or omitted the word like, and that his reason for using the word was because like poles or plates of batteries are connected to line at ends. It would now be in order for him to 'rise and explain' how like poles can produce unlike currents!"—*Journal of the Telegraph.*

Again I am mistaken! Now, what shall I say—neutral? Does he mean that a current flows from zinc plate of battery direct to lines, or from both end plates of a battery to line?

In my last published diagram, now under discussion, similar plates are not connected to line at same end. Then, if a current flows to line from one battery, will not also a current flow to line from a similar plate of the other battery at the other end of line, if each has a ground wire at the opposite end of line by which to pass to earth.

If "like" and "unlike" both are wrong, then I'm done on this point, having learned the new axiom that two currents are neither alike nor unlike! Or has there lately been a third kind of a current incubated in the *Journal* laboratory? If so, then we may with propriety call it a *neuter gender electrical equine!* No wonder they have a four horse team.

How many kinds of electrical currents?—Answer. Three: positive, negative and neuter.—*Journal Text-book.*

I have never yet found a battery with practically two currents, but I have found that with two batteries connected to the same wire, the two currents could be passed in opposite directions, and I considered them as *relatively* positive and negative.

Perhaps the readers of the *Journal* are satisfied with only one side of its discussion with one who was so unworthy as to be editorially kicked out of its columns. I had hoped to meet it with line for line, but with its three kinds of battery currents no wonder it mixes things equal to a country pettifogger, and goes for me "in a way that is childlike and bland!"

Now, if this is not enough, I may have occasion to call attention to the file of the *Journal* for 1869, in which that eminent electrician, Mr. George B. Prescott, advocated strongly the principle of two non-interfering currents on the same wire.

BEAR.

A "Little" Too Much.

TO THE EDITOR OF THE TELEGRAPHER.

I DO not wish to find fault with the management of THE TELEGRAPHER, in fact its general management and conduct is perfectly satisfactory, but on behalf of your numerous readers I submit to you whether you are not giving us just a little too much of Mr. George Little, C. E. Understand me, that I am not criticising Mr. Little's Automatic Telegraph System, which I am perfectly willing to concede is the perfection of all telegraphy, but it does seem to me that unless Mr. Little can give us some new ideas that it would be more becoming in him, and certainly more interesting to the larger part of your readers to occupy your columns less frequently. For one, and many others have made similar remarks, I am not intensely delighted or interested in the list of his various patents, of which he informs us

he has a remarkably large number, or the repetitions in different communications and "original articles" of their claims. All that may do very well for two or three times, but it is getting monotonous, and, as the boys say, do "give us a rest."

Mr. Little seems to be in a perfect state of combativeness towards a party named Edison, and whenever E. projects his unfortunate cranium Little seems desirous of mashing it with a (literary) club. Now, I have no sympathy with Edison—in fact, from what I have heard in regard to him, and from what has appeared editorially in THE TELEGRAPHER, I think his moral and telegraphic turpitude must be conceded, but why harass our feelings with duplex reviews and refutations of statements and assertions of which otherwise we should never hear? Would it not be better for Little and Edison to meet in some retired spot and physically or scientifically annihilate each other? At any rate such a disposition would relieve the public from participation in their difficulties.

The communications of another correspondent of THE TELEGRAPHER, Mr. D. H. Craig, are much more lively reading, and if we must regard him as rather extravagant in his claims and assertions, he manages to make them more readable and interesting. In common with many others, I have been greatly attracted to that "ten year old child" who performs such remarkable telegraphic feats, and hope he (or she) is well and making progress. I have no animosity towards that child, although threatened with superseding my telegraphic functions by such "cheap labor." I notice, however, that Mr. Little disavows the paternity of the "ten year old," and goes in for skilled talent and good pay in telegraphy. In that, at least, his head is level.

Well, I had better wind up this epistle or your other readers (of course I regard my own literary productions with complacency) will consider me as a great bore also, and will eventually desire a rest, too, from

A COUNTRY PLUG.

A Remarkable Occurrence.—A Night Operator on C. P. R. R., of California, Promoted to an Agency.

CALIFORNIA, Nov. 26.

TO THE EDITOR OF THE TELEGRAPHER:

MR. ALFRED CLARKE, night operator at Cisco, C. P. R. R., Sacramento Division, has been promoted to station agent at Summit, same division. The promotion of a night operator to an agency on this division is a very remarkable occurrence, and deserves mention.

T. E. LEGRAPH.

Miscellaneous.

TIME BY TELEGRAPH.—The telegraphic apparatus at the Naval Observatory at Washington is now connected with the main lines of the Western Union Telegraph Company, so that not only is the time ball dropped daily at noon, but the same signal is widely distributed by the telegraph company. It goes directly from the Observatory to the main office in New York city, and thence it is sent to nearly every State in the Union. The immediate object of these signals is to furnish accurate and uniform time to the railroads, and throughout the whole vast territory in question there is scarcely a train whose movements are not regulated by the Observatory clocks. The clocks at the Navy Department, at the Army Signal Office, at the Treasury Department, and at the Western Union Telegraph Company's offices, are all directly controlled by electric currents sent every second by the standard clock of the Observatory.

A NEW FORM OF ELECTRO-MAGNET.—A contributor to the *English Mechanic* thus describes an electro-magnet constructed upon a novel plan and possessing a power far greater than those of the ordinary type:

"First, I took a number of pieces of iron wire, 16 gauge and 12 in. long, and commencing half an inch from the end, I wound fine silk-covered wire (as used for the secondary in coils) for 2½ in. down, then gave two or three long turns, carrying the wire to within 3 in. of the other end, and wound that in the same manner as the first, and leaving long ends of the fine wire for subsequent attachment. The covered wire was then dipped in a spirit varnish and put aside to dry. When I had covered a number of these I bent them up into the form of a horse-shoe magnet, and put round them a number of pieces of similar wire, but uncovered, so that I had a horse-shoe magnet much resembling the bundle of wire in the core of a 'coil.' The whole lot were then wound with eight coils of 16 gauge covered wire in the usual manner, and all the ends of the fine wires soldered to the outside copper wire. The result quite surprised me, and no doubt will be of some use to those who do not mind a little trouble for the sake of a superior article.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, DECEMBER 12, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

EXTRA INDUCEMENTS TO OBTAIN SUBSCRIPTIONS FOR THE TELEGRAPHER.

It has been customary, at this season of the year, to offer PREMIUMS to those who may be willing to make special exertions to procure additions to the SUBSCRIPTION LIST OF THE TELEGRAPHER. In pursuance of this custom, the following

LIBERAL LIST OF PREMIUMS,

which it is believed will prove satisfactory to the friends of the paper, has been prepared, and we have no doubt will meet with the same general favor and acceptance as previous similar offers have done.

THE TELEGRAPHER is the only generally recognized and established representative of the

TELEGRAPHIC FRATERNITY

in the United States and the Dominion of Canada, and, as such, has long enjoyed the confidence and approval of the great body of the telegraphers. Every effort has been and will be made to not only maintain but increase its

VALUE AND EFFICIENCY.

It is no ephemeral publication, but is a successful and firmly established journal, as is demonstrated by the fact that it has regularly appeared for

MORE THAN TEN YEARS,

having been enlarged from time to time, as its increasing patronage has warranted.

It is hoped that, recognizing the value and importance of the paper, the telegraphers generally will renew their efforts to immediately and largely

INCREASE ITS CIRCULATION.

To give everybody a chance to

PARTICIPATE IN THE PREMIUMS

the following offer is made:

FOR TWENTY SUBSCRIPTIONS,

to the person forwarding the names and money a No. 1 TELEGRAPH SOUNDER, or NOAD'S STUDENT'S TEXT-BOOK and CLARK ON ELECTRICAL MEASUREMENT, or any other Electrical or Telegraphic works of equal value.

FOR FIFTEEN SUBSCRIPTIONS,

THE FAIRY ELECTRIC ENGINE, or a set of F. L. POPE & Co.'s popular NONPAREIL TELEGRAPH APPARATUS.

FOR TEN SUBSCRIPTIONS,

an elegant Gold TELEGRAPHER'S BADGE PIN.

FOR SIX SUBSCRIPTIONS,

a No. 3 TELEGRAPH KEY; new and elegant pattern.

FOR FOUR SUBSCRIPTIONS,

a copy of THE TELEGRAPHER one year, or F. L. POPE'S MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

FOR TWO SUBSCRIPTIONS,

one of the new and popular SNAPPER SOUNDERS, introduced by Mr. R. W. POPE, with a HARD RUBBER KNOB.

For the Books offered above any other work or works of equal value will be sent if desired.

Subscriptions must be for ONE YEAR, or its equivalent in shorter subscriptions, and at the regular price of

TWO DOLLARS PER YEAR,

with twenty cents additional for postage on Canada subscriptions. Remittances may be made by P. O. Order or Registered Letter, at the risk of the Publisher, and the expense of the order or registration deducted from the amount forwarded.

Those who send subscriptions for premiums should state that fact.

Subscriptions may be sent in as obtained, and more names added from time to time, and the Premium claimed for the whole number when desired.

All letters and remittances must be addressed and made payable to

J. N. ASHLEY,

P. O. Box, 5503.

Publisher.

Special Notice.

FROM and after January 1st, 1875, the United States postage on THE TELEGRAPHER will be prepaid by the publisher. Notwithstanding the additional expense the price of subscription will remain as heretofore, Two Dollars per annum, payable in advance.

Hereafter it will not be necessary for subscribers in the British North American Provinces to remit the additional twenty cents heretofore required for the prepayment of the United States postage.

Send in the Subscriptions.

IN order that there may be no delay in forwarding subscriptions to THE TELEGRAPHER, until the commencement of the new volume, we have decided to renew our liberal offer of last year. Any subscriptions or renewals of subscriptions received, will be commenced with the first number of Vol. XI, which will appear January 2, 1875—the remaining numbers of the present volume being furnished to such subscribers gratis. This liberal proposition, in addition to the prepayment of postage from the commencement of the New Year, will no doubt insure speedily large additions to our present subscription list.

Indications of Renewed Prosperity to Telegraphic Interests.

THE causes which have led to the very general suspension of telegraphic construction and extension during the past year are, of course, mostly of a temporary character. With their removal or cessation there will be a return of activity in this as in other branches of business. We anticipate this will be partially the experience of the next year. There will, without doubt, be much more new telegraph lines constructed in 1875 than there has been in 1874.

One great obstacle to telegraphic progress has, we think, been pretty effectually disposed of for some years to come. The danger of Government confiscation of telegraph property, if it ever had any real existence, is probably over. The people have manifested no approval of the projects for Government control or ownership of the telegraphs of the country, and the Treasury is in no condition to warrant any hazardous experiments in that direction. It is, therefore, hardly probable that even Mr. GARDINER HUBBARD will be able to reopen this winter the HUBBARD and ORTON debating society, as heretofore.

The financial depression succeeding the panic of the fall of '73 completed the work which the protracted and sometimes threatening discussion and pressure of the postal telegraph policy had commenced, and, probably, a less amount of new telegraph line has been constructed in the United States during the present year than in any previous year for a long time. It has been almost impossible to obtain money for new enterprises, and those companies already in operation wisely suspended progress for the time. The Western Union Company having decided to adopt the policy of paying dividends, which had been so long suspended, was necessitated to husband its resources for that purpose, and, therefore, has done little more than to keep the existing lines in operation. Of course it cannot continue this policy; extensive as are its lines, and the territory they cover, they must be supplemented and increased by other wires over new routes and territories, and additional wires on routes already covered.

As is elsewhere noted, the Atlantic and Pacific Telegraph Company is preparing for a fresh and vigorous start in the spring, and has quite an extensive programme of extensions under consideration. Other companies will also extend to a greater or less extent, so that we believe that the aggregate of construction, additions and reconstruction, for the next year, will aggregate a very respectable amount.

It is true that the business depression and stagnation is not yet passed, and that its effects must continue for some time to come. But the outlook for the future is encouraging, and when the winter is over we believe that there will be a considerable revival of general business. It is not to be expected that the seeming prosperity and intense speculative activity which was so rudely checked by the panic of '73, will be renewed during the coming year, but we believe that there will be a gradual and healthy revival of business, which in turn will warrant and demand an increase of telegraphic facilities.

The efforts to transfer the Atlantic and Pacific lines to Western Union control having been checkmated, the prospect is that the competition between the companies and their allies on each side will be very active in the future; and if this shall be conducted with reasonable regard to the interests of the stockholders and of the employes, it will no doubt prove beneficial. Fair and honorable competition for the telegraph business of the country is to be desired, but experience has shown that the cut-throat policy is not ultimately advantageous to anybody.

In view of all the circumstances and conditions, present and prospective, we think it may be safely concluded that the worst is about over, and that the telegraphs of the country are about to enter upon a season of renewed activity and prosperity. If in this we are correct it will indeed be pleasant information to many who have found their occupation and emoluments restricted, and sometimes entirely taken away from them during the past year. It is a promise of remunerative employment for line builders and manufacturers of telegraph material, apparatus and instruments, and of a greater demand for telegraphic service, which shall take up some of the surplus telegraphic labor now seeking employment or drifting temporarily or permanently into other occupations. It is furthermore an unmistakable indication of the returning and reviving prosperity of the country.

We must not, however, jump to the conclusion that all this is to be immediately realized. The winter months must be gone through with, and they are likely to prove hard and trying ones to telegraphers as well as to others. Telegraphic labor is in excess of the demand, and those who have situations will do well to stick to them, if possible, until there is a certainty of bettering their condition. Those who have employment must aid, as far as possible, those who have neither employment or money. We must help one another to bear the burdens of the day, and look forward hopefully to the good time which is coming, it is to be trusted, in the now not very distant future.

Not Exactly the Fair Thing.

Our attention has been called to what purports to be a reprint in the *Toronto Globe*, of Nov. 24th, of an editorial article from THE TELEGRAPHER of Nov. 7th, on "Excellent and Successful Telegraphic Management and its Result." In this article, as it appears in the *Globe*, the following paragraph is omitted, which refers to the competition which the Montreal Telegraph Company has had to encounter:

"During its existence several competing telegraph companies have been organized, and the Dominion Telegraph Company, now in successful operation, is by no means a competitor to be despised, and is pursuing, under its present management, a policy similar to that of the Montreal Company, and with satisfactory results. The Dominion Company is yearly extending its lines, and the season now closing will have added 700 miles of line to that which it previously had. This company is also paying dividends regularly to its stockholders—that for last year, and we believe for the year previous, having been at the rate of 5 per cent. In fact, telegraphic enterprises that do not pay dividends are not much in favor with our Canadian friends."

In the next paragraph, the word "those" is altered to "that," which is required to make sense after omitting the previous paragraphs, but which materially alters

additional lines on some routes should be undertaken, and the wires on existing routes should be increased, which will involve the expenditure of a considerable amount of money, the Trustees deem it the best policy to provide for this expenditure by the issue of the reserved stock of the company rather than by incurring indebtedness, as would otherwise be unavoidable.

Foreign Telegraphic Notes.

On Tuesday, Nov. 17th, the steamer Norseman, belonging to the Western and Brazil Telegraph Company (Limited), left the Thames with the shore end portion of the cable to be laid, in the interest of the Central American Telegraph Company (Limited), between Demerara and Cayenne, the remainder of the section following shortly in the steamship Hooper.

In his speech to the Legislative Council of Western Australia, the construction of a telegraph line to South Australia was recommended by the Governor.

A SHORT time ago it was announced that the British Post-office was about to introduce a new and smaller form for telegraphic messages, and that the saving thereby secured would be somewhere about £30,000 a year. The improved form is exactly half the size of that hitherto in use, but no diminution of public convenience will result from its introduction, for the same number of writing spaces has been provided, the economy in size being gained by the compression of certain official particulars relating to the preamble of the message, and the transfer of the general instructions from the front to the back of the form.

Telegraphic and Electrical Brevities.

In his Annual Report the Secretary of War states that the line of military telegraph from San Diego, Cal., to Prescott and Tucson, Arizona, provided for by the Act of 1873, which appropriated, upon an estimate of this department, \$50,311 80 for its construction, was built by labor of troops, using the means of transportation of the Quartermaster's Department. The line is 540 miles long, and cost \$45,000. The balance of the appropriation remains unexpended. As a surplus of wire remained unused on the completion of the line, it was used to extend the telegraph to Camp Verde. By this line, cheaply constructed, the principal posts in Arizona are placed in immediate communication with each other and with the headquarters of the Department of Arizona, of the Military division of the Pacific, at San Francisco, and with the War Department.

The new telegraph through Staten Island, New York, is rapidly approaching completion, and will soon be in operation, with offices at the various ferry landings, and an intermediate one at the County Clerk's office in Richmond.

The Highest Telegraph Station in the World.

THE Western Union Telegraph Company opened offices at Denver, December 7th, at Fair Play and Alma, Colorado. The latter place is supposed to be the highest regular telegraph station in the world, being ten thousand five hundred feet above the level of the sea.

Death of Ezra Cornell.

MR. EZRA CORNELL, whose name is indissolubly connected with the introduction of the magnetic telegraph in this country, died on Wednesday last, Dec. 9th, at Ithaca, N. Y., after a brief illness.

The following brief obituary is from the New York Commercial Advertiser:

Ezra Cornell was born at Westchester Landing, Westchester County, January 11, 1807, of Quaker parentage. His father was a potter, and young Ezra assisted him at Tarrytown, and afterwards in Madison county, where they removed in 1819. The advantages of early education then were small, but the boy made the most of them. In 1826 he left home to work for himself, and found employment at Homer, but removed to Ithaca in 1828, where he worked in the machine shop of a cotton factory at eight dollars per month and his board. He worked alternately at agricultural and mill work until 1842, when he became interested with F. O. J. Smith and Professor Morse in telegraphic enterprises. He was appointed Assistant Superintendent of the line between Baltimore and Washington, and first suggested the substitution of poles for the pipe that was originally intended. In 1845 the line was extended to New York City, and Mr. Cornell was put in charge, and in the same year he superintended the construction of a line of telegraph from New York to Philadelphia. In 1846 he constructed a line to Albany, and another in the year following from Troy to Montreal. By these operations he made money, and having faith in the telegraph he invested it largely in stock, and so reaped a fortune. Honors came to him also. In 1863 he was a member of the Assembly, and in 1864-5 a State Sen-

ator. But the crowning glory of Mr. Cornell's life is the University that bears his name. He endowed the college with the munificent gift of \$760,000, and also took upon his own shoulders the location and sale of the agricultural land scrip with such success that the ultimate endowment from this source will probably reach \$2,000,000. Ithaca owes to him a public library with an endowment of \$50,000. Ezra Cornell's life was not only busy and honorable, but most useful to his fellow men. He has left such an example of a noble life as best illustrates the genius of our free institutions.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended November 17, 1874, and bearing that date. 156,843.—DUPLEX CHEMICAL TELEGRAPHS. Thos. A. Edison Newark, N. J., assignor to himself and Geo. Harrington, Washington, D. C. Filed March 13, 1873.

Two opposing batteries constantly in circuit through receiving instrument, when not transmitting, neutralize each other. When transmitting one is short circuited by transmitter, leaving other to neutralize outgoing main current in home receiving instrument.

The local batteries u and v or w and x in a shunt from the main line and opposing each other, and a connection between them to the transmitting or receiving instrument, in combination with the main batteries, resistances and circuits, arranged substantially as and for the purposes set forth.

Died.

MCCONNELL.—At Marshalltown, Iowa, Dec. 3d, 1874, of consumption, HARRISON MCCONNELL, late operator Cedar Rapids, Iowa, office, aged 26 years.

A CARD.

THE METALLIC GALVANIC BATTERY.

A NOTICE having been extensively published and circulated announcing the appointment by Edwin Eagles of another firm as sole agents for the manufacture and sale of the Metallic (or Lead) Galvanic Battery, known to the trade as the "Eagles Metallic Galvanic Battery," and enjoining all other parties from manufacturing or selling the battery, we take this method of informing the public of our position and rights in regard to said battery.

At the time the notice referred to was prepared and published it was well known to Eagles, as well as to us, that his application for a patent on the battery had been rejected more than a year previous, on the ground that the applicant was not the original inventor.

The original inventor of the battery now has an application pending in the Patent Office for a patent on his invention, which we have no doubt will be granted, and which, when issued, will be controlled by us.

In any case the notice is preposterous, as in no event can a valid patent possibly be issued to any other than the original inventor.

We continue and shall continue to manufacture and sell said Metallic Galvanic Battery, and parties purchasing of us will be fully protected in their right to sell and use the same.

Those who may purchase this battery manufactured by other parties not authorized by us, will be, after the issue of the patent, legally liable to pay royalty to us on battery so purchased from or made by unauthorized parties.

The Metallic (Lead) Galvanic Battery may be had of us, or from Messrs. L. G. TILLOTSON & Co., who are our agents for its sale, at our prices, and who will guarantee against infringement in any battery that they sell.

F. L. POPE & CO.,

New York, Dec. 9, 1874.

38 Vesey Street.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS of every description, at

No. 54 SOUTH FOURTH STREET,

(Corner Chestnut street,)

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

ECONOMIZE!

Procure the best and cheapest Telegraph and Electrical Instruments and supplies of all kinds from,

LANNERT & DECKER, 31 1/2 Prospect St., Cleveland, O. Send for circular.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET;

or to

L. G. TILLOTSON & CO.,

8 Dey street, sole Agents.

AMERICAN COMPOUND TELEGRAPH LINE WIRE.

COPPER FOR CONDUCTIVITY.—STEEL FOR STRENGTH.

The superiority of the COMPOUND TELEGRAPH WIRE compared with Iron, consists in its LIGHTNESS, relative TENSILE STRENGTH, CONDUCTIVITY DURABILITY, EFFICIENCY and RELIABILITY.

Address, American Compound Telegraph Wire Co.

ALANSON CARY, Treasurer,

No. 234 West 29th St.,

New York.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY

40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required, Liberal commissions will be paid upon any orders that may be secured for us. Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON,

CORNELIUS ROOSEVELT,

Secretary and Treasurer,

President.

 CINCINNATI, O., ST. LOUIS, MO.,
 Elm St., cor. 5th. 409 North Third St.

Manufacturers and Dealers in
TELEGRAPH INSTRUMENTS AND SUPPLIES,

RELAYS, unequalled for beauty and strength;
 COMBINATION SETS; BOX and POCKET RELAYS.

CHALLENGE, PONY and REPEATING SOUNDERS.

KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.

REGISTERS, with SPRINGS or WEIGHT.

OUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.

REPEATERS—HASKIN'S AUTOMATIC, and others,

SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.

ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.

ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.

BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.

INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON. BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANIFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

SOMETHING NEW!

[PATENTED SEPT. 29, 1874.]

THE FAIRY ELECTRIC ENGINE.

A perfect working model of an engine

Run by Electricity!

It will work well with an ordinary local battery.

Price, with two cells Eagles' Metallic Battery.....\$6 00
 " without Battery..... 4 00

May be seen working at the office of the THE TELEGRAPHER.

For sale by

The Electro-Magnetic Manufacturing Company,

36 BROAD STREET, NEW YORK.

P. O. Box 1804.

Also for sale by

L. G. TILLOTSON & CO., 8 Dey street.

F. L. POPE & CO., 38 Vesey street.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2. Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERs made.

Our CATALOGUE, embracing a large amount of new matter, and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,

AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,

FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,

 41 THIRD AVENUE,
 Chicago, Ill.

MANUFACTORY OF THE SPENCEREAN STEEL PENS, BIRMINGHAM, ENGLAND.

SPENCEREAN DOUBLE ELASTIC STEEL PENS.

The superiority and excellence of these justly celebrated Pens are appreciated, as is shown in their constantly increasing sale. They are comprised in fifteen numbers, of which one number alone has an annual sale of more than 5,000,000.

The SPENCEREAN PENS are manufactured of the very best material by the most expert workmen in Europe, and are famous for their elasticity, durability and evenness of point.

THE SPENCEREAN PENS ARE FOR SALE BY ALL DEALERS.

We make Fifteen Numbers of Pens, differing in flexibility and fineness of point, adapted to every style of writing, as follows:

- No. 1. COLLEGE PEN. *Point Fine; Action Perfect.* This is a great favorite with our leading penmen, is largely used in the Schools and Commercial Colleges throughout the country, and gives better satisfaction than any Pen before the American Public.
- No. 2. COUNTING-HOUSE PEN. *Point Fine and Flexible,* well adapted to the use of Correspondents and Accountants.
- No. 3. COMMERCIAL PEN. *Point Medium.* An Easy Writing Business Pen.
- No. 4. LADIES' EXTRA PEN. *Point Extra Fine and Flexible.* For Delicate Fino Hand Writing this is a very superior Pen.
- No. 5. SCHOOL PEN. *Point Fine, Medium in Flexibility.* For a durable School Pen it has never been equalled.
- No. 6. FLOURISHING PEN. *Point Long, Flexible and Medium in Fineness.* For Off-hand Flourishing.
- No. 7. QUILL PEN. *Point Medium, Quill Action.* A smooth, Easy Writing Pen. Its name well represents its qualities.
- No. 8. CONGRESS PEN. (New.) *Medium Flexible Point.* A very superior Pen for all styles of writing. This Pen undergoes a process that renders it non-corrosive and three times more durable than any ordinary Steel Pen.
- No. 9. BANK PEN. *Point Long and Flexible.* A great favorite with Accountants, Tellers, etc.
- No. 10. CUSTOM-HOUSE PEN. *Point Medium.* Well adapted to all styles of Bold Free Hand Writing.
- No. 11. UNIVERSITY PEN. *Point Medium, very Smooth and Flexible.* The action of this celebrated Pen is very fine.
- No. 12. EPISTOLAIRE PEN. *Point very Fine and very Flexible.* This is the finest Pointed Pen made, and, for very Delicate Writing, Map and Fine Pen Drawing, it has no equal.
- No. 13. ENGRASSING PEN. *Point Blunt and Smooth.* Particularly adapted to Coarse Hand Writing and Engrassing.
- No. 14. ARTISTIC PEN. *Flexible, with extra fine point.* This Exquisite and Truly Celebrated Pen is the Best Pen extant for Fine Ornamental Writing.
- No. 15. THE QUEEN. *Point extra fine.* Admirably adapted to all kinds of Fino Writing.

Sample Cards containing all the FIFTEEN Numbers, securely inclosed, will be sent by mail on receipt of 25 cents.

WILSON, BLAKEMAN, TAYLOR & CO.,
 138 & 140 Grand street, N. Y.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,

PATENTED APRIL 8, 1873,

L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be

FAR SUPERIOR TO ALL OTHERS

for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY

AT THE

CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without ANY ATTENTION whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,

and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market. Send for Circular.

EUGENE F. PHILLIPS,

20 CONDUIT STREET,

PROVIDENCE, R. I.,

Manufacturer of

Patent Finished Insulated Wire, Patent Rubber Covered Wire, Magnet Wire, Patent Electric Cordage, Cables, etc.

I claim to furnish the best Braided Wire in the Market, and I believe it is acknowledged as such by all large Telegraph Companies and Telegraph Supply Dealers.

My Wires were awarded the first premium at the Cincinnati Exposition of 1874, both for best "Office" and best "Insulated Line Wires."

These Wires are furnished in any desirable color or plaids.

My Rubber Covered Wire will not crack, and is not affected by ordinary extremes of heat or cold. The rubber covering is of uniform thickness, and the wire will be found in the exact centre—a result not heretofore produced.

I also make cables of any number of conductors at the regular price for a single wire.

With new and improved machinery I feel satisfied that I can furnish magnet Wires as good as any to be found in the market.

All Wire used by me is made to my special order, and is the best that can be procured in the market.

I could give a long list of testimonials, but depend on the merits of the Wire for patronage.

Please send for sample card and price list.

These Wires can be had at my prices of

FLEXIBLE CORDS, all kinds, &c., &c.

We warrant all Wire to be of the highest conductivity, tested by our Galvanometer, which compares with the tests of the highest authority in this country.

TILLOTSON'S EXCELSIOR TELEGRAPH INSTRUMENT.

(PATENTED JUNE 24, 1873.)

This apparatus is constructed of the best material, and finished equal to any Telegraph Instrument, and is warranted first class in every particular. It is especially adapted to the requirements of Students of Telegraphy and the operation of Private Telegraph Lines.

- Price, complete, Sounder and Key mounted on finely finished Mahogany Base, with one Cell Hill's Patent Battery, with Chemicals, eight feet of Office Wire, and "Smith's Manual of Telegraphy"..... \$7 50
- Two sets..... 14 50
- Price of Sounder and Key only..... 6 50
- Arrester attached..... 7 50

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,
ONLY MANUFACTURER
OF
PURE GUTTA PERCHA GOODS
IN THE
UNITED STATES.

Has also on hand, and makes to order,
SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR
TELEGRAPH, UNDERGROUND AND ELECTRIC USE.
Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for
MAGNET AND OFFICE USE,
of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order
SUBMARINE CABLES, INSULATED WIRES, for
TELEGRAPH AND ELECTRIC USE,
AND FOR
BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing
SUBMARINE TELEGRAPH CABLES,
to make and deliver at his Factory any style of Cable. Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO.,
8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,
has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

VOL. X. WHOLE No. 440.

Original Article.

How an Electrician got a first class Lightning Rod cheap.

ANY of our readers who may have happened to be going to or from Hudson Bay, by way of Kichago and Wilmaukee, have doubtless noticed the pretty little village of Lowood, which, attracts the traveller's notice at once, on account of the almost entire absence of lightning rods upon its buildings, so different from other western villages, where the superfluity of these ornamental, if not useful appendages, often makes the locality look, as Mark Twain says, "like a silver-mounted canchake." He will naturally wonder why "this is thus." Thereby hangs a tale. We would not have it for one moment supposed that this state of affairs in Lowood had escaped the eagle eye of the peripatetic vender of paratonnerres—*Anglice*, lightning rods—as he roamed through the villages between Kichago and Wilmaukee, seeking whom he might defraud. Not a bit of it! Lots of these fellows had tried to swindle the Lowoodites with all sorts of patented and unpatented spiral, right and left hand twisted, corrugated, compound and hollow lightning rods; and even the ingenious chap that carried with him an awful example, in the shape of a small model of a dwelling house, inside of which was a bottle of hydrogen gas, that he used to touch off by a spark down the chimney from an electrophorus, the result of which was an explosion that blew the house into smithereens, and hurled its cork inhabitants high in the air, to the mingled delight and terror of the honest granger and his innocent family. Even this worthy practical philosopher couldn't sell rods in Lowood. They would get off from the train with a sample rod about a yard long, mounted on a highly polished mahogany board, proceed briskly up the street, and shortly tackle some *habitan* and commence to expatiate volubly on the dangerous character of the electric fluid, and then pull out statistical tables showing that more property and lives had been destroyed in this way than by the combined effects of war, pestilence and famine. As soon as the *habitan* could get a word in edgewise he would say: "Hold on a minit, Mister; did you notice that handsome cottage near the station, situated in a grove of trees, and surrounded by a big yard with a nice fence around it?" The lightning rod man had noticed it, and intended to call on the owner on his way back and sell him some rods. He thought it the most likely thing in the world that the owner of such a nice looking house might give him an order for rodding it in a most complete and elegant manner. "Wal, he might give you an order, and then agin he might not. No, Mister! In that house lives one of the prominentest citizens of this town. His name is Winters, and he is the boss electrician of the Great Eastern Disunion Telegraph Company, which owns and occupies more litenin' than any concern on airth; and Winters, you just bet he understands the nater of that critter to a fraction, and he says that the rods most of you fellows put up are a dog-goned humbug, and he won't have 'em on his house anyway. You see, we all foller Winters' example, because we know Winters, and Winters is sound; he understands litenin' like a book, and 'tain't no use, Mister, for you to try to sell litenin' rods in Lowood." Then the agent would, after hearing the same story a dozen times, leave town by the first train, a sadder and a wiser man.

Finally, the rod peddlers made a combined assault on Winters. They waylaid him in his office, at the Great Eastern Disunion Telegraph headquarters, on the street corners of Kichago, on the trains of the Northwest-by-nor Railroad as he was going home, and when he approached his house at Lowood, coming from the train, he usually found three or four of these chaps, with "samples," sitting on his verandah and doorsteps. They would beg and implore him to let them rod his house; they would do it at cost, they would do it for nothing, they would even pay him handsomely for the privilege of doing it! Flesh and blood couldn't stand a siege of this kind forever, and Winters finally surrendered, but with all the honors of war. He at last told one agent that he might rod his house if he would agree to do it gratis, and would in all respects strictly follow his directions in putting up and con-

necting the conductors. The agent, in great glee, consented to all the conditions in advance. "Now," said Winters, "I want you to put up a half inch copper rod, and solder every splice in it. Don't you put any of your trumpery insulators on it, but fasten it directly to the house, and rivet and solder it to a plate of sheet copper, ten feet square, and buried horizontally twelve feet under ground." By the time the electrician had concluded his specifications the agent's face was nearly as long as one of his own rods. He silently bowed and departed, and it was so long before Winters saw him again that he concluded he had settled one agent at least. But one evening, as the electrician, returning from Kichago, entered his yard, he discovered a gang of Irishmen at work with picks and shovels, who had nearly completed an excavation in his lawn large enough to bury a horse and cart in, let alone the driver. On a large heap of dirt stood the lightning rod agent, bossing the job of planting the ground plate. And now, to make a long story short, the electrician of the Great Eastern Disunion Telegraph Company is the proprietor of the most scientifically constructed lightning rod, with the fewest "ohms" in it, that can be found in this or any other country. Whether the agent has yet made a colossal fortune putting up similar ones for the Lowoodites, is very doubtful, to say the least.

The Western Union Telegraph Company.—Its Business and Prospects.

THE following is the report made by President Orton to the Directors of the Western Union Telegraph Company, on Wednesday last. The accompanying resolutions declaring a quarterly dividend of two per cent. on the shares of the company, which were unanimously adopted, appeared in the last number of THE TELEGRAPHER.

EXECUTIVE OFFICES,
WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, Dec. 9, 1874.

TO THE DIRECTORS.

The report made to the stockholders at their annual meeting on the 14th of October last contains a full statement of the operation of the company for the fiscal year ended June 30, 1874, and of its condition on that day. Printed copies of this report being now before you, I shall not repeat much of its details in this paper.

At the semi-annual meeting of the directors, held on the 3d day of June last, I submitted a statement in which the profits, partly estimated, for the three months ending June 30 were put down at \$740,000, together with a recommendation from the Executive Committee that a dividend of two per cent. be declared payable out of the profits of that quarter. The actual profits for that quarter, as subsequently ascertained by the official returns, were \$762,029 44.

At a meeting of the Executive Committee held on the 1st day of September last, a dividend of two per cent. for the quarter ending September 30 was declared based upon estimated profits for the quarter of \$825,000. The actual profits were \$822,316 04.

The profits for the current quarter ending December 31st inst., of which we have complete returns for the month of October and nearly complete for November, are estimated by the Auditor at \$856,527 08. After careful revision, I have deducted \$15,000 from the Auditor's estimates, which gives \$841,527 08 as the profits for the quarter.

The following is a comparative statement of receipts, expenses and profits for each month of the year 1874:

	Receipts.	Expenses.	Profits.
January.....	\$48,873 28	\$550,785 52	\$193,117 76
February.....	681,761 11	481,784 15	199,976 96
March.....	761,979 34	504,285 83	257,693 51
April.....	770,961 12	546,758 65	224,202 47
May.....	788,848 96	507,682 07	281,166 89
June.....	798,215 05	536,554 97	261,660 08
July.....	808,979 05	557,744 60	251,234 45
August.....	797,910 91	521,144 51	276,766 40
September.....	839,548 99	545,226 80	294,322 19
October.....	883,678 74	577,151 66	306,527 08
November.....	825,000 00	560,000 00	265,000 00
December.....	835,000 00	565,000 00	270,000 00
Totals.....	\$9,530,749 55	\$6,454,088 76	\$3,076,660 79
December, 1874, estimated.			
1874.....	\$9,530,749 55	\$6,454,088 76	\$3,076,660 79
1873.....	9,282,033 66	7,047,016 38	2,235,017 28
	\$248,715 89	\$592,927 62	\$841,643 51
	(Increase.)	(Reduction.)	(Increase.)

It appears from this exhibit that the gross receipts for the current year are \$9,530,749 55, against \$9,282,033 66 for 1873, showing an increase of \$248,715 89 for the current year, while the expenses have been reduced from \$7,047,016 38 in 1873 to \$6,454,088 76, being a difference of \$592,927 62 in favor of the current year, and that the profits are \$3,076,660 79, against \$2,235,017 28, being an increase of \$841,643 51 over the profits of 1873.

In view of the facts above stated the Executive Committee at their regular meeting on the 2d inst. passed a resolution recommending that the Board at

this meeting direct a dividend of two per cent. to be made out of the profits of the current quarter.

The year 1874 has been notable for the general dullness in every department of business which has prevailed in all sections of the country. The fact that we have been able during the year to increase receipts and reduce the expenses of the company, so as to yield a net profit of nearly forty per cent. in excess of the preceding year, may be accepted as an indication of what the results will be when the business of the country shall have resumed its accustomed activity. The results of our operations this year also seem to confirm the wisdom of the policy which the managers of the company have steadily pursued, for several years past, of extending the lines, increasing the facilities, reducing the rates and so improving the character of the service as to induce the public to increase their use of the telegraph.

On the 1st day of February, 1873, the maximum tariff between the most remote points on the company's lines was fixed at \$2.50. This was equivalent to a reduction of more than fifty per cent. on messages between the Atlantic and Pacific States, the rates having been previously from \$5 to \$7.50. The first effect of this reduction was a considerable loss of revenue. But for several months past the revenue from messages between the Atlantic and Pacific States has been larger than during any corresponding period before the rates were reduced, and we have been able to transmit the increased volume of business with even greater promptness than before, without the addition of a single wire to the transcontinental line. This result is largely due to the successful operation of the duplex apparatus, of which I have spoken in previous reports.

In my last annual report to the stockholders, I stated the fact that we were then operating between New York and Boston, and had been for about two weeks previously, an apparatus called the quadruplex, by means of which two messages were sent in the same direction, and two other messages in the opposite direction upon one wire at the same time. Since that time the inventors, Messrs. Thomas A. Edison and George B. Prescott, have so far perfected the apparatus that it is now working successfully on a direct circuit between New York and Chicago. The great success of this invention within so short a time after its introduction leads me to believe that we shall be able to put it upon routes between all stations where the business requires the use of either two, or three, or four wires. If the further experiments about to be made shall demonstrate the ability of this apparatus to work satisfactorily through the long circuits of the lines to the Pacific, thereby increasing the capacity of those lines, without involving any expense for additional wires, I shall be inclined to recommend a further reduction of the present maximum rate of \$2.50. Indeed, such is my confidence in the growth of the telegraph business within the next few years that I believe it will be practicable for the company to continue reducing the higher rates, and extending the distances to which the lower rates are applied, until we shall ultimately have but four rates for day messages, namely:—25 cents, 50 cents, 75 cents and \$1, and half these rates (excepting the lowest) for night messages, and that this result can be gradually accomplished without impairing the company's ability to pay satisfactory dividends to the stockholders.

Mention was made in my Annual Report of the fact that the cable of the International Ocean Telegraph Company, which connects the coast of Florida with Cuba, was interrupted between Punta Rassa and Key West, and that efforts were then being made to repair the break and restore communication. I now have the pleasure to report that by the aid of the International Ocean Telegraph Company's steamer Professor Morse, Mr. N. De Bree, the agent of the company at Key West, has thoroughly overhauled the cable, cut out several defective parts and brought it into perfect working order. On account of this success, efforts are now being made to recover and restore another cable between those points, which failed and was abandoned three years ago.

Respectfully submitted,

WILLIAM ORTON, President.

Details of the Wreck of the Cable Steamer La Plata.

By mail from England has been received the details of the wreck of the Messrs. Siemens Brothers' cable steamer La Plata, in the Bay of Biscay, which foundered off Ushant on Sunday morning, Nov. 30th, only 15 of those on board having been saved, 60 persons losing their lives by the disaster.

The La Plata was a steamer of 965 tons register, built in Shields in 1862, with engines of 120 horse power. She had done much service in laying telegraph cables, notably those between Holyhead and Kingstown, Villa Real and Gibraltar, Heligoland and the Elbe, Constantinople and Odessa, the Shetland Isles and a section of the Calio and Isle de Franco line. On the

present occasion she was chartered by Messrs. Siemens Brothers from the owner, Mr. W. T. Henley, of Fenchurch street, and carried a crew of captain (Dudden), three officers, surgeon (Hughes), four quartermasters, four engineers, seven stewards, three cooks, two boatswains, a carpenter, eleven stokers, twenty-one seamen and a lamp lighter, besides the professional staff—namely, Mr. Ricketts, in charge of the cable and grappling apparatus; six electricians and ten cable laying hands. There were five boats on board and two patent rafts—one on the bridge and the other on the after deck. The wind up to Friday evening was fair, when it blew—as one man described it—“a living gale,” and the ship became almost unmanageable. This was partly owing, some of the survivors declared, to the character of the machinery on board. The vessel shipped vast quantities of water, and the ponderous grappling apparatus, several tons in weight, was said to have shifted, splitting the decks and letting in the water.

The La Plata foundered off Ushant, in the full fury of the southwesterly gale, or rather hurricane, which, from the time of its outbreak, had veered round from the north. The quantity of telegraph cable which had been paid out, with the vain endeavor, by lightening the ship, to counteract the effects of the seas that broke in upon her, was 150 miles of the 250 she had in her hold.

Subjoined is the report of Mr. Walker, late chief steward of the La Plata: “La Plata, Captain Dudden, left Gravesend on the morning of Thursday, 26th November, in charge of Mr. Martin, pilot, bound for Rio Grande Sol. We arrived off the Isle of Wight on Friday morning, when the pilot left. The ship then proceeded down the Channel, and toward evening the wind began to freshen, the ship steaming about four knots—the wind still kept increasing, till on Saturday at midnight it was blowing a gale. We shipped a heavy sea, which carried away the port jollyboat and davits, one man being at the same time washed overboard. A short time afterward the starboard waist boat was carried away. The gale still increased. On Sunday morning, between eight and nine, the engineer reported the ship making a great quantity of water. It was then agreed to lighten her, and we commenced paying out the cable over the boom. We paid out a quantity and then let it go. By ten o'clock the fires were all out in the stoke hole. We then prepared the remaining boats and rafts to leave the ship, which was gradually sinking by the stern. At half past twelve she foundered, stern first, with sixty persons on board. The only persons who got off were twelve in the port quarter boat, and three others were picked up, making fifteen in all. Before leaving we saw one boat on the port side stove in. Of the remaining two boats, one was capsized when the ship went down and the three persons picked up were out of her. The captain and doctor remained on the bridge, having failed to get clear the patent life rafts, and both are supposed to have sunk with the remainder of the crew when the decks blew up. We were in the boat two hours before clearing away from the wreck, being unable to render any assistance through fear of staving and swamping the boat. We were in the boat for twenty-three hours, provisioned with only a small piece of cheese and one bottle of gin. We kept two hands bailing with buckets the whole time, as our boat made much water. At daylight on Monday morning we saw a ship, distant about five miles off, which proved to be the Gare Loch, of Glasgow, Captain Greenwood, by whom we were picked up about half past eleven, and were treated most humanely by the captain, his lady, the surgeon, officers and passengers, all of us being supplied with stimulants, and dry, warm clothing. After an hour on board we were transhipped to the steamer Antenor, for London, and landed at Gravesend. The survivors beg publicly to return their most sincere thanks to the commander and all on board the Gare Loch.”

Of those on board at the time the La Plata foundered there were lost, Captain Dudden, Mr. Hughes (the surgeon), the three officers, one of the four engineers, seven of the ten stewards and cooks, both the boatswains, the carpenter, all the eleven stokers, fourteen of the twenty-one seamen, and the whole of the cable staff numbering sixteen, with Mr. Ricketts and the six electricians accompanying him.

A Scientific Practical Joke.

In a little work entitled “Recuerdos de Humboldt” (Recollections of Humboldt), the author, Dr. Aristides Rogas, relates what he terms *un incidente gracioso*, which happened to Humboldt at Calabozo. On approaching Llanos he was very anxious to obtain information about the electrical eels (*tembladores*) which abound in the rivers of the district. For this purpose he arranged to visit an eccentric student of electrical science, who, before the appointed time, contrived—with some ingenuity and great difficulty—to place one of the fish in question *en rapport* with the knocker on his study door. The servant, as desired by

his master, directed the illustrious visitor to rap, and on his doing so a discharge of electricity took place, throwing him to the ground.

The narrative goes on to state that Humboldt received his practical information as to the nature and amount of the electricity generated by the *tembladores* with all the equanimity of a philosopher in search of knowledge.

The Telegraphers' Mutual Benefit Association.

ACKNOWLEDGMENT OF RECEIPTS FOR ASSESSMENTS UP TO AND INCLUDING DEC. 10, 1874.

ASSESSMENT No. 71.

4, 5, 16, 21, 25, 28, 46, 53, 56, 74, 77, 86, 91, 98, 112, 121, 131, 145, 157, 181, 188, 208, 211, 217, 235, 245, 267, 274, 277, 286, 289, 301, 302, 349, 383, 385, 416, 434, 464, 467, 510, 526, 532, 536, 547, 549, 553, 564, 576, 594, 615, 622, 626, 649, 703, 715, 721, 731, 815, 821, 825, 832, 858, 880, 915, 916, 923, 941, 1001, 1013, 1024, 1039, 1054, 1081, 1084, 1126, 1154, 1173, 1175, 1178, 1182, 1183, 1199, 1225, 1252, 1259, 1282, 1293, 1300, 1304, 1306, 1345, 1357, 1368, 1371, 1394, 1402, 1403, 1404, 1409, 1410, 1440, 1518, 1527, 1550, 1568, 1571, 1690, 1695, 1708, 1735, 1815, 1831, 1852, 1862, 1894, 1901, 1944, 1950, 1951, 1985, 2019, 2027, 2030, 2036, 2049, 2082, 2135, 2143, 2164, 2174, 2175, 2178, 2214, 2228, 2229, 2238, 2239, 2241, 2259, 2287, 2289, 2305, 2308, 2311, 2312, 2322, 2330, 2334, 2336, 2337, 2338, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359.

ASSESSMENT No. 70.

8, 312, 742, 859, 932, 1169, 1489, 1516, 1553, 1881, 1986, 2221, 2226, 2257, 2269, 5280, 2284, 2285, 2286, 2288, 2291, 2292, 2293, 2301, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2331, 2332, 2335, 2339.

ASSESSMENT No. 69.

27, 33, 51, 58, 76, 100, 148, 169, 182, 237, 238, 242, 246, 258, 429, 438, 451, 453, 455, 457, 476, 481, 527, 566, 604, 652, 725, 804, 869, 883, 899, 908, 920, 934, 1011, 1084, 1103, 1131, 1153, 1207, 1224, 1273, 1437, 1450, 1559, 1579, 1600, 1605, 1607, 1608, 1609, 1610, 1611, 1612, 1639, 1653, 1655, 1657, 1677, 1690, 1691, 1715, 1716, 1731, 1743, 1786, 1798, 1799, 1835, 1922, 1926, 1931, 1934, 1941, 1964, 1968, 1974, 1975, 1976, 1978, 1995, 2015, 2037, 2045, 2081, 2109, 2128, 2133, 2141, 2146, 2150, 2170, 2177, 2244, 2248, 2249, 2261, 2268, 2273, 2281, 2282, 2283.

ASSESSMENT No. 68.

185, 186, 187, 496, 497, 499, 500, 505, 507, 508, 695, 697, 705, 1071, 1104, 1400, 1504, 1556, 1557, 1570, 1613, 1670, 1741, 1921, 1945, 1946, 1987, 2151, 2236.

MISCELLANEOUS.

No. 67.—2115.
No. 66.—490, 506, 800, 1496.
No. 65.—495, 503, 2132, 2251.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice, that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

Character of Electric Discharges.

A FLASH of the duration of $\frac{1}{1000000}$ of a second is instantly recognized by the retina, but the effect on the eye lasts fully $\frac{1}{2}$ of a second. The duration of the flashes recently examined by Professor A. M. Mayer, of the Stevens Institute, varied from 0.124 to 0.0416 of a second. An idea of the length of this last mentioned interval may be obtained by recalling the fact that a rapid involuntary wink takes place in nearly the same time. That the Leyden jar discharge is multiple was discovered by Professor Henry, and this has been subsequently confirmed by Cazin, Tedderson and Rood. Professor Mayer, however, has sought more definite results, and the object of his investigations has been a permanent record of the character of the discharge, of its duration, and of the intervals separating its constituent flashes and sparks. To this end he prepared disks of thin printing paper, blackened over burning camphor, and of a diameter of 5.8 inches. When one of these was revolved very rapidly it became quite flat by centrifugal action, and in this position the discharge between points or balls perforated it, leaving the required record. By presenting momentarily to the rotating disk the delicate point attached to a vibrating tuning fork, the number of vibrations per second of the fork was determined to the last degree of precision by means of a break-circuit clock, which at each second sent a spark from an inductorium through the fork. The result was traces on the blackened disk; and by tracing the axis of the sinusoidal line with a

needle point, and then drawing radii through symmetrical intersections of the axis on the line, the disk was divided off into known fractions of time. These marks were then rendered permanent, the disk centred on a dividing circle, and the indications read by a low power microscope, determining with accuracy intervals and durations to one 50,000th of a second.

The results thus far obtained we summarize below, and we understand that others have been reached which the investigator withholds until he has subjected them to more careful examination.

The first discharge was between large inductorium points, 0.39 inches apart, the striking distance of the coil being 17.7 inches. Thirty-three clear round holes were made in the disk by a portion of the discharge lasting $\frac{1}{3}$ of a second. The average intervals between the perforations at the beginning was $\frac{7}{100}$ of a second; then followed a period of quiescence of $\frac{1}{1000}$ of a second, and then a shower of 30 minute sparks, lasting $\frac{1}{30}$ of a second. The average interval separating these was $\frac{1}{1000}$ of a second. The second discharge was between platinum points, 0.39 inches apart, of a large inductorium, with a Leyden jar of square inches, connected with the terminals of the secondary coil. The discharge on its path around the disk dissipated 91 little circles of carbon, each perforated by from 1 to 4 holes. The discharge lasted 0.124 second, and the intervals were $\frac{1}{100}$ of a second up to the tenth flash. For four fifths of the discharge they were separated by $\frac{1}{1000}$ of a second, and at the last by $\frac{1}{1000}$ of a second.

We understand that Professor Mayer is examining the discharges of the frictional and Holtz machines, as well as of the Leyden jar and inductorium, so that results of considerable scientific interest and importance may be expected.—*Scientific American.*

Electrical Countries.

CERTAIN interesting phenomena have recently been noticed by the Hayden Expedition in the mountains of Colorado, showing the high electrical state of the elevated position known as Station 9, Uncompahgre Peak, during the passage of a storm. Although the indications of a change in the weather could be seen at a distance, the electricity at the point of observation did not become plentiful until a characteristic buzzing was heard. Painful sensations followed, and at the back of the head and at the elbows a sharp pricking, like that of needles or a sharp knife, was felt. By this time the party came to the conclusion that they were standing on dangerous ground. Those standing on the very summit of the peak and along the sharp ridges leading from it experienced the severest shocks. After beating a hasty retreat, and remaining on the sides of the mountain to continue observations, it was noticed that after each discharge or flash of lightning, a short rest ensued, until a sufficient quantity of electricity had again accumulated. Those nearest the point struck would feel a heavy shock pass through them. These same phenomena were noticed during three days of continuous storms. At many places the rocks were glazed where the electric current had passed. The formation of tubes in sand from the same cause is well known.

A French meteorologist, M. Fournet, has suggested that it would be an interesting question for Science to determine whether certain countries or regions are in a higher electrical condition than others, and whether meteorological reactions do not result from the unequal distribution of the electricity. Similar phenomena to those detailed above have been noted upon the elevated plateaus of Mexico, and nearly a century ago Volney recorded remarkable noises occurring during thunderstorms in the neighborhood of Philadelphia. In South America, at Popayan, province of Granada, Boussingault says that thunder is heard every day and electrical phenomena are common. The extreme dryness of the Andine table lands also favors similar effects, and it is said that in the Chilian desert involuntary erection of the hair upon animals, as well as the appearance of sparks leaping from clouds to soil, is common. Dr. Livingstone notes that during the spring, a period of great dryness, the African deserts are traversed by a warm north wind so highly charged with electricity that the plumes of the ostrich stand upright, and that sparks are produced by the mere attrition of the garments.

In India, at certain localities, telegraphic wires are maintained with great trouble. It is stated that during storms of exceeding violence the conductors become charged almost to melting. Professor Loomis has observed abundant electricity in the atmosphere about New York city, especially during winter. We have repeatedly remarked the high electrical condition of the hair on cold nights, and also that the mere act of walking on a soft carpet in a heated room will cause a crackling sound under the foot.

From all the various examples which have been collected of this curious condition, it would appear that the abundant presence of electricity is not due necessarily to heat of the season, since in this country it is never more strongly manifested than after a cold

northwest wind; nor are indications in any other region more clear than in the dry and icy air of Siberia. It would appear that the reservoirs of electricity exist in the most widely separated parts of the globe. If it be admitted, in accordance with the opinions of Fournet, Manry and Admiral Fitzroy, that the ordinary winds are in relation with these great electrical sources, further and more extended operations upon them would be in the interest of meteorological progress. If, for example, the electricity of each great atmospheric current, tropical or polar, is regularly positive or negative, it may be, as Fitzroy suggests, believed that the changes of weather which supervene, at the moment when one electrical current succeeds the other, have on a small scale a certain analogy to the changing of the trade winds. Fournet remarks upon a natural relation of these phenomena with the meteorites produced during storms. These views are, however, mainly conjectural, so that there remains a large field for definite research.—*Scientific American.*

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

The Other Side.

TO THE EDITOR OF THE TELEGRAPHER.

THE TELEGRAPHER for some time past, and especially of late, has endorsed the automatic system as being the best and most practicable method of realizing cheap rates for telegraphic service. In a recent editorial there appears a statement that the system is "not inimitable" to the skilled labor of the Morse system. Several of my friends, as well as myself, cannot so understand it, but are open to reasonable conviction.

Let us look at the question a little in detail. We will suppose that the Automatic system will transmit as many words over a wire as the managers of the scheme claim, thus setting aside the question of its scientific success, although crosses, etc., might practically reduce the average speed. The Labor question is the question interesting us the most.

The work of preparing a strip for the Automatic transmitter requires a certain amount of time, afterwards further time for transmission, and still other time for copying after its reception. Touching this consideration of time, we find the Morse operators performing instantaneously the work of transmitting and copying, thereby saving over one half in time, as the message would be copied ready for delivery by Morse in the time occupied in simply preparing the slip for the Automatic. To counterbalance this, the Automatic system must more than double the number of employes of the Morse system in order to accomplish the same work in a given time, as every practical operator is aware that more words can be copied from an instrument in a specified period of time (all things being equal) than can be translated from strips and written out.

Should skilled labor be employed by the Automatic system with as high rates of compensation as are now paid to Morse operators, the cost of service to any company adopting it would be more than doubled, making, I am afraid, an expense actually exceeding the amount saved in interest on money invested in more wires—even were they only duplexed.

The Automatic Company now in operation between New York and Washington claims to pay its employes in New York city an average of but forty dollars per month. (See their report of trial on President's message a year or two ago.) Now, anybody knows that neither skilled nor reliable labor can be employed at any such average rate. We know, of course, that a certain amount of skilled labor is requisite in any system; perhaps in this case it would be comprised in the manager and chief operators of the offices. Is it likely that a company will pay from eighty to one hundred dollars per month in New York city for men to copy from slips, if they can hire boys at forty or fifty? Again, if it is possible to work a Quadruplex successfully, utilizing one wire so as to do the business of four average single wires, there would be wires enough in the country to do the business likely to be offered for many years to come. The Quadruplex has been worked up to the standard of four wires on test occasions. Although it is not claimed to be perfected yet, it is being worked from New York to Chicago satisfactorily.

For the reason that labor can remain as it is now employed and compensated with the success of the Quadruplex, and must change with the Automatic, and again, from the belief that one wire utilized up to the value of four single wires will be amply sufficient for all the business of the country, even at cheaper rates, arises the antagonism among the profession to the Automatic and the preference for the Quadruplex. Much has been said about the breaking upon the

Duplex and Quadruplex interfering with their speed; but those, while true if they existed, are not practically substantiated in actual experience; men are placed upon Duplex and Quadruplex wires who think it no great feat to receive for a whole hour without opening their keys. A break upon the Quadruplex affects but one man besides the breaker himself; the other two working on, unconscious of it.

As it was found infinitely more reliable to do Morse business by sound instead of paper in former years, so I imagine, upon the same grounds, that a Quadruplex would be much more correct on the whole than the Automatic. In that system the subject matter passes through the hands of two different persons (the puncher and the copyist) at totally different times, consequently neither can serve as a check upon the other, while in the Morse system exactly the opposite is true in practice, many mistakes being thus detected.

The gist of the matter appears to rest just here. Should the Automatic system employ skilled labor, and pay accordingly, they must incur an expense likely to be double that paid for the same work by Morse in a like time. Cheapening rates, and thereby gaining more business, would proportionately increase this expense; thus, while saving the number of wires, the company would deplete their treasury.

Cheap labor appears to be the only way that the Automatic system can succeed financially, as it is a well known fact that at present no inconsiderable amount of the receipts of telegraph companies are paid to employes. To double, or even materially increase this expense, would be disastrous.

Unless we see something in THE TELEGRAPHER that will convince us that our opinions are erroneous, it will almost appear that, for the first time, THE TELEGRAPHER has a policy not in consonance with the interest of the vast majority of telegraphers.

Knowing that your columns are open to any fair minded and honorable expression of opinion, I proffer this communication, hoping thereby to elicit a more detailed expression of your own views as to the merits of the rival systems—the Automatic and the Quadruplex. MORSEITE.

Successful Working of the Quadruplex.—Good Time on President's Message.—Reduction of Salaries, etc.

CHICAGO, Dec. 14th.

TO THE EDITOR OF THE TELEGRAPHER.

ANOTHER successful trial of the Quadruplex was made on the morning of the 7th in the Western Union office here, and I understand they have been working it more or less every day since, as duplex, triplex or quadruplex, as the business demanded, using it on their large No. 6 wire through repeater at Buffalo to New York.

Very good time was made on the President's Message, both on the Atlantic and Pacific and Western Union lines. I was unable to get figures from the A. and P. as telegraphers in other business can't get as much information from them as from the W. U. The W. U., I understand, had it repeated at Buffalo, receiving it on 4 wires from there, and distributing to papers and sending on the same number of wires to Milwaukee, in two and one half hours. Assistant night manager Springer, and Messrs. Whitford, Mereness, Stone, and Billy Wallace did the receiving, while Jim Fiske F. E. Angell distributed the Chicago press copies to the satisfaction of all concerned, and Messrs. Anderson, Hazeltine, Fortier, and A. J. Long rushed it to Milwaukee. Very good time was also made in getting it to San Francisco; counting out the difference in time between Chicago and San Francisco, they had the message there in fifteen minutes after it was received in Chicago.

The A. and P. has very unwisely, in our estimation, reduced these salaries of all their operators here, who were getting over eighty-five dollars a month, to one thousand dollars per year, and those who had been getting salaries below that figure as much in proportion. The result of this will be to drive all the better class of operators out of their employ, as fast as they can get suitable places elsewhere with other companies.

Mr. O. M. Stone, day report operator of the W. U. office in this city, has received the appointment of Chief Operator and Secretary to the Master of Transportation of the Western Division of the Baltimore and Ohio R. R., with headquarters in this city. This is an excellent appointment, and the B. and O. R. R. will never have cause to regret it.

Telegraphing is rather dull and probably will be until after the holidays. OCCASIONAL.

A New Plug Factory Started.—A Bull.—Probable Reduction of Salaries.

TO THE EDITOR OF THE TELEGRAPHER.

In the language of the darkie preacher at camp meetings, "still dey enm." A majority of the fraternity had lost track of A. M. Valentine, formerly manager

of the "Mx." Chicago Western Union office, and his brother, formerly manager of the Northwestern Telegraph office at Janesville, Wis. "Gone into other biz," was the answer given to all anxious inquirers when interrogated as to their whereabouts, their immediate friends no doubt being ashamed to tell what that "other business" was. Well, to make a long story short, there has been another "plug" factory established, and it is at Janesville, Wis.

Could first class intelligent telegraphers engage in a more disgusting business? If they could I would like to have you or your readers point it out to me. The aforesaid Messrs. Valentine are the proprietors. I would rather a friend of mine would engage as boot black to a fifth class ten cent barber shop, drive an omnibus, make soap, chew gum, preach, go to Congress, anything under the light of the sun than start a Telegraph College. It's a shame that the authorities don't abate them as nuisances. There never has yet a College student graduated and been able to take a situation in an office in any capacity from messenger upwards. Why don't some of the older telegraphers get some of the leading St. Paul, Milwaukee, or Chicago dailies after those miserable frands.

Judging from a conversation in regard to this Janesville affair over one of the Northwestern lines a few days since, between two well known managers out this way, this one is but a sample of the many that are in full blast all over the country.

Quite an amusing bull was made by one of the gentler sex recently in this neck o' woods. "Ten coal stoves" being received and delivered by her "Ten coat sleeves." She must have been thinking more of coat sleeves than coal stoves. Probably she has been kept as warm by the former many times as by the latter—who knows.

This is the time for cutting down salaries in this section. The policy will no doubt be inaugurated soon. More anon. NORTHWEST.

Legal Proceedings against the Automatic Telegraph Company and others.

A SUIT has been commenced by Messrs. Daniel H. Craig and James B. Brown, plaintiffs, against Messrs. Geo. H. Harrington, Geo. Little, Thomas A. Edison, The Automatic Telegraph Company and the National Telegraph Company, defendants, in the Superior Court of the City of New York, in which the plaintiffs claim a judgment for an account from the Automatic Telegraph Company of the receipts of the company, and for payment of the royalty reserved to the said D. H. Craig under a contract dated September 9th, 1869. Also, a decree enjoining said Little, Harrington and Edison from selling or disposing of in any way, without the consent of the plaintiffs and the Automatic Telegraph Company, of the rights, title or interest in the inventions and patents of said Little and Edison in connection with the Automatic or Fast Telegraphy. Also, for a decree enjoining the Automatic Telegraph Company and the National Telegraph Company from making any sale, assignment or transfer of said patent rights granted to the National Telegraph Company by said contract of September 9th, 1869.

The plaintiffs also ask for a preliminary injunction on the defendants, as above, pending the decision of the suit.

Government Telegraph Schemes.

NOTWITHSTANDING that the new Postmaster General has set his face resolutely against the combination of any telegraphic schemes with his department, a bill has been introduced in Congress to have a postal line established between Boston and Washington. The scheme was brought out by a Southern Senator, evidently to feel the pulse of the North on the subsidy and improvement business. These gentlemen may as well understand at once that people in this part of the country are opposed to any such schemes. Whenever the Government has gone into private business, such as the construction of railroads, it has made a muddle of it. From the tone of the President's message, it is evident that he wishes to confine his administration to its legitimate channels. When Congress attempts to go a step beyond that limit it will do it in opposition to the popular will.—*New York Commercial Advertiser.*

EXPERIENCE has shown that the great difficulty to be surmounted by those who desire to acquire knowledge, is the wish which they possess to proceed rapidly. Progress, to be real, must be slow and cautious. —*W. H. Precece.*

BREAK! break! break!
On that darned old shanty key,
A hundredth part of the patience I have
He never has shown to me.

Break! break! break!
Did you ever see such a plug?
If I had him here I'd certainly punch,
His horribly ugly mug!

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, DECEMBER 19, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

(P. O. Box 5503.)

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the **Eleventh Volume** of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER.

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION, but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE
AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded, free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club Rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503,) NEW YORK.

The Telegrapher and Automatic Telegraphy.

We print this week a communication from a telegraph operator on "The other side" of the subject of automatic telegraphy, its relative cost, its bearing upon the interests of the telegraphic fraternity, and the proper position of THE TELEGRAPHER in its consideration and treatment, as the representative of the interests of the telegraphers of the country.

We are pleased to publish this communication, notwithstanding its criticisms of the paper. Our columns are freely open to the discussion of all matters of telegraphic interest, and if in our editorial treatment of such subjects we are in error, we are willing to be convinced, and acknowledge our error. The communication of our correspondent "Morsetite" is well and temperately written, and forcibly presents his views, and we doubt not that of many other telegraphers.

It may be conceded that the preparation of the messages for transmission by the automatic instruments and for delivery after transmission occupies time, and that in this instance time is money. The question really is, so far as telegraph companies are concerned, whether the aggregate cost of the service is as much or more than it would be under other systems of telegraphy. If it is, then that objection would be fatal to it. We do not believe that this has been or can be demonstrated. The process of preparing the messages for automatic transmission can be accomplished by the punching machines now in use more rapidly than the average time of transmission by the ordinary systems. It certainly requires practice and skill on the part of those engaged in this part of the business to do it rapidly, but so does it require these to transmit rapidly by any other system. When thus prepared, the message can be transmitted automatically with a rapidity and certainty that is not attainable by any other telegraphic process. The labor of a number of punchers would be requisite to keep a single wire employed automatically, worked at the minimum of its speed. It renders possible the utilization of a wire to its full capacity, which is not possible under any other system. In case of the interruption of a wire from crosses or breakages, the accumulation of business for an hour can be worked off in a short time, and the entire time during which such interruption continues can be utilized for the preparation of the messages for such rapid transmission when the difficulty is remedied. By other systems such accumulation of business has to be worked off at comparatively a slow rate, and frequently hours must elapse before the files are cleared.

The business automatically transmitted can be copied and prepared for delivery by any number of persons required, and there is, consequently, no unnecessary delay in doing it. If the amount of business to be done were limited to that which is now transmitted, it might, perhaps, cost nearly as much to do it, excepting, of course, what is saved by the smaller number of wires as at present; but by the automatic system the whole time of the persons employed can be utilized, and nothing would be lost waiting for circuits etc., which every practical telegrapher knows, on Morse lines, interferes so seriously with the amount of work which an operator can accomplish. The saving of time thus effected, in a large office especially, is a very important factor in the problem of expense, and renders it practicable with the same number of employés to execute a much larger amount of business, at a relative less expense to the company.

It is, however, with its bearing upon the interests of the telegraphers themselves that our correspondent and telegraphic readers generally are most concerned. It is argued that under the automatic system skilled telegraphic labor will be at a discount; and, as we have before remarked, some of the promoters and advocates of the automatic system are responsible for this impression. In making out their claims of the system to public favor, they have placed the compensation of the employés at exceedingly small figures—much lower, in fact, than persons suitable for the work could be employed for in ordinary times. Our corres-

pondent refers, in this connection, to the report of Mr. HARRINGTON of the trial on the transmission of the President's message between Washington and New York last year, which, he says, states the average wages of its employés to be forty dollars per month. If he will refer to that report he will find the salaries of the operators engaged in that work to have been put down at \$100 per month. The salaries of the punchers and copyists are put at forty dollars per month—which is, undoubtedly, lower than suitable persons could be obtained for in ordinary times, and if the system were generally introduced and a considerable number of them were required. As before stated, it requires practice and skill to become expert and rapid in the preparation of the matter for transmission, and the enormous increase of business which would follow the general introduction of the automatic system would create a demand for such skill and experience that would insure its proper and adequate compensation. It would also necessitate the employment of more operators than would seem necessary with the business as it now is.

From a personal examination of the matter we are convinced that it requires as much intelligence and skill to make a first class "puncher" as it does for a good operator, and automatic telegraph companies would find it necessary to pay as good salaries as are paid for such skill and intelligence in operating. Does our correspondent doubt that the Western Union or any other telegraph company would soon fill its offices with \$40 operators if they could do so with safety to their business and profit to themselves? Besides, we have never claimed or believed that the automatic system was to entirely supersede all other systems, but have always believed and held that, while it would be most advantageous on main routes and between the principal offices, it would necessarily be worked in conjunction with the other systems of telegraphy. The increase in the business, and the necessity for employing operators to work circuits by other systems in connection with the automatic, would undoubtedly give employment to as many operators as at present, and at as satisfactory remuneration as now.

Our correspondent seems to think that we are not inclined to give the quadruplex arrangement the credit which it deserves. In this he is mistaken. We have never asserted or argued against the quadruplex that it was not feasible or practicable. We have asserted, what every intelligent electrician well knows, that quadruplex telegraphy is not a new invention *per se*, and that its practicability is mainly owing to the application to it of Mr. STEARNS' condenser. THE TELEGRAPHER has not been backward in according to Mr. STEARNS the credit due him for making the duplex practicable, and to his application of the condenser probably more than to anything else is due the success of the quadruplex.

We have also believed, on scientific principles, that it would not be found practicable to work the quadruplex successfully on ordinary wires, but that it would require conductors either of a large size or with very perfect insulation, and as we understand, the experience of the Western Union Co., thus far, has proved the correctness of our opinion.

We are watching with interest the experiments which are being made with the quadruplex, and willingly record its successes in THE TELEGRAPHER. If, as Mr. ORTON states in his report, which we print this week, it solves the problem of cheap yet remunerative rates for telegraphic service, we shall not be slow to recognize its value, whatever we may think personally of the individual who claims the credit of having successfully adapted it.

In some remarks which we printed some weeks since on the "Organ Business," we referred somewhat harshly in this connexion to Mr. GEO. B. PRESCOTT, the electrician of the Western Union Company, who seemed to be associated in what we considered an attempt to manufacture capital by excessive premature laudations of the invention and presumptive inventor, and in the design to injure THE TELEGRAPHER, by bolstering up a

nonsensical sheet in opposition to it. We have been assured that we were wrong in our premises, and regret that any injustice was done Mr. PRESCOTT, with whom our personal relations have always been and continue to be friendly.

In conclusion, we would say that we should very much regret to believe that THE TELEGRAPHER had a policy not in "consonance with the interests of the vast majority of the operators." While we do not believe that any telegraphic system can be permanently shelved because it will reduce the compensative cost of telegraphic labor, whether THE TELEGRAPHER shall recognize and advocate it or not, we are equally confident that the general introduction of the automatic system, for the reasons before stated, will not be inimical to the interests of the telegraphic employés. Having no pecuniary interest in any telegraph company or system, we are in a position to maintain the independence of THE TELEGRAPHER, and shall endeavor, in all scientific and practical telegraphic matters, to deal fairly and equitably. The real interests of the telegraphers are our interests as well, and certainly it is not intended that any policy which we may adopt shall be otherwise than favorable thereto.

A Reform Needed in our Patent Laws.

It is generally conceded by political economists that a well devised and properly administered system of patent laws is of the utmost importance to the general welfare of the nation at large. A patent for a useful invention or discovery is not, as many persons contend, an injurious and unjustifiable monopoly. It is, in reality, nothing more than a contract between the inventor and the Government, representing the general public. The conditions of this contract are, that the inventor shall produce some new and useful invention or discovery, hitherto unknown, and shall communicate to the public a full knowledge thereof, by means of a proper application for letters patent, in order that the public may be enabled to know what the invention is, and to practice it after the patent expires. On the other hand, the Government grants to the inventor the exclusive right to practice his invention or discovery for a limited time, and this grant the Government agrees to sustain and enforce by means of its courts.

If it be admitted that this policy is a sound one, it follows that the laws should be so framed as to encourage invention, by affording every possible facility for obtaining patents, and for protecting the rights of the owners of such patents during the period for which they are granted. Furthermore, the administration of the patent office should be in accord with the spirit, intention and purpose of these laws.

In our opinion the patent laws of the United States are in their general character superior to those of any country in the world. The intention of the law is that a thorough and systematic examination shall be made, in order to establish the novelty of every alleged invention, before a patent is granted to the inventor. It is, perhaps, too much to expect that such an examination should be in all cases absolutely perfect, and we freely admit that they are now often very imperfectly made; yet we are far from agreeing with our neighbors of the *Scientific American*, who argue from these facts that the present examination into the novelty of alleged inventions should be done away with altogether, and a patent granted as a matter of course to every applicant, as is done in Great Britain and several other countries. There is no doubt that under the present system of publishing the drawings and specifications, and by having the back drawings and specifications of all patents printed in a form accessible to the public, combined with a classified digest or abstract of all patents which are or have been issued, as is done in Great Britain, it would be possible to prevent almost entirely the grant of any invalid patents. To be sure, it might require a higher grade of examiners in the Patent Office, whose salaries would need to be sufficient to induce them to remain permanently in the service, but

it would be entirely proper to meet this additional expense by an increase in the patent fees, if necessary. It costs far less to pay double fees in the Patent Office than to be involved in endless litigation, which is sure to be the fate of every inventor having a meritorious invention, under a loosely administered or defective patent law.

But, notwithstanding the excellence of our present patent laws in the main, they are exceedingly defective in many of their details. As all improvements in the system must necessarily commence with the fundamental law, we desire to aid in the work of bringing about a reform by calling attention to a few of its more prominent defects. One of the most serious of these is in relation to reissues, in reference to which the *Scientific American*, of Dec. 19th, contained the following very pertinent observations:

Nothing is more important to him (the inventor) than the right to amend his patent through a reissue. Rarely does a patent, as first obtained, embody the invention in a fully available shape, and often is its real gist mistaken altogether. The common law authorized amendments by means of a surrender and reissue, and the statute regulated and rendered more definite the rights of the patentee in this respect. The great purpose, in both cases, was to limit the new patent to the real original invention, giving the full benefit thereof to the inventor, but nothing more.

To guard against abuse and to prevent a patentee from enlarging the scope of his patent, or from bringing in a new subject matter through a reissue, the courts have—rather severely—held that oral proof of the full scope of the original invention was inadmissible, and that nothing could be claimed in the reissued patent unless either the model, the drawings, or the specification—as originally filed—showed the invention thereof.

The new law (of 1870) has taken a most indefensible step in farther limitation of a previously existing right, by rendering the most reliable of record evidence wholly incompetent in such cases. The model or drawings may still be called as witnesses, but not the specifications. No matter how fully or how clearly the invention may be set forth in the latter, still, in cases where there is drawings, nothing can be claimed in a reissue which is not shown in those drawings or in the model. A credibility is thus given to a *sign* or a *mute device*, which is absurdly denied to a *written declaration*. Pantomime is regarded as more reliable than articulate language. This is all wrong.

Another absurd requirement, which was interpolated into the law of 1870, provides that the specification of an application for reissue must be sworn to by the inventor, if he be living, and this, it is to be observed, even if he has no interest whatever in the patent at the time of the application. In fact, his interests at some subsequent time may be and often are such as to make it an object for him to prevent such a reissue, and to render his original patent as "inoperative and invalid" as possible.

As a specimen of the practical operation of the present law in relation to reissues, a case occurring within our knowledge is in point. An inventor took out a patent under the law of 1870, in which the model and drawings showed but one method of operation, embodying the leading principle of the invention. A very obvious modification, to be used under certain specified conditions, was described in the clearest manner in the specification, but it was not thought necessary to claim it in the original application. A subsequent applicant obtained a patent, which embodied the modification referred to in the drawings, but he did not claim it as his own invention. The first applicant then applied for a reissue, claiming the feature in question, as he had a perfect *legal* right to do, which claim was denied him under the letter of the statute of 1870. He then applied for a second patent covering the device, which was granted him. Then the second applicant reissued his patent and obtained a claim on the same device, on the strength of having shown it in his drawings. This left no resource to the owners of the patent of the original inventor but to reissue his second patent and apply for an interference, which they were unable to do, because the original inventor, though living, had removed to some distant and unknown locality; the only alternative being that of going through an expensive course of legal proceedings in order to establish their rights. All this trouble,

delay and expense to the original inventor and his assignees was the direct result of the two preposterous provisions inserted in the act of 1870, to which we have above called attention.

It is due to the late Commissioner LEGGETT to state—what we know to be the fact—that he has used every effort during the past two years to procure a repeal of the above, as well as several other objectionable provisions of the patent laws; but, unfortunately for inventors, Congress has been so busy in attending to salary grabs and various other schemes of plunder, that they have thus far found no time to take action on the bill for that purpose, although it has been before them during the last two or three sessions.

Every inventor who reads this should make it a point to stir up his member of Congress, and see if a reform cannot be brought about in this matter during the present session.

While upon this subject, we may remark that we have never been able to see the sense of the decree that a model shall be furnished with every application filed in the office. In many cases it is a most troublesome requirement, especially to the poor inventor, as it frequently entails a larger expenditure of time and money than all the other conditions combined, and renders it necessary to have a stupendous and costly building at Washington, for the purpose of furnishing house room to an enormous number of models, the greater part of which are not of the slightest earthly use to anybody. A very large number of the applications for patents are of such a nature as to be much more clearly shown in a good drawing than they can be in a model; and we are of the opinion, if this requirement were abolished altogether, and a more strict supervision exercised over the character of the drawings, the public welfare would be subserved. Such a measure would tend to improve the character of the drawings, and render it necessary that they should be as clear, full and distinct as possible, and with a sufficient number of figures to thoroughly illustrate the invention. As ninety-nine persons out of a hundred who wish to inform themselves in regard to any particular patent have no means of doing so except by recourse to the drawings, great strictness should be exercised in requiring fullness of detail. If this were properly done, as it is to a great extent in Great Britain, the necessity of illustrative models might be altogether dispensed with, as in fact it always has been in that country.

We scarcely need apologize for having devoted so much space to this discussion, as it is one of interest to a large number of our readers, as well as a matter of great importance, not only to them, but to the inventive public at large.

The Eleventh Volume of "The Telegrapher."

WE present in this number of THE TELEGRAPHER our Prospectus for the Eleventh Volume, which commences with number 442, for January 2d, proximo.

It will be seen that all the valuable features which have heretofore characterized the paper will be retained in the coming volume. No labor or expense, warranted by the patronage received, will be spared to not only maintain the character of the publication as a first class independent telegraphic journal, but to add to its importance, value and interest during the ensuing year. Its columns are enriched by the contributions of some of the best and most experienced electricians and telegraphers of the country, and it presents a complete weekly record of all matters of interest in connection with the telegraph in this country and the world. Its columns will continue as heretofore to be freely open to the discussion of all telegraphic matters, and electrical science in its relations with the telegraph.

The commencement of a new volume with the New Year affords an excellent opportunity for new subscriptions, as well as for renewals of those which expire with the present volume, and the attention of telegraphers and others is invited to the liberal terms offered to those who may exert themselves to maintain and increase its circulation.

It should be remembered that THE TELEGRAPHER is no ephemeral publication, but is a thoroughly established and successful journal. The indications for its future are bright and encouraging.

New subscriptions and renewals made at any time previous to the New Year will be commenced with the first number of the new volume, the intermediate issues being sent free. After January 1st the postage will be prepaid by the publisher, without increase in the price of subscription.

Personals.

Mr. H. DEMING, station agent and operator at Manchester, Vt., is on leave of absence. Mr. A. B. CONNER, night press operator from Rutland, supplies the vacancy.

Mr. GEO. W. METCALF, press operator at Montpelier, Vt., during the two months' session of the Vermont Legislature, is at present subbing at Rutland. Upon Mr. CONNER's return from Manchester Mr. METCALF takes the place of Mr. FRED. W. LIVINGSTON, manager at Burlington, Vt., for a few weeks.

Mr. CHARLES DAY, and Mr. IRWIN of Toronto, Canada, have accepted positions on the night force, Western Union office, St. Louis, Mo.

Miss FLORA COATES has been appointed to a position on the day force in the Western Union office at St. Louis, Mo.

Mr. H. C. MAHONY, of St. Louis, Mo., has been appointed manager of the Western Union office at Denison, Tex.

Mr. E. F. DRAKE has been appointed manager of the Western Union office at Wachita, Kan.

Mr. JOHN E. POWERS is taking night report in the Western Union office at Topeka, Kan.

Mr. JOSEPH MCELVAIN is employed on the night force of the St. Louis, Mo., Western Union office.

Mr. C. T. DAY has resigned his position with the Atlantic and Pacific Telegraph Company, at 198 Broadway, New York, and accepted a situation in the Western Union office at St. Louis, Mo.

Foreign Telegraphic Notes.

THE liquidators of the British Indian Submarine Telegraph Company, the Anglo-Mediterranean Telegraph Company, and the Malta Telegraph Company, have issued their final report for presentation to the meeting on the 3d proximo. They state that all the concessions, property, and liabilities of the companies have been transferred to the Eastern Telegraph Company (Limited), and that the undertakings are fully wound up, in accordance with the terms of the resolutions of the 3d October and 1st November, 1872.

The traffic receipts of the Western and Brazilian Telegraph Company, for the four weeks ended Nov. 20th, were £9,076.

The West India and Panama Telegraph cable, which was damaged in the harbor of Aspinwall by the German mail steamer dragging her anchor, has been repaired.

More Trouble about the Lease of the Franklin Company.

THE New York World learns from Boston that Mr. G. B. Williamson and seventy-four other stockholders in the Franklin Telegraph Company have petitioned the Supreme Court of Massachusetts for a dissolution of the said company, and the appointment of a receiver of its property and assets, to pay its debts and divide the proceeds among the stockholders. The petition was filed 8th inst., and asserts that the Atlantic and Pacific Telegraph Company, having acquired a controlling interest in the Franklin Company, has removed its books and records to New York, where it refuses the stockholders any access to them. It impugns the legality of the lease of the Franklin recently announced by the Atlantic and Pacific Company, and asserts that the stockholders in the Franklin are defrauded of their just rights, and therefore prays that the lease may be vacated and the receiver appointed as above stated. Yesterday, 11th inst., the Supreme Court of Massachusetts appointed a hearing of this petition for the first Monday of February.

Mayor Wickham's First Official Act.

In Nassau street, near the Post-office, stands a telegraph pole that obstructs the pavement. Mayor Wickham ran against it the other day, and declared, while

rubbing his forehead, that the first act of his official life should be to make the Western Union Company remove that pole.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended November 17, 1874, and bearing that date.

156,920.—ELECTRO-MAGNETIC MOTORS. C. J. B. Gaume, Brooklyn, N. Y. Filed Dec. 29, 1873.

Claims that by use of rounded poles and U shaped armatures greater force is obtained, attraction of side as well as of face of core being utilized.

In an electro-motor, the combination of the magnets having the rounded and tangential polar extremities and the double U shaped armatures, substantially as set forth.

156,942.—MAGNETIC MOTORS. G. M. Phelps, Brooklyn, N. Y. Filed Oct. 8, 1874.

The contact point on the lever *f* is kept bright by contact with the wheel *h*, revolving in oil. That part of the circuit closing wheel which runs in contact with the frame being of smaller diameter than the part running in contact with the commutator springs, a partial slipping movement over the springs is produced, thus keeping them free from dirt.

1. The wheel *h*, revolved in oil or similar material, and forming one of the circuit closing points, in combination with the lever *f*, forming the other part of the circuit closer, and a governor for opening or closing the circuit, according to the speed, substantially as set forth.

2. A commutator composed of a range of springs, *s*, and a circuit closing wheel, *n*, running in contact with a circular bearing, when the said wheel is of different diameters at the two points of contact, for the purposes set forth.

3. The ring segments *m*, connected by insulated studs with the circuit closing springs *s* and with the electro-magnets *a*, in combination with a circuit closer *n*, revolving in contact with the commutator springs *s*, substantially as set forth.

156,969.—CLAMPS FOR TELEGRAPH WIRES. Geo. A. Beach, Toledo, Ohio. Filed Aug. 12, 1874.

The wire to be clamped is laid upon the ledge, when the lever forces the sliding block down, the latter being guided by the inclined slot.

The portable clamp herein described, for clamping telegraph wires, rods, etc., consisting of the plate or body *A*, formed with the serrated flange or bed *A'* and slots *F* and *F'* clamping block or jaw *B b*, and lever *C D a*, all constructed, arranged and adapted to operate substantially as and for the purposes set forth.

[ADVERTISEMENT.]

A Card.—The Metallic Galvanic Battery.

In reply to our former card, Edwin Eagles has published a statement, in which he alleges that our assertions in regard to the METALLIC GALVANIC BATTERY are false, and intended to mislead the public, and prints our contract with him as evidence of our recognition of his claim as the original inventor of said battery.

In said contract it is provided that we shall have the exclusive right to manufacture and sell said battery for seven years, it being premised that he is the inventor "of a new and useful improvement in electrical batteries, for which he has applied for letters patent of the United States," etc.

It is provided in the third specification of the contract that "they (we) will keep, or cause to be kept, a just and true account of all moneys received for the manufacture and sale of said improved electrical battery, under said letters patent," and pay him a royalty of ten per centum of the gross amount so received.

When the contract was made we believed that Eagles was the original inventor of the battery, and anticipated no difficulty in his procuring a patent therefor. The application was rejected by the Commissioner of Patents, as before stated; and, notwithstanding our efforts to obtain for him the grant of a patent, we were unable to do so, the invention having been anticipated by the inventor, whose application is now pending.

If Eagles was not the original and first inventor, and could not legally obtain a patent, of course our agreement to pay a royalty to him was invalid.

His statement that his patent will soon be issued he knows to be false, and even if it be so issued, we shall

have for some years the exclusive right to make and sell the battery under the terms of his contract with us—our part of which will be strictly performed when he gets a valid patent on the invention.

We do not propose to bandy epithets with Eagles, whose only object is to injure our business, and who is now well aware that he is not the first inventor, and can never get an original patent for the invention.

F. L. POPE & Co.

New York, Dec. 17, 1874.

PHILADELPHIA.

L. G. TILLOTSON & CO.

beg to announce the opening of an establishment for the sale of

TELEGRAPHIC AND ELECTRICAL GOODS of every description, at

No. 54 SOUTH FOURTH STREET,
(Corner Chestnut street,)

PHILADELPHIA.

They solicit the patronage of their friends and the telegraphic fraternity generally.

ECONOMIZE!

Procure the best and cheapest Telegraph and Electrical Instruments and supplies of all kinds from

LANNERT & DECKER,
31½ Prospect St., Cleveland, O.
Send for circular.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,

No. 40 WEST EIGHTEENTH STREET;
or to
L. G. TILLOTSON & CO.,
8 Dey street, sole Agents.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY

40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skilful mechanics to estimate upon work, or will give any information in writing that may be required. Liberal commissions will be paid upon any orders that may be secured for us. Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON,
President.
CORNELIUS ROOSEVELT,
Secretary and Treasurer,
40 West 18th Street, New York.

GEOERGE H. BLISS & CO.,
 41 Third Avenue, Chicago, Ill.
 CINCINNATI, O., ST. LOUIS, MO.,
 Elm St., cor. 5th. 409 North Third St.
 Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

RELAYS, unequalled for beauty and strength;
 COMBINATION SETS; BOX and POCKET RELAYS.
 CHALLENGE, PONY and REPEATING SOUNDERS.
 KEYS, various styles, including the SCHNEIDER KEY, just
 out, no legs, wire connections above the table.
 REGISTERS, with SPRINGS or WEIGHT.
 CUT OUTS, many varieties, including a new style of PEG CUT
 OUT, with an adjustable LIGHTNING ARRESTER, just out.
 REPEATERS—HASKIN'S AUTOMATIC, and others,
 SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES
 and LIGHTNING ARRESTERS.
 ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also
 SELDEN PRINTER.

ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR
 ALARMS, and WATCHMAN DETECTORS.
 ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHT-
 ING APPARATUS.

MEDICAL INSTRUMENTS and APPARATUS on hand and made
 to order. Second hand instruments for sale cheap,
 and repairing done at short notice.

BATTERIES in great variety, including the latest inventions;
 also a full assortment of battery material.

WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE
 WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED
 LINE WIRES; SUBMARINE, SUBTERRANEAN and
 HOUSE CABLES.

INSULATORS—BROOKS. SCREW GLASS and KENOSHA CARBON.
 BRACKETS, PINS and SPIKES, TELEGRAPH POLES,
 LINE BUILDERS and REPAIRERS' TOOLS.

TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANI-
 FOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES,
 ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and
 AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are
 elegantly finished and mounted on highly polished rosewood,
 mahogany and walnut bases.

SOMETHING NEW!

[PATENTED SEPT. 29, 1874.]

THE FAIRY ELECTRIC ENGINE.

A perfect working model of an engine
Run by Electricity!
 It will work well with an ordinary local battery.

Price, with two cells Eagles' Metallic Battery.....\$6 00
 " without Battery..... 4 00

May be seen working at the office of the THE TELEGRAPHER.

For sale by

The Electro-Magnetic Manufacturing Company,

36 BROAD STREET, NEW YORK.
 P. O. Box 1804.

Also for sale by

L. G. TILLOTSON & CO., 8 Dey street.
 F. L. POPE & CO., 38 Vesey street.

A NEW GALVANIC BATTERY.

**Durability, Efficiency, and Economy of Expense
 and Labor at last Secured.**

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for
 manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic
 and other purposes yet devised.

The Battery cell is made of *lead*, and forms one pole of the
 battery. Sulphate of copper is the only chemical required to be
 used.

These Batteries have been fully tested during the last year,
 although only recently offered for sale, and have proved to be
 superior to any other as regards efficiency, economy and dura-
 bility. When once set up they require no attention for from
 four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready.
 No. 1 is a large square cell, and can be used as a local or for
 running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a
 saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.
 Descriptive circulars and price list forwarded upon applica-
 tion to

Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

**BROOKS' PATENT TELEGRAPH
INSULATOR WORKS,**
AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
Resistance Coils, Submarine Cables,
AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,
22 South Twenty-first Street. PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,

AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

**A SUPERIOR PRINTING TELEGRAPH
INSTRUMENT,**
FOR PRIVATE AND SHORT LINES.

*Awarded the First Premium—Silver Medal—over all others at
Cincinnati Industrial Exposition, 1872.*

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employés, &c., for the introduction of the Printer.
For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
No. 50 BROAD STREET (Rooms 12, 13 & 14).

GEO. H. BLISS & CO.,
41 THIRD AVENUE,
Chicago, Ill.

MANUFACTORY OF THE SPENCEREAN STEEL PENS,
BIRMINGHAM, ENGLAND.

SPENCEREAN DOUBLE ELASTIC STEEL PENS.

The superiority and excellence of these justly celebrated Pens are appreciated, as is shown in their constantly increasing sale. They are comprised in fifteen numbers, of which one number alone has an annual sale of more than
\$3,000,000.

The SPENCEREAN PENS are manufactured of the very best material by the most expert workmen in Europe, and are famous for their elasticity, durability and evenness of point.

THE SPENCEREAN PENS ARE FOR SALE BY
ALL DEALERS.

We make Fifteen Numbers of Pens, differing in flexibility and fineness of point, adapted to every style of writing, as follows:

- No. 1. COLLEGE PEN. *Point Fine; Action Perfect.* This is a great favorite with our leading penmen, is largely used in the Schools and Commercial Colleges throughout the country, and gives better satisfaction than any Pen before the American Public.
- No. 2. COUNTING-HOUSE PEN. *Point Fine and Flexible,* well adapted to the use of Correspondents and Accountants.
- No. 3. COMMERCIAL PEN. *Point Medium.* An Easy Writing Business Pen.
- No. 4. LADIES' EXTRA PEN. *Point Extra Fine and Flexible.* For Delicate Fine Hand Writing this is a very superior Pen.
- No. 5. SCHOOL PEN. *Point Fine, Medium in Flexibility.* For a durable School Pen it has never been equalled.
- No. 6. FLOURISHING PEN. *Point Long, Flexible and Medium in Fineness.* For Off-hand Flourishing.
- No. 7. QUILL PEN. *Point Medium, Quill Action.* A smooth, Easy Writing Pen. Its name well represents its qualities.
- No. 8. CONGRESS PEN. (New.) *Medium Flexible Point.* A very superior Pen for all styles of writing. This Pen undergoes a process that renders it non-corrosive and three times more durable than any ordinary Steel Pen.
- No. 9. BANK PEN. *Point Long and Flexible.* A great favorite with Accountants, Tellers, etc.
- No. 10. CUSTOM-HOUSE PEN. *Point Medium.* Well adapted to all styles of Bold Free Hand Writing.
- No. 11. UNIVERSITY PEN. *Point Medium, very Smooth and Flexible.* The action of this celebrated Pen is very fine.
- No. 12. EPISTOLAIRE PEN. *Point very Fine and very Flexible.* This is the finest Pointed Pen made, and, for very Delicate Writing, Map and Fine Pen Drawing, it has no equal.
- No. 13. ENGRASSING PEN. *Point Blunt and Smooth.* Particularly adapted to Coarse Hand Writing and Engraving.
- No. 14. ARTISTIC PEN. *Flexible, with extra fine point.* This Exquisite and Truly Celebrated Pen is the Best Pen extant for Fine Ornamental Writing.
- No. 15. THE QUEEN. *Point extra fine.* Admirably adapted to all kinds of Fine Writing.

Sample Cards containing all the FIFTEEN Numbers, securely inclosed, will be sent by mail on receipt of 25 cents.

IVISON, BLAKEMAN, TAYLOR & CO.,
138 & 140 Grand street, N. Y.

THE TELEGRAPH MONITOR:

A REVISE AND ENLARGEMENT OF THE
TELEGRAPH MANUAL,

BY
TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual,"
"History of America," "Civil War in America;" Member
of many Scientific and Learned Societies of Europe
and America; Commander of the Order of Dan-
nebrog, Denmark; Order of St. Olaf,
Norway, and of the Sword Order,
Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80
pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

Vol. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

Vol. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

Vol. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ørsted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

Vol. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Chappé, Le Sage, Roulard, Cooke, Wheatstone, Davy, Steinhell, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

Vol. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any attention whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a

LOCAL BATTERY,
or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

PROVIDENCE, R. I.,

Manufacturer of

Patent Finished Insulated Wire, Patent Rubber Covered Wire, Magnet Wire, Patent Electric Cordage, Cables, etc.

I claim to furnish the best Braided Wire in the Market, and I believe it is acknowledged as such by all large Telegraph Companies and Telegraph Supply Dealers.

My Wires were awarded the first premium at the Cincinnati Exposition of 1874, both for best "Office" and best "Insulated Line Wires."

These Wires are furnished in any desirable color or plaids.

My Rubber Covered Wire will not crack, and is not affected by ordinary extremes of heat or cold. The rubber covering is of uniform thickness, and the wire will be found in the exact centre—a result not heretofore produced.

I also make cables of any number of conductors at the regular price for a single wire.

With new and improved machinery I feel satisfied that I can furnish magnet Wires as good as any to be found in the market.

All Wire used by me is made to my special order, and is the best that can be procured in the market.

I could give a long list of testimonials, but depend on the merits of the Wire for patronage.

Please send for sample card and price list.

MODERN PRACTICE OF THE ELECTRIC TELEGRAPH.

A HAND-BOOK FOR

ELECTRICIANS AND OPERATORS.

By FRANK L. POPE.

Seventh Edition, Revised and Enlarged by the addition of 40 pages of New Matter on

RECENT IMPROVEMENTS,

AND

FULLY ILLUSTRATED.

8vo, cloth, \$2.00

Copies sent free by mail on receipt of price.

My new Catalogue of American and Foreign Scientific Books sent per mail, on receipt of ten cents.

D. VAN NOSTRAND, Publisher, 23 MURRAY STREET and 27 WARREN STREET.

THE BISHOP GUTTA PERCHA WORKS,

422, 424, 426 EAST 25th ST., N. Y.

S. BISHOP, Proprietor,

ONLY MANUFACTURER

OF

PURE GUTTA PERCHA GOODS

IN THE

UNITED STATES.

Has also on hand, and makes to order,

SUBMARINE CABLES, OFFICE CABLES, AND INSULATED WIRES OF EVERY VARIETY,

FOR

TELEGRAPH, UNDERGROUND AND ELECTRIC USE.

Fuse Wires, Leading and Connecting Wires for SUBMARINE and MINING PURPOSES.

Also, a NEW COMPOUND (thoroughly tested) for underground and out-door use.

Cotton, Linen, Silk and Fibre covered Wires for

MAGNET AND OFFICE USE,

of any pattern or style.

OFFICE WIRES,

Cotton and Gutta Percha covered, with any number of conductors required.

Gutta Percha and Cotton covered Wires for HOTEL ANNUNCIATORS, ELECTRIC BELLS and BURGLAR ALARMS.

Has on hand and makes to order

SUBMARINE CABLES, INSULATED WIRES, for TELEGRAPH AND ELECTRIC USE, AND FOR

BLASTING AND MINING PURPOSES.

In every variety desired.

As an Insulation for Telegraph Cables and Electric Conductors GUTTA PERCHA has been universally adopted by all scientific and practical Electricians and Manufacturers of Telegraph Cables and Wires in this country and Europe, and has sustained, with increasing superiority in the practical test of over twenty-five years' general use.

The PROPRIETOR will guarantee, to all parties purchasing

SUBMARINE TELEGRAPH CABLES,

to make and deliver at his Factory any style of Cable, Insulated with Gutta Percha, as low as they can import Cable of the same style and quality, and in half the time required to import them.

CABLES OF ONE MILE OR LESS manufactured and delivered at one week's notice.

ORDERS RECEIVED AT THE FACTORY.

Messrs. L. G. TILLOTSON & CO., 8 DEY STREET, NEW YORK,

have been appointed by me GENERAL AGENTS for the sale of any Telegraph Cable or Wire manufactured at the Works in New York, at Factory Prices, delivered in New York.

JOHN THORNLEY, 503 Chestnut St., Philadelphia,

has been appointed Agent for the sale of any and all goods manufactured by me, at Factory Prices, delivered in New York.

Any Goods manufactured (except Telegraph Goods) are for sale in New York by

SARGENT & STUDLEY, 26 Park Place, RUBBER CLOTHING CO., 363 Broadway.

D. HODGMAN & CO., 27 Maiden Lane, SHEPARD & DUDLEY, 150 William St.

Original Articles.

The Automatic versus the Morse System of Telegraphy.

I HAVE read with much pleasure the excellent communication of a correspondent under the signature, "Morseite," in THE TELEGRAPHER of December 19th, which pleasure was not at all lessened by the fact that my own conclusions, so far as I have had the necessary time and opportunity to look into the matter, differ materially from his. I have taken but little part, thus far, in the controversy which has been for several years in progress between the respective advocates of the Morse and Automatic systems, principally because I did not like the spirit in which it has been carried on. Instead of argument we have had recriminations and appeals to individual and class prejudice; while instead of facts, we have had theories and extravagant assertions, and this has been too much the case on both sides.

This correspondent has written in a commendable tone of moderation and fairness, and I trust his example may be followed by others who have anything to say on either side.

The whole question lies in a nutshell. If, by means of the Automatic system, the telegraphic business of the country can be transmitted as promptly and correctly as by means of the Morse system, with its present and prospective improvements, and the work can be done by the former at any material reduction of expense, then the general introduction of the Automatic is only a question of time. That it will in any event supersede the Morse system entirely I do not consider at all probable, but it is certain that nothing any of us may say or think on the subject will influence the final result. The editor of THE TELEGRAPHER seems to think that the introduction of the Automatic system offers the only probable solution of the vexed problem of cheap telegraphy, and for expressing what is doubtless his honest conviction, an attempt has been made to prejudice the telegraphers of the country against him, on the ground that he is opposing their interests, an assertion that comes with a peculiar ill grace from a journal apparently run in the interest of, if not owned by a party who has probably made more money out of Automatic telegraphy thus far, than any other man in the United States.

But I intended in this communication merely to glance at the relative capacity and expense of the two systems, as the matter presents itself to my mind.

The rate of speed at which wires are actually worked is a matter of endless dispute when discussing this subject. I give below the result of six consecutive days' actual work, taken from the records of the New York Western Union office in 1868:

MORSE CIRCUITS.

Wires.	No. Messages.	No. Words.
No. 1, to Chicago	2,088	64,728
" 3, " Buffalo	1,267	39,654
" 7, " Boston	508	55,948
" 4, " Baltimore	839	40,534
" 11, " Washington	1,051	33,682
Total for 6 days	5,753	234,546

PRINTING CIRCUITS.

Wires.	No. Messages.	No. Words.
No. 5, to Albany	1,308	41,108
" 1, " Boston	1,948	79,638
" 10, " do	1,719	61,979
" 1, " Washington	1,866	76,342
" 7, " Philadelphia	1,639	52,509
" 8, " do	1,754	55,174
Total for 6 days	10,234	366,750

If we suppose each wire worked to its full capacity from 9 A. M. to 5 P. M., it would give a total of 240 hours per week for the Morse circuits, and 288 for the printing circuits, and the average result would be as follows:

Morse, average per hour.....	977 words.
Printing, " "	1,273 "

The circuits included in the above statement were at that time the busiest ones in the New York office.

During the year 1872 several instances of first class work on regularly numbered messages were timed, of which I take a few of the best:

MORSE CIRCUITS.

330 messages in 6 hours 30 min....	50.7 per hour.
136 " " 2 hours.....	68. " "

PRINTING CIRCUITS.

606 messages in 7 hours, 86.5 per hour.
700 messages in 8 hours 45 minutes, 80 per hour.

Some of the best work in this country has been done in transmitting the President's annual message from Washington to New York. The time recorded is as follows:

Year.	No. Words.	No. Wires.	Time.	Average per hour.
1872	11,339	12	45 mins.	1260
1873	10,635	8	59 "	1368

If we therefore put the best Morse transmission at 1,368 words per hour, and divide it by the greatest number of messages per hour given above, which is 68, it gives us an average of 20.1 words per message, which is probably very near the truth. This would give us as the present attainable speed, in actual work, on a circuit of 250 miles, say:

Morse, 1,368 words per hour.
Printing, 1,738 words per hour.

Now let us see if we can approximately get at the cost of transmission by the Morse system, under favorable circumstances, on a 250 mile circuit. We find, as above, that a first class Morse operator can send or receive at the rate of 330 messages in 6 hours 30 minutes, which is 50.7 per hour, say 400 per day of 8 hours. The two operators would cost say \$4 per day each, or \$8 for the two.

We have procured the following figures from official sources: The cost of a good line is not less than \$150 per mile, or \$37,500 for 250 miles. We therefore have:

Interest on cost of line, at 7 per cent....	\$2,625 00
Maintenance of line \$7.70 per mile....	1,925 00
Battery \$1.21 per mile	302 00

Total per year.....	\$4,852 00
Total per day.....	13 29
Add salaries of two operators.....	8 00

Total expense per day of one wire, having capacity of 400 message.....	\$21 29
Cost per message.....	.053

There are, of course, numerous other expenses, such as rent, clerk hire, superintendence, stationery, lights and fuel, etc., which it is fair to suppose will be about equal for either system. If we admit that the duplex is equal to two wires, and the quadruplex to four, which is a very liberal allowance, we would have to estimate for the increased cost of battery and operators only. We should, therefore, have, by the same method of calculation, approximately the following figures:

Cost per message, ordinary circuit.....	.053
" " duplex circuit.....	.037
" " quadruplex circuit.....	.029

If it were possible to work an *octoplex*, the cost per message would be .026, so it appears that, all things considered, there is no great gain in carrying this principle beyond the duplex, for working circuits of ordinary length. On longer circuits the proportionate saving would be greater were it not for the fact that the difficulty of working a complicated apparatus rapidly and continuously also increases in proportion to the length of the circuit. As the number of routes carrying business enough for a quadruplex is not very great, it would seem hardly probable that this system will work the revolution in the telegraph service that your correspondent seems to expect.

The automatic perforating machine now used I have seen worked by an expert at the rate of over fifty words per minute. It can certainly be fingered much faster than the Phelps printer. Each letter is made by a single touch, and it would be entirely within bounds to place the capacity of the machine, in the hands of a good operator, at 2,000 words per hour. The most authentic record I have at hand of the speed of the automatic, is that of the transmission of the President's message and accompanying documents in 1873 from Washington to Pottsville, Pa., a distance of about 240 miles by the line. On this occasion 11,640 words were transmitted in thirty-four minutes, or at the rate of 20,538 words per hour, and I was informed by Mr. Sellers, of Reading, that no special effort was made to send it with unusual rapidity. We may safely allow this rate, after the system is thoroughly established, or say, 20,000 words per hour.

In my opinion the only place where cheap labor will be found available in automatic telegraphy is in the copying. The characters are written with accuracy and distinctness, and with the type writing machines now in use it does not necessarily require a high degree of skill to copy from the telegraphic strips and print the messages at the rate of say 1,500 words per hour. This work can be done at this rate by girls for about \$1.50 per day. The perforating, however, requires ex-

actly the same kind and the same amount of skill as the work of a first class Morse or combination operator.

Now let us see what we can do on one wire by the Automatic system:

Interest on cost of one wire.....	\$2,625 00
Maintenance	1,925 00
Battery	302 00

Total per year..... \$4,852 00

" " day.....	\$13 29
Salaries of 10 perforating operators..	40 00
" " 2 operators at Ins't's....	8 00
" " 14 copyists.....	21 00

Total expense per day..... \$82 29

The number of messages in 20,000 words is, as we have seen, 1,000, which would be 8,000 for a day of eight hours, and the cost would be .0101 per message. This would be less than one third the cost of the duplex, and a little in excess of one third the cost of the quadruplex system.

I think no one will assert that the capacity of the Morse system is underrated in the above calculation; and I am quite sure that every unprejudiced telegrapher who is familiar with the Automatic system will admit that, under a properly organized system of handling business in the offices, equal, let us say, to that of the Western Union, it will be capable of doing certainly as much, and probably considerably more than I have given it credit for.

I have only referred in this article to the working of ordinary circuits of say 250 miles in length, but it is evident, in circuits of 500 miles or more, the comparison would be still more favorable to the Automatic.

If the introduction of the Automatic system should result in the reduction of rates to one half their present amount on all the principal routes, it is evident that a large increase of business will follow, and the whole number of first class men employed would exceed by at least 50 per cent. the number at present required.

I am fully aware that the "cheap labor" propositions of the advocates of Automatic telegraphy have created a strong prejudice against the system in the minds of American operators, but the system itself is not responsible for this.

In fixing the salary of first class operators, as much account is made of experience, good judgment, ability to read copy correctly, etc., as of mere manual dexterity, and all these qualities are as much required in operating an Automatic punching machine as in a Morse or printing instrument.

In regard to the comparative accuracy of the Morse and Automatic systems, much might be said on both sides. I incline to the opinion that experience will prove the latter to be quite as accurate as the former, though probably less so than the printing instrument. This, however, is a question that it is of little use to speculate upon. Only experience can determine the point with absolute certainty.

If I am correct in my estimates of the cost of working the two systems, I do not see how the Automatic can fail to become very extensively employed in the future, either by a new company or by the Western Union, or more likely by both. I must confess that I do not myself think the success of the Automatic will be adverse to the interests of operators. Even if it were otherwise, I see no help for it. If the Automatic system turns out to be the most profitable one, it will eventually make its way into the field in spite of all the opposition that may be brought against it, and if not, it will have to follow the long line of beautiful inventions that had "no money in them," and have consequently been allowed to lapse into oblivion.

Elizabeth, N. J., Dec. 22, 1874.

Retrospective and Otherwise.

By OWTON A. FLYE.

I MARK this 14th day of December, in the year of our Lord, &c., as an anniversary, not commemorative especially of a closing epoch or a dawning era, but indicating, rather, two important and prominent periods in the history of my life and my profession, to wit: the steady gradation, by uneasy stages, from the point where I was the best operator in the universe of God, toward that ultimate where I shall come to know, and of which I have now a remarkable conception, that I am *not* the embodiment of all that is best in the ranks of that calling which I had so fondly hoped to adorn. There was a time, in the very outset of my professional career, when it seemed to be the firm conviction of my soul that earth had no sorrows which my sending could not heal, and that my receiving must have taken many a weary burden from the life of the transmitter with whom it was my duty to be connected. But time and experience have so modified my convictions that now, at this 14th annual contraction of my views in that

respect, the recollection of my former glory has become so indistinct as to raise the question in my mind whether, after all, the circumstances had any foundation whatsoever in fact.

It was partly on account of this, and partly because I was sorry to see a beginner starting wrong in life, that I could not enter into the enjoyment of the affair when young Sneezweed, with his deft fingers still upon the key that had carried dismay to the heart of an unsuspecting victim, and with his mind still inflated with the importance of the transaction, leaned insinuatingly over to tell me that "he had made that snake hunter at Town Line sick." Now, out of all the emotions which thronged my inner consciousness at this announcement, two evolved themselves into unmistakable prominence—one as to the elements and conditions that go to make up a snake hunter, and the other taken up with conjectures as to the nature of the disease with which he, she or it had been visited by this veritable Nemesis.

The former question I dismissed for subsequent consideration, and the latter I soon began to regard as an ailment whose cause and cure were so far removed from the province of *materia medica* as to preclude the possibility of a diagnosis, even at the hands of Esculapius himself.

It will be conceded, I presume, that there comes a time in the life of every person endowed with reasonable faculties for a correct understanding of things—that there comes a time, I say, when he feels that the capacities of his soul are filled, and that constructed as he is, in the frailty of a nature which is simply human, it would be an act of cruelty to add another drop to his cup of joy, now already so replete as to be a positive burden to his being.

I instinctively felt, when Sneezweed spoke to me, that the time had come for me to do reverence to such a sentiment. I had an intuitive knowledge that my young friend was under the spell; and under the influence which seemed to surround the occasion, I did the best thing that could be done in a situation like that—namely—sighed. I comprehended in an instant the complete history of this case, from the time when the principal in it, working assiduously in an unpretentious railway office in the country, and aspiring unswervingly to a commercial one in the city, down to the very moment when the culmination of his hopes had been reached; and when his chair went back to an angle of forty-five degrees, and his eyes closed on the scene for a moment, as if to say, "now, my ambitious soul, he still." I knew that the zenith of his aspirations had been attained, and that earth had no more delectable thing to give him than that hereafter his lifeway might be strewn with flowers, yet no future enjoyment could come to him as substantial as that. Friends might forsake him in the years that were coming, but no desertion on their part could separate his soul from its remembrance of that; and I felt that the critical period of his transmitting life had been reached, and henceforth, when the social knot should be gathered, on dull days, at convenient localities in the office, to discuss the relative merits of its members, Sneezweed would be admired as having achieved the distinction in his profession to say (in the slightest perversion of a western phrase) that he had "sickened his man."

The Lease of the Lines of the Franklin Telegraph Company to the Atlantic and Pacific Telegraph Company Confirmed.

A MEETING of the Franklin Telegraph Company was held in Boston, on Wednesday, Dec. 16, in response to a petition of a minority of the stockholders, representing 3,710 shares, for the purpose of considering the subject of leasing the property to the Atlantic and Pacific Telegraph Company for the sum of \$30,000. W. J. Syms, President of the Company, called the meeting to order and the records of the last meeting were read.

Mr. John R. Bullard, of Dedham, took exception to the records, and contended that he offered a protest verbally before the vote to lease the lines, and then reduced it to writing. He insisted that his protest should have been entered in the order in which it was offered. The vote on amending the records was 1,645 shares to 5,172, and they were approved. A motion was then offered approving the lease to the Atlantic and Pacific at \$27,500 per annum. Mr. George R. Williamson asked for the reading of a letter in which he claimed that he had, in behalf of certain parties, made an offer to lease the line for \$35,000 per year, payable semi-annually, and protesting against the leasing of the line to any parties for a less sum than \$35,000. The President took the ground that no offer had been made by Mr. Williamson. Mr. Williamson read a reply to his letter, in which Mr. Lyons stated that he had no power to lease the line to any other parties than the Atlantic and Pacific Telegraph Company. In reply to a question the President read a letter addressed by him to J. B. Brown, in which he said:

"I think that it is greatly to the interest of the Franklin Company to lease, upon the terms that I have procured for it, for the following reasons: The books of the Company show that a net profit of \$119,135 68 has been earned during the years commencing April 30, 1870, to April 30, 1874. During 23 months of that time the Company had the Signal Service business, which they had not before, have not now, and may not have again, which produced \$54,000 at an extra cost to the Company of \$12,000 for expenses, which, reduced, leaves \$42,000 to be deducted from the \$119,135 68, which leaves \$78,000 for the average earnings of the Company for four years—which is about \$19,000 per year. I can only find that all that time two dividends have been paid to stockholders, and the Company has a round debt of \$9,000 unpaid. To reply, it can be said that the books do show that as much as \$44,000 has been made in one year. Deduct for signal service business, now lost, \$27,000, less its expense, say \$6,000, the result will be for that year \$23,000—a much less amount than has been obtained for the Company by leasing it to the Atlantic and Pacific Company on the terms in the lease. The resolution passed at the stockholders' meeting in November instructed me to lease at not less than \$25,000. I found upon the record of the Company that, at a meeting of the stockholders, held in October, 1873, a resolution passed to lease to the Atlantic and Pacific Company the Franklin Line, at not less than \$25,000. An appeal was made to the Committee of the Atlantic and Pacific Company, that the Franklin Company had incurred indebtedness by reason of contracts for extension of lines, say two lines from Rye Beach to Boston; also, finishing of line from Providence to Newport, and some extensions in New Jersey, which, with the expenses, would amount to \$25,000, or perhaps \$30,000, for which the Franklin should become vested, as the Company had some indebtedness yet to pay besides the rent mentioned, and for that reason the rental of the Company should be increased to \$27,500 per year, which was done, and a clause inserted that, if to satisfy existing contracts more lines had to be built, then the Franklin Company had the right to build the same and get eight per cent. additional rent on the amount expended, up to a rental of \$30,000 per annum. But if the stockholders of the Franklin did not wish to build or incur any more debt, the Atlantic and Pacific Company had the privilege of building and collecting revenue or rent therefrom. The present debt of the Company without the bond is about \$10,000; with the bond, under \$20,000; and \$27,500 per annum for 99 years. That, in my opinion, is much better than the Franklin Company has ever done, and more than the books can possibly show it to be worth.

An ineffectual attempt was made to stave off the vote, after which the vote was taken with the following result: In favor of ratifying the lease, 5,170 shares; opposed, 27 shares, and the lease was declared confirmed.

This ends the matter so far as the lease is concerned, unless the Supreme Court should grant the application pending for a receiver.

Kite Tails and Telegraph Wires.

TO KEEP the telegraph lines free from entangling alliances in a city like New York is no easy task, and the chief of sinners in this respect is the small boys' kite tail. As though presuming on the service to telegraphy rendered by one of their class in the hands of Franklin, these playthings—of future Franklins, let us hope—are incessantly taking liberties with the wires, breaking thereby their own continuity, and endangering the continuity of the messages the wires are intended to convey. To assist the kite tails in this mischievous work naughty boys tie stones to strings and strips of cloth, and then sling them so that they wind round the wires and suspend the stones—a perpetual menace to passers underneath. In this way the wires in many neighborhoods are made to resemble the limbs of an African prayer tree, with its burden of rags, tags and strings hung on hy pious wayfarers.

The effect is not ornamental, nor does it add to the efficiency of the wires, especially on rainy days. At almost any moment on the side streets you may see the telegraph men climbing the poles to remove the strings, or reaching for the nuisances with long rods like stout fishpoles, which they twist among the strings until they are firmly attached, then by main strength strip them from the wires, sometimes at imminent risk of the integrity of the wires and their attachments. We never see the operation without wondering at its clumsiness. Why not burn the strings? It would be an easy matter to attach a light to the end of a slender bamboo pole, so that the flame could be slid along under the wire, charring any string or rag it might encounter, thus dislodging the snarls that are so hard to remove by force. The light could be hung, if need be, so as not to touch the wire or in anyway interfere with the transmission of messages. A simple hook, or a grooved wheel at the top of the

pole, would enable the apparatus to run along the wire so that it would be no trouble to guide it.—*Scientific American.*

Left by the Wayside.—The Adventures of Two Nice Young Operators from Golden.

SUNDAY being a nice, warm sunshiny day—just the day for a pleasant drive—two gay and handsome young telegraph operators of Golden resolved to show their store clothes in the streets of the Capital. After placing themselves in the handsomest "livery rig" in Golden, they shook the lines over a pair of fiery sorrels and drove down over the hills to Denver. After doing the main streets and attracting the admiration of numberless susceptible marriageable young ladies, and the envy of the Denver masculines, they wound up their drive by a whirl along West Larimer street. Unhappy resolve! The team of frisky sorrels resolved upon rebellion just as they crossed the Cherry Creek bridge. At a mutually agreed upon signal they shied to the roadside and dumped the young telegraph operators out upon a lumber pile and trotted on up the street as if nothing had occurred. Reaching the corner of Fifteenth and Larimer streets the mischievous animals pretended to take fright at a street car, and turned the buggy over upon the turn-table, leaving two wheels of the vehicle scattered promiscuously about the streets, and the Golden animals decided upon a hasty flight for home. They went dashing down Fifteenth street at a full gallop just at dark. Officer Sanders thought he would stop them, but changed his mind when the plunging animals were within a few feet of rushing over him. The last that was heard of that team was a thundering noise in the direction of the Fifteenth street bridge, as the team started for Golden. A short time afterward two young men called upon Sanders, inquiring whether he had seen "a stray team."

"Stray team?" said Sandy, "I saw a span of sorrels again! like h—l towards Golden!"

The young men took the train for home early on Monday morning.—*Denver (Col.) Democrat.*

An Electrical Conversation.

LONDON, ENGLAND, Dec. 5, 1874.

TO THE EDITOR OF THE TELEGRAPHER.

ONE of the most interesting events that has occurred in a long time—that is, from an electrician's point of view—was the "conversazione" given by Sir William Thomson, President of the Society of Telegraphic Engineers, on Thursday last, at King's College in the Strand, the affair being under the immediate management of Mr. G. E. Preece, the indefatigable secretary of the society. All the most recent electrical and telegraphic inventions were exhibited, and nearly, if not all of them, were set up in working order, with batteries, etc., complete. So many of these inventions were exhibited that I hardly know where to commence in describing them. I was much interested in watching the operation of an artificial submarine cable, composed of resistance coils and condensers, which exhibited precisely the same phenomena as an actual cable. The microscope galvanometer used for receiving the signals was arranged upon the mirror principle, but showing a black reflection on white ground. This is said to be more easily read, and to enable the receiving clerk to write his own message. This was exhibited by Mr. H. Varley.

Two automatic cylinder transmitters by Messrs. Siemens Brothers were "in circuit," to demonstrate the special functions of the transmitter and the working of the duplex system. The instrument unites two functions, composing and transmitting messages which are sent by pressing finger keys, each key forming its own letter, which is made by one pressure only, while it is received in "Morse" characters. The machine is in actual working upon a portion of the Indo-European system.

Specimens were shown under microscopes of various marine insects which attack submarine cables and work their way through gutta percha and hemp, and in some cases producing an actual "fault." At present telegraphists are open to suggestions for the destruction of these insidious destroyers. Poisoning has been suggested, but the experiment has not yet been tried, as far as I have heard.

Among the American inventions exhibited were the "electric gas torch" and "the electro-motograph," which are greater novelties on this side the Atlantic than in the United States, I fancy.

A type setting machine, by Mr. Mackie, attracted universal attention. It is a mechanical triumph, which has now been often described, and its capabilities seem only to stop short at making "copy." Its mechanism may be somewhat understood by saying that it has a slight resemblance to the capstan of a ship; that it has twenty-five pockets arranged around it at equal distances; that each pocket has eight divisions, holding eight kinds of type; and that the twenty pick-pockets, after having their triggers set at the "spelling bracket," by means of the perforated paper, run round and underneath the "pockets," and extract one or more letters at once, delivering them in due order at the spout, in endless lines, ready for justification. In the larger machines such a phrase as "and," "the," "man," "who," "which," etc., would be extracted from one pocket by one movement of a pick-pocket. The machine has been used for years by Messrs. Clay, Sons & Taylor, and is now setting the small advertisements of the *Hour*, the first line in minion and the remainder in nonpareil coming out the moment the attendant turns the handle or the steam is turned on.

A tide calculating instrument, a highly elaborated piece of mechanism, was exhibited by Sir W. Thomson, and the theory of its action is based upon the harmonious method of reduction carried out by Sir William, as reporter of the Tide Committee of the British Association, the whole of the calculations for which were reduced under the superintendence of Mr. E. Roberts, F.R.A.S. The main solar and lunar components and their several inequalities are registered in the form of an indicator diagram. When the machine is in action each solar hour is automatically notched in the diagram, so that tidal heights can be read off at any time in the day. The indicator paper is wound off on an endless reel, so that a whole year's curves can be traced on a single slip. Fitted on the same frame as this calculator was a tide gauge, with Sir William Thomson's improvements, which do away with the irregularities of printed paper, the instrument marking time and height. A large number of prominent electricians and scientific men were present, and the reunion was in every respect a most successful one. RECORDER.

Adjournment of Congress for the Holidays.— Scare at the Capitol.—New Fire Alarm Telegraph Needed.

WASHINGTON, D. C., Dec. 22.

TO THE EDITOR OF THE TELEGRAPHER.

The resolution to adjourn from to-morrow until Tuesday, January 5, passed the House of Representatives yesterday, and will no doubt be agreed to by the Senate to-day.

There has been no mention of telegraph matters in either House since my former letter, and no indication of interest therein.

Considerable excitement was occasioned one day last week in the House end of the Capitol by a rumor that the large stores of wood and coal in the vaults were on fire. A dense smoke of a peculiar odor filled the cellar, which gave color to the report. Upon investigation it was found that some person had incautiously lighted a gas burner, which had in some way got turned under the Western Union cables, which are suspended from the roof of the vaults, and the inflammable tar and hemp soon caught fire and burned rapidly, causing a dense smoke. The cable was rendered useless for telegraphic purposes by this accident, but the employes of the company soon substituted temporary wires for the cable, and there was but little interruption to business.

A local morning newspaper here published a sensational account of the burning of a *gas pipe* in the vaults of the House, and gave a vivid description of the rush of the flames toward the piles of wood and coal, and that its timely discovery by two of our citizens alone prevented great damage being done to the Capitol, etc.; all of which, of course, is bosh, as the foregoing is all there was of it, the burning cable being represented in the account by the supposititious gas pipe.

The necessity for the reconstruction of the fire alarm telegraph in this city has long been apparent, and there is at last some prospect of this important matter receiving attention. At a meeting of the Board of Fire Commissioners a few days since, a report was read from Mr. H. R. Miles, superintendent of the fire alarm telegraph, calling attention to the worn out condition of the line and apparatus comprising the system of fire alarm telegraph in his charge, from long continued use, and to the urgent necessity for immediate action, looking to the introduction of an entirely new system; and, in view of the facts fully explained in the document, he solicited the cooperation of the board in securing the passage of a proper bill by Congress during the present session for the construction of the most approved system of automatic fire alarm telegraph in the District. The report was accompanied by a bill to be presented to Congress, making an appropriation of \$50,000 from

the national treasury for the construction of the desired new system of fire alarm telegraph, the money to be expended by the District authorities, and an equal amount to be paid by the District of Columbia.

After fully discussing the report and the accompanying bill, it was finally ordered that they be transmitted to the District Commissioners, with the cordial endorsement of the Fire Board, and an earnest request that the District Commissioners recommend prompt and favorable action by Congress.

Mr. Miles also presented a communication announcing the death of Henry H. Bishop, who had been employed in the fire alarm telegraph office for nearly seven years; and, on motion of Mr. Thomas, it was ordered that Frank B. Squires be recommended to the District Commissioners for appointment to the position made vacant by the death of Mr. Bishop, and that Mr. G. H. Noyes be recommended to succeed Mr. Squires.

It is to be hoped that Congress will act promptly in this matter, as it is one of great importance to the city, whose fire alarm telegraph is liable to prove inoperative at a critical juncture. CAPITOL.

Electrical Puzzles Demanded.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE been a steady reader of your paper for years (having bought it every Saturday that I have had a nickel to spare and did not want a glass of beer). I have waded through all of Mr. Little's interminable explanations, sometimes commencing at the beginning and reading them through that way, and sometimes at the end, and worrying through 'em backwards; it doesn't matter much which. I have struggled with his duplex reviews, which, I confess, I was able to make nothing out of, even with the aid of a stereoscope.

Having, I say, done this, I feel perfectly competent to "tell you what you ought to do." The public, sir, demands puzzles! And it will be satisfied with nothing but puzzles!

What can be more elevating than to see a plug sit down, with a bran new pencil and a big pile of yellow soft sheets, to calculate the resistance of the Harlem bridge, or to solve some such problem as this: Given, a hairpin and a battery jar, make a self-breaking, double acting repeater, capable of connecting two lines, each a hundred miles in length.

Why not afford people this innocent pleasure? I think it would be a good plan for you to start a rebus column, like the "Fireside Weekly" or the "New York Companion." It would be far more interesting than those complicated sums in addition, with which you occasionally regale us under the mysterious heading of "assessments." You might, perhaps, offer as a prize a "shocking machine," warranted not to hurt a fly, or a register which you have to turn yourself with a crank.

If you don't adopt my suggestion I shall patronize some other paper, I warn you. V. I.

P. S.—If you really want to go into the puzzle business, why, I've about a dozen myself that I would dispose of for a consideration.

General and Recapitulatory.

IN THE WILDS OF JERSEY, Dec. 10th.

TO THE EDITOR OF THE TELEGRAPHER.

HAVING "written up" some operators of Jersey, we will now give a sort of recapitulation.

Since writing my last communication Mr. F. S. Gannon, chief train despatcher for the N. J. M. R'y, at Jersey City, has been triumphantly carried off by that young lady from Port Jervis and *duplexed*, and now they enjoy their double life at Hackensack. From appearances, we should say Frank made a very good selection, as also did she. Now, Mac and John, it's your turn—which speaks first?

Huntington, formerly manager of the A. & P. Telg. Co., of Jersey City, has resigned, to accept a position with the Am'n Dist. Telg. Co. in New York; while Huntington of Paterson has gone to New York, in the general office of the N. J. M. R'y.

Zabriske, at Wortendyke (whom the types made me say signed "Q" instead of "Z"), has been transferred from "S. Y." to "W. S." office, same place. Steve has gone to "W." to work nights in place of "Ed," who has gone to Midland Park "M. P." new office; and then there is Mac at "P. O.," who has got married since my last. Well, he no doubt deserves her. It must be catching.

"Co." and "G. S." still stick it out at "C. S." and "N. S.," while Jay M., at "D. G.," has his hands full in attending to tickets and telegraph, while Merriam reads his TELEGRAPHER weekly, and would rather go without his meals than his paper.

I will correct my account of the Erie Telg. Supt., Mr. Holmes. He is tall and slim, instead of short and stout, which applies to his assistant chief operator, Sampson. Jake, of "F. H." Paterson W. U. office, has left Billy and accepted the position of ticket agent and operator for the Erie R'y, at Newark.

On my rounds I missed making mention of a few, and hardly know if it is best now to do so, being afraid they might find out who "P's and Q's" is, and "go for" me, as "Q" wanted to for publishing his name.

I omitted Mr. J. Christopher, agent and operator at Ridgefield Park, N. J. M. R'y; also Mr. S. L. Holbrook, agent and operator at West End. He is the father of two or three sons who are telegraphers. The omission of these was unintentional on my part, and hope I am excusable in this case, as well as in that of one of the most prominent on the Midland, Mr. Jno. H. Bonds, div. clerk of the road at Jersey City, who has retired from the field of actual service to help our supt.

"J. C.," office of the Midland, has been moved from No. 24 Exchange Place to No. 20 of the same street and building, in the old office of Penna. R. R. Telegraph. It is a much more desirable location than that previously occupied. They expect soon another wire from this office to the general office at 96 Liberty st., N. Y., by looping on to No. 9 A. & P. wire.

Thanksgiving has come and gone, and I hope all enjoyed their turkey as well as did your correspondent.

Some who know say that P's and Q's "gives us away"—perhaps so. The adoption of the peculiar sig. was for two reasons; the first, that "Q" was forever trying to make me believe I made 6 for a P; the second and main reason, that our brother, whenever giving us advice, would be certain to say, "mind your P's and Q's."

We hope to hear from M. & E. Division of the D. L. & W. operators.

My next will be the N. J. & O. M. R. R. (southern division) operators. In future I shall try to do as I have tried to do in the past, to *mind my*

P's AND Q's.

P. S.—For fear of not thinking of it next time, I will wish all "A Merry Christmas and a Happy New Year." The same to our worthy editor.

Automatic Telegraphy and Legal Proceedings.

TO THE EDITOR OF THE TELEGRAPHER.

MY attention having been directed to a paragraph in your issue of the 19th inst., wherein it is stated that certain parties ask for an injunction on myself, as also on other parties, permit me to reply by saying that no injunction has been applied for, nor is it at all likely that such will be the case, for obvious reasons, well known to all concerned. GEORGE LITTLE,

December 23, 1874. Passaic City, New Jersey.

Daily Line Tests in England.

THE method of daily testing at the principal telegraph offices in England is as follows:

Each wire is first opened at the distant station for a stated time. The constant of a tangent galvanometer, *i. e.* its deflection with twenty cells through a resistance of 1,000 ohms, is noted, and then the copper pole of the line battery is put to the ground and zinc to line through the galvanometer, and the deflection noted. The tangent of the deflection first found is multiplied by the standard resistance and divided by the tangent of the reading when connected to the line; and this is again multiplied by the number of miles' length in the circuit tested. The product is the insulation per mile in ohms. The method used at some of the principal American offices is substantially the same.

Electric Lights for Lighthouses.

It is stated that the two lighthouses at the Lizard promontory, on the southern coast of England, at the entrance of the British Channel, are about to be fitted with the requisite apparatus for exhibiting the electric light. In experiments recently made near Paris, with an electric light specially adapted for illuminating distant objects, it was found that distance up to ten miles could be clearly brought out, and by means of telescopes every point in the cone of light could be reconnoitred. This was accomplished by a sort of gigantic lantern lens, the carbon points being placed within the tube supporting the lens. A light of this kind is, of course, not wanted in a lighthouse, but it would be of considerable value in disclosing to those on shore the position and condition of a vessel in distress.

Proposed Reform in the British Patent Laws.

WE see it stated that the Lord Chancellor of England has intimated his willingness to receive a deputation on the Patent Laws, and to consider the bill in which the proposed reforms are embodied. The chief points are reduction in the cost of the letters patent, a simplification in the manner of obtaining them, and amendments in the legal proceedings for repression of infringement. A general reform of the Patent Office and of the arrangements of the Patent Museum will also be proposed.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, DECEMBER 26, 1874.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

TENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,

DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday,

AT

No. 38 VESEY STREET, New York.

ELEVENTH VOLUME.

The Publisher, in announcing the **Eleventh Volume** of

THE TELEGRAPHER,

which will commence with the number for JANUARY 2, 1875, desires to return thanks for the LIBERAL SUPPORT which it has hitherto received, which it is expected and believed will be continued during the ensuing year.

All the popular and valuable features of the paper will be retained, and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

THE TELEGRAPHER

is a thoroughly INDEPENDENT TELEGRAPHIC NEWSPAPER, bound to of in the interests of no TELEGRAPH COMPANY, CLIQUE or COMBINATION; but honestly devoted to the interests of the PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest description of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME or EXPENSE, warranted by the patronage received, will be spared to improve its character, and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS

ELECTRICAL AND TELEGRAPHIC JOURNAL

UPON THE

AMERICAN CONTINENT.

Under the new Postal Law publishers are required to prepay the postage on their publications sent to subscribers. Notwithstanding this additional expense the

Terms of Subscription

will remain as heretofore:

ONE COPY, ONE YEAR.....\$2 00

SINGLE COPIES.....Five Cents.

Specimen Copies will be forwarded free on application. Subscribers in the Dominion of Canada will not need hereafter to forward the Twenty Cents heretofore required to prepay the United States postage.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the cost of the order or registration may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) NEW YORK.

Renew your Subscriptions.

WITH the close of the volume a considerable number of subscriptions expire. We hope that most of these will be promptly renewed, and that the friends of THE TELEGRAPHER will avail themselves of the opportunity afforded by the commencement of a new volume to induce many new subscribers to enroll themselves on our books.

Hereafter the United States postage on all papers sent by mail is required to be prepaid, but, notwithstanding the additional expense thus entailed on the publisher, the price of subscription will not be increased, but remain, as heretofore, at TWO DOLLARS per annum, in advance. Send in your renewals and new subscriptions as speedily as possible, so that they may commence with the new volume.

To Correspondents of The Telegrapher.

IN consequence of Friday of this and next week being holidays, we are obliged to have THE TELEGRAPHER printed one day earlier for these two weeks than usual, in order to reach our subscribers at the regular time. Several communications intended for this week's paper are consequently unavoidably left over until next week.

Close of the Tenth Volume of The Telegrapher.

THE swiftly passing months have again brought round the close of the year, and with its expiring days the TENTH VOLUME of THE TELEGRAPHER is completed.

It is customary, in closing the record of the year and volume, for the Editor to improve the occasion by a few appropriate remarks, and although we do not know that there is anything which needs to be specially noticed at this time, yet we will not depart from the usual custom.

It will doubtless interest the friends and readers of THE TELEGRAPHER, to know that, notwithstanding the depressed condition of business generally during the past year, the paper has received an adequate support, and has been pecuniarily successful. As may be supposed from the price at which it is offered, it is by no means a mine of wealth to the publisher, but it occupies a position which no other telegraph journal has ever succeeded in attaining, of being supported entirely by the patronage received in the regular course of its business. During the year several other telegraph journals of more or less pretensions have been undertaken in different localities, all of which, with one exception, have already been interred in the journalistic graveyard in which annually so many similar ventures are entombed. Were the scurrilous exception also at the end of its career, it would be more creditable to all the parties concerned.

We have greeted these aspirants with kindly welcome as they have appeared, and have had no jealous feeling towards them, and regret that their publishers and editors should have realized so soon the difficulties which beset the path of journalism—especially class journalism. The same difficulties would undoubtedly have proved equally fatal to THE TELEGRAPHER in its earlier history had it not been sustained by the National Telegraphic Union, from whose treasury the deficiencies in its receipts were made good. For the past five years, however, it has been self-supporting, and we have no doubt will continue to be so in the future.

Of the success of the paper as a telegraphic and electrical journal it is perhaps hardly the proper thing for us to speak. We have, during the past as in previous years, received many assurances of satisfaction at and approval of its general tone and character, and words of commendation and cheer which have greatly encouraged us in the necessarily arduous task of

maintaining a journal of a high character, and one which should appropriately represent the telegraphic fraternity and the telegraphic interests. During the year we have received contributions to its columns from some of the most able and experienced telegraphers and electricians in the country, to whom we desire to express our thanks for their kind assistance, and solicit a continuance of their favors. The telegraphic fraternity generally have had the opportunity afforded them to discuss freely in its columns all matters of interest to them professionally. In no other publication can this opportunity be found, and it is one of the most valuable features of THE TELEGRAPHER, and one which shall be continued, at least so long as it shall continue under its present management and control. Free from any complication with any telegraph company, combination or clique, we are prepared to treat all telegraphic interests fairly and equitably, and always intend to do so.

It is not to be expected that THE TELEGRAPHER could succeed in pleasing all its constituents, especially when these are so numerous and so widely distributed. If there were none but words of praise we should be inclined to suspect that something must be wrong. We have been criticised and found fault with sufficiently to correct any overweening self-conceit that we might be disposed to indulge in. For sensible and honest criticism and fault finding we have the highest respect, and always endeavor to make such a means of improvement. The style of journalism which some of the telegraphic fraternity prefer is not of a character to elevate either the intelligence of the reader or the reputation of the journal. The history of BILL SMITH'S moustache, the impression that TOM JONES supposes he makes on his landlady's daughter, or the killing effect of JACK JONES'S new tile on his female acquaintances, etc., may be deeply interesting to some, but are of hardly sufficient importance to require much space to be devoted to them. Those who pine for that kind of mental pabulum must not look for it in the columns of THE TELEGRAPHER, or of any other journal which has a regard for its reputation or character.

During the volume which closes with this number we have endeavored to combine instruction in scientific and telegraphic matters with a complete record of telegraphic progress throughout the world, and such light and amusing articles as were available. That we have not wholly failed in our purpose to represent faithfully and creditably the telegraphers and telegraphic interests, we are assured by the continued support which we have received.

In conclusion, we desire to return our sincere thanks to the many friends who have stood by us during the closing year, by contributions to the columns of THE TELEGRAPHER and by material support in subscriptions and advertising patronage. We confidently anticipate the continuance of the favors of old friends and the accession of new ones during the year upon which we are about to enter. May it be indeed a Happy New Year to us all, and witness such a renewed and well founded prosperity to one and all as shall make it memorable in our future history—that it will witness a revival of telegraphic extension and progress we are already assured.

Active Telegraphic Competition Probable.

THE indications are that we are about to witness very active competition in telegraph business in the near future. The plans which had been adroitly laid for bringing the Atlantic and Pacific Telegraph Co. under Western Union control having been frustrated, both parties are preparing for an active and vigorous campaign. The advantages possessed by the Western Union Company in the great extent of its system, and its large revenues, will be conceded, but on the other hand, the companies competing with it are not so badly off as some may be inclined to suppose. The Atlantic and Pacific Company, by its perpetual lease of the Franklin Company's lines, has added permanently and largely to its facilities. It has no debt, and has been

for some time quietly absorbing lines of other and less important companies, and proposes in the coming year to build additional wires on new routes to still further extend and complete its facilities. When the Direct United States Cable is completed, it will have independent cable telegraphic communication with Europe, which, whether the cable itself shall prove to be a remunerative enterprise to its stockholders or not, will be an important advantage to the lines competing with the Western Union combination. We believe its business is conducted with economy—perhaps too economically in some respects. The Southern and Atlantic Company is completing its lines through to New Orleans, thus affording a good seaboard connection with the South, and the Dominion Telegraph Company gives a good connection with the Dominion of Canada. The danger of Government interference with telegraphic interests has kept matters comparatively quiet for the last two or three years, but this is apparently removed, for some time to come at least, and the elements are apparently all ripe for a renewal of active telegraphic competition. How this will affect the interests of the telegraphic fraternity is a question of much importance to the employés. We can hardly suppose that such a competition will affect them unfavorably, as it must increase the demand for telegraphic service.

We hope that this competition will be conducted sensibly, and that neither party will go into the euthrota policy of reducing rates below a compensating standard. Such a policy can benefit neither, and it should be remembered that it is always much easier to reduce rates than it is to restore them to a remunerative basis when once reduced.

President Orton's Report to the Directors of the Western Union Telegraph Company.

WE printed last week the report made by President ORTON to the Directors of the Western Union Telegraph Company, giving the results of the business of the company for the six months ending December 31st, partially estimated. This report is encouraging, showing, notwithstanding the reduction of tariff, an increase of receipts for the current year of about a quarter million of dollars, and a decrease of expenses of nearly \$600,000.

Mr. ORTON refers to the success of the "quadruplex," so far as it had been tested, as having been very satisfactory, and intimates a purpose, if it shall prove equally satisfactory on further tests, of recommending a still further reduction of tariffs, and anticipates the time when there shall be but four rates for telegraphic despatches on the lines of the company.

We are informed that since that report was written the quadruplex has been successfully operated between this city and Chicago on regular business. The title to the quadruplex instrument is in dispute, and if it shall prove to have been actually developed by the person who claims to have done it, there is likely to be somewhat protracted legal proceedings to determine its ownership.

The report will no doubt be read with interest by telegraphers generally, and, like all Mr. ORTON's official papers, is well written and interesting, not only to the stockholders and telegraphers but to the general public.

It gives us pleasure to know that the Western Union Company is prosperous and prospering, as it represents so largely the telegraphic interests of the country.

Comparative Cost of Telegraphic Systems.

ON the first page of this paper will be found a communication from Mr. F. L. POPE, in which interesting and suggestive figures are given upon the relative cost of the Morse, duplex and quadruplex, and the automatic telegraph systems. These figures have been carefully worked out and are believed to be substantially correct. If they do not make quite as good a showing

for the pecuniary advantages of the quadruplex as is sanguinely claimed by President ORTON, that is not the fault of the figures. It is very easy to make statements and assertions, but figures will tell the story much more accurately and reliably. We hope that this article will be carefully read by all telegraphers, and we will willingly publish their conclusions, or if it can be controverted, the columns of THE TELEGRAPHER are open to any person who may desire to controvert it.

Literature.

A descriptive account of a new system for the simultaneous transmission of telegrams in opposite directions upon the same telegraphic wire. By MARQUIS L. VIANISI. Translated from the French by EDWARD ROSENBUSCH, C. E.; M. S. T. E. Malta, 1874.

WE are indebted to Mr. ROSENBUSCH for a copy of the above pamphlet, which contains a full description of the VIANISI system of duplex telegraphy, with well executed lithographic drawings. The system described is on a principle which we do not remember of ever having seen applied for this purpose, the only special apparatus required being a peculiar key, and, of course, a rheostat for each station. The VIANISI system is said to be successfully at work between Naples and Rome, and is to be tested in submarine telegraphy at an early day. We may give an illustrated description of this system at an early day.

Carte des Communications Telegraphiques Internationales; dresse d'après des documents officiels par le bureau International des Administrations Telegraphiques. Berne, 1874.

The director at Berne has our thanks for a copy of this beautiful map, which is about four feet square, and shows at a glance all the overland and submarine telegraph routes in Europe, Asia and Africa. A small division in one corner gives the principal routes in every part of the world. The work is brought down to the latest dates, and is executed with rare beauty and fidelity. As a reference map for the electrical engineer or statistician it must prove of great value, to say nothing of its obvious value in the telegraphic offices of all countries.

Personals.

Mr. SAMUEL KELLY, lately of St. Paul, Minn., Northwestern Company's office, is taking report for the Western Union Company at St. Joseph, Mo.

Mr. GEO. McMAHON, recently of the St. Paul, Northwestern Company's office, has accepted the position of Night Manager W. U. Co.'s office, Kansas City, Mo.

The Telegraph.

The First Snow Storm of the Season.—City Telegraph Lines Demoralized.

THE first snow storm of the season in this vicinity occurred on Sunday last, and it was a very creditable opening of the winter season. The snow commenced falling at an early hour Sunday morning, and continued to fall steadily and heavily all day. There was, fortunately, little if any wind, but the wires and poles throughout the city became very heavily loaded with sleet and snow, and were prostrated in all directions. The Fire Alarm Telegraph was badly demoralized and became practically useless, the wires being down in all directions. The whole force of the Department was engaged in the work of restoring the wires, and by Monday night the main circuits were again in operation, but it will require several days to completely repair the damage. Fortunately no extensive conflagration took place during the interruption, and the precautions taken to notify the fire companies were sufficient for the purpose.

The hundreds of wires belonging to the several telegraph companies were also very badly damaged, the Western Union Company having only twelve wires in working order Sunday night. All the available force of the different companies was hard at work, and by Tuesday night the greater part of the damage was repaired. Some telegraph poles were broken by the weight of the snow and sleet, and by the strain caused by the broken wires.

The great number of wires which are required for telegraphic purposes in this city, and which are sus-

ended on poles and across the roofs of buildings in all directions, render such a storm as that of last Sunday exceedingly damaging and destructive. The wires are crossed in all directions, and many of those which are not broken are temporarily rendered useless from this cause.

Such an occurrence forcibly indicates the necessity for placing the wires under ground, where no storm can affect them. Unquestionably telegraph companies will eventually be compelled to adopt an underground telegraph system for large cities—the rapid extension and increase of telegraph business, and the constant adaptation of electricity to new uses in the way of communication, necessitating a corresponding and constant addition to the number of wires required.

The Southern and Atlantic Telegraph Company.

AT a meeting of the Board of Directors of the Southern and Atlantic Telegraph Company, held at the office of the Company, No. 51 New street, in this City, Wednesday, Dec. 16th. Mr. W. F. Herring, of Augusta, Georgia, was elected to fill a vacancy.

The following officers were also elected: Mr. Charles W. Blossom, President; Mr. Henry Hentz, Vice-President.

Mr. C. C. Blossom was appointed Secretary and Treasurer, and Mr. George H. Grace, General Superintendent.

Near Completion of the Southern and Atlantic Lines to New Orleans.

THE lines of the Southern and Atlantic Telegraph Company are completed through Mississippi to the Louisiana State line, and the construction of the remaining section of the line is being vigorously proceeded with. It is expected that within a few days the connection with New Orleans will be completed, and the line be in working order to that point.

The company has met with determined opposition in the extension of its lines, and every possible obstacle has been placed in its way, but it has overcome them all, and is about to realize the success for which it has been striving.

There has been no competition for telegraph business with the Western Union Company at New Orleans since the transfer of the Pacific and Atlantic wires to that company.

The United States Direct Cable.

UP to the time of writing this there is no news of the completion of the United States Direct Cable. The latest reports from the Faraday were up to Saturday, the 19th inst. She had then been engaged in taking up some forty miles of the cable between Torbay, N. S., and the buoy off the Newfoundland coast, and removing a slight fault which had been developed in that section of the cable. This done, about ninety knots additional of the cable had been laid from the place where it was originally buoyed off Newfoundland. The end was then buoyed, and the Faraday proceeded to the place where the other end of the cable was, buoyed, to make another attempt to lay the balance of the cable, and it is hoped soon to hear that, notwithstanding the lateness of the season, the work has been completed and the line in operation.

The Marine News Department of the Gold and Stock Telegraph Company.

THE Gold and Stock Telegraph Company has added to its business a marine news department, which is located in the basement of the Cotton Exchange in this city. This department is in charge of Mr. Thomas P. Scully, and arrangements are being completed for permanently establishing the business of marine news reporting in competition with the Merchants' Marine News Room.

There is in connection with this room quite a large telegraph office of the Western Union Telegraph Company, of which Mr. Robert M. Mattocks is manager. There are in this office eight instruments, and six operators are employed. The business of the Cotton Exchange is received and transmitted at this office, which in itself supplies a large amount of business to the line.

The Southern and Atlantic Telegraph Company also has an office in the Cotton Exchange, and is well patronized by the cotton brokers.

The New Sandy Hook Telegraph Line.

THE war between the city authorities of Bayonne, N. J., and the constructors of the new telegraph line to Sandy Hook, has finally been settled by removing the line from the streets and avenues in dispute. The new location follows the line of the abandoned Jersey City and Bergen dummy railroad, from Centreville

to the Latourette House dock at Bergen Point, where the line crosses to Staten Island by a submarine cable across the Kill von Kull.

Foreign Telegraphic Notes.

THE traffic receipts of the Eastern Telegraph Company for November, 1874, amounted to £33,060, as against £35,096 for the corresponding period of 1873; and those of the Eastern Extension Telegraph Company for the same month amounted to £17,728, as against £17,454 for the corresponding period of 1873.

The foundering of the steamer La Plata with a portion of the Brazilian cable on board will, it is stated, involve a total loss to the underwriters of £100,000. In the case of the Gomos, which was wrecked a short time since, the loss has, up to the present time, been only partially settled. The total liability will, it is reported, be about 35 per cent. of the whole sum insured.

The adjourned meeting of the Direct United States Cable Company, in London, Nov. 30th, was again adjourned until Dec. 14th. The shareholders were informed that the directors had no further communication to make with regard to the cable.

Telegraphic and Electrical Brevities.

THE Western Union are erecting large poles on Church and Dey streets, arranged to carry a great number of wires. The latter will be carried from the pole lines in the streets, over the buildings between Fulton Church and Dey street, to the new building which is now approaching completion.

The wires will enter the battery room, one story underneath the grand operating room, most of them coming in on the two rear sides of the building. The repairing of damages arising from the late great storm has temporarily put a stop to operations on the new work.

The Automatic Fire Alarm telegraph lines suffered but slightly during the recent severe storm. Mr. Fenn, the energetic superintendent, had everything working properly by noon on Monday. This speaks well for the construction of the lines under Mr. Fenn's charge.

The Telegraph in Switzerland.

THE *Journal Telegraphique* contains many interesting statistics with reference to the despatch of telegrams in Switzerland in 1872-3. It is shown, among other things, that 89.5 per cent. of all the telegrams sent reached their destination within an hour (as against 82.5 per cent. in 1872), and that the proportion of telegrams that arrived in thirty minutes and less, rose from 61.5 in 1872 to 68.5 in 1873, which shows a commendable degree of progress in good administration.

Matched.

THE following from the *Dallas (Texas) Daily Herald*, will interest the telegraphic friends of the parties.

"NEW ORLEANS, Dec. 9th, 1874.

"Captain George R. Eitemiller, well known as a Texas ranger and celebrated athlete and tumbler, arrived in this city last night. He is matched with P. Boliver Ayers. He is doubly welcome, from the fact that his genius as an electrician and practical operator in the employ of the Western Union Telegraph Company is unexcelled."

FACTS should invariably be acquired from actual observation. It is not alone sufficient to read of a fresh fact in a book. An effort should be made to see the fact for itself. Books merely direct search, but we should never be satisfied with mere reading.—W. H. Preece.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5508, New York City.

For the week ended November 17, 1874, and bearing that date. 156,897.—ELECTRIC TELEGRAPH APPARATUS. William Thomson. Glasgow, Great Britain. Filed Jan. 6, 1872.

Suspended Signal coil, controlling siphon ink recorder, has each side in a magnetic field. Graduated shunts are applied thereto. The coil and its core, stiffened in one plane by stays, and provided with counterpoise to lessen irregular vibrations, are suspended from a removable plate. Ink or other fluid is forced through siphon to clean it by hydrostatic pressure. Paper kept moving slowly when no signals are being received, to prevent accumulation of ink at end of siphon. Apparatus driven by an electro-motor, whose speed can be regulated by shunts or resistances. Shunts are controlled by a differential movement, regulated by a pendulum. Speed of paper regulated by electric chronometer, time being marked on paper by a punch on the wheel work. An electrified inductor is connected to siphon by a thread of small conducting power, whose length increases or diminishes resistance to passage of current.

1. The combination and arrangement, substantially as before set forth, of the electro-magnet, the suspended signal coil, and the fixed soft iron core for said coil.
2. The combination, substantially as before set forth, of the suspended signal coil, the suspended siphon or marking tube, and the connecting fibre, with a removable plate or stock, so that the said coil and marking tube can be readily removed and replaced by others adjusted for use.
3. The combination, substantially as before set forth, of the signal coil with the stretched wires communicated with the insulated terminals, the drum to shorten or lengthen the said wires, and a torsion head to turn the same on their axes, so that the signal coil may be adjusted by the torsional elasticity of the stretched wires, which also act as electrodes.
4. The combination, substantially as before set forth, of the marking tube, of the stretched wire that carries it, and the torsion head for turning the said wire.
5. The combination, substantially as before set forth, of the ink reservoir, of the marking tube, and the suspended signal coil, so that, while the said marking tube is fixed to the ink reservoir, the outer end of said tube is free to be moved in consonance with the oscillations of the signal coil.
6. The combination, substantially as before set forth, of the ink reservoir and the device for applying a varying pressure to the surface of the liquid in said reservoir, so that said liquid may be drawn or forced through said tube as desired.
7. The combination, substantially as before set forth, of the working arm of the marking tube with a stay for stiffening it.
8. The combination, substantially as before set forth, of the marking tube with a counterpoise to diminish vibrations.
9. The method, as before set forth, of preventing an accumulation of ink at the point of the marking tube when signals are not being received, by traversing the paper slowly past the said point at such times.
10. The combination, substantially as before set forth, of the plate connected with the earth, the insulated plate, the contact springs, the revolving carriers, and the siphon or marking tube.
11. The combination, substantially as before set forth, of the motor and the paper drawing gear by hanging pulleys, so as to diminish vibrations.
12. The combination, substantially as before set forth, of the paper drawing rollers with a pendulum, so as to control the speed of the former.
13. The combination and arrangement, substantially as before set forth, of the paper moving mechanism, the chronometer mechanism, and the types of the latter, so that the time is recorded upon the signal receiving paper.
14. The combination, substantially as before set forth, of the electrified conductor with the siphon or marking tube by an adjustable inductor of very high resistance, whereby any excess of electricity may be drained off.
15. The combination, substantially as before set forth, of the suspended signal coil, the magnet, the inductor, and a dry pile to initiate the electrification of the inductor.
16. The arrangement, in the same machine, of a single motor with the suspended signal coil, the siphon or marking tube, the mechanism for moving the receiving paper, and the mechanism for moving the punched paper, so that the same motive power which produces the electric sparks is employed to move forward the receiving paper and the punched paper for sending signals.
17. The relative arrangement, substantially as before set forth, of the suspended signal coil, the siphon or marking tube, the signal transmitting mechanism, and the paper moving mechanism, so that the same strip of paper may be employed both to receive and to transmit the signals.
18. The relative arrangement, substantially as before set forth, of the suspended signal coil, the siphon or marking tube, the signal transmitting mechanism, the paper moving mechanism, and the switch and shunt, so that the same paper may be employed to record both signals transmitted and signals received.
19. The combination and arrangement, substantially as before set forth, of the suspended signal coil, the siphon or marking tube, the inductor, the two constant springs for giving positive and negative signals, and the switch, so that, in a machine producing marks by the operation of a suspended coil, positive and negative signals may be given by two contact springs only.

Born.

DUGGAN.—To Mr. J. C. DUGGAN, of the Charleston, S. C., Southern and Atlantic Telegraph office, Dec. 16, 1874, a boy, 12½ pounds.

WILLIAM BROWNLEE,
Dealer in
CEDAR TELEGRAPH POLES
OFFICE FOOT OF SHELBY STREET,
DETROIT, MICHIGAN.

PHILADELPHIA.
L. G. TILLOTSON & CO.
beg to announce the opening of an establishment for the sale of
TELEGRAPHIC AND ELECTRICAL GOODS
of every description, at
No. 54 SOUTH FOURTH STREET,
(Corner Chestnut street,) PHILADELPHIA.
They solicit the patronage of their friends and the telegraphic fraternity generally.

ECONOMIZE!

LANNERT & DECKER,
31½ Prospect St., Cleveland, O.
Send for circular.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that are returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET;
or to
L. G. TILLOTSON & CO.,
8 Dey street, sole Agents.

CHAMPION BURGLAR ALARM AND ANNUNCIATOR COMPANY
40 WEST 18th STREET, NEW YORK.

We invite TELEGRAPH MANAGERS AND OPERATORS throughout the country to act as our agents for the introduction of our superior BURGLAR ALARMS AND ANNUNCIATORS into private houses, hotels, banks, &c. Upon receipt of plans of houses we will send skillful mechanics to estimate upon work, or will give any information in writing that may be required, *Liberal commissions will be paid upon any orders that may be secured for us.* Our Alarms and Annunciators have just been awarded the FIRST PREMIUM of the American Institute.

Explanatory Circulars will be furnished upon application to the Secretary.

L. G. TILLOTSON, President.
CORNELIUS ROOSEVELT, Secretary and Treasurer,
40 West 18th Street, New York.

THE Rev. Dr. Sunderland, chaplain of the U. S. Senate, prayed "that God would make this Congress as the Sanhedrim to the Jew," but the telegraph reported it as the "Sacred Ram to the Jew."

GEOURGE H. BLISS & CO.,
41 Third Avenue, Chicago, Ill.
CINCINNATI, O., ST. LOUIS, MO.,
Elm St., cor. 5th. 409 North Third St.
Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

- RELAYS, unequalled for beauty and strength;
- COMBINATION SETS; BOX and POCKET RELAYS.
- CHALLENGE, PONY and REPEATING SOUNDERS.
- KEYS, various styles, including the SCHNEIDER KEY, just out, no legs, wire connections above the table.
- REGISTERS, with SPRINGS of WEIGHT.
- OUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
- REPEATERS—HASKIN'S AUTOMATIC, and others,
- SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
- ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
- ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
- ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
- MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.
- BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
- WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
- INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON. BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
- TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE SIXLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.
- PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRICAL APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

SOMETHING NEW!

[PATENTED SEPT. 29, 1874.]

THE FAIRY ELECTRIC ENGINE.

A perfect working model of an engine

Run by Electricity!

It will work well with an ordinary local battery.

Price, with two cells Eagles' Metallic Battery \$6 00
" without Battery 4 00

May be seen working at the office of the THE TELEGRAPHER.

For sale by

The Electro-Magnetic Manufacturing Company,

36 BROAD STREET, NEW YORK.

P. O. Box 1804.

Also for sale by

L. G. TILLOTSON & CO., 8 Dey street.

F. L. POPE & CO., 38 Vesey street.

A NEW GALVANIC BATTERY.

Durability, Efficiency, and Economy of Expense and Labor at last Secured.

THE EAGLES METALLIC BATTERY.

PATENT APPLIED FOR.

The undersigned having secured the exclusive Agency for manufacture and sale of the

EAGLES METALLIC BATTERY,

now offer them to the public as the best Battery for Telegraphic and other purposes yet devised.

The Battery cell is made of lead, and forms one pole of the battery. Sulphate of copper is the only chemical required to be used.

These Batteries have been fully tested during the last year, although only recently offered for sale, and have proved to be superior to any other as regards efficiency, economy and durability. When once set up they require no attention for from four to six months, according to the service required of them.

Two sizes are made at present, but others will soon be ready. No. 1 is a large square cell, and can be used as a local or for running motors. Price, \$2.25.

On Locals, one No. 1 cell is used in place of two Daniells, at a saving of nearly one half in cost.

No. 2 is a round cell, designed for main line. Price, \$2.

Descriptive circulars and price list forwarded upon application to

F. L. POPE & CO.,

(P. O. Box 5503.)

Syracuse, N. Y.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The Electro-Mechanical Gong Striker,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the
original *FARMER & CHANNING PATENTS*, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, **THESE**
CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its in-
troduction into their localities is cordially invited, and

their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an Insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection, introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines,
being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that
will work practically with a single DANIELL cell, a BATTERY
that does not require to be taken down but once a year, and the
very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter
and description, is now ready for distribution.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,
 AND AGENCY FOR THE SALE OF
Siemens' Universal Galvanometer,
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
 DAVID BROOKS, Proprietor,
 22 South Twenty-first Street, PHILADELPHIA.

THE PATENT INSULATOR.

This invention was first introduced into public use in 1867, and now hundreds, without exception, attest its perfection as an insulator; also its economy over all others when maintenance is included with first cost.

Siemens' Universal Galvanometer.

This instrument for the measurement of ordinary resistances, such as relays, sounders, conductivity of line wires, insulation, &c., stands unrivalled for simplicity and correctness, and is now the standard instrument for such work in all countries.

Siemens' Submarine Cables, Cables for River Crossings of every description,
 AND
Insulated Conductors.

These Cables are unexcelled in construction, and can be procured in less time and at about half the cost of those manufactured in this country.

A SUPERIOR PRINTING TELEGRAPH INSTRUMENT,
 FOR PRIVATE AND SHORT LINES.

Awarded the First Premium—Silver Medal—over all others at Cincinnati Industrial Exposition, 1872.

The undersigned is now prepared to supply the improved and superior

PRINTING TELEGRAPH INSTRUMENTS

manufactured under the patent of Mr. J. E. SELDEN. This instrument has already been extensively introduced, and has given complete satisfaction to all who have adopted and used it. It is SIMPLE, RELIABLE, and not liable to get out of order; can be operated by any person of ordinary intelligence after a few minutes' instruction and practice.

PRIVATE LINES

constructed in the best and most substantial manner, and on reasonable terms.

Favorable arrangements will be made with line constructors, telegraph employes, &c., for the introduction of the Printer. For further particulars, terms, &c., apply to

MERCHANTS' MANUFACTURING AND CONSTRUCTION CO.

S. J. BURRELL, Superintendent,
 No. 50 BROAD STREET (Rooms 12, 13 & 14).
 P. O. Box 496.

WATTS & COMPANY'S

"BEST" TELEGRAPH WIRE

is the most popular brand in the market. This wire is offered on its merits alone. We have never failed to secure the order when placed in competition with other prominent brands. Invoices guaranteed equal to sample, which will promptly forwarded on application.

GEO. H. BLISS & CO.,
 41 THIRD AVENUE,
 Chicago, Ill.

MANUFACTORY OF THE SPENCEREAN STEEL PENS,
 BIRMINGHAM, ENGLAND.

SPENCEREAN DOUBLE ELASTIC STEEL PENS.

The superiority and excellence of these justly celebrated Pens are appreciated, as is shown in their constantly increasing sale. They are comprised in fifteen numbers, of which one number alone has an annual sale of more than 5,000,000.

The SPENCEREAN PENS are manufactured of the very best material by the most expert workmen in Europe, and are famous for their elasticity, durability and evenness of point.

THE SPENCEREAN PENS ARE FOR SALE BY ALL DEALERS.

We make Fifteen Numbers of Pens, differing in flexibility and fineness of point, adapted to every style of writing, as follows:

- No. 1. COLLEGE PEN. *Point Fine; Action Perfect.* This is a great favorite with our leading penmen, is largely used in the Schools and Commercial Colleges throughout the country, and gives better satisfaction than any Pen before the American Public.
- No. 2. COUNTING-HOUSE PEN. *Point Fine and Flexible,* well adapted to the use of Correspondents and Accountants.
- No. 3. COMMERCIAL PEN. *Point Medium.* An Easy Writing Business Pen.
- No. 4. LADIES' EXTRA PEN. *Point Extra Fine and Flexible.* For Delicate Fine Hand Writing this is a very superior Pen.
- No. 5. SCHOOL PEN. *Point Fine, Medium in Flexibility.* For a durable School Pen it has never been equalled.
- No. 6. FLOURISHING PEN. *Point Long, Flexible and Medium in Fineness.* For Off-hand Flourishing.
- No. 7. QUILL PEN. *Point Medium, Quill Action.* A smooth, Easy Writing Pen. Its name well represents its qualities.
- No. 8. CONGRESS PEN. (New.) *Medium Flexible Point.* A very superior Pen for all styles of writing. This Pen undergoes a process that renders it non-corrosive and three times more durable than any ordinary Steel Pen.
- No. 9. BANK PEN. *Point Long and Flexible.* A great favorite with Accountants, Tellers, etc.
- No. 10. CUSTOM-HOUSE PEN. *Point Medium.* Well adapted to all styles of Bold Free Hand Writing.
- No. 11. UNIVERSITY PEN. *Point Medium, very Smooth and Flexible.* The action of this celebrated Pen is very fine.
- No. 12. EPISTOLAIRE PEN. *Point very Fine and very Flexible.* This is the finest Pointed Pen made, and, for very Delicate Writing, Map and Fine Pen Drawing, it has no equal.
- No. 13. ENGRASSING PEN. *Point Blunt and Smooth.* Particularly adapted to Coarse Hand Writing and Engrassing.
- No. 14. ARTISTIC PEN. *Flexible, with extra fine point.* This Exquisite and Truly Celebrated Pen is the Best Pen extant for Fine Ornamental Writing.
- No. 15. THE QUEEN. *Point extra fine.* Admirationly adapted to all kinds of Fine Writing.

Sample Cards containing all the FIFTEEN Numbers, securely inclosed, will be sent by mail on receipt of 25 cents.

IVISON, BLAKEMAN, TAYLOR & CO.,
 138 & 140 Grand street, N. Y.

THE TELEGRAPH MONITOR:

A REVISED AND ENLARGEMENT OF THE TELEGRAPH MANUAL,

BY TAL. P. SHAFFNER, LL. D.,

Author of "Telegraph Companion," "Telegraph Manual," "History of America," "Civil War in America;" Member of many Scientific and Learned Societies of Europe and America; Commander of the Order of Dannebrog, Denmark; Order of St. Olaf, Norway, and of the Sword Order, Sweden; &c., &c., &c.

This great telegraphic work will consist of five volumes, 80 pages each, and will contain over

3,000 ILLUSTRATIONS.

The author has undertaken this important publication at his own expense, and he hopes telegraphists throughout the world will accord to it a patronage commensurate with its merits. For nearly thirty years the author has been connected with the telegraphic systems of both hemispheres and an observer for general instruction, and this work will contain the substance of facts thus collected, having especial reference to practical telegraphy.

The first four volumes will be ready for printing in May, and the whole work may be issued in monthly parts of quarter or half volumes.

VOL. I will contain a general history of electrical discovery by ancient and modern philosophers—the experiments of Otto Guericke, Hawksbee, Gray, Wheeler, Du Fay, Muschenbroek, Franklin, Canton, Dalibard, Watson, Cavendish, Coulomb, and others who practically manipulated static electricity; the whole prepared especially for the telegraphists as useful information in pursuing the art of telegraphing.

VOL. II.—A full account of the discovery of the Voltaic battery, and the many improvements and modifications of this telegraphic generator of electricity, considering the experiments of Galvani, Volta, Cruikshanks, Daniells, Wollaston, Bunsen and Grove. Also, magneto and thermo electricities, and the application of their respective forces for telegraphic and useful purposes.

VOL. III.—In this volume will be considered Terrestrial Magnetism, Aurora Borealis, Magnetic Needle, Ships' Compass, and Magnetic Phenomena generally. Also, Electro-Magnetism as discovered by Ersted and manipulated by Schweigger, Ampère, Arago, Sturgeon, Henry, Faraday, Jacoby and others. The application of these discoveries for practical telegraphy by inventors, from time to time.

VOL. IV.—A general history of the ancient and modern telegraphic systems, semaphoric and electrical, including telegraphs of Ohappé, Lo Sage, Ronald, Cooke, Wheatstone, Davy, Steinheil, Morse, Bain, House, Hughes and others. Also, the construction of overland, subterranean and submarine lines, including conductors, insulators, paratonnerres, and telegraphic implements generally.

VOL. V.—This volume will give a full account of the various telegraphic apparatuses for simple and automatic manipulation; the combination of circuits for repeating or translating; double and duplex transmission. It will also contain a large amount of general information for practical telegraphists, respecting conducting and non-conducting compositions, tables, and a Dictionary of telegraphic technical terms.

The whole work will be written for the telegraphist, but it will not be mathematical. The illustrations are designed for specific instruction, and their explanation concise. It will be so arranged that either one of the volumes may be bought by those not wanting the whole.

Each volume will have a complete Table of Contents and an Index.

The above must be regarded as an approximate division of the subjects.

As the work progresses further notice will be given.

The publishers will be announced hereafter

THE PERFECT BATTERY.
CLEANLINESS. CONSTANCY. ECONOMY.

THE
LOCKWOOD BATTERY,
PATENTED APRIL 8, 1873,
L. G. TILLOTSON & CO., Sole Agents,
No. 8 DEY STREET, N. Y.

This Battery has been in extended practical use for more than a year, and is now acknowledged by leading Electricians in this country and Europe to be
FAR SUPERIOR TO ALL OTHERS
for telegraphic purposes, or closed circuits of any description. This Battery received the **FIRST PREMIUM** over all competitors for

POWER, DURABILITY AND ECONOMY
AT THE
CINCINNATI INDUSTRIAL EXPOSITION OF 1873.

The size shown in the cut (No. 2), when charged with 5 lbs. sulphate of copper per cell, is capable of working two or three main circuits of average length for **MORE THAN ONE YEAR**, without any attention whatever. The copper and zinc solutions are perfectly separated, and there is

NO LOCAL ACTION,
and the circuit is **ABSOLUTELY UNIFORM** at all times. It is equally well adapted for a
LOCAL BATTERY,

or for any purpose requiring a uniform, powerful and constant current.

The number 2 size (price \$2.50) is now ready for sale. Other styles are in preparation, and will soon be put on the market.
Send for Circular.

54 South Fourth Street, Philadelphia.
22 West Fourth Street, Cincinnati.

SOLE AGENTS.

New York, Oct., 1873.

We have appointed Messrs. L. G. TILLOTSON & Co. Sole Agents for the sale of the Lockwood Battery.

LOCKWOOD BATTERY CO.
W. H. SAWYER, Secretary.

ORTON'S PATENT PENCIL HOLDER.

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread, and will hold the pencil perfectly firm.

Price, 25 cents each.

sent by mail on receipt of price.

Price per doz., \$1.80.

One half of actual size

ELECTRIC BELL,
PATENT SELF-CLOSING KEY,

(Patented October 27, 1873.)

Price.....\$5 50

The lever of this Key swings in two directions, vertical and horizontal. A spring presses it against an adjustable contact point on right hand side.

In sending with this key take hold of the knob and move to the left, this opens the circuit, then operate in the ordinary way. As soon as released the lever swings back against side contact point, closing the circuit.

The Platina Points are large and hard.
Self-Starting Register, of new design, protected by a Glass Shade, complete, with Paper Reel and Weight. . \$50 00

Sounders, from..... 4 50 to \$6 50

Electric Bells, single stroke or continuous ringing, from..... 5 00 to 8 00

Relays, from..... 9 50 to 16 00

Improved Switch Keys, from..... 3 00 to 5 50

Send for Illustrated Circulars.
The above may also be had of F. L. POPE & CO., 38 Vesey street, New York, at Manufacturer's prices.

THE NONPAREIL TELEGRAPH APPARATUS,

NEW AND IMPROVED, WITH STRAIGHT LEVER KEY.

FOR AMATEURS, STUDENTS AND SHORT LINES.

This popular *Pioneer Cheap Telegraph Instrument* has recently been improved and a *Straight Lever Key* placed upon it, which makes it as nearly perfect as possible.

Since its introduction over 2,000 of them have been sold, and is still the *leading telegraphic apparatus of its class.*

They are furnished at the following popular prices:

Single Instruments, with three cells of Battery, Chemicals, Connecting Wire and Instruction Book, \$6.50

Two sets of Instruments, etc., 12.00

Send for our new Circular and Price List.
