Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System OF FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER, 104 Centre Street, NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, the ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDBERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

The Chemistry of the Automatic Telegraph.

By GEORGE LITTLE.

DURING my investigations in the endeavor to discover a chemical formula, or formulas, whereby to prepare the paper for the proper reception and retention of the electro-chemical writing by my "American automatic system of fast telegraphy," it occurred to my mind, after much thought and reasoning on the subject, that a chemically prepared receiving paper should be saturated with a chemical preparation that would possess the following *desideratums*.

First.—The avoiding of all dark, or light, too heavy bluish, or greenish shades of color, any of which would be likely to involve the risk of *assimilating* with the possible varying shades of writing that may be brought about by the changing electro-chemical condition of the line current, and which would be likely to result in the obscuring or the loss to sight of some portion of the telegram.

Second.—The chemical formula to be economically prepared, and to be of such a nature that the paper saturated therewith, should be possessed of deliquescent or moisture absorbing property, in order that the same should not dry too rapidly before use by exposure to atmospheric influences; and instead of, as heretofore, according to old formulas, giving off poisonous vapors in the operating room, it should possess the additional properties of absorbing and retaining the carbonic acid from the air of the room, and to be in all respects to the parties handling the same *perfectly harmless*.

Third.—To dispense with the objectionable use of sulphuric acid in the formula as a conductor, its use causing a rapid decomposition and consequent abstraction of the equivalents of iron held by the *ferrocyanide of potassium*, as also effecting the gradual decomposition of the iron stylus, which should not take place when the receiving instrument and line is in a *normal state*.

Fourth.—To select an auxiliary oxydizing agent which should not seize upon the equivalents of iron held in the solution whilst in a normal state; but that such a condition of abstraction and union should be fulfilled only at the moment, or at such times as when the equivalents of iron are "set free" by *electro-decomposition*.

Previous to the adoption of my electro-chemical formulas, now in constant use with slight or unimportant change in their proportions, I had gone through the range of the sulphurets and salts of metals, avoiding altogether the salts of more costly metals, as also the salts of those metals not very readily decomposed; also manipulated with the various preparations of *tannin*, including a *decoction of tea*, in combination with bi-carbonate of soda and chloride of sodium. Neither of these preparations fulfilling the before named requisite conditions I finally prepared a formula, whose elements consisted in the use of *chloride of calcium*.

As, being very *greedy of water*, and will absorb its own weight at zero C., its presence does not affect the equivalents of iron held in solution during the normal state of the line current; it requires two hundred degrees of heat, centigrade, before it will part with all its water; it has also the singular property of abstracting the poisonous carbonic acid from the air of the operating room, and it keeps cool. I noticed that when the salts of *ferrocyanide of potassium* was used in less proportion than heretofore, that it was very easily decomposed by the long line currents, I therefore selected this yellow salt also for the following reasons: as possessing only two equivalents of iron in its composition, and therefore in that state capable of being made to take up one more equivalent of iron. I do not here refer to *ferrocyanide of potassium*, a reddish salt known as having three equivalents of iron in combination, acquired during the process of electro-decomposition; the positive iron stylus yields up the one other equivalent, the three equivalents of iron being then set free, and reduced as a "white precipitate," *i. e.*, as cyanide of iron, but not visible to the eye on account of the rapidity with which oxygen converts the same into *Prussian blue*.

As a substitute for sulphuric acid I found a perfectly

harmless conductor in common salt, and one which has also a great affinity for moisture, taking up one hundred parts of water to thirty parts of *chloride of sodium*.

For an auxiliary oxydizing agent which will not seize upon the equivalents of iron during the interval of electro-decomposition, I found that which fulfilled the required conditions in a preparation of *chromium*.

The advantages resulting from the use of the before named simple and comparatively inexpensive preparations are, that when properly prepared according to the formula the same may be decanted and put aside for future use, whilst the paper saturated with this solution assumes a delicate canary or yellow color, and possessing great desideratums in regard to health, time and economy. A brief description of the foregoing *fiducial features* appears in my specifications of 1872, as also my "iodide formula" and method for the recovery and reutilizing of old stock.

Passaic City, N. J., June 1, 1875.

(To be continued.)

A Pair of Stars.

By DOUBLE SIX.

OUR telegraphic literature at present seems to be mostly of a reminiscence character. Almost every one of our class papers contain weekly a number of anecdotes and stories of old-time telegraphers, their astonishing exploits in rapid work, the immense amount of whiskey they could carry, etc., in many of which—if we are to credit the accounts given—they were far in the advance of the present generation of operators. There are a number of stories, which may possibly come under this head, floating about here; and as they may be new and amusing to some of your readers we will venture to trot a couple of them forth for inspection.

Some years ago, in the course of his wanderings, "Hank" Cowan, a well known character to American operators, dropped into A— office one evening, after the majority of the boys had gone home for the night. As usual, Hank had on board a tremendous cargo of "tanglefoot," and was in just the mood for showing off his superior abilities as an operator. Our friend "W." was in his accustomed place on State Press, rolling out his well known steel plate Spencerian copy, etc., etc. (believe that's the orthodox way to mention it), when Cowan espied him, and, marching over as steadily as possible, he hauled him forcibly from the chair, remarking as he did so: "Here, you (hic) get out; let a man sit down (hic); you can't take press." "W.," having undoubted faith in Hank's ability to do the work, willingly accepted his very polite invitation, and sauntered off to the other end of the room to enjoy a little rest after his evening's work. In about half an hour "W." took it into his head to step over and see how the "man" was getting along. He went, but not a whit too soon. The sight which met his eyes was one well calculated to make any operator feel like doing something not laid down in Christian ethics. There sat Hank, blind as a bat, unable to see an inch beyond his nose, scratching away for dear life over and over, line upon line, within a space of about half an inch in width, which was already worn as black as the carbon sheets beneath. Into this space he had crowded half an hour's rapid sending. It was all there, of course; but, then—Well, "W." finally had it all repeated; but, rest assured, he is more careful about letting strangers "sit in" for him since this experience.

And the next is "Bogy." Ah!

"When Greek meets Greek,
Then comes the tug of war."

Can this terrestrial sphere of ours produce another pair like unto these? We trust not.

Mr. Bogardus, better known to the world at large as "Bogy," was a character, indeed, always hard up, short of stamps, always in search of a job, always ready to embrace any opportunity to gather in the needful. One of our most popular summer watering places was the scene of his operations at one time. He had been continually applying for a position for several days, but to no purpose. Johnny O— knew his man, and acted accordingly. One night Bogy came and begged to be allowed a night's lodging in the room back of the office, used for a cloak room and other purposes. This modest request was granted, as the manager had not the heart to refuse him. Next morning bright and early he was up, washed, dressed and hair combed as neat and tidy as a country school ma'am, and stationed at the receiving window ready for customers. By the time Johnny arrived he had taken in about a dozen messages for various points, the greater part of which were checked, "Collect guaranteed by Bogy."

Comment is unnecessary, suffice it to say that our would-be receiver probably had a good square drink that day.

A more recent incident is too good to lose. It was an original description of last sending, given a few days ago by a New York artist, who was at the time being made the target for some pretty lively shooting by one

of our fast men. After struggling for a while—and, by the way, it happened on the "off" side of the quad, at that—with some of the high-toned eloquence of the speaker of the house, he threw open his key with a desperate snap, and rattled back, in accents of unmistakable excitement: "Oh! ———, this stuff comes like beans through a horn."

The Utility of the Electric Fluid.

SINCE the establishment of the first telegraph line, the rapidity with which electricity has been utilized, and the multiplicity of purposes to which it is now applied, are truly astonishing. The manufacture of electric apparatus has become a business of great and constantly increasing importance, employing the best scientific and mechanical skill. One of the most useful applications of electricity is for the establishment of instantaneous communication between the various apartments in dwelling houses, factories and buildings of all descriptions, either as a safeguard against fire, protection from burglars, or for the purpose of facilitating business operations, and no first class building is now regarded as containing "all the modern improvements" unless supplied with telegraphic appliances.

To-day, Mr. Tom. A. Graham, the popular manager of the W. U. Telegraph office in this city, exhibited and explained to us one of the most wonderful of these inventions, and which is destined soon to become generally introduced throughout the land. It is a marvelous electrical invention for the purpose of guarding against fire, and if the example of other cities is imitated here there is a good prospect for those of our citizens who avail themselves of its utility to secure a reduction in the rates of insurance now charged.

The mercurial fire alarm is to be placed in hotels, factories, storehouses, or any large buildings or residences. It consists (1) of mercurial bulbs or thermostats placed in the ceiling throughout the building; (2) of insulated copper wire running from the thermostats to the office of the building, or to police headquarters, and forming with the battery an electric circuit; (3) an electric annunciator and bell, placed in the circuit of the office or terminus of the wires.

The thermostat consists of a glass bulb filled with mercury and placed in a metallic shield for protection. The bulb has two upright tubes, in each of which is a platinum wire. In the shorter tube, which is closed, the platinum wire connects with the mercury at all times. In the other the wire is set above the mercury at that degree of temperature at which the alarm is intended to be given.

When the atmosphere around any thermostat in the building is overheated, the electric circuit is completed at that point, the bell rings to draw attention to the fire, and the annunciator indicates where it is. This is the invention of a Chicago genius, and in that city the alarm is being generally introduced in all large buildings. As an indication of the practical utility and the great merit of this alarm, the action of the fire underwriters of Chicago has been to make a reduction of ten per cent. per hundred dollars on all buildings and stocks insured where this mercurial fire alarm has been introduced.

We hope that Mr. Graham may be successful in introducing this truly wonderful invention in our city, and that he may meet with the hearty coöperation of our board of underwriters. By calling at his office parties may see and test this alarm, where also may be seen Holmes' burglar alarm, designed for private residences, call bells, batteries, etc.

Mr. Graham has put up a large number of the latter in private dwellings, offices and manufactories, in this city. Their convenience is very evident; by merely touching a small knob clerks may be summoned to the office, servants called to any part of the house, the coachman from the stable, etc. They can be arranged either for a single stroke or for a continuous series of strokes. D. M. Osborne has a line connecting his residence and office, nearly a mile in length. Wm. C. Barber has stable gongs, etc., and Dr. Willard a burglar alarm complete throughout his large and handsome residence. Others are in contemplation by numerous citizens.—*Auburn (N. Y.) Daily Advertiser.*

Amalgamation of Battery Zincs.

THE simplest and quickest method is that of M. Berjot (a chemist at Caen), which consists in immersing the zinc in a liquid composed of nitrate of mercury and hydrochloric acid. A few moments is sufficient for the complete amalgamation of the zinc, however solid its surface may be. With a quart of this liquid, which costs less than 50 cents, 150 zincs can be amalgamated. The liquid should be prepared in this manner:—Dissolve in warm water 200 grains of mercury in 1,000 grains of aqua regia (nitric acid one part, hydrochloric acid three parts). When the mercury is dissolved, add 1,000 grains of hydrochloric acid.

The "Quadruplex" Controversy.

TO THE EDITOR OF THE TELEGRAPHER.

WITH the single exception of automatic telegraphy, probably no question has ever arisen in connection with the telegraph upon which intelligent and practical telegraph experts have differed more widely than they have as to the importance or value of the quadruplex system.

That experienced and exceedingly astute gentleman, the President of the Western Union Co., has publicly expressed his sense of the importance of the invention, in the declaration that it virtually quadrupled the transmitting capacity of that company's 150,000 miles of line wires—thus making the 150,000 equal to 600,000! and as the same authority has fixed the actual cost of keeping each mile of the company's wires in working order at upwards of \$8 per annum, it appears that Mr. Orton thinks the actual value of the quadruplex system to the Western Union Co. may be considerably in excess of \$3,600,000 per annum.

It is only just, however, to say, on behalf of Mr. Orton, that when he gave currency to this fabulous estimate of the value of the quadruplex system, he seems, in his enthusiasm, to have forgotten that his company already owned a duplex system, which is claimed to be capable of double the speed of the ordinary Morse system, and of half the speed of the quadruplex—so that, in fact, the latter system only added to his company's facilities the value of \$1,800,000, instead of \$3,600,000 per annum.

There is also another and very important consideration to be taken into account, so far as Mr. Orton is concerned, and that is that when he spoke of the value of the quadruplex system to his company he supposed he had the poor inventor securely within his toils, and that it rested with him to say when his company should clutch the prize for a mere nominal consideration.

Recently some judicial facts have come before the public, in the Court of Chancery in New Jersey, which indicate that the Western Union Co. are not yet, nor likely in the future to be the owners of the quadruplex system; and as it is a well known maxim with Mr. Orton, that there is no value and no legality in any patents or systems which his company does not own, it is quite likely that that gentleman will issue another dispensation upon the quadruplex, and place it in the same position as he did the automatic system—"totally impracticable, either in connection or in competition with the Morse system."

My own idea is, as your readers have been specifically informed, that Mr. Orton and all others who have written upon the duplex and the quadruplex systems are most absurdly wrong in their estimates of the intrinsic value of either of those systems—and I assert that no one can truthfully affirm that a specified large amount of telegraphing can now be done between any two points in the country, say 400 miles apart, and daily through the year, as cheaply, or as expeditiously, by the duplex or by the quadruplex, as it can be done by the regular Morse system.

Whilst I say this I by no means mean to say that the quadruplex system is not of great value to the Western Union Co.; and it is not surprising that Mr. Orton should make the desperate struggle he is now making before the officers of patents in Washington, and before the Chancery Court in New Jersey, to maintain his hold upon that very meritorious invention.

The quadruplex controversy has developed so much heat and passion on both sides, and it has been discussed in the newspapers with such unreasonable bias, that even the telegraph fraternity have at best only a glimmer of the real truth in the premises; and as we now have all the contracts or other papers connected with the subject published and sworn to through the legal tribunals, I propose, with your permission, to lay the exact facts before your readers.

Near the close of 1870, and after the success of automatic telegraphy between Washington and New York had, under my direction, been fully demonstrated to the extent of a reliable speed of transmission and recording of over 1,000 words per minute, the system was handed over to George Harrington, who assumed, in the interest of the Automatic Telegraph Co., the duty of putting the system into operation throughout the country. In furtherance of this duty he entered into a contract with T. A. Edison, of Newark, the inventor of the quadruplex system, by which Mr. Edison and Mr. Harrington agreed to unite their interests "as owners in all original inventions and improvements, invented, purchased or obtained by them, or either of them," for the term of five years.

In a subsequent section Mr. Edison reserved certain specified inventions made or to be made for the Gold and Stock Telegraph Co., not at all in dispute; but all other inventions, and the profits arising from the same, were to be owned, one third by Edison and two thirds by Harrington.

On the 4th of April, 1871, Mr. Edison conveyed to Mr. Harrington, by power of attorney, irrevocable, the absolute control of his one third interest in his inventions and patents, "whether already issued, applied for, or to be hereafter applied for, * * * * * and of all the patents that may be issued therefor, that are or may be applicable to automatic telegraphy or mechanical printers."

The second instrument (which, in no sense, invalidated the first one) between Edison and Harrington was somewhat less comprehensive in its terms than the first one, and voluminous arguments have been made and published by no less than six of the leading lawyers of the country in regard to the legal bearings of those two agreements in connection with other agreements subsequently made between Mr. Edison and Mr. Prescott, the electrician of the Western Union Co.; but though the legal gentlemen have succeeded in greatly befogging the legal rights of the contesting parties, yet the equitable rights of all are so clearly apparent from an examination of the legal papers in the case, that no unprejudiced person who examines them can for a moment doubt as to the final result of the litigation, when it reaches, as it ultimately must, the Chancery Courts.

Under the contract of 1870, between Edison and Harrington, some thirty or forty inventions were made by Edison, and the patents were duly assigned to Harrington; but as early as January, 1873, Edison had made many experiments looking to the development of duplex and quadruplex telegraphy, and had actually completed several duplex and at least one quadruplex machine, and those machines really embrace some of the essential features of the present quadruplex machines. Both inventions, duplex and quadruplex, were as fully completed as it was possible to carry them without the aid of more extended circuits than were at Edison's command; whereupon, without the knowledge of Harrington, Edison applied to Mr. Orton for the use of the wires of the Western Union Co. between the hours of midnight and seven o'clock in the morning, which Mr. Orton, with his usual kindness in such matters, readily conceded. Thereupon Mr. Edison entered up a series of careful experiments, running through one hundred nights upon the wires and a good part of one hundred days in adjusting his machines at his own machine shop, and at the end of that time he had so far perfected his duplex machines as to feel satisfied they would perform satisfactorily in regular business, and he had also made some valuable improvements in his quadruplex machines; and at this stage of the matter Mr. Edison applied to Mr. Orton to have his duplex machines put to regular work, whilst he would continue his efforts to develop his quadruplex ideas. Mr. Orton promised compliance with Mr. Edison's wishes, but failed to give any orders to his subordinates to carry Mr. Edison's wishes and his own promises into effect, and finally sailed for Europe, without even noticing an urgent letter from Mr. Edison upon this subject.

After Mr. Orton had sailed for Europe Mr. Edison addressed himself to Mr. Prescott, the Electrician of the Western Union Co., and stated his difficulty to him, and asked his aid in having the duplex instruments put to work on the Western Union lines, and as an inducement for him to do so, Edison was constrained to promise to him a half interest in his inventions, and was also forced to agree to recognize Mr. Prescott as joint inventor of the duplex and quadruplex inventions, although up to this time Prescott had done nothing directly or indirectly towards the inventions, and did not even understand, and probably does not to the present day, the exact principles involved in the operation of the machines.

Thereupon Mr. Prescott draws up a contract, on the 9th of July, 1874, between himself and Mr. Edison, wherein Prescott recited that he and Edison were the "joint inventors" of the machines before referred to, and this fraudulent paper was forced upon Mr. Edison as the only condition upon which he could be permitted to continue the development of the duplex and quadruplex inventions upon the wires of the Western Union Co.

After Prescott had forced upon Edison compliance with his demands, and had signed in due form this fraudulent agreement, it was discovered, on consultation with the patent attorney, that a patent obtained by an oath on the part of Mr. Prescott, which would be rank perjury (as he had no hand or brains in the inventions), would have no validity, and thereupon Mr. Prescott subsided as a "co-inventor" in the patent papers, and at the same time procured the suppression of the fraudulent "co-inventor agreement, and procured Mr. Edison's signature to a second contract, which admitted that Edison was the sole inventor, but that Prescott was half owner; but whilst the "co-in-

ventor" dodge was omitted in the patent papers, it was by no means omitted in the *Journal of the Telegraph*, the official journal of the Western Union Co., wherein Mr. Prescott published, soon after, a leading and flaming editorial, in which the inventions before described were stated as those of "George B. Prescott and T. A. Edison, and the same were held up to the admiring gaze of the partisans of the Western Union Co. as the greatest achievements in telegraphy since the discovery of the telegraph. This editorial article was marked out and sent to all the leading journals of this country and of Europe, and for several weeks afterwards Mr. Prescott's name rung throughout the civilized world as the leading inventor of duplex and quadruplex telegraphy, whilst in truth he had no more to do with those inventions than the man in the moon.

Up to this time, to wit, the 9th day of Aug., 1874, neither Mr. Prescott nor Mr. Orton had done anything more than has been described, to aid in the development of the duplex or quadruplex systems. And at no future time did Prescott ever invest brains or money in the inventions of Mr. Edison, except a small sum for solicitor's fees and for some new machines—and the only money ever given to Edison by any one connected with the Western Union Co. was the sum of \$5,000, from Mr. Orton, on the 10th day of Dec., 1874, full one week before any formal proposition to sell the quadruplex inventions to the Western Union Co. had been made by Prescott or Edison—and this was the only money consideration that Mr. Edison ever received from any person connected with the Western Union Co. The receipt which Mr. Edison was required to give for the \$5,000, recited that he and Prescott had agreed to assign the quadruplex inventions to the Western Union Co. "provided the terms of payment for such assignment should be satisfactorily adjusted between said parties and said company."

Thereupon Mr. Edison and Mr. Prescott consulted about the terms of sale of the inventions to the Western Union Co., and on the 16th of Dec., 1874, made a formal written offer of sale, and the only formal offer which Edison and Prescott ever made to the Western Union Co. The proposition was not satisfactory to Mr. Orton, and he treated the matter with indifference and rather repelled the overtures of Mr. Edison, who, at that time, was in such great straits for money to pay his workmen that he was disposed to make almost any concession for ready money.

Mr. Orton well knew Mr. Edison's necessities, but treated his anxieties with silent contempt, and set out on an extended tour through the West.

Soon afterwards Mr. Edison offered his interest in the quadruplex inventions to Mr. Jay Gould, and, with the approval of Mr. Harrington, a formal sale of Edison's and Harrington's interests in the duplex and quadruplex inventions were duly executed between Gould, Edison and Harrington, before any intimation had been received from Mr. Orton that the Western Union Co. would purchase the inventions upon any terms. And it is clearly proven that Mr. Orton took no notice of Edison's proposition of sale until after he had been informed that the title to the inventions had passed into the possession of Mr. Gould. Then, of course, Mr. Orton became very anxious, and was ready to accept anything in the form of an agreement to sell the inventions to the Western Union Co.; but it was too late. Jay Gould had bagged the game and left Mr. Orton only the poor consolation of a realizing sense of the operation of biting off his own nose, by too much "smartness" in driving a bargain with a needy inventor.

Shortly after Mr. Orton returned from the West (in the following month) Mr. Edison apprised him and Mr. Prescott that he had disposed of his interest in the inventions to Mr. Gould, influenced thereto by Mr. Orton's apparent indifference about the inventions, but more particularly because he had become satisfied that the inventions were legally held under one or both of his contracts with Mr. Harrington, of 1870 and 1871. Mr. Edison, at the same time, offered to refund to Mr. Orton and Prescott their advances to him, which they declined to accept.

Following this came the withdrawal from the Patent Office, by Mr. Edison, of his application for patents for his inventions, for the joint benefit of himself and Mr. Prescott, and filing new papers for the patents to issue, as some thirty or forty had already issued to Edison and Harrington under the agreements of 1870 and 1871.

Thereupon followed legal proceedings at Washington and in New Jersey, instituted by the Western Union Co. and Prescott, against Edison and Harrington, the objects of which are to compel Edison to make a title to his inventions to the Western Union Co. and Prescott and to restrain the issuance of the patents except to Edison and Prescott. Competent and disinterested legal gentlemen, who have read all the pleadings, assure me that Mr. Prescott has no legal control whatever as to the form in which the patents shall issue—that resting, under the law and the facts, absolutely in the discretion of the inventor, Mr. Edison—Mr. Prescott's only legal remedy for any real or imaginary wrong to himself being a suit for damages against

Edison or a suit in Chancery against Edison and Harrington, where, of course, Mr. Prescott will be met by the two *bona fide* contracts between Edison and Harrington of 1870 and 1871, under which it is alleged, under oath, that Harrington has expended \$100,000, whilst Prescott has never expended, so far as has been shown, any money whatever.

In an equity suit, therefore, as far as Prescott and Harrington are concerned, there would seem to be no room for agreement, and the equities are so apparent that it would seem unlikely that Prescott will ever attempt to litigate the question. His own record in the matter of the inventions, and his unsuccessful attempt to foist himself upon Edison as a "co-inventor" will naturally induce him to subside and leave the controversy to Mr. Orton and Mr. Gould, who will not be apt to surrender any of his legal rights at the bidding of the President of the Western Union Co., whose equities in this controversy have now been fairly placed before the readers of THE TELEGRAPHER.

From the sworn papers in the suits, it appears that when Edison commenced his dealings with Mr. Orton, early in 1874, and with Mr. Prescott in the spring or summer of that year, he supposed that his second agreement with Harrington, of 1871, superseded the first one of 1870; which was a very natural idea to a gentleman like Mr. Edison, who has all the ordinary characteristics of his class of scientific and ingenious men, who are habitually careless, even to recklessness, in scrutinizing contracts or other forms of commitments in business matters.

Previous to 1874, Mr. Edison and Mr. Harrington had been working together to perfect all the details of the Little system of automatic telegraphy, and having accomplished this duty far beyond the original hopes of Mr. Little or myself—having indeed made the automatic system absolutely perfect—Mr. Edison switched off on to duplex and quadruplex telegraphy, more as an interesting electrical study than with any idea of making a valuable invention; and as he never contemplated, and does not now contemplate, quadruplex or duplex telegraphy, as even a possible competitor of automatic telegraphy, he overlooked the fact that Mr. Harrington might object to his dealing with the Western Union people—and as Mr. Harrington was absent from the State at the time, and for some months subsequently, he had no knowledge of what Edison was doing, and, of course, had no occasion to dissent from what Edison proposed to do—whilst Edison, thinking that he was doing nothing which could have any real value in Harrington's estimation, and in comparison with automatic telegraphy, kept on with Mr. Orton and Prescott, as we have seen, and with the results detailed.

If the real truth were spoken, it is probable that if Mr. Orton had not so unreasonably magnified in his annual report to his shareholders the importance and value of the (as he then styled them) Prescott and Edison quadruplex inventions, though he knew two months before that Prescott had nothing to do with the creation of the invention, and if Prescott had not filled the editorial columns of the official "journal" of the W. U. Co. with his own laudatory and inflated claims as the chief "inventor" of the quadruplex machines and system, and absurdly expressed the opinion that there was "millions in it," and that it was *the* invention of the age, and the final solution of the cheap telegraph problem—I say, except for these manifest absurdities on the part of Mr. Orton and Prescott, it seems extremely probable that Mr. Harrington would never have taken the trouble even to inquire what Edison was about, or how far he was acting outside or inside of his contract obligations. But when Mr. Harrington's attention was finally called to the real position of Edison with Prescott, he placed his contract of 1870 before him, and from the reading of which Edison quickly perceived that his invention of the quadruplex system belonged, in its results, two thirds to Harrington and one third to himself, and that the absolute business control of the invention was vested in Harrington, both by the contract of 1870 and of 1871.

The business relations between Mr. Harrington and Edison from 1870 till 1874 were well known to Mr. Orton and Prescott in a general way, and they were specifically notified before they made any agreement with Edison that all his inventions, made or to be made, belonged to Harrington, and through him to the Automatic Company, and Mr. Orton will not deny this statement, so far as he is personally concerned.

With this simple statement of facts your readers will not find it difficult to understand where the equities are in this much discussed and wholly misunderstood triangular fight over the quadruplex inventions.

Chicago Western Union Changes and Personals.

CHICAGO, ILL., May 22.

TO THE EDITOR OF THE TELEGRAPHER.

THERE have been but few changes since my last in the Western Union office here. Messrs. Armstrong, of the Detroit duplex, and McCulloch, of the Galesburg

and Quincy wire, have been assigned to duty on the Cincinnati duplex. "Dad" and "Mack" make a good duplex team. "Jack" Martin, of the Cincinnati duplex, was to take the Detroit duplex, but has been on the sick list ever since the day after the change. A. J. Long has been filling Jack's place on the Detroit duplex since his (Jack's) indisposition. "Eph." Martin takes McCulloch's place on the Galesburg and Quincy wire. Among the visitors to our office recently were Miss Dean (daughter of Judge Dean, of San Francisco, visiting friends at Highland Park, Ill.), and Miss Stager (daughter of Gen. Anson Stager), who were shown around the office by Gen. Stager; Miss Lillie Smethells, now employed on the Michigan Central R. R. line; and Mr. Fisher, Chief Clerk of the St. Paul, Minn., North Western office.

Mr. Lester, of the N. Y. duplex, who has been so seriously ill, was out yesterday and called at the office. Although but a shadow of his former self, he is on the mend, and hopes soon to be able to gladden the office by his presence again.

We were lately shown a poem, written by an old timer, a brother of "Billy" Manners, of the First N. Y. wire. It is well written, and reflects great credit on Mr. Manners, who, by the way, is a first class phonographer as well as operator. He certainly has talent in his new departure, and should cultivate it still more.

The following, for Hawthorne avenue, in the address of a message from Shenandoah, Iowa, is pretty good: "*Hawehorhounnie Street*;" the street, no doubt, was added to make it read right. This Scandinavian word originated among the *grangers* between the office that repeated the message to Burlington and Shenandoah. It looks like a sender's mistake.

Probably the most *impudent* occurrence which transpired recently was that of a man with such a beard (!) as "Billy" Manners has got (*to get*) asking Ass't Manager Jones to let him go out to get shaved to-day. The day men say it's fearful.

I can't stand it. I subside also.

WESTERN UNION.

Weather.—No Meeting of the American Electrical Society.—Important Legal Decision.—Disastrous Effects of Lightning.—Response to "John Sterling."

CHICAGO, ILL., May 24.

TO THE EDITOR OF THE TELEGRAPHER.

ALTHOUGH we have had a few chilly days recently, reminding us that stern winter was loth to be driven from his stronghold, still we can say truly that spring, with its birds, refreshing showers, beautiful flowers, &c., is at last with us. We bask in the sunlight one minute, the next we rush for shelter (under some friendly awning) from one of these western thunder storms.

There being no business of importance on the tapis, there was no meeting of the American Electrical Society last Wednesday evening. As there is generally a lull just before a storm, as well as after one, no doubt the next meeting will be as characteristic for its interest as the one at which Mr. Gray's telephone was explained—that being the last one held.

We noticed our friend Mr. "Harry" Garner, lately of the Supt's office, Renovo, Pa., P. & E. R. R., in town Saturday.

Mr. "Steve" Robinson, Manager of the W. U. Board of Trade office in this city, was recently elected a Vestryman of Dr. Cooper's Church (Episcopalian of the Dr. Cheney School) on the north side. On Saturday he gave "the boys" of the different offices a call, and gently requested them to "come down" with "two bits" apiece to help him to buy a library for the Sunday school they were starting in connection with that church. As Steve is one of the kind not to be put off with a negative answer to such requests, he gathered in a good many "bits."—Don't tell us, old "Vets," that the fraternity are deteriorating in morals, when we see one of the old sinners like "Steve" go to work in such a good cause.

Quite an important decision was rendered here on Friday, in the Superior Court, by Judge Geary, in the case of Findley vs. Bagley, wherein the latter attempted to show that a telegram could not be regarded as a contract. The Court held that the telegraph company should be considered as the agent of Bagley in effecting the purchase of goods, and that the defendant was liable for damages resulting from nonfulfillment of such contract. The Judge directed an order for the assessment of damages to be entered, and the defendant moved for a new trial.

Geo. Baron, an operator at Joliet, Ill., was considerably bruised and scared by the horse he was driving running away and plunging into an excavation for a new building in that city on last Thursday evening; his companion, Paul Deiss, a clerk in the post office, had his skull broken and was otherwise seriously injured, and will probably die.

Lightning played some curious pranks during a

heavy storm at Burlington, Iowa, about dark on Thursday evening last; striking the house of Alderman George Kreichbaum it passed down through the flue and stovepipe, prostrating all the inmates of that house, as well as those of the house immediately adjoining. Mr. K., who was sitting, reading, with his arm upon the stove, was rendered insensible; his shirt sleeve torn off his arm and detached from the garment, and his neck badly burned and blistered. His injuries were pronounced very serious but not fatal. He should have one of "Winters'" lightning rods.

In reply to "John Sterling" I wish to say that I did not mean to take him to task for his construction of rule 34, but only for not quoting my language correctly, *i. e.*, as I used it; for, to me at least, his construction of my language as he quoted it did not convey my meaning; but when quoted just as I wrote it, it does convey my meaning.

I thought by his construction of my language that he was an ally of "Nihil Namless," but I am very glad I was mistaken, as you know, Mr. Editor, I am very radical on this "female operator" question. As I have before expressed myself, "I believe women should not only be 'telegraph operators' if they desire to, but when they perform the same service they should have the same pay as men, ability, etc., being equal."

You also know me well enough to know that I am willing to stand by every paragraph I have ever written for publication, and to end the matter, if my construction of rule 34 was not complimentary to the male portion of the fraternity I can't help it. I meant just what I said; but if any of them feel aggrieved, I will say this much, that I am very sorry, as no offence to any one, male or female, was intended; as I grow older I shall probably be able to write so that I shall not be misunderstood by any one, from messenger boy to Gen'l Supt.

Mr. Sterling has been indeed fortunate in having had such pleasant superiors, and in this connection, with two or three exceptions, I myself have been peculiarly fortunate also; but I personally know of operators, both male and female, who have been ill treated in just the manner I formerly noticed; and in their interest I ventilated the subject. I admire Mr. Sterling's grit, but it may be that when such a case comes under his notice he may consider "discretion the better part of valor," and think as I did that a proper ventilation of facts, first without names, may work such a reform that personalities need not be indulged in. I believe in doing a good work quietly if you can, without any special flourish of trumpets; wait a while for the other side to capitulate, without wasting any ammunition; then, if they don't surrender, fire your broadsides.

My judgment for once has been right; in neither of the cases I referred to will any further ventilation be necessary.

The fact that such is the case gives me heartfelt pleasure, and I do not care to know whether I was instrumental in effecting the change or not, as long as I know that a change for the better has been wrought.

I am glad "John" is not spoiling for a fight, for I am one of the best runners that ever left tracks with the heels towards the enemy.

Although I cannot help feeling a little nettled (and honesty compels me to admit this) at being attacked on what I consider a side issue in this case, *i. e.*, misinterpretation of the rule in question, still, I do honor Mr. Sterling for his manliness in acknowledging his erroneous impression of my character, and assure him he is freely forgiven. In conclusion I will say (without any flattery) that I have been very much amused and instructed by "John Sterling's" writings, not only in THE TELEGRAPHER, but also in other telegraph papers (as I take them all), and hope he will continue to favor the fraternity with his readable and interesting contributions for many years. OCCASIONAL.

He Appeared to Have a Prejudice Against Telegraphs.

Soon after the first telegraph line was constructed through Alabama, on the way from New York to New Orleans, in 1847 or '48, an unprecedented drought occurred in that section of country, which was attributed by the ignorant and superstitious inhabitants to the malign influence of the poles and wires. Accordingly, the Ku Klux turned out in force, and many miles of the line were torn down and destroyed. The following is a *verbatim* copy of a notice which was posted in Marion County at that time:

"The state of Alabama } this the 5 of
Marion county } may.

Notice to the managers of the Tellegraft Ware you ar hereby forewarned to not put up the Ware any more for it shall not stay up any more long at a time if you do not let it stay Down the hole county is going to Just go before your Eyes and Tare it down and throw away the glassis and throw away the Ware and Skin the first man says anything Agant it and throw his hide a crows a Pole and split

JUMP UP JOHN, THE WOLF KETCHER."

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JUNE 5, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.) 38 VESEY ST., New York.

PREMIUMS FOR SUBSCRIPTIONS.

1,000 NEW SUBSCRIBERS WANTED.

It is desired to add 1,000 new names to the present Subscription List of THE TELEGRAPHER during the next two months. To accomplish this it is only necessary for the friends of the paper to engage energetically in presenting its claims to the consideration of the Telegraphers generally throughout the country.

To encourage such efforts it has been decided to offer the following

LIBERAL PREMIUMS.

For Two New Subscriptions, or Renewals of Subscriptions which have or are about to expire, we will give the person sending them

A NEW POCKET GALVANOMETER.

For Three New Subscriptions or Renewals,

A NEW POCKET GALVANOMETER, Nickel Plated.

A very handsome and useful article to every Telegrapher.

For Six New Subscriptions or Renewals,

A No. 3 TELEGRAPH KEY.

For Ten New Subscriptions or Renewals,

A No. 1 SOUNDER or No. 1 TELEGRAPH KEY.

For Fifteen New Subscriptions or Renewals,

A GALVANO-ELECTRIC or SHOCKING MACHINE.

The price of this Machine is \$10.

For Twenty-five New Subscriptions or Renewals,

A No. 2 RELAY.

For Forty New Subscriptions or Renewals,

A No. 1 RELAY,

Handsomely finished, with glass shade.

For One Hundred New Subscriptions or Renewals,

A No. 1 SELF-STARTING REGISTER

With glass shade, and everything complete.

Subscriptions must be paid in advance at the regular price of TWO DOLLARS per year. Subscriptions for less than a year will be counted proportionately.

Those who may desire to obtain Premiums can send in subscriptions as obtained, and they will be credited therefor, and can call for such Premium as they are entitled to for the whole number so credited at any time.

Specimen Copies of the paper will be forwarded, on application, to those who may desire to use them in canvassing.

Remittances should be made by Draft, Postal Money Order payable to, or Registered Letter addressed to,

J. N. ASHLEY, Publisher,

P. O. Box 5503.

NEW YORK.

The Quadruplex Controversy.

In accordance with the principle which has always governed us in the management of THE TELEGRAPHER, of affording in its columns opportunity for free discussion of all telegraphic matters, we print this week a communication upon "the quadruplex controversy," which purports to give a full and correct statement of the matters in dispute from the EDISON-HARRINGTON-GOULD standpoint. Evidently the statements made in regard to the dealings of the putative inventor of the quadruplex are derived mainly from EDISON himself, whose word is as good as his oath—and the value of both is as well known to our correspondent as to us and others who have had dealings with him.

We have from the first declined to discuss editorially the equities in this matter, as between EDISON and Mr. PRESCOTT, or between EDISON, Mr. HARRINGTON, Mr. GOULD and the Western Union Telegraph Co. We do not now propose to depart from this, but we have exhibited and propose to exhibit the duplicity and "crookedness" of the course characteristically pursued by this remarkable genius, EDISON, in his dealings with all parties in connection with these inventions. In the first place, every person who has had dealings heretofore with EDISON knows that he is utterly unreliable, that it is a well known characteristic of his to systematically and deliberately "go back" on every person who has ever endeavored to aid or cooperate with him in his inventions or business.

The attempt (for originating which the credit belongs to Gen. BENJ. F. BUTLER) to make EDISON appear as the guileless and overreached inventor beguiled by "wicked partners," causes incredulous amusement to all who know him. From the time that he obtained his first patent until the present time, probably not a single person has had dealings with him in his inventions but what has suffered more or less severely pecuniarily. He has taken up one after another, and when they had been squeezed as much as possible, has dropped them, and generally is found working directly against his late friends, associates or partners, and is by no means backward in publicly denouncing his quondam partners as "damn fools," "public nuisances," &c.

EDISON made his appearance at the Western Union office under the circumstances narrated by our correspondent. He was at that time, and had been for some time before, as was well known, connected with the Automatic Telegraph Co., a rival and competitor of the Western Union Telegraph Co. The idea advanced was that he desired to perfect and improve the duplex inventions of Mr. STEARNS; his real purpose, of course, was to get an opportunity to bring out the quadruplex. Whether at that time he had conceived the idea of using the Western Union facilities to build up a system for its rivals cannot of course be certainly known. Eventually he, of his own motion, and for advantages which will readily be perceived, proposed to Mr. PRESCOTT that they should cooperate in developing the quadruplex, which was then in a crude state, and that for his cooperation and assistance he, PRESCOTT, should have a one half interest in all his duplex and quadruplex patents and inventions. The suggestion of the co-inventor idea was EDISON'S, not PRESCOTT'S, and it was supposed by both that any cooperation of the latter in perfecting the invention would entitle him to join in the applications for patents. They were subsequently advised, however, that the patents, if so issued, would be of questionable legality, and a new contract was substituted, under which the one half interest was to be secured by an original assignment. Thus far every thing was working smoothly. It should be stated, however, that Mr. PRESCOTT in the meantime had been warned of EDISON'S peculiarities, and that it was only a question of time and opportunity when he would go back on him and the Western Union Telegraph Company—his informant indicating the very course which he subsequently pursued—that is, that suddenly he would disappear from the Western Union premises without warning or notice, and would be seen there no more.

It was upon this information that Mr. PRESCOTT took the steps to legally secure, so far as possible, his interests in the patents and inventions.

EDISON had filed his applications, assigning the patents to himself and Mr. PRESCOTT, had received \$5,000 on account from the Western Union Company; and of course was on the lookout for a new customer, whom he found in Mr. JAY GOULD. He was seen no more at the Western Union office, and the efforts of Mr. PRESCOTT and other Western Union officials and messengers to find him were ineffectual. He had gone across the street and was doing his best to make it "hot," as he expressed it, for his partner and his other former Western Union friends.

If he had been "coerced" into making the agreements with Mr. PRESCOTT and the Western Union Co., as alleged, why should he, at midnight, in a cowardly manner run out of a side door of his shop in Newark to avoid an interview with the former? Would not an honest and honorable man, who found that he had inadvertently and mistakenly entered into an arrangement and agreements which he had no moral or legal right to make, have met his partner fairly, explained the situation in which he found himself, and endeavored to find some satisfactory solution of the situation? Would he not seek to repair, as far as possible, the injury he had done, and if that was impossible, at least exhibit a manly, and not a cowardly and sneaking spirit, seeking by hurried flight into the darkness of the night to avoid the presence of the man he had attempted to wrong? "Conscience doth make cowards of us all," says SHAKESPEARE, and thus EDISON, telegraphically warned that Mr. PRESCOTT had called at his house and was then on his way to the shop to have an interview with him, left his studies and his work and fled, hoping that the darkness of the night and sneaking through the alleys and byways of Newark would secure him from recognition. His hopes were realized, and from that day to this Mr. PRESCOTT has never set eyes upon or exchanged a word with his partner.

As between the numerous claimants of these duplex and quadruplex inventions we do not take sides, we have endeavored to state fairly the facts and arguments presented by all parties. As we have before remarked, the only thing that seems to be clear is that whoever may eventually succeed in establishing title and interest in them, THOMAS A. EDISON certainly has none left. He has so numerously conveyed his interests that it may, perhaps, be regarded as an abandonment to the public use, so far as he is concerned; and he has succeeded not only in divesting himself of title and interest in these inventions and patents, but of any claim he might have had to respect and confidence as a man, and has exhibited his true character so plainly, that if, hereafter, any person or corporation shall be deceived or humbugged by him, they will not be entitled to sympathy or morally to assistance in maintaining their supposed rights.

As to the relative value of the duplex, quadruplex and automatic systems, we do not care to discuss them at the present time. In fact, our correspondents and contributors have kindly relieved us of the necessity therefor, for which we are much obliged to them. We will only say that the quadruplex apparatus, when it was abandoned in the Western Union office by EDISON, was by no means perfected, and that the improvements which have been effected upon it since by Mr. GERRIT SMITH and others have made it much more efficient and reliable than it ever was under EDISON'S manipulations.

We will conclude this article by a brief statement of the present legal situation of this quadruplex matter. The Commissioner of Patents having decided that the patents should issue as a matter of legal right and practice to EDISON and PRESCOTT, as assignees of EDISON, HARRINGTON and EDISON have brought the matter before the Secretary of the Interior, by an application to him to withhold his signature from any patents so issued, that may be presented to him to sign. Numerous briefs, *pro* and *con*, have been filed

with him by leading lawyers. His decision will not probably be authoritatively known until the patents are ready to issue.

A suit in equity has also been commenced, and is now pending in the Chancery Court of New Jersey, by the Western Union Telegraph Company against EDISON and PRESCOTT (the latter being joined *pro forma*), praying for an injunction restraining the defendants from making any assignment, license, or conveyance of the patents to other parties; and to compel them to execute the necessary documents under an alleged written agreement between the parties, to give the plaintiffs exclusive use and benefit of said invention. The bill of complaint and the answer of the defendant, EDISON, have been filed, and are lengthy documents, which we have not space to refer to more particularly. What other litigation may grow out of the matter will be developed hereafter.

The cause of this costly and troublesome litigation is solely the double dealing and duplicity of EDISON. As he now claims he first went back on his contract with Mr. HARRINGTON (who had, as he swears, invested over \$400,000 in his experiments) for the benefit of the rival of the company, of which he (HARRINGTON) was President. Having obtained the facilities he required and five thousand dollars in money, he then goes back on his new friends and allies for the benefit of Mr. HARRINGTON, Mr. GOULD, and the Atlantic and Pacific Telegraph Company.

His first contract with Mr. HARRINGTON, if it has the scope and effect now claimed for it, was a fraud upon Mr. E. B. WELCH, one of his numerous partners (and as usual pecuniarily a sufferer therefrom) in Boston, who held another of EDISON'S multitudinous contracts for a half interest in his duplex and quadruplex inventions, made in 1869—a copy of which has already appeared in THE TELEGRAPHER. His first contract with Mr. HARRINGTON was also a fraud upon Mr. D. H. CRAIG, with whom he had an existing contract of a similar character. In fact, his contracts and assignments are so numerous, and of so conflicting a character, that it will doubtless afford the courts and the lawyers abundant employment for some years to come to unravel them, and decide their respective bearing, effects and legality. And EDISON still lives, ready and anxious to affix his signature to as many more contracts, agreements and assignments as he may consider his interests may call for from time to time.

The Telegraphic Situation.

THERE does not seem to be anything specially noteworthy in regard to the telegraphic situation, but some matters of interest may, perhaps, be stated. The companies competing with the Western Union are waiting as patiently as possible for the establishment of independent telegraphic connection by the Direct United States Cable, which, if successful, will undoubtedly be an important addition to their present facilities, and add to their strength in the contest which is progressing for the telegraphic business of the country.

The Atlantic and Pacific Telegraph Co., in addition to the new lines already reported as commenced, are engaged in building a new line from Philadelphia to Pittsburg, Pa., over the route of the Pennsylvania R. R. The line from Chicago to Milwaukee is approaching completion, and the line from Chicago to St. Louis is progressing.

The automatic apparatus is being extensively introduced upon the lines of this company, and is reported as doing good service and aiding the company materially in disposing of its business.

President T. T. ECKER has recovered sufficiently to be out, but has gone to the country for a few days to complete his restoration to health, before taking up the full burden of his duties again.

The price of Western Union stock has fluctuated widely during the past week, having been sold down as low as 71, but with a speedy recovery to 76 & 77. There don't seem to be any special reason for the de-

cline or advance, other than such as is afforded by the speculative movements of the street.

Dulness is the prevailing characteristic of the telegraph, as of other business, and we do not look for any special activity in any direction for a few weeks to come.

The Direct United States Cable.

WE had hoped to be able, in this issue of THE TELEGRAPHER, to record the fact that the Direct Cable had been completed, and was in actual operation between Rye Beach and Ireland. Its completion may possibly be announced before the paper goes to press, as the Faraday, after coaling and making such repairs etc., as were necessary, sailed from Sydney, Cape Breton, on Tuesday last, for the location of the buoy to which the ends of the cable are attached. As only some twenty miles of the cable remain to be laid to close up the gap, it will take but a few hours after reaching the buoy, with favorable weather and the sea clear of ice, which latter alone prevented its being finished before, to complete the work.

Rumors and reports of amalgamations with the Anglo-American and arrangements with the Western Union Telegraph Co., etc., have been very freely and generally circulated upon the street, especially during this week, but we have good reason to assure our readers that they are merely stockjobbing reports, circulated for the purpose of advancing the price of Western Union stock. The actual working of the cable in connection with the companies competing with the Western Union will soon demonstrate the falsity of the statements which have been so positively and persistently made.

Personals.

Mr. JAMES C. DE LONG, late of Shreveport, La., is taking night press at St. Louis, Mo., Western Union office.

Mr. DAVID S. RYAN has been appointed Night Chief Operator of Western Union, St. Louis, Mo., office.

Mr. DAVE CAMPBELL is subbing in the St. Louis, Mo., W. U. office, for Mr. H. C. MAHONEY.

Mr. B. A. OSTRANDER, of Lawrence, Ks., has been appointed assistant to Mr. C. E. SMALLS, at Denison, Texas.

Mr. E. BURR, of Leavenworth, Kansas, has accepted a position with the Western Union Co. at Denver, Colorado.

Mr. M. AHERN has been appointed to a position on the day force at St. Louis, Mo., W. U. office.

MESSRS. JOHN McNEVIN and GEO. W. HUDDLESTON, at the St. Louis, Mo., Western Union office, have been transferred from the night to the day force.

Mr. P. H. SHAUGHNESS, formerly Supt. of the Manhattan Quotation Telegraph Co., of this city, has retired from the telegraph business, and is now accumulating wealth as the proprietor of a boot and shoe emporium, at Wappinger's Falls, N. Y.

MESSRS. H. L. WATERBURY and HENRY H. SHELLY, of Albany, N. Y., favored this city and THE TELEGRAPHER with a brief visit last week.

Mr. H. A. DUSONCHET, operator at Washington, D. C., in the United States Signal Service, has been transferred from the Washington to the San Diego, Cal., office.

Mr. O. K. TOMPKINS has been transferred from the Washington, D. C., to Maricopa Wells, Arizona, office, United States Signal Service.

Mr. GEORGE PAULSOCKET, of the Buffalo, New York and Phila. R. R., General Office, Buffalo, N. Y., has resigned, to take a position in the Police force, Buffalo Precinct, No. 2, as operator and doorman.

Mr. J. E. BEBER, of the B., N. Y. and P. Rwy., at Emporium, Pa., has been transferred to the Buffalo, N. Y., General Office, same road.

Mr. GEO. A. BROSS, of the B., N. Y. and P. Rwy., at Port Alleghany, has been transferred to Emporium, Pa., in place of Mr. BEBER.

Mr. A. L. TURNER, formerly on Lake Shore and M. S. R. R., at North East, Pa., relieved Mr. G. A. BROSS at Port Alleghany.

Mr. H. J. BROSS, of Olean, N. Y., has resigned, to

take a position on the Police force at Buffalo, N. Y., Precinct No. 5.

Mr. RANDALL, of L. S. & M. S. Rwy., relieved Mr. BROSS at Olean, N. Y.

Mr. W. THOMAS, of Franklinville, Pa., has resigned, and been relieved by Mr. RYAN.

The Telegraph.

By Cable.

MEETING OF THE INTERNATIONAL TELEGRAPHIC CONFERENCE.

ST. PETERSBURG, June 2.—The International Telegraphic Conference was opened here to-day. The Czar gives a banquet to the delegates to-morrow.

The Franklin Telegraph Stockholders' Suit for Dissolution of the Company.

THE majority of the stockholders, but holding a minority of the stock of the Franklin Telegraph Co., petitioned the Supreme Judicial Court of Suffolk County, Mass., for a decree vacating the lease of the lines of the company to the Atlantic and Pacific Telegraph Company, at an annual rental of \$27,000, which it was claimed was fraudulently and illegally obtained, and for the appointment of a Receiver, the dissolution of the company, the sale of its property, and the winding up of its business. Pending the hearing of this petition, as has before been stated in THE TELEGRAPHER, the obnoxious lease was annulled by agreement between the parties. A hearing was given on the 25th of May, when the respondents, by a sworn amendment to their former answer, further answered that, during the preceding week, the lease complained of in the petition had been cancelled by agreement of both companies, and thereupon claimed that all ground of complaint had been removed. The petitioners claimed, however, that the act of cancelling the lease was a subterfuge, and simply served to show further, and if possible, more distinctly, the complete power of the New York over the Massachusetts corporation. The Judge reserved decision upon the matter at that time, with a view of reporting the case to the full Court, but gave the petitioners time till the 31st ult. to consider whether, in view of the amended answer of the respondents, they would make any amendment to their petition. At the hearing on Tuesday, June 1st, the petitioners decided that they would make no amendment, but let the case go up as it stood in the pleadings. The question for the consideration of the full bench is, therefore, whether the lease having been cancelled in the manner stated, there is any remaining ground on which the Court should exercise its discretion and appoint a Receiver. The case now goes over to the November Term.

It is not probable that, the lease having been annulled and the company restored to its former status, the prayer of the petitioners will be granted.

Foreign Telegraphic Notes.

AT a meeting of the Great Northern Telegraph Company, at Copenhagen, on the 28th March, the total dividend for the year was announced as being at the rate of 7 per cent., and £12,114 14s. 1d. was added to the reserve fund.

The directors of the German Union Telegraph and Trust Company have issued their report for the year ending May 1st, 1875. The available balance amounts to £12,096 3s. 7d., out of which an interim dividend of 5s. 9d. per share was distributed in January last, and a further payment is now recommended of 7s. per share—making a total distribution of 12s. 9d. per share, or at the rate of £6, 7s. 6d. per cent. per annum.

Recently a man fell from the roof of the Pomona Gardens, near Manchester, England, and, fortunately for him, his fall was broken by the telegraph wires on the Bridgewater Canal, otherwise he must have been killed, or, at all events, lamed for life.

Trial is to be made at Portsmouth, England, of a system of signaling by bugle, which has been introduced by Capt. Bamber, Royal Marines, for use in fogs or at night, when no signal lantern is available. The plan consists mainly in the adaptation of Morse's telegraphic alphabet to bugle calls, the "long" and "short" being represented by different notes.

The traffic receipts of the Direct Spanish Telegraph Company for the month of April (30 days), 1875, were £1,494, 14s. 5d., against £1,475 3s. in March (31 days).

At a special meeting of the Eastern Telegraph Company, specially convened for the purpose of considering the advisability of the company's acquiring a convention with the Italian Government for a new cable be-

tween the Island of Sardinia and the Italian continent. After some discussion and opposition the resolution providing therefor was adopted. The length of the cable will be about 116 miles, and the price agreed to be paid to the contractors is £32,000, either in shares of the company at the market price, or in 6 per cent. debentures at par. The concession was granted to Baron Erlanger, and it is from that gentleman the company propose to purchase it. The Italian Government pays a subsidy for the cable of £4,400, or nearly 14 per cent. on the capital cost of the cable.

The total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended May 15, 1875, was 406,574—an increase on the corresponding week last year of 31,050.

The cable steamship Hooper has arrived in the Mill-wall Docks after an expedition of five months in laying the cables of the Central American, West India and Panama, and Cuba Submarine Telegraph Companies.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS—NEW YORK, May 27, 1875.

ASSESSMENT No. 73.

4, 5, 23, 28, 33, 46, 53, 54, 55, 60, 61, 64, 65, 67, 72, 77, 86, 88, 89, 90, 91, 93, 108, 114, 121, 134, 136, 137, 140, 141, 142, 143, 144, 145, 148, 153, 157, 176, 177, 179, 181, 183, 184, 201, 202, 215, 218, 220, 235, 244, 247, 254, 257, 267, 269, 273, 276, 280, 294, 301, 302, 328, 346, 347, 349, 351, 352, 353, 367, 371, 372, 378, 379, 380, 383, 385, 391, 394, 398, 402, 405, 406, 413, 416, 425, 430, 431, 434, 463, 467, 509, 526, 532, 536, 542, 546, 547, 548, 552, 553, 554, 561, 664, 576, 577, 586, 587, 592, 597, 603, 604, 615, 649, 659, 671, 672, 685, 690, 692, 694, 703, 708, 717, 729, 731, 734, 735, 740, 750, 751, 756, 764, 766, 769, 772, 799, 803, 808, 815, 825, 830, 831, 843, 855, 874, 886, 901, 915, 916, 917, 922, 923, 938, 941, 943, 976, 977, 978, 991, 995, 998, 1001, 1005, 1013, 1023, 1028, 1039, 1040, 1047, 1054, 1055, 1072, 1081, 1085, 1088, 1090, 1099, 1126, 1134, 1135, 1136, 1143, 1144, 1147, 1167, 1173, 1175, 1177, 1183, 1193, 1194, 1200, 1205, 1208, 1224, 1226, 1227, 1251, 1252, 1260, 1266, 1276, 1277, 1282, 1292, 1294, 1295, 1300, 1304, 1306, 1825, 1329, 1345, 1353, 1354, 1355, 1356, 1358, 1364, 1365, 1368, 1376, 1394, 1402, 1403, 1404, 1409, 1410, 1440, 1444, 1453, 1454, 1455, 1458, 1484, 1485, 1498, 1504, 1505, 1506, 1507, 1508, 1517, 1518, 1522, 1524, 1527, 1532, 1550, 1554, 1555, 1560, 1568, 1569, 1571, 1579, 1582, 1589, 1593, 1594, 1615, 1626, 1630, 1635, 1656, 1658, 1672, 1681, 1695, 1597, 1698, 1707, 1708, 1721, 1823, 1728, 1753, 1745, 1773, 1875, 1778, 1790, 1791, 1810, 1811, 1812, 1815, 1817, 1830, 1831, 1847, 1852, 1869, 1881, 1894, 1901, 1911, 1913, 1914, 1916, 1919, 1938, 1942, 1943, 1944, 1950, 1957, 1964, 2965, 1970, 1985, 1991, 1995, 2019, 2021, 2026, 2027, 2028, 2030, 2036, 2044, 2049, 2057, 2061, 2063, 2065, 2082, 2097, 2113, 2114, 2119, 2133, 2135, 2138, 2143, 2147, 2159, 2162, 2172, 2174, 2175, 2178, 2180, 2181, 2182, 2191, 2194, 2195, 2196, 2197, 2199, 2201, 2202, 2203, 2204, 2205, 2206, 2212, 2214, 2216, 2221, 2223, 2224, 2228, 2229, 2233, 2239, 2241, 2243, 2244, 2254, 2259, 2263, 2288, 2289, 2295, 2296, 2297, 2298, 2309, 2310, 2312, 2321, 2330, 2331, 2333, 2334, 2335, 2337, 2338, 2343, 2345, 2346, 2348, 2350, 2351, 2354, 2358, 2363, 2364, 2365, 2371, 2374, 2386, 2387, 2392, 2395, 2412, 2413, 2414, 2415, 2416, 2424.

ASSESSMENT No. 73.

185, 186, 187, 232, 240, 565, 695, 697, 705, 848, 871, 927, 939, 1058, 1063, 1071, 1198, 1241, 1307, 1309, 1311, 1312, 1313, 1314, 1315, 1317, 1318, 1319, 1320, 1321, 1322, 1336, 1372, 1400, 1437, 1438, 1500, 1501, 1515, 1556, 1557, 1570, 1580, 1613, 1670, 1722, 1727, 1795, 1796, 1797, 1804, 1823, 1824, 1854, 1924, 1945, 1946, 1947, 1969, 1987, 2110, 2123, 2125, 2151, 2236, 2339, 2291, 2352, 2370.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

Curious Magnet.

In the year 1607 Galileo wrote to a friend about a wonderful magnetic stone, one property of which was that the same pole would both attract and repel the same piece of iron. At a distance of four or five finger lengths it attracted the piece, but at a distance of one finger length it repelled it. He found, on examination, that the piece of iron was magnetized steel. In a note to the French Academy, M. Janin says he is able to produce the phenomenon in a quite intelligible way. He magnetizes a bar to saturation with a current producing (say) austral magnetism. Then with an inverse current he communicates the certain amount of boreal magnetism, less than the austral, and leaving some of it in the deeper parts. Then he dissolves the steel with acid, which gradually removes the boreal layers, and ere long discloses the austral. Now, the latter are not disclosed equally all over; they make their first appearance at the extremity, on the edges and corners, the boreal layers still occupying most of the surface; and (in contrariety to the latter) they have great tension but small magnetic moment. Suppose, now, the austral pole of a magnet to approach. While it is still distant it is subject to the predominating effect of the boreal layers of the bar, and is attracted; but, when brought quite near the extremity, the austral points gain the predominance and there is repulsion; thus matching Galileo's mysterious stone (which, somehow or other, got lost).

Quotations of Telegraph Stocks at N. Y. Stock Exchange.

Table with columns: May, WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. It shows bid and asked prices for various telegraph stocks.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended May 11th, 1874, and bearing that date. 163,190.—ELECTRO-MECHANICAL PRINTING INSTRUMENTS.—Hans R. M. J. Hansen and Christopher P. Jurgensen, Copenhagen, Denmark. Filed Feb. 14, 1874.

1. The writing ball U and keys K p, having their points of contact arranged in a straight or diagonal line over the cylinder e, as set forth, in combination with the disk cylinder e, sectors f, the shield T, provided with a series of contact pieces, arranged either in a straight or diagonal line, to correspond with the points of contact of the keys K p, substantially as specified, the escapement R, spindle O, contact wheel K, tooth a, electro-magnets 2g, armatures 2d, armature type arms 2a, and a clockwork, substantially as and for the purposes set forth.

2. The writing balls U and keys K p, arranged as described the disk cylinder e, sectors f, the shield T, having a series of contact pieces arranged thereon, substantially as set forth, and a clockwork, when used as a separate apparatus, and at any distance from e and in combination with the electro-magnets 2g, armatures 2d, armature type arms 2a, an escapement regulated by electro-magnetism, and a clockwork, as another and separate apparatus, the two being connected together by a series of wires of the same number as the keys K p, and such wires being joined in a cable, when the two apparatus may be used as an electric printing telegraph, substantially as set forth. 3. The disk cylinder e and sectors f, in combination with the drum S, substantially as and for the purposes specified. 4. The writing ball U, the keys K p, disk cylinder e, sectors f, escapement R, and a clockwork, in combination with the pinion L, rollers 2f, 2g, 2h, having a carbonized paper band wound around them, the armature type arms 2a, and a moving surface, such as a paper band, Z, substantially as and for the purposes set forth. 5. The writing ball U, keys K p, disk cylinder e, escapement R, and a clockwork, in combination with the spindle O, pinions t and s, spindle V, carrying milled edge wheel z, and the paper band or other moving surface Z, substantially as and for the purposes described. 6. The rollers 2p, in combination with the paper band Z, substantially as and for the purposes set forth.

163,221.—COMPOUNDS FOR INSULATING TELEGRAPH WIRES.—Alphoso A. Maglaughlin, Coldwater, Mich., assignor of one half his right to Llewellen H. Johnson, same place. Filed Feb. 8, 1875. Pine tar, eleven; coal tar, four; rosin, fifty; pulverized coke, sixteen; India rubber, three and a half.

An insulating material composed of pine tar, coal tar, rosin, coke and India rubber, mixed and compounded in the proportions and manner substantially as herein set forth.

TRADE MARK. 2,491.—TELEGRAPH INSTRUMENTS AND APPURTENANCES.—Patrick & Carter, Philadelphia, Pa. Application filed April 13, 1875.

"Word 'CHAMPION.'" Born. NYE.—At Hokah, Minn., May 14, 1875, to the wife of Mr. J. M. Nye, Sup't Telegraph of the Southern Minn. Railroad, a son.

Married. HUGHES—BARROW.—At the residence of the bride's parents, Ringtown, Pa., May 29, 1875, Mr. GEO. S. HUGHES, Operator P. & R. R. K., Mooresburg, Pa., to Miss EMMA BARROW.

THE AMATEUR'S TELEGRAPH APPARATUS.

Comprising SOUNDER, KEY, CUP OF BATTERY, CHEMICALS, WIRE AND MANUAL.

Several Thousands of these Instruments already sold. They give good satisfaction.

PRICES. Amateur outfit, complete, No. 1, \$7 50. " " " 2, " " " 6 50. " Sounder and Key, No. 1, " " " 6 50. " " " 2, " " " 5 50. Battery, per Cell, " " " " " 45

DISCOUNT. Twenty per cent. discount will be allowed when remitted for in advance.

WESTERN ELECTRIC MANUFACTURING CO.

SOLE AGENTS. ORTON'S PATENT AWL CLIPS.

These Clips have been in practical use for three years, and are rapidly displacing all others. They are designed for holding messages and every form of blanks. For convenience, durability and economy they are unequalled.

WESTERN ELECTRIC MANUFACTURING CO., 220 KINZIE STREET, Chicago, Ill.

WESTERN ELECTRIC MAN'FG CO.
 220 Kinzie Street,
 CHICAGO, ILL.

CELEBRATED
 PRIVATE LINE OUTFIT.
 THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

- Private Line Outfit, complete..... \$10 00
- Instrument only..... 8 00
- Bliss Reservoir Battery, per cell..... 2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

 Manufacturers and Dealers in

TELEGRAPH INSTRUMENTS AND SUPPLIES.

- RELAYS—COMBINATION SETS; BOX and POCKET RELAYS. PONY and REPEATING SOUNDERS.
- KEYS, various styles, including the SCHNEIDER KEY, wire connections above the table.
- REGISTERS, with SPRINGS or WEIGHT.
- CUT OUTS, many varieties, including a new style of PEG CUT OUT, with an adjustable LIGHTNING ARRESTER, just out.
- REPEATERS—HASKIN'S AUTOMATIC, and others.
- SWITCH BOARDS—REPEATING, BATTERY and GROUND SWITCHES and LIGHTNING ARRESTERS.
- ANDER'S GALVANIC and MAGNETO-ELECTRIC PRINTERS; also SELDEN PRINTER.
- ELECTRIC BELLS, HOTEL ANUNCIATORS, FIRE and BURGLAR ALARMS, and WATCHMAN DETECTORS.
- ELECTRIC RAILWAY SIGNALS and ALARMS, ELECTRIC GAS LIGHTING APPARATUS.
- MEDICAL INSTRUMENTS and APPARATUS on hand and made to order. Second hand Instruments for sale cheap, and repairing done at short notice.
- BATTERIES in great variety, including the latest inventions; also a full assortment of battery material.
- WIRES—MOORE & SON'S and PHILLIPS' MAGNET and OFFICE WIRES, GUTTA PERCHA and KERITE WIRES, BEST GALVANIZED LINE WIRES; SUBMARINE, SUBTERRANEAN and HOUSE CABLES.
- INSULATORS—BROOKS, SCREW GLASS and KENOSHA CARBON. BRACKETS, PINS and SPIKES, TELEGRAPH POLES, LINE BUILDERS and REPAIRERS' TOOLS.
- TELEGRAPH STATIONERY—REGISTER, MESSAGE and MANFOLD PAPERS, CARBON SHEETS, STEEL and AGATE STYLUSES, ORTON'S PENCIL HOLDER, SAFETY MESSAGE HOOK and AWL CLIP, STANDARD TELEGRAPH BOOKS, &c.

PRICE LISTS FURNISHED FREE ON APPLICATION.

Our TELEGRAPH INSTRUMENTS and ELECTRIC APPARATUS are elegantly finished and mounted on highly polished rosewood, mahogany and walnut bases.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
 No. 40 WEST EIGHTEENTH STREET,
 or to
 L. G. TILLOTSON & CO.,
 8 Dey street, Sole Agents.

THE POCKET GALVANOMETER,

FINELY FINISHED IN BRASS, will be sent to any address by mail, on receipt of ONE DOLLAR, and 3 cents to pay the postage.
 NICKEL PLATED, Twenty-five Cents extra.
 Special inducements to Operators and others acting as Agents.
 Further information and Circulars on application.

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - \$12 80
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - \$6 00
- No. 1 Keys, Caton pattern, curved levers. Price, \$6 50 reduced to - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - \$4 40
- No. 1 Premium Register, \$45, reduced to - \$36 00
- " " Spring Register, \$47 50, reduced to - \$38 00
- " 2 Register. Price, \$38, reduced to - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

- No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to - \$12 00
- No. 2 Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - \$6 40
- No. 2 Ditto, \$7, reduced to - \$5 60
- No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to - \$4 00
- No. 4 Keys. Price, \$4, reduced to - \$3 20
- AMATEURS' KEY, \$3 50, REDUCED TO - \$2 50
- EXCELSIOR AMATEUR INSTRUMENTS, \$6 50, REDUCED TO - \$5 20
- BUNNELL'S LEARNERS' INSTRUMENTS, PERFECTED, \$6 50, REDUCED TO - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs
ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by
MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

C HARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

VOL. XI.

WHOLE No. 465.

Original Articles.

The Chemistry of the American Automatic Telegraph.

BY GEORGE LITTLE.

Inventor and Patentee of the American Automatic Telegraph.

(Concluded from page 133.)

IN my previous article relating to the "Electro-chemical science" of the automatic telegraph, I notice a *typographical error* as follows: FERRI-CYANIDE of potassium is represented as a yellow salt, it being well known as a reddish salt; whilst FERRO-CYANIDE of potassium is stated as being a reddish salt and known as having three equivalents of iron in combination—it being a well known yellow salt with two equivalents of iron.

Both of the above salts of iron have been known to telegraph scientists during the last quarter of a century, the yellow salt always being preferred (as also by myself for reasons heretofore stated), but owing to the want of a correct formula, it had previous to the publication of my chlorides of calcium and sodium formulas in 1872, seemed to be impossible to make up the solution with either of the *prussiates of iron*, in such a way as to prevent *self-decomposition* going on during the normal state of the line, due in part to the use of sulphuric and nitric acids. (See Culley, pp. 195-7, fourth edition, and p. 203 fifth edition; also, Sabine, 1869, pp. 200-2.)

It took me nearly *three years* to bring my *formula*, involving the use of the *prussiates of iron*, to that absolute state of perfection in regard to economy, durability, sensitiveness and freedom from contaminating effects.

Perhaps it will be as well to direct a little more attention in respect to the RED and YELLOW *prussiates of potassium*. Drs. Ure and Watts, the eminent British chemists, say of both of these salts that the transformation of the FERRO-CYANIDE into that of the FERRI or FERRID-CYANIDE can be effected by electricity; see vol. 2, pp. 239-40; see also other authorities on chemistry, in regard to this FERRI or FERRID-CYANIDE of potassium, which differs only from FERRO-CYANIDE in its having one equivalent of iron more, and can consequently, therefore, be, and is developed from the FERRO-CYANIDE by the abstraction and union, in this case, with the one equivalent of iron set free from the iron stylus, by electro-chemical action.

In conclusion, I will here remark that in neither case will the *cyanide of iron* be reduced from either of these salts of the red or yellow *prussiates* with sufficient *rapidity* for use with my "American automatic telegraph system," unless a conducting media be added to the solution, and which I prefer to be *chloride of sodium*; i. e., common salt. The addition of *chloride of calcium* materially augments the deliquescent nature which I always prefer that the receiving paper should possess, when prepared in accordance with my *established formula*.

Passaic City, N. J., June 8, 1875.

A Telegraph Operator's Lark 25 Years Ago.

THE representative operator of to-day is not what the representative operator was twenty-five years ago; those who in the early days of telegraphy sat perched upon high wooden stools, at high flat tables, picking out despatches, letter by letter, and word by word, from the dimly indented dots and dashes of the old time register, reading the press reports once a day (when the *wire* wasn't down), to grumbling old time editors, with two ounces of German silver spectacles on their noses, have some perception of the grand march of improvement which has taken place, both in operators, instruments and mode of doing business.

Then, as a rule, operators who could not play a good game of billiards, drink a proportionate share of whiskey when out with a crowd, carouse all night, work all day, and be on hand for a lark the second and even third nights until a late hour, were looked upon by their fellows with a large share of contempt.

In some respects those good old days of passes on

railroads and at hotels were more preferable to the majority of operators than these latter days of no passes, no privileges, and monopoly imposition. At the time of which we write, the N. Y. A. & Bu. Tel. Co. was a *large* institution, with headquarters at U—. Several days previous to the first of January, 185—, it was generally understood all along the line, from N. Y. to Bu., that a sort of reunion was to be held at S—, on that first day and night of the new year. No specified programme as to the order of exercises was promulgated, but it was understood that the boys were to have a good time *generally*. By noon of the day appointed about twenty operators were assembled at the G— Hotel, all duly registered, and pointed out as distinguished guests; yes, *distinguished*, for it must be borne in mind that at this time a telegraph operator was no common specimen of humanity. He was considerably above the ordinary mortal in the estimation of the public; and in the estimation of very many whose occupations smattered not of novelty or "greased lightning," he was an object of admiration and awe. Our legislators uow-a-days do not receive so many marks of respect as did the old time telegraph operator.

After the party were all in line, armed and equipped as the law directs, they strolled out by twos around the city, piloted by Frank Warren, a residenter, who but a year or two thereafter took sick and was laid in his grave. A kinder hearted boy never lived in the world than Frank, and many a friend wept tears of genuine grief when he was laid away to rest.

The party visited many places of note about the city, putting in an hour or two with the cue, and about five o'clock P. M., having been entertained in a lordly style, they retraced their steps to the hotel, where, as had been previously arranged, the winding up of the day's entertainment was to take place.

There was nothing too good within the walls of the old G— for this party of brass pounders. The proprietors of this hotel, as in fact the proprietors of all other first class hotels, were largely the recipients of favors from operators at this time, and now, when an opportunity offered, these proprietors intended to cancel the debt so far as possible, and most nobly did they accomplish it. In one of the smaller dining rooms of the house a dinner was spread which would have done honor to the imperial cook of her highness. To describe it and mete out justice would be next to impossible. Change after change, vegetables, savory meats, fowls wild, fowls tame, fish, etc., etc.; and then came the wines; from the sparkling Heidsieck to the oily old Otard, none were left out of the bill.

The most fastidious were waited upon to their taste. It was not until about an hour after the introduction of the wine, and when toast after toast had been drank and responded to, that the full capacity of the party for fun could be estimated. Songs were sung in every key, the most of which ended up with "We won't go Home till Morning, till Daylight doth Appear," in full chorus.

Stories were told, jests were exchanged, telegraphic experiences were related, and loud bursts of laughter were frequent and prolonged. One of the rural brethren had been seeking for some time to gain the ears of the party, and, finally succeeding, related the following experience: Boys, you know I'm the operator at R—, and we do piles of biz there, I tell ye. Why, my receipts have been as high as *five* dollars in one day when the *wire* was up and working all right. About a month ago Jim R— came down to R. to visit us for a day or two and have a good time. Jim, you know, has a pretty high opinion of himself, and thinks that what he don't know about telegraphing ain't worth much. Well, Jim he comes down, and was fooling round the office, and between us we set to to hatch up some sort of devilment. First Jim he'd propose some trick and it would be talked over and abandoned; then I'd suggest something, but we couldn't exactly agree on anything, until, finally, a bright idea struck Jim, and says he "I have it uow, old boss. Do you know of a real green Irishman that's only been over a week or so, who left his family in New York or some other seaport till he could arrange for them to join him?" Now it so happened that I did know just such a man, and I said "Yes, I do, exactly." Tim O'Leary had been over just about a month, and was then employed by an uncle of mine about the stables, and about as green a specimen as I ever set eyes on. "How big is he?" says Jim. "Well, he's pretty brawny," says I, "and full of muscle." This caused Jim to falter for a moment, but he soon rallied and renewed the conspiracy with energy. "Have you a stove zinc?" he asked. "Yes, here it is;" and I drew forth the article from the wood box where I had stored it for the summer. "That's it;" and he went with his jackknife, cut across the centre on both sides, bent it over his knee and broke it in two before I could stop him. "Now," says he "you have a main battery, Grove cups?" "Yes." "Pretty strong, eh? filled up this morning, eh? Good! How many jurs?" "25." "That'll do, uow give me some fine wire; that's it," as I produced a portion of an old relay coil. Jim placed the two pieces of zinc on the floor about two feet from the gate leading inside the counter to the operating room, leaving a space of about a quarter of

an inch between them, and connecting each with the battery with the small wire so they could not be seen, then he got some sawdust and litter and scattered it around and over the zinc plates, to make them look as though they had always been there; and after testing them with his fingers to see if the connection was O.K., he announced all in readiness. I began to have a faint idea of what he was driving at. "Now," says Jim, "you know a green Irishman is the most superstitious mortal on the face of the green earth, and we can make him do just what we want him to if we work it right; so you go to him, keep a straight face and tell him that there must be some important news for him at the office, as the instrument has been calling Tim O'Leary at a great rate, and saying that Tim's darlint wishes to speak to him. Give him a hint that it's very extraordinary, and almost like a manifestation from the other world. Ask him if Mrs. O'Leary was in good health when he left her." Well, off I starts, found Tim, and after telling him what was wanted, and how oddly the telegraph machine worked, and going through with my instructions as well as I could, Tim became very much excited, and was very eager to return with me in hot haste. "Och, and sure," says he, "my darlint Biddy is in trouble, bad luck to the likes o' me for laving the creatur."

As soon as we reached the office, Jim with a professional air, commenced to interrogate, "Is your name Tim O'Leary?" "An sure it is that same sur, bad luck to me." "Sh!" says Jim, "don't talk so loud man, do you know you may soon be in the presence of death, p'raps you are already, and the spirit of your wife be even now calling to you over the wire. Sh! there it is again, Tim O'Leary, Tim O'Leary!" says Jim, as the instrument commenced to work just then. Tim, who was standing outside of the counter, opened his mouth wide, turned as white as a sheet and gasped for breath, "Och, murthur" (in a whisper), "what'll become o' me? och, och, o-h-o-n-c!" and Tim sobbed violently. "Hist" says Jim (whispering), "you must be very careful and not make any noise, or you may scare her away, and perhaps this will be the last chance you will ever have of conversing with your wife. You will have to come inside; but you must take your shoes and stockings off, those brogans would make too much noise altogether." Tim immediately obeyed, and I do believe if Jim had required him in addition to this to get down on all fours and crawl under the gate, he would have done it meekly. Jim went outside leaving the gate open, and when Tim had disrobed his feet, took hold of his arm, and with a very mysterious air told him in a whisper that if he had ever abused his wife, that now was his time to confess it. "When the spirits get possession of our wires there is no telling what they will do, and if you have ever beaten Biddy or misused her, she may do something. You must be very quiet and meek, and perhaps nothing will happen." Upon this Jim led him towards the gate, being very careful to keep well behind him. Tim stepped along with fear and trembling, when, reaching the zinc plates, he put one foot upon one, and by a skillful manoeuvre by Jim, the other foot came squarely down upon the other, but it didn't stay there you can bet; in about a second there was about four feet of air between that zinc plate and Tim's soles, for he sprang up like a rubber ball, all in a heap, with a yelp that would have done honor to the lungs of a Comanche. "Och, murthur!" When he came down he came astride the crack in the zincs again, and again he went up. This he did four or five times, each time with the unearthly cry, in frightened accents, "och, murthur! och, murthur!" Finally he came down with both feet on one plate, but just as soon as he found that he wouldn't have to go up again, he made up his mind to go off, and accordingly made a rush for the gate and outer door, through which he darted like an arrow, hatless and shoe and stockingless. Having on knee breeches, when his stockings were removed his legs were bare to the knees. We rushed to the front windows, and in about a minute, Tim emerged from the stairway below, struck out into the middle of the street, and streaked it as though the old boy was after him. Dogs, boys, men and women in large numbers were soon in hot pursuit, and a livelier race never was witnessed.

Tim, wild with fear, made far reaching bounds, Keeping ahead of all but the hounds,

Jim and I just rolled on the floor, and our sides fairly ached from laughter. He took the first train for home, and I have never seen Tim nearer than two blocks of the office since.

Immediately following the relation of this story, for full five minutes there was a general burst of laughter, and a general scene of uproar and confusion occurred, during which a loud call was made for a speech from Matt, the then acknowledged champion of the key.

Familiarly speaking, Matt was "a trump!" He was more than that, he was two trumps. Twenty-two summers had sufficed to mature in him a tall, manly form, whose every movement was grace. Good looking, intelligent, and possessing a suave manner, accompanied by an easy dignity, he was a great favorite among his associates. This being an extraordinary

occasion, Matt, as well as many of his companions, had allowed his better judgment to be overcome by special and oft repeated invitations to "tip the glass with me," which will account for the disconnected nature of his speech somewhat. After his name had been called several times, Matt slowly arose from his seat, and, making a dignified bow, spoke as follows:

My Brothers—Upon this very auspicious occasion it is proper (hie) that we *deliberate* upon (hie), upon, yes, gen-lmen, I repeat, upon such a glorious 'casion as the present, wheu, as you are probly 'ware (hie), we're zembled on this 'casion to—to—yes, zertinly we are—to show to our constituents (hie) that the 'lectric telegraph is a power behind the pole—(hie) no, dem it, a power, a power behind the th-throne (applause). Yez, zur, gen-lmen, a power behind the throne (first gesture). Gen-lmen, the 'lectric telegraph. We'll (hie) stretch'r from pole to pole; from the Pazifto to the 'lantiocean, and the lightnings shall flash (hie) from the storm beat cliffs of Maine over the snow capped pinacles of the r-r-Rocky Mountains (hie); and we'll find'er a ground wire on the sandy sh-shores of the billions (hie)—no, dem it, no, the billowy Pazifto (great applause). I repeat, Mr. Chairman, we'r-r in r-r-rinfancy (hie); yez, zur, ov course we are. (Here a tumbler was passed to Matt containing a colored liquid, which, having quaffed, apparently to his entire satisfaction, he resumed): Gen'lmen, we are met upon this glorious 'casion for the purpose of celebrating the first anniversary of our nash—no, dem it—our-r-r; yez, zur, ov course, gen-lmen, and why may we not elasp hands upon this 'stordinary (hie) 'casion, and, by our living 'zample, show to the world that the 'lectric telegraph, yez, zur, the 'lectric telegraph (hie) is the most noble work of man? (Tremendous applause and eries of "Go in, Matt; you're a brick.") Yez, zur (Matt's gestures at this stage were becoming very energetic, several goblets having been swept from the table by his vigorous arms), gen-lmen of the ju—, no, dem it, no, gen-lmen, I'm deeply 'mpressed with the glory of this 'casion. Yez, zur, Mr. Chairman (hie), in the not distant future I behold the mouth of eternity (hie) upon which is 'mblazoned in letters of gold the magic words "Morse Magnetic Telegraph." (Deafening applause.) Hoorah! three cheers for (hie) "lectric telegraph!" Matt raised his right arm to its extreme height, then brought it down with tremendous force towards his left lower extremities, his foot slipped, and he rolled under the table, where the cheer after cheer of his companions gradually became less and less distinct to his ears, until at last the thunderings of a twenty-four pounder would have been powerless to awake him.

This very prophetic speech elicited the wildest applause, which continued for some minutes. Although delivered in a broken, stammering manner, and thought to be the outburst of liquid enthusiasm and the extravagance of a heated brain, who can say that the eye of that mind did not clearly see the future of the telegraph and the glory of its attainments? Those remarkable utterances of prophecy have been remarkably fulfilled.

Matt's peaceful slumbers were undisturbed for a time, but soon the number of the wakeful members of the party began to diminish, and the "old heads," constituting themselves a health committee, vigorously applied such remedies as were at hand for the restoration of the fallen braves. The vinegar cruets were resorted to, and soon the acidulous nature of the remedy prevailed to bring them to a partial recognition of things temporal; but such a dishevelled, ghostly set of men were never seen before. Matt, after much persuasion, opened his eyes, looked wildly about him, and ejaculated "Yez, zur, the bar-strangled-spinner and the (hie) 'lectric telegraph shall wave, shall wave—," This created a general laugh, and Matt soon came to understand the true state of affairs, and expressed a strong desire to go to bed. This the doctors peremptorily refused. After the patients had been washed, brushed, combed and administered a dose "to cure the bite" they were themselves again.

The trains which were to take them to their homes were now almost due, and the party repaired to the office to settle the bill. They found no bill to settle, however; the genial host waived their pocketbooks back into their pockets with hospitable grace, and, after expressing a hope that they had enjoyed themselves, invited them to come again. After many hearty shakes and good byes at the depot the party were soon homeward bound.

It is a fact worthy of record that several of the party on the eastward train got it into their heads that they were going west, and could not be convinced otherwise.

The quotations in London of the shares of the Anglo-American Telegraph Company are reported at 57½ for 100 paid, and of the Direct United States Cable Company at 11½ on 20 paid. The reduction of rates which took place May 1 of 50 per cent., and the pending competition with the United States Direct Cable, have affected unfavorably the price of Anglo-American shares.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Complimentary and Appropriate Presentation to Mr. Geo. C. York.

CHICAGO, ILL., June 2.

TO THE EDITOR OF THE TELEGRAPHER.

THE following correspondence was occasioned by and accompanied the presentation of ten volumes of Chamber's Encyclopedia (Library Edition, bound in half calf), to Mr. Geo. C. York, formerly Asst. Manager of the Western Union operating force in this city:

"CHICAGO ILL., May 31, 1875.

MR. GEORGE C. YORK:

Accompanying is a set of books which we, your many friends in Chicago office, beg you to accept as a slight testimonial of the high regard, esteem and respect in which we hold you. The gift is prompted by nothing save feeling of the truest friendship. We have known you years; our associations with you in an official position have universally been intimate and pleasant ones; our 'connections' close, and those which will ever be looked back upon with feelings of the most unfeigned pleasure. We have always found you kind, thoughtful and considerate; a kind friend to those whom you honored with your friendship, thoughtful in your watchful care over the best interests of the company, and considerate in your dealings with those occupying positions under you, ever ready and willing to speak a kind word to him or her who needed it, and to give the best advice to those who sought it; a gentleman in every sense of the term; one whom we cannot meet in social circles or hold converse with, without the knowledge of the fact that we are the better for having met and spoken.

It is, therefore, our desire to attest our good will in some substantial form; these books, themselves, have but little intrinsic worth, yet they bespeak a friendship that gold could never purchase. Accept the gift; and with it the best wishes, the lasting good will, and the entire friendship of each and every member of the several operating forces of the Western Union Chicago office."

"CHICAGO, ILL., June 1st, 1875.

TO THE OPERATORS.

My Friends—I am in receipt of your gift and accompanying letter. As to the former I will say that I commend the modesty which leads you to refer to it as of slight intrinsic value, but be assured of my appreciation of its invaluable quality and appropriateness, as a gift of intelligent affection. As to the latter, I find it difficult to express the well nigh unspeakable pleasure which comes to me through its munificent sentiment. To be held in the hearts and contemplations of my friends, in the condition you so amiably set forth, is surely a rich indemnity for all experience that has been painful, and all labors that have been arduous.

Your act and words to me at this time most happily exhibit the high degree of success with which we have severally conserved the elements which create and perpetuated the friendly ties of life. Although I have been unfortunate in the progress of business, we regard the result as the arbitrement of fortunes which inevitably control us, but to which we are able to rise superior upon the strength of the sympathies that exist between us. Your choice selection I shall preserve with care and read with delight, and thereby ever be reminded of you and of the kindly motive that produced it.

I would that I were able to make individual reciprocation with something more tangible than words; but, failing in that, I greet you responsively with the thanks of my heart, wishing for you the prosperities of life and the virtues which adorn it. GEO. C. YORK."

To the ladies of the Chicago office belongs the honor of originating the appropriate and laudable presentation indicated by the foregoing correspondence. The sensible manner in which the presentation was made calls for the greatest commendation, and we think we can lay claim to originality in this respect.

Unlike many presentations of a similar character, where the donors go in a body to the residence of the recipient and partake of enough good things to deplete the larder and purse of the fortunate individual to an extent which very nearly approaches the cost of the present, to say nothing of the embarrassment occasioned, especially to the party intended to be honored, the books were sent on the evening of the 31st ult., by a messenger, to Mr. York's residence, unostentatiously, and merely accompanied by the presentation letter,

which was the production of Mr. John W. Strang, of the St. Louis duplex.

The matter had been conducted so quietly that Mr. York was taken completely by surprise. The works are very valuable, costing nearly \$60. OCCASIONAL.

The Automatic vs. The Morse.

WASHINGTON, D. C., May 29.

TO THE EDITOR OF THE TELEGRAPHER.

IN THE TELEGRAPHER of May 8, under the heading of Morse vs. Automatic, John Sterling gives us a few facts which I think must be based on hearsay or opinion. With your permission I would like to state some actual facts.

In the first place, John Sterling says the Automatic system would not be applicable on way wires. For his information I will state that the Automatic Co., before it went over to the A. & P. Co., worked the Automatic system on one circuit from two offices in New York, one in Trenton, two in Philadelphia, two in Baltimore, and one in Washington, making eight business offices. There were also eight way test offices always in circuit and expected to answer at first call. What could a circuit with sixteen offices be called if not a way wire? Press or any other matter can be sent from any station and copy taken by all other stations in circuit at the same time by Automatic as well as by Morse.

Again, he says most of the Automatic Company's business was done by Morse. It frequently occurred that a day's business would number from 900 to 1,000 messages average for a week, besides 4,000 to 5,000 words of press, between 8 o'clock A. M. and 6 o'clock P. M. The tariff on the Automatic line was 25 cents for 20 words and 1 cent for additional words, and our customers were liberal, so that messages averaged over 40 words each, counting date, address and signature. Presuming that we had had 40 words per minute men, and that every minute could be utilized, which of course could not be where business was being exchanged between eight different offices, the messages would not have been transmitted until midnight, and the press for an afternoon paper would have been ready for delivery about 2 o'clock the next morning; but the Automatic Co. did not do most of their business by fast Morse, and so delivered messages and press promptly, and closed their offices altogether for the night at 9 o'clock P. M.

In another place he says no woman could work a perforator. We had a lady who for the space of ten months perforated from 125 to 200 of our long messages a day, equal to 225 ordinary messages at least on a busy day. She is still perforating, as are also two other ladies who learned when the Automatic Co. first started; and I wouldn't be surprised if either of them could perforate more words in an hour than he can send on a short circuit by Morse.

He also says he does not believe that 500 words can be sent and legibly recorded in a minute. On the 12th of December, 1873, there were sent from Washington to New York over a circuit of 281 miles 12,000 words in 22½ minutes, including delays and stops; or not including stops, the actual time of transmission was 18 minutes, as timed by the Postmaster General and several gentlemen who witnessed the operation in Washington. This gives an average speed of 666 words per minute. The writing was very clear and distinctly recorded at New York, and in proof of it, if John Sterling will send me his address through the Editor of THE TELEGRAPHER, I will send him a piece of the strip which was preserved by Postmaster James of New York City, who with several other gentlemen witnessed its reception there. What was done then can be done any day, and he might have seen it done long ago if he would have taken the trouble to go into an Automatic office.

I do not believe that a strip has passed over the Washington and New York circuit within the last three months at so slow a rate as 250 words per minute, which he says is "a higher average than is warranted by its achievement thus far."

He further says that in order to send 500 words per minute it must be able to record legibly 250 signals per second, which he does not believe is possible. I think he is a great ways out of the way in his calculation of 6 letters to a word and 5 2-9 dots to a letter. I have taken the trouble to count words, letters, dots and dashes lately, and from six different items of press containing 357 words, and 15 messages containing 200 words, no initials or technical names, I get the following aggregate: 557 words, 2,639 letters, 1,472 dashes, 4,717 dots. This, being the composition of 21 different persons, I think might be taken for an average. There was no item that averaged 5 letters to a word, the general average being 4.73. The letters average 0.56 of a dash, and 1.79 dots, each. It must be remembered that the letter E is probably used a hundred times where X is used once, and T is used as many times where Q is used once, and that L, I, O, A, M and N, which contain only two dots or dashes, are used frequently, while J, G, K and other long letters are comparatively used but seldom, so that in the ordinary construction of words,

as generally used, the average is less than three dots and dashes to each letter.

The length of a dash should and does on our perforator equal the length of two dots; T is the length of an I; and M takes the same space as H. On the basis of my calculation 500 words at 4½ would contain 2,377 letters, 1,331 dashes, 4,242 dots; and counting a dash equal to two dots, we have 6,863 dots instead of 15,000, as by his calculation, or 115 instead of 250 per second.

I have sent 498 words in 19 seconds, over 1,500 words per minute, or more than 350 dots per second, over 50 miles of wire, and it has been beautifully recorded; and I do not doubt that it can be done on a circuit of 250 miles.

One point more and I will close. When John Sterling makes calculations based on the average speed of transmission, I do not think it is fair in him to take the high average of 40 words per minute for the Morse, and then take the comparatively very fair average of 500 words for the Automatic and reduce it 50 per cent., and then for the sake of round numbers take off ten words more, which he actually does, making the speed 240 words instead of 500.

The Morse vs. The Automatic.

BOSTON, MASS., May 31st.

TO THE EDITOR OF THE TELEGRAPHER:

IN reply to Mr. Craig, I wish to say that my calculations, so far as the speed attainable by the Automatic system was concerned, were based wholly on hearsay, but the average I gave for copyists and punchers must stand, for it is based upon no partisan theory, but upon solid facts. I have it from those in a position to know as much on the subject, and perhaps more practically, than Mr. C., that 30 words per minute is a fair average, and that 40 to 45 words is as high as has been attained. From a little experience in operating one of them, I do not doubt that such is the fact, and I think I should prefer receiving or sending by Morse for 3 hours, at 40 words, to working a punching machine at 30 words the same length of time. Perhaps Mr. C. has a punching machine which will do the work he claims for it; certainly those now in use by the A. & P. will not perform one third of it.

His estimate on the "Type writers" is more modest, but exceeds probability. There is one in use in this city, on which I am informed 50 words per minute have been written. No doubt an expert could write 65 or 70 words—about the same number as the maximum that has been obtained on the combination printer.

I admit that the figures given on the Morse side were too large. While it is possible for a man to send or receive 2,000 words per hour, for two or three hours, as is frequently done on the lines of the W. U. Co., yet 20,000 words per day of 10 hours would be well nigh impossible, and would be likely to break down any one who might try it for any length of time. Still there was nothing absurd in the statement made; while the fallacy of the claim of 135 words per minute for the punching machines needs no word of mine to make it apparent to any one who has seen them in operation.

Really it would seem as though if the friends of the Automatic are able to demonstrate its superiority as well practically as theoretically, there must be capitalists who could be convinced and persuaded into putting "money in it," for the development and extension of the system. Yet strange to say, the company which was formed for that purpose, after several years' struggle, during which it barely maintained its existence, was forced to assimilate with a stronger and wealthier corporation. That company (the A. & P.) acquired the Automatic system as a part of its bargain, and with a great flourish of trumpets, announced that it had the "boss thing" in telegraph machinery. The rates were to be reduced, and there was to be a lively time generally. Well, the rates were reduced several months ago to between 5 principal points five cents or so. Yet the "monopoly" still does nineteen twentieths of the business between those points.

On the 14 W. U. wires between New York and Boston, probably 60,000 to 100,000 words are exchanged per day. Mr. Craig tells us the Automatic system is capable of doing all this on one wire, in from 2 to 4 hours.

The "stupidity" of the W. U. management, in failing to see the beauties of that system and adopt it, has been the burden of the plaint uttered for several years by those interested in the Automatic system. Mr. Craig has time and again advanced against the impenetrable wall of indifference which surrounds the W. U. stronghold with his crushing array of unreliable figures. Mr. Little has told them the story of the discovery of "points" on electricity, by attentive study of an old mill race—points which resulted in the "overflow rheostat dam," and when they wouldn't listen he has slung science, jawbreaking science, at them; then ponderous satire, but without effect. Finally, he has addressed himself to the readers of this paper, who can't escape, and pours into their ears the story of a genius which is not appreciated, and an intellect going

to seed, consoling himself by the reflection that he was *once* listened to, and by our betters too; ay! by a committee of the House of Commons, &c. After all these attempts to enlighten the W. U. management, Mr. C. says now that the W. U. never had a chance to get the Automatic system, never could have got it, and never will, because its parents nourished and brought it up expressly to fight the monopoly—a sort of young Sampson dedicated to the "opposition." However those timid Morseites, who saw their "occupation gone" in their minds eye, may take courage now. The Automatic is entirely out of reach of such base considerations as filthy lucre. 'Tis dedicated to a high and noble destiny. Who says America is not worthy to rank with classic Greece or Rome in the sublime self-sacrifice of her citizens? I always supposed the motive of those labored arguments and experiments for the benefit of W. U. officials, was a desire to sell out to the best possible advantage.

Mr. Craig's tender solicitude for the dear public, in the matter of "Cheap Telegraphing," is not at all singular. If he and his friends of the Automatic can only persuade that public that this system is all they claim it to be, they might get their wheel turned by which to grind that little hatchet. Apparently the A. & P. hasn't turned it very much to their advantage. If the W. U. would only take hold and turn awhile, what a glorious chance it would be for the Automatic people!

Mr. C.'s idea in regard to "Express Messages" is a good one, but would prove very difficult in execution. If introduced, it should be impartially and uniformly throughout the country, which would be well nigh impracticable as business is done now. The half rate system was a long step in that direction, and no doubt further advances will be made towards that end at no distant day.

J. S.

Proper Credit Accorded an Inventor.

NEW YORK, June 7.

TO THE EDITOR OF THE TELEGRAPHER.

THERE is a statement in the article describing the Commercial News Department of the Gold and Stock Telegraph Co. in THE TELEGRAPHER of March 29, which, though very flattering to myself, hardly does justice to another gentleman. I allude to Mr. G. M. Phelps, who has, perhaps, done more to perfect printing telegraphs than any man living.

The instruments in question (financial) were originally invented and put in operation by Mr. Phelps as two wire machines. Some experiments I made satisfied me that, with an alteration in the running gear, the instrument would work as well on one wire. This proved to be the case, and the change was made in all of the instruments.

The improvement was found, on subsequent investigation, to be covered by a patent granted to Pope & Edison some years before.

HENRY VAN HOVENBERG.

More Attempts to Burn the Museum.—Personal.

ALBANY, N. Y., June 8.

TO THE EDITOR OF THE TELEGRAPHER.

THERE seems to be a settled determination on the part of some unknown person to complete the destruction of the Museum Buildings. Not content with the disastrous result of last spring's attempt, two more efforts have recently been made to accomplish this object. On Saturday evening, May 29, about six o'clock, some of the workmen on coming down from the roof discovered a fire burning briskly in a pile of Georgia pine lumber on the first floor, in the room formerly occupied by E. Everson, Banker. This they extinguished without calling upon the fire department. On Tuesday evening of the following week a similar attempt to fire the building, in nearly the same place, was frustrated by the "Protectives." Clothes saturated with kerosene were found in both instances under the lumber, proving beyond all question that the fires were both the work of an incendiary.

A young man named George Sinclair, employed in the Marble Pillar Restaurant, which is located in the basement of the building, is now under arrest, circumstances pointing very strongly toward him as the guilty party. His examination was commenced Saturday afternoon before Justice Clute. Three or four witnesses were examined, but no positive proof of the guilt of the accused was adduced. The examination will be continued this week.

The boys do not appear so anxious to see the old corner wiped out as they did a few months ago. There seems, at present, to be a reasonable probability that we shall be able to occupy the new quarters some time in July. May "Old Prob." do his best for us this time. Legislative business being over, we are having a little "let up," which is being made the most of in anticipation of the summer rush which will soon be upon us.

"Senator" Steward, the capital—no, that's not it, I mean the Capitol Operator—has resumed his usual

place in the main office, and is now engaged in making life miserable to the luckless "Hubbites" who chance to make their appearance on 30 East. Mr. Chas. E. Arnold has taken unto himself wings and flown away to pastures green, where the gentle zephyrs, etc., etc.—the fact is we were out in the country once, and the impression has not yet entirely faded from our mind—in other words, Mr. A. has resumed his old position at Fort William Henry Hotel, Lake George, for the season. Mr. Chas. H. Davis, the Artist, of Worcester, Mass., commences a starring engagement on the quad, June 15, for two weeks only; terms 100 per cent. of the receipts and a benefit. ("O. R." gives the benefit.) Foreman Thompson recently received a lot of poles which Captain Mackintosh facetiously termed "clothes-line props;" they are sixty-five feet long, two feet four inches thick at the butt, and are to be used in changing wires at the cable house in East Albany, and also in running them into the new office. DOUBLE-SIX.

Personals.—A Bull.

CHICAGO, ILL., May 29.

TO THE EDITOR OF THE TELEGRAPHER.

AMONG the recent changes in the Western Union force here are the following: Frank M. Crittenton, of the regular night force; and "Eddie" Dennis, of the all night force, have been assigned to duty on the day force.

Mr. "Sam" Bracken, of the St. Paul wire nights, has been transferred to the vacancy on the all night force, caused by Mr. Dennis's promotion to the day force. It is not often at this late day that you hear regrets on a line when an operator who has worked it a long time is transferred, but such was the case in regard to Mr. Bracken's assignment to the all night force. He was very popular with the operators on that line.

Mr. "Al" Baker, an old timer, formerly of Chicago, but more recently of San Francisco Western Union office, has accepted a regular position on the night force in this office.

The recent additions to the substitute "gang" are "Gus" Carroll, formerly of Stock Yards (Ill.) office, but recently Des Moines, Iowa, night report operator; "Jake" Tolman, of Omaha Western Union office, and Harry Garner, one of the unfortunates of the "gobbled up" Pacific and Atlantic Co. of this city, recently of Renova, Pa., P. & E. R. R. office.

As a specimen of bad reading of copy, the following "Trkkliva," Ill., for "Trskliva," Ill., "takes down" every pin and calls for a "set up" on the other alley.

WESTERN UNION.

Extension of the A. & P. Wires to Milwaukee.—The Great Western Telegraph Co.

MILWAUKIE, WIS., May 15.

TO THE EDITOR OF THE TELEGRAPHER.

OTHERS have done it, why should not I?—that is contribute my mite to help in the good cause the telegraph(er) fraternity. It would be hard indeed to scrape up much that would be of general interest to the readers of THE TELEGRAPHER, after "Western Union" and "Occasional" have sent in their first pick, but I may be able to communicate some items that they have omitted.

The Atlantic and Pacific Telegraph Co. are progressing finely with the extension of their wires to this city from Chicago, and expect to have them in operation here by the 1st of July.

Supt. Knapp, of the Great Western Telegraph, is doing a rushing business in Chicago now, between Milwaukee and Chicago, one day recently showing 110 messages per hour.

Recently a 9 pound *souder* was added to the family circle of Mr. E. W. Farnham, the efficient operator on 'Change at Milwaukee, for the Great Western Co. Good luck to him!

Where is "Nihil Nameless" quietly reposing now? Should "John Sterling" die under the recent blow, we would wish to see his obituary headed "Automatic."

If this is acceptable, you may hear from me again.

PANT A. LOON.

An Electric Fish.

As a gentleman, fishing near Penzance, England, gaffed a large fish, he was seized with a numbness in his arms, accompanied with an indescribable and painful sensation, which was really an electric shock. His servant man, who accompanied him, suffered in the same manner, he having assisted in securing the torpedo. The electrical apparatus in this fish was found, on examination, to consist of small membranous tubes, which occupy the space between the head, the pectoral fins and the branchue. They are disposed like a honey-comb and divided by horizontal partitions into small cells, which are filled with a mucous substance, the whole arranged like a galvanic pile.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JUNE 12, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.)

38 VESEY ST., New York.

PREMIUMS FOR SUBSCRIPTIONS.

1,000 NEW SUBSCRIBERS WANTED.

It is desired to add 1,000 new names to the present Subscription List of THE TELEGRAPHER during the next two months. To accomplish this it is only necessary for the friends of the paper to engage energetically in presenting its claims to the consideration of the Telegraphers generally throughout the country.

To encourage such efforts it has been decided to offer the following

LIBERAL PREMIUMS.

For Two New Subscriptions, or Renewals of Subscriptions which have or are about to expire, we will give the person sending them

A NEW POCKET GALVANOMETER.

For Three New Subscriptions or Renewals,

A NEW POCKET GALVANOMETER, Nickel Plated.

A very handsome and useful article to every Telegrapher.

For Six New Subscriptions or Renewals,

A No. 3 TELEGRAPH KEY.

For Ten New Subscriptions or Renewals,

A No. 1 SOUNDER or No. 1 TELEGRAPH KEY.

For Fifteen New Subscriptions or Renewals,

A GALVANO-ELECTRIC or SHOCKING MACHINE.

The price of this Machine is \$10.

For Twenty-five New Subscriptions or Renewals,

A No. 2 RELAY.

For Forty New Subscriptions or Renewals,

A No. 1 RELAY,

Handsomely finished, with glass shade.

For One Hundred New Subscriptions or Renewals,

A No. 1 SELF-STARTING REGISTER.

With glass shade, and everything complete.

Subscriptions must be paid in advance at the regular price of TWO DOLLARS per year. Subscriptions for less than a year will be counted proportionately.

Those who may desire to obtain Premiums can send in subscriptions as obtained, and they will be credited therefor, and can call for such Premium as they are entitled to for the whole number so credited at any time.

Specimen Copies of the paper will be forwarded, on application, to those who may desire to use them in canvassing.

Remittances should be made by Draft, Postal Money Order payable to, or Registered Letter addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.

NEW YORK.

Improvements Proposed and Feasible in the System of Transacting Telegraph Business.

THE minds of telegraphers and telegraphic managers have been so much occupied with improvements suggested in the machinery and apparatus required for telegraphing, especially in this country, that but little attention, comparatively, has been bestowed upon improvements which are possible and feasible in the system of doing the business, which is scarcely of less importance. The contest has been earnest and energetic over the relative merits and demerits, efficiency and lack of efficiency of MORSE, Automatic, duplex and quadruplex, the views of the several parties on these points being no doubt influenced to a considerable degree by the ownership or supposed ownership of the patents to the alleged improvements respectively. This contest will no doubt continue for some time to come, and the final decision of the matters involved, if ever made satisfactorily, can only be so after prolonged trial and encounter in actual use of the several systems.

While by no means disposed to underrate the importance of this discussion and the systems involved in it, and as our readers are aware having decided, and we think well founded opinions of our own in regard to them, yet it may be profitable for a time to take up other branches of the great telegraphic problem and consider them.

It is not to be denied that the popular demand is for cheaper telegraphic facilities than the public now has. The only thing which has in the past given Government telegraph projects in this country the little popular support which they have received was the idea industriously and persistently put forth by their advocates that under Government ownership and management the rates for telegraph service would be materially reduced. The discussion of these projects has pretty effectually disposed of this fallacy, and we think the people generally have become convinced that under Government management the actual cost of the telegraph would be largely increased, and that a material reduction of rates, while it might benefit a few who have occasion to use the telegraph largely, yet would create a deficiency in receipts which must be made up by taxation of the whole.

It is true that within the last few years the rates for telegraphic service have been largely reduced. This reduction has been fully as great, if not more so, as the actual situation of telegraph companies would warrant. We do not see how these rates, under existing circumstances, can be further very much reduced, without entailing actual loss.

The question thus arises how is this popular demand to be met, with fair compensation and justice to telegraph owners? It has been suggested by one of our correspondents that a division of the business offered for transmission with different rates of charges therefor would be an important step in this direction. It is undoubtedly true that nine tenths of the messages offered for transmission if delivered at any time in from six to twelve hours would answer their purpose just as well as though delivered within a few minutes. On the other hand some of the messages are valueless unless transmitted and delivered immediately. It has been proposed therefore, to establish a class of "express" messages, which shall be guaranteed precedence and quick delivery, an extra price being charged for such service; a second class of messages which do not require especial despatch, to be sent at the convenience of the lines, but within a specified time, at say about the present rates, and a third class, to which even less importance is attached, to be sent at a considerable reduction from present rates.

It is true that plausible objections may be and have been urged against such an arrangement, but is it not worth while for telegraph managers to seriously consider and carefully investigate the practicability of such a division of the business? It has been partially effected already in the half rate night messages, and although the public were some time in realizing the advantages of that arrangement, yet it has now come to be generally understood and appreciated.

If telegraph wires were continually occupied in the transmission of despatches, no doubt even lower rates than are now exacted would be profitable, but how few wires, comparatively, are thus continuously occupied. We cannot see any insuperable obstacle to the introduction of this system, and believe that something like it will eventually be adopted by our telegraph managers.

It has been urged in opposition to such a system, that the laws of this State, and probably of most of the States, require messages to be transmitted in the order in which they are received. This argument is just as good against the half rate night messages, as to which, so far as we know, it has never been raised. It is not in either case a valid objection, for both would be a special contract between the telegraph company and its customers, and therefore not within the scope of the law in regard to telegraphic service.

Undoubtedly there are obstacles to be overcome in the successful introduction of this, as of any other change in existing methods of doing business; but they are not, in our opinion, of a formidable character; and we should like to see an agreement among telegraph managers to make a thorough trial of it, and are confident that it would result in an increase of business and of revenue, and would, when understood, be satisfactory to telegraph customers. If once properly and systematically tried, we do not believe that either party would be willing to abandon it and return to the present system.

The Vacation Season.

THE summer season has been fairly inaugurated at last, and although as yet we have had but little uncomfortably warm weather, yet we may expect soon to be sweltering under a torrid atmosphere, and reminding each other of the remarkably heated condition of the thermometer. The next two or three months is universally regarded as the vacation season, and, in common with other people, telegraphers desire to be released, for a brief period at least, from the toil and confinement to which they are subjected during the rest of the year.

This is a very natural and commendable wish, for "all work and no play" is by no means calculated to inspire energy or conduce to enjoyment and health. In the earlier days of the telegraph it used to be considered that a telegraph employé who had labored faithfully was entitled to this temporary release from duty, and relief operators were employed by the company to take their places in turn. Since the telegraph business has grown to its present proportions this custom has been discontinued, and, while leaves of absence are generally granted when asked for, a substitute is required to be provided by the recipient of such a favor. The reason assigned for this by telegraph managers is that now the business is so extensive, and so many persons are employed, that it is too great a tax upon the companies to dispense gratuitously with their services. There is plausibility in this argument, and yet we are inclined to believe that the companies would not, in the end, be losers even if the old custom were continued. The employés, as a general rule, would appreciate such an evidence of regard for their comfort and welfare on the part of their employers, and we have no doubt but that most of them would do enough more and better work to compensate for their temporary release from their exacting duties and labors.

We have before urged this consideration upon the managers of telegraph companies, but have not succeeded in convincing them of its validity, or securing the general adoption of the policy advocated. We fear that we shall be no more successful at this time, though, for the sake of the telegraph employés, of the country we heartily wish that we might be.

However, as during the summer months telegraph business is likely to be dull, and during the present summer even more so than usual, arrangements may be made, which, without taxing the companies, or even seriously incommoding the employés, will enable many of them to enjoy a vacation. In offices where

several operators are employed, they can arrange to do each other's share of the labor in turn, and thus be enabled to enjoy themselves, without pecuniary sacrifice, which many cannot well afford. To such an arrangement on the part of its employes, by which the business is properly attended to and provided for, we presume no telegraph company or superintendent would object.

The vacation question always comes up prominently at this season of the year, and for the time being interests the fraternity more than duplex, quadruplex, automatic, or other practical questions. We do not desire to create any discontent on the part of telegraph employes, and have not written for that purpose. They cannot claim a vacation as a matter of *right*, for the company is entitled to all the service for which it pays, and if it is not regarded as a matter of policy to grant such a favor, it only remains for the employes to make the best possible arrangement for their own comfort and convenience, compatible with their duty to their employers.

Completion of the United States Direct Cable.

ON Wednesday afternoon, the 9th inst., the report of the completion of the laying of the United States Direct Cable was received. As yet no congratulatory messages have passed over the line, it being desired first to thoroughly test the cable. It will not probably be open for public use for a week or two yet. The cable company have leased from the Franklin Company two wires from Rye Beach, New Hampshire, to New York, which are run into the office of the company at No. 16 Broad street in this city. The rate of charges for messages has not yet been announced, but will be in a few days.

It is now about thirteen months since the Faraday left the Thames to lay the New Hampshire and Nova Scotia section of the cable. On the 20th of August last the shore end of the main cable was laid from the steamship *Dacia* in Ballenskelley's Bay, Ireland, and on the 2d of September the Faraday effected the splice between the shore end and the deep sea cable, and commenced paying out towards Newfoundland.

After many vexatious and costly delays the cable has at last been completed, and in a few days the competition between the Anglo-American and Direct Cable Companies, which has been so long and unexpectedly delayed, will be inaugurated.

Don't Forget "The Telegrapher."

WE hope that the friends of the *THE TELEGRAPHER* (and every telegraph employe should be a friend to the paper devoted to the interests of the telegraphic fraternity) will not cease their efforts during the summer to bring the paper to the attention of those who are not now subscribers. The summer is a dull season for newspapers as well as for other business, but this should induce extra exertions on the part of those who appreciate the importance of maintaining an independent telegraph publication to maintain and increase its subscription list. We offer very liberal commissions and premiums for subscriptions, and no labor or effort is spared to make *THE TELEGRAPHER* an interesting as well as valuable paper.

We are aware that the times are hard, but the price of subscription is so small that it would appear as if every telegrapher ought to be able to afford it. Will not our friends bear this in mind, and encourage the publisher by their successful efforts to prove that his labors are practically appreciated?

Printing Telegraph Instruments Duplexed.

ANOTHER important step has been successfully taken in duplex telegraphy. The Combination Printing Telegraph Instruments used to a limited extent by the Western Union Company have been successfully adapted to duplex operation. Two of these instruments, specially arranged for working on the duplex system by Mr. G. M. PHELPS, are now in operation sending and receiving simultaneously on one wire, and the speed at which they are

worked is represented as something remarkable. Mr. GERRETT SMITH has been engaged for some time past in making the necessary arrangements of circuits, etc., to accomplish this, and it is a complete success. The ease and rapidity with which these new instruments work, and the advantages which they possess will be likely to lead to a more extensive use of them by the Western Union Company. No doubt they can be adapted to quadruplex operation also, and with four improved combination printers working on one wire, the amount of business which can be transmitted will be likely to astonish not only outsiders, but a large proportion of even experienced telegraphers.

It would be another instance of the changes which time brings about, if the printers with their old time recommendation, "Prompt, Accurate and Reliable," should once more become a leading and favorite instrument for commercial telegraphic purposes.

Consolidation of Insulated Wire Works.

We learn from Mr. EUGENE F. PHILLIPS, the well and favorably known manufacturer of office and insulated wires, cables, etc., of Providence, R. I., whose advertisements will be found on the title page of *THE TELEGRAPHER*, that he has purchased the business and machinery for the manufacture of wire of Messrs. FRANK S. MEAD & Co., of that city, and will consolidate the two establishments under his personal ownership and management. This gives Mr. PHILLIPS the advantage of the very superior machines used by MEAD & Co. heretofore, for manufacturing insulated magnet wires, of every size and description required. Some specimens of the wires manufactured by these machines shown to us are of a very superior quality and beauty, the insulating covering being very evenly and beautifully wound upon them by these machines. Only the best quality of material is used by Mr. PHILLIPS making his wires, and the excellent quality of his goods fully warrants the remarkable success which he has achieved in this specialty. His extensive manufactory is fully equipped with the best and latest improved machinery, experienced and careful workmen, and orders are promptly filled at reasonable prices.

Mr. PHILLIPS also manufactures a very superior article of patent flexible gaslight tubing, which, we are informed, is meeting with deserved success, it being the best article of the kind made in this or any other country.

Send us Telegraphic News.

WE have repeatedly requested telegraphers throughout the country and the British Canadian Dominions to forward us matters relating to telegraphs and telegraphers that may come to their notice, for publication in *THE TELEGRAPHER*. Many do this and to such we return our sincere thanks. We desire to make this paper a complete record of all telegraphic matters of interest, and to do this we must rely to a certain extent upon the friendly cooperation of the fraternity. All items of news, information in regard to new lines built or projected, extension of old lines, new offices opened, personals, etc., are of interest, and are fully appreciated by us, and by our readers. We have no doubt but that many of our readers who have not hitherto done so, could aid us materially in this matter, and we take this occasion to renew our request for their cooperation.

The Sixth Cincinnati Industrial Exposition.

THE magnitude and success which have attended the Industrial Expositions held at Cincinnati, Ohio, annually for the past five years have caused them to be regarded as one of the notable events of the year.

The prospectus and announcement for the SIXTH Exposition has been issued, and it is designed to make the one for the present year even more extensive and complete than those which have preceded it. The building in which it will be held was specially erected for these exhibitions, and presents an available space of 338,000

square feet, or nearly eight acres under roof. Within this building there will be an acre of machinery in motion, and ample provision made for fully and satisfactorily testing competing machines.

The premium list is very full and comprises gold, silver and bronze medals, and high money premiums in gold.

The Exposition is managed by a Board of Fifteen Commissioners, appointed by the Board of Trade, the Chamber of Commerce and Ohio Mechanics' Institute.

The halls and grounds will be open for the reception of articles from and after Monday, August 2. The Exposition will be open to the public on Wednesday, September 8, and will continue open until Saturday, October 9.

Applications for space must be made to the Secretary, Mr. FRANK MILLWARD, who will furnish all necessary blanks and information.

Coming Home.

Mr. WM. ORTON, President of the Western Union Telegraph Co., sailed from Liverpool on Wednesday, the 2d inst., on the steamer *Celtic*, for New York, and will probably arrive by to-morrow (Sunday). His absence has been prolonged somewhat beyond the time originally intended. It is understood that Mr. ORTON returns home with improved health and renewed energy to resume the arduous duties of his position.

Personals.

Lieut. THEO. SMITH, has at his own request been relieved as Sup't of U. S. Military Telegraph, Arizona Line, at San Diego, Cal., and will rejoin his Regiment, the Fifteenth Infantry, now stationed in New Mexico.

Mr. S. S. McCULLOUGH, has accepted a position with the W. U. Telg. Co. at Fort Scott, Kansas.

Mr. JAMES O'TOOLE, of St. Louis, Mo., W. U. office, has resigned, and leaves for San Francisco, Cal., on the 15th inst.

Mr. CHAS. T. DAY, of the St. Louis, Mo., W. U. office, is visiting Brooklyn, N. Y., and it is said that CHARLES will duplex before returning to the West.

Mr. E. A. KEENE, of St. Louis, Mo., is visiting at Titusville, Pa.

Mr. HENRY C. MAHONEY, has returned to St. Louis, Mo., and is looking splendidly after his vacation. MACK tips the scales somewhere in the neighborhood of 200 pounds now.

Mr. CLARK, Train Despatcher of the Cairo and St. Louis R. R., has moved his office from East St. Louis to the general office in St. Louis.

Mr. B. SMITH, of Hamilton, Canada, reversing Horace Greeley's advice to young men, has "gone east," to work in the Dom. Tel. Co.'s office in Montreal. He is a good operator, and what is somewhat rarer among "lightning transmitters," is a thoroughly good boy into the bargain. He never quotes scripture irreverently over the wires, and never makes such cruelly discouraging remarks to aspiring "plumes" as some impatient "rushers" do.

Mr. FRANK REVELL, of Dundas, Canada, has decided that following telegraphy is not the fastest way in the world of becoming a millionaire, and so has given it up. Mr. N. MILLER, of Stayner, has accepted Dundas office, in his place.

The Stayner vacancy is to be filled by Mr. GEO. SOMERS, who has been acting as message boy in Barrie office. He is a smart young fellow, and can "frite gerse" after the most approved style.

Mr. A. MUIR, has been put in charge of the Woodstock, Canada, Dom. Telg. office, vacated by Mr. W. TATTEN. He boasts of having the *sweetest* little office on the line. It is in a confectionery store.

Mr. GEO. NOBLE, of St. Catharines, has accepted a position with the Dominion Tel. Co., in Hamilton, Canada.

Mr. F. BOISSEAU has been transferred from Montreal to Ottawa, Canada, D. T. Co.

Mr. FRANK MERRILL has resigned the position of night manager of the Milwaukee, Wis., Western Union office to engage in the practice of law.

Mr. W. N. PASSMORE has resigned his position with the Western Union Co. at Milwaukee, Wis., to take a situation in a bank.

Mr. E. W. FARNHAM, formerly of the Great Western

Telegraph, at Milwaukee, Wis., has accepted the position of night manager of the Western Union office, same city, vice Mr. FRANK MERRILL, resigned.

Mr. R. J. NICOD, is taking night report in the Milwaukee, Wis., Western Union office, in place of Mr. PASSMORE, resigned.

Mr. JERRY O'CONNELL, still holds to his position in the Northwestern Co's. Milwaukee, Wis., office.

The Telegraph.

The Western Union Dividend.

THE regular quarterly meeting of the Directors of the Western Union Telegraph Company was held at the Executive Office on Wednesday, June 9th. The earnings for the year ending the 30th inst. partly estimated, were reported at \$9,581,000, and net earnings at \$3,154,000, which, after payment of interest, would leave \$2,725,000, or over 8 per cent. on the capital stock. A dividend of 2 per cent. for the quarter ending the 30th inst. was declared, payable July 15th. The transfer books will be closed June 19th.

Annual Parade of Employes of the American District Telegraph Company.

THE annual parade and inspection of the employes of the American District Telegraph Co. will take place on the morning of July 5th. The line will be reviewed by the officers of the company, and the inspection and exhibition drill will take place in the City Hall Park. About 400 messengers and 50 patrolmen, together with a juvenile band, will take part in the parade. Each employe will report in full uniform, picadilly collar and white gloves.

The messengers are drilled daily in the various offices of the company, all the drilling being under the supervision of Drill Inspector J. F. Cowan, who was appointed by the Superintendent to have general charge of all the arrangements. The Board of Juvenile Officers for the coming year will be appointed just previous to the parade.

Messenger No. 12, at present day sergeant of the 10th District, is prominently named for the colonelcy.

It is generally thought that the 37th and 10th Districts will carry off the prize for superiority of drill, as they seem to excel even militia organizations.

The 28th District will probably, as usual, excel in equipment.

Telegraphic and Electrical Brevities.

ALL the North River telegraph cables of the Atlantic and Pacific Telegraph Co. which formerly crossed the river at the foot of Nineteenth street have been removed to the foot of Seventeenth street. The Atlantic and Pacific, and the Marine Sandy Hook lines have now 19 cabled wires crossing at this point.

The Southern and Atlantic Telegraph Co. have opened an additional office for the accommodation of their business and customers at No. 6 Broad street, New York.

The Atlantic and Pacific Telegraph Co. have rented the office formerly occupied by the Great Western Telegraph Co., at Milwaukee, Wis., and expect to have their new line from Chicago completed and occupy it for business by the first of July.

How Government Telegraph Works.

WE have already noticed that the Government Telegraph in England ran behind \$500,000 the past year. Sir Stafford Northcote, Chancellor of the Exchequer, in his "hudget speech," holds the following very striking language in regard to the revenue and expenditure:

"With regard to the telegraphs, I am sorry to say there is a falling off, and that falling off is of a character which illustrates the difficulties of that undertaking. Undoubtedly the telegraph service has not yet been brought into a remunerative condition. We are not as yet paying our way; we are contributing very little toward the interest on the debt incurred for the purchase, and we can only hope that through the exertions which are being made to improve the service, and to bring it into a more economical position, we shall, by and by, set that matter right. The difficulties under which we have to administer a service of that kind—a service which interests everybody, and which leads to demands being made in all directions—are very great indeed. I know very well that honorable men are continually pressed by their constituents to bring forward complaints that for years telegraphic communication is not afforded to this, that or the other portion of the kingdom, and they are very reluctant indeed to accept the answer that the Government cannot afford to give it. There is a feeling that the Government ought to be able to afford to give it,

and we cannot give those sort of answers which private companies could and, I suppose, did give in such cases. This is a point worthy of consideration, not so much in regard to the telegraph service itself, in which we are now fairly embarked, and of which we must make the best we can, as in reference to suggestions of acquisitions of other forms of property, and the conduct of other kinds of business, in which I hope the House will never be led to embark without very carefully weighing the result of this remarkable experiment." (Cheers.)

It will be observed that the telegraph as yet does not pay its running expenses, while the interest of the investment is permanently in arrears. The cost of the purchase was \$50,000,000, the interest upon which, even at the low rate of 3½, is \$1,725,000 a year, toward which, says Sir Stafford, "we are contributing very little"—probably nothing at all, as they will naturally first endeavor to meet running expenses. The Chancellor of the Exchequer briefly hints at the difficulties under which the Government labors, with local interests clamoring in every direction to be satisfied. These difficulties, serious as they may be in the small, compact and thickly settled territory of Great Britain, where the influences of patronage are much less malign, and public jobbery is much less prevalent than with us in America, would open a bottomless abyss of expenditure, official incompetence and corruption. The tone of the speech indicates that, if the subject were to come up *de novo*, Parliament would not, from its present experience, embark in Government telegraphy, and the cheers with which the Commons greeted his sentiments show that he correctly represented their feelings.—*Springfield Republican*.

The Telegraph in Egypt.

IN the later years of the life of Mahomet Ali he caused a semaphoric telegraph to be established for communication between Alexandria and Cairo. There were seventeen stations intermediate between these terminal points, and signaled from one to another with so much rapidity that messages from Cairo were received at Alexandria in forty minutes, and the chronicler takes pains to add: "Those from Alexandria were received at Cairo in the same interval of time." This mode of telegraphic communication of course yielded to the electric telegraph, by which Cairo is now connected not only with Alexandria, but with the most remote parts of Egypt, there being more than four thousand miles length of line, and double that extent of wire. The whole is operated by the Morse instruments. The submarine telegraphs in the Mediterranean on the one side and in the Red Sea and Indian Ocean on the other, of course complete the telegraphic communication with every part of the world. Despatches between Cairo and Washington are, in fact, exchanged within twenty-four hours, including all delays in transmission and the necessary pause for the preparation of answers.

Miscellanea.

ACTION OF THE ELECTRIC CURRENT ON FUSED METALS.—The behavior of amalgams and melted alloys, when traversed by the galvanic current, was studied a few years ago by M. Gerardin, who, however, did not make quantitative measurements. We find from *Archives des Sciences* that M. Obach has lately gone into the matter more fully, and arrived at somewhat different results. His conclusions are:

1. The passage of the galvanic current does not produce any electrolysis, either in amalgams or in alloys.
 2. After having been traversed by a current, amalgam decomposes equally water at both poles exactly as before.
 3. The action of the current does not at all modify the hardness or the malleability of the alloy lead-tin, nor the state of fluidity of the alloy potassium-sodium.
- It does not produce in the composition of the alloy, in the neighborhood of the electrode, any change exceeding the limits of possible error in the analysis.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended May 18th, 1875, and bearing that date.

163,310.—FIRE ALARM TELEGRAPH CIRCUITS.—John N. Game-well, Hackensack, N. J. Filed March 30, 1875.

No two contiguous boxes on same circuit, thus avoiding, in great measure, danger of interference, and insuring good alarm circuit in every neighborhood.

The combination and arrangement, in a fire alarm telegraph, of a series of signal stations and electric circuits, as herein described, whereby each signal station throughout the series is in a different circuit from that or those located nearest or adjacent to it, as specified and shown.

163,318.—GALVANIC BATTERIES.—Vincent E. Keegan, Boston, Mass. Filed Feb. 4, 1875.

Claims that a purely electro-chemical action is secured by the form of battery covered by first claim, and that the wire coil "prevents the occlusion of hydrogen gas and the metallic salts within the walls of the porous cell" surrounded by it.

1. The arrangement of a porous cell, a, placed within another porous cell, b, which shall allow of a space between them to constitute a vessel, and each cell to contain an acid or a salt, which shall be electrically or chemically different in each cell, to act electively with each other and to the negative metal of the battery, in the manner substantially as described.
2. In combination with the porous cell, b, a coil of wire *m m' m''*, through which the electric current circulates, said wire surrounding the porous cell, and consisting of a continuation of the wire leading from the zinc pole of the battery.

163,549.—TRAIN TELEGRAPHS.—A. N. Towne, San Francisco, Cal. Filed Dec. 28, 1874.

The insulated cylinder or circuit breaker is designed for use with an elastic conducting cord extending from end to end of the train.

1. A signal apparatus for railway trains, consisting of two complete electric circuits connecting with the opposite poles of a differential magnet, one of which circuit passes through the entire length of the train, so that when the train circuit is ruptured the remaining circuit will cause the armature of the magnet to vibrate back and forth and ring a bell, substantially as above described.
2. The insulated cylinder or circuit breaker, s, with its screw *x*, in combination with the spindle *t*, with its short barrel *u* and surrounding spring *v*, said barrel *u* having the projecting spring rod *v*, substantially as and for the purpose above described.

REISSUE.

6,434.—TELEGRAPHIC PRINTING APPARATUS.—Theodore M. Foote and Chas. A. Randall, Brooklyn, E. D., N. Y., assignors, by mesne assignments, to the Gold and Stock Telegraph Company, New York City. Patent No. 105,060, dated July 6, 1870. Filed Apr. 24, 1875.

1. A type wheel rigidly secured to its shaft, and controlled by an escapement and step by step motion, in combination with a unison stop that is disconnected by the printing mechanism, substantially as described.
2. The combination, with a printing telegraph instrument, of a unison that arrests the movement of the type wheel shaft, an electro-magnet, to throw the unison out of action, and one main line circuit, substantially as specified.
3. In a printing telegraph, the unison mechanism brought into action by the type wheel or its shaft, to arrest the movement of such type wheel substantially as specified.
4. In a printing telegraph instrument, a type wheel and its shaft rigidly secured together, in combination with an escapement for moving or controlling the type wheel, a unison mechanism for adjusting or setting the type wheel, and an electro magnet for effecting the printing, all automatically controlled from the sending station through one main circuit.
5. In a printing telegraph instrument, a type wheel, in combination with a unison that operates to stop both the type wheel and the motor that carries the same when the unison is effected, substantially as specified.
6. A compound helix, consisting of three pairs of electro-magnets, C¹ C² C³ C⁴, having a switch bar, F, passing through the core of the middle pair C² C³, in combination with the relay magnet, type wheel and printing magnets, and circuit connections, arranged and operating substantially as set forth.
7. The double pallet *c*, oscillating between the teeth of the ratchet wheels *e* *f*, that face each other upon the type wheel shaft *a*, in combination with the magnets B B', substantially as and for the purpose described.
8. The oscillating anchor *y*, and pins *w* *x*, in combination with type wheel shaft, and with the printing lever, or any part connected to the same, substantially as and for the purposes set forth.
9. A paper feeding mechanism, composed of one elastic roller, and a second roller or an oscillating foot, and operated from the printing lever of the telegraphic printing apparatus, as herein described.

LECLANCHE BATTERIES.

IMPORTANT NOTICE.

After JANUARY 1st, 1875, we will allow TWENTY CENTS for each used-up Porous Cell of this Battery that is returned to us free of charge, in good order. A change is made in the discount to the trade. A list will be furnished on application to

THE LECLANCHE BATTERY COMPANY,
No. 40 WEST EIGHTEENTH STREET,
or to
L. G. TILLOTSON & CO.,
8 Dey street, Sole Agents.

WESTERN ELECTRIC MAN'FG CO.
220 Kinzie Street,
CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

20 PER CENT. REDUCTION IN THE
PRICE OF
TELEGRAPH INSTRUMENTS!

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commer-
cial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - - - \$12 80
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - - - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - - - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - - - \$6 00
- No. 1 Keys, Caton pattern, curved levers. Price, \$6 50 reduced to - - - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - - - \$4 40
- No. 1 Premium Register, \$45, reduced to - - - \$36 00
- " " Spring Register, \$47 50, reduced to - - - \$38 00
- " 2 Register. Price, \$38, reduced to - - - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

- No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to - - - \$12 00
- No. 2 Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - - - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - - - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - - - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - - - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - - - \$6 40
- No. 2 Ditto, \$7, reduced to - - - \$5 60
- No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to - - - \$4 00
- No. 4 Keys. Price, \$4, reduced to - - - \$3 20
- AMATEURS' KEY, \$3 50, REDUCED TO - - - \$2 50
- EXCELSIOR AMATEUR INSTRUMENTS, \$6 50, REDUCED TO - - - \$5 20
- BUNNELL'S LEARNERS' INSTRUMENTS, PERFECTED, \$6 50, REDUCED TO - - - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, a \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

[Written for THE TELEGRAPHER.]

"Nihil's Requiem."

"Shut the door, good John! fatigued I said,
Tie up the knocker. Say I'm sick—I'm dead!"

I.

"WE'VE shed our tears o'er Nihil's grave,"
We've sighed and "blowed" our nose,
We've wiped our eyes—been comforted,
And changed the "mould" for rose.
We've laid our mourning weeds aside,
We've taken heart again,
Convinced that "Nihil's" painful loss
Is our eternal gain.

II.

His mortal foes may now repose
In quiet dreamless sleep,
The tongue that once so wisely wagged
Will ne'er hereafter "cheep."
Canadian women well may boast
They've laid a Yankee low,
Whose puritanic pilgrim blood
Made him their deadly foe.

III.

He did not, like Montgomery brave,
Fall fighting at Quebec,
His weapon bore a longer range—
Assured him safer neck.
Far southward of the border line
He marshalled his array,
His mighty sword a nightster pen,
Waged hot the wordy fray.

IV.

But fate at last the mortal blast
Thrust through his manly side;
And "Nihil," sore beset by ices,
Alone and friendless died.
His spirit rises—life's fever o'er—
His ashes quiet sleep.
No more will women move his soul,
Nor sorrow o'er him sweep.

V.

And now comes "Sterling," barbarous man,
And o'er his lowly grave
Performs his savage Indian dance,
And mocks the fallen brave.
He deals in lofty arguments
Such as the wise oft choose.
Calls "Nihil's" class obscure and mean,
His intellect obtuse.

VI.

Defends his own weak article
As "satire" smooth and soft;
Quotes Latin, French, from phrases old
In Worcester's upper loft.
Calls in a lady to his aid,
Who tells him all her mind;
And join in stabbing "Nihil's" ghost
Now floating in the wind.

VII.

He'll find, if I mistake not, soon,
Like him of old renown,
That though he sternly o'ud it fly,
Still "Nihil" "will not down."
Ah! Sterling is a wondrous man,
With most surprising mind.
But pity 'tis his giant brain
Were not somewhat confined.

VIII.

If thus he overtasks his mind,
He may not long survive.
"Such powerful efforts soon will kill"
The oldest man alive.
Economize your strength;
Just think, if you should die,
Where could the Western Union find
A man could soar so high?

IX.

The system of telegraphy
Morse left as his bequest,
Depends for life, indeed it does,
On "Sterling" taking rest.
Think what they would lose, dear John,
Should you "go up the flume?"
Then spare yourself and us, my boy—
Don't get in such a fume.

X.

Guid send you long may work the key,
And long may wield the pen,
Long may you live to fight for Morse,
And bless your fellow men.
May Western Union mortgage bonds
Line well your pocketbook;
And happiness, to ripe old age,
Stay by your chimney neuk.

ICHABOD CRANE.

Original Articles.

"Duffer" De C——.

It is a very good and comfortable thing to have a good opinion of one's own abilities; but there is sometimes danger of carrying this virtue to excess, and being laughed at in consequence. This was the case with Dufferin De C——, otherwise known as "Duffer." His family were at one time quite wealthy and aristocratic; but long before "Duffer" was old enough to smoke his first cigar (though he *did* learn that manly accomplishment quite early in life), they were in what is generally described as reduced circumstances. Had our hero been naturally smart the family influence might have procured him a situation in a law office, or he might even have had the chance of making his fortune as a bank clerk on a munificent salary of say two hundred a year; but as he always showed a woful lack of smartness in everything except "putting on airs" and "blowing," his folks decided that the best thing they could do would be to let him adorn the telegraphic profession, shrewdly thinking that "brass pounding" required but a minimum amount of brains. To his intense disgust he was obliged to begin his brilliant career as a common message boy. It took about six months' steady hammering to initiate him into the mysteries of dots and dashes; but after he had once mastered his letters he showed a surprising aptitude for "slamming in slack," as he called giving impertinence to other operators on the line. As he could not take one word of what was said in reply he remained in blissful ignorance of the sarcastic answers to his playful sallies. After he had been about eight months in the office, and had accomplished the extraordinary feat of receiving an office message (on the register) he modestly expressed the opinion that he "knew most all there was to learn about the biz;" and a few weeks after that he began to throw out dark hints to the effect that if the company knew what was good for their own interests they would make him Superintendent without further delay.

The very day his year of message running expired he sent the following business-like message to the Superintendent: "I am a good sound operator. I want a situation." The Superintendent happened to be in the operating room when this message arrived, and so sat down to the key and called up the office. "Duffer" answered, and Superintendent said, "How long have you been at the business? Are you good at copying press reports?"

"Is it to me you are sending?" innocently inquired "Duffer," when he closed his key.

"Well, yes," replied the Superintendent.

Not knowing who it was at the key, and thinking it a fine opportunity to display his telegraphic lore, "Duffer" coolly retorted, "Repeat it, then. Take the other foot to it and try write Morse."

"In reply to your application the Superintendent thinks you had better practice a year or two longer before describing yourself as a sound operator and asking for a situation. In the meantime it would be as well for you to indulge in a little less impertinence, and let the paper run when you answer a call," was gently wafted o'er the wire to his expectant ears, or eyes, rather, for he took it on paper.

So "Duffer" was obliged to hide his light under a bushel for another long year, though not without several efforts on his part to get a chance to shine in an office of his own.

At last his perseverance was rewarded. One bright summer day the Superintendent sent him a message, saying, "You can go and take charge of D—— office. Start to-morrow." "Duffer" thought that immense," and in the luiness of his heart borrowed ten cents and treated the office boy to a pint of peanuts, and spent the remainder of the day entertaining him with glowing accounts of how he would "salt" the plugs on that line, and astonish the natives generally.

Before he had been many days in his new office he gave the rest on the line to understand that he was an uncommonly last operator, and must be treated with the respect due to "sushers." "But pride must have a fall," and it was not long before his was taken down most cruelly. It happened in this wise: A man in S—— wanted to know the price of wheat in "Duffer's" vicinity, and sent the following message:

"From S——

To Operator, D——.

What is wheat worth there?

JOHN ANDERSON."

He did not quite catch the address, but thought it sounded like "O. Prater," and as the message was sent quite slowly he could not bear the thoughts of endangering his reputation by breaking, so he addressed the envelope "O. Prater, Esq.," and handed it to the message boy to deliver. The boy scanned it curiously and remarked that he had never heard of that man, "Go and hunt him," was the laconic reply.

So he went and hunted, but hunted in vain. In about a couple of hours he returned and piteously de-

clared he had "hunted all over and couldn't find him nowhere."

Any ordinary operator would have felt discouraged under the circumstances, but "Duffer" was not an ordinary operator, so did not feel discouraged.

"Oh you did not half look," said he, "Go and try again."

The boy tried again, but after a long and weary search returned in despair, and announced in the words of the immortal Sairy Gamp—"I don't believe there's no sich a person!"

"Oh, pshaw! You're no good! when you've handled as many messages as I have, guess you'll be a little sharper at it. Very likely it belongs to one of the men out at Clark's mill. Just keep an eye on the office and I'll deliver it myself. It's only three miles out."

Off he went to Clark's mill, but could not find any one there answering to the romantic cognomen of Prater. He sadly wended his way back to the office and sent a savage message to S——'s office saying, "Give better address message to Prater signed Anderson. Been chasing all over country after him and can't find."

Fancy his feelings when the answer came back, "You'd best go drown yourself in an empty beer barrel! Message signed Anderson is to yourself. It is Operator not O. Prater."

A malicious fellow artist in G——'s office who had had several "breezes" with "Duffer" happened to overhear the affair, and made it his business to rise and explain the joke to every one on the line who had missed it. It proved poor "Duffer's" death blow. He was never able to regain his lost prestige. Every time he tried to assert his dignity some heartless fellow would extinguish him by slowly drawing out "Prater." This preyed upon his haughty spirit and destroyed his appetite, and he tried to drown his sorrows in "tanglefoot."

Then his ideas of *meum et tuum* became badly mixed. Inspired by a laudable desire to increase the Co.'s receipts and turn an honest penny on his own account at the same time, he took to playing billiards with the Co.'s money. But fortune obstinately refused to smile upon his little game, and he lost every cent the company had in the office. At the end of the month he was obliged to send in his statement without any funds. Being unable to explain matters to the satisfaction of the secretary, he was politely requested to remit at once, and send in his resignation at the same time. As he had neither cash nor credit he could not remit, but he knew they would not wait long for his resignation, so one dark night he "silently stole away" and has never been heard of since.

Thus ended the telegraphic career of one who might have been an ornament to the profession and a credit to the fraternity at large had he not allowed his conceit to run away with his common sense. "Sushers" take warning!

Guelph, Ontario, June 9th.

A July Storm.

By J. S.

ONE of the grandest displays of electrical phenomena I ever witnessed, occurred on a July day in 1866, while the writer had charge of the telegraph office at a small village in central Massachusetts.

The weather had been extremely hot and sultry for several weeks, without the relief of even a passing shower to lay the dust or purify the atmosphere. The day on which the storm occurred was preceded by a very sultry night, and morning dawned upon a temperature of about 80°, which, as the burning rays of the sun poured more and more vertically down upon the dry and parching earth, rose to 102° at noonday. At about 3 o'clock a mass of clouds like a black wall, were seen coming up the eastern horizon, and soon afterwards a similar embankment of dark, threatening clouds appeared in the west. The two storm clouds slowly advanced toward each other, and soon the preliminary flashes between them occurred. The pall of clouds in the west had obscured the sun, and cast a gloom over the earth below, that better enabled us to witness the play of the lightnings. The battle was opened by a vivid flash followed by a rolling detonation, and a few pattering drops warned the pedestrian to seek shelter. The store in which my office was located, was in a large two story building, the most prominent in that part of the village, and as the rain began to fall in torrents, passers by gradually dropped in, until there were perhaps twenty persons of both sexes in the store. As the storm increased in fury, and flash followed flash with blinding vividness, accompanied by thunder—sometimes sharp and crashing like the clashing of millions of cymbals; again rolling over the vaulted heaven, with a sound as of a heavy train passing at full speed over a bridge, but far more loud and reverberating; again with the sullen boom and roar that one might have heard at Petersburg or Waterloo—the little company drew closer together, and each

made a pitiful attempt to smile, and to speak unconcernedly of the storm, while the pallid faces and trembling forms of the women, and solemn visage of the men, revealed the terror they sought to conceal. An unusually vivid flash and startling peal filled the hearts of the company with dismay—the lightning had shattered a noble elm within a dozen rods of the store! Another bolt of dazzling brilliancy fell upon a building a short distance up the street, and children came shrieking out of the house and ran to the store crying that their father was killed by the lightning. While the excitement and terror thus created were at their height, the Heavens were illumined by a sheet of flame, surpassing all that had preceded it in vividness, which was accompanied by a deafening peal of thunder, a jarring crash that made the building tremble, and a report, loud as that of a musket, at the rear of the store where the telegraph instrument was located. Every one supposed for a moment that our building had been struck by the lightning. Such terror as was depicted on the faces of the assembled company at that moment it has never been my lot to witness again. There were no shrieks, no cries nor sobs. Every faculty seemed frozen by fear. A woman sank fainting to the floor, and a strong man fell upon his knees in a posture of prayer. It was some moments before the company realized that it was a false alarm, and regained something of their composure. The man rose to his feet looking as though he thought he had been guilty of a very cowardly action. The woman soon recovered consciousness, and the storm having meanwhile spent its force, the company was ready to laugh at the fright they had experienced. It was learned that the father of the children had been only stunned, and that no serious casualties had occurred.

The telegraph relay was found melted and useless. The striking of a telegraph pole a short distance away had caused its explosion, and the accompanying crash and report which had so worked upon the fear of those present.

Never have I witnessed a more impressive instance of the realization by human beings of their insignificance before the mighty forces of Nature; of the utter nothingness of man in comparison with those forces, which are themselves but the minor, and insignificant agents of Nature for the regulation of one of the smallest of the countless millions of orbs which spangle the midnight firmament, and compose God's universe!

Good Counsel to Telegraphers.—How to get Subscribers for the Telegrapher.—A Cautious Scotchman, etc.

TORONTO, CANADA June 4th.

TO THE EDITOR OF THE TELEGRAPHER.

I WAS greatly pleased with "Agitator's" sensible and interesting article in last week's paper, on the merits of THE TELEGRAPHER, and can heartily endorse all he says in its favor. Subscribing for THE TELEGRAPHER is the most profitable and satisfactory investment any intelligent operator can make, and no one who is ambitious of rising in the profession can afford to dispense with it. Although its circulation is certainly very large, it ought to be a great deal larger, and by a very little extra trouble on the part of those who take it the number of subscribers might easily be doubled. "Agitator's" advice to those who plead poverty as an excuse for not subscribing is very good; for it would be an advantage to them, in more ways than one, to be put on a shorter allowance of cigars and lager; but the trouble is those whom his suggestion is intended to benefit are not likely to see it, as they do not take the paper. Allow me to propose an amendment on his motion: *Let every operator who takes the paper persuade one more operator to do likewise.* Any operator who has not influence enough to get at least one person to subscribe, does not count for much. It is the easiest thing in the world to do if one only goes the right way about it, just send a specimen copy, dilate a little on the advantages to be derived from subscribing, ask him to send in two dollars, and the thing is done—though of course some of them do need asking more than once, but that's nothing. As I have secured upwards of a hundred subscribers this spring simply by asking them to take it, I think I may safely claim to be "good" authority on the subject.

It is splendid fun getting up a club; if people only knew how much fun was to be derived from it, "club raising" would soon be as much the rage as spelling matches were a short time ago.

The majority of those to whom I wrote and sent

specimen copies said in reply that they had never heard of the paper before, but liked it very much, and would be glad to subscribe. Some of them, however, were not so sensible, but required such a fearful amount of persuading before they would venture their money in the concern that the game seemed scarcely worth the ammunition it took to bring it down—it took a couple or three letters and a specimen copy to convince some of them that it would be a paying investment—to say nothing of unlimited quantities of eloquence (?) over the wire as to the merits of the paper, and the advantages to be derived from reading it. There was one canny Scotchman, especially, who seemed bent on thoroughly investigating the matter before committing his little all. In reply to the first letter I wrote him he requested a sample of the paper, which I sent him. Then he wrote a letter of inquiry about the general moral tone of the paper, and the scientific knowledge and religious opinions of its editor, with a few searching questions as to his domestic affairs gracefully sandwiched in between. I answered to the best of my poor ability, and politely regretted that I was unable to tell him whether the editor was a happy benedict or a crusty old bachelor. In reply he sent a telegram announcing that the letter was satisfactory, and he was pleased with the paper and would subscribe for it; but before he carried out that good resolution he was seized with a fit of caution or distrust, and sent another message, saying he was afraid that was a picked copy I sent him, and not a fair specimen of the paper, but considerably above the average; and in order to insure himself against being victimized, he directed me to forward another paper of date chosen by himself. The one he hit upon happened to be an excellent number—far better than the one first sent him, and it brought him to his senses nicely. He sent in his subscription next day, with a meek apology for being so suspicious, and gave me permission to hold him up as a warning to all who seemed inclined to doubt the excellence of the paper. I know he will be delighted with this honorable mention.

A few of the operators in this office kindly undertook to assist me by "puffing" the paper on every possible occasion, but some of them displayed more zeal than discretion in their peculiar way of doing it. For instance, the operator at S— after receiving my invitation to subscribe, asked the operator in charge of that line here to tell him confidentially what kind of a paper that really was I had been praising so highly—if it really had any fun in it. Operator here rashly replied that it was a "glorious old paper," full of fun—as a tip-top comic paper *Grip* couldn't begin to compare with it—was simply nowhere in comparison—had to hide its diminished head and beat an inglorious retreat wherever THE TELEGRAPHER put in an appearance." S— operator was greatly impressed by his enthusiastic account of it, and sent me a message asking for a specimen copy and promising to subscribe if I approved of it. Operator here forgot to tell me what kind of a character he had given the paper, so I was not aware it was amusement the S— man expected, and innocently sent him the only copy I had left, which happened to be about the driest TELEGRAPHER that has ever appeared. Next day I received from him the following message: "TELEGRAPHER received and jokes diligently searched for. No doubt it is a fearfully funny paper, but unfortunately I am not adjusted to see the points of its jokes. As a comic paper I prefer *Grip* after all." He did not subscribe.

Another poverty stricken artist said that as soon as he could earn enough at telegraphing to pay his board bill he would try and borrow the needful to subscribe, but in the meantime would rather take his dinner!

I can't begin to tell you how comical some of the letters were, have already taken up more than a fair share of the paper; but if some of your readers, both ladies and gentlemen, would try to "relieve the monotony of existence" by getting up a club, I can assure you they would find it highly amusing, and profitable also.

The Telegraph Business of Chicago.—Personals.—Lightning on a Rampage and Lightning Rods at a Discount.

CHICAGO, ILL., June 7.

TO THE EDITOR OF THE TELEGRAPHER:

NOTWITHSTANDING the time for the dull season is approaching rapidly, there appear to be no signs of a "let up" in this part of the telegraph world.

The A. & P. seem to be working their wires to their full capacity. The Great Western are doing more business than they did a month or two ago. I have been kindly furnished with some figures from the W. U. office. On the 24th ult., the Board of Trade office alone took in over 2,300 messages.

On the 29th ult., up to 10 o'clock, P.M., the business between here and Milwaukee, and here and New York alone, aggregated over 2,300 messages; and on the 3d

inst., between here and New York, there were 1,533 messages transmitted.

Mr. C. S. Jones, Supt. of Illinois Central Telegraph Lines, has gone with his wife and daughter to board at the Lawndale Hotel, in the beautiful little suburb of Lawndale, six miles from the business centre of the city, on the C. B. & Q. R. R., intending to remain during the summer. This makes the third telegraph addition to the population of Lawndale—Mr. Martin A. Ford, an old operator (now in other business), and W. C. Long, of the W. U. office, being also residents of that place.

Miss Florence Glasson, of the W. U. office here, has been severely affected by the death of her mother, a very estimable Christian lady, which occurred on the 25th ult.

During the past week lightning storms have been abundant. The foolish policy of seeking shelter under trees at such times has been verified again; on the 3d instant a flock of a dozen sheep which had taken shelter under a tree near Schoolcraft, Mich., were instantly killed by a flash of lightning coming down the tree, and a man passing near them badly stunned.

A barn near Shirley, Ill., was struck on the 4th inst., and two men badly injured and a horse killed.

A woollen mill at Beaver Dam, Wis., was struck the same day, and one of the employes severely injured.

The superior (!) quality of the style of lightning rods now in use was tested the same day in one of our neighboring suburbs, very much to the disgust of the owner of the building. The lightning running down the rod left it for an open window to find the water pipe inside to get to the earth, showing how good (!) an earth plate the rod had. The house of a telegrapher standing ten feet away, without any rod at all on it, was not touched, nor were the inmates even stunned. Fortunately the family belonging to the house protected (!) by the lightning rod were absent, or instead of a few dollars damage there might have been a funeral.

Some of our operators out this way are getting too high toned to put Dutch words and names down as they are spelled, as, for instance, the translating of Joseph "Schütz" into Joseph "& Calib."

OCCASIONAL.

A Telegrapher's Trip to Northern Pennsylvania.

SOLOMON'S GAP, PA., June.

TO THE EDITOR OF THE TELEGRAPHER.

I WILL endeavor to write a brief, and I hope not entirely uninteresting narration of a recent flying trip to the mountains of Northern Pennsylvania, a section of the State which undoubtedly produces more operators than any other State in the Union.

With an operator's usual baggage, a "lean satchel and bumbrel," I left New York by the early train on Wednesday morning, and by ten o'clock we had placed many miles between us and the sultry city. As we sped by the green fields and through the small villages, where the people were out of doors, seemingly on the same mission, to breathe the pure country air, I almost regretted ever having entered the telegraphic service, to be confined in an office for long hours every day.

At Dover, N. J., I met my old friend, Mr. George Raymond, formerly of Spragueville, Pa. George is a first class man, and one who always has a pleasant countenance and word for every one. At Washington, Mr. Wm. L. Hoff, the gentlemanly and efficient operator of the Morris & Essex Railroad, and also the manager of the W. Union office, was found. "N" is looking well and happy, notwithstanding his having been married but a short time since.

Leaving Washington far in the distance, we crossed the Delaware River, and were on Pennsylvania soil. After crossing the Delaware the scenery became more grand and beautiful. Following the west bank of the Delaware for miles, we came in sight of the famous Water Gap. Here the river flows between two high and almost perpendicular mountains, presenting one of the finest views in the State. At this place I met the agent, an old acquaintance, Mr. H. Staples, who has been agent and operator for the railroad company for years. A Western Union office is soon to be established at the Water Gap House, for the accommodation of visitors during the summer. I understand Mr. Strawbecker, of Scranton, is to take charge of the office there. I also found the veteran telegraph repairman, Mr. R. Blair, who was engaged gathering the monthly reports from the various offices along the line to Scranton; at Scranton, the first I had the pleasure of seeing, was Mr. Samuel Kellum, the courteous chief operator of the L. & W. R. R.; Sam is looking hale and hearty, and continues to despatch trains with the same old regularity. At the Western Union office I met the genial superintendent of telegraph, Mr. R. O'Brien, whom I found busily engaged, although not too much so to extend a hand of welcome and friendship.

The Scrantonians pride themselves in having as nice and cosy an office as can be found outside of Philadelphia and Pittsburgh, in which I fully concur. The

office is handsomely finished and everything arranged in perfect order. A large repeating business is done at this office in addition to the large local business. I had the pleasure of meeting Messrs. Thomas, Strawbecker, O'Brien and Smith; understand Mr. Smith contemplates studying medicine, and is about to "step down and out" of the telegraph service. He has my best wishes for every success in his new departure, and I expect when I return again to find an M. D. attached to his cognomen, suspended in some fashionable part of the city. I had but an hour at Scranton, and exceedingly regretted not having time to call on Messrs. White, Murphy and other Scrantonians.

At 3.15 I stepped into the cars of the Central Railroad of N. J., en route to Wilkesbarre. As this was a freight and accommodation train I had anticipated a slow trip. At a small place called Spring Brook the train came to a stop. We were delayed half an hour in switching cars, and improved the opportunity by a chat with Brit Bogert at "W.'s" office, after which I had an interview with a few dusky miners as to the probability of resumption of work in the mines, and after discussing the Beecher-Tilton scandal our talking properties became nearly exhausted, and, somewhat parched, I entered the train to partake of a refreshing drink of—ice water. The bell rang and we once more made a move. At "Miner's" Station, a small town of two houses and a blacksmith shop, I met our old friend, Jim Boggs. Any one who has ever had occasion to travel on the Skowhegan Railway, in Maine, has undoubtedly met Jim. When I last met him he was running as a conductor of the "Skowhegan express," to which he had graduated from the telegraphic ranks. Boggs was then sporting a diamond pin, gold watch and chain, and would have been taken for the Vice-President of the road or some ex-Senator. Noticing his somewhat seedy appearance, I ventured to ask the cause. Jim, after hesitating a moment, replied in his usual dry manner: "Well, you see, Ben, I'm farming it now," and he pointed in the direction of the road to a dilapidated looking wagon, drawn by oxen, as if to prove his assertion. The conductor shouted, "All aboard," and we bade the ex-conductor adieu. Wishing success to his farming interests, and that the grasshopper plague would not visit "Miner's," we were soon out of sight.

At Wilkesbarre I found Mr. Brit Bogart, of the Central road. His general appearance had been changed considerably since I last saw him by the addition of a mustache rivaling that of Montagu, which it is understood is very captivating among the Wyoming belles. At the Western Union office, on Market street, I met Manager Lieb and Messrs. Dameson, Johnson and Graff. They are looking so robust that I imagine the pure mountain air agrees with them, or that "Regal" is a very wholesome beverage. Bidding our Wilkesbarrean friends adieu, I left for Ashley. During our short stay at Ashley I made the acquaintance of the Messrs. Babcock and Kennedy, of the Central Railroad office, both gentlemen of the first class, to whom I was greatly indebted for the many kind favors shown, but as we learned the crusaders had visited Ashley we did not venture to propose a glass of—cider. The following morning, incited by curiosity and the earnest solicitation of a friend, I decided to make a tour of the "Planes," four miles in length, by which coal is hoisted up the mountain sides, on the same principle as the famous Switch-back, near Mauch Chunk. The road passes through dense forests. At some points one becomes giddy as he looks over the side of the cars into the valleys hundreds of feet below. If one desires romantic scenery it may be found here. A telegraph wire is constructed from the foot of the plane to the engine room above, the trains being signalled by telegraph, the engineers doing their own telegraphing. After leaving the cars I ascended the "Penob" mountain at the "Point," as it is termed, i. e., the highest pinnacle, 2,500 feet above the Susquehanna river. We could distinctly see twenty miles distant without the aid of a glass. When leaving the valley it was quite warm, but here it was decidedly chilly, and an overcoat would have been both comfortable and acceptable. After visiting the telegraph office at this place, where I saw Mr. Bennett and Mr. Tobin, the day and night operators, I returned to my temporary residence, the next day to leave by the first train for home, greatly pleased with the trip. BEN BREESE.

Too Much Atmospheric.—Personals.—Western Union Pun-nish.

CHICAGO, ILL., June 5.

TO THE EDITOR OF THE TELEGRAPHER.

THE lightning played sad havoc during the last three or four days. A great many of the duplex relays in this office were burned, the charge being so very heavy that the lightning arresters did not present sufficient attraction to induce the "fiery and untamed steed" to take the shortest cut to the earth, but he preferred to go on the farthest way round, because it was too much trouble to get off, or because he did not want to.

"Fatty" Stewart, of Buffalo, has been added to our list of subs.

"Fred" McMillen, of the Gold and Stock Room, having gone on a visit to New York, his place has been taken by "Charley" Burch, who held the position previous to "Fred's" appointment. "Sam" Bracken, who has just returned from the funeral of his uncle at Niles, Mich., has relinquished the all night trick and taken his old position among us on the St. Paul wire nights; Mr. "Jim" Fish taking the all night position, and Mr. Cushing (who has been working St. Paul during "Sam's" absence) taking Mr. Fish's place on the Pittsburg "string." We work two duplex to New York nearly every night now. Mr. "Al" Baker "forks" the Detroit duplex regularly now nights. "Fred" Goodrich has the Galesburg and Quincy, and "Eddie" Dorval "frites gerse," on the Burlington and Keokuk line.

I understand "Billy" Manners and "Johnny" Kemp, have changed wires days, the former taking the Davenport, Des Moines and Rook Island wire, the latter the first New York. "Jack" Desmond is on regular nights now. Quite a new departure is noticeable—Asst. Manager Jones gracing the night force by his presence among them very often, a thing not noticeable by the Asst. Manager under the old regime. Nice toilet soap has taken the place of Babbitt's patent itchgivingskiintakingoff stuff, and the boys have bought a house for it. That luxury in a wash room, a clean towel, is always on hand (of some cheek boy). The work of wainscoting (wherever there is any chance for bare walls to be marked up outside of the operating room) still goes on. We have the cleanest, best lighted office you ever sot eyes on. "Jimmie" Conlon has taken a 12 o'clock trick on the Metropolitan nights since "Q" (Lethgow) took "Qn" office. This don't seem like the same office we worked in three months ago; everything works like the wheels of a new wagon or an old one fresh greased. The boys all "springer" round cheerfully "kelly"-ectin (collecting) very rarely in knots to discuss the probability of having to strike (another boarding house). They seem to know if they stand "plum" up to their duty the "sholes" of adversity (noon hour) will not trouble them, no "leary" eyed insinuating looks are feared, and trifling midemeanors are "congdon"(ed) if not "repeated" and "the winter of discontent (of the day force) is (still) made most glorious by this son of York" (the old gentleman's son George).

I ain't often taken in this way and I am perfectly harmless. WESTERN UNION.

The Whereabouts of Some of the old Pacific and Atlantic Operators.—Personals.—Severely Injured.—Struck by Lightning.

CHICAGO, ILL., May 31.

TO THE EDITOR OF THE TELEGRAPHER.

MEETING a friend a few days ago, and making some inquiries of old Pacific and Atlantic men, I ascertained the following: Mr. Hodges and Mr. "Ed" Savercool operators and repairmen at Kokomo, Ind., and Logansport, Ind., respectively, are working for the A. & P. at Cincinnati, Ohio.

Mr. George Getches is repairing for the Vandalia Road at Terra Haute, Ind. If "Geo." attends to repairing as well as he did to those old three-cornered repeaters at Anderson, Ind., his employers will have no reason to complain.

Mr. Geo. E. McReynolds, who accepted the position of operator and repairer for the P. & A. at Kokomo, Ind., when Mr. Hodges resigned, is now working for the Indianapolis, Peru and Chicago Railroad at Bunker Hill, Ind., as agent and repairer. Mr. John C. Hanchett, formerly chief operator for the P. & A. at St. Louis, Mo., is now in the mercantile business. When last heard from he was at Marine, Madison Co., Ill.

Mr. "Charlie" Fortier, of the Chicago W. U. office, has been obliged to resign his position on the day force, on account of the confinement being so injurious to his health that his physician expressed fears that he would never fully recover, if he continued to confine himself so closely to business. "Charlie" has been troubled lately with erysipelas, and several attacks of dizziness caused by a rush of blood to the head. He has taken the A. & P. "Ex" office (vacated by Mr. Minor C. Gross, who went to Philadelphia with the W. U. Co.) for the present.

"Charley" Baltzell, a messenger boy in the W. U. office at Mason City, Ill., 12 years of age, received severe injuries Thursday morning. While endeavoring to get off a hand car in motion he fell, and the wheels passed over his left foot, nearly severing the toes from it. If not fatally injured he will at least be crippled for life, as amputation will no doubt be deemed necessary.

Considerable damage by lightning is being recorded this spring. At Lincoln, Neb., on Tuesday last, Hon. W. H. Burger, a former member of the Legislature of that State, was struck dead while corraling stock on

his farm at Red Willow, Webster Co. On Wednesday afternoon a German farmer, driving out of Sidney, Ill., on the Toledo, Wabash and Western Railroad, had his team killed and was himself rendered insensible for some time. OCCASIONAL.

Telegraphic Matters in Chicago.—Excellent Appointments.

CHICAGO, ILL., June 9.

TO THE EDITOR OF THE TELEGRAPHER.

THERE have been no startling developments in telegraphic circles here since the changes recently consummated in the management of the two main telegraph offices in this city, the Western Union and the Atlantic and Pacific. Mr. Maynard, the new W. U. Manager, is fast gaining friends by his quiet and unassuming manner, as well as his impartial treatment of his large force of operators. Though a strict disciplinarian, he appreciates the difficulties of certain circumstances, and is always willing to make due allowance therefor. This is doubtless owing to his long practical experience as an operator, and certainly speaks well for any man elevated to the dignity lately conferred on him.

Mr. A. G. Stolbrand, the new manager of the Atlantic and Pacific office here received his appointment on May first, and it was but a just and merited tribute to his long and faithful connection with the opposition lines. Though comparatively young in the profession, he is old in practical experience, and with the requisite facilities at his control, will no doubt manage the A. and P. offices in this city to the entire satisfaction of his superior officers. He is universally liked wherever he goes, and has held important positions of trust in various sections of the United States. His return among us, after nearly eight years' absence, was welcomed heartily by the congratulations and hand shakings of his hosts of friends.

The latter company are successfully working the "Automatic" system to Omaha, Detroit, Cincinnati, Buffalo and Cleveland, having been placed in successful operation at all these and several other points by Mr. Stolbrand, on his way west from New York, excepting at Omaha, which point was equipped by Mr. D. E. Sweet, chief operator of the A. & P. office, Chicago.

THE TELEGRAPHER is eagerly looked for by all the boys here and read with great interest. The subscription list will doubtless be materially increased here shortly. TRIX.

Hot and Cold.—Births.—Personals.—Damages from Lightning.

CHICAGO, ILL., June 12.

TO THE EDITOR OF THE TELEGRAPHER.

THIS changeable climate is enough to give any ordinary man the horrors. Yesterday was so hot that windows and doors were a nuisance, and the night even so warm that it was almost impossible to sleep soundly. This morning and all day to-day it was so cold that, besides keeping doors and windows closed, an overcoat would have been very comfortable.

Our friend, O. W. Hamilton, of the Western Union day force, was made the happy father (on the 6th inst.) of a fine daughter—this being the first "cherub" and weighing eight pounds. Of course Olin is as proud "as a darkey with a new shirt."

Mr. McKelvey, extra operator for the Illinois Central R. R., has gone to Matteson, Ill., on that road; while Mrs. Powers (the lady who handles the keys so gracefully at that point) takes a vacation of three weeks among her friends in Detroit, Mich.

Did you ever hear of the E. C. Tiptz Windmill Co.? Neither did the delivery clerk of one of our neighboring towns, but he had no trouble in finding the Eclipse Windmill Co. Oh! Chicago, Chicago, how are the mighty fallen, and what's the matter with Hannah?

Frank E. Knapp, a well known lightning rod peddler, of Geneva, Ashtabla Co., Ohio, was mysteriously murdered, while partially intoxicated, on the night of the 4th inst., at Kalamazoo, Mich., and left in the barn of the American House.

The following casualties by lightning in this section of the country are recorded in recent issues of our daily papers. Near Tallula, Ill., on the 4th inst., a young man named Frank Gumm, while ploughing, was instantly killed and had his team of mules killed also, while a companion near by was severely injured.

At Shelbina, Mo., on the same day, during a heavy storm, a young man named Stevens, at work in a field about two miles from the town, was struck and with his team, immediately killed.

On the 5th inst., near Lucayne, Kansas, while Morris Will (a farmer residing near that place) was going home, accompanied by his hired man, in his two horse wagon, he and his team were struck and instantly killed, while the hired man was laid out insensible.

OCCASIONAL.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JUNE 19, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.
ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.
INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.) 38 VESEY ST., New York.

PREMIUMS FOR SUBSCRIPTIONS.

1,000 NEW SUBSCRIBERS WANTED.

It is desired to add 1,000 new names to the present Subscription List of THE TELEGRAPHER during the next two months. To accomplish this it is only necessary for the friends of the paper to engage energetically in presenting its claims to the consideration of the Telegraphers generally throughout the country.

To encourage such efforts it has been decided to offer the following

LIBERAL PREMIUMS.

For Two New Subscriptions, or Renewals of Subscriptions which have or are about to expire, we will give the person sending them

A NEW POCKET GALVANOMETER.

For Three New Subscriptions or Renewals,

A NEW POCKET GALVANOMETER, Nickel Plated.

A very handsome and useful article to every Telegrapher.

For Six New Subscriptions or Renewals,

A No. 3 TELEGRAPH KEY.

For Ten New Subscriptions or Renewals,

A No. 1 SOUNDER or No. 1 TELEGRAPH KEY,

For Fifteen New Subscriptions or Renewals,

A GALVANO-ELECTRIC or SHOCKING MACHINE.

The price of this Machine is \$10.

For Twenty-five New Subscriptions or Renewals,

A No. 2 RELAY.

For Forty New Subscriptions or Renewals,

A No. 1 RELAY,

Handsomely finished, with glass shade.

For One Hundred New Subscriptions or Renewals,

A No. 1 SELF-STARTING REGISTER.

With glass shade, and everything complete.

Subscriptions must be paid in advance at the regular price of TWO DOLLARS per year. Subscriptions for less than a year will be counted proportionately.

Those who may desire to obtain Premiums can send in subscriptions as obtained, and they will be credited therefor, and can call for such Premium as they are entitled to for the whole number so credited at any time.

Specimen Copies of the paper will be forwarded, on application, to those who may desire to use them in canvassing.

Remittances should be made by Draft, Postal Money Order payable to, or Registered Letter addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.

NEW YORK.

Competition in Telegraphy.

COMPETITION is said to be the life of trade, and it is certain that competition not unfrequently makes things lively if not profitable. The railroads have recently been indulging in a very active and bitter competition, which proved anything but profitable, and which, added to other unfavorable conditions of traffic, have brought some of them to bankruptcy, while it has seriously damaged the stronger companies. Wiser counsels are understood to have prevailed at last, and a compromise has been brought about, which, if honestly adhered to and carried out, will prove beneficial to railroad interests.

Competition in telegraphy is demanded by the public, and exists to a considerable extent in this country. In European countries telegraphic competition is impossible, as the lines are owned and the business controlled by their respective governments. Fair and reasonable competition is beneficial to the public, and to telegraph employes; and, so long as the lines are under private management and ownership, will undoubtedly always exist to a greater or less extent. It is of great importance to telegraphic employes that the business shall not be monopolized, either by a mammoth telegraph company or by the government. If it should, they would necessarily be less independent and their interests not as well maintained as while they have a choice of employers.

It does not by any means follow that, in advocating telegraphic competition, we favor a cut-throat policy, which shall destroy the productive value of telegraphic investments. There is room enough for two or more telegraph companies in this country, and with proper and economical management they can be made remunerative. We consider that a good deal of money is wasted in carrying on the telegraph business, which, if saved, would add to the value of telegraphic investments. Red tape is sometimes a good thing, but too much of it is apt to be expensive as well as obstructive. The Western Union Company is popularly supposed to be afflicted with too much red tape. We do not assert that it is so, but if it is, it should be abolished with as little delay as possible. A proper system of business, accounts, etc., is indispensable to the successful transaction of so extensive a business, but if so much red tape is used as to save or secure ten cents at the expense of a dollar's outlay, it seems to be evident that the sooner it is dispensed with the more profitable it will be for the stockholders, and the more advantageous to the employes. What is needed is a simple and comprehensive system of business and accounts, which shall, at as little expense as possible, secure to the company, its patrons and employes, that which belongs to them respectively.

The Anglo-American Telegraph Co. is about to experience competition, from which it has heretofore been exempt. Having so long had a monopoly of Atlantic telegraphing, naturally the prospects of competition, even with a single cable, is not looked upon kindly by the managers and stockholders. It cannot be avoided, however, and we presume that they will get used to it in time. To add to the misfortune, in consequence of the business depression in this country and abroad, the business, notwithstanding the reduction of tolls which took effect May 1st, is limited, and insufficient to occupy even the cables of the old company. It is not therefore a pleasant prospect to be called upon to share this business with a rival company. The effect of the reduced business and the pending competition has been to reduce the market price of shares of the Anglo-American Co. very materially, and naturally disquiets some of the holders. We think they are good property yet, however, and would not object to owning a few thousand of them. It is rather singular that the shares of the Direct United States Cable Co., with but one cable and that just completed and not yet open to business, sell at about the same percentage as the Anglo-American. It shows a confidence in the prospective business of the new cable which must be very gratifying to the managers. Whether the new company pro-

poses to go below the present tariff is not yet known, but we should hardly suppose it would do so, at least for the present.

One great difficulty, and it is by no means confined to telegraph companies in this country, in producing favorable financial results, is the disproportion between the actual value and investment and the nominal capital of the companies. Both the Western Union and its principal competitor, the Atlantic and Pacific Company, have nominal capitals greatly in excess of the actual value of the property. To earn respectable dividends on these is very difficult, and besides creates an impression with the public that it is unduly taxed for telegraphic service in order that dividends may be earned. We do not know that this can now be remedied, but it is unfortunate that the practice of watering stocks has been carried to such an extent. It hampers and embarrasses the companies in raising necessary capital for extensions and new enterprises, which must necessarily be required. It is to be hoped that in the future, should new companies be required to take up the business, this error at least will be avoided. It is evident that a company whose capital should represent the actual investment, and something near the real value of its property, would have a decided advantage in any competition with other less fortunately situated competitors.

The Telegraph Thirty Years Ago and To-day.

ON Monday last we received a call from Mr. HENRY O'RIELLY, whose prominent connection with the introduction of the electric telegraph in this country is historical. Thirty years ago, the 13th inst., the contract between Mr. O'RIELLY and Prof. MORSE and his associates for the construction of telegraph lines and introduction of the then new MORSE telegraph system was signed. All the parties who were then interested in the telegraphic invention and enterprise, except Mr. O'RIELLY and Mr. F. O. J. SMITH, have, we believe, passed away, and neither of these gentlemen is now prominently interested in the telegraph business.

How different was the status of the telegraph then and now! Then it was struggling for existence, its value and practicability unappreciated, those engaged in its introduction popularly regarded as wild enthusiasts, and the capital required to extend the initial line, which had been constructed under an appropriation, obtained with the utmost difficulty from Congress, of forty thousand dollars, between Washington and Baltimore to this city, secured only by the most strenuous efforts, and mainly by Mr. O'RIELLY himself. Now the telegraph has become one of the greatest institutions of the world, and penetrates through every section of the country; millions of capital, and probably 30,000 persons are employed in its administration and service in the United States and Canada.

The struggling infant of thirty years ago has become the sturdy giant of the present, and is destined to even greater development in the future. Those who, amid doubt, discouragement, and against obstacles which seemed well nigh insurmountable, achieved the successes which securely laid the foundation of the telegraphs of the present, should be gratefully remembered and honored by the people who enjoy the inestimable benefit and advantage of their labor and enterprise.

New Music.

WE have received "The Melville Polka-Mazourka," the composition of Mr. JOHN H. MILLIKIN, of the Western Union Telegraph, Boston, Mass., office. Mr. MILLIKIN's ability as a musical composer as well as telegrapher has been very fully demonstrated heretofore, and this last production of his musical genius is calculated to add to his already creditable reputation as a composer. It is pronounced by our musical critic to be an exceedingly pretty and attractive composition. It is not so commonplace and trashy as such pieces are apt to be, and deserves to meet the success and appreciation which it will doubtless receive.

It is published by Messrs. GEO. W. RICHARDSON & Co., of Boston.

Manual of Telegraphy and Catalogue of Private Line Instruments.

WE have received from the Western Electric Manufacturing Co. a very useful little work, entitled *Manual of Telegraphy and Catalogue of Private Line Instruments*. It contains a condensed telegraphic manual, prepared by Mr. GEO. H. BLISS, for the use of amateurs and learners, and instructions for the construction of private telegraph lines, connecting instruments, etc., which have been carefully prepared, and contain information of great value and importance to those for whom it is designed. Appended to the manual is a catalogue of the printers and other instruments manufactured for private, railroad, and commercial lines, with a brief but comprehensive description of each.

The Manual will be forwarded on application to the company, at No. 220 Kinzie street, Chicago, Ill.

The New Washington, D. C., Fire Alarm Telegraph Contract.

The Commissioners to whom, by Act of Congress, the government of the District of Columbia is entrusted, have awarded the contract for rebuilding the Fire Alarm Telegraph of the District to Messrs. GAMEWELL & Co., who will proceed at once to put up a first class system. The Fire Alarm Telegraph now in use in the District is old, dilapidated, and not such as is required. The system to be introduced will combine all the improvements which have been made in the American Fire Alarm Telegraph system since the one about to be superseded was constructed.

Personals.

AMONG the recent arrivals of telegraphers at San Francisco, Cal., are Messrs. JOHN H. POWERS, of Chicago, Ill., B. S. SHELDON, of Chattanooga, Tenn., and H. H. SMITH, of Virginia, Nevada.

Mr. E. ERNEST STREETER is assistant operator, Santa Barbara, Cal., Western Union office.

Don. Y. P. VILLEGAS is manager of the San Juan South, Cal., Western Union office.

Mr. G. E. WARD is manager for the San Joaquin and King's River Canal Telegraph Company, at Firebourn's, and Mr. JAS. J. EDDY, manager same company at Canal Headquarters, Cal.

Mr. N. F. HARRISON has accepted a position as assistant operator, Gilroy, Cal., Western Union office.

The Telegraph.

The Direct United States Cable.

THE completion of the Direct United States Cable, which was announced in the last number of THE TELEGRAPHER, after so many misadventures and delays, has attracted general attention and congratulation. The entire cable from Rye Beach, N. H., to Ireland, is in good working order, and messages on business of the company are constantly passing over it. No time for opening it to public service has yet been announced. Under the contract for laying the cable, the contractors have thirty days after the cable was finally completed to test it before handing it over to the company. Until the contractors are ready to transfer the cable to the Direct United States Cable Company it will not be opened to the public, and until it is ready for public service the rate of tolls to be adopted will not be made known.

The following condensed history of the actual laying and attempts to lay the cable will be of interest for future reference:

On the 16th of May, 1874, the steamship Faraday left the Thames for the United States to lay the New Hampshire and Nova Scotia section of the cable. Owing to foggy weather the laying of this part was not completed until the 15th of July. The Faraday then proceeded to Nova Scotia for the purpose of submerging the main cable to a point on the coast of Newfoundland. On the 26th of July the cable had been laid from Nova Scotia to this point and was buoyed in Conception Bay. The Faraday then returned to England to take on board the remaining portion of the cable. On the 20th of August the Dacia landed the Irish shore end of the main cable in Balinskelligs Bay, Ireland, and on the 2d of September the Faraday effected the splice between the shore end and the deep sea cable, and commenced paying out toward New-

foundland. On the 4th of September, a fault having been discovered, the cable was hauled back, but parted during the operation. The cable was recovered, however, on the 6th, and the laying was proceeded with until the 10th, when the cable again broke while being taken back for a fault. After many unsuccessful attempts at grappling, owing to the tempestuous weather, the ships returned to Queenstown harbor on the 2d of October for the purpose of refitting and taking in coal and supplies, and proceeded again to sea on the 23d of the same month. On the 2d of November the cable was picked up and spliced, and paying out was resumed toward Newfoundland. The laying was continued until the 8th of November, when another fault was observed, and the cable was cut and attempted to be buoyed. This, however, owing to the heavy sea, failed; and as the weather showed no signs of moderating the ships made for Harbor Grace, N. F. After a short delay they proceeded again to the grappling ground, where they arrived on the 16th of November. On the 24th, after the cable had twice been lifted and again abandoned on account of the severity of the weather, the cable was brought up and eight miles of it taken back. The fault was found to be in these eight miles. Bad weather, however, still prevailing, the cable had to be buoyed, and on being taken up again on the 25th it parted while being raised to the surface.

After several attempts to recover the cable, which were frustrated by the severity of the weather, the ships, running short of coal, put into St. John's, N. F., on the 7th of December, and left again on the 15th. The Faraday now took up the Newfoundland end of the Nova Scotia and Newfoundland section, made a splice, and, after laying the shore end and intermediate sections toward Ireland, again proceeded to grapple for the other end on the 19th of December. The weather, however, became so violent that after the ships had kept to their work until the 9th of January, 1875, they were obliged to return to England for repairs and new stores. About two months ago the Faraday returned and completed the task which had been beset with so many cares and difficulties."

By the laying of this cable we have now five cables connecting the North American Continent with Europe, as follows:

Years.	Length.
1866—Ireland to Newfoundland.....	1,896
1869—Brest to Duxbury, Mass., via St. Pierre.....	3,330
1873—Valentia to Newfoundland.....	1,900
1874—Valentia to Newfoundland.....	1,900
1875—Direct cable.....	3,060

The new cable is laid from Ireland to Nova Scotia and thence to Rye Beach, New Hampshire.

Rumors of arrangements and amalgamations of the new cable company with the Anglo-American and Western Union Companies have been industriously circulated, and doubtless, to some extent, credited, but there is no foundation for them. The articles of Association of the Direct Cable Company provide that no amalgamation or arrangement for division of business or profits with any existing companies or lines of Atlantic telegraph shall ever be entered into. These articles have as binding an effect as an act of parliament, and can only be altered or abrogated by act of Parliament. This would not of course preclude an agreement as to the rate of tolls to be charged for the transmission of business, but no such agreement has been entered into, and the competition between the two companies promises to be a genuine one.

The New Easton and Amboy Railroad Telegraph Line.

THE Easton and Amboy Telegraph was completed at noon on Saturday, the 12th inst. This line runs along the Easton and Amboy R. R. (an extension of the Lehigh Valley R. R.) 60 miles in length, and was constructed by Mr. Homer A. Clute, the Supt. of Telegraph of the latter company.

The line is run on the south side of the road the entire distance from Perth Amboy to Easton without crossing the R. Rs., which indicates good engineering on the part of Supt. Clute. The line is run through the Musconetcong Tunnel, which is a mile in length, by a plan devised by Mr. Clute, viz., wooden arms or fixtures are placed in perpendicular form, 150 feet apart, at the highest point along the side of the tunnel, and held by two bolts put into the rocks by means of drilled holes, six inches in depth.

Brooks' patent insulators, which are exclusively used on the line, are screwed to these arms, to accommodate from one to six wires. The wires through the tunnel are painted with a heavy coat of paint to keep them from becoming rusty and also to maintain their conductivity. The wire used on this line is the best brand of charcoal iron, and its size No. 11, American gauge. The line will, during the present season, be extended to the company's office in New York, also to Mauch Chunk, from Easton, a distance of forty-six miles.

Mr. Clute has now over 500 miles of line under his charge, which are managed second to none in this country; and his success and the splendid working of the different circuits are due to his great energy and close personal attention.

Return of and Presentation to President Orton.

ON Sunday last President Orton, of the Western Union Telegraph Company, accompanied by his two daughters, arrived home from England by the steamer Celtic, from Liverpool. Mr. Orton has been much benefited by his trip, and returns to duty with improved health and vigor.

The directors and officers of the Western Union Company had prepared a surprise for their President, who found, upon arrival at his country residence at Irvington, N. Y., a magnificent dinner service of 13 pieces of solid silver, from the Gorham Manufacturing Company, bearing on each the family monogram, presented by them to Mr. and Mrs. Orton. It was designed to have presented this service on the 23d of May, the silver wedding day, or twenty-fifth anniversary of the marriage of Mr. and Mrs. Orton, but the absence of Mr. Orton prevented. A kind and appreciative letter by acting President Cornell, on behalf of the gentlemen by whom the presentation was made, accompanied the gift. The kindness of his official associates is naturally highly appreciated by Mr. Orton.

Foreign Telegraphic Notes.

THE Anglo-American Company directors have passed a resolution that on and after June 2 the estimated gross receipts of the company for the previous day be posted daily at the company's office, 23 Throgmorton st., E. C. London.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended May 22, 1875, was 386,733, an increase of 21,321, on the corresponding week last year.

The Post-office Submarine Telegraph stores at Lowestoft, England, were destroyed by fire on the eve of the Derby. The flames spread with great rapidity, and the building—which was 300 feet in length—was destroyed, together with a quantity of paraffin, paints and other oils, and a number of rockets. The total damage caused by the fire is estimated at £18,000, including a quantity of submarine cable. The contents, to the extent of £14,000, were insured in the Sun office.

The manufacture of the new cable for the Western Union Telegraph Company, from Punta Rassa to Key West, is being carried on at the India Rubber Company's works, at Silvertown.

The cable to connect Chorrillos, the watering place of Lima, with Caldera, in Chili, has had a commencement. After its completion messages can be transmitted from Peru to Valparaiso and over the Andes to Buenos Ayers, thence to Bahia and thence to Lisbon.

In the process of telegraphing the Morse paper is used in a narrow strip, about three eighths of an inch wide, and is of a greenish tint, so as to be less trying to the sight of the operator than ordinary white paper. It is usually wound on spindles about 4½ ft. long and 8 inches in diameter, and afterwards cut into rolls of the width required for the instrument, viz., about three eighths of an inch. Of these spindles, each containing upwards of thirty miles of paper, no fewer than 350 per month, or upwards of 4,000 per annum, are consumed in the postal telegraph service throughout the country; so that the total annual consumption of the narrow strip must exceed 130,000 miles. Nearly 7,000 miles of Wheatstone paper are used in the postal system in the course of a year; and this is obtained by cutting up into coils upwards of 300 spindles of much the same dimensions as those of the Morse paper. A mile of Morse paper cut into the narrow strip required for the instrument only weighs 2 lb. 3 oz., while a mile of Wheatstone paper is nearly 1½ lbs. heavier. In a large office like that at St. Martin's-le-Grand many miles of these tape-like records must be constantly on hand, and if they could only be placed side by side with the corresponding message sorted away in the vaults underneath they might tell a curious tale. At the end of every three months some tons of both are carted off to the mysterious "mill" of her Majesty's Stationery office, whence no official form or document was ever known to return—in its original shape, at all events. "Pulp" is the condition to which all such matters are reduced.

The traffic receipts of the Western and Brazilian Telegraph Company, for the four weeks ending May 28th, were £10,510.

The new cable about to be laid between Australia and New Zealand, in connection with the Eastern Extension Telegraph Company's system, will receive special guarantees as to rates from the New Zealand Government. The contract for the new cable will be under-

taken by the Telegraph Construction and Maintenance Company.

The average time occupied in the transmission of telegrams between Madrid and England, "via Santander," during May was three hours twenty-six minutes, including transmission over Spanish land lines.

An official memorandum from the Great Northern Telegraph Company states that, according to information received from Foochow, an agreement was entered into and signed on the 21st May, between the Chinese Government, represented by the Imperial Commissioner Shen Panchen, Viceroy and General in the Province of Fookien, charged with full powers by Tsung-li-Yamem, Minister for Foreign Affairs in Pekin, and the Great Northern Telegraph Company, to the following effect: "The Chinese Government pays the company full compensation for the damage done to the Foochow-Amoy line in January last. The company to erect a line of telegraphs between Foochow and Amoy for account and risk of the Chinese Government. Inland telegraph stations to be established in Amoy, Foochow, and the two intermediate towns, Hinghua and Chuenchan. The working of the line to be undertaken by the company for account of the Chinese Government."

The traffic receipts of the Eastern Extension Telegraph Company for the month of May shows a decrease of £1,106.

The cable steamship Hooper has arrived in the Mill-wall Docks, after an expedition of five months in laying the cables of the Central American, West India and Panama, and Cuba Submarine Telegraph Companies.

Telegraphic Electric Brevities.

A BATTERY man, who has tried the experiment, says that to keep the jars of a sulphate of copper battery clean, coat the inner surface of the jar for about an inch at the top with common white paint. This, he says, will entirely prevent the sulphate of zinc from accumulating on the outside of the jar.

The American District Telegraph Co., of San Francisco, Cal., have opened an office at 417 California street, but are not yet in complete working order. The district system is to be worked under an arrangement, and in connection with the Western Union Telegraph Co., as in New York and other cities east of the Rocky Mountains.

The transfer books of the Western Union Telegraph Company will be closed until the 16th of July.

The Legislature of Rhode Island at its present session has revived the charter of the Narragansett Cable Co., with a proviso that a cable connecting Rhode Island with some European country shall be laid and in operation by the year 1880, in order to preserve the charter.

The Fifth International Telegraph Conference.

THE Fifth International Telegraph Conference assembled at St. Petersburg, Russia, on the 2d instant. Representatives from all foreign countries and foreign telegraphic administrations are present, the British Postal Telegraph Department being represented by Mr. H. C. Fischer, the Controller of the Central Telegraph Station in London, and Mr. Allan E. Chambre, the Surveyor of the Private Wire Branch of the department. Col. Robinson with Major Bateman represent the Indian Telegraph department; Sir James Anderson and Mr. Lewis Wells (formerly of the Electric and International Telegraph Company) the Eastern Telegraph Company; Sir James Carnichael and Mr. S. M. Clare, the Submarine Company; Mr. Andrews the Indo European Company, and Mr. H. G. Erichsen, the Great Northern Company.

The principal business of the conference will be the codification of regulations arrived at on previous meetings, so as to secure some uniformity in the treatment of international messages. An important proposition, having for its object the reduction of the minimum number of words in foreign European messages from 20 to 10, and a corresponding reduction of the tariff for such messages, will be brought forward; and the attention of the conference will be asked to a somewhat similar proposition with regard to extra European messages. The sittings of the conference will, it is anticipated, extend over a period of six weeks.

Pecuniary Results of the Reduction of Atlantic Telegraph Tolls.

THE reduction from 4s. to 2s. per word for messages transmitted over the Anglo-American Company's cables, which went into effect on the 1st of May last, would naturally affect unfavorably for a time the receipts of the company. Exaggerated reports of the losses the company would and did sustain in consequence were circulated for the purpose of depressing the price of the stock, and did seriously affect the

market value of the shares. As, previous to the second instant, no authentic statements of the receipts were made, there was no means of contradicting authoritatively these reports. Realizing the damaging effects of such reports, the directors, although they have heretofore opposed it, decided to make public each day the amount of the gross receipts of the previous day.

The figures show that, although, as was expected, there has been a considerable reduction in the gross receipts, yet the actual reduction is not by any means as large as has been stated. The general depression of business in this country, as was before known, has affected the business of the company. The returns now published show that the daily average from the 1st of January to the 30th of April, 1875, were £1,782, as compared with £1,976 in the corresponding period of 1874. Under the same tariff a decrease of £194 per day is thus shown. From the 1st to the 31st of May, 1874, with a tariff of 4s., the daily average receipts were £1,813; for the same period of 1875, with the rates reduced one half, the average receipts were £1,095, or a decrease of £718 per day.

The estimated receipts for the 1st of June were £1,240, as compared with £1,095 for the daily average of the month of May. The receipts for the 2d of June were £1,400; for the 3d, £1,340, the decline being about 30 per cent., a decided improvement being shown over the month of May.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS.

NEW YORK, June 10, 1875.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended May 25th, 1875, and bearing that date.

163,753.—ELECTRICAL CIRCUIT CLOSER.—L. L. Duerden, Brooklyn, N. Y. Filed May 8, 1875.

1. A telegraph key, the moving part of which (for making and breaking contact) consists of a flexible and elastic diaphragm or disk, secured at its edges to a suitable base, and operating substantially as herein shown and described.

2. The combination of the flexible and elastic metallic diaphragm or disk, the recessed base, to which said diaphragm is secured at its edges, and the contact points, enclosed in a chamber formed by and between the disk and base, substantially as set forth.

3. A telegraph key, in which the contact points are curtained in a chamber hermetically sealed, or practically so, to the atmosphere, substantially as set forth.

DESIGNS.

8,342.—TELEGRAPH KEY.—Charles W. Lewis, Chicago, Ill., assignor to the Western Electric Manufacturing Company, same place. Application filed April 12, 1875. Term of patent 14 years.

GEO. H. BLISS & CO., 220 Kinzie Street, CHICAGO, ILL.

Telegraph instruments and supplies in great variety, of the latest patterns and highest finish.

Prices always as low as the lowest.

The usual twenty per cent. discount is still allowed on instruments of our manufacture when remittance accompanies order.

Manual and price list free.

CELEBRATED
PRIVATE LINE OUFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

20 PER CENT. REDUCTION IN THE
 PRICE OF
TELEGRAPH INSTRUMENTS!

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - - - - - \$12 80
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - - - - - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - - - - - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - - - - - \$6 00
- No. 1 Keys, Caton pattern, curved levers. Price, \$6 50 reduced to - - - - - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - - - - - \$4 40
- No. 1 Premium Register, \$45, reduced to - - - - - \$36 00
- " " Spring Register, \$47 50, reduced to - - - - - \$38 00
- " 2 Register. Price, \$38, reduced to - - - - - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, ETC.

- No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to - - - - - \$12 00
- No. 2 Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - - - - - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - - - - - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - - - - - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - - - - - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - - - - - \$6 40
- No. 2 Ditto, \$7, reduced to - - - - - \$5 60
- No. 3 Keys, curved levers, Caton style, same as No. 1, but smaller. Price, \$5, reduced to - - - - - \$4 00
- No. 4 Keys. Price, \$4, reduced to - - - - - \$3 20
- AMATEURS' KEY, \$3 50, REDUCED TO - - - - - \$2 50
- EXCELSIOR AMATEUR INSTRUMENTS, \$6 50, REDUCED TO - \$5 20
- BUNNELL'S LEARNERS' INSTRUMENTS, PERFECTED, \$6 50, REDUCED TO - - - - - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THEIR CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE
HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDEES made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

[Written for THE TELEGRAPHER.]

Filibuster the Mighty.

BY TOM QUAD.

If you ask me whence this poem,
Whence this parodic preparation,
Whence this wild attempt at satire,
With its telegraphic flavor,
With its slaps at "sushing" humbugs,
With its scorn of pluggish follies?
I should answer—I should tell you,
By old Massachusetts Harbor,
In the chummy land of breezes,
In the land of crooked places,
In the land of filibuster,
I observed it—I remarked it.
From a telegraphic college
Came a youth of loud appearance,
With diploma sealed and inky,
Which announced him as a mighty
Slinger of the subtle juices.
First he went to that department
Where they check the dirty half rates,
And there he penned a noble "gssage"
To Mr. Brown, in old Manhattan,
Saying, "I am an operator of eblity,
Have you for me got any bus. is?"
He was nonplussed at the answer,
And worse for all that have to work him,
Down he settled in that city—
City of the crooked places,
There, among a hundred like him,
To seek for glory and poor whiskey.
Chief of plugs, this youth became there
Chief of huge abecedarians;
And the sun each night descending,
Found him pluggy as at morning,
And the sun each morn arising,
Found him worse than in the evening;
One by one he lost the virtues—
Lost the few and scanty virtues—
Virtues of whose solid substance
He had once possessed the shadow.
In his penmanship, for instance,
He could once write somewhat different
"A" and "O" and "N" and "R,"
With some degree of plainness,
But now, alas! his copy
Was but a vulgar ink blotch,
Which a spider, dipped in fluid,
Would have come to try and rival
On the second eastern press wire
Sat this youthful filibuster,
Sat this noble plug, the mighty,
With his head upon his bosom,
With his eyes half closed in pleasure,
Sighing to himself half gently,
As he slid the subtle juices
To New York and way with calmness,
Thus he pondered in his headpiece—
He who, in semblance of his maker,
Had a head upon his shoulders—
Upon his rounded farmer shoulders,
Where his brains might do duty,
If he had possessed the tissue,
But which were empty as a battery,
Empty as a worn out battery,
Which has been salted all to piece
"I will loose my scaled jerking,
Turn the dogs of war upon them,
Make them smell their holes in sorrow,
Make the break sheet grow in blackness,
Till it rivals carbon paper."
Then he start-d all his muscles,
Loosened all his forearm muscles,
Sent each dot faster than the others,
Sent each dash shorter, quicker,
Sent his spaces smaller, smaller,
"Till they lessened into nothing,
"Till his letters were but spatters,
"Till the relays could not answer
To the waverings of the circuit.
Suddenly there came a breaking,
Some one opening quick and sudden,
With polane but heartfelt utterance,
Saying, "you can't send; you run together,
Stick and jerk, and flirt and flutter;
Get relief and spare our feelings."
Now this youthful filibuster—
One among the great fiascos
In the land of salt and freshness,
Did not relish pointed sayings,
Or doubtful personalities,
So he winked his glistening optic,
In his nose he placed his finger,
Braced his feet against the table,
As he loudly shouted, "blast it!
Come my friends and see me salt 'em,
Come ye plugs and bow before me,
See me warp the second press men."
Then he blew upon his muscle,
Screwed the key down to short stroke,
And said, with dite vehemence,
"Dash it, dash it, will you tell me
Where to 'four,' you bloody heathens,
Where to start my dexter mains?"

Oh, you plug, go hire a temple,
Where you can air your sticky chinning."
Quoth a man from old Manhattan
Writing with such dreadful firmness
That the plugs fell from the switches,
And the very tables trembled.
"Get you hence," says bold Nu Haben,
"Take your hand from off the key there,
Let it fall upon the ploughshare,
Let it rake in weeds and cowslips,
As it did six months before,"
"You have busted all the windows,
Split the cross-arms very badly,
And my relay's gone to thunder,
With the lever bended double,"
Shouted Hafford in dismay.
"Give me but a ragged cheese knife,
With which to chop your head off,
And in joy I'll always revel,"
Added Woo-ter in the chorus.
Springfold didn't tumble, but requested
Time to make some few repairs,
Which he's told us since by letter
Were of a serious nature.
Providence alone kept his key closed
Out of a weak desire for glory,
Relying on the breaks of others,
Upon the forced breaks of others,
To save his hard earned reputation,
Earned by various unknown openings,
Which were always east of Hibtown,
City of the crooked places.
Thus the youthful filibuster,
He the mighty, awful rusher,
Got a most ignoble take down
At the hands of injured press men,
On the second eastern press wire.
Then up from the table rose he;
From the worn out table rose he,
Turned and waved his hand at parting,
Swore a sickening oath of vengeance,
Then straightway he left the country,
Left the land of the fiascos,
Left the land of filibuster,
Plunged into the teapot harbor
And was lost and gone forever,
Gone to Hades no doubt forever.
Now to sushers and all salters
Let this direful case of trouble
Prove a most befitting lesson.
Take ye heed and save the pie ces;
Never serve a key to short stroke,
Never blow upon your muscle,
It will only make you trouble,
It will only start the calamity.
Better send at nine a minute,
And be sure that they will get it,
Than be shot from any country,
Shot in haste from any country,
To the land of the Hereafter.

Original Articles.

Synopsis of a Paper "On Lightning Rods," Read by Mr. I. N. Miller before the American Electrical Society.

BY OCCASIONAL.

SOME time ago I promised your readers a synopsis of the paper "On Lightning Rods," read before the American Electrical Society at Chicago, by Mr. I. N. Miller.

In fulfilling my promise I shall endeavor to present that part of the paper only which contains points not heretofore discussed in THE TELEGRAPHER. I wish that I could, in justice to the paper, ask to have the whole document printed, but its length renders this unadvisable, and as the readers of THE TELEGRAPHER cannot have the entire article, I have endeavored to present to them the most salient, interesting and valuable points.

It is probable that hereafter I shall not be able to furnish THE TELEGRAPHER copies of the valuable papers which are constantly being read at the meetings of the American Electrical Society, as the Executive Committee have decided to print the most valuable and important papers in pamphlet form for circulation; and as it might detract from the circulation of such documents, and prove injurious to the interests of the Society, to furnish them for publication in the widely circulated telegraph journals—THE TELEGRAPHER and *Journal of the Telegraph*—they will probably in future reserve the right of publication.

In his interesting and instructive paper "On Lightning Rods," Mr. Miller first calls attention to the fact that although more than a century has passed since Benjamin Franklin first introduced lightning rods, only "the mechanical part has been studied and improved, and that the protection to buildings by the rod of to-day is no better than that of the first rod introduced, and that the fault does not lie in the rod proper, but in its connection with the earth." That instead of being a protection the rods, as now connected to the ground, are an absolute injury, "involving a discharge without being able to conduct it into the earth."

Mr. Miller lays the blame in a great measure to the purchasers of lightning rods, as he states, if the vender should attempt to place a few feet more copper in the ground, so as to make a more perfect earth connection the purchaser would at once surmise that he was be-

ing swindled, and probably refuse to pay for the extra copper.

Referring to the scientific principles involved, Mr. Miller affirms as true, "that a greater quantity of electricity can be collected from the atmosphere upon a fine point than a blunt one," and that "a cluster of fine points might act as an inducement for electricity to pass to the earth, that with a blunt point would not do so;" but, he says, "no matter whether the rod ends in a fine or blunt point, electricity always selects the route of lowest resistance," and that if a rod is used which is a better conductor than the building itself * * * it will conduct the greater part of the discharge regardless of the kind of points employed." If this is the case (which there is no reason to doubt), I should think rods with blunt points (which should possess the conducting qualities Mr. Miller claims they ought) would be the best, unless, as he asserts, "blunt points might be fused more than sharp ones." This objection could be met by the adoption of Mr. Miller's suggestions in regard to proper earth connections, as in this case he claims that a blunt pointed rod "would not be fused off until it was no higher than the building while the present generation exists."

Without a proper earth connection the glass insulators used are more of an injury than a benefit to the building, especially if it contain gas in water pipes.

After quoting Sir William S. Harris and Professor Henry M. Noad on the subject, Mr. Miller calls attention to what should be taken into consideration, in the construction of a lightning rod, such as its peculiar construction; its position with regard to surrounding objects; the metal used; the character of the soil upon which it rests, etc. That to protect properly a building containing gas and water pipes they should be connected to the rod where they enter the earth.

He thinks the theory "that electricity passes over the surface of bodies only, and the conductivity depends solely upon the surface," is erroneous, and that although "a hollow body will contain as great a static charge as a solid one of equal size, for electricity in a dynamic state, or in motion, the case is a different one; the conductivity being in proportion to the mass or weight and not to the surface." Mr. Miller therefore deprecates the use for lightning rods of strips of copper rolled up and joined together, instead of using a solid rod. He also claims that much of the copper which enters into the construction of lightning rods is of so poor a quality that its conductivity is far below that of iron, and that none but the purest Lake Superior copper should be used in their construction.

He very clearly explains the difference between electricity of high and of a low tension; and says, in regard to the difference of opinion as to whether a joint should be riveted or soldered, if the joints are made in such a manner as to prevent the different sections from separating it is all that is required; and that the important point in the construction of lightning rods, and the one which in practice has been so much neglected, is that of proper earth connection. He also claims that if a joint between a copper and an iron rod be properly made "there will be no greater resistance to the passage of the current at the joint than through any other portion of the copper rod."

Where gas and water pipes can be connected to the lightning rod it is much better to use them than the ordinary earth plates, as otherwise the "copper rod would have to be connected to a metallic plate buried in moist earth, and having a surface area of 1,000,000-000 square inches, or a plate over 2,500 feet square, to form as perfect a connection as if connected to such pipes. Mr. Miller also asserts that our chimneys are better conductors than the rods as usually constructed with their insufficient and defective earth connections; and that although lightning will readily leap across short spaces of air to pass from one end of a rod to the earth, it would necessarily have to leap several feet in every direction in order to reach a sufficient quantity of earth through which to diffuse itself with the same facility as through the copper rod. To insure a good earth connection every available, piece of metal in the vicinity that has any connection with the ground should be connected to the rods, and that if wells or ponds of water are available the rods should reach them.

Mr. Miller deprecates the practice of coiling up a ribbon of copper for an earth connection, as in this manner less than half of its surface comes in contact with the soil, but if put down without coiling both sides come in contact with the earth; and the important object—getting as much metal in contact with the soil as possible—would be accomplished. He proposes a decided improvement in earth connections, that "holes be bored into the earth, say ten feet deep and ten inches in diameter, and the rods packed therein with coke; and when rods are connected to gas pipes the connections should be made outside of the metre, as a heavy charge has been known to melt the lead pipes used in making connections with metres.

Mr. Miller closes his very able paper by expressing the opinion that "the subject is worthy of careful consideration by those interested."

Chicago, Ill., June 15.

Bastie's New Process of Tempering Glass, and its Application to Telegraphy.

Prof. T. EGGLESTON, of the School of Mines in this city, has made a long and systematic series of experimental investigations into M. Bastie's new process of tempering glass. He found that ordinary window glass, after having been subjected to the process, would resist the shock of a two ounce steel cylinder dropped from a height of fifteen feet, and a pound cylinder from a height of seven feet, while an ordinary pane would resist only 30 inches fall of a two ounce ball. It can be heated to any temperature without breaking. A curious feature of glass thus treated is, that it can be thrown to almost any distance without fracture, but if it does break, it flies literally to atoms. Prof. Eggleston read a paper a few days since before the Institute of Mining Engineers, in which he gave the above and many other interesting particulars in regard to this new discovery.

It appears that glass of any form or quality may be treated successfully, and that its properties as a non-conductor of heat are enormously increased. This would render it probable that its insulating properties are increased also, these two qualities being apparently proportional to each other in most if not all-known substances.

The prospective value and importance of this discovery to telegraphic interests can scarcely be over-estimated. Glass is very extensively used in telegraphy, mainly for line insulators and battery jars, and the loss by breakage in these two items alone, to a company like the Western Union, amounts to a very large sum of money annually. By the aid of this new discovery the average insulation of the wires may be vastly improved, for not only will cracked and broken insulators become a rarity, but the form of the insulators themselves may be greatly modified with advantage. One great difficulty has hitherto been, that the disposition of material best adapted to secure good insulation—that of a hollow cylinder of great length and small diameter—is most unfavorable in respect to mechanical strength, and for this reason we have hitherto been obliged to make a compromise in form, which materially reduces the electrical resistance of the insulator during rain. The new process of tempering the glass will afford great possibilities of improvement in this respect. There are also many minor applications of this substance that will suggest themselves from time to time—for instance, as a substitute for hard rubber in the manufacture of electrical and telegraphic apparatus. Further developments of the capabilities of this extraordinary discovery will be awaited with great interest.—*Journal of the Telegraph.*

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

St. Louis Railroad Connections Completed.—Correction.—Married and Contemplating Matrimony.—Personal Items.

ST. LOUIS, Mo., June 15.

TO THE EDITOR OF THE TELEGRAPHER.

It is a matter of congratulation that at last we have a Union depot situated in the heart of the city, and the difficulties attendant upon passenger travel in and out of St. Louis have been completely encompassed. The stranger coming to St. Louis is landed at once in the heart of the city, without the long, tedious drive in a crowded omnibus as heretofore. The depot on this side is situated on the corner of 11th and Poplar streets; while the one in East St. Louis is situated at the eastern approach of the great steel bridge, the wonder of the world. Trains pass over the bridge, thence through the tunnel along Washington avenue to 8th, thence to Poplar street. The two depots are placed in communication with each other by a telegraph line running through the tunnel. Mr. H. C. Mahoney is manager of the telegraph department on this side, and is assisted by Mr. Samuel Cassidy, while the eastern office is ably managed by Gillie Manchester.

In a former issue of THE TELEGRAPHER it was erroneously stated that Mr. D. S. Ryan had been appointed night chief. It should have read "assistant." Mr. John H. Topf is night chief, and I am happy to say he is a good one, and is universally liked by all of the operators. He has served his time at the key and knows how to treat the boys white, and at the same time do his duty to the company.

Our genial friend, Mr. Chas. T. Day, was united to one of New York's fairest daughters in Brooklyn on

the 8th inst. Charley has secured a handsome as well as a good and noble companion, and all his friends join in wishing them long life, prosperity and happiness—

"Blest time of joy and bliss complete
With hours the sweetest of the sweet,
When two hearts tender seeming prove
As one beneath the bonds of love.

"Earth's path must lead through fairest bowers,
Beneath the feet springs brightest flowers,
And radiant skies arch the world o'er,
More grand and golden than before.

"Thus onward through the rolling years
Two hearts as one share bliss and fears;
Untiring breathe life's holiest tune,
Nor spend, till death, the honeymoon."

Mr. Wm. W. Cummings, our worthy and estimable chief, leaves to-morrow for Toledo, Ohio, where he goes for a vacation, and to indulge in fishing and boat riding. We all wish him a pleasant time and safe return. Mr. A. E. Van Tyne fills the position of chief during Mr. Cummings' absence. Van is a great favorite with all the boys, and has the ability to discharge the arduous duties devolving upon him in a creditable manner. It is rumored that Mr. John L. Cassidy is soon to take unto himself a mate. Thos. P. Wheeler, Esq., says he wouldn't marry, but that photograph which he carries in his left pocket speaks volumes to the contrary, and its a little strange that he don't like to manipulate any but the Chicago wire (Vy.)

Mr. Jas. C. DeLong, who came here to take "Press," has been suffering severely from an affection of the lungs, and is working the Cairo circuit days, while Mr. W. T. Loper still takes night "Press," much to the gratification of the printers, as the telegraph editors say it's a shame to put a pencil on his copy, so perfect is it.

"Nihil's" Ghost Speaks from his Untimely Grave.—A Wandering Spook Retorts on his Assailants.

CINCINNATI, O., June 10.

TO THE EDITOR OF THE TELEGRAPHER.

THE affairs of men are often absurd to themselves. How much more so then to one who, having shuffled off his mortal coil, and clad himself in sable habiliments, has "gone down into the cold and silent tomb." Which is "of no consequence."

While I was in the flesh, I suffered the slings and arrows of outrageous ignorance and misrepresentation, and, as mortals are apt to do, I sometimes retorted by casting back mud for mud, and filth for filth. Now, that I am no longer subjected to the gallings of the body, I can look without emotion on what would then have chafed me sorely. But lest any earth covered mortal should think that such spirits as I know nought of what passes below, permit me through the proper medium to make known the fact that we are permitted yet a while to wander among our old familiar haunts, with the friends and amidst the scenes we loved, "While in the body pent."

Does one ask,

"Who killed Cock Robin?"

I answer, he died a natural death, but that there is one man who thinks that he beat out my brains with a Sterling literary cudgel. (?) Having settled that point, return we to our mutton! I am permitted all unseem to hover over my old fellows of the office and watch their movements and compare them with what they did whilst I was among them; I see their faults and foibles as only amusing follies, transmitted largely from their parents and ground into them by the circumstances in which they have been placed; what was often irritating then is only funny now. And I, a disembodied shade, am often forced to laugh till my transparent sides almost split, and my unsubstantial ears are almost rent with the silent roar of my own guffaws! Did you think sprites do not laugh? you are mistaken, so far as the class to which I belong is concerned, I have laughed harder and oftener as a ghost than I did as "Nihil." You will remember, perhaps (I do, for ghosts do not forget), that I passed during my brief, unhappy life as "the melancholy Dane." Up here in the ethereal regions I have become quite merry. And it is as entertaining pastime as I could wish to enter as I do sometimes, in my character as an essence, into the mind of some poor flesh burdened old friend, and see the clashing of the cogs of his brain, as they try in vain to revolve in the grinding out of some tough job of composition for the press. Imagine, if you can, my passing into the mental mill of my respected friend "John Sterling," and watching everything come to a dead stand for want of a new idea to grind, or the ability to manage an old one. Ah! how well I knew what spring to touch (John has told you how I could, as a mortal, introduce the "Reverberating Thunders" and "Lurid Lightnings," until "Milton" and "Homor" passed out for refreshments), how easily I could have stretched out my immaterial hand

and opened the floodgates of wisdom and language. But shades have other occupations than helping overwrought mortals to write prosy articles. Imagine me sitting beside him, an invisible presence—looking over his shoulder at words that would not come, and seeing them on the paper, where to him all was blank. But to nudge him would have been folly of which a ghost would never have been guilty, for my phantom elbow would have passed clear through his gross stomach without having disturbed the contents by even so much as a ripple on the gastric sea. Poor man! I can smile, but I cannot put ideas and arguments where they are not. Imagine, also, my feelings (for ghosts feel) as I stood behind him (Sterling the Wise), and peering through the portals of his head (which are behind) while he wrote that last wonderful article in reply to a dead man. Think what a seething, bubbling, roaring mass of red hot thought must have been before my impalpable eyes as I looked and beheld the cesspool from which issued the reference to "Nihil's" sisters and the Empress Maria Louise. Ah! "the hog loves his wallowing in the mire." And then I beheld him, as it were, imprisoned under a towering *Cra (i) g*, surrounded and threatened by an ever advancing sea—of arguments on automatic telegraphy—lashed into fury by his Canitic order to retire, and as he vainly and desperately strove to free himself from his perilous situation, the *Cra (i) g*, fell upon him with an awful crash—"fifteen hundred words per minute between Washington and New York"—and "Sterling" was no more than an unpleasant memory.

"Oh, why should the spirit of mortal be proud?" Then I visited in my freedom the cave in which lives one of your correspondents, who occasionally has a lucid interval, and saw the tools with which his brain mill is supplied. I need not mention the fact that flatery is the one in which his main dependence is placed. I was often glad, while living, that he only wrote occasional contributions, and for your sake and your readers, I am doubly glad now. To me, a spook, it was amusing to see the two men sitting solitary and gloomily apart, until the breath had passed out of my body, and then rushing eagerly like hungry vultures, fanning each other affectionately with their fragrant wings while they devoured the flesh. They have violated the law which governs the denizens of earth. They have made a dead body the bond of their union. Let them look to it that mortification do not ensue to themselves.

To "Jo," I have only to say that whatever of glory in battle or victory may belong to my foe, she may claim undivided. She was the gallant foe—she is the generous victor. This is a privilege that bodies do not often enjoy, and I try to be as thankful as a wraith can be for it. Not many of the perverse "spirits" of these degenerate days, are allowed to appear in print over their own signatures. This I enjoy by virtue only of the newly discovered Transfusion Practice. Having transferred my thoughts into the mind of a faithful medium (not Katie King), I am enabled to send you this in visible characters.

I cannot close without a word of advice to my sonneteer, "Ichabod Crane." He is evidently a young man, and no doubt sincere in his intentions; but up where I am sentimental verses over graves do not take well. We have no tombstones to engrave them on, and if we had, we could only bring them to the notice of other spooks by carrying the gravestones to them, which would be rather a heavy load for disembodied spirits, to say nothing of the slim chances of their being recognized by their owners, on account of their epitaphs. Besides all this, they make one feel uncomfortable.

I hope they will let my poor ashes rest now. Let them think that—

"The 'Nihil' who wandered in search of his bread
Has faded away like the grass that ye tread."

Give us a short repose. Let us have a little "hard rest."

NHIL NAMELESS,

W. S.

(Which means Wandering Spook.)

The Weather.—Telegraph Business in Chicago, etc.

CHICAGO, ILL., June 14.

TO THE EDITOR OF THE TELEGRAPHER.

VERY little has transpired within the past month worthy of note. That everlasting topic, the weather, of course, must be commented upon.

We have had quite pleasant weather, "generally speaking." Gentlemen visiting this city for a short period, say 12 to 24 hours, should first furnish themselves with the following necessities: Heavy overcoat, spring overcoat, linen suit, umbrella, rubbers, summer hat, a palm leaf fan, and many other articles to dress himself to suit the weather, which is liable to change in an hour. We have sunshine one hour and the next thunder and lightning, "making things pleasant all around."

The receipts of the W. U. office in this city for the month of May were \$1,973,81 larger than for the month of April.

The following is the increase for May over April:
 Number of messages..... 16,359
 " word " special..... 18,568
 Total number through messages sent and received in May..... 137,131

Mr. A. H. Hamilton, of the Chicago Western Union day force, was last Sunday, June 6th, presented with a fine daughter weighing nine pounds. Ham. came around Wednesday morning smiling, with his best suit on.

Charlie Birch is with us again. Charlie takes his old job in the gold room. He is the only man that can handle that business. Mr. E. O. Waite, Manager of Clinton, Iowa, has resigned, and Mr. J. D. Mills, Manager of Clinton, Iowa, Railroad Office, has been appointed his successor.

Mary's little lamb must have been annoying Benson at Dubuque, Iowa, when he received "Texas, Dale, Harry, Son & Co., for Teasdale, Harrison & Co."

Ben, who would be the son's father in first mentioned address? "I gin it up." QUAD.

Dominion Telegraph Extension.—A Juvenile Superintendent.—Personals and Bulls.

TORONTO, CANADA, June 15.

TO THE EDITOR OF THE TELEGRAPHER:

Mr. C. B. McQUARRIE, inspector for the Dominion Telegraph Co., who has been down in the Lower Provinces since the first of April, making arrangements for the new line to be built there, returned to Toronto last week, and reports favorably of the proposed route. The Dominion Company will begin building as soon as the contract between them and the Direct U. S. Cable Company is signed (which is daily expected), and two hundred miles of poles are now being got out for the purpose. They will only build from Tor Bay to Halifax and St. John this season, but early next season they will run up a line from Quebec and St. John, and thus have a direct line to the cable. It is quite probable, also, that they will have a direct wire from Montreal to New York before many weeks, via Swanton and St. Johnsbury. It will, of course, be a great advantage to the Co. to be able to handle cable business.

The grand event of the week is the arrival of a "son and heir" in Supt. Neilson's family. Neilson, junior, is said to be a remarkably fine little fellow.

Miss H. McCarty, of Aurora, has taken charge of the Stouffville office. As she is a good operator, and a very amiable and attractive young lady, her office will, no doubt, do a good business.

To be in the fashion, our staff perpetrate a few "bulls" occasionally. For instance, a message for Cazinovia, Madison Co., N. Y., was copied "Cazin via Madison Co., N. Y."

Operator at O—— wanted better address to message to "Stole," signed same. When advised to make it "Steele," he had no difficulty in finding the man.

In another message, a first class operator copied it "expenzon," instead of "expense on." The party to whom it was addressed said he did not understand that kind of Greek, and wanted it repeated. Moral:—Count your check.

C. H. Hosmer, Esq., Supt. Eastern Division, visited this office last week.

We have been enjoying beautiful weather here for the last few weeks—fine and dry, but comfortably cool. It is just the kind of weather to make telegraphers' hearts rejoice, though the farmers, who live in blissful ignorance of bad insulation and escapes, would prefer a little more rain.

DOT.

"Nihil" and "Jo."—A Sharp Rebuke of "John Sterling."—The Morse and Automatic Systems.

CINCINNATI, O., June 3.

TO THE EDITOR OF THE TELEGRAPHER.

I WAS amused on receiving the last copy of THE TELEGRAPHER to see the sympathy manifested by sensitive "Jo" over poor "Nihil's" sad fate. She seems, woman-like, to be repentant just as soon as it is evident that the damage she has done is irreparable. While the poor, misunderstood, abused man was with us she rejoiced in her power to "skelp and skad" him just to make him squeal. He died "game" though, and in so doing, I am satisfied, pleased her much better than he could have done in any other way. The ladies admire heroes, and I prophesy now, that should his ghost ever "revisit the glimpses of the moon" she will be the first to welcome it. Altogether, she did the neatest thing she has yet accomplished in that last brief paragraph. I am also of the opinion that

N—— is not dead, nor even sleeping, and that of all his literary antagonists he entertains the highest opinion of "Jo."

I think "Sterling" rather overdid himself in his last article. His gratuitous offering of his lady friend's remarks concerning the cause of "N's" fears, was complimentary neither to that lady's delicacy nor "Sterling's" good sense. I question much if she said anything like it, and if she did she certainly betrayed a heart as familiar with the sinful emotions of the bad man as she claimed "Nihil's" to be.

I do not design in this to revive a controversy buried, it is to be hoped, in "Nihil's" grave, but simply to express my extreme disgust at such indelicacy of expression.

I happen to know "Nihil," and I know that he is in heart and feeling a man, one whose arm and voice have ever been as ready in a lady's defence as his pen has been ready with good logic and earnest warning. I would advise "Sterling" if ever hereafter another such controversy should spring up in THE TELEGRAPHER or any other journal, to keep out of the ranks of combatants until he has learned something of the rules of civilized warfare. The slang and jeers of a "man of the world" may very readily pass for the expressions of a dark experience, but they will scarcely assume the weight or force of argument. I beg "Jo" to reconsider her "vote of thanks." Bestow your sympathy rather over "Nihil's" grave. A dead foe is better than an unworthy friend alive.

I have taken much interest in the occasional articles bearing upon Automatic telegraphy, and hope I may be pardoned if I presume to offer a few thoughts on that topic. I shall not attempt to argue, my knowledge of the practical working of the Automatic system is too limited for that, but there are a few plain facts which are the common property of us all, and these will sometimes bear very frequent repetition. First, the Morse system has been new for a long time in operation. It is in the nature of things that an improvement over it should be made, just as in it improvements have been made. Second, nothing great has ever yet been invented but that afterward something better came up and crowded it out. It is time that the improvement be made in telegraphy. The business of the commercial world demands it. Demand always creates supply. Third, the W. U. is a monopoly whose chief capital is Morse. Monopolies invariably tend toward their own destruction; sometimes through their own corruption, sometimes through the corruption they breed elsewhere, but more frequently through the counteraction they produce in public feeling and private enterprise. Monopolies are oppressions. Oppressions incite resistance. Sometimes this manifests itself in open riot—sometimes in the invention of new apparatus and new and cheaper methods. Fourth, Nature tends from the abstract to the concrete, from the elemental to complex, from the simple to the compound, from the unit to the sum, from the atom to the molecule. Morse is an element, a simple, a unit. From it must grow the complex, complete (measurably at least). And I might close with the advice of the Jewish Rabbi concerning the doctrine of the early Nazarenes: "If this doctrine be of men it will come to naught." If the Automatic system is of no value then it will die of itself, but if it possess merit, then will it live, and "not die." If it be a fraud and doomed to speedy "Nihil-ation" why so much lead spent in killing it? If it be a "hit" then the less outcry the better, else will those who are the "active" ones come off as did "Auld Nick" when he sheared the sow—have "plenty of noise and mighty little wool."

I said I should not argue. I have not done so. Certainly no one can say, however, that there is not some sanity in these thoughts which to me are facts. I believe many a W. U. employé feels as I do, and could express himself better, were his bread and butter not wrapped up in his silence. I speak without the fear of that gigantic monopoly, the W. U., before my eyes. No sword is suspended over my head by a thread in the hands of that Company.

I shake hands cordially with Craig. He is a man of "my style," and I say as did the Emir of old, "Let there be peace between me and thee." Long may he flourish—his pen: and long may THE TELEGRAPHER open its independent columns to him and others of his sense and judgment. UNO HOO.

A Dominion Telegraph Office Destroyed.—Enterprise under Difficulties.

TORONTO, CANADA, June 19.

TO THE EDITOR OF THE TELEGRAPHER.

ON the morning of the 18th inst. the office of the Dominion Telegraph Co., in Barrie, was totally destroyed by fire. The fire broke out about 2.30 A. M., a few doors from the office, and spread so rapidly that the operator, Mr. J. L. Kerr, had barely time to disconnect the instruments, and get them, with the books,

etc., out, before the office caught fire. The whole back part of the building was in flames, when he suddenly remembered that he had forgotten the switch board. Anxious to do the best he could for the Company, he rushed into the burning building, and with the aid of a jack knife, succeeded in detaching it from the wall and got out just in time to save himself a singing, and drenching from the hose. Twenty-three buildings on the north side of Dunlop street and six brick stores on the south side were destroyed. Three telegraph poles belonging to the Dominion Co. and three belonging to the Montreal Co. were also consumed; the wires in some places being melted with the heat. As soon as the fire subsided sufficiently to allow him to climb the poles, Mr. Kerr cut the wires, and securing the corner of a butcher's shop for a temporary office, run the wires into it. He then made a rustic table of two pork barrels and a barn door and announced himself ready for business at 8.45 A. M. There was a heavy rush of business all day, which he dispatched in his usual first class style. The Montreal Co.'s wires were burned from three poles, but their office was not much damaged. They got the line built up again and were able to resume business at about 8 P. M. Mr. Kerr deserves great credit for the promptitude and enterprise he displayed on this occasion.

Mr. Fred Robertson, of Port Hope, has taken charge of the Dom. Telg. Co.'s office at Uxbridge, and Mr. G. W. Deuch has accepted the office at Markham. DOB.

Scraps.—An Incident.

TO THE EDITOR OF THE TELEGRAPHER.

THE correspondence columns of our paper are one of its interesting features—a little monotonous sometimes perhaps, when subjects are scarce or when Little's automatic seeks new glory, or seeks to prolong what it may have already found—but taken on the whole, the space given to correspondents is filled with interesting matter which is of itself worth the subscription price of the paper. Many, doubtless, preserve the paper whole and file it. Those who have conveniences to do so have an advantage which I have not. Still when I stumble upon a good thing, which I occasionally do, I do not let it pass, but clip it and paste it with my collection of gems and good things in my scrap book. Those who haven't one, take my advice and start one at once. In mine I find very many things which are as fresh to-day as when put away. Looking them over, I find a fair sprinkling from these columns, among which are some "Humors of the telegraph," personals, character sketches, reminiscences etc. Prominent among the collection is an article by "No Sig." entitled "Idiosyncrasies of Telegraph Operators," which struck me as picturing a phase of a telegraphic life as accurately, and, as a picture, being as recognizable as anything in literature could be.

In our office we have our "heavy man," our "light man," our "fast man," and our "medium," which is doing well for our extent of office. The heavy man was the victim the other evening to an unfortunate combination of circumstances, which has caused some mirth among the rest of us and might elicit a smile from others. His name is not Brown, but that is what I will call him for convenience sake.

We have (or had—he is gone, thank Providence) an artist up the line who is not in a fair way to rival the best kind of men. Indeed, it would require a great deal of improvement for him to rival a very poor man. It was he that Brown got hold of the other evening with about six words of easy matter addressed, probably, to the agent. Having sufficiently raised him, Brown paused, looked back over his shoulder at the Division operator and said he would bet him the cigars that F. D. would not break him on that. The other answered with cool complacency, and without looking up, that he would bet him, and Brown started it carefully. He was going to have a dead certainty of it and in steering from the danger he cleared it too widely and shoaled upon the other coast, for as he was approaching s——i——g the man, F. D., ventured to say what he had never at any time said before and in all human probability never will again—he commanded Brown in tones which were at once dulcet and ominous to "g a faster."

The chief virtue of this happening is its nearness to home. O. H. KAY.

Miscellaneous.

THE STREAM MAGNET.—M. Donato Tommasi state that, if a current of steam at a pressure of 5 to 6 at mospheres is passed through a copper tube of 0.08 to 0.12 inch in diameter, and coiled spirally around an iron cylinder, the latter is magnetized so effectually that an iron needle, placed at the distance of some inch or two from the steam magnet, is strongly attracted, and remains magnetic as long as the steam is allowed to pass through the copper tube.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JUNE 26, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.
INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS IN lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an *extra copy free*.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.) 38 VESEY ST., New York.

PREMIUMS FOR SUBSCRIPTIONS.

1,000 NEW SUBSCRIBERS WANTED.

It is desired to add 1,000 new names to the present Subscription List of THE TELEGRAPHER during the next two months. To accomplish this it is only necessary for the friends of the paper to engage energetically in presenting its claims to the consideration of the Telegraphers generally throughout the country.

To encourage such efforts it has been decided to offer the following

LIBERAL PREMIUMS.

For Two New Subscriptions, or Renewals of Subscriptions which have or are about to expire, we will give the person sending them

A NEW POCKET GALVANOMETER.

For Three New Subscriptions or Renewals,

A NEW POCKET GALVANOMETER, Nickel Plated.

A very handsome and useful article to every Telegrapher.

For Six New Subscriptions or Renewals,

A No. 3 TELEGRAPH KEY.

For Ten New Subscriptions or Renewals,

A No. 1 SOUNDER or No. 1 TELEGRAPH KEY,

For Fifteen New Subscriptions or Renewals,

A GALVANO-ELECTRIC or SHOCKING MACHINE.

The price of this Machine is \$10.

For Twenty-five New Subscriptions or Renewals,

A No. 2 RELAY.

For Forty New Subscriptions or Renewals,

A No. 1 RELAY,

Handsomely finished, with glass shade.

For One Hundred New Subscriptions or Renewals,

A No. 1 SELF-STARTING REGISTER.

With glass shade, and everything complete.

Subscriptions must be paid in advance at the regular price of TWO DOLLARS per year. Subscriptions for less than a year will be counted proportionately.

Those who may desire to obtain Premiums can send in subscriptions as obtained, and they will be credited therefor, and can call for such Premium as they are entitled to for the whole number so credited at any time.

Specimen Copies of the paper will be forwarded, on application, to those who may desire to use them in canvassing.

Remittances should be made by Draft, Postal Money Order payable to, or Registered Letter addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.

NEW YORK.

The Centennial Celebration and the Telegraph.

THE Centennial Celebration of the Declaration of Independence of the United States, which is to be held in Philadelphia in 1876, is now assured to be a great success. The exhibition buildings are now being erected and will cover several acres of ground. It is proposed to hold, on this occasion, a grand exposition, which shall display the progress which the country has made in industrial pursuits, and in the adaptation of new facilities and conveniences to the use and service of the public. This exhibition, commencing on the Fourth of July, will continue for some months, and will attract to it thousands of people, not only from all parts of our own continent but from the whole civilized world.

It is to be hoped that this opportunity will not be allowed to pass without a thorough and creditable representation of the telegraphic systems of the country, which shall demonstrate to the world the wonderful progress which has been made in the development of electrical science and the telegraphic art. It is eminently proper and desirable that such an exhibition should be made, and that it shall not be partial and incomplete.

It is a well known fact that most of the important developments and adaptations of the telegraph to popular service and use have been made in this country, and that it is more generally and universally used here than in any other part of the world. Electricity and the telegraph have been subordinated to public service here, as they have not been anywhere else, and telegraphic inventions have been stimulated and encouraged here as they have been nowhere else. The character and genius of the American people lead them to seek for and encourage the development of facilities for domestic and business purposes, and consequently inventors have here put forth their best and most practical efforts. We do not mean to disparage the labors and genius which in other countries have been devoted to this special department, but it is well known that it has been found extremely slow and difficult to introduce elsewhere the telegraphic inventions which here have met with almost immediate recognition and acceptance. Aside from the ordinary commercial telegraphs but little has been done abroad toward utilizing this great element. The system of instantaneous reporting of the quotations of the stock exchanges and markets to brokers, merchants, etc., which here has grown into an enormous business, is almost unknown in Europe. The system of electrical fire alarms and electrical protection of premises and localities against the spread of conflagrations, are unknown abroad. The larger cities, especially, in this country are covered with private telegraph lines, so-called, which, except in England, are elsewhere but seldom employed. The American system of electrical railway signaling is far in advance of that in use in any other country. The American automatic telegraph system; the printing telegraph; the duplex and quadruplex telegraph apparatus, are either American inventions or have been developed and made practical in this country. The only printing telegraph used to any extent in other countries, the Hughes, is the invention of an American. And so we might go on specifying, but the above is enough to prove the truth of our assertion. It would then be a disgrace to the telegraphic genius and interests of this country if our great Centennial Exhibition should come and go without such a telegraphic display as shall manifest to the world our superiority in telegraphic matters.

In order that this display shall be national in its character, it is essential that the proposed exhibition should not be a mere advertising demonstration on the part of manufacturers and dealers in telegraphic and electrical apparatus; the managers of the telegraph companies should cooperate in making it in every respect a national exposition. Every system of telegraph and every adaptation of electricity to public service should be shown in actual and continuous operation.

Action should be taken in this matter at an early day, and sufficient space secured in which to make a

suitable display. We have no doubt but that the managers of the Centennial, who are making every exertion to insure its being successful and creditable in every department, will afford every facility and assistance in their power if a movement is inaugurated for such a telegraphic exposition as we have suggested. It will require organized and energetic action, however, and it should be commenced soon. If there ever can be an occasion when it would seem advisable that the competition and jealousy which are inseparable from free telegraphy should be set aside, and all parties heartily cooperate in effecting a desirable result, this is one. And not only the managers of telegraph companies and enterprises should cooperate, but the manufacturers and dealers in electrical and telegraphic apparatus should aid in the good work. We presume that some of the leading parties in this line will have exhibitions of their own, but these should all be combined in one department in such a manner as to make them parts of a general exhibition.

We have thus hastily jotted down a few suggestions on this important subject, in the hope that they may attract attention and lead to definite, united and effective action. Although it is yet a year before the Centennial Exhibition takes place, it is time that some steps should be taken preparatory to it, if it is desired to make such a demonstration and display as we have briefly indicated. If this be done now, no doubt all who propose to participate might be induced to unite their efforts, and the result of such united action would be beneficial as well as creditable to all concerned. Who will take the initiative?

We understand that it is proposed by the managers of the Centennial Exhibition to appoint an electrician who shall have the supervision and direction of the electrical and telegraphic department. It is of the first importance that great care shall be exercised, in making this appointment, to secure the services of a suitable and properly qualified person, as upon this will depend very much the success of this department, and the credit which will result to the electrical and telegraphic interests of the country.

We have learned that a party whose qualifications and acquirements as an electrician and telegrapher are not of an order which will be likely to prove either satisfactory or beneficial, is making great effort to secure this position. While we have no personal unfriendly feeling to the gentleman referred to, we should very much regret his appointment on his own account, as well as on that of the great interests at stake.

It will be unnecessary for the managers of the Centennial Exhibition to go outside of Philadelphia for the proper person for that position; Mr. DAVID BROOKS, as an electrician and practical telegrapher, is eminently fitted to fill the position of electrician to the Centennial Exhibition with credit to himself and country, and advantage to the exhibitors in that department. He has had experience with similar exhibitions abroad, having been one of the United States Commissioners to the Vienna Exposition, and, besides, enjoys an extensive personal acquaintance with the electricians and telegraphic engineers of Europe. We make this suggestion without consultation with Mr. Brooks, but hope that he may be induced to accept the appointment, confident that none better could be made.

The Volume Half Completed.

THE current number of THE TELEGRAPHER completes the first half of Volume XI and of the year; the volumes now commencing and ending with the calendar year. While newspapers as well as other interests necessarily feel the influence of the long continued business prostration, yet we have the satisfaction of announcing to our friends and readers that, despite all the adverse influences which it has had to encounter, THE TELEGRAPHER has been fairly supported. It has of course required constant care and labor to maintain the paper as a successful publication but it has been done, and we have no doubt but that

it will continue to be so maintained. It has become one of the indispensable telegraphic institutions of the country, and we are constantly in receipt of the most flattering commendations from those who are best qualified to judge of its value and importance.

THE TELEGRAPHER has a corps of correspondents and contributors to its columns of which we may well be proud. In this respect it has never before been so favored as at the present time, and we are constantly receiving accessions to our assistants in this department.

We are about making some new business arrangements, which will enable us to devote more time and attention to the conduct of the paper than heretofore, and we hope to be enabled to make the paper even more interesting and valuable in the future than it has been in the past.

It is desirable that the circulation of the paper should be increased, and although we are aware that the summer season is not a favorable one for increasing the number of subscribers, we hope that those who regard it as desirable that this paper should be efficiently supported will favor us by exerting their influence to add to the number of its patrons and readers.

We gladly avail ourselves of this opportunity to return our sincere thanks to the many friends who have, by efforts to increase its circulation and by contributions to its columns, aided us in maintaining an independent telegraphic journal, and confidently solicit a continuance of their favors.

We have no special promises to make—the paper as it has been heretofore is the best guaranty of what it will continue to be, and we can only renew our assurance that, as in the past, no feasible effort will be spared to make it a creditable representative of the telegraphic fraternity and telegraphic interests.

The National Board of Trade and the Postal Telegraph Schemes.

THE National Board of Trade, which is composed of delegates from the local Boards of Trade throughout the country, was recently in session at Philadelphia. The Committee on Resolutions among others reported a resolution endorsing the postal telegraph scheme. After considerable debate this resolution was indefinitely postponed, thus substantially recording the opinion of the principal merchants of this country, whose interests are intimately connected with the proper administration of the telegraph, against Government ownership and management of the telegraphic facilities of the country.

The advocates of a postal or Government telegraph for this country, never a very numerous or influential body, have steadily decreased in number and influence under the discussion of the subject, in and out of Congress, which has taken place during the last few years, and whatever may have been heretofore the motives which have actuated those who so persistently pressed the motion, its reintroduction in Congress may fairly, and would be regarded as merely an attempt to subject telegraph companies to useless and unnecessary expense and trouble in defending their interests.

Personals.

Mr. J. H. BURROWS has been appointed to a position in the W. U. office at Houston, Texas.

Mr. CHAS. NEWTON, Houston, Texas, W. U., has resigned, and accepted a position with the same company at St. Louis, Mo.

Mr. A. G. TAYLOR, of Galveston, Texas, W. U. office, has resigned and leaves there July 1st for his home in New York State. This said he has serious intentions of soon becoming a Benedict.

Mr. EDWARD L. PARMELEE, of St. Louis W. U. office, is acting as assistant day chief during Mr. W. W. CUMMINGS' absence.

Mr. H. C. MAHONEY has resigned his position in the Western Union office, to accept the managership of the Union Depot office at St. Louis, Mo.

Mr. SAMUEL CASSIDY, of the St. Louis, Mo., W. U. office, has resigned, to accept a position as assistant to Mr. H. C. MAHONEY in the Union Depot office.

Mr. DAVID CAMPBELL, of St. Louis, Mo., has gone to Jefferson, Texas, where he expects to "sub" for Mr. PILLOW for a month or two.

Mr. CHAS. T. DAY has been transferred from the night to the day force, St. Louis, Mo., W. U. office.

Mr. L. N. BOONE, of Hannibal, Mo., has been appointed to a position in the St. Louis, Mo., W. U. main office.

Mr. E. W. FARNHAM has resigned the position of night manager of the Western Union, Milwaukee, Wis., Western Union office, to take charge of the Chicago and Milwaukee Division of the Great Western Telegraph Company.

Gold and Stock Telegraph Company.

THE Directors of the Gold and Stock Telegraph Company have declared a dividend of three per cent., payable on and after August 2d. It is understood that this company is now in a prosperous financial condition, and it is hoped that dividends may be hereafter regularly earned and declared.

A New Telegraph Company.

A MILWAUKEE, Wis., correspondent of THE TELEGRAPHER writes that on the 11th inst. much surprise was occasioned by the appearance of a new telegraph counter on 'Change in that city, the blanks headed "Board of Trade Telegraph Co., for Board of Trade business exclusively between Chicago and Milwaukee. Allan C. Knapp, lessee and manager." He further states that this is believed to be a blind, and that it is a Western Union operation to run out the Great Western Co.

Telegraphic Consolidation.

Mr. PLATT BURR, of Idaho, superintendent of the Nevada and Northern Telegraph Company, the only telegraph company in Idaho whose lines extend from Winnemucca, Nevada, to the mining districts of Idaho, has been in this city for some days, and has just completed a working contract between his company and the Atlantic and Pacific Telegraph Company, whose lines connect at Winnemucca. Mr. Burr has also purchased and shipped several hundred miles of wire, with which his lines are to be extended to Portland, Oregon, this summer. The territory thus reached by this line is regarded as one of considerable importance. The Western Union Company, whose lines extend from San Francisco to Portland, via the coast, has hitherto enjoyed a monopoly of the telegraph business at Oregon and Washington Territory; but the successful issue of this new enterprise will afford the Atlantic and Pacific Telegraph Company an opportunity of getting a large share of this very profitable business, while it opens up telegraphic communication to the people of Idaho and Eastern Oregon.

The American District Telegraph in New Orleans.

THE American District Telegraph system is being introduced in New Orleans, La., under favorable auspices. The company has been organized under the laws of Louisiana, and are now engaged in constructing their lines and fitting up their offices, and announce that they will be prepared to commence business on the first of September next.

Mr. W. H. Bofinger is the manager, and Mr. J. C. Berban, supt. The executive office of the company is at No. 128 Gravier street.

A New North River Cable Laid.

A NEW seven wire cable has been laid this week for the Gold and Stock Telegraph Company across the North River. This cable has been laid directly across the river from the foot of Cortlandt street to Jersey City, in the track of the Ferry of the Pennsylvania Railroad. Heretofore the cables across the North River have been laid at Fourteenth street and from there as high up the river as Seventy-ninth street. This has been done because it was deemed impracticable to maintain cables so low down as Cortlandt street, on account of the large number of vessels anchoring in that locality. The laying the cables so high up the river has been a cause of great expense and difficulty to the telegraph companies, as it necessitated the construction and maintenance of from ten to twenty miles of extra land line to make the necessary connections.

It has been decided by the Gold and Stock Co. to make the experiment of maintaining a cable at the Cortlandt Street Ferry crossing, and if it should prove successful, most of the North River cables of that company and of the Western Union will eventually be removed to the lower section of the river. The saving which will result, if the experiment is successful, will be important, and warrants its being made.

It is understood that the Gold and Stock Co. have already made contracts for private lines in Jersey City, which will occupy several of the wires in the new cable, and they will undoubtedly all be taken up in a short time.

Automatic Complications.

MR. GEORGE LITTLE, inventor of the American Automatic Telegraph, advertises his United States Automatic Patents (37 in number) for sale. He claims that the Automatic Telegraph Company, having failed to fulfil its contract agreements with him, has forfeited any right it has had heretofore to ownership or control of said patents, and that, under the terms of his said contract, the ownership of the patents has reverted to him.

The Great Northern Telegraph Company.

THE annual meeting of the Great Northern Telegraph Company took place at Copenhagen on the 28th of April. During the past year no extensions of the European cables have been made; efforts have been confined to thoroughly consolidating the undertaking, and otherwise utilizing the resources at the company's disposal. Two cables had been broken, one of which (France and Denmark) had only recently been repaired. All cables are now in a most satisfactory state. The Danish Government lines had been improved and rebuilt. Sir Wm. Thomson's recorder was the instrument now employed on all lines between England, Denmark and Russia, and the speed had thereby been considerably increased. The European traffic statistics show an increase of 27 per cent. on the work of 1873, viz:

	Francs.
1874.—722,386 Messages, valued.....	2,332,568
1873.—536,206 " "	1,840,496

Increase..... 492,072

A school for theoretical and practical education had been established at Tabor, near Copenhagen, and a pension fund for the staff of the company started. It now counted 150 members, who contribute three per cent. of their salaries, and the company a like amount.

Interruptions to the China and Japan cables had been few compared to the previous year. The land lines were in good condition, and extensions in China were being cultivated. The increase of traffic over this section of the company's system, as compared with 1873, equalled 38 per cent. The dividend for the year was fixed at 7 per cent.

Electricity and the Arctic Expedition.

It appears, says *The Telegraphic Journal*, of London, that in the Arctic expedition "electricity" will not be forgotten, for experiments are to be made with regard to the electrical state of the atmosphere. Sir Wm. Thomson supplies his well known "electrometer," and other instruments will be used. Spectroscopes are provided for observation of the aurora; and the employment of batteries for obtaining comparison spectra being out of the question, a Gramme machine has been provided to produce the necessary current of electricity.

Experiments with a Multiplex Automatic Apparatus.

THE *Independence Belge*, of April 16th, states that a telegraphic apparatus presented by Mr. W. C. Barney, an American, for multiplex automatic transmission, was tried on the telegraphic lines of Belgium from the 14th to the 25th of March last.

An engineer of the government telegraph department of Belgium in an official report gives the following statement of two experiments made with this apparatus:

"The 16th of March at half past five P. M. I transmitted communications simultaneously from Brussels to Anvers (Bourse) and to Liege. M. Barney, who was at Anvers, informed me that he received well; an agent of M. Barney, who was at Liege, telegraphed me that the communication was received there also, but in feeble characters.

"The 18th of March the trial was repeated. I was at Anvers (Bourse) on this occasion with M. Barney. The son of the latter transmitted from Brussels. We received at Anvers a legible despatch, and Liege announced to us that he also received well. These two

attempts did not continue a long time. The speed was from 300 to 400 words per minute."

This second experiment has been even more satisfactory than the first.

The Belgian official expressed the wish that he had had an official of the technical service at each of the three apparatus, that the efficiency of the system of Mr. Barney might be definitely determined upon.

It is to be hoped, says the *Independence Belge*, that these experiments may be continued, for the apparatus which has so far given good results appears to contain the solution of a telegraphic problem of incontestable importance.

Revision of Rates for Government Messages.

It is stated that Postmaster General Jewell will in a few days invite representatives of the principal Telegraph Companies to meet him in Washington for consultation, with a view to a rearrangement of the telegraph rates charged the Government. The Government now pays one cent per word, including address and signature, for each circuit of 250 miles.

A Noted Telegrapher in Trouble.

FIVE men recently attempted unsuccessfully to rob the office of the Texas Express Company at Willis Station, Texas, on the International and Great Western Railroad. Four of them were captured, among them Charles Ellsworth, John Morgan's telegraph operator during the war.

Telegraphic Apparatus in the Sixth Cincinnati Industrial Exposition.

THE managers of the Sixth Cincinnati Industrial Exposition have very sensibly placed telegraphic apparatus and supplies in a class (department K, class No. 60,) by themselves. In this class the following premiums are offered: For the best system for simultaneous transmission of two or more messages over same line (in operation); best system for Automatic Telegraphy (in operation); best system for Fire Alarm Telegraph (in operation), each a gold medal.

For best system for Private Line Telegraph (in operation); best system transmission of musical sounds by electricity; best system Automatic Fire Alarm Telegraph (in operation); best system telegraphic railway signals; best system for adaptation of the telegraph to domestic use; best fire alarm signal box; best display of instruments and supplies; best instruments for quotations, each a silver medal.

Best galvanometer; best telegraph battery; best electric light; best electric hotel annunciator; best box relay, key attached; best pocket relay magnet; best Morse register; best single cut-out; best switch for from four to twenty wires, each a bronze medal.

Best telegraph set, (key, sounder and relay); best electric magnetic motor; best magnetic watchman's clock; best printing instrument for private lines; best dial instrument for private lines, each a silver medal.

Best coil wire; best sample office and magnet wire; best submarine cable; best air cable; best amateur instrument; best insulator; best electric gas lighting apparatus; best burglar alarm; best electric clock, each a bronze medal.

The Exposition will be open for the reception of articles from Monday, August 2d, to Tuesday evening, September 7th. Open to the public from Wednesday, Sept. 8th, to Saturday, Oct. 9th.

A Missing Telegraph Operator.

GEORGE WOODWORTH TOWNSEND mysteriously disappeared from Terre Haute, Indiana, on the 24th of January, 1874, since which time all trace of him has been lost. He was an operator and railway clerk; had worked for the L. S. and M. S. R. R.; had filled the position of train despatcher on the Flint and Pere Marquette R. R., and at the time of his disappearance was station agent of the E. T. H. and C. R. R. at Clinton, Indiana. No cause is known to exist why he should secrete himself.

His description is as follows: About 25 years of age; 5 feet 7 to 8 inches high; slender, but probably has matured; bluish gray eyes; fair complexion; regular features; straight nose; slightly projecting teeth, with space between the upper front teeth.

Any information of his whereabouts or fate will be gratefully received by his widowed mother, Mrs. Lucy S. Townsend, Sturgis, St. Joseph Co., Mich., or Lonergan & Thiel, St. Louis, Mo.

What Telegraph Wires are For.

AN interesting incident occurred last Wednesday on the visit of the Indians to the White House. A year ago, when a telegraph wire was erected at the Cheyenne

River Agency, the home of Lone Horn, he objected strenuously to it as a mysterious innovation on the red man's rights. The agent explained to him the use of the wire, and when the telegraph apparatus came took him to see it in operation, and told him whenever the little key clicked the sound ran along the wire till it reached the great father's ear. This incident and the explanation passed out of the recollection of the agent, but in the memory of the savage it was written down as one of the great wonders of his experience, and when he went to the White House the other day he traced the wires along the streets and insisted on seeing whether or not the agent had deceived him when he said they ran into the great father's ear.—*Washington Correspondence Chicago Inter-Ocean.*

What the Telegraph Did for Adam.

OF all the freaks of the telegraph, this is one of the most laughable: A young man, when about to start for his new parish, was unexpectedly delayed by the inability of his Presbytery to ordain him. In order to explain his non-arrival at the appointed time, he sent the following telegram to the deacons of the church: "Presbytery lacked a quorum to ordain." In the course of its journey the message got strangely metamorphosed, and it reached the astonished deacons in this shape: "Presbytery tacked a worm on to Adam." The sober church officers were sorely discomposed and mystified, but, after grave consultation, concluded that it was the minister's facetious way of announcing that he had been married, and accordingly provided lodgings for two instead of one.—*Scotch Paper.*

Scene on No. 2 West.

"Ra" in "H. S" to "J." in "N. J." (who having "taken in" a few numbers of *The Operator*, fondly imagines himself to be a full fledged electrician)—"Is on to 3?"

J.—"Dunno."
Ra.—"Try me on No. 3."
J. does so and reports.
"Line dead open. Reverse your local and it will come O. K."

J. is surprised to find that his brilliant remedy does not have the desired effect, and "Ra" begins to cultivate (and express) a profound contempt for "J.'s" scientific knowledge.

A country, M. D., coming to Indianapolis, Ind., was confronted with a telegram received from him to disprove an assertion of his. Said he, "That's not the one I sent. Its not my handwriting, besides, I wrote it with a lead pencil."

Quotations of Telegraph Stocks at N. Y. Stock Exchange,

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, P. O. Box 5503, New York City.

For the week ended June 1st, 1875, and bearing that date.] 163,915.—STATIONS FOR SUBMARINE TELEGRAPHS.—Robert F. Bradley, Moffetsville, S. C. [Filed Mar. 29, 1875.]

In ocean telegraphy, a station for placing intermediate points in communication with the land termini, constructed of a hollow sectional column which is supported on a universally jointed base-plate, and anchored, by stay-chains or cables, to bottom stay-plates secured by stakes, for carrying the branch cable from the main cable to the surface, substantially as and for the purpose set forth.

163,923.—DUPLEX TELEGRAPHS.—M. Gally, Rochester, N. Y. [Filed Feb. 9, 1875.]

1. The combination, with the main line, of a branch containing both the receiving instrument and a magnetic key or switch for connecting main line with battery, or for breaking its direct connection with ground, substantially as specified. 2. The combination, with circuit D, having a magnetic switch therein, of circuit A A', the one being open while the other is closed, and vice versa.

3. The combination, with the main line, of sub-line A' and switch f, for cutting out the main battery when not in use for transmitting, substantially as specified. 4. A receiving magnet, provided with ordinary electro-magnet or magnets, and an additional magnet or magnets, all acting upon the same armature-lever for equalizing its stroke under different conditions of currents, substantially as specified. 5. A compound electro-magnet, consisting of a number of cores and helices, a part of which are stationary, the armature being adjusted to them by means of a spring, the others being in themselves adjustable, to be moved to or from the armature, substantially as specified. 6. An armature having magnetic extremes and non-magnetic centre, the extremes to be affected by electro-magnets as a polarized armature, and the centre as a common armature, substantially as specified. 7. The combination, with the main line passing through one or more of the magnets of the receiver, of the compensating circuit passing through the same magnet or magnets, and also through another magnet or magnets not affected by the main line current, but all acting upon the same armature lever, substantially as specified. 8. The combination, with a main line and its battery, of one or more circuits, each having a section of union with the main line, and an independent battery maintaining intact its own circuit current, the magnetic or neutral condition of each section of union changing with any change of the direction of the main current, substantially as specified. 9. The method of reducing the resistance of a wire or helix to a given current, by passing through it, in whole or in part, the current of another circuit or circuits.

163,924.—ELECTRIC MOTORS.—Charles J. B. Gaume, Williamsburgh, N. Y. [Filed May 1, 1875.]

The frame or box armature E, made with four, more or less, plain or concaved sides, having half-round or square enlargements formed upon their outer or inner surfaces, substantially as herein shown and described.

164,031.—ELECTRIC SIGNALING AND RECORDING APPARATUS.—William J. Phillips, Philadelphia, Pa. [Filed April 28, 1875.]

Arranged so that a watchman may send in a signal to central office, announcing his visit to any post, and at the same time register by suitable devices the time of the visit upon a dial in the box, all in an ordinary district alarm system.

1. The combination, with an electric signaling or alarm mechanism, of a recording mechanism, for registering at the transmitting station the time of transmittal of a signal therefrom, substantially as set forth. 2. The double-faced signal-box, provided with the signaling mechanism and the clockwork register, substantially as set forth.

3. The combination, with the circuit breaking wheel and motor train thereof, of a pencil or other marking point of a registering mechanism and suitable connecting devices, substantially as set forth. 4. A double-faced signal-box, provided with the flanges R S and bolts U, substantially as and for the purposes set forth.

5. In the registering mechanism, the pencil-arm M, composed of the rigid parts m m', united by a spring slip or piece, n, substantially as and for the purposes set forth. 6. The combination, with the arm M, provided with projection e, of the standard Q, provided with beveled upper edge or end, substantially as and for the purposes set forth.

REISSUE.

6,476.—CIRCUITS AND CIRCUIT-CLOSERS FOR RAILWAY SIGNALING APPARATUS.—H. W. Spang, Reading, Pa. Patent No. 142,131, dated Aug. 26, 1873. [Filed Nov. 10, 1873.]

1. The combination, in a circuit closer, breaker, or changer, operated by a suitable pressure device, of an insulating foundation, having metallic conducting pieces arranged thereon, and a metallic roller or rollers for electrically connecting the same, substantially as set forth. 2. The metallic plates or rails O O' O² or O³ O⁴ O⁵, or O⁶ O⁷ O⁸ O⁹, in combination with the insulating-plate N, guide rod P, sleeve Q, roller head R roller or rollers R', as and for the purpose set forth.

3. The combination of curved spring or yielding pressure bar E, detached lever C, and a circuit-closer having an insulated foundation with metallic roller or rollers, for electrically connecting the same for closing an electric railway signal circuit, as set forth. 4. The combination of electro-magnets T¹ T² T³, armature lever U, armatures U¹ U², and springs V² V³, one or both, substantially as described.

5. The combination of the two lines of rails a a' of insulated section A of railway track, electro or relay magnet T² T³, controlling a secondary circuit and electric railway signal apparatus, and connected with said lines of rails at one end of said section of track, and a circuit closer, and breaker, and battery, located beyond the opposite end of said section of track, and connected with said lines of rails thereof at said opposite end, as and for the purpose set forth.

6. The combination of electro-magnet T¹ T², battery Y, and circuit closer and breaker B with electro-magnet T² T³, connected with lines of rails a a' of insulated section A of railway track at one end thereof, and battery Y' and circuit closer and breaker B', located beyond and connected with said lines of rails at the opposite end thereof, as and for the purpose set forth.

7. The combination of an insulated section of railway track, the respective lines of rails of which are in continuous metallic connection, an electro-magnet having its terminals connected respectively to opposite lines of rails of said section at one end thereof, a galvanic battery having one of its poles connected to one line of rails of said section at the opposite end thereof, and its other pole connected with a circuit closer, which is electrically connected with the other line of rails at said opposite end of the section, substantially as and for the purpose set forth.

Married.

MASON—WILSON.—At Moberly, Mo., June 8th, 1875, Mr. JOHN Q. MASON, Manager Western Union Telegraph Company, to Miss VIRGINIA M. WILSON, of Moberly.

"Married! it is not so; thou hast misspoke, misheard, It cannot be; thou dost but say 'tis so!" Our heartiest congratulations, JOHN.

Born.

BROWNSON.—To the wife of H. L. BROWNSON, Train Dispatcher K. P. R., at Ellis, Kansas, a son, June 18th, 1875.

20 PER CENT. REDUCTION IN THE PRICE OF TELEGRAPH INSTRUMENTS!

SEE WHAT IT MEANS.

On First-class Morse Sets for Railway and Commercial Lines:

- No. 1 Relays, of standard size and resistance (120 to 150 ohms), on rosewood bases, fine finish, polished rubber covered coils, wound either with our patent glazed or with best silk covered pure copper wire, having soldered connections and firm nut fastenings throughout, and latest improved extension adjustments. Regular price, \$16, reduced to - - - - \$12 80
- No. 1 Relay, same make throughout, but of higher resistance, 160 to 600 ohms. Price, \$18, reduced to - - - - \$14 40
- No. 1 Relay, ditto, low resistance, 60 to 100 ohms. Price, \$15, reduced to - - - - \$12 00
- No. 1 Sounders—"Railroad" or Bunnell's "New Giant" Sounders, with all the latest patented improvements in both. The best forms of Morse sounders ever invented. Beautifully finished. Mounted upon rosewood bases. Price, \$7 50, reduced to - - - - \$6 00
- No. 1 Keys, Catou pattern, curved levers. Price, \$6 50 reduced to - - - - \$5 20
- No. 2 Keys, W. U. pattern, curved or straight levers. Price, \$5 50, reduced to - - - - \$4 40
- No. 1 Premium Register, \$45, reduced to - - - - \$36 00
- " " Spring Register, \$47 50, reduced to - - - - \$38 00
- " 2 Register. Price, \$38, reduced to - - - - \$31 40

Box Relays, Combination Sets, Pocket Relays, Switches, Cut Outs, Lightning Arresters, etc., furnished at the same rate, viz., 20 PER CENT. REDUCTION from regular prices. See catalogue.

SINGLE SETS, OR PARTS OF SETS, WILL BE SENT BY EXPRESS AT THESE PRICES TO ANY PART OF THE U. S., ON RECEIPT OF MONEY ORDER OR DRAFT FOR THE AMOUNT OF THE BILL.

Superintendents and others about to purchase first class equipment for offices will readily see by a comparison with other price lists the advantages here offered to those who send their orders to us.

No. 2 SETS.

LEARNERS' APPARATUS, SHORT LINE INSTRUMENTS, Etc.

- No. 2 Relays, 150 to 175 ohms resistance. Price, \$15, reduced to - - - - \$12 00
- No. 2, Relays, 50 to 100 ohms resistance. Price, \$11, reduced to - - - - \$8 80
- Pony Relays, complete and pretty little instrument for short lines, city wires, etc., \$7 50, reduced to - - - - \$6 00
- No. 2 Pony Sounders, \$6 50, reduced to - - - - \$5 20
- No. 3 Pony Sounders, \$5 50, reduced to - - - - \$4 40
- No. 1 Main Line Sounders for lines from 1 to 6 miles in length. Price, \$8, reduced to - - - - \$6 40
- No. 2 Ditto, \$7, reduced to - - - - \$5 60
- No. 3 Keys, curved levers, Catou style, same as No. 1, but smaller. Price, \$5, reduced to - - - - \$4 00
- No. 4 Keys. Price, \$4, reduced to - - - - \$3 20
- AMATEURS' KEY, \$3 50, REDUCED TO - - - - \$2 50
- EXCELSIOR AMATEUR INSTRUMENTS, \$6 50, REDUCED TO - - - - \$5 20
- BUNNELL'S LEARNERS' INSTRUMENTS, PERFECTED, \$6 50, REDUCED TO - - - - \$5 20

At the above figures all grades of Telegraph Instruments may be obtained from L. G. TILLOTSON & CO. for less money than will buy as good materials at any other manufactory in America.

Orders, correspondence and inquiries will receive prompt attention. Make your memoranda of amounts for what you want from the above price list, and enclose the sum to us by postal order or draft along with your order for goods.

Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor. We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

The Late Man's Lament.

TEN o'clock has come and gone
And still I linger here,
Patiently awaiting for
Webster to appear.

Of course he will not come
"Till the town is still and dead,
And every other honest man
Lies snoozing in his bed.

I wonder what he'll find
Be idle that wrestling match?
Its wonderful the items
His active brain does hatch.

"V. C." wants to go home;
Says, "tell h m cut it short."
Ble-s me if it's pl asant,
This wait'g for "report."

"Madame Rumor" and "The Coroner"
His never failing source
Of items for the rural press,
And we get stuck, of course.

His footstep on the stairs,
With his number thirteen shoes;
Sweetest music to my ear,
For it drives away the blues.

He's coming with the "figures;"
This is long enough I think;
I'll stop it for the present
And go and take a drink.

Fifteen Years' Telegraphic Progress.

BY A DOWN EASTER.

WHEN we take a retrospective view of the progress of telegraphy during the last fifteen years, in its scientific and practical aspects, even those of us who are most familiar with the facts can hardly fail to be greatly surprised at the actual advances that have been made in almost every particular.

In 1859—it is difficult to realize that sixteen years have elapsed since then—the writer was employed as an operator in one of the principal offices in the interior of New England, and has ever since been more or less intimately connected with telegraphic interests. At that time four distinct systems of telegraphy were in use in that section of the country. Telegraphy had become quite familiar to the public and had fairly entered upon the era of development and extension which has brought it to its present position as one of the leading and most important interests of the country, the world, and the age. As it is not intended to make this a review of general telegraphic progress, but merely of the section of the country included in the New England States, its scope will be somewhat restricted. To review telegraphic progress and development throughout this country and the world would require more labor and space than can well be spared at the present time. Within that time submarine or ocean telegraphy has been practically originated and developed, and been extended until even the most distant and widely separated countries and places have been telegraphically connected, and the old and new world bound together by electric cords, which are gradually making the whole world, in effect, but one community.

But to return to New England and its systems of telegraphy. The telegraphic business was transacted by the American Telegraph Company, which did perhaps the largest share of the business between New York and Boston, employing the House and Combination Printing Telegraph instruments exclusively upon their lines. The "House Wire," running on the turnpike via New Haven, Middletown, Hartford, Springfield and Providence, was divided into two sections (everything being re-written at Springfield), and was kept working almost constantly day and night at a high rate of speed. The Associated Press reports were mainly transmitted over the House circuits, amounting frequently from 15,000 to 20,000 words per day, and this, with the commercial business transmitted over it, would be considered very great service even at

this day. The best operators to be had were employed, and necessarily so, when the condition of the wires used is taken into the account. Salaries, however, were much less than is now paid to first class operators, but this was "before the war." All business between Boston, Albany and the West by this line was also repeated at Springfield.

The New York and New England Union Company, which had before this time absorbed the lines of the New York and Boston Bain Company, had five wires between New York and Boston on which the Morse system was worked (principally by means of Palmer and Hall's antiquated and boxed up registers and humpbacked keys), and was the competitor of the American Company. Receiving by sound was at that time not generally practiced, although at rare intervals some office would be equipped with an old fashioned "sounder." These, I recollect, used to sound precisely like a village blacksmith's shop in the distance. Receiving by sound was at this time usually regarded by telegraph managers and superintendents as rather a hazardous matter, and operators were generally required to let their paper run, even if they had become, as many of them had, quite expert in reading telegraphic signals by ear. As for the registers above spoken of, they were only to be compared with old Dr. Beecher's meeting-house bell, which he used to say sounded like a fur cap with a sheep's tail for a clapper!

The competition between the "House" and "Union" lines, as they were generally termed, was quite active and bitter, and scant courtesy was shown to each by either, though most of the operators and employes were usually on very good terms personally, but personal relations were not allowed to interfere with their devotion to the interests of the companies they served. In that day, when the telegraph business was, compared to what it is now, of limited amount, and the lines were divided up among numerous companies, each of whom covered but a relatively small extent of territory, more direct personal interest was felt in the prosperity and success of their respective companies by the employes than is the case now, when the business is conducted by mammoth corporations, when receipts and expenditures amount up into the millions, and whose employes are numbered by thousands. At that time faithful employes were granted vacations, relief operators and clerks provided, etc., which have since, perhaps necessarily, become obsolete. The employes of the "Woodpecker" (Morse), "Dye Tub" (Bain), and the "Coffee Mill" (House) lines were loud and earnest in advocating and defending their favorite systems, and not always scrupulous in decrying the merits of competing lines and systems. But, business aside, they were usually hail fellows well met out of business hours, and ready to join each other either in religious, or I regret to say, not unfrequently in less commendable pursuits.

Northward, through Vermont and New Hampshire, ran the "old reliable" Bain line, or "Dye Tub" telegraph, as Jack Selden used to call it in contradistinction to the "Woodpecker" telegraph of the Union line. I believe that this line continued to run the Bain system for nine years after it had been abandoned on all other lines, to be ultimately revived only in the automatic telegraph system. The "dye tub" offices were equipped with horizontal turn table registers and old fashioned sand batteries; and it never seemed to make much difference to them if their line was on the ground for a mile or two, and a heavy rain prevailing.

Occasionally a long continued northeaster would come up and stop all communication between New York and Boston for hours, and the way business was delayed and the patrons of the lines humbugged was something which would not be submitted to at the present time. As the telegraphic poet of those days (the fraternity has never lacked the poetic or rhyming element in its ranks) had it:

Little that indulgent public
Knows how they are skinned alive;
We know better how 'tis managed—
"Package by express at five!"

Science, as applied to telegraphic construction, had not made very material progress in the days of which this is written. The lines were of ungalvanized and very rusty wire, and nobody suspected what unnumbered "obms" were snugly packed away in the complicated snarls that amateur line repairers were wont to construct under the impression that they were making a "splice." Then anybody who could twist two ends of a wire together was considered a fully competent line repairer, and operators took turns with office boys, battery men, volunteers and office frequenters of small occupation in driving out to repair lines when the wires were down.

The office fixtures and apparatus now so familiar to the telegraphic fraternity, and considered indispensable to a proper working of the wires, were then almost unknown. Switch-boards and lightning arresters were but just beginning to be talked about, and were

generally considered by the telegraph superintendents and managers who had heard of them as new fangled and useless notions. The use of switch-boards on the New England lines seems to have started in Boston, which was then the headquarters for scientific telegraphy for the United States. Mr. George F. Milliken, who was in 1860 promoted to the managership of the Boston office of the then American company, in which he has been continued by the American and Western Union administrations to the present time, and to all appearances is destined to live and die as the occupant of that honorable and important position, was a great hand at getting up switch-boards, repeaters, etc., and many of his ideas, such as the spring and wedge arrangement for connecting instruments to the line, are now used everywhere. He was also the first telegrapher in this country who ever made use of a galvanometer for regularly testing lines. He had a tangent galvanometer in use in the Boston office for this purpose even at that day, which was really the beginning of the era of civilization in American telegraphy.

In 1859 the American and Union lines were consolidated. Consolidations had not then become so familiar to the telegraphic mind as since, and this was one of the most important which had then taken place. It naturally made much uneasiness and conjecture among the employes, and, as a consequence of it, more changes took place than had been experienced on New England lines for many a day. The employes of the Morse or "Union" line, were for a time much chagrined that they could not take the leading position in the consolidated company, and for some time after the offices were brought together under one management there was much rivalry as to which (the Morse or Printing circuits) should do the most and best of the business. This, however, gradually died out, and ere long each was willing the other should do the work and receive the honor therefor—what there was of it. For reasons which it is not necessary to consider here, but which it should be said had nothing to do with the "speed, accuracy and reliability" of the printing telegraph instruments, the number used was gradually reduced, only two through wires being equipped with them at the present time.

Within the three or four years succeeding the consolidation of the American and Union lines, a number of new wires were put up over routes hitherto unoccupied, and many ladies were placed in charge of the minor, and occasionally one or two made their appearance in the larger offices. This innovation caused a good deal of excitement and angry discussion for a time, which seems quite laughable now, in view of the severe "going over" experienced by that defunct, but uneasy in his ghostly ceremonies, correspondent of THE TELEGRAPHER, "Nihil Nameless," received for his comparatively mild and gentlemanly heresies on that question. It soon became evident to impartial observers that, whether for good or otherwise, the female element in telegraphy had "come to stay," and it must be conceded that the dreadful effects which many of the masculines so fearfully anticipated have not been realized. The telegraphic field is large, and constantly being extended, so that the number of sisters who have thus far devoted themselves to telegraphic pursuits have not, so far as I can perceive, very seriously crowded the brothers similarly employed.

New and greatly improved patterns of Morse instruments began to appear on American lines about these days, from the establishment of Mr. G. M. Phelps, then located at Troy, N. Y., before that time principally known as the manufacturer of House printing telegraph instruments, and as the inventor or arranger of what is known as the combination printer, combining the House and Hughes inventions in what was practically a new instrument. The keys from Mr. Phelps' shop had straight levers, while the registers and sounders were of a style that will be readily recognized from the description of a witty young lady in one of the Connecticut offices, who called the registers "mud turtles," and the sounders "flat irons."

Between 1862 and 1864 the Grove batteries, which had been used for main wires from the very beginning of telegraphy in this country, and had been generally regarded as the only battery adapted to such use, were replaced by the carbon bi-chromate battery, and the Lefferts plug insulators took the place of the almost infinite varieties that had hitherto prevailed. During the time that General Lefferts occupied the position of engineer and general manager of the consolidated American company, the character of the lines, the arrangement of offices and the general conduct of the business was systemized and vastly improved, and the lines between Boston and Washington were, all things considered, superior to any in the country.

Another consolidation in 1866 threw the whole system into the hands of the Western Union Company, and a new set of officials came into power, whose fixed principle of procedure seemed to be to upset everything that had been done by the American Company's employes. The Grove battery was again restored to favor, and instead of working the lines by separate batteries, a reform which General Lefferts had

finally brought about, everything was crowded upon one battery in each large office. The resistance of the relays was cut down about two thirds, the division electrician, whose scientific and practical attainments were of a singular and wonderful character, being possessed with the brilliant idea of doing all the telegraphing by "quantity" instead of "intensity" electricity, as heretofore. His theory was, as near as it could be understood, that there are two kinds of electricity, "quantity" and "intensity," and that his predecessors had ignorantly used the latter instead of the former to work the lines, an error which it was his mission to demonstrate and correct. This spasm of science run mad did not last long, however, as might have been foretold, but the experiments and changes made were a source of great tribulation and mental disquietude to the office managers and district superintendents who were ordered to carry them out, and whose experience and ability were loftily and quietly ignored.

The introduction of the gravity battery, and of the duplex and quadruplex instruments is so recent that it is hardly worth while to occupy time or space in recapitulating their history. But it is not a little curious to look back even a very few years and note the changes that have taken place in the "way things are done." While all change is not necessarily improvement, as is evident from the instance above referred to, yet it is undeniable that there has been very great improvement in working telegraph wire and in conducting telegraph business in the last fifteen years. This has been to a great extent necessitated by the increase and development of the business, and whatever improvement has already been effected, it is probably safe to assert that the *ultima thule* has not as yet been reached. There is still less of science applied to the construction and operation of lines and instruments than there should be. Probably the cost of doing the business could be materially reduced—and the reliability of wires and apparatus considerably increased—by the better and more general application of scientific principles, as well as practical experience thereto. The class known in Europe as electrical and telegraphic engineers, is not recognized in this country, but that there should be encouragement extended to electricians to perfect themselves in the science as applied to telegraphy is unquestionable. Many of the telegraph managers and even practical telegraphers are given to regard somewhat incredulously the suggestion that science can be a saving element in telegraphic cost, but without science but little real progress or improvement is possible. In the earlier telegraphic days of which I have endeavored to treat briefly and locally, there are yet many who were then engaged in telegraphic pursuits, some of whom are yet in the service, that will bear witness to the crude and usually erroneous guessing upon which the construction, equipment and operation of telegraph lines and apparatus were conducted. The wonder is not that we were then unable to accomplish more, but that we really did accomplish so much. It is safe to say that any telegraph company whose business should be thus managed at the present time would speedily become bankrupt. Marked and essential as has been the improvements already effected, much more yet remains to be done, and the necessity for the services of intelligent, educated and experienced electricians and telegraphers, is not likely to cease, at least during the present century.

Telegraphic Signals.—How Trains are Run through Bergen Tunnel.

It is claimed by the managers of the Erie Railroad that the system of signals in use at their tunnel through Bergen Hill is the safest and best that is in use at the present day for the running of trains through a tunnel. A visit to the east end of this tunnel, and an examination of the machinery and its workings, will at once show the spectator that all the care possible is taken to prevent accidents of any sort. The electric signals by which this plan of running trains is carried out, are connected by insulated wire or covered wire running over the hill, thus making the connection between the two signal houses which are at each end of the tunnel. In each of these houses is an electrical signal machine, which is so arranged that when the key is closed at one end of the tunnel, the bell strikes four times at the other end, and by this the signal man knows that a train has just passed out at the other end all right, and that he can let in another. It is a rule that two trains shall not be let into the tunnel at one time on the same track, and that on the rear of each train must be a red light, and the signal man, whose duty it is to send back the signal "All right!" must see that the train had such lights on the rear of the car when it passed by the signal house. In a busy time the two roads that use this tunnel, the Erie and the D., L. and W., often run as many as 300 trains through in a day, and it is often the case that two trains bound west come up to the mouth of the tunnel, or the place where they are all

obliged to stop before going in, at nearly the same time, and the train that stops first has the right of way in the tunnel, the other not being allowed to start in until the one preceding it has been signalled back as having passed through all right. Should a train be gone over fifteen minutes without being signalled back as all right, the waiting train will be sent in with a note to the signalman at the other end to send back two signals when the last train passes him, and he is also cautioned to look out and to proceed in a cautious manner. It takes on an average about six minutes for a train of ordinary length to go through. Should any accident happen to a train in the tunnel it is the duty of the conductor to send a man back with torpedoes and a lantern to signal trains of danger ahead. Should two trains be let into the tunnel with an interval of fifteen minutes, and no signal of their safe arrival be sent back to the end from which they started, no more trains would be let in until a man had walked through the tunnel and back, and seen that no obstruction was in the way. So that if a train should break in two in the middle while in the tunnel there would be no accident, if all hands did their duty. The way in which trains are signalled from the houses during the day, is by a large wooden circle, which is on the top of the signal house, it standing with the white side visible when a train is in the tunnel, and the red one when "all's well." In the night a red and white light is used in its place. It takes twenty cups of an ordinary battery to keep the thing in working order, and Mr Conklin, the superintendent of the tunnel, who has held his present position for the last six years, is always there during the day time, and it is mainly through his exertions that the present system of signals used here is so perfectly managed. The tunnel has two tracks through it, and the same rules apply to the one track as well as the other, as there is no rule prohibiting the running of the two trains through on different tracks at the same time, but trains must always take the right hand track in going through. The signalman knows by the number of strokes of the bell just what has transpired at the other end, and he signals the engineer accordingly.—*The Evening Journal, (Jersey City, N. J.)*

The Electric Light for Light-Houses.

THE report of Major Elliott, of the engineer corps who was sent to Europe by the Government last year to procure information respecting the light-house systems of England, France and other countries, contains much interesting information in regard to the application of the electric light for that purpose. There are several such lights now in use both in France and England. The most powerful which has been yet constructed is at Souter Point, between Sunderland and the Tyne. The lens is 39.38 inches in diameter, surrounded by eight panels of vertical condensing prisms, which in their revolution give flashes at intervals of one minute. The apparatus covers the sea horizon or 180°, the light being visible for twenty miles.

Two electric lights are situated on the South Foreland, three miles from Dover. These are 1,000 feet apart—one being 372 and the other 275 feet above sea level. The electric current is generated by means of large magneto-electric machines, two being provided for each light, though one only is used, except in very thick weather. These are driven by a steam engine, and all parts of the machinery, including boilers, are kept in duplicate. Each machine is composed of 96 helices, mounted upon 6 gun metal wheels, each having 16 helices. "Between" wheels are placed the magnets, 8 in each division, 40 of which are composed of 6 layers or leaves riveted together, and 16 with only 3 leaves or layers. The magnets are stationary, the helices being made to revolve at the rate of 400 revolutions per hour. The actual power required to work one machine is 6 indicated horse power. Coke is used for fuel, and about 56 pounds are consumed during the night.

Each of the 6 plate magnets will lift a weight of 108 pounds, and each 3 plate magnet will lift 54 pounds, so that the attractive power of one machine equals 5,184 pounds, the total weight of all the magnets in one machine being 2,088 pounds. The machines are connected with the lamps by means of underground cables. Each lamp contains two pieces of carbon about ten inches long by three eighths of an inch square. They are made from coke dust and are consumed at the rate of 34 inches per night for each light at a cost of one penny per inch, exclusive of waste and breakage. They are moved toward each other by means of automatic apparatus, and the only danger of irregularity of the lights arises from the presence of foreign matter in the carbons. This, however, is instantly corrected. Here the rear light is utilized by means of totally reflecting prisms to reinforce the front light, which, like that at Souter Point, is required over a range of 180° only. Both lights are fixed, the lenticular apparatus being of the usual description, and made by Chance Brothers & Co., of Birmingham. The power of each

beam is estimated as equal to 180,000 candles, and Major Elliott states that when he observed them from Dover, a distance of three miles, they threw a very distinct shadow from objects on the pier. The annual cost of a single light of this description in England is about £800—say \$4,000, which is double that of a first order single oil light station, while the light produced is between six and seven times that of the most powerful lens with the 4 wick Douglas oil burner.

At the time of Mr. Elliott's visit there were in England the two fixed electric lights at South Foreland, the revolving light at Souter Point, and a fixed light at Dungeness; in France two fixed lights at La Héve and a revolving light at Grisez; in Egypt a revolving light at Port Said; and in Russia a fixed light at Odessa. These were all the electric lights then in use, but we believe more have been decided upon, if not introduced in Great Britain, and more are contemplated in France. No other nations had adopted them.

M. Quinette de Rochemont, Engineer des Points et Chaussées, has written an interesting account of the French light at La Héve. The light-houses there were lighted for the first time in 1774. At that time wood fires were used. In 1810 lamps were introduced, with reflectors. In 1845 the reflectors were replaced by dioptric apparatus; and electricity was substituted for oil tentatively in 1863 and definitely in 1865.

The plan now in operation at La Héve is very similar to that at South Foreland. There are 6 plate magnets of a power of 145 to 155 pounds, and some 3 plate magnets with a power of 75 pounds. The carbon points are manufactured from graphite, the residue contained in gas retorts. They are ten inches long, and from one third to one half of an inch thick. The optical apparatus is about one foot in diameter, and it sends the light tangentially to the surface of the sea. Many accidents, however, have occurred at La Héve. In one instance the lights were extinguished for the space of an hour, and much trouble has been experienced with the machinery, which is now placed in a more satisfactory condition. Of the cost of this light we have no data later than 1869, but it appears that the average of that and the four years previous was \$3 215.34, the total number of hours of illumination averaging 4,135 annually. The machines are started ten minutes before the time of illumination, so that the currents may be well established, and its light is exhibited fifteen minutes after sunset and extinguished fifteen minutes before sunrise. Double lights are produced whenever the fog is so dense that the keepers cannot see the beacon lights on the north pier of Havre, and this occurs during about eighty hours every year.

The disadvantages attending a general use of electricity are due chiefly to the large amount of space required for the steam engines and the magneto-electric machinery, for storing coal, coke, etc., and for collecting and preserving the water for the engines. The repairs needed require also special workmen, not usually found in the vicinity of light-houses. Consequently, the electric light can at present be made available only in certain localities. It would be disadvantageous in light-houses at sea, or that are not easily accessible, or those which are distant from centres of population. But where there is plenty of space, and where cities are within easy reach, their substitution for other lights is strongly approved by mariners.

Electrical Arrangement of the New Palace Hotel at San Francisco, Cal.

EVERYTHING is done in California on a mammoth scale. A new hotel is in progress of construction at San Francisco called the Palace Hotel, which, from the description, seems to be a veritable palace. It is the largest hotel in the world, and will contain 1,200 rooms, and everything about it is to be on a similar magnificent scale. The following description of electrical arrangements will be of interest to the readers of THE TELEGRAPHER:

There will be one electrical annunciator on each floor, containing from 120 to 160 numbers each, with its special service in constant attendance. Each room is provided with a push button, communicating with the office, also with an automatic thermostatic fire alarm, which, by a slight increase in the temperature of the room, rings the bell continuously in the office, and at the same time announces the room from which the alarm proceeds. There will be about 160 electrical clocks throughout the building, all governed by one regulator in the office. There are already about 120 miles of copper insulated wire running through the building from the different rooms to the main office. There will be seven annunciators in all the building, besides one small one in each elevator. Each floor has a tube receptacle for letters for the post-office. There is a pneumatic dispatch tube, by which messages and parcels can be instantaneously sent to any point on the different floors. The watchman's tell-tale indicator in the office faithfully reports the intervals of the watchman upon his regular rounds both day and night, and in other respects indicates the method and manner of his attendance to duty.

The Galvanic Battery.

In regard to the economical application of electricity, no subject is so important as the relative merits of different forms of batteries. For illuminating purposes and lecture demonstrations we have hitherto had to rely upon the Bunsen or Grove battery; but, during the siege of Paris, a form of bichromate of potash battery, known as the Chutaux battery, was frequently employed to yield the electric light used on the ramparts. Count Moncel gives a full account of the different forms of the Chutaux battery, and furnishes some interesting data for the comparison of the Chutaux and Bunsen battery when giving the electric light. The following results were obtained from the two batteries, each being composed of 48 cells, and each working for two hours:

BUNSEN'S BATTERY.			
Light equal to			Surface of zinc employed.
At beginning.	End.	Mean.	
109	66	87.5	318.61 square inches.
Carcel lamps.			

CHUTAUX BATTERY.			
Light equal to			Surface of zinc employed.
At beginning.	End.	Mean.	
132	63	97.5	92.88 square inches.
Carcel lamps.			

In working each of these batteries for half an hour successively, the following results were found:

	BUNSEN.		CHUTAUX.	
	Light equal to	Carcel lamps.	Light equal to	Carcel lamps.
1st period of half an hour....	109	66	132	63
2d period of half an hour....	Beginning 134	128	Beginning 134	128
	End 137	100	End 137	100
3d period of half an hour....	Beginning 106	80	Beginning 106	80
	End 97	51	End 97	51
4th period of half an hour....	End 66	63	End 66	63

According to these figures, the bichromate of potash battery flags much quicker than the nitric acid battery, a fact which evidently depends on the polarization of its plates, to which it is always liable. It is, however, more economical.

One rather important advantage of these batteries is that they can be kept in a closed place without giving out any odor or unhealthy emanation; besides this, the liquid evaporates slowly. The author had also been able to verify the statement that, after a battery had been charged for more than a year, and then left alone, it had hardly lost anything of its power. The relative consumption of zinc and acid and the comparative cost of working of the whole battery are not given; but so far as the foregoing data are concerned, the Chutaux evidently promises extremely well. So says the *Telegraphic Journal*. For lecture purposes an electric light is rarely wanted for more than half an hour, the great desideratum being a rapid means of charging and discharging the battery. In this respect nothing could be better than the Chutaux; being a single fluid battery, the plates can be raised and lowered easily and rapidly. One of the characteristics of this bichromate battery is the constant percolation of fresh solution through the battery; by this means a good deal of the bad effect of polarization is got rid of. Here is the composition of the solution of his batteries, recommended by M. Chutaux: Water, 1,500 grains; bichromate of potash, 100 grains; bisulphate of mercury, 50 grains; sulphuric acid, 200 grains. The electromotive force of such a cell is at first more than twice that of a Daniell cell, but in duration it cannot, of course, be favorably compared.

The cost of working the Chutaux, Count du Moncel finds to be about 35 cents, which he states is less than that of a Daniell cell, the advantage being that in the Chutaux an electro-motive force of nearly double is obtained, and an internal resistance less than half that of the Daniell, besides other obvious advantages noticeable in the working of the two forms. A battery of 24 Chutaux cells, according to our author, can furnish a rarely brilliant electric light at a cost of about 15 cents per hour.

What a Telegrapher Saw on a Railroad Trip.

TO THE EDITOR OF THE TELEGRAPHER.

WITH your permission I shall endeavor at this time to give the readers of THE TELEGRAPHER a short sketch of what I saw from the window of a westward bound passenger train on a trip from northern Ohio to one of our northwestern cities. I boarded the train and fortunately found an unoccupied seat. Before starting I had the pleasure of administering to the wants of an

elderly lady (who had secured a seat directly opposite me) by getting her silver cup filled with "hot tea," for which she kindly thanked me. Wonder if she was aware of rogues and their slippery ways when she entrusted me with that silver cup? She at once began lurching on fried cakes and cold viands, with the tea for a "washer," which no doubt assisted (?) the digestion of the fried cakes. Directly in front of me sat a lady and her little daughter. The latter, "traveling fashion," was almost constantly mincing some fruit or nuts, for which the newsboy, having a good assortment, was well patronized. The car was comfortably filled, and about one half of the passengers ticketed through. A seat in the front part of the car was occupied by a tall, slim gentleman, in a stiffly ironed duster. From his actions he seemed "stiff" in every respect. The seat back of me was occupied by a gentleman on his way to San Francisco, in whom I found a pleasant travelling companion. The train steamed out with fair prospects, but before proceeding very far the weather became quite threatening in appearance. On passing along through the suburbs of the city we started from the houses were left behind in quick succession—the fences looking like one blurred streak or mass.

The smaller villages were passed, leaving nothing but a current of air mixed with dust and smoke to mark our course. Our route was through a level country and in places quite thickly settled, but frequently could be seen "new grounds," with burning stumps, and the farmer with his team hauling together large logs, busily engaged in making his place look civilized. The farm buildings were mostly frame, but occasionally could be seen the more substantial brick dwellings, and frequently the old and original log mansions. Nothing, however, presented a richer or more beautiful appearance than the neat frame dwellings painted white, with their green window shutters. Very many farms had nothing but sheds for barns and stables. All along could be seen the industrious farmer cultivating the soil and preparing for the spring crops. Frequently could be seen men, women, boys and girls planting corn, while the smaller members, with the favorite feline or canine, were in adjacent fence corners making music by twisting the tail of the former or pinching the ears of the latter.

At almost every town along the route crowds of villagers were to be seen, some expecting a dear friend from a distance, while some were saying their last good-bye to those whom they would probably not meet again for years. Others, again, are found on hand at the arrival of every train, prompted by a spirit of idle curiosity. Such persons seldom have any calling. Their business, therefore, never detains them from their usual vocation of leaning against the depot buildings and fences to gaze. Here can be seen people of all classes, both in nature and disposition—the proud and naughty townsman and his less pretentious neighbor, the countryman. What a wide contrast in their appearance—the former with his airiness, and the latter with his faded attire and long weather-beaten locks. The latter the possessor of the real stamina of life, having money in his pocket, the former with all his possessions on his back.

Towards evening the storm which threatened us soon after starting burst upon us with all its fury, and it continued showery the balance of the journey. Frequently the sturdy farmer could be seen standing behind a large tree or shelter from the falling torrents (his team hitched to the fence near by) little thinking of the dangers connected with the bad practice of thus exposing himself to the elements with which we telegraphers deal daily without harm. In one field two wagons were standing with the horses unhitched and tied to the body of the wagon, while the drivers and their canine friend sheltered themselves by lying underneath. A passing glimpse into the houses would present the occupants engaged in various household duties, or grouped about the doors or windows waving their handkerchiefs or hats to the occupants of the passing train. In one house an aged lady (looking through her glasses) sat in an old fashioned spit-bottomed rocking chair, busily knitting—quite a contrast to the other youthful members of the family.

A couple of lassies on a country road with packages in their arms, who doubtless had been to the village store, attracted considerable attention by their fresh complexion and rosy cheeks. Two fishermen, with a small string of fish, seemed contented with their piscatorial excursion, as whistling they journeyed through the rain homeward. At one farm house a couple of girls were chasing two little calves into a corner of the lot. What their intent was will probably always remain a mystery—they might have been trying to get a "corner" on veal. Be that as it may, the performance was very amusing to the passengers.

A hasty glance into the telegraph offices at the different stations along the route revealed a neat and comfortable appearance—most of them being perfect models of neatness, with the latest improvements and conveniences for the transaction of business. Some of the manipulators of the key were "triting gerse" with a persistency worthy of better results, while others were

apparently (Micawber fashion) "waiting for something to turn up." Some with company were entertaining them—conversing freely and laughing heartily. Occasionally an "artist" with a telegram could be seen out in the crowd of passengers elbowing his way in search of the consignee. Others, again, were leaning or balanced in the window, looking at the crowd of people at the train.

As the train neared its destination (as is usually the case) a more social and friendly feeling manifested itself among the passengers, all wondering how it could be possible they did not get acquainted sooner—they would inquire of each other as to their destination, route, time, etc., required before reaching it. This would lead to the knowledge of some distant friend or acquaintance that one or the other knew or had heard of. In this way quite a friendly conversation sprang up and the remainder of the tedious journey passed off quite pleasantly; the willingness to render each other assistance being manifested by every look and action. What a lesson we can learn from every day occurrences if we will only be content to take the positions of scholars instead of always wanting to be teachers.

The Bunker Hill Centennial.—Telegraphic Display.—Personals.

BOSTON, MASS., June 29.

TO THE EDITOR OF THE TELEGRAPHER.

THE staid equanimity of conservative Boston has been disturbed by the Bunker Hill Centennial.

The grand old city fairly outdid herself both in the excellent manner in which the celebration was carried out and in the enthusiastic greeting given by her citizens to the Southern soldiers as they marched through her thoroughfares.

The great feature of the day was the procession, ten miles in length, and taking four hours to pass a given point. The buildings on the route were profusely decorated with bunting, presenting a gala appearance. Noteworthy historical sites, such as the old State House, in front of which the first American blood was shed by the British soldiery in 1770; Faneuil Hall and the old South Church bore placards, reciting the revolutionary history pertaining to each.

The telegraphic business for several days before the 17th was very heavy; messages came pouring in from all parts of the country, asking for rooms and windows from which to view the pageant. A special line of telegraph was built by the God and Stock Telegraph Company along the line of the procession, and twelve stations were established at different points on the route, the Chief Marshal governing and directing its movements by wire.

Through the commendable efforts of Mr. C. F. Wood, superintendent, ably seconded by Mr. J. H. Miliken, who had entire charge of the arrangements, the Western Union Telegraph Company made a very creditable display in the trades division of the procession. In a carriage, tastefully and appropriately decorated, were placed a combination printer instrument, operated by the veteran, C. B. ("Bull") Noyes, and Morse instruments, manipulated by Mr. C. D. Stanford and J. H. Miliken. The printer distributed specimens of his work in the shape of mottoes, etc., which were eagerly sought for by the spectators as mementoes of the Centennial.

In the evening, the illumination of public buildings and the display of calcium lights from Bunker Hill monument, the dome of the State House and other elevated points, concluded a truly successful celebration.

Mr. W. J. Parrott has been appointed manager of the Western Union office in the Post-office, vice Mr. Edgar S. Lodge, resigned. The latter gentleman, I understand, intends to take the medical course at Harvard, with a view to making medicine his profession. Mr. C. S. McCoy has been promoted to the position on the N. Y. duplex (nights) made vacant by Mr. Matt. Davius' resignation, and Mr. J. Walton has taken Mr. McCoy's former "split brick." More anon.

CENTURION.

The Baltimore and Ohio Railroad Telegraph.

TO THE EDITOR OF THE TELEGRAPHER.

COL. ROBT. STEWART, Superintendent Baltimore and Ohio Telegraph department, has recently appointed Mr. J. C. Hankinson, Div. Opr. C. O. C. and N., Lake Erie and Straitsville Divisions, with headquarters at Newark, Ohio. The Baltimore and Ohio Company have, perhaps, the poorest telegraph lines in Ohio, and Col. Stewart is just the man to bring them out, if allowed to spend a little money, which is exceedingly doubtful; since the disastrous war which has raged between that company and the Penna R. R. economy is already noticed, a few hundreds of bad joints have been taken out, and a number of offices re-run, and in time we may expect to see the Baltimore and Ohio lines equal their rival (the Pan Handle), which, under O. H. Booth, are second to none in this country.

SELDON.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JULY 3, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.
ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

Telegraphic Management, Business and Profits.

THE natural and inevitable tendency of the telegraph business is to concentration in a few companies which shall cover large sections of territory and be subject to consolidated central management. We do not mean by this that the business should be, or will be, in a consolidated monopoly. The history of telegraphic consolidations or attempted consolidations and monopolies clearly demonstrates the futility of any such designs or attempts. Telegraphic competition is not only desirable but inevitable; and, as we have often stated, no protracted telegraphic monopoly in this country is possible, so long as the telegraphs are private or corporate enterprises, and are not owned and operated as a part of the Government administration, protected from competition by legal enactments. We have seen the best arranged, and apparently about to be successful plans to make the telegraph business a monopoly, frustrated just as they seemed likely about to be realized. Undoubtedly, if all existing telegraphic organizations were practically consolidated into one gigantic corporation to-morrow the means would be speedily provided for the construction of competing lines. The genius and instincts of the American people are opposed to monopolies, and there are parties enough interested in the construction and operation of competing lines to give direction and efficiency to this sentiment, however unpromising such enterprises may appear, and with whatever ability and regard to public accommodation such a monopoly might be managed.

The Western Union Telegraph Co. is frequently referred to as the "great monopoly," but this can hardly be regarded as anything more than a misnomer when it is remembered that it finds competition more or less efficient and vigorous on all its principal routes. There is in fact and never has been for any length of time such a thing as a telegraphic monopoly, and we have no fears that there will be very soon. Mr. JAY GOULD may entertain the designs which many ascribe to him of eventually consolidating the Atlantic and Pacific and the Western Union Companies, when he is enabled to obtain the control of such a consolidated company, but even if successful in this, telegraphic monopoly would not be by any means permanently established.

The popular mind is given to crediting Mr. GOULD with all sorts of magnificent and difficult of realization schemes and plans, many of which, probably, he has never really entertained. When it became known that

he had taken an active interest in the Atlantic and Pacific Telegraph Company it was at once surmised that he intended eventually to capture the Western Union also, and establish a consolidated telegraphic monopoly which should exceed anything ever before known. This surmise soon came to be accepted as an assured fact by many who have since regarded every fluctuation in the quotations of Western Union shares as directly due to his manipulation. We are not in Mr. GOULD'S confidence and do not profess to know what his plans in connection with telegraphic matters may be, but have no doubt he is and has been greatly entertained by the confident assertions which are constantly put forth by parties no better informed than ourselves, as to his plans, purposes and operations. Although, as before stated, we are not in Mr. GOULD'S confidence, we will hazard the assertion that his real purpose in telegraphy, as in other enterprises in which he engages, is to make money, and, probably, he has already been quite successful in this. We do not suppose that it makes any material difference to him whether he makes money out of the Atlantic and Pacific or the Western Union, and very likely he finds profit in both, as the fluctuations in the market price of the shares of either afford abundant opportunity for a bold speculator with ample capital at command to buy and sell to advantage. It is to be regretted that telegraph property has become the football of street speculation, but it cannot now be helped, and we do not look for any change in this respect.

We have, however, been led away from the subject of which we intended to treat. That there is a large margin for improvement in telegraphic management, and that such improvement would be to the advantage of the business and increase its profits we think most of those who are familiar with the subject will agree with us. It is no doubt a fact that in this country it costs the telegraph companies generally too much to do the business. The machinery employed is too complicated and expensive for the results attained. It is an advantage that a telegraph company should cover a large extent of territory, or in fact the whole country, and such a company ought to be able to do the business at a relatively less per centage of cost than if it was divided up among a number of comparatively small companies of limited territory and restricted operations. We have before referred to the example of the Montreal and Dominion Telegraph Companies of Canada, and of the Northwestern Telegraph Company. These companies, with comparatively restricted territories and by no means of a favorable telegraphic character, by careful and economical management, show much better relative pecuniary results than the leading telegraph organizations of the United States. We do not propose at this time to enter into an elaborate discussion of the different systems of management, having done so quite fully on a previous occasion, but only refer to them to illustrate our position.

It appears to us that what is most urgently required for the interest of telegraph property generally in this country is a simplification of the system of administration; a determined cutting off of all superfluous attachments, or those which do not prove remunerative for the amount expended on them, and a reduction of all expenditures of an extraneous character to the lowest possible amount consistent with efficient administration. We do not in this connection refer to the salaries of operators and other subordinate employes. These are already, in most instances, as low as they can well be made, but there are plenty of directions in which reductions could be made which would not prove at all disadvantageous, but otherwise.

If the principal telegraphs of the country were the individual property of Mr. A. T. STEWART, Mr. VANDERBILT or other of our leading and successful business men and millionaires, does any one doubt that they would be more economically managed or that the pecuniary results would be more satisfactory? It is one great defect of leading corporate enterprises in this country that the proprietorship is continually changing

from day to day, and that a majority of the stock passes from one to another who pay but little attention to the management of the property, and who look to the fluctuations in the market price of the shares for their profit, rather than to the legitimate results of the business.

The reader, who is merely an employe on a salary of one or the other of the telegraphic corporations of the country, may ask what interest he or she has in this subject, which many consider as concerning only the capitalists or speculators who hold or deal in telegraph stock? To such we would say, you are most directly interested in the subject. Your compensation and position depend largely upon the wise or unwise, economical or wasteful administration of the telegraphic business. If the business is unremunerative, you are obliged, whether you realize the fact or no, to contribute largely to make up the deficiency. A successful and profitable enterprise can and will necessarily employ the better class of talent and remunerate it more satisfactorily. If telegraph business is depressed permanently, the employes must suffer. It is thus directly for their interest that the telegraphs should be wisely and economically administered. Individually they cannot perhaps do much to correct the evils to which we have referred, but collectively their efforts in that direction will prove of much value. Let each manager, operator and clerk in his or her respective sphere seek to realize economy and efficiency in telegraphic business, and the aggregate result will be very marked, and the influence of such example would perhaps extend further than might generally be supposed.

We are aware that the relative cost of doing telegraph business is much greater now than when each company had one or two offices only in even the large cities, and the public brought the business to those offices, than at the present time, when, with greatly reduced charges for telegraphic service, it has become necessary to maintain a large number of offices in all parts of a town or city for this purpose. This additional expense is, however, offset by a largely increased volume of business. Undoubtedly the telegraphs at the present day labor under many disadvantages, but none which should in seasons of ordinary business prosperity with such management as we have been trying to advocate, prevent their being equitably remunerative not only to those employed in the service, but also to those who invest their money in such beneficial enterprises.

The Duplexed Telegraph Printers.

THE experiment of working the Combination Printing Telegraph apparatus, duplex, between this city and Boston has proved to be a complete success, and will probably result in the extensive use of printers on the Western Union lines. The quadruplex arrangement of circuits is used, although only two circuits are worked by the printers, the other side, which, with the Morse instruments, is used for operating circuits, being utilized for breaking the sending circuit when required. By this arrangement neither circuit interferes with, or interrupts the other, as is the case with the quadruplex Morse.

The operators are delighted with the new arrangement, and say they can work faster and more easily than with the old arrangement or single circuits. In one day recently, one thousand messages were transmitted over a single wire between this city and Boston, employing four operators only, and doing as much business as could have been accomplished by quadruplex Morse circuits and eight Morse operators, on the same wire in the same time.

This improvement is likely to open up a new and successful future for printing telegraph instruments, which had been somewhat out of favor of late years, and have heretofore been used only to a limited extent. The advantages of the printing telegraph are obvious, and as the recent improvements appear to have obviated most of the objections which have been urged against these instruments, we confidently look for their being used

more extensively than ever before. With the improvements which have been made upon them, they can be adapted to work very long circuits, longer even, it is believed, than the Morse. These improvements and adaptations to duplex working have been made by Mr. G. M. PHELPS, the Supt. of the Western Union Co.'s manufactory in this city, and by Mr. GERRIT SMITH, the able and intelligent assistant to the electrician of the company, Mr. PRESCOTT, and they deserve great credit for the genius and ability displayed.

In consequence of the small number of printers in use of late years, the printing telegraph operators have become reduced to just about the number required to work the few instruments lately used between this city, Boston and Washington. Any increased demand could not readily be supplied, and as such a demand must come very soon, it would be well for the Western Union Company to select a sufficient number of intelligent young men, and have them instructed in operating the printers. It takes longer to make a good printing operator than it does Morse, and there is no danger, even if this should be commenced at once, that they will be ready before their services are required.

The duplex printers are likely to prove the most serious competitors that the Automatic system has yet had to encounter. Messages can be transmitted in this way so rapidly, and when transmitted, being ready for delivery without copying or transcribing, the advantage is manifest. "Prompt, accurate and reliable," is the motto of the printing telegraph, and we believe that it is fully deserved.

The Rates for Government Telegraphing.

A FEW days since Postmaster General JEWELL, to whom, under the Act of Congress on the subject, is given the power to fix the rates for government telegraph messages transmitted on the lines of companies who have accepted the provisions of the National Telegraph Act of 1866, notified the Presidents of the Western Union, Atlantic and Pacific, and Southern and Atlantic Telegraph Companies of his desire to confer with them in regard to a readjustment of the present charges on such messages.

The former Postmaster General, Mr. CRESSWELL, had fixed the rate two or three years ago at one cent per word over each circuit of 250 miles or less, at which rate government messages have since been and are now transmitted.

Accordingly, on Tuesday last President ORTON, of the Western Union, President BLOSSOM, of the Southern and Atlantic, and Mr. DUFF, representing the Atlantic and Pacific Companies, met the Postmaster General at Washington for this purpose. A long discussion ensued, the representatives of the telegraph interests arguing against any reduction from the present rates. The Postmaster General finally informed them that he would not now decide the matter, but would notify them that it was probable he would reduce the rates one quarter of a cent on each word, making it three fourths of a cent, instead of one cent, as at present.

Mr. ORTON gave notice that his company would not consent to the reduction, which he considered it was unreasonable that they should be required to accept.

On account of the illness of Gen'l ECKERT, the President of the Atlantic and Pacific Telegraph Company, he was unable to be present, but sent a letter to the Postmaster General saying that his company was satisfied with the present rates.

It has caused some surprise to telegraphic interests that Mr. JEWELL, who was formerly a practical telegrapher, and therefore familiar with telegraphic matters, should propose a further reduction on the extremely low rates for government telegraphing fixed by his predecessor, who was not regarded as predisposed to accord the telegraph companies any compensation to which they were not, to put it mildly, at least fully entitled.

We are informed that the average of the prices now paid by private customers and the government respect-

ively are from fifty to eighty per cent. in favor of the latter. There does not appear to be to those who are familiar with telegraphic matters any good reason for this reduction, further than a desire to make a reduction in the expenditures for telegraphic service by the Government.

We would suggest to the Postmaster General that if it is desired to reduce the aggregate expense of such service, it can be accomplished as effectually and with more justice to the telegraph companies, by instructions to government officials to use the telegraph less freely, and to condense their messages into as few words as will answer the purpose of such messages, as private patrons of the telegraph do, and as they themselves would do if they paid for the messages out of their own pockets. We have no doubt but that in this way the aggregate expense of telegraphic service to the Government might be reduced even more than twenty-five per cent., and the wires freed for business, to the companies of a more profitable character.

The Direct United States Cable.

THE new Direct United States Cable, has not yet been opened for public business, nor, in fact, has it been turned over to the company by Messrs. SIEMENS BROS., the contractors, by whom it was laid. Much surprise has been caused to the public by the delay, and unfavorable reports have been circulated in regard to the actual condition of the cable.

We are now at liberty to state the facts in regard to it, which we have not been hitherto. When the cable was finally laid some weeks ago signals were passed over it freely, no difficulty being experienced in working it. Tests, however, showed a fault in the long section of the cable between Newfoundland and Ireland, of no immediate importance, but still necessary for the contractors to remedy before the cable could be delivered to the company in accordance with the contract, in order to entitle them to payment of the balance due them. By the terms of the contract the contractors had the right to retain possession of the cable for thirty days after it was laid.

The Faraday is now engaged in raising the cable and repairing the fault. On Monday last the cable was raised and cut, and signals communicated from the ship. The exact location of the fault has been determined, and the cable officials expect, before this paper is issued, that the difficulty will be remedied and the cable ready for delivery to the company, after which it will be regularly opened for public use.

Retirement from Business of F. L. Pope & Co.

AS WILL be seen from an announcement made in our advertising columns, the firm of F. L. POPE & Co. have disposed of their stock of telegraph apparatus, etc., and business, to the enterprising and popular house of L. G. TILLOTSON & Co., and will hereafter discontinue the business, in which, to a limited extent, they have been engaged for the past three or four years. In so doing, they have been actuated by various considerations, not the least of which is the fact that both of the members of the firm are engaged in other occupations, with which their late business materially interfered. There is moreover a tendency toward the concentration of this business in fewer hands, as it requires from year to year a larger capital, in order to be carried on advantageously and profitably. Hereafter the specialties, including the metallic, or lead battery, which has proved very successful, in which this firm were interested, will be manufactured and dealt in by Messrs. TILLOTSON & Co.

Messrs. TILLOTSON & Co. have also within a few weeks purchased the railway supply business of Messrs. VOSE, DINSMORE & Co., who were perhaps, next to themselves, the largest house in that line in this country. These transactions are the natural result of the stringency of the times, arising from the late financial panic, and may be accepted as an indication of the general tendency in almost every branch of trade.

This change will not in any way affect the Electric Railway Signal enterprise, which has been developed by Mr. POPE and his partner, with others, and which is destined eventually to prove a great success. The system of electric railway signals presented by the Electric Railroad Signal Co., is by far the most complete and reliable one that has been thus far introduced.

The enterprise and popularity of Messrs. TILLOTSON & Co. are too well known, and too generally appreciated, to need any special commendation from us. The customers of F. L. POPE & Co. will, we are confident, have no reason to regret the change which has been made, and will be sure of receiving just and liberal treatment from L. G. TILLOTSON & Co., who are cordially recommended to their favorable consideration and patronage.

As has been very generally known, the publisher of THE TELEGRAPHER was the partner of Mr. POPE in his late enterprise. In retiring from that business he will be enabled to devote more time and attention to the interests of the paper, which will hereafter be the main object with him, and he proposes now to make an effort to effectually advance the interests of the paper—the only really independent telegraphic publication in the country. The success of THE TELEGRAPHER under his management, even in conjunction with other interests which have occupied a large share of his time and attention, has been most satisfactory. That this success will be even more marked under the new condition of things, we have no doubt.

We now confidently appeal to the telegraphic fraternity generally to cooperate with us, and by united efforts to make THE TELEGRAPHER such a success in telegraphic journalism as shall reflect credit upon all concerned in telegraphy in this country and the Dominion of Canada.

A New Western Union Loan.

WE recently recorded the failure of a loan offered by the Western Union Telegraph Company for four millions of dollars, to provide the means for retiring bonds of the company which fall due in November next. The original loan was termed a gold loan, the principal and interest being payable in gold. This was offered at 97½ per cent., but only a small amount was subscribed for.

A new proposition is now made by the company for a currency loan of the same amount. This is offered at 95 per cent., and seems to find very ready acceptance from capitalists and investors, nearly half of it having been subscribed within a day or two after its being put upon the market, and no doubt is entertained that it will all be promptly taken.

The stock of the company has recently materially advanced, and is actively dealt in at the Stock Board.

The Western Union Co. have a splendid property and business, and, with ordinarily judicious management, there should be no question of its continuing to pay good dividends even upon its very large capital.

Read, Consider and Act.

WE would call attention to the prospectus of THE TELEGRAPHER, and to the liberal offer of premiums to those who may interest themselves in increasing its circulation, which will be found in its advertising pages. We have determined to make a vigorous effort to secure a largely increased circulation for this paper, and ask every telegrapher who believes that its maintenance and liberal support is of value and importance to the fraternity to aid us in this effort. We will furnish the best paper that our ability and means will permit, and in return expect that those who believe that we are rendering good service will aid us by contributions to its columns, and by efforts to add to the number of its readers. The approbation of those for whom we labor is highly gratifying to us, especially when manifested in a practical manner.

Don't put off your share of the work to the fall, or a more convenient season, but do all you can now; and

when once you have shown your faith by your works do not become weary in well doing.

Our subscription list has been increasing of late, which at this season of the year is highly encouraging, and shows that the enemies of the paper and the prophets of evil are not correct in their antagonistic assertions and predictions.

Our ambition is to make the best and most useful and readable telegraphic publication in the world, and to have it more generally and heartily supported by those whom it benefits than any other similar publication. All of this can be realized with the assistance and coöperation of the telegraphers generally. Shall we have it?

The Western Electric Manufacturing Company, of Chicago, Ill.

THE Western Electric Manufacturing Company of Chicago has become, under its present able management, one of the leading manufacturing establishments of that enterprising city. Their extensive manufactory, at No. 220 Kinzie street, is equipped with all the necessary machinery for turning out work of a superior quality and excellence. They are prepared at short notice to equip telegraph lines of any extent with apparatus, batteries, etc., and everything required at reasonable prices.

This company also make a specialty of the manufacture of office and magnet wires of every description.

Phillips' Office Wires.

THOSE who may desire to examine some excellent specimens of insulated office wires may be gratified by the inspection of such wires manufactured by Mr. EUGENE F. PHILLIPS, of Providence, R. I., run in the office of the American District Telegraph Co. at No. 407 Broadway, in this city. These wires are beautifully run, and are excellent specimens of Mr. PHILLIPS' manufacture, and are a credit to his workmanship. Those who are interested in such matters are invited to call and see them.

Personals.

Mr. CHARLES C. WHITNEY, formerly chief clerk of Supt. Wallick, of the Western Union Telegraph Company at Indianapolis, Ind., and more recently Assistant Secretary of the Franklin Life Insurance Company, of that city, has accepted the appointment of Chief of the Redemption Bureau, under United States Treasurer NEW. Mr. WHITNEY left for Washington July 1st, to enter upon the discharge of the duties of his office.

Supt. GEO. T. WILLIAMS, Supt. Western Union Telegraph Company, has appointed Mr. "SARGE" PEABODY as his chief clerk, *vice* MR. CHAS. S. LAMB, who goes to the Pacific Coast with his brother, Supt. FRANK LAMB, of the same company.

Mr. J. J. GALIVEN, of Calvert, Texas, has been appointed to a position on the Western Union day force at St. Louis, Mo.

Mr. J. W. DICKENS, of Macon, Mo., has been appointed night operator at Hannibal Depot, Mo.

Mr. JNO. F. STANSFER, of Columbus, Ind., has accepted a position on the day force in the St. Louis, Mo., Western Union office.

Mr. D. A. WILLIAMS, of the St. Louis, Mo., Western Union office, has been appointed manager of the Sedalia, Mo., city office, same company, *vice* G. A. SINGER, resigned.

Mr. JOHN McNEVIN is the day Press man at St. Louis, Mo., Western Union office, *vice* Mr. JAMES O'TOOLE, resigned.

Mr. CHARLES T. DAVIS, late receiving clerk at Kansas, Mo., Western Union office, has been appointed to a position as operator in that office. This is an increase of force.

Any person knowing the present address of Messrs. PAIGE and QUIGLEY, who were employed as telegraph operators at the Chilton House, Ontario, Canada, in 1872-'3, respectively, is requested to advise Mr. C. BREHLER, manager of the Atlantic and Pacific telegraph offices, Lockport, N. Y., of the same.

The Telegraph.

The Atlantic and Pacific Telegraph Co.

THE Atlantic and Pacific Telegraph Co. are pushing their new lines through as rapidly as possible, and expect in a few days to have their line between Chicago and Milwaukee in operation.

The executive offices of the company have been removed from the front to the rear offices of the first floor of 198 Broadway, which are better adapted to the purpose, and also relieves the officials from the annoyance caused by the noise of Broadway. The new offices have been very neatly and comfortably fitted up for their present occupancy.

President ECKERT, whose partial recovery from his severillness was noticed some weeks since, experienced a relapse which was more severe than the original attack, and which has prevented hitherto the resumption of his official duties. He is now convalescent, however, and expects to be able to attend to business again in a few days.

During his illness Mr. A. B. Chandler has attended to the President's duties as well as his own, which has imposed upon him very arduous labor, but which he has met with his characteristic energy, industry and ability.

A Violent Storm.—Its Effect on Telegraph Lines.

ON Tuesday night last a violent thunder storm came up which lasted several hours, and caused considerable damage to telegraph lines south of this city. Nearly all the wires between New York and Washington were interrupted, and so continued through the night.

The Western Union Loan.

THE entire seven per cent. currency loan of \$4,000,000 of the Western Union Telegraph Company at 95, was subscribed for on Wednesday last, and subsequently 1 per cent. was offered for the scrip or privilege. The success of this loan had a favorable influence on the stock, which advanced to 79½—an advance of 4½ per cent. on the week.

Death of a Telegraphic Manufacturer and Inventor.

MR. SAMUEL CHUBBUCK, of Utica, N. Y., died at that place on Monday last, June 28th. Mr. Chubbuck was one of the first who engaged in the manufacture of telegraph instruments, in which he was engaged until his death. He was the inventor of the pony sounder and other improvements.

Foreign Telegraphic Notes.

THE traffic receipts of the Great Northern Telegraph Company for the month of May last amounted to 366,423fr., and for the same month last year to 363,932fr. The aggregate traffic receipts from the 1st of January to the 31st May amounted to 1,602,397fr., and for the corresponding period last year to 1,629,998fr.

The Indo-European Telegraph Company notify that the average time in transit between London and India, *via* Teheran, of all outward messages to India, including the messages for Penang, Singapore, China, Japan, Java and Australia, during the week ending the 4th instant, was one hour seventeen minutes.

The construction of a new land line of telegraph between Amoy and Foochow has commenced, in virtue of the agreement lately concluded with the Chinese Government by the Great Northern Telegraph Company.

The secretary of the West India and Panama Telegraph Company (Limited) announces that information has been received of the interruption of two of the company's cables, *viz.*, between St. Thomas and St. Kitts, and between Grenada and Trinidad, in consequence of which telegraphic communication with St. Kitts, Antigua, Gaudaloupe, Dominica, Martinique, St. Lucia, St. Vincent, Barbadoes and Grenada is for the present suspended. The company's ship (screw steamer) Investigator has already left St. Thomas to effect the repairs. The repair of either of the broken cables will restore telegraphic communication with the islands cut off. The interruption of the cables named does not interfere with telegraphic communication with Jamaica, Panama, Porto Rico, St. Thomas, St. Croix, Trinidad, Demerara and Berbice.

An agreement has been entered into between the Government of New Zealand and the Eastern Extension Telegraph Co. for the extension of the company's system to that colony. The cable is to be laid by or before April 30, 1876; the colony to pay a subsidy of

£7,500 per annum, payable quarterly, during a period of ten years; the charge for the transmission of messages through the cable not to exceed 7s. 6d. per message of ten words, and 9d. for every additional word, inclusive of names and addresses; the tariff to be reduced to 5s. for every ten words, and 6d. for every additional word whenever the average number of messages during any preceding six calendar months has amounted to 200 per day, excluding Sundays, and whenever the colony shall guarantee a similar number of messages per week.

Born.

MORRIS.—To the wife of Mr. JOHN L. MORRIS, of the Shreveport, La., Western Union office, June 25th, a son, 13 pounds.

ANNOUNCEMENT.

We have sold to L. G. TILLOTSON & CO., of No. 8 Dey Street, New York, our stock of Telegraphic Instruments, Apparatus and Supplies, and retire from the business from this date.

We take pleasure in commending to our former customers and friends the old established, well known and popular house to whom we have transferred our business. It is unnecessary to assure those who have dealt with L. G. TILLOTSON & CO. that they may in all cases depend upon receiving just, honorable and liberal treatment from them.

With superior facilities for manufacturing, and a stock which comprises all descriptions of Telegraphic Apparatus, Equipment and Supplies, orders entrusted to them will be promptly and satisfactorily executed.

THE SPECIALTIES

which we have hitherto manufactured and dealt in:

THE EAGLE METALLIC BATTERY,

which has, *when manufactured by us*, given such excellent satisfaction, and which has proved to be a superior electro-magnetic battery for telegraphic and other purposes;

THE NONPAREIL TELEGRAPH APPARATUS,

for Learners, Amateurs and short Telegraph Lines, the pioneer instrument of that popular class; and

THE GLOBE LIGHTNING ARRESTER,

which, in some respects, is the best Lightning Arrester in use, will hereafter be manufactured and sold by TILLOTSON & CO.

We avail ourselves of this opportunity to return our sincere thanks to those who have heretofore favored us with their patronage.

This transfer will not affect the

ELECTRIC RAILROAD SIGNAL CO.,

which has always been unconnected with our other business, and will be continued as heretofore.

F. L. POPE & CO.

New York, June 30, 1875.

DISSOLUTION OF COPARTNERSHIP.

The copartnership hitherto existing under the firm name of F. L. POPE & CO. is this day dissolved by mutual consent. The business of the late firm will be settled by J. N. ASHLEY, who is authorized to use the firm name for that purpose.

F. L. POPE,
J. N. ASHLEY.

NEW YORK, July 1, 1875.

WESTERN ELECTRIC MAN'FG CO.
 220 Kinzie Street,
 CHICAGO, ILL.

CELEBRATED
PRIVATE LINE OUTFIT.
 THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....\$10 00
 Instrument only..... 8 00
 Bliss Reservoir Battery, per cell..... 2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

WESTERN ELECTRIC M'FG CO.,
 CHICAGO, ILL.

JUST OUT.

NEW AND ENLARGED EDITION OF

SMITH'S
MANUAL OF TELEGRAPHY.

CONTAINING

Complete Directions for Self-Instruction in Telegraphy,
 Instructions for Building and Operating

SHORT LINES OF TELEGRAPH,

Diagrams showing the manner of connecting wires, batteries instruments, &c.

Descriptions and cuts of all forms of telegraph instruments, batteries, &c.

Cuts, descriptions and prices of the

BEST LEARNER'S APPARATUS

AND

SHORT LINE INSTRUMENTS;

Together with full explanations of everything necessary for the

AMATEUR TELEGRAPHER

To know.

Every operator and every student of telegraphy should have one

It is the

MOST COMPLETE, PRACTICAL

And easily understood explanation of the

MORSE TELEGRAPH

AND ITS APPARATUS

EVER PUBLISHED.

PRICE.....30 CENTS.

Sent post paid upon receipt of price.

L. G. TILLOTSON & CO.,

8 DEY STREET, NEW YORK.

THIS SYSTEM OF
FIRE ALARM & POLICE TELEGRAPH
WITH A CENTRAL OFFICE,
OR
UPON THE AUTOMATIC PLAN,

is now in operation in the following Cities, to which reference is
made for evidence of its great

SUPERIORITY, VALUE
AND
UNIFORM RELIABILITY.

Albany, N. Y.,	New York City,
Alleghany, Pa.,	New Orleans, La.,
Boston, Mass.,	New Bedford, Mass.,
Bridgeport, Conn.,	New Haven, Conn.,
Buffalo, N. Y.,	Newark, N. J.,
Baltimore, Md.,	Omaha, Neb.,
Chicago, Ill.,	Philadelphia, Pa.,
Cincinnati, Ohio,	Pittsburg, Pa.,
Columbus, Ohio,	Portland, Maine,
Cambridge, Mass.,	Peoria, Ill.,
Charlestown, Mass.,	Providence, R. I.,
Covington, Ky.,	Quebec, L. C.,
Detroit, Mich.,	Rochester, N. Y.,
Dayton, Ohio,	Richmond, Va.,
Elizabeth, N. J.,	St. Louis, Mo.,
Fall River, Mass.,	St. John, N. B.,
Fitchburg, Mass.,	Springfield, Mass.,
Hartford, Conn.,	San Francisco, Cal.,
Indianapolis, Ind.,	Savannah, Ga.,
Jersey City, N. J.,	Syracuse, N. Y.,
Louisville, Ky.,	Troy, N. Y.,
Lowell, Mass.,	Taunton, Mass.,
Lawrence, Mass.,	Toledo, Ohio,
Lynn, Mass.,	Toronto, Canada,
Mobile, Ala.,	Washington, D. C.,
Montreal, Canada,	Worcester, Mass.,
Milwaukee, Wis.,	

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, - - - - - PUBLISHER.

SATURDAY, JULY 10, 1875.

VOL. XI. WHOLE No. 469.

[From the Providence (R. I. Journal.)]

The Real Inventor of the Electric Telegraph.

To the Editor of the Journal.

THE FIRST ELECTRIC TELEGRAPH.

I HAVE before me "An Address by Rev. Charles S. Harrower, at the Obsequies of Harrison Gray Dyar, in Rhinebeck, N. Y., Feb. 3, 1875," from which I make the following extract, the purport of which will probably be new to most of your readers, should you print it. Your correspondent will just add that he had the pleasure of a limited acquaintance with Mr. Dyar for some years before his death, and should deem him, from his unostentatious nature and studious and deep-reaching mind, to be just the man to conduct himself under the circumstances, as is related in Mr. Harrower's interesting narrative.

T.
"It was in 1826 or 1827, when he was but twenty-one years of age, that Mr. Dyar's studies in electricity culminated in carrying a wire around a certain race course on Long Island, New York, and the transmission of messages thereby. This was the first piece of electric telegraph perfected on this continent. Many experiments were made about this time by ingenious men in Europe and America, but in a most important item of detail Mr. Dyar surpassed all his peers. It occurred to him that wires could be stretched from city to city, and correspondence maintained, if an alphabet were devised. Accordingly, he set himself to work, and finally perfected that system of dots, marks and spaces which is now known as the 'Morse Alphabet.' It ought to have been called 'Dyar Alphabet.' Vast improvements were in store for this new agency in the world, the electric telegraph, but until Prof. Henry discovered how to intensify a current of electro-magnetism by using bars of soft iron, or rather say until Prof. Morse adopted the discovery in 1836, *i. e.* for ten years, I have no doubt Mr. Dyar was the pioneer of all the world in telegraphic experiments. Surely we are gathered about the coffin of one of the foremost men in his generation.

The success of the experiment on Long Island was so satisfactory that Mr. Dyar and his associates felt justified in undertaking to carry a line from New York to Philadelphia. For this arrangements were advanced, when they were strangely interrupted.

It would be a long story to tell of the desperate selfishness of the man whom they employed to assist in raising funds; how he tried to become possessed of stock in the enterprise; how, failing in one scheme, he determined to drive Mr. Dyar into some arrangement by giving him trouble of the strangest, but, unfortunately, most aggravating sort. It was about the time of the bank conspiracy trials, and this unscrupulous man obtained a writ against his employers under a charge of 'conspiracy for carrying secret information from city to city.' Mr. Charles Walker, the brother-in-law of Mr. S. F. B. Morse, was Mr. Dyar's counsel, as well as intimate friend.

After having absented himself from New York for a few months, Mr. Dyar returned and consulted with Mr. Walker, who thought that, however groundless such a charge might be, it might give his client infinite trouble to stand suit. Accordingly the enterprise was then and there abandoned; so that just at the moment when a great victory was about to be achieved by a foremost experimenter and inventor, the wicked greed of a trusted subordinate postponed for years its accomplishment, and almost entirely deprived our friend of his true need of fame. So far as known Mr. Dyar made no further discoveries in telegraphy. When, moreover, seventeen years after his success on Long Island, and fifteen years after his proposed line to Philadelphia, Mr. Dyar heard that the brother-in-law of his friend and counsellor had persuaded Congress to build the line between Washington and Baltimore, and had adopted the system of marks, dots and spaces himself had invented, he did not once ask to have his alphabet accredited to him, but praised Mr. Morse in the sincerest terms for his energy, perseverance and success, and accounted him fully entitled to his fame as one of the world's benefactors.

His attitude in this connection was characteristic, and surely it was very noble. But facts warrant me

in saying, and it is the merest justice to remind you, that had it not been for the bank conspiracy excitement, the first public line of telegraph would have been erected seventeen years earlier than it was, and not by the Congressional influence of Mr. Morse, but by the private enterprise of Mr. Dyar."

Battery Covers.

WHEN it was proposed to use oil on the surface of the cells of the gravity battery to prevent evaporation, it was thought a very simple, and effective, and economical device. No doubt it was, and is; and yet oil is an unpleasant element. To cleanly hands it is offensive. In warm weather or in a heated room it has an odor very ungrateful to the ordinary sense; and even with its use in preventing evaporation, it is usually found necessary to add water, at least monthly, as well as to clean the parts—which latter, by reason of the oil, is far from being a pleasant duty.

Mr. Geo. P. Milliken, manager of the Boston office of the Western Union Telegraph Co., writes as follows in reference to this subject:

"I have now in the battery room a few cells without oil with wooden covers—one with zinc, one tin. The metallic covers are made with a rim one inch wide, fitting the cell, but not too closely. The openings for the wires and the space round the rim are filled with paraffine and tallow. They were set up May 7th for use in local circuits, and now (June 24th), without a drop of water added to them, there is no sign of diminution, and all are clean and neat, as at first. The wooden coverings were put on May 19th, and the cells look well. These covers can be made for less than the cost of oil, and are permanent."

All experiments of this kind are valuable, and to us it appears particularly so when any improvement is suggested which tends to cleanliness and neatness as well as economy. We think it not unlikely that Mr. Milliken's experience, if confirmed by prolonged tests, may lead to a change in the present directions respecting the use of oil in batteries.—*Journal of the Telegraph.*

A Curious Magnet.

M. J. JAMIN, of the Paris Academy of Sciences, recently adverted to a singular case of magnetic power observed by Galileo, and described by him in 1607. He had met with a loadstone "of such power that, if the point of a cimeter be brought near to it, at a distance equal to the thickness of a silver piastre (about a crown piece), it can no longer be kept back; even a strong man resting the cimeter against his breast could not resist the attraction." He continues to say:

"I have discovered another admirable effect, which I had not met with in any other loadstone; the same pole will attract and repel the same piece of iron. At a distance of at least four or five fingers' breadth it will repel it. If the piece of iron be placed on a table, and the loadstone be placed near it, the iron will be driven back, and retreat so long as the loadstone is pushed toward it; but if the latter be drawn back, as the distance is four fingers' breadth, the piece of iron is attracted and follows the loadstone as it is drawn back, but it does not go nearer than one finger's breadth."

This loadstone was bought by the Grand Duke; Galileo continued his experiments with it, and it turned out that the piece of iron above referred to was magnetized steel, for mere iron was attracted at any distance by the loadstone to the amount of six pounds weight. In short, it had the property of attracting and repelling the same pole of magnetized steel. This curious loadstone is unfortunately lost.

M. Jamin, after giving this piece of history, states that he has without seeking it, found a parallel case, which has no mystery about it. A steel bar may be magnetized to saturation by a very powerful current, and the magnetic fluid will penetrate to the very core of one of his halves, which he calls *positive*. This being obtained, the same bar is exposed to an inverse current, which, very weak at the outset, gradually increases in intensity, and determines a boreal or *negative* magnetization, merely superficial at first, but going down deeper by degrees, leaving, however, positive strata further down. The outer surface is now carried off by corrosion in an acid, so that the exterior negative surface is removed and the subjacent positive strata are brought to light. A bar thus prepared will behave like Galileo's steel in the presence of a common magnet.

Figures Printed by Lightning.

PERSONS who are killed by lightning stroke are frequently found marked about the body in a peculiar manner, the lines being grouped into semblance of the trunk and branches of a tree. In case the casualty actually happens anywhere in the vicinity of a tree, the ramifications are attributed to some mysterious property of the lightning, which reproduces on the body (as

was stated in a published instance) "the fibers, leaves and branches with photographic accuracy."

Mr. C. Tomlinson, in a communication to *Nature*, states that the trees have nothing to do with the figures which are produced directly by the lightning. The same markings may be found in sheets of crown glass by passing over them the contents of a Leyden jar. The writer, however, mentions a variety of curious phenomena in which horseshoes, metallic numbers, etc., have been found reproduced on the persons of people struck in their neighborhood. Mr. C. F. Varley throws light on these last mentioned cases in giving the record of an accidental observation made during the working of a Holtz electrical machine, the poles of which were furnished with brass balls about an inch in diameter. Noticing some specks on the hall of the positive pole, Mr. Varley tried to wipe them off with a silk handkerchief, but in vain. He then examined the negative pole, and discovered a minute speck corresponding to the spots on the positive pole. This pole sometimes exhibits a glow; and if in this state three or four bits of wax, or even a drop or two of water, be placed on the negative pole, corresponding non-luminous spots appear on the positive pole. Hence, it is evident that lines of force exist between the two poles, by means of which we may telegraph through the air from the negative to the positive pole. And in explanation of the above cases, in which the lightning burn on the skin is of the same shape as the object from which the charge proceeded, all that is necessary is that the object be + to the horseshoe, brass number, etc., the discharge being a negative one.

Velocity and Duration of Lightning.

A LARGE flash of lightning, distinctly seen, often leaves upon the mind an impression that it has lasted fully a second or more, but it is proved that such is not the fact. Its velocity is at the rate of 288,000 miles per second. The utmost duration of a flash from beginning to end is estimated not to exceed the sixtieth part of a second, though retained upon the retina so much longer. This may be proved during a storm on a perfectly dark night by setting a wheel to work so rapidly that in a steady light its spokes appear to blend and become individually invisible. It being dark, and the wheel rapidly revolving as above, when a flash of lightning occurs the wheel will appear to the eye motionless, every spoke being distinctly and separately visible and still. This was first observed by Wheatstone, and is recorded by him, in conjunction with other similar experiments, as conclusive proof that the duration of the flash is excessively brief.

New Absolute Galvanometer.

AN absolute galvanometer is described by Professor Guthrie, as constructed for him by the Messrs. Elliott. Its principle depends upon the computation of the strength of the current by the measurement of the mechanical force necessary to bring to a given distance from one another two electro-magnets, which are affected by the current in such a fashion that they repel one another. The galvanic current whose force is to be measured coils around two fixed soft iron masses, rendering them magnetic, and then around two movable soft iron masses suspended by a vertical thread. Many of the laws of electro-dynamics may be readily illustrated by this instrument, and not only may different currents be compared with the greatest accuracy, but the absolute mechanical value of the current may be at once arrived at.

An Improved Hotel Annunciator.

OUR readers are familiar with the ordinary "annunciator" used in hotels to show the number of a room from which a bell has been rung. The best forms of the apparatus are worked by electrical agency, and M. Delbrayeux, in France, has just invented an improvement by which the object of the ringing is indicated. The contrivance is commended by Comte du Moncel in the *Bulletin de la Société d'Encouragement* for May. The arrangement is quite simple. Under each number of the indicator there is a board with a list of the more common requirements in hotels, and an index needle, moving up and down, stops at the proper one; at the same time a bell rings till the domestic comes and restores the needle to its starting point. In the transmitter there is a corresponding table of requirements, with an index needle, which is moved by means of a small metallic button. The person ordering has merely to push the index to the particular order he wishes to give, and by this movement he effects an interruption of the current, producing the number of emissions and interruptions necessary for the signal. Afterwards he brings the needle back to its initial position again, but this, the Count remarks, might be done automatically.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS.

NEW YORK, June 28, 1875.

ASSESSMENT No. 76.

22, 25, 29, 33, 52, 54, 58, 59, 60, 67, 72, 101, 108, 141, 142, 144, 145, 153, 172, 176, 177, 178, 179, 184, 185, 186, 187, 188, 189, 190, 191, 193, 197, 198, 201, 202, 220, 230, 247, 254, 267, 302, 323, 367, 379, 381, 391, 392, 393, 398, 416, 418, 426, 431, 438, 476, 526, 547, 552, 454, 565, 575, 586, 592, 603, 604, 605, 649, 655, 659, 671, 685, 691, 695, 697, 705, 708, 714, 729, 734, 735, 742, 750, 751, 756, 799, 820, 831, 842, 843, 855, 874, 880, 901, 912, 941, 952, 976, 998, 1001, 1005, 1023, 1040, 1047, 1054, 1071, 1081, 1085, 1088, 1090, 1143, 1147, 1155, 1156, 1157, 1159, 1160, 1162, 1177, 1185, 1196, 1200, 1308, 1225, 1226, 1227, 1233, 1273, 1276, 1282, 1304, 1325, 1364, 1365, 1385, 1390, 1391, 1400, 1402, 1403, 1404, 1407, 1410, 1417, 1426, 1440, 1448, 1484, 1498, 1505, 1524, 1531, 1554, 1555, 1556, 1557, 1569, 1570, 1582, 1593, 1594, 1613, 1615, 1620, 1623, 1626, 1630, 1635, 1644, 1656, 1670, 1681, 1684, 1687, 1688, 1695, 1707, 1709, 1710, 1713, 1721, 1723, 1724, 1729, 1745, 1773, 1775, 1790, 1791, 1798, 1799, 1809, 1810, 1811, 1812, 1839, 1840, 1841, 1847, 1852, 1869, 1903, 1907, 1917, 1919, 1922, 1924, 1926, 1938, 1942, 1945, 1946, 1965, 1972, 1985, 1987, 1991, 2015, 2021, 2025, 2027, 2029, 2041, 2044, 2045, 2069, 2072, 2083, 2089, 2103, 2113, 2114, 2118, 2141, 2142, 2151, 2159, 2172, 2175, 2180, 2181, 2183, 2184, 2185, 2191, 2196, 2200, 2201, 2204, 2205, 2206, 2212, 2214, 2216, 2221, 2234, 2236, 2243, 2248, 2250, 2263, 2273, 2090, 2295, 2296, 2297, 2298, 2299, 2306, 2313, 2314, 2316, 2317, 2319, 2330, 2331, 2333, 2334, 2335, 2336, 2341, 2342, 2344, 2349, 2351, 2358, 2367, 2373, 2379, 2381, 2385, 2287, 2388, 2390, 2391, 2392, 2393, 2394, 2396, 2403, 2412, 2413, 2417, 2418, 2419, 2421, 2424, 2431, 2432, 2433.

ASSESSMENT No. 75.

113, 566, 594, 1093, 1232, 1267, 1572, 1590, 1619, 1678, 1713, 2024, 2038, 2048, 2238, 2257, 2261, 2280, 2355, 2366, 2378, 2380.

ASSESSMENT No. 74.

883, 1207, 1609, 2128.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Wires Seriously Affected by Lightning.—Personals.—A Telegraphic Desperado.

ST. LOUIS, Mo., June 27.

TO THE EDITOR OF THE TELEGRAPHER.

It has rained here almost every day for the past four or five weeks, accompanied by an unusual amount of lightning, which seriously affected all of the wires at times. Our old veteran and friend, Mr. Sidney Fairchild, has been at Sedalia, Mo., the past week, acting as temporary manager. Mr. John Hayes manipulated Western "Press" during Sid's absence.

The night Western "Press" is now sent to Kansas City, Leavenworth, St. Joe, Atchison and Lincoln; Kansas City "relaying" it for Lawrence, Topeka, Denver and Fort Scott. Heretofore it was sent direct to all the above points. The new arrangement is a good one and will save much time.

Mr. James C. De Long is fast recovering from his recent indisposition and now holds down our heaviest circuits.

Mr. W. S. French works "N. O." nights, while Charley Newton takes care of the Cincinnati circuit.

The base ball game of the season is to take place on the 4th of July, between a picked nine under Mr. W. W. Cummings and Captain James S. Nelson. Nelse has been taking lessons in pitching from Bradley, of the Brown Sons, and is confident of being victor.

A despatch from Brownsville, Texas, states that five robbers boarded a train on the International Railroad on the 17th inst., near Houston, Texas, intending

to seize and throw the Express safe from the car, which was supposed to contain heavy remittances from this city to cattle men in Southern Texas. Vice-President Hays, who happened to be on board, seized the leader, a man named Brooks, and throttled him. Hays' pistol fell out of the car during the scuffle or he would have used it. There were five robbers in the attack, all wearing masks. Two of the five were captured—Brooks and one Ellsworth, a well known telegrapher. The Ellsworth referred to is supposed to be George Ellsworth who worked in this city just prior to the war. When the rebellion broke out Ellsworth joined John Morgan, the Kentucky guerilla, and was his cypher operator during the existence of the band. In 1865 he shot and killed a saloon keeper at Sharpsburg; Ky., for refusing him a drink of whiskey, and escaped from three different jails in which he was incarcerated the third time being released by the jailor's daughter who fell in love with the prisoner. Ellsworth is a member of an aristocratic Canadian family.

It is stated that the Beecher-Tilton trial has thus far brought the Western Union Telegraph Company three quarters of a million in additional newspaper tolls—"Its an ill wind."

Personals.—Fourth of July Coming.

CHICAGO, ILL., June 30.

TO THE EDITOR OF THE TELEGRAPHER.

AMONG the recent additions to the "sub" gang here are Messrs. T. O. Cord, formerly of the Am. District Telegraph Co. in this city; Goodfellow, of Buffalo; our old (and now thoroughly reformed) manager, R. C. Rankin; and Messrs. Keeler and Hamilton, all apparently "good fellows." Our friend Everham, after a whirl a few hundred miles west of here, has concluded there's "No place like Home, Sweet Home," and is again among us as a "sub." Gus Carrol is now airing himself in the would-be capital of ye State of Illinois, viz, Peoria, having gone there to relieve "Pete" Rowe. "Davy" Anderson has gone on a little pleasure excursion to Mansfield, O., with his wife and that baby, and I suppose will pass through Piqua; "Hoop'em up," Davy, night. Manager Springer disturbs the electric current on "Cx" N. Y. Duplex during "Davy's" absence. Mr. French (the veritable Samivel, my boy), the "Osixerator," who agitates the "mystic fluid" on Janesville days, has also gone to the Buckeye State to see the "Olc Fokes," and Mr. Farley, the blonde, troubles the boys with report there. Don't swear, "Py!" Just say, "Oh, Oshkosh!" for short. The Fourth of July is coming; yes! they had it here about a year ago. Some of the boys had it very bad, especially on the morning of the fifth. They didn't look or act like operators, but more like merchants, you know, taking inventory of stock purchased previously beforehand you know, and some of them didn't seem to think it was very good stock either. I suppose we'll see the accustomed notice on the bulletin board telling the day they will be on a certain number of hours (about half the day), and night men—on as usual; well some of the day men worked nights once—that's so. Just tell that Milwaukee fellow, and "Clix," and "Quad" to pitch right in, for they can't none of them get any of our glory unless it's "Occasional," and I've got him fixed, 'kase I'm

WESTERN UNION.

The Correspondents of The Telegrapher Reviewed and Commended.

TO THE EDITOR OF THE TELEGRAPHER.

THE sudden reduction in space occupied by correspondence in the columns of THE TELEGRAPHER would be sufficient evidence, if our perspiring condition daily and nightly failed to convince us that the heated term had been fully inaugurated. For several years past I have noticed that when the mercury in the thermometer gets up into the nineties, the literary zeal of your numerous corps of correspondents oozes out of their pores, and they are content to leave to you the task, in which at other seasons they so liberally assist, of filling the columns of our paper. I do not know that there is any reason for complaint on this account by anybody but yourself, for we never find a lack of excellent reading whether correspondents bear or forbear. It must be rather severe upon you, however, and I assure you that you have my heartiest sympathy, and to show that it is practical, as well as sentimental and sincere, I propose to occupy, with your permission, of course, some of this vacant space.

And in this connection I desire to compliment your correspondents who so frequently entertain and instruct us. We are all greatly indebted to "Jo" and "Dot" for their lively and interesting contributions. Although of the feminine persuasion, they deserve the highest commendation for the literary ability and taste displayed. All your readers, like Oliver Twist, persistently ask for more. There is no danger of our tiring of

reading their contributions, and we sincerely hope that they will not "weary in well doing." Even "Nihil Nameless," although slain by the sharp arrows of their wit and the force of their arguments, gallantly recognizes their sincerity and courtesy, and even from an untimely grave speaks their praises. "Nihil Nameless," although somewhat prolix, was always readable, and his courage in espousing, as he did, an unpopular, and truth compels me to say, in my opinion, an untenable side, has excited my respect and admiration. His "Wandering Spook" shows that even the portals of the tomb cannot crib and confine his genius, and that, although presumptively dead, we may yet hope to hear from him occasionally.

"John Sterling" too, is a favorite with me, although I must say that the "setting down" which he received from "Nihil" and "Uno Hoo" was rather discouraging. But he has rendered good service, and it is to be hoped that he has not been literarily placed *hors du combat* by his encounters with a Craig and his other combatants. Let us hear from "John" by all means, and may his communications (if less lengthy, which is, perhaps, desirable) be frequent in the columns of THE TELEGRAPHER.

Your correspondent, D. F. H. Craig, perhaps lacks positiveness of statement (!), but then his communications and figures never fail to interest. I regret to see that he is disposed to champion Edison, the well characterized professor of duplicity and quadruplicity. With his experience with that individual I could not have supposed that he would ever have prostituted his pen to defend him. "Interest, the white man's god, blunts the edge of his dagger" too frequently, it is true, and I must say that I am disappointed in Craig. Deep and prolonged contrition, and "works meet for repentance" can alone wipe out the stain which his advocacy of Edison and his duplicity has caused. By the way, much surprise was expressed that with your well known and intimate knowledge of Edison and his transactions, that communication should have appeared in the columns of THE TELEGRAPHER. It was a striking and forcible illustration of the principle of liberality and fair dealing which is characteristic of the paper, and did no harm.

"Occasional" and "Western Union" are always welcome as the flowers in May, and we are indebted to them for much useful and interesting information. I cannot, of course, refer individually to all your correspondents. Collectively they present a corps of which you may well be proud. From all parts of the country they greet us, and no portion of the paper is more generally and pleasurably read than the correspondence columns.

I am reminded by what I have written that prolixity is also one of my besetting sins, and that I should set your other correspondents a better example, especially when I have really so little to say.

If what I have written should be regarded as of sufficient interest to appear in THE TELEGRAPHER I shall be gratified—if otherwise, I presume there is yet room in your waste basket, and I am not easily mortified.

COME AGAIN.

Postponement of Telegraphic Excitement.—The New Cable.

TO THE EDITOR OF THE TELEGRAPHER.

IT was generally anticipated that we should have a rather exciting summer in telegraphic matters, from the demonstration which was made some months ago by the Atlantic and Pacific Telegraph Company, when it came under the control and management of Mr. Jay Gould. For some reason, however, the excitement which ensued was of brief duration, and the "great monopoly" seems to be pursuing the even tenor of its way without serious disturbance. It seems to have been another instance of "great cry and little wool."

The apparent quiet may, however, be deceptive and preliminary to some great telegraphic earthquake, destined to upset things generally. The great reduction of tariffs promised by the Atlantic and Pacific Co. under its new management appears yet to be in the vocative. As a telegrapher I have no desire to see a material reduction in telegraph rates at present, and think the Atlantic and Pacific managers have done well to reconsider their hastily announced intension of a further reduction. Until that company can earn a dividend at present rates it would seem to be folly on their part to still further reduce their income.

The quadruplex excitement seems to have died out for the present, and the Western Union Co. are undisturbed in the use of that remarkable invention. It is not probable, from all the information thus far available, that the Atlantic and Pacific Co. are likely to realize very much from becoming one of the numerous purchasers of the quadruplex patents. That much sold invention seems likely to stick in the possession of the Western Union Co.

Beyond the extension of its lines I cannot learn that the Atlantic and Pacific Co. is as yet doing much. The columns of THE TELEGRAPHER are eagerly scanned

from week to week for additional information, which we know would be there if any such was in existence. But we look in vain for it, and weekly lay down the paper with a feeling of relief that the evil day is indefinitely postponed.

The Direct United States Cable is another aggravating ignis fatuus, which is always just ready to be opened to public use, and inaugurate the long promised competition in Atlantic telegraphy, but which for some reason is never quite ready for the work. That it will eventually be a business reality there is yet some faith to believe; but it has been so often heralded, only to relapse into ominous silence, that our faith in it weakens from day to day. I see by THE TELEGRAPHER that it has actually been used for the transmission of messages on business of the Company, and so far it is gratifying to know. The contractors have evidently had hard luck in laying this cable, and will probably find it eventually anything but a profitable job, while the Direct United States Cable Co. must have been seriously damaged by the failure to complete it as expected. To the uninitiated it looks as though there had been serious mismanagement somewhere in laying this cable, which was expected to prove so great a success. That all parties interested may soon get out of their difficulty is heartily to be wished.

It may be a merciful dispensation that we are spared the threatened excitement in telegraphic matters during this hot weather, and that with energy renewed by the cooler weather of the coming fall we may be better able to endure it. Until then we should all endeavor to possess our souls with patience. The world was not made in a day, and we cannot expect great telegraphic revolutions to be speedily accomplished.

WATCH AND WAIT.

Answers to Correspondents.

G. W. M.—Zinc and spelter are the same. The quotations you refer to are for zinc in bars as spelter, and rolled zinc as zinc.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended June 8th, 1875, and bearing that date.

164,183.—CAUTERY-ELECTRODES.—Jerome Kidder, New York, N. Y. [Filed Mar. 29, 1875.]

1. In galvano cautery instruments, for excising tumors, an insulating handle, extending back of the fixed supporting ring to such length that a firm hold for the hand is produced, substantially as specified.
2. In galvano cautery instruments, the insulating handle having the loop drawing slide ring at the upper section and the fixed holding ring at the lower section, arranged in connection with the circuit opening and closing spring button, near the fixed ring, whereby the exciting action of the instrument is instantly obtained by the joint employment of the thumb and fingers, substantially in the manner and for the purpose set forth.

164,184.—VESICULAR ELECTRODES.—Jerome Kidder, New York, N. Y. [Filed Mar. 29, 1875.]

A double vesicular electrode provided with an insulating head, in which the metallic conductors are embedded flush with the surface, substantially as and for the purpose set forth.

164,185.—RESERVOIR ELECTRODES.—Jerome Kidder, New York, N. Y. [Filed Mar. 29, 1875.]

An electrode for common exterior application, provided with a reservoir for hot water, substantially as and for the purpose set forth.

164,227.—ELECTRIC RAILWAY SIGNALS.—H. W. Spang, Reading, Pa. [Filed Feb. 4, 1874.]

1. The combination of an insulated section of railway track, the respective lines of rails of which are in continuous metallic connection, a galvanic battery having its poles connected respectively to opposite lines of rails of said section at one end thereof, an electro-magnet having one terminal of its coil connected to one line of rails of said section at the opposite end thereof, and its other terminal connected with a circuit closer, which is electrically connected with the other line of rails at the same end of the section as is the first terminal, substantially as and for the purpose set forth.
2. The combination of rails R R¹ of insulated section A of railway track, battery B, wires 1 2, rails R² R³ of short insulated section of track C, wire 5, wires 3 4, electro-magnet M, and signal apparatus D or P, or both, substantially as described.
3. The combination of insulated or separated sections of single rails R R¹, short insulated sections of rails R² R³, connected rails R⁴ R⁵ R⁶, galvanic battery B, wires 1 2, galvanic battery B¹, wires 6 7, electro-magnet M, arranged to operate a signal or signals, wires 3 4, electro-magnet M², having armature lever composed of parts l l', insulated from each other, points p p¹ p² p³ wires 8, 9, 5, 10 11, resistance coil Y, wire 12, electro-magnet M¹, arranged to operate a signal or signals, wire 13, circuit closer O, and wires 14 and 15, substantially as and for the purpose set forth.
4. The combination of separated short rail section R², of section C, connected rails R⁴ R⁵, wire 7, battery B¹, wire 6, separated rail R⁶, wire 8, electro-magnet M², wire 9, lever l, points p p¹, wire 4, electro-magnet M, arranged to operate a signal or signals, wire 3, separated rail R of section of track A, wire 1, battery B, wire 2, and connected rail R¹, substantially as and for the purpose set forth.
5. The combination of electro-magnet M, arranged to operate a signal or signals, wire 13, separated rail R⁴, wire 12, resistance coil Y, wire 11, lever l, points p p¹, wire 10, separated rail R², wire 6, galvanic battery B¹, wire 7, connected rails R⁴ R⁵ R⁶, wire 15, circuit closer and breaker O, and wire 14, substantially as and for the purpose set forth.

6. Rails R R¹ of insulated section of track A, having a galvanic battery B, and electro-magnet M¹, arranged for controlling or operating a signal or signals connected therewith at one end, b, of said insulated section of track, and galvanic battery B¹, and electro-magnet M, arranged for controlling or operating a signal or signals connected therewith at the other end, a, of said insulated section of track, in combination with a circuit closer and breaker, or device for closing and breaking circuit at each end a and b of said insulated section of track A, substantially as described, and for the purpose set forth.
 7. Rails R R¹ of insulated section of track A, having galvanic battery B and electro-magnet M¹ arranged for controlling or operating a signal or signals connected therewith at one end, b, of said section of track, and galvanic battery B¹ and electro-magnet M arranged for controlling or operating a signal connected therewith at the other end, a, of said section of track, in combination with galvanic battery B² and electro-magnets M² M³ (or one electro-magnet, M², with two levers or conductors l l', as in Fig. 7), and rails R² R³ of short section of track C; also, with galvanic battery B³, electro-magnets M⁴ M⁵, or one electro-magnet M², and two lever l l', or conductors, and rails R⁴ R⁵ of section of track C, substantially as and for the purpose set forth.
 8. The combination of electro-magnet S, armature lever E, slotted at its upper end and connected by a pin with lever H, bearing toothed sector I, pinion K, shaft e₂, weighted arm N, short arm n, and disk L, substantially as described.
 9. The combination of spring O' with vibrating signal disk L, as and for the purpose set forth.
 10. The insulated switch rail R⁴, arranged to slide upon insulated plate R¹ for the purpose of being brought into line with either rail R² or R³, which are electrically connected, substantially as and for the purpose set forth.
 11. The combination of rails R⁹ R¹⁰ R¹¹ of siding or crossing section A², insulated at S² S³, rails R⁷ R⁸ R⁹ of section of track A, frog E, wires H² H, and wires 1 2 of battery B, substantially as and for the purpose set forth.
 12. Resistance coils D D', in combination with rails R R¹ of insulated section of track A (or with wires 3 5 and 1 2), substantially as and for the purpose set forth.
 13. The combination of rails R R¹ of insulated section of track A, wires 1 2, battery B, wires 3 5, electro-magnet M, wire 4, and rails R² R³ of insulated section of track C, substantially as described.
 14. Rails R R¹ of insulated section of track A, in combination with wires 1 2, battery B, wire 3, electro-magnet M, wire 4, and short insulated track section C, or other circuit closer, substantially as described.
 15. Circuit closer and breaker or changer G, actuated by switch rod f', or its equivalent, in combination rails R R², plate H, wire 5, connecting wire 9, or equivalent rail R⁶, wire 6, wire 7, insulated rail R, wire 3, electro-magnet M, wire 4, circuit-closing section of track C, or its equivalent, having metallic connection with rail R¹, substantially as and for the purpose set forth.
 16. Insulated or separated section of track A² of branch track, or siding, or crossing at grade, in combination with rails of insulated section of main track A, battery B, magnet M, and short insulated section of track C, or other circuit closer, substantially as and for the purpose set forth.
 17. Rails R R¹ of insulated section of track A, in combination with wires 1 2, battery B, wires 3 5, magnet M, wire 4, electro-magnet M¹, wires 8 7, battery B¹, wire 6, and rails R² R³ of section of track C or other circuit closer, substantially as shown and described.
- 164,228.—ELECTRIC RAILWAY SIGNALS.—H. W. Spang, Reading, Pa. [Filed Oct. 2, 1874.]
1. A polarized relay magnet, which controls a visual or audible signal, or both, a galvanic battery or batteries, and devices for controlling circuits, in combination with the rails of an insulated section of railroad track, A, so as to be operated by opposite or reverse currents, as and for the purpose set forth.
 2. Polarized relay M, battery B², signal operating magnet T, circuit changer D, battery B¹, sections of track A¹ A², and battery B, in combination with lines of rails R R¹ of section of track A, as set forth.
 3. The combination of circuit changer D, having two magnets E E', of different resistances, battery B¹, and sections of track A¹ A², as set forth.
 4. The combination of magnet M, battery B¹, wires 2 6 7, and rails R R¹ R² R³, arranged to be operated by the metallicly connected wheels of a car or train, substantially as set forth.
 5. The combination of magnet M, battery B¹, wires 2 7 8 9, and rails R R¹ R² R³, arranged to be operated by the metallicly connected wheels of a car or train, substantially as set forth.
- 164,270.—GALVANIC BATTERIES.—Howard P. Dechert, New York, N. Y. [Filed Nov. 12, 1874.]
- Interposes a secondary or local action copper pole between the poles of a sulphate of copper battery, and near the zinc pole, in order to prevent the accumulation of copper upon the zinc pole when the sulphate of copper solution rises too high.
- A secondary or local circuit pole, separate and distinct from the primary pole, applied in connection with a primary pole, substantially as and for the purpose set forth.
- For week ending June 15, 1875, and bearing that date.
- 164,406.—FIRE ALARM SIGNAL BOXES.—R. N. Tooker, Chicago, Ill. [Filed March 12, 1875.]
- Bell or gong attached to signal box, and sounded by mechanism actuated by turning the handle to unlatch the door. Designed to prevent maliciously disposed persons from turning in false alarms.
1. The combination, with a fire alarm signal box, of an alarm bell or its equivalent located at the box and sounded by a mechanism which is set in motion by the operation of the device which allows the box to be opened, substantially as specified.
 2. The combination, with the bell or gong, of the handle, the hammer l, and the intervening mechanism by which the motion of the handle is imparted to said hammer, substantially as specified.
 3. The combination, with a fire alarm box, of the handle, the shaft S, the arm U, and the curved catch m, substantially as specified.
 4. The combination, with a fire alarm box, of the arm U, the drum D, both being carried by the same shaft, the chain O, spiral spring P (which is held at its under end), catch m, upright spring P', provided with the shoulder b, and the lug g, substantially as specified, whereby the door is automatically latched.
 5. The combination, with a fire alarm signal box, of the gong K, screw f, sleeve j, and aperture n', substantially as specified.
- 164,425.—FIRE-ALARM SIGNAL BOXES.—Stephen Chester, Elizabeth, N. J. [Filed Dec. 21, 1874.]
- Weight attached to an arm of gear sector, and raised by an independent pinion gearing with the sector, and operated by a key inserted through an aperture in the door of the box. A swinging plate on inside of door, normally held from in front o keyhole by an extension of armature lever; but when circuit i

broken by transmission of signal from any box, the armatures in all the boxes fall away from their magnets, and thus allow the swinging plates to cover the keyholes. Armatures fall away to such a distance that they can only be restored by the introduction of extra battery force at central station after the signal is completed.

1. In combination with an electric signaling apparatus, a revolving pinion or gear-wheel, which is moved directly by a key or other winding device, in combination with a gear-wheel, sector, rack, or other shaped device, connected directly with the driving weight, its support or shaft connected with a spring, for the purpose of raising the weight or winding the spring, substantially as hereinbefore described.
2. In combination with any automatic electric signal apparatus a cog wheel, pinion, or equivalent device, revolving and sliding to and fro upon either a fixed or movable shaft, to be turned by means of a key or equivalent implement, the end of which engages in slots or obstacles provided therefor on the end of the said pinion, for the purpose of winding up weights or springs, substantially as hereinbefore described.
3. The combination of an independent pinion or equivalent device with a wheel, sector, or rack, and a key or equivalent implement which may pass through an orifice in a closed door, for the purpose of winding a spring or raising a weight.
4. The arrangement of ratchet wheel or equivalent device in the closed door or cover, to prevent the key from being turned except in one direction, substantially in the manner and for the purposes hereinabove set forth.
5. In combination with any inclosed rotating device to be operated by a key, the combination of a slotted movable shaft, F, spring or equivalent retaining pin e, and slotted wheel R, to render a peculiarly shaped key necessary to operate the combination, substantially in the manner and for the purposes hereinbefore described.
6. The combination of a swinging plate or equivalent device with a magnet placed within a closed box, to close and open a keyhole or orifice in said box at certain desired times, substantially in the manner and for the purposes as hereinbefore described.
7. The combination of magnet, armature bar, and any device for closing the keyhole of the signal box connected therewith, and to be moved thereby, with telegraph line having connections with more than one series of batteries, so that when the apparatus is in circuit with the lesser battery the magnet shall be competent to hold the armature against its face, and retain the movable device in one fixed position so long as the circuit remains unbroken; but if the armature bar be, by any cause, removed to its extreme reverse position, thus carrying with it the movable device to a second or third position, the magnet will not be competent to withdraw the armature bar from said reverse position until the said lesser or normal battery be temporarily augmented by the addition of extra series of battery therefor provided.

164,537.—FIRE ALARM SIGNAL BOXES.—W. E. Facer, Toronto, Canada. [Filed April, 26, 1875.]

- Transmitting key operated by the motion of notched die in one direction only. Current shunted momentarily from bell magnet on depression of winding arm. A pivoted double stop prevents the operation of winding arm a second time, until transmitting mechanism has returned to starting point. Doors of all boxes but that from which signal is sent are locked by means of a pivoted segment and a mercury balance, operated by an extension of armature lever on breaking of circuit.
1. The disk E, having its notches arranged diagonally, so as to form cams, in combination with the transmitting key F and the elbow lever G, having a pin, h, substantially as and for the purpose described.
 2. The combination, with the insulated lever K and spring L, having contact points, of the crank N, substantially as and for the purpose described.
 3. The combination, with the notched disk E, the main driving spring, and the intervening train of gear wheels, of the friction governor, consisting of a disk, a, having pivoted, segments b, springs c, and an adjusting bar, d, all contained within the frame e, substantially as and for the purpose described.
 4. The combination, with the crank N and the setting crank O, carrying a spring and a stud, i, of a pivoted double stop, P, substantially as and for the purpose described.
 5. The combination of the pivoted locking segment V and the mercury balance U with the armature of the magnets, and the stud o upon the door bolt, as and for the purpose described.
 6. The combination of the locking segment V, carrying stud X, with the spring seated lever catch W upon the inside of the outer case, and the stud Y upon its door, substantially as and for the purpose described.

164,598.—FIRE ALARM REGISTERS.—Willard W. Sawyer, Springfield, Mass., assignor to himself and Geo. M. Stebbins. [Filed Feb. 5, 1875.]

- For registering upon indicating wheels the number of the box announced by the bell in engine-houses.
1. The combination of the stop-wheel e, having prongs or projections thereon, with the push-rod d as a means of determining or changing the position of the tripping rod, substantially as described.
 2. The combination of the push-bar d, the stop-wheel e, the rack and pinion i, or equivalent connection, and the tripping-rod f, whereby the desired combination of numerals or characters is made upon two or more wheels, D, substantially as set forth.

Miscellanea.

MAGNETS FOR ELECTRO-MOTORS.—Magnets or armatures for electro-motors may be softened as follows: Heat the iron to an even dull red heat all over; and if the surface of the iron has not been faced off in a machine, lightly file it to remove the scale, and then immerse it in common soft soap, allowing it to remain therein until it is quite cold. Then reheat the magnet to an even red heat whose redness is barely perceptible, and bury it in pulverized lime, wherein it must also remain until quite cold, when the metal will be found as soft as it is possible to make it, and the blade of an ordinary penknife will cut it. At the second heating the iron will emit a light blue flame, showing the effect of the immersion in the soft soap. The conductivity of the magnet may be, by this process, very much increased.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JULY 10, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

Practical Suggestions.

THE flashing lightning, reverberating thunder and steadily falling shower, as we write, suggest ideas of green fields, verdurous woods and growing harvests, which shall afford pleasure to the heated denizens of cities, who may be so fortunate as to be enabled to enjoy them for even a brief season, and reward to the labor of the husbandman, which shall substantially enrich the country. But they also suggest other ideas less pleasant and agreeable. These are of telegraph wires, surcharged with atmospheric electricity; operators cooped up in stifling offices whose difficulties are augmented and labors prolonged and increased by this temporary display of the mighty forces of nature. To such, a thunder storm seems to be an unmitigated evil, which it certainly is not, and their principal desire, forcibly expressed, is that it may soon pass over, and with as little damage to the lines and instruments as possible.

Much damage is done every season to telegraph wires and apparatus by lightning, but this is in great part due to inadequate preparations to meet such an emergency. Every telegraph instrument and battery should be protected from damage by atmospheric electricity by proper and efficient lightning arresters. These may be readily obtained, and it is seldom that any material damage is done to such when thus protected. To omit the use of arresters on account of the expense is a "penny wise and pound foolish" policy, as has been constantly demonstrated. Wires may be also almost absolutely protected from damage by lightning by the use of suitable conductors attached to the poles, which shall carry off to the earth, whose capacity for receiving and disposing of it is practically unlimited, the surplus charge, which otherwise so often proves destructive to poles and wires. In England and on the Continent of Europe the use of such lightning conductors is very general, and it has been introduced on some lines in this country, but by no means so generally as it should be. It costs something in money and labor, it is true, but the extra cost is repaid every season in the ability to use the wires, when otherwise their use must be suspended, sometimes for hours at a time, and in the prevention of the damage which poles and wires suffer every year when not thus protected. Telegraph cables submerged in the waters are peculiarly liable to damage from lightning; and so great has been the difficulty, injury and loss experienced

from this cause, that these are seldom left without more or less protection from lightning arresters. If not so protected they are almost certain, at some time during the electrical season, to be rendered useless temporarily, if not even entirely destroyed.

In selecting lightning arresters great care should be taken that they are really what they purport to be, and not merely cheaply constructed and practically useless shams. They should have sufficient surface in the plates to receive, and a sufficiently good connection with the earth to carry off even a heavy charge of electricity. Where gas and water pipes are available, they should be connected by large conductors with them, and when these conditions are properly fulfilled there is little danger of damage from lightning.

Now that we are in the midst of the electrical season these suggestions will perhaps receive attention from those who are interested in the management and operation of telegraphic lines and apparatus, though it can hardly be considered as an evidence of carefulness on the part of those who have not already made such essential and necessary provision. In this case, however, it is better to attend to the matter late than not at all; and every telegraph superintendent and manager should see to it at once that every practicable appliance that experience and prudence suggests has been provided for the protection of the telegraphs under their charge.

The Rates for Government Telegraph Messages.

We last week gave a brief account of the conference between the representatives of the Western Union, Southern and Atlantic and Atlantic and Pacific Telegraph Companies and the Postmaster General, relative to the rates to be charged for official Government messages over the lines of such telegraph companies as have accepted the provisions of the General Telegraph Act of 1866.

In reply to the suggestion of the Postmaster General that the rates should be reduced 25 per cent. from the former rate of one cent per word in each circuit of 250 miles, Mr. ORTON made a very able argument in behalf of the telegraph companies. He showed that the advantage possessed by the Government in priority of transmission alone, would be worth commercially very greatly enhanced instead of reduced rates—at least double the ordinary tariff charges. Instead of charging more, as would be the case to the public under a similar arrangement, the companies performed the services for the Government at greatly reduced rates, besides allowing an increased number of words per message. In addition to these advantages the distances for Government messages were calculated by air lines, whether telegraph lines exist on such direct routes or not, paying accordingly, regardless of actual distance of transmission by circuitous routes to reach destination, or of frequent necessary repetitions.

In closing, Mr. ORTON stated that the Western Union Company would be willing to continue the service at the same but not at materially reduced rates.

Mr. BLOSSOM, on behalf of the Southern and Atlantic Telegraph Company, concurred in the views of Mr. ORTON, briefly showing that the business of the telegraph companies had not been generally profitable, the Western Union Company alone, of the companies represented, having been able to make any dividends after many years' business, and closed by stating that his company would prefer to be excused altogether if rates were reduced, while perfectly willing to serve the Government on the present basis.

Mr. ORTON finally suggested that the Government continue to pay the existing rates, with the understanding that in no case should it be charged for more than ten circuits of 250 miles each, or ten cents per word, regardless of actual distance.

The conference closed by the Postmaster General taking the papers for further consideration, remarking that he thought he ought either to reduce the rates to ½ cent per word, or the Government pay full commercial

rates and economize by reducing the volume of Government telegraphing, which he thought unnecessarily large.

Subsequently the Postmaster General gave a decision, in accordance with the suggestion of Mr. ORTON, retaining the former rate, with the amendment limiting the charge on any message to ten circuits or ten cents per word. This decision is generally acceptable to the telegraph companies.

The Appointment of Electrician to the Centennial Exhibition.

We are gratified to know that the suggestion of THE TELEGRAPHER in regard to the proper person to receive the appointment of Electrician to the Centennial Exhibition at Philadelphia, has been favorably received. Mr. DAVID BROOKS is just the man to do honor to the electrical and telegraphic interests of the country. As an electrician his ability is well known and generally recognized in Europe, as well as in this country. His long experience as a practical telegrapher and telegraph manager fully qualify him to arrange and supervise the telegraphic display in the best and most satisfactory manner. As a Philadelphian, as well as an American, he will feel the greatest interest in making the electrical and telegraphic department of the exhibition one of its most prominent and successful features.

No doubt among the large number who will be induced to visit the United States and its Centennial Exhibition next year, many of the leading and prominent electricians of Europe will be included, and his extensive and intimate acquaintance with these will be a very great advantage.

The prominence and success of the Electrical and Telegraphic Department of the Exhibition will depend largely upon the official who shall have it in charge. If an incompetent or inefficient person should unfortunately receive the appointment through any influence that may be brought to bear, it would be most unfortunate. Under such circumstances the managers of the telegraph companies would take little or no interest in it, and it would degenerate into a mere advertising medium for manufacturers and dealers in electrical and telegraphic apparatus and supplies.

Mr. BROOKS is willing to accept the position, and devote to the service his best efforts and talents. We understand that the propositions to appoint him meets with favor from those in whose hands final action lies, and we hope very shortly to be able to announce that it has been made. It certainly is one eminently fit and proper, and we have yet to hear the first word against it from any source.

Celebration of Independence Day.—Parade and Review of the Messengers of the American District Telegraph Company.

THE celebration of the anniversary of American Independence has come and gone, attended with the usual noisy demonstrations, military and civic parades, orations, and accidents to life and limb, arising from the reckless and careless use of explosives and firearms.

In this city the municipal parade took place at an earlier hour than usual, and passed off satisfactorily. One feature of the parade this year was novel, and attracted much attention and compliment from the municipal officials, as well as the multitude of spectators who lined the streets, and witnessed the review by the Mayor, at Union Square. We refer to the parade and review of the Messengers and Police of the American District Telegraph Company of this city, which formed a part of the municipal pageant.

In accordance with orders previously issued, the corps of messengers formed in line on Thirty-seventh, Thirty-eighth and Thirty-ninth streets and Sixth avenue, under command of Drill Inspector J. F. COWAN. The police corps formed on Sixth avenue, and were commanded by Capt. JOHN HASSARD and Roundsman J. F. O'BRIEN.

The order of formation was as follows:
Police.

Captain of Patrol, JOHN HASSARD.

Twenty Patrolmen.

Superintendent H. W. POPE.

Quartermaster J. H. HINGLE.

Prof. J. C. JOHNSTON, with the Juvenile Band of the Soldiers and Sailors' Orphan Home—twenty pieces.

J. F. COWAN,

Drill Inspector and Col. Commanding.

Lieut. Col. J. M. BALL.

Adjutant R. T. TIGHE.

MESENTERS.

First Company, Capt. WALES.

Second Company, Capt. MONTROSE.

Third Company, Capt. CONKLIN.

Fourth Company, Capt. BYRNES,

(With the colors).

Fifth Company, Capt. PETTY.

Sixth Company, Capt. DUNNING.

Seventh Company, Capt. TURRELL.

J. F. O'BRIEN, Roundsman, and twenty Patrolmen.
Municipal Police.

Each company was full, presenting sixteen files front, and the alignments were perfect, showing an extraordinary familiarity with tactics, and their perfect drill and discipline. They formed the rear of the first division of the municipal procession, and looked well in their neat uniforms, and were continuously cheered and applauded by the spectators who lined the streets through which they passed. The rain which had fallen early in the morning had made the streets slippery, and the marching was evidently difficult for the troops, but the boys had been so well drilled that they went over the whole route in good order, and were, in fact, the only part of the procession that received any applause, and it was the general remark that their marching was equal, if not superior to that of the military.

They were accompanied by the excellently drilled Juvenile Brass Band, of the Soldiers and Sailors' Orphan Home, in new and handsome uniforms, who discoursed some excellent music. Many of the boys in this band are quite expert telegraph operators—telegraphy being taught at the Home to such of the boys as show an adaptability to the business, as a branch of their regular education.

The route of the procession was down Fifth avenue to Canal street, to Broadway, and up Broadway to Union Square, where it passed in review before the Mayor, and a large concourse of people who had been attracted to see the show.

Immediately after passing in review the command countermarched, wheeled into line and performed various battalion evolutions amid the enthusiastic applause of the spectators. They were highly complimented by Mayor WICKHAM for the perfection of their drill, and the neat and handsome appearance they presented.

Each messenger, according to orders, wore a Piccadilly collar, with hair cut close and their personal appearance everywhere was favorably commented upon.

The *Tribune* and other city newspapers are exceedingly complimentary to the boys, and say that their marching and alignment were superior to that of the best regiments in the line. It has always been the ambition of the Sup't of the Company to bring the messengers up to this standard, and no labor or pains have been spared to accomplish this. This drilling of the boys is found to have an excellent effect, creating an *esprit du corps* among them not otherwise attainable, and most of them feel the greatest interest and pride in the efficiency and excellence of their organization, and in the superiority of the companies to which they respectively belong.

Messrs. COWAN, TIGHE and BALL, and the company commanders deserve praise for their labor, which have been gratuitous, and without which so favorable a result could not have been effected.

Mr. J. B. ASHURST, Sup't of the Messenger De-

partment of the Company, is entitled to much credit for his zeal and efficiency in bringing up the *personnel* of the large corps of messengers employed to its present excellent standard.

The boys are in perfect discipline, and it is intended to maintain the organization permanently.

Solid Summer Reading.

In the present dearth of exciting topics to treat upon and entertain their readers with, the newspapers are filling their columns with dissertations on and accounts of the wonderful KEELEY motor, which is to upset all previously accepted theories of motive power, revolutionize the world, do away with the use of steam, of fuel, of boilers and of engines, and with a single glass of water, and nearly without cost, propel railroad trains for hundreds of miles; and the telegraphic inventions of EDISON, the great professor of duplicity and quadruplicity. The remarkable and astounding genius of the latter had its latest exemplification in the columns of the *New York Sun*, which devoted, a few days since, two columns of its valuable space to an account of his rediscoveries and reinventions, and the wonders displayed in his headquarters at Newark, N. J. It is true that the *Sun's* elaborate account lacked the element of novelty, but it aids in making, in popular estimation, a great genius out of the professor. It fails, however, to give the public any account of his dealings with "wicked partners" whom the "guileless youth" has been taken in and *done* by, or the legal complications which their wicked machinations have caused. It would be interesting to some of these "wicked partners" if the *Sun* had added to its account a statement of the number of times and persons those inventions have been sold to and contracted for, with the futile efforts made by them to obtain interviews with the professor after he had given them the "cold shake."

There is a great deal in the professor's history for the last ten or fifteen years which would be of interest to write up, and it is to be hoped that some enterprising daily will devote time and space to developing and recording it. Without this his real greatness will fail of appreciation, except by those who have suffered pecuniarily from their confidence in and dealings with him. Let us have the whole story.

The Direct United States Cable.

NOTHING has been heard from the *Faraday* since the last number of THE TELEGRAPHER, and the Direct United States Cable is not yet in operation. The delay is very annoying to all concerned, but there seems to be no help for it. No signals have passed over the cable since it was raised and cut by the *Faraday* as has been previously stated.

Some of our daily contemporaries in this city have published a statement, which has been very widely copied, that no intelligible signals have passed over the cable. This is not correct. We are assured that for eleven days after the laying of the cable was completed a large number of messages were exchanged over the cable, between the cable officials and contractors, and that the cable worked very satisfactorily. There was shown by the tests, however, a slight fault in the long section of the cable which the contractors, Messrs. SIEMENS BROTHERS, desired to remedy before delivering the cable to the Direct United States Cable Company. This they are now attempting to do, and meantime the cable is still in the hands of the contractors and under their control, and not that of the cable company.

Characteristics of a Genius.

It is a common saying in the southern section of the country that "the longest pole knocks the persimmon." The leading telegraph companies of the country seem to have realized the force of this homely saying, and are looking for the pole which shall knock off the tele-

graphic persimmon. Our Western Union friends think that the duplex and quadruplex pole will prove the longest eventually, and that the persimmon is theirs. Our Atlantic and Pacific friends, while they are by no means indifferent to the length of the quadruplex pole in the hands of their opponents, and are, therefore, striving as vigorously as possible to deprive them of it, still believing the automatic pole to be even more lengthy and effective, and place their chief reliance for the ultimate possession of the persimmon in that. They believed that their arrangements with the late Automatic Telegraph Company had assured them a practical monopoly of the use of this pole, but now comes Mr. GEORGE LITTLE, who claims that the longest end of that pole belongs to him, and proposes to resume possession of it, the Automatic Company not having (as he claims) fulfilled its agreements with him, and his thirty-six automatic patents thus reverting to his possession and control.

The professor of duplicity and quadruplicity, most of whose numerous partners, wicked or otherwise, seek interviews with him in vain, also lays claim to both the quadruplex and automatic poles, but has so numerously conveyed his supposititious interests in them as to make it difficult to decide in whom the title, if he ever had any, now resides. We have heard it intimated that a new customer would be welcome to him, and that he is ready with additional agreements contracts and assignments for such customer whenever he may turn up. The only difficulty is to find the customer, for having already dealt with and become known to all now engaged in the business, it will be necessary to organize an entirely new company in order to supply a new purchaser, and in the present financial condition of the country this is not very easy of accomplishment. However, he has been remarkably successful in finding new victims whenever the necessity for them has arisen heretofore, so that we suppose he need not despair of their being provided in the future. If we are not misinformed he is financially in sad want of new customers at the present time, and from the announcement in his recognized organ that he has devised an apparatus for working three circuits each way on a single wire simultaneously, we are convinced that he is preparing for some new *coup de etat* which shall surpass all his former achievements. His genius will never permit him to hesitate or falter when the exigencies of his finances or the erratic characteristics of his conscience demand the development of new and startling electrical or telegraphic devices and customers. So long as the electrical works of native or European electricians and telegraphers, or the specifications of forgotten applications for patents hold out, there will be no lack of *new* inventions on the part of the Professor.

A Friendly Call.

WE were favored on Wednesday last with a call from Mr. HUGH NELSON, Supt., and Mr. C. R. HOSMER, Manager, of the Montreal office of the Dominion Telegraph Company, of Canada.

Mr. NELSON reports the Dominion Company as being in a flourishing condition, though Canada, as well as the United States, is suffering from the prevalent business depression. They come here on business of the company, and are accompanied by Mr. SWINYARD, the General Manager of the Dominion Company.

Personals.

Mr. DAVID McCARGO formerly General Supt. of the Pacific and Atlantic Telegraph Co., has been appointed General Supt. of the Alleghany Valley; the Oil Creek and Alleghany River; and of the Buffalo, Corry and Pittsburg Railroads. Mr. McCARGO, assumed the duties of the position, June 23. He has been for some time past Receiver of the Oil Creek and Alleghany Valley Railroad.

Mr. E. W. BARNES has been appointed manager of the New Orleans, La., Western Union office.

Mr. GEO. W. TRABUE has been appointed Supt. of the Second District of the Southern Division, Western Union Telegraph Co., in the place of Mr. J. B. TREE. The headquarters of the District will soon be removed to Nashville, Tenn., but will continue at Louisville, Ky., until further notice.

Mr. D. R. SAUNDERS, manager of the Long View, Texas, Western Union office, has resigned and gone to Kentucky, to engage in other business.

Mr. W. J. PETE, of Dallas, Texas, has been appointed manager of Long View, Texas, Western Union office.

Mr. CHARLES PATCH, of Memphis, Tenn., Western Union office, has resigned and accepted a position with the same Company, at San Francisco, Cal.

Mr. A. W. JONES has been appointed manager of Alama, Colorado, Western Union office.

Mr. W. T. LOPER night press operator, St. Louis, Mo., Western Union office, has resigned and gone home to Oshkosh, Wis., for a short visit, after which he will probably accept a position in the East.

Mr. THOMAS P. WHEELER succeeds Mr. LOPER on night press, at St. Louis, Mo., Western Union office.

Mr. JAMES C. DE LONG, takes the position formerly held by Mr. WHEELER, on Chicago duplex, days, St. Louis, Mo., Western Union office.

Mr. SI. WILLIAMS, formerly of the Cincinnati, O., Western Union office, has been appointed manager of the Western Union office in the Union depot, at East St. Louis, Ill., with Messrs. EDDY, NEVILLE and W. C. BRYANT as assistants.

Mr. T. J. HERBEL has resigned his position as agent on the Colorado Central Railroad, and is rusticated in Denver, Col.

Mr. CHARLES E. BOCK, has been appointed telegraph operator for the Cairo and St. Louis R. R., at East St. Louis, Ill.

Mr. G. J. FERGUSON, late of the N. M. R.R., has been appointed agent and operator at Sparta, Ill., for the Cairo and St. Louis R. R. Co.

Mr. JOHN BARTLEY, has accepted the position of telegraph operator for the Cairo and St. Louis Railway Co., at Murphysboro, Ill.

Mr. JOSH. LITCHED, of Henderson, Ky., has accepted a position as operator and extra train dispatcher of the Atchison, Topeka and Santa Fe R. R., at Topeka, Kansas.

Mr. C. C. PARSENEY, has been appointed Supt. of Telegraph Central Branch of the Union Pacific Railway, with headquarters at Atchison, Kansas.

Mr. C. P. COCHRAN, has been appointed Supt. of Telegraph of the Atchison and Nebraska R. R., at Atchison, Kansas.

Mr. HARRY H. ECKERT, of the St. Louis Western Union office, has resigned, and goes to the country for his health.

Mr. WM. MONTGOMERY, of the Lawrence, Kansas, Western Union office, has been appointed manager at Eudora, Kansas, St. L., L. & W. R. R. office.

Mr. H. H. HUNT, of the Memphis, Tenn. Western Union office, has been transferred to the New Orleans, La., office of the same company.

Mr. C. E. MORROW, of the Memphis, Tenn. Western Union office, has been transferred to the Helena, Kansas, office of the same company.

Mr. J. S. ROBERTS, has been appointed manager of the Manitou, Colorado, Western Union office.

Mr. BERT AYERS has resigned his position with the Western Union Company at New Orleans, La., and is visiting in Cincinnati, O. He will probably go to New York soon.

Mr. ED. SCHERMERHORN is working for the Colorado Central R. R. Co. at Fork-of-Creek, Colorado.

Mr. J. L. CASSIDY, of St. Louis, Mo., Western Union office, spent the "Glorious Fourth" at his house in Barry, Ill.

Mr. F. SCOTT SMITH, formerly of Albany, N. Y., Western Union office, but more recently of Saratoga, N. Y., office, has resigned his position in the latter office, and goes to Michigan to engage in the lumber business with his brother.

Mr. GEORGE WOODWARD, late of "Da" Union Depot office, at Albany, N. Y., has accepted a position in Western Union office at Albany.

Mr. A. S. HOWE, late chief operator of the Utica, N. Y., Western Union office, has resigned, to engage in other business. No successor has been appointed, Mr. G. E. ALLEN performing the duties of chief operator in connection with those of manager.

Messrs. BEARDSLEY and CHASE have resumed their old places at Saratoga Springs, N. Y., Western Union office.

Mr. F. W. GLIDDING, of Springfield, Mass., is subbing for Mr. F. ALFRED EVANS at the Albany, N. Y., Western Union office.

Mr. C. H. DAVIS has accepted a position on the night force Western Union main office, 198 Broadway, New York.

The Telegraph.

By Cable.

TELEGRAPHIC PROGRESS IN MEXICO.

CITY OF MEXICO, June 30, via HAVANA, July 7.—The telegraph line between Tampico and San Luis Potosi has been completed.

Foreign Telegraphic Notes.

THE Anglo-American Telegraph Co., announces a quarterly dividend at 1 1/2 per cent., or at the rate of 5 per cent. per annum.

The contract for submerging a telegraphic cable between Sydney (Australia) and New Zealand has been signed by the Telegraph Construction and Maintenance and Eastern Extension Telegraph Companies.

The international Telegraph Conference at St. Petersburg has passed a resolution forbidding the artificial formation of compound words. The Conference has accepted the principle of letters as a substitute for a measure of words, deciding that, within the limits of Europe, five letters shall be equivalent to a word, and on Transatlantic lines, or lines going beyond Europe, ten.

The Directors of the Eastern Telegraph Co. recommend the declaration of a final dividend of 2s. 6d. per share, making, with previous payments, a dividend for the year ending with March 31st, of 5 per cent., carrying to reserve £36,000.

The Eastern Extension Telegraph Co. has declared an interim dividend for the quarter ending March 31st, 1875, of 3s. per share, or 6 per cent. per annum, free of income tax, payable July 15th.

The Post-office has been so unfortunate as to have two of its cables broken for some time now, and on this account direct communication with the Channel Islands and the Isle of Man has been suspended. There is, however, a fair prospect of the repair of both cables being effected at no distant date. The cable ship Caroline, chartered by the Postmaster-General for the purpose, is on her way to the Channel Islands, where it is understood she will recover a portion of a disused cable, and proceed thence to repair the Isle of Man cable with the same. Meanwhile, a section of new cable will be manufactured to replace a portion of the Channel Islands line partially worn out, and it is hoped that no great length of time will elapse before the whole repairs are completed. The Post-office is somewhat awkwardly situated in regard to this particular portion of its work in having no cable ship of its own wherewith to execute the repair and renewal of cables, and its difficulties have not been lessened by the recent destruction by fire of its extensive cable stores at Lowestoft.

The West India and Panama telegraph cable between St. Thomas and St. Kitts has been repaired, and all stations on the company's system are now, therefore, in telegraphic communication with Europe.

The total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ended June 12th, 1875, was 415,422, an increase on the corresponding week last year of 40,248.

The Cuba Submarine Telegraph Company have received information of the repair of the cable between Punta-Rassa and Key West, whereby telegraphic communication with Cuba, Jamaica, Panama, Porto Rico, St. Thomas, Trinidad, Demerara and Berbice has been restored. The steamship Professor Morse leaves London next week to lay a duplicate cable between the first mentioned points.

At the International Telegraph Congress at St. Petersburg, the real subjects for debate will concern almost exclusively the adoption of a fixed international tariff, with the settlement of the base on which it is to be fixed. The British proposal that the latter shall be the number of letters in a word and not the syllables, has been privately communicated to the representatives, and it is understood that it will meet general acquiescence. The idea of using the whole word as a base for the charge is rejected beforehand as obviously too much in favor of the Teutonic system of forming compound nouns by simply joining two or three in one, instead of connecting them by prepositions as in French

and other Latin tongues. Thus one of the commonest orders sent on the Continent, that for firewood, might be given by the one German word *Brennholz* or by our own similar compound, whereas the Frenchman would have to pay for three in sending for his *bois du chauffage*.

It appears from the report of the Controller and Auditor General on the capital account of the English Post-office Telegraphs, that the total cost of the Post-office Telegraph system, up to the close of the financial year 1872-73, was £9,085,458.

The traffic receipts of the Eastern Telegraph Company for the month of May amounted to £30,602, against £30,225 at the corresponding period of 1874; and of the Eastern Extension, Australasian and China Telegraph Company to £17,773, against £18,879 last year.

The traffic receipts of the Brazilian Submarine Telegraph Company for the month of May amounted to £12,080.

The number of messages passing over the Cuba Submarine Telegraph Company's lines during the month of May (including those received at the new station in Cienfuegos) was 2,481, estimated to produce £2,400 against 1,788 messages, producing £1,851, in the corresponding month of last year. The actual receipts of the three months ending March amount to £7,153, as compared with the estimated amount of £7,100.

The traffic Receipts of the Direct Spanish Telegraph Company for the month of May amounted to £1,442 9s. 2d., against £1,494 14s. 6d. in April.

The number of messages forwarded from postal telegraph stations in the United Kingdom, for the week ended May 29th, was 409,008, an increase over the corresponding week last year of 62,373; for the week ended June 5th, 415,296, an increase over the corresponding week last year of 30,017.

The Telegraph in Western Australia.

ALMOST all the towns of Western Australia are now connected by telegraphic wires. Albany, King George's Sound, is united with Perth, the capital, whence wires run to every place of importance north and south, with the exception of Geraldton. As the work of telegraphic extension is rapidly progressing, it is expected that in a short time a line will be carried to the last mentioned town. The colonial parliament has voted £15,000 for the construction of a line from Western Australia to South Australia. The charge made for the transmission of messages between any two stations in Western Australia is 1s. for the first ten words, and 6d. for each additional word.

Anglo-American Telegraph.

THE following are the traffic receipts of this company from messages at the reduced tariff of 2s. per word for the week ending on Thursday:

Friday, June 19	£1,500
Saturday, " 20	1,340
Sunday, " 21	350
Monday, " 22	1,250
Tuesday, " 23	1,460
Wednesday, " 24	1,540
Thursday, " 25	1,350

The average daily receipts in June last year, with the messages at the rate of 4s. per word, was £1,950.

SPRAGUE.—At Kansas City, Mo., to the wife of Mr. HENRY C. SPRAGUE, Supt. of Telegraph for the Missouri River, Fort Scott and Gulf R. R., on the morning of July 1st, 1875, a son. Ten pounds.

WESTERN ELECTRIC MAN'G CO.
220 Kinzie Street,
CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THERE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
**104 Centre Street,
NEW YORK,**

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SULLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Gennine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

The Occult Forces of Nature Utilized.

THE WONDERFUL INVENTIONS OF MR. T. ANANIAS EMPERICUS.

FOR a period of almost ninety years, and during nearly twenty-five hours of every day, including Sundays, the extraordinary genius of whom we are going to furnish to the readers of *The Moon* (price two cents) some slight account, has occupied himself in the practical investigation of those mysterious molecular and atomic vibrations which he has so happily termed electricity. Although the young editor up in the tall tower, with characteristic moral obliquity, assumes to be the sole mouthpiece of a certain eminent and reticent financier, yet our readers will at once realize how unfounded is this assumption when they read in the columns of today's *Moon* the facts, which, with our usual enterprise, were the first and only journal to discover and make known. A few days since we despatched our philosophical and scientific reporter, with instructions to penetrate the Wilds of Jersey, and to bring back all that was known and a good deal that was not known, and never will be, in reference to the discoveries of the extraordinary mental phenomenon of whom so much has been recently heard, and so little has been recently seen.

By diligent inquiry among the policemen and apple-women of one of the principal industrial centres of the neighboring principality, the laboratory of the great genius was discovered, and after satisfying the occupant that he was neither a minister of the gospel nor a deputy sheriff, our representative succeeded in effecting an entrance into the sacred precincts. Like all truly great men, the genius wears dirty shirts, chews tobacco and eschews whiskey. He rejoices in a stovepipe hat, which has seen better days, and No. 24 boots. Notwithstanding his advanced age, and the incredible amount of labor he has gone through, he scarcely appears to be more than thirty. In answer to a brief interrogation on the part of our representative, Mr. Empiricus, with characteristic modesty and self depreciation, proceeded to give some account of his labors, frequently illustrating his remarks with practical illustrations of the most startling description. It seems that Mr. Empiricus was first led into the train of investigation which has produced such surprising results, by observing, as long ago as 1786, that a frog's hind legs could be made to jerk about in a very curious manner by the application of strips of zinc and copper. After a series of wholly original experiments, he found that two metals might be placed in a jar filled with a blue liquid, the nature of which remains a profound secret, and connected by means of a copper wire, wound into a spring-like form over a common white pine broom-handle, and that an ordinary rod of iron, such as are found in most first class blacksmiths' shops, placed within this spring, would utterly neutralize and set at naught the old theories of gravitation, as beautifully expressed by the poet in the well known lines:

"What goes up must come down,
On your head or on the ground."

at least so far as small bits of iron are concerned; but this was as nothing to his triumphant discovery, elaborated between 1832 and 1844, that intelligence could actually be transmitted over common metallic wires at a moment's notice, and even after dark. General Tremendous Trumpeter was the only man on earth who had discrimination enough to take any stock in this discovery, or to induce his friends to put any money into it. He organized a joint stock company, called the Arctic and Antarctic Telegraph Company, and despite the feeble opposition of one Morse (who set up a pretended claim to Mr. Empiricus's great invention), aided and abetted by an obscure convocation of poverty-stricken adventurers, calling themselves the Western Union Company, he succeeded in compelling an unwilling and unbelieving world to "walk off on its ear." The principle of this invention is very abstruse, but we can perhaps render it luminous to the readers of the *The Moon* by a simple illustration. Let an ordi-

nary Cotswold or merino lamb, about two weeks old, represent the metallic conductor, say between New York and Washington, and the tail of the lamb (which for convenience sake we will suppose to be in Washington) may be looked upon as the movable portion of the "sounder," as it is technically termed, at the terminal station. The "battery," at New York, is typified by the milk producing apparatus of the maternal sheep, and when the front end of the lamb is applied thereto at New York, the tail end of the lamb at Washington will begin to vibrate with inconceivable rapidity, so that a skilled agriculturist, who could only see the rear portion of the lamb, would be able to understand, with unerring accuracy, precisely what was going on at the other end of the animal. Mr. Empiricus, while one day strolling in the field, had his attention attracted by the somewhat unusual spectacle of three distinct lambs deriving simultaneous sustenance from a single sheep, and he furthermore observed that the amplitude of the caudal vibrations was neither isochronous nor isodyamic in any one of the three juvenile muttons. To an ordinary mind there would have appeared to be nothing especially significant in this phenomenon, but in the mind of a genius like Mr. Empiricus, it was fraught with infinite possibilities, and destined to give birth to a train of discoveries, the result of which, it would not be too much to say, the ancient Nicholas himself will never live to see the end of. That immortal sheep will live in history, the peer of Galileo's chandelier and Newton's Newtown pippin. He returned to his humble abode. It was not the mellifluous caterwauling of the nocturnal tom cat, nor the spirit stirring bugle blast of the myriad voiced sereaders from the Haekensack meadows that drove sleep from his eyelids that night. Ah, no! it was something far worse than these, it was the **TRIPLIPLIX!** There are in every community a large number of impatiently inquisitive individuals, and by some of such we may be interrogated as to what this Tripliplix is. The Tripliplix, then, is a grand universal, irradiating, electrical convolvulus. Whether its pulsations are of a trichotomous or of a trydaethylous nature, is a subject upon which philosophers are not agreed. General Tremendous Trumpeter is understood to incline towards the former hypothesis, but one thing is certain, that it is destined to knock thunder out of the Western Union Company, if it can only be got away from its rightful owners. Not the least singular thing about this discovery—and we ought to have mentioned it before—is the infinite mathematical possibilities which lay concealed within it. Long before the discovery itself had ever been thought of, one half of it had been sold in Boston and two thirds in Washington. Half of it was disposed of afterwards in New York. The gifted inventor was afterwards offered 1,000 shares of Boston, Hartford and Erie stock for his entire interest, which he is understood to have accepted. There are few things in this world that will bear cutting up into eight thirds, and Mr. Empiricus's friends justly look upon this as the crowning triumph of his skill.

It must not be supposed, however, that the subject of this sketch has devoted his entire time to the discoveries we have mentioned. He has made hundreds of thousands of experiments with various chemicals. Our reporter, who dabbles a little in chemistry himself, asked him if he had ever noticed the peculiar effect produced by means of a soluble, saponaceous mixture of a fatty acid and an alkali, combined with protoxide of hydrogen, when applied to the human epidermis. Mr. Empiricus said, "No, I have never experimented with that compound at all, I have often been requested to, but on the whole I never thought it would pay."

Mr. Empiricus's laboratory is now situated in an ordinary brick building, which in its exterior architectural effect is very similar to other brick buildings. There is a commodious stone edifice on the east bank of the Hudson river, about thirty miles from New York, which has been erected and munificently endowed by the State, and which is much better adapted for the occupancy of persons engaged in some of the especial mechanical and mathematical branches than buildings of our ordinary class, and it has been thought by some that such a genius as we have attempted to describe would never feel fully satisfied until he had succeeded in establishing himself therein, but of course this is a matter with which we have nothing to do, and can afford to leave it entirely to the judgment of the parties interested.

[From the *Overland Monthly*.]

Mr. Columbus Coriander's Gorilla.

My article on the Origin of the Human Species had been months in preparation. Much of the fame which I have since secured by its publication in that widely circulated magazine, the *Interoceanic Monthly*, is due to the fact that I spent weeks in deep investigations in ethnological science, comparing results, and especially examining the points of resemblance which exist in the

brute creation and the nobler race of man. To say that I utterly overthrew the Darwinian theory, and quite demolished the tribe of pretenders who have since attempted to imitate that great apostle of error, may not be strictly in accordance with modesty, but hosts of candid friends will admit that it is strictly true. I know very well that, though my untiring labors in the cause of science are not yet thoroughly appreciated, an admiring posterity will dwell with delight on the name of Samuel Sincox as the benefactor of his race, who showed where that race had its birth, and from what primitive elements it sprang. For further particulars, see the *Interoceanic Monthly* for June, 18—.

My favorite haunt during the progress of my article was Coriander's menagerie; having resolved that this should be the masterpiece of my life, I spared neither labor nor expense upon it, and actually procured a season ticket to the menagerie, and passed many pleasant hours in watching the wild animals, studying their habits, and drawing many valuable conclusions from their points of resemblance and difference. Consequently, though the apes and monkeys had furnished me with an inexhaustible fund of amusement and interest, I was delighted beyond measure when it was announced that Coriander had secured a live gorilla for his collection of wild beasts. An agent had been despatched to Africa, and had sent home, with great secrecy, a real live specimen of this dreadful beast; and so well had all the negotiations been kept, that nobody knew of what was being done until the monster was fairly caged and on exhibition at Coriander's menagerie. I entered with zest upon a study of the creature's habits and peculiarities; and, while the idle curiosity of mere wonder mongers kept a vast crowd about the cage wherein the furious beast was confined, I calmly surveyed it from a safe distance, and made my scientific observations for the benefit of mankind. And when vulgar wonder at the strange beast had somewhat subsided, and I could get nearer the cage and watch the gorilla, I was more and more impressed with the human traits which I discovered in the extraordinary animal. His manner of reclining was, though impish, half human, and his grotesque gait, as he sprang from side to side of the narrow prison, was suggestive of his supposititious congener—man; even his terrible howl, which rent the air of the museum constantly, had a human shade of sound.

One rainy day, when the great hall of the museum was unusually vacant of visitors, I almost leaned against the cage in my eager watch of the movements of the gorilla. I fancied him roaming in his native African jungles, the terror of every living thing, or rearing, with a strange and grotesque solicitude, his young family. I wondered how much akin to human love and hate were the passions that raged beneath that hairy breast, and how much of real feeling was in the loud and anguished howl that occasionally burst from those fang-like jaws. Thus speculating I drew incautiously near the bars of the cage where the monster restlessly paced up and down, and was inexpressibly startled at feeling his hot breath on my cheek, while from his huge, hairy lips came the sound "Sam." I actually jumped with astonishment, whereupon the creature, beseechingly said, "Hush, hush, for heaven's sake do not leave me!" Mustering courage enough to ask what all this meant, the gorilla answered, "I am your old friend, Jack Gale; don't leave me."

So Coriander's famous gorilla was none other than my old friend, Jack Gale.

And this is how Jack happened to be a gorilla:

Coriander's keepers were too watchful to permit much conversation, but taking from the gorilla, for such he still was to me, the address of Jack Gale, 1233 Morusmulticaulis street, I went home to revise some of my deductions relative to the origin of the human species, founded on observations of the gorilla in a state of comparative wildness. The menagerie closed at ten o'clock in the evening, and precisely at half past ten I was at Jack's lodgings, to which I climbed up four flights of crooked and very dark stairways. The room was small and cheerless; the windows were carefully guarded by thick curtains; three or four swinging bars depended from the ceiling, for the practice of its inmate in acrobatic exercises; across the foot of the bed lay a well dressed gorilla's skin, and at a small table, and absorbing the contents of a pot of beer, sat the wearer of this discarded robe. This was the haunt of the African gorilla. He told his story in a few words:

"When you and I were used to talk with each other along the Tallapoosa and Athens wire, I never thought to meet you as a live gorilla, but here I am. After the war was over and the Government discharged so many telegraph operators, it was hard scratching for awhile; and after you and I left the Decapolis office I was well nigh broke more than once, only a few cents standing between me and beggary. But I kept a stiff upper lip and struggled up to Cincinnati, where I met with Coriander. He was out there with his menagerie and was about to come on to this city and open a big show. He is a great old villain, but he has the sweetest, nicest little daughter that was ever given to man. You

haven't seen Clara Coriander, have you! No? Well, you have not seen the loveliest and best girl in the world, then. But, as I was saying, old Coriander was preparing for a year's campaign in this city, and allotted a great deal on a real live gorilla, which had been captured in the wilds of Africa somewhere. Oh, curse that gorilla! I wish I had been dead before I ever heard of him."

And here Jack groaned. "I loved Clara Coriander. I suppose you have guessed that out already. But it was the old story; poor young man without fortune or friends; cruel parents, determined that their only daughter shall not marry a beggar; young lady inconsolable and devoted to aforesaid poor young man, but dreadfully afraid of papa, whose only child she is. Well, Coriander came on here and I followed, the old man giving me the job of writing his posters and advertisements, to keep me from starving, I suppose. The long expected *Gooroo* arrived from Zanzibar, but no gorilla was there on board for Mr. Coriander; there was a skin of that celebrated animal, the beast himself having departed this life off the island of St. Helena, in imitation of the example of another much feared person who once resided in that locality.

"Coriander was frantic. The great card of his menagerie was not to be his. His long cherished plans were a wreck; his money was spent for naught; he had no gorilla. After all, I rather liked the old wretch (Coriander I mean.) He has an absolute passion for his 'profession,' as he calls it, and was more in despair because he had no gorilla than because it was a bad financial operation, which left him without that for which he had spent so much money. He was wretched in his disappointment, and postponed indefinitely the opening of his menagerie, though my elegant advertisements were in all the papers, and our flaming posters covered the walls of the city from one end to the other. Gloom reigned in the house of Coriander.

"This was my opportunity. I was in love with Clara, and without any permanent occupation. Presenting myself before the old man, I said, 'Mr. Coriander, you want a gorilla?'

"To be sure," said he testily.

"I will furnish you with one."

"The devil you will!"

"Look here," said I, stepping back a few paces. Grasping the top of a heavy old wardrobe that stood in the room, I swung myself up, clambered along the top, sprang up and down, over chairs and tables, raced around the room with huge strides and jumps, and finally wound up my performances by rushing at the astonished Coriander, and, beating my breast, gave a terrific howl, that fairly made the old man quail as he writhed in his chair. I had not been practicing for nothing, evidently. Coriander was actually frightened.

"What does this mean?" he gasped, with some rage mingled with his perturbation.

"I am the live gorilla from the wilds of Africa," said I. "Give me my skin that arrived by the *Gooroo* from Zanzibar, and I will sear the city out of its senses when the menagerie opens, after a brief delay, on account of the difficulty of preparing for the enormous additions, which a discriminating public will be delighted to see."

"Old Coriander embraced me with tears in his eyes, declaring that I was a real genius, and was born to the show business.

"But," said I, "though I am poor and need the money which you will pay me, I have one other condition, and that is that you shall give me your daughter's hand if I succeed."

"The old man was rather taken aback at this, and flatly refused at first; and we wrangled over the matter for two or three days, but after seeing me, in the skin of the gorilla, go through many antics and performances, he reluctantly gave in, and agreed that after one year of gorilla life in his service I should have the happiness of marrying Clara. He only stipulated that I should not hereafter tell anybody of the cheat, and that not even Clara should know of it now.

"I am aware that my profession is not high art, as you call it, and on hot days it is precious uncomfortable. But what won't a fellow do under the pressure of an exchequer in distress, and enticed by the promise of the hand of the prettiest and best girl in the world? The pay is not much, but I keep soul and body together, which is more than some poor devils do in this great city. By the way, Sam, have you got five dollars about you?"

Now, if there was anything that Jack Gale specially loved, it was the state of being in debt. He was never so happy as when in debt, and when by accident, or the interference of friends, he got out of it, he was uneasy and wretched, apparently, until he got in again. The normal condition of the man was debt; so, when he asked me for a loan, I could not help laughing, and I told him that he had undoubtedly found one of the greatest privations of his gorilla life to be the difficulty of contracting new debts.

"That's a fact," said Jack; "the menagerie opens at eight o'clock in the morning; it takes me a good hour to get myself up for the day, and we don't shut up

until ten o'clock at night; so you see my professional duties are very confining, and a real, live African gorilla is not supposed to have first rate credit with the people who poke stale sandwiches and peanuts through his cage bars by day."

I promised Jack that if old Seanocks, of the *Interoceanic Monthly*, accepted my article on the Origin of the Human Species, I would divide the proceeds with him. Jack and I had shared and shared alike with our little gains too often in years gone by for me to remember which owed the other now. Besides, I told him that I had studied his habits as a gorilla and he had some claim upon the profits of an article in which his personal peculiarities figured so largely.

During the next few days I observed the characteristics of Coriander's African gorilla with new interest. He performed wonderfully well; it was difficult to realize that the hairy, ravening, agile, and grotesquely moving beast, from which every visitor shrank back aghast, was only jolly Jack Gale, serving out his hard servitude for an anticipated bride, very much after the ancient fashion of Laban's kinsman. The cunning rascal had a fashion of leaping at the bars when curious people came too near, driving them away from a narrow inspection by his hideous yells and angry mouthings. But his roars, which were really artistic in their brutal sonorosity, served us a good purpose. As I was night editor on the *Daily Highflyer*, and kept pretty close from ten until three o'clock in the morning, and Jack was caged until the hour at which I went to work, it was not easy for us to meet. So we exchanged the salutations of the day and a few scraps of news by using our old signals, learned long ago in the telegraph office. Instead of the rat-tat-tat of the little instrument so familiar to both of us, Jack, by a series of long or short howls and grunts, gave me his message, to which I replied by careless taps of my cane or hand, nobody suspecting that my casual movements meant anything, nor supposing for an instant that a sudden burst of African forest yells, which sent a fat lady nearly into hysterics, and made two small children howl with apprehension, merely meant "She with the pink bonnet is my Clara."

And it must be confessed that Clara Coriander was an exceedingly attractive young person. Blonde, slight in figure, and with one of those fair, transparent complexions that make you think of a light shining through an alabaster vase, Clara Coriander was certainly as lovely a girl as one ever lays eyes upon. Besides, she was an only daughter, and old Coriander had grown rich in the menagerie business. Jack was a lanky dog (gorilla, I should say) to gain her hand—if he ever did; but one could not help thinking, as he noted her dainty manner and delicate, somewhat *distingué* face, that she was hardly the girl to fancy a fellow who had personated a gorilla, even for her hand. I was afraid that Jack had made a mistake in thus debasing himself to the absurd passion of her cruel parent for the possession of a gorilla. Moreover, by debarring himself from her society for a greater portion of the time (Sundays only excepted), he left the field open for some more fortunate rival, who might, in the mean time, carry off the prize.

But Jack felt sure that he was all right, and by a precious bit of deception he had led Clara to believe that he was hard at work, night and day, at some legitimate calling, earning money for his future ambitious designs in life. The poor little thing believed in him, but Jack said it was very hard for him to be obliged to see his beloved flirting, right before his eyes, at the menagerie (for the girl had a taste for natural history, and was there often), with some perfumed dangler, who was in love with her pretty face and old Coriander's money. On these occasions he hated himself for his mean disguise, and found satisfaction in howling at the gay party in such dreadful fashion as sent them quaking from his cage; and then he cursed himself for having driven away his lovely angel, and was smitten with sudden remorse as he saw her rose-hued cheeks blanch at his terrific cries. At such times he could with difficulty restrain himself from shouting: "Don't be frightened, dear, it's only Jack!" But he was fortunately preserved from such an untimely exposure.

Old Seanocks was very mean, and, though he accepted my article on the Origin of the Human Species, only paid me the pitiful sum of twenty dollars for that valuable contribution to knowledge. Twenty dollars for the labor and thought of weeks! Was ever anything so absurd? And there was Jack confidently expecting at least twenty-five dollars to purchase a birthday present for Clara. Jack loved to make presents, and the deeper he got into debt the more presents did he bestow on his friends. Such another whole-souled fellow he was, to be sure.

But I pocketed the disappointment along with the money and went straightway to the menagerie. There was quite a little crowd about Jack's cage, standing at a respectful distance. In his capacity as the real African gorilla, Jack had just avenged himself on a dangerous rival by snatching off his matchless wig. This gentleman had long deceived his friends with his ambrosial locks, but Jack's quick eye had discovered

the cheat and he seized a favorable moment to make a grab for it. To his inexpressible joy it came off in his paw, and the discomfited gawling and amused Clara Coriander. The amateur gorilla was in a frenzy of delight, and tore up and down his cage, scattering Mr. Jonquil's chestnut curls with savage glee. Old Coriander afterward had to pay for the wig, of course, but he was so delighted with the stroke of showman genius displayed in its destruction that he paid the bill without a murmur. None but a wild and savage animal, of course, would "snatch a gentleman bald-headed," as the old man expressed it. I suppose some of my readers, who now recollect the occurrence, will agree with Mr. Coriander in his opinion.

After the little crowd which this amusing affair had drawn around the cage dispersed in various directions, I drew near enough to hand Jack a ten dollar note, which was his share of the proceeds of my article in the *Interoceanic Monthly*. He snatched it furtively, for the keepers were not far off, and cramming it into his ferocious jaws (lined with blood-red velvet), he howled in his usual *staccato* style, "Didn't I scalp old Jonquil, though!"

One of the keepers approaching me, said suspiciously, "Look a-here, young man, you make entirely too free with that ere beast. He's awful, he is, and some day he'll just go for you, if you ain't keerful. Why, this afternoon he just tore a gentleman's skelp clear off his head, and he was bore out in a faintin' condition. Just see the hair of him all scattered over the cage."

I humbly thanked him for the caution, and drew off asking for information as to the creature's habits. He was very communicative, and enlightened me with much valuable knowledge relative to his diet, averring that he invariably was fed before the menagerie was opened, the raw meat and live rabbits which he devoured exasperating him by their blood to that degree that it was not safe for any person but the keeper to come into his sight. The gorilla enjoyed this confidential communication and roared his approval thus: "He's the head liar of this menagerie."

Jack and I kept up a casual correspondence from day to day by means of our telegraphic signals, for I had little time to see him when off duty. Occasionally I strolled in of an evening to commiserate his fearful *ennui* and cheer him up with a friendly sign, or, when opportunity offered, to chat furtively with the man-gorilla, who swore dreadfully at the bad bargain which he had made. His confinement was growing excessively irksome, and though his constant exercise kept him in good bodily health, poor Jack lost his spirits and grew positively wretched in mind. One night, when I had managed to find time to visit him at his "den" in Morusmulticallus street, he grew quite plaintive over his unhappy condition.

"Hang it, Sam," said he, "you have no idea how mad it makes me to think that I have shut myself up in that cage for a year, and with no chance of getting out without telling Clara what I have been doing. And there she goes pottering about the menagerie, like a blessed little angel as she is, without the least idea that Jack, unhappy Jack, is glowering at her from his cursed gorilla prison, longing to say the words that would bring confusion and dismay upon all of us. And when I see some other fellow flirting around with her, and old Coriander leering over her head at me, knowing full well how aggravated I am, why, it just makes me wild."

I comforted Jack as well as I could, and bade him hope that some stroke of luck would yet deliver him from his voluntary thralldom and bring him to his love. He was hopeful that old Coriander would find the gorilla business unprofitable, and would offer to buy him off, or consent to a shorter term. He vowed one day that unless relief soon came, he would address the crowd about his cage and inform them that he was an unmitigated humbug; that he was no gorilla at all, but a distressed gentleman, John Gale by name, temporarily held in duress by that old rascal, Columbus Coriander. But he restrained himself and waited. It was well that he did.

One evening, finding an unemployed half hour at my disposal, I sauntered into the menagerie hall, and watched the poor weary beasts slowly composing themselves to their unquiet slumbers. It was nearly time to close the show for the night, and not many people were left to stroll about among the cages. Old Coriander was there with his fat wife, the lovely Clara floating about in a cloudy white dress, and followed by a train of admiring swains. The poor gorilla was stretched at full length on the floor of his cage, with his face sullenly turned to the rear partition. Passing by the poor fellow, with a little pang of regret, I stopped before a cage of apes, poor Jack's next door neighbors. No wonder that he felt blue sometimes.

Suddenly there was a rush of hurrying feet; a strange confusion pervaded the whole place, lately so quiet and still; and above the pungent odor of the menagerie I detected that of burning wood. The place was on fire, and instantly everybody ran for the exits.

The hall was filled with blinding smoke; the red tongues of flame thrust themselves eagerly through the thin partitions which separated the main exhibition hall from the lumber rooms in the rear. And the people, who rushed selfishly down the narrow stairways, fled not only from the flames but from the poor beasts, who cowered in their cages, or roared angrily as they caught the mad excitement around them. The scene was terrible; the crackling, roaring fires sweeping out into the lounge room; the wild terror of the caged animals; the shrieks and cries of flocks of suddenly liberated strange birds; and the surging clouds of smoke which rolled through the high arches overhead. Passing near the gorilla's cage I heard Jack's voice, as he yelled with stentorian lungs: "Will nobody let me out? Oh, will nobody let me out?" Quick as thought I ran behind his cage and unfastened the narrow flap that closed the opening. In another moment the African gorilla was out and across the hall, to where a blonde young lady in a white dress was being helplessly borne along by old Coriander, also encumbered by the stout mother of Miss Clara, for Jack had seen that his beloved was in mortal danger. Raising the fainting girl in his strong arms, the hairy monster rushed down the stairs, astounding the coming firemen with the sight of a ferocious gorilla carrying off a respectable young lady, whose flaxen curls lay lovingly over the dreadful shoulders of the beast, which, with ludicrous failure, endeavored to cress the pallid face of the young lady with his hairy jaws, stiff with padding and whalebone, and nicely lined with blood-red velvet.

The gorilla fled up the street, bearing his dainty burden—for, once in sight, he could not stop without exposure. Plodding travellers on the illuminated sidewalks were startled by the swift apparition of a gorilla carrying off a young lady, who was borne into dark alleys to be eaten in the obscurity of some hidden den. Casual wayfarers through back streets shrieked and ran as they beheld a flaming hairy dragon leaping with enormous strides, and carrying the corpse of a nice young person hanging over his shoulder. Good Mrs. Harris, who keeps the lodging house at No. 1283 Morusmulticaulis street, fell down in a deadly swoon at her own doorway, as she was returning from class meeting, to see the Evil One, equipped with the traditional head, horns and tail—breathing fire and sulphurous smoke, and violently deporting a beautiful young lady, who had, for love of dress and other worldly vanities, sold herself to the Old Nick. Vaulting over the prone body of the insensible Mrs. Harris, Jack eluded his few pursuers, and darted up the stairs to his own private den, where he shut and locked himself and his fair burden from the world.

The lovely Clara revived shortly, and, opening her eyes, shut them again with a great scream. She was in the den of the African gorilla. There was more fainting, and more anguish on the part of Jack, who cursed his luck and his folly together. "It's Jack; it's only Jack," he cried with real agony, as he tore off his mask, and the young lady, slowly returning to her senses, once more opened her eyes and beheld her lover, a real African gorilla from his chin downward, but possessing a very resolute yet anxious human head—very like Jack Gale's, with the scalp and grinning jaws of the defunct monster hanging behind his ears.

This was an extraordinary situation; a nice young lady in a strange garret, confronted by an erratic young man in semi-gorilla costume; his countenance flushed with excitement and exercise; his eyes wild with anxiety and alarm, and his whole manner that of a person who is in a state of utter quandary. The truth of history compels me to record the fact that Miss Clara Coriander threw up her hands and laughed as she would die. She was a sensible girl, and liked a good joke. Old Coriander's plans were laid bare to her clear vision in one moment; she saw through the whole trick, and laughed in the face of the astonished Mr. Gale.

"Oh, Jack," she said, as soon as she could recover her breath, "how could you be such a fool? Where am I? How shall I ever get home? Oh, oh, oh!" To all of which Jack could only reply by instalments. But, by secluding the young lady on the stairway, he succeeded in preparing for their return to the Coriander mansion. Through the half deserted streets the young couple went in different guise from that in which they had before astonished those who saw them flee. The gorilla delivered up the old man's daughter, and was glad to be told that the menagerie, not quite ruined, must needs be closed for a few months for repairs.

The show opened again in due season with new attractions, under the management of Coriander and Gale. But in all the lines of cages of rare beasts no African gorilla was to be found. In lieu thereof they showed a handsomely stuffed skin of the much lamented beast, which came to an untimely end in consequence of a cold caught by exposure at the great menagerie fire. Coriander's heart relented when Jack saved his daughter from the burning building, and he found his inventive genius invaluable in the show business.

I have seen the only young gorilla born on American

soil of which there is any account. It has pink cheeks and blue eyes, and is learning to answer to the name of Clara Gale.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

"Quadruplex" and "Automatic" Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

SINCE the publication of my review of the "Quadruplex" controversy, in THE TELEGRAPHER of the 5th of June, the telegraphic fraternity—especially those of the Western Union persuasion—have been somewhat free in criticising, in private, that performance; and I notice in the last number of your journal that your correspondent, "Come Again," has given public expression to his astonishment that you should have opened your columns to that communication, though he is kind enough to admit, after all, that it "did no harm." I regret that your correspondent, in claiming from me "deep and prolonged contrition," and works meet for repentance," which he thinks "can alone wipe out the stain which his advocacy of Edison and his duplicity has caused," had not found it consistent with his ideas of fairness, to point out wherein that communication was not a proper one for me to write, and for you, as a chronicler of current telegraph history, to spread before your readers. It certainly was my intention to discuss, in a fair spirit of newspaper controversy, what were then and what are now very interesting questions connected with one of the most important discoveries in telegraphy during the past thirty years; and if "Come Again," or any of your other correspondents, have any exceptions to take to any of my conclusions, I shall be glad to consider the same, if fairly presented through THE TELEGRAPHER.

I do not feel called upon to defend Mr. Edison against the reflections of "Come Again," or the weekly tomahawk and scalping-knife of the Editor of THE TELEGRAPHER, but I will say, what perhaps I am better qualified to speak about than any other person, except, possibly Mr. Edison himself, and that is, he has been, like myself, since 1870, very much troubled with "wicked partners," one of whom has left his country for his country's good, and it would be a very proper thing for the telegraphic fraternity to suppress their judgment for a short time upon all undeveloped points connected with "Quadruplex" and "Automatic" telegraphy. I will simply add that the conclusions I expressed in my communication of the 5th of June, in regard to the "Quadruplex" system and its rightful owner, are unchanged, and can be maintained, if need be, with new and potent arguments; and in regard to "Automatic" telegraphy, I may say it has reached a state of existence which enables it to vindicate its own right to live, and its future course will be upward and onward in spite of its bitter and unscrupulous opponents, the "Morse" bigots, and also in spite of the public folly and fraudulent statements of one of the original inventors of the new system, who first conspired with one of Mr. Edison's late "wicked partners" to defraud his early associate and best friend, and ending in said "wicked partner's" defrauding him and others, and fleeing to Europe. It seems to me quite likely that the Philosopher of Passaic City will yet come to the conclusion that "honesty is the best policy;" and when he arrives at that happy condition, I predict that he will retire from his present somewhat expensive pastime of pouring out his personal malice through the advertising columns of the city press. D. H. C.

Telegraphing by Light.

TO THE EDITOR OF THE TELEGRAPHER.

I SEND you herewith a newspaper extract containing an account of a system of telegraphing by flashes of light, using the Morse telegraph alphabet, said to have been invented by Mr. H. C. Mance, of the East Indian Telegraph department. This seems to be attracting considerable attention in England, but it is by no means a novelty in this country, having been in use for twelve or fifteen years by the U. S. Engineer officers engaged in the survey of the great lakes. Capt. F. U. Farquhar read a paper before the Civil Engineers' club of the northwest some three or four years ago, descriptive of the process of surveying employed in this service, in which he referred to the method of triangulation employed in the following words: "After the sides of the triangles expanded to more than 28 or 30 miles the stations were often not visible from each

other. A heliotope was then used at the station looked at. But after the lines expanded to more than 60 miles the heliotope failed, and small looking-glasses (10x12 inches) equatorially mounted were used. During a bright day the reflection of the sun's rays from one of these glasses was distinctly seen for more than 100 miles. By means of cutting off the light for unequal intervals telegraphic messages were frequently exchanged over lines more than 90 miles long. The reflected light from these mirrors was thrown in the right direction by means of a screen, leaving a hole through it a very little smaller than the mirror. The centres of the mirror and of the hole in the screen were placed on the line joining the two stations, and when the edges of the hole in the screen were equally illuminated the attendant knew the reflected light was directed on the other station."

Capt. Farquhar's paper was published in the *Railroad Gazette* of this city some three years ago, if I remember rightly. It appears, therefore, that this is, after all, an American idea. I have heard frontiersmen say that the Indians on the plains use bits of looking-glass for flashing signals to each other over a distance of several miles, probably in somewhat the same manner that they communicate intelligence over long distances by signal fires, as I have often seen them do.

F. L. POPE.

Elizabeth, N. J., July 14, 1875.

The Telegraphers' Base Ball Match.—The Chicagoans Victorious.

CHICAGO, ILL., July 12.

TO THE EDITOR OF THE TELEGRAPHER.

AS PROMISED in my letter of the 10th inst., I herewith send you the result of the exciting game of base ball played yesterday (Sunday) between the Dots and Dashes, of St. Louis, and the nine from the Western Union night force of this city (generally known as "Sam Bracken's" nine), which resulted in a victory for the Chicago boys. The weather was very unfavorable, the play being stopped several times on account of the rain, the boys having to play in the mud nearly to their knees. The Chicago boys having on light suits, were as deplorable a looking set of base ballists as you ever saw. The Dots and Dashes won the toss, and went to bat first.

The following is the score:

ST. LOUIS DOTS AND DASHES.			CHICAGO.		
	R.	P. O.		R.	P. O.
Carroll, c.....	3	2	Delaney, 1 b.....	2	4
Marsh, s. s.....	3	2	Kemps, 2 b.....	2	5
Bell, 2 b.....	2	3	Scates, p.....	5	1
Cummings, 1 b.....	2	3	Bachelor, s. s.....	6	1
Nelson, p.....	3	1	Meserole, 3 b.....	4	1
Deering, l. f.....	1	4	McCutloch, r. f.....	2	5
Irwin, c. f.....	2	3	Andrews, l. f.....	2	4
Lenhardt, 3 b.....	1	4	Kerns, c. f.....	2	4
Moxon, r. f.....	1	4	Bracken, c.....	4	2
Totals.....	18	26	Totals.....	29	27

SCORE BY INNINGS:

St. Louis.....	2	0	5	0	0	0	9	1	1	—18
Chicago.....	3	1	4	6	7	0	6	2	0	—29

Left on bases—Chicago, 6; St. Louis, 2.
Double plays—Chicago, 5; St. Louis, 1.
Umpire—Deviney, of Empire Club, of St. Louis.
Scorers—E. P. Whitford, of Chicago, and R. C. Hayes, Editor Electric, St. Louis.

OCCASIONAL.

Right Men in the Right Places.

TO THE EDITOR OF THE TELEGRAPHER.

IT is always gratifying* to see the right man in the right place; and if this is true it is doubly gratifying to see right men in right places. We have in mind the Lehigh Valley R. R. Telegraph department. Supt. H. A. Clute has made two noteworthy appointments there recently which reflect to his credit. Mr. R. C. Laverty, chief operator at Mauch Chunk, Pa., has been appointed division operator of the Eastern and Amboy Extension, with headquarters at Metuchon, N. J. J. Lewis Hall, late manager of the Carbondale, Pa., W. U. office, succeeds him at Mauch Chunk.

It has been our large privilege to know each of these gentlemen personally, and we can speak highly of them both. We hope they will succeed and give the eminent satisfaction in their new positions of trust and responsibility that they have done heretofore in many others. We are confident they will. VIVIAN.

"No, I don't want none of your lightning rods," said a Kentucky farmer, last week, to a man who had stopped at his house to put up patent lightning conductors. "I ain't afraid of lightning; it's the thunder I believe's going to knock us all ondwise some day." "You don't seem to comprehend," said the pedlar; "these are silver tipped rods are lightning rods, and the gold tipped ones are thunder rods—just what you want," and he persuaded the old man into ordering up the gold tipped rods.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JULY 17, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE ON APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

A New Telegraph Company.

We should about as soon look for lightning from a clear sky as for the organization of a new telegraph company, national in its purpose, in the present general depression of business. It seems, however, that capitalists exist who believe that there is a profitable opening for such an enterprise if the reports from the Pacific Coast are correct. We are informed by despatches to the press that on Saturday last the organization of the new National Telegraph Company was perfected at San Francisco, and that its incorporators represent more capital than any equal number of men on the Pacific Coast. The nominal capital stock of the new company is \$25,000,000, in 250,000 shares, at a par value of \$100 each. Of this amount \$7,500,000 are said to have been subscribed, on which ten per cent. has already been paid. The incorporators are MICHAEL REESE, CALVIN W. KELLOGG, JAMES K. KEENE, F. D. ATHERTON, WILLIAM SHARON, WILLIAM BURLING and ALFRED A. COHEN. These parties are men of large means, and leading capitalists. U. S. Senator SHARON, of Nevada, is the President of the company.

It is stated to be the purpose of the company to commence the construction of lines at the earliest possible moment, and that they propose to extend lines all over the United States and principal points in the British Provinces. Within ninety days they promise to open a central construction office in New York. Four through wires are to be built between San Francisco and New York; and here is where the singular feature of the enterprise comes in; it is stated that tolls are to be fixed at extremely low rates, about equal to those which have been advocated in connection with a postal telegraph.

We do not know upon what the calculations of the promoters of this new scheme are based, but for us, and those who are familiar with the telegraph business, there would seem to be no possibility of paying expenses, to say nothing of profit in such rates. If the proposed lines are actually built, and such rates adopted, however wealthy the incorporators may be, personally, the company will certainly find itself bankrupt in a very brief time. It is the usual thing for new companies at the start to promise great reduction of rates, and sometimes to attempt it, but the result heretofore has certainly not been encouraging for a repetition of the operation. Telegraphing is an expensive

business, and only the General Government would feel like engaging in a business at rates which insure a large and accumulating excess of expenditures over receipts. This statement, if really authorized by the promoters, casts a shade of suspicion on the enterprise.

It is further stated in the despatches that no stock is for sale at present, the promoters proposing to show their confidence in the enterprise by building the lines before asking the public to participate in it as shareholders.

The above is really all that is known here at present about this new enterprise, but we shall, probably, before long have further information concerning it. The incorporators are certainly men of means, and if they are disposed to invest their money there is nothing to prevent their doing so. As an abstract proposition there does not appear any immediate pressing necessity for additional telegraphic facilities. Business generally is very much depressed, with no very apparent prospect of early improvement. It will, however, take some time to construct the new lines, and, perhaps, by the time they are ready for business, the business will be ready for them. Most likely there is something behind this enterprise which does not as yet appear. THE TELEGRAPHER, in the interests of telegraphers, investors and the public, can only wish this and all telegraphic enterprises abundant success.

It may be that the professor of duplicity and quadruplicity having exhausted the customers for his inventions in the east, may find the new custom for whom he is understood to be looking in this new company. The amount of capital is encouraging, for no concern with less capital can afford to carry him and his much sold inventions.

A California Correspondent of The Telegrapher Married.

AS WILL be seen from a notice in another column of this paper, our attentive and interesting Californian correspondent, CLIX (Mr. WM. E. SMITH), has recently entered into life partnership, having taken unto himself a wife. We congratulate him most heartily on his good fortune in securing for a partner a youthful and accomplished lady, who will share his joys and sorrows, and be to him truly a helpmeet.

He has also resigned his position with the Western Union company at San Francisco, and accepted the responsible situation of Manager of the Los Angeles, Cal., office of the Atlantic and Pacific Telegraph Company. His ability and experience as a telegrapher, and his popularity as a man will prove very advantageous in his position, both to himself and the company which has been so fortunate as to secure his services.

Referring to this marriage, the San Diego Union of the 23d ult. says:

"We chronicle elsewhere the marriage, on Monday, of Wm. E. Smith, Esq., formerly manager of the Western Union Telegraph office, in this city, and Miss Helen L. Bashford, daughter of Hon. Coles Bashford, Secretary of Arizona. The happy couple proceeded immediately to Los Angeles, where Mr. Smith will occupy the position of Manager in the office of the Atlantic and Pacific Telegraph Company. A large circle of friends join in wishing them every earthly happiness, with ever increasing prosperity."

A Suggestion to the Friends of The Telegrapher.

WE desire that such of the friends of THE TELEGRAPHER as are willing to cooperate with us in our effort to increase its circulation and influence would communicate with us as speedily as possible, and give us the benefit of their suggestions as to the best manner of effecting it in their respective localities. What we wish is to inaugurate a general and systematic effort to speedily increase the patronage of the paper, and in this we must largely rely upon the cooperation of those who concur in the belief that the influence of this paper is, on the whole, beneficial to the fraternity. With the general cooperation of the friends of the paper in our efforts most encouraging results are assured.

Shall we have it? If yes, will they not at once communicate with us as above requested, and inaugurate a systematic and persistent plan to make the effort a gratifying and permanent success?

Telegraphing by Light.

We print in another column a description of a system of telegraphing by flashes of light, using the Morse telegraphic alphabet, which is claimed to be the invention of an official of the East Indian Telegraph Department, also a communication from Mr. F. L. POPE on the same, demonstrating the fact that this is an American invention, and has been used here for twelve or fifteen years. In this as in most other branches of practical telegraphic advancement and improvement, the United States leads the van, and while we do not question the honesty of Mr. MANCE's belief in his being the inventor of this system, it is evidently another case of reinvention.

Cheap Telegraphic Apparatus.

THE new advertisement of Messrs. LENNERT & DECKER, of Cleveland, Ohio, will be found of interest to those who design purchasing telegraphic and electrical apparatus and instruments. It will be seen that their prices are very low, and their work is of a good quality. Those requiring anything in their line will do well to send for their circular.

Personals.

MISS M. PACKARD is the day operator, and Mr. H. B. GROVER the extra operator for the C. B. & Q. R. R. at Earl, Ill.

MR. E. W. FARRAR attends to the telegraphic interests of the C. B. & Q. R. R. and Western Union Telegraph Co. at Downer's Grove, Ill.

MR. M. F. BOGNY is working for the Western Union Co. at Racine, Wis.

MR. M. V. B. SMITH still attends to the wants of the public telegraphically at Morrison, Ill.

MR. P. D. WHITEHEAD is the operator at the local freight office of the Ill. Cent. R. R. Co., at the foot of South Water st., Chicago, Ill.

MR. FRENCH, formerly assistant agent of the Associated Press at Chicago, Ill., has been appointed agent of the Northwestern Associated Press; and Mr. VIGGS, clerk in Gen. STAGER's office, has been appointed agent of the California Associated Press at Chicago. MR. HORACE JONES, who has held both positions for a number of years past, has been relieved.

MR. ROOT, of the Chicago, Ill., Western Union night force, has returned from his eastern trip, looking very much refreshed.

MR. J. E. DOYLE may now be found at the local freight office, Chicago, Ill., of the Mich. Cent. R. R., doing the telegraphing for that road.

MR. J. MORTON FOSTER, lately of Montreal, is managing the Boston quad. on the night force at 197 Broadway, W. U.

MR. F. J. ALDRICH, of Worcester, W. U., resigned, is working in Rutland, Vt.

MR. G. B. SWIFT, formerly of the Western Union Telegraph Company, has been appointed to the management of the 10th, 15th and 16th districts of the American District Telegraph Company in this city.

MESSRS. THOMAS MCCARTHY, ASHHURST, HINMAN & WILLIAMS, of the Western Union force, at 197 Broadway, went to Saratoga on Saturday last, to help during regatta week.

MR. J. H. LARGAY, formerly of Washington, D. C., has accepted a position at 179 Broadway, W. U. office, night force.

MR. C. T. TAYLOR has been transferred from night to day work at the W. U. main office, Broadway & Dey street.

MR. F. M. HUNTINGTON, night operator at South Broad street, Newark, has been transferred to the day office of master mechanic, Meadows Shop, Penn. R. R., Meadows, N. J. (near Jersey City.)

Mr. BISHOP has resigned his position in the Southern and Atlantic Co. at Boston, Mass., and returned to the Western Union office, taking the position vacated by the resignation of Mr. J. A. KENNEDY.

Mr. WEAVER, of New Bedford, Mass., takes the place in the Boston, Mass., Western Union office made vacant by the transfer of Mr. PARROTT to the Post-office.

Mr. M. O'HERN, for some years past a clerk in the Boston, Mass., W. U. office, has accepted a position in the S. & A. Co. as operator.

Mr. R. H. LORD, an old timer, is operator in the Western Union office at Fort Wayne, Ind.

Mr. C. W. MCKAY officiates in the Warsaw, Ind., W. U. office.

Mr. ROBT. C. LAVERTY, formerly chief operator of the Lehigh Valley Railroad Company's wires at Mauch Chunk, Pa., has been transferred and appointed division operator of the New Jersey Division, with headquarters at Metuchen.

The following appointments of operators on the New Jersey Division of Lehigh Valley Railroad telegraph have been made by Supt. H. A. CLUTE:

Mr. FRANK KING day operator at Perth Amboy, N. J.

Mr. F. A. BERGER night operator at Perth Amboy, N. J.

Mr. O. H. BERGER day operator at Bound Brook, N. J.

Mr. L. M. LEVY day operator at Three Bridges, N. J.

Mr. L. K. MILLER night operator at Three Bridges, N. J.

Mr. W. E. MILLER day operator at East End Tunnel.

Mr. IRA B. TICE day operator at West End Tunnel.

Mr. G. F. GROFF night operator at West End Tunnel.

Mr. SAML. SWARTZ day operator at Easton, Pa.

Mr. WM. E. HERBST assistant operator at Easton, Pa.

Mr. FRANK CARY night operator at Easton, Pa.

Mr. THOS. H. BROWN succeeds Mr. L. K. MILLER at Coxtou, Pa., transferred to Three Bridges, N. J., Lehigh Valley R. R.

Mr. H. A. SNOW, night operator at L. & B. Junction, Lehigh Valley R. R., has resigned, to accept a position elsewhere. Mr. E. A. ACKERMAN takes his place.

Mr. JOHN NICHOLS has accepted a position as assistant operator at Bethlehem, Pa., L. V. R. R.

Mr. ROBT. C. HERBNER takes the day office at Lehighon, Pa., L. V. R. R., a position made vacant by the withdrawal of Mr. A. S. MILLER.

Mr. J. WM. LATTIG has been appointed operator at "C. H." office, Mauch Chunk, Pa., L. V. R. R.

The Telegraph.

The Duxbury Cable Broken.

THE annual break on the Duxbury and St. Pierre cable took place some time since, and the cable is still interrupted. It will be repaired as soon as the repair ship can be spared to attend to it.

A New Telegraph Cable laid to Martha's Vineyard.

ON Thursday, July 8th, a new telegraph cable was laid from Falmouth to Oak Bluff, Mass., across Martha's Vineyard Sound. The government granted the use of the revenue steam cutter Gallatin, the cable having arrived several days previous, on board the schooner Ira D. Burgess.

The weather being favorable, the vessels got under way at about half past three o'clock in the morning, and steamed over to Falmouth, where they commenced operations, and from Falmouth Heights they recrossed the Sound to the East Chop, paying out the cable, and at this point connected with the wires already erected along the beach, to the office on the Bluffs. The whole work was completed at precisely half past three in the afternoon, which was announced by the firing of guns, &c. Although twelve hours were consumed in the whole operation, the cable was actually laid the entire distance across the sound, five and a half miles, in an hour and a half. The Western Union Telegraph Co. have this enterprise in hand, and Col. Wood, their efficient superintendent, gave his personal attention to the work. A great many people were out to witness the landing of the cable, and were curious to see the "twisted wire" which is to be the medium of thought between Martha's Vineyard and the rest of the world.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom during the week ending June 26, 1875, was 408,411—an increase on the corresponding week last year of 17,254.

A circular issued by the directors of the Direct Spanish Telegraph Company congratulates the shareholders on the satisfactory progress of the company's business. The accounts for the half year ending 30th ultimo show profit sufficient to pay a dividend for the past half year at the rate of 5 per cent. per annum on the ordinary shares, after providing all interest on preference shares up to that date. All quarterly balances up to 1st March last have been regularly received from the Spanish and French Governments. Both the company's cables continue in excellent working order.

A telegram from Scinde, dated Thursday last, states that a bill has been introduced in the Legislative Council of India to amend the telegraph law, with the object of giving Government the power to make rules under the existing Act.

Western Union Notes.

THERE was a good deal of excitement at "197," Thursday morning, about eleven thirty, to know the result of the regatta at Saratoga, and the boys reached eagerly for the "bulletins," which were manifested and handed around every two or three minutes, announcing the progress of the race. Some bets were made, and a good deal of speculation indulged in. The result, which is known throughout the world ere this, was received with delight by the large number of Cornell's devotees.

During the past week several fine photographs of the interior of the general operating room, Western Union Building, have been on exhibition in that department. The largest is a comprehensive view of the whole interior, and the smaller ones are views of the switch alone—the same interior view reduced. They are generally liked, but the room looks deserted, the photographs having been taken on Sunday, and what operators were present excluded from the scene. They are offered for sale at prices ranging from \$1 75 to \$2 75, frames included.

The Saratoga Quad. has been working to its full capacity the past two or three days, and it has been found necessary to work the remaining additional wires to their utmost in order to handle the great rush of business.

The Anglo-American Telegraph Receipts.

We take the following from the City Article of the Standard of Thursday last, with reference to the traffic returns of the Anglo-American Telegraph Company:

"The publication of the average daily traffic returns by the Anglo-American Telegraph Company affords a good basis upon which to make a reliable approximate estimate of the receipts for the current half year, of which there are only fifteen days' returns now wanting. For the first four months of the year the receipts were, at £1,782 per day, £213,840; for May, at £1,095, per day, at £33,945; and for the 15 days of this month they have been £17,690. Estimating for the remaining 15 days of the month the same amount, the total for the half year would reach £283,165. Last year's working expenses were about £70,000; taking them at £35,000 for the current six months, a balance would remain of £248,165. An interim dividend of 1 1/2 per cent. was paid for the March quarter, so that after payment of a further dividend at the same rate for the June quarter, there would apparently remain an available balance of £73,165.

These facts leave no room for doubt that the interim dividend now shortly to be announced will be at the same rate as for the previous quarter, more especially as the receipts already shew a considerable tendency to improve under the stimulating influence of the reduced tariff. It is worthy of note that while the traffic of the first half of this month, i. e., up to Tuesday last, show, as above given, an average of £1,180 per day, or an advance of nearly 8 per cent. on the May returns of £1,095 per day, the receipts for Wednesday and Thursday last were no less than £1,590 and £1,480—these two days showing only a reduction of 21 per cent. compared with the average of June last year, notwithstanding the reduction in the charges for messages of 50 per cent.—The Railway News.

The American Fire Alarm Telegraph.

THE Committee appointed by the Commissioners of the District of Columbia to investigate and report upon the best plan for the reconstruction and extension of the Fire Alarm Telegraph in Washington and Georgetown, D. C., in their official report, say:—"For many years past your committee, as officers of the fire department, have been familiar with the practical workings of the Gamewell system of fire telegraph, and have recently seen in operation the very latest improvements in the act which this company has incorporated in their general system. Your committee has

seen pretty nearly all the devices ever used for the purpose of giving telegraphic alarms for fire, and agree unaniously in the opinion that the 'Gamewell,' in solidity of system and the excellencies of its details, far exceeds all others now in use. We find that both in system and detail it is more simple, more reliable, and in the end would prove far more economical than any other system we have investigated."

The Common Council of Philadelphia, on Friday of week before last, passed an ordinance appropriating two hundred thousand dollars for the reconstruction of the fire alarm system of that city by Messrs. Gamewell & Co.

The Great Western Telegraph Company.—Receiver's Report.

In the Circuit Court at Chicago, Ill., in the matter of Jeremiah Terwilliger et. al., vs. The Great Western Telegraph Company, Oliver H. Horton, receiver of the company, a few days since filed his report.

After referring to his former reports heretofore made, the receiver sets forth the condition of the company, and says that at the time of his appointment as receiver there was pending before the master an investigation as to the accounting between Solah Reeve and the Great Western Telegraph Company, which was at that time partially concluded—such accounting having been conducted on the part of the company by Messrs. Harding, McCoy & Pratt, as attorneys. The receiver states that he requested those gentlemen to continue and conclude such accounting before the master. The receiver asserts he is unable to report the amount of the indebtedness of the Company, for the reason that a very considerable proportion of such indebtedness is still undetermined, and stands under exceptions to a number of the reports filed by the master, although reports by the master in chancery upon many of such claims have been filed in and approved by the court, whereby a large amount of such claims have been adjudicated to be correct, and allowed. Assuming the indebtedness as reported by the master to be correct, the receiver estimates the indebtedness in round numbers as follows:

Reported by the master, exclusive of Reeve's accounting.	\$66,000
Bonds.....	23,000
Reeve accounting.....	56,000
Accrued interest, etc., estimated.....	5,000
	\$150,000

To which add amounts to be paid to Western Union Telegraph Company under contract, balance due on master's fees, attorneys and receiver's fees, etc., say.....

	20,000
Estimated total.....	\$170,000

The receiver reports that he has no money with which to pay the said indebtedness, and knows of no property or assets belonging to the Great Western Telegraph Company with which they could be paid, except the property mentioned in this report, which are the lines west of the Mississippi river. The receiver sets forth further that he has never received anything for his services, and has never been able to pay any attorney's fees; that the telegraph lines are growing old, and will, from this time henceforth, need quite extensive repairs. From his opinion, he thinks there will be no profit in operating the lines under a temporary administration, such as that of the receiver must of necessity be. In his opinion, a large amount of money will have to be expended in making extensions and advantageous connections, and perfecting and putting into complete order said lines before they can be made to pay. The creditors are clamorous in regard to their pay, and there is no prospect of raising funds to settle with them until a sale of the property shall have been made. For these and various other reasons, the receiver deems it absolutely necessary, and recommends to the court that the lines be sold by and under the order and direction of the court, and that in case of such order, it should be provided that of the proceeds of the sale a sufficient sum should be retained by the court to protect the purchaser at such sale against any valid or subsisting liens, otherwise the sale thereof might be very materially injured, to the detriment of the creditors.

The report further sets forth that the receiver has filed exceptions to eleven of the reports of the master upon claims against the company, together with exceptions filed by other parties against the master's report as to their claims—amongst them being those of the company in the matter of the accounting with Reeve, and therefore the receiver prays specific instructions from the court, directing him in what cases he shall be authorized to employ solicitors.

A New Telegraph.

A REMARKABLY ingenious and simple system of telegraphy has been invented by Mr. Henry Mance, Superintendent of the Persian Gulf Telegraph Department, which promises to greatly modify existing telegraph arrangements. It consists in sending flashes of light from one point to another by means of a small mirror

The flashes are long or short, to represent the dashes and dots of the Morse system—the dot being represented by an instantaneous flash and the line by a somewhat longer apparition of it.

By the aid of this very simple language any two persons whose mirror can carry a flash over the distance between them may converse at will for any time during which their lights serve them.

It is proposed by the managers of the Centennial to appoint an electrician who shall have the supervision and direction of the electrical department.

The Centennial Electrician.

It is proposed by the managers of the Centennial to appoint an electrician who shall have the supervision and direction of the electrical department.

We notice that THE TELEGRAPHER suggests the name of Mr. David Brooks, in which nomination we heartily concur.

A Telegraph Operator Robbed.

ABOUT ten o'clock Saturday morning, July 10th, two men entered the telegraph office at Mountain View, on the Delaware, Lackawanna and Western Railroad.

A Lightning-rod Vender Shot.

ON Friday evening Albert Hart, residing three miles from Woodbridge, N. J., shot and probably fatally wounded John Higgins, a pedlar of lightning-rods.

An Astonished Burglar.

IN the City of Elizabeth, N. J., which is within a half hour's ride of New York by the New Jersey Central and Pennsylvania railroads, reside a number of gentlemen connected with telegraphic interests in this city.

Unaware of these facts, several of these residences have been made the object of attack by midnight adventurers, who evidently do not read THE TELEGRAPHER.

Quotations of Telegraph Stocks at N. Y. Stock Exchange.

Table with columns: July, WESTERN UNION, ATL. AND PAC., AMER. DIST., GOLD AND STOCK. Rows show bid and asked prices for various dates from July 8 to 14.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each.

- 164,661.—ELECTRICAL BILLIARD REGISTERS.—Chas. H. Russell and Julius Sax, London, England, assignors to Bernhard Ahrens, same place. [Filed June 20, 1873.]
Two index fingers, one for each ball, carried on same shaft, one directly, one by a sleeve, each actuated by its own electromagnet and circuit.

164,778.—ELECTRIC RAILWAY SIGNALS.—H. W. Spang, Reading, Pa. [Filed March 24, 1874.]

- 1. The combination of a series of batteries, polarized relays, and means for making or breaking the circuits of the batteries arranged substantially as set forth, whereby any one of the relays will be operatively affected only by the current from its own designated battery, and not by the current from either of the batteries adjacent to such designated battery.
2. The combination and arrangement of polarized relay M, section of track A A, and battery B with polarized relay M', section of track A' A', and battery B', so that should current of battery B' pass over relay M a safety signal will not be given, as set forth.

Married.

SMITH.—BASHFORD.—At San Diego, Cal., Monday, June 21st, 1875, Mr. WM. SMITH, Manager of the Los Angeles, Cal., Pacific and Atlantic Telegraph office, to Miss NELLIE E. BASHFORD, daughter of Hon. COLES BASHFORD, Secretary of Arizona Territory.

CHANDLER.—ZIMMERMAN.—In New York, on Monday, June 21, 1875, Mr. Frank Chandler, Mr. EUGENE CHANDLER, operator at East Newark, N. J., for the Pennsylvania R. R., to Miss LOUISE ZIMMERMAN, of New York City.

THE AMATEUR'S TELEGRAPH APPARATUS,

Comprising SOUNDER, KEY, CUP OF BATTERY, CHEMICALS, WIRE AND MANUAL.

Several Thousands of these Instruments already sold. They give good satisfaction.

PRICES.

Table listing prices for Amateur outfit, complete, No. 1 (\$7 50), Sounder and Key, No. 1 (6 50), and Battery, per Cell (45).

DISCOUNT.

Twenty per cent. discount will be allowed when remitted for in advance.

GEO. H. BLISS & CO.,

220 Kinzie St., Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	3 00	2 55
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.
 No. 1 Alarm Bell, 3 3/4 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$1 50; reduced price, \$3 38.
 No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.
 All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER, finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense.

Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y. Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application. All orders will receive prompt and careful attention, consigned to

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

**FIRE ALARM
AND
POLICE TELEGRAPHS,**

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of two years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDER made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

The Centenary Insulator.—Little's Dry Zone Inverted Cup, or Umbrella Insulator, Universally Used.

By Rip Van Winkle.

It has been said that, among the impossibilities cited to convince Job of his weakness and impotence, the Almighty asks, "Canst thou send lightnings that they may go and say unto thee, here we are?" It is not to be inferred that the Almighty, in propounding this question, which at that time could not be affirmatively answered by mortals, intended to suggest an impossibility, the removal of which was not to be at a future time vouchsafed to his creatures.

Just about one century had elapsed since Watson, in 1747, erected at Shooter's Hill, Kent, England, his telegraph line of nearly two miles in length, down to 1846, when George Little came into the telegraphic field. In the interval telegraph engineers had been greatly exercised and troubled to discover a means of confining the electric current to the wires suspended in the air, which of course was and is an essential prerequisite of successful telegraphy. This problem appeared to the pioneer telegraphers and electricians almost insurmountable. They had resorted to the use of baked wood, cloth saturated with gum-lac, glass knobs and double cones of earthenware (with the wire threaded through the centre), and other devices, all of which proved insufficient and fallacious.

In 1846 Kimber, of London, a maker of moulds for glassware, was employed to make suitable moulds for the manufacture of Mr. Little's dry inverted cup zone, or umbrella insulator. This was fully described and illustrated in THE TELEGRAPHER for December 5, 1868. At the same time that the moulds were made for the manufacture of glass insulators of this pattern, the stoneware pottery at Lambeth, and the porcelain pottery at Staffordshire were also turning out the dry zone insulators in stoneware and porcelain. These came into extensive use at once, and was really the first practical step made in a hundred years towards the proper method of insulating land lines, now universal throughout the world.

By means of this valuable discovery, which solved one of the most difficult problems in practical telegraphy, it is possible to transmit signals over a circuit of five hundred miles, in weather which would, without this form of insulator, render it impossible to do so for fifty, and not unfrequently for five miles even.

It is left to the practical telegrapher what could be done in telegraphy, especially with the rapidity of transmission now indispensable, without Little's dry zone inverted cup, or umbrella form of insulator.

Success the Result of Failure.—A Telegrapher's Reverie.

By Mephisto.

I AM strolling through the woods. It is autumn, and the golden brown of approaching dissolution has tinged the dark green of the tree foliage, giving an air of maturity and ripeness to vegetable creation; the last rays of the setting sun impart a rich warmth of appearance to those trees that catch its subdued light, bringing them out in greater contrast with the somewhat sombre darkness of the background—a darkness which is yet not gloomy, but rather restful, soothing to eyes that have been exposed to the glare, and dust, and toil of the day; while the gradually increasing quietude is inexpressibly grateful to a nervous system that has been all day on the rack in the busy hive we call life. The birds are seeking their roosts, and their twittering, as it sinks by degrees into perfect silence, rather increases than breaks in upon the sense of stillness that surrounds me. The flowers are folding up their little petals, shutting up in their variegated embrace many a small insect that there seeks a fragrant couch. Now and then the distant lowing of the cows, wandering slowly homewards, and stopping to gather here and there an occasional morsel of delicious herb or grass, adds still more to the general peacefulness;

and as nature slowly sinks into its nightly repose, my thoughts and feelings, too, seem to subside into a more equable and gentle stream, and I am left at leisure to "chew the cud of sweet and bitter fancies"—to digest the mental food that my life has taken in in the years that have rolled by, and to gather from it such nourishment as shall help me to live through the years that are yet to come.

'Tis a pretty long vista I have to look back upon—a long, long road with many a turning; a road travelled often with bleeding feet and heavy heart, only a few of its more prominent landmarks catching the view here and there, and even these dim and hazy in the distance. It has been a journey with no very definite aim or object, and its result so far is failure. I have put down the figures on my mental slate, I have added them up, and they amount to nothing! absolutely nothing! Everything that I have put my hand to, everything that I have tried, has come to some lame or impotent conclusion, or has come to no conclusion at all.

When I was a babe I clamored, and roared, and struggled for my daily bread, and I do no more even now. I work, and struggle, and tussle with the world that I may eat, and drink, and be clothed, but do not even the brutes do this? If there is anything higher in life than living, then I have not reached it; if life has an end, an object to be attained, then I have not attained it, and this is rather a humiliating idea. If it is so that I should be and am not, where lies the blame? If I should have an object, an ambition—Well, I have had ambitions: it was once my ambition to wear a frock coat and pants and a stand-up collar! I have attained that ambition anyway, but what does it amount to? The coat gets seedy, the pants fringe at the bottoms, and the stand-up collar gets demoralized and refuses to stand up. What, then, becomes of that ambition? The rag picker gathers it into his satchel, and for me it is done.

Once had an ambition to have a wife. Well, in the due course of events I got one, and that ambition too was attained, but was it a success? It gave me some hours of additional hard work, it introduced me to the phenomenon called "doing chores," and it gave me not a few certain lectures. Do you call that success? I don't.

After all, what is success? Is that which we so call really success? Nine men out of ten will tell you that to succeed is to make money; others will say that success means wealth, fame, power, rank, position; but is it so? Now, I begin to think that the measure of my success has been wanting, because I have called it by a wrong name—wealth, rank, fame, power—not these, but to be HAPPY is to be successful. Now, the greatest happiness men can know is to impart happiness to others; this is at once the noblest, purest, most unselfish aim a man can have, and one not difficult of attainment.

Professor Pepper says that in making philosophical experiments a failure is really a victory, because, in trying again, we knew what errors to avoid by the lessons our failures have taught us, so that every blunder is in reality a step towards ultimate success.

And here I come to the end of my reverie, my paper, and I fear, long ago, your readers' patience, with these words of wisdom. If I have failed before, it is because I have tried to please myself. That was a mistake. Now, henceforth I will try and make others happy rather than myself, and then, I doubt not, I shall find that "success is the result of failure."

Depositing a Letter in a Fire Alarm Telegraph—Peculiar Result.

THE Cincinnati Gazette gets off the following good one: "Visitors from the country should be a little careful how they post letters in fire boxes. Henry Clark came to town a few days ago from Brown County, and spent last Sunday in the vicinity of South Camp, Washington. He wanted to post a letter, and not being very well up in city ways, took fire alarm box No. 283 for a letter box. As he approached it he could read the words 'key to be found at the saloon.' He applied to the saloon keeper, who produced the key in great haste, supposing there was a fire. Returning to the box, the Brown County man opened it and saw within what was apparently an inner door with a handle to it, and the words, 'Pull down the hook and then let go.' Thinking his letter would not be safe unless he deposited it in the innermost place, he pulled down the hook and then let go. Presently there was a commotion, and while Mr. Clark was studying out some better way of getting into the interior, two or three engines came tearing up to the place in search of the fire. The cause of the alarm was traced to the unfortunate man from Brown County, and he was arrested for turning in a false alarm. The next day he was arraigned in the police court, fined \$1 and costs, and went away a sadder and wiser man."

A new town in the California quicksilver region has been named Mercury.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS.

NEW YORK, July 10, 1875.

ASSESSMENT No. 76.

Table with 25 columns and 25 rows of names and numbers, representing assessment data for the Telegraphers' Mutual Benefit Association.

ASSESSMENT No. 75.

Table with 25 columns and 25 rows of names and numbers, representing assessment data for the Telegraphers' Mutual Benefit Association.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

The Lizard Lights.

THE lights at the Lizard are now undergoing considerable alterations. New lanterns are in course of construction. The source of light in future will be the magnetic electric, on the principle invented by Professor Holmes, combining all the improvements which he has recently made. The dioptric apparatus has been specially designed and constructed for the magnetic electric light. The machines for the production of these lights will be worked by Ericsson's caloric engines in lieu of the steam engines hitherto in use, thus entirely removing all risk of explosions and the necessity of water supply. It is intended also to establish a powerful "Syren" fog signal at this station, to warn mariners, in thick weather, of their proximity to the coast. This "Syren" will be worked by the same engine. The works are being rapidly carried forward, and it is expected that the lights will be exhibited by next Christmas.

A New Swindling Dodge.

It has remained for a St. Louis artist to devise and attempt a swindling scheme which is admirable for its novelty, though it chanced to fail at the first trial, and is of no further value. The device consists in bringing two telegraphic despatches and a signature book to a wealthy man for his signature, the page of the book being so cut and underlaid with a blank check that the signing of the name twice would give the clever operator a check both endorsed and signed. The business man narrowly escaped the trap, which failed for lack of a little forethought, as the paper beneath, not being securely fastened, slipped enough to attract attention as the name was being signed the second time. This small circumstance defeated the pretty plan, and saved the discoverer a big deficit in his bank account.

Excellent Telegraphic Arrangements, and Heavy Business at Saratoga.—Albany Items.
—Resignation of Sup't
A. L. Dick.

ALBANY, N. Y., July 20.

TO THE EDITOR OF THE TELEGRAPHER.

THE Western Union office at Saratoga Springs has been very materially enlarged and improved since last season, and is now one of the most thoroughly equipped and manned offices of its size in the country. The operating room has been greatly enlarged by the removal of a partition (taking in "Bogy's" back room), and is a commodious and pleasant room.

Among the additions are three "quartette" tables of the W. U. pattern, a set of differential duplex, and a set of improved quadruplex instruments; the former being used on the Albany, and the latter on the New York circuit. Branch offices have been opened at the Congress and United States, also at Moon's Lake House, on Lake Saratoga.

The force, headed by the faithful and popular manager, J. G. Owens, is as follows:

E. A. Beardsley.....	Boston.
Edward O. Chase.....	Philadelphia.
Theo. Williams.....	New York.
G. E. Hinman.....	"
C. H. Thomas.....	"
L. B. McCarthy.....	"
J. A. Ashwist, Cashier.....	"
F. H. Patrick, Delivery Clerk.....	"
D. H. Patterson, Book-keeper.....	"
Wm. H. Hill.....	"
Geo. Wheelock.....	Fall River, Mass.
F. C. Noble.....	Augusta, Me.
M. J. P. Kavanagh.....	New York.

The names of these gentlemen are well known, and are a sufficient guarantee that the work of this office is being done in a first class manner.

Tuesday and Wednesday of last week were the heavy days of the season thus far, being the occasion of the University Boat Races. These trials of muscle draw together annually an immense throng of people from all parts of the country, who are interested in the success of the various crews, and give rise to a grand rush of telegraphing for a few days. The arrangements for transmitting this business were about as near perfect as possible this year. An office was opened on the grand stand, from which the progress of the race was reported every half mile, to New York office, and from thence it was bulletined throughout the country.

The experience of Tuesday showed plainly that one wire would not accommodate the rush which was sure to come on Wednesday, that being the crowning day of the regatta. Supt. A. S. Brown, Assistant Electrician Gerritt Smith, and Supt. of Repairs Geo. Thompson were on the ground, and seeing the necessity for greater facilities for the Lake offices, lost no time in providing them. After six o'clock Tuesday evening the work was commenced, and a second wire strung from the main office to the grand stand. This wire was hitched on one side of the quad, and was worked through to New York without any difficulty, while the first was worked "single."

Wednesday evening the press despatches were very heavy, aggregating 49,640 words, the bulk of which was sent after nine o'clock, on four single wires and the quad, the whole being finished about two o'clock. The entire business during the regatta foots up 113,446 words of press matter and 4,270 messages. Great credit is due to the gentlemen in charge and to the operating force for the handsome manner in which they disposed of this mass of business.

And now, like the crowd on Thursday, after the sports were over, I will leave Saratoga and come down to Albany, where a few items are awaiting their turn.

Mr. W. Ashdown, A. & P. operator at West Albany, picked up a \$400 diamond pin the other day, and upon returning it to Mr. H. S. Rosenthal, the loser, received a double X greenback for his trouble. It is understood that "W." does not object to this picking up business.

Two masons were at work in the new battery room a few days ago; one remarked to the other, "This would make a very good drill room if those posts were not in the way" (pointing to a couple of pillars in the centre of the room). "Why, do they intend to use this for an armory?" queried his companion. "Of course; they are fitting it up for the battery," replied the first singer of bricks and mortar.

A message was received here recently addressed "J.

H. Tobrigrand, Union Hotel, Saratoga." Mr. Tobey was finally found at the Grand Union!

Mr. A. L. Dick, for several years Superintendent of the New York Central Railroad Telegraph, has resigned. No official announcement of his successor has as yet been made, though it is generally understood that Mr. W. A. Graves, of Albany, will be the man. This settles it. DOUBLE SIX.

Reflections for Correspondents of The Telegrapher.—Personals.—Erroneous Statements in regard to the Milwaukee Board of Trade Telegraph.—Bulls.—Atmospheric Electricity on the Rampage.

CHICAGO, ILL., July 10.

TO THE EDITOR OF THE TELEGRAPHER.

AN evidence of how little we are missed in this wide world was strikingly manifested during the past two weeks. You may ask what that has to do with THE TELEGRAPHER? Well, haven't I appeared with my weekly contribution weekly for years? how was it possible THE TELEGRAPHER could make its appearance without that Chicago letter? Well, well, such is life, and as long as I can't stop the publication by not writing, probably I had better keep on writing and disgust your readers to such an extent that they will one by one fail to renew their subscriptions. We must find some way to squelch you—you are becoming a power; when, by withholding our support, we can't do it, we'll have to try some other means. Such thoughts as the foregoing have no doubt often entered the minds of many of the fraternity heretofore; seeing their weekly contributions as they appeared, they seemed, no doubt, to think that there was nothing else to fill that space, and stop writing to see if such was not the case. Whether agreeably or disagreeably disappointed the result is the same—THE TELEGRAPHER still appears weekly, just as interesting as if we had never been known! Such remarks may do injustice to your correspondents, but are they not warranted by the way you are treated by them during the heated term, when, most of all, you need their assistance? I hope more of them will come to the rescue, for whether the neglect comes from causes I have set forth in ridicule, or from any other, the result is the same. As for myself, circumstances over which I had no control prevented my weekly effusions lately. When we are sick we can't write; when our days are spent in toil and our nights in anxious watching over our loved ones who are sick, we cannot write; and this is my excuse for seeming neglect. As a result of the negligence we must travel over old ground that should have been gone over when the news was fresh, but in the hope that it will still be news to a majority of your readers, I send it.

The last meeting of the American Electrical Society, which was held on the regular night, the 3d Wednesday night in June, was the most interesting, for a small meeting, that has ever been held. Mr. C. H. Summers, of the Executive Committee, presided, and Mr. C. S. Jones, secretary (as usual), was in his place.

A paper from Mr. R. J. Hewett, of Austin, Texas, on the "Improvement of the Siné Galvanometer," was presented; also one from I. N. Miller, of Chillicothe, Ohio, being a supplemental paper on "Lightning Rods." Both were placed on file for discussion at a future meeting, when a larger number should be present.

Mr. W. C. Long presented a list of names of operators in the Western Union office who favored a local society being organized similar to the one in Milwaukee (organized by General Superintendent C. H. Haskins), which should be an auxiliary to the American Electrical, and should hold weekly meetings afternoon and evening, to give the night as well as the day operators a chance to be present. The list was referred, by unanimous vote, to the Executive Committee for their action. It is signed by a majority of the oldest and best men on the Western Union day and night forces here, who are really in earnest in wishing to get a better knowledge of the business which affords them a livelihood, and which is yearly spreading even to the uttermost parts of the earth.

That the meetings of the American Electrical Society are growing in interest is shown by the part taken by the members, old and new, in the discussions. Those of the members who are obliged to be absent are losing a great deal, and those who fail to join from feelings of distrust, or for fear they would not be made welcome, should drive such thoughts from their minds, and, by joining at once, not only benefit themselves by mingling with those who once stood where they stand, but also benefit their fellows who have not had their experience and are eagerly waiting to be instructed. I have heretofore tried to impress upon the fraternity the benefits to be derived from forming local societies as auxiliaries to the American Electric, and those of them who are near enough Chicago should lose no time in joining that Association, for although the society would probably never miss them if they did not join,

still every little helps, and each one has an influence which he exerts for good or otherwise. Whether conscious or not of the fact, such is the case, and we will be held responsible for the talents with which we have been entrusted.

I notice, in a recent issue of the Bloomington, Ill., *Pantagraph*, that Mr. J. N. Coons has been appointed manager of the Great Western Telegraph Company in that city. The office has been moved into his segar, news and variety store, at 103 West Jefferson street. The *Pantagraph* adds: "Mr. C. is an experienced operator, and all business entrusted to him will be transmitted with promptness, accuracy, and at lowest rates." Those of us who know "C." know that too much is not claimed for him by this notice, when it is remembered that he was a successful telegraph manager at different points in the oil region in Pennsylvania during the times when it took fighting to get business and keep it. His estimable wife, formerly Mrs. Morris, who was known in Pittsburg, Pa., Pacific and Atlantic office as "V," and at many points through the oil regions, where she used to make the boys get down to their work when she had specials to send, also assists Mr. C., and it looks as though, with such a team in the opposition, telegraph business was going to be lively in Bloomington.

I noticed our friend "Pete" Rowe, of the W. U. office at Peoria, Ill., in town a few days ago, looking as happy as if he had not been married.

"Patsy" Tierney, of the W. U. night fore in this city, was called suddenly home to New York City by the sudden and dangerous illness of his mother. It is rumored he intends engaging with the A. and P. in New York and will not return here. "Patsy" was a universal favorite and a strictly first class operator.

I am told that one of the W. U. Chicago ladies, to make THE TELEGRAPHER more popular, uses it for a fan these hot days, and when the boys call on her at her table and remark about her nice fan, she improves the opportunity to show the beauties of the paper and tell them they should subscribe, and as they can't refuse such arguments, the result is easily conjectured. That's the kind of girls we have!

Mr. O. S. Demise attends to the interests of the W. U. Tel. Co. at the Central Hotel in this city and his extensive news stand at the same time, which, by the way, is one of the best in the city. Our friend Lithgow, "Q," still continues to coin money selling tickets and telegraphing, on the percentage system, near MeVieker's Theatre, on Madison street. Henry Jahn, although quite young, attends faithfully to the interests of the Metropolitan Co. of this city at the Metropolitan Hotel. Some of the older members of the fraternity might take pattern from this attentive young man.

The statement made by your Milwaukee correspondent that the Board of Trade Telegraph Company, recently established between this city and Milwaukee, with Mr. Allan C. Knapp as lessee and manager, was gotten up to run out the great Western Company, is without foundation in fact. Neither is the rumor circulated in the interest of other parties, that it was entirely a Western Union affair, true. As well might the story circulated at the time the A. and P. leased a wire of the W. U. Co. between here and Omaha, that the W. U. had obtained a controlling interest in the A. and P., have been credited, as this absurd one. Mr. Knapp leases his wire from the W. U., 'tis true, but outside of this it is a purely private affair, in which an old and well known telegrapher has engaged to try to make a little money honestly, and instead of being used in this manner he should be encouraged.

If your name was D. H. Elliott, how would you like to have a boy running all over town asking folks if they knew D. Elliott? Mr. Elliott don't like it, but I dare not tell who made the bull. "Space, please." I suppose if your girl was in the habit of sending you nice little messages signed Ophelia, and you should get one signed O. P. Helia, you would be skeered too, and think she had been changing her name before you was ready. Oh! it was cruel to scare the poor fellow that way. One of the metropolitan boys is responsible for all this damage.

We hope "Pant a Loon," of Milwaukee, will not omit to give us more news from that quarter, as I notice that with all the correspondents you have in Chicago they fail to give us any Milwaukee news; and how could they? Sail in, even if you have to roll up your "Pant a Loons."

During the severe storm in the vicinity on the 22d of last month, the depot telegraph office at Highland Park, Ill., was struck by lightning and burned down. Fortunately the operator, hearing the storm approaching, was warned and vacated the building before it was struck. For the past two weeks storm has succeeded storm in such quick succession that it would be impossible to chronicle the disastrous effects of all of them. The earth and the clouds above seemed to vie with each other in producing electricity of that explosive and combustible nature which is so destructive to life and property. After reading "John Sterling's" account of the storm in the east years ago, I had thought I

should like to witness such a sight, but did not think my wish would be gratified so soon. I was awakened about three o'clock in the morning a few days ago by a continual lighting up of the room, accompanied by a rushing sound like that of a large fire. On the impulse of the moment I was about to scream fire, when I thought I would investigate farther. There was no noise save a hissing noise and the continuous lighting up. I found on opening the front door the air filled with a thick damp vapor, difficult to breathe from its heaviness and density. It looked like smoke, and when the lightning flashed it seem to lick it up as fire would oil. It was certainly a grand sight—I might say awfully grand. I watched it for fifteen minutes and the thunder was not heard for nearly half an hour afterwards; and as soon as the thundering became perceptible it began to rain. There were no very loud reports as if the lightning was striking anything, but just a rumbling rolling sound, and the rushing fiery sound, as if the elements were as quietly as possibly clearing the earth of its poisonous vapors.

Mr. John L. Rhodes, living eleven miles east of Jerseyville, Ill., narrowly escaped with his life a few days ago, his barn being struck, and with his hay, grain and several head of live stock consumed. A fishing party at Broken Kettle, Iowa, were struck by lightning and a man named Knapp instantly killed, while the other four were badly injured. At Springfield, Ill., hail fell as large as hen's eggs. The residence of Mr. Williams being near his barn, his wife was seriously shocked by the same charge that struck the barn and killed a valuable horse.

A family near New Carlisle, Ill., were badly stunned, while the barn was struck, and it and the contents, valued at \$2,500, destroyed by the fire resulting from the lightning.

At Brashear, Mo., a few days ago, while three men were in a granary, filling wheat into sacks, lightning struck the barn, and one of the men, while sewing up a sack, was instantly killed—being struck on the head, neck and breast. At Mariou, Ind., during the same stormy siege, the residence of Mr. Thornburg was struck, he and his wife knocked senseless, and the building badly damaged. At Jerseyville, Ill., Mrs. John A. Cory was so badly shocked that her life is despaired of. At Prairie du Chien, Wis., a valuable horse and some stock standing twenty feet distant from a barn that was struck, was instantly killed. At Battle Creek, Mich., a school house, which a little while before had been filled with scholars, was struck and badly damaged. In the southern part of Illinois three brick houses were struck and the inmates seriously injured—especially a young lady, who was leaning against the side of the house where the charge entered. At Cincinnati the bonded warehouse of R. W. Caldwell, distiller, was struck, and burned down, entailing a loss of \$23,000. Three or four dwellings near the Gest st. bridge, and a fire engine house was also struck, without any serious damage, except knocking down a young lady who was standing in the door of one of the dwelling houses. At Logansport, Ind., a man named Warner had his clothes nearly all torn off him, and was very badly injured by being struck. At Mona, Iowa, a boy named Levison, while driving home the cows, was struck and instantly killed, while his two companions were badly stunned. At Columbus, Ohio, on the 4th inst., a church and a house near by were struck, and a man named McMullin, in the latter, also struck in the back of the head, the current passing around his body and down his right leg, burning and stunning him severely. At Fairbury, Ill., on the 3d inst., while a large number of persons were celebrating the 4th, a storm came up, driving them from the grove to the awnings of the buildings on the south of the public square. Two houses were struck and burned down and a mule killed within fifty feet of hundreds who had taken shelter there. Nearly all of the people were hurt more or less. It was commented upon as a miraculous escape. In Curran township, near Springfield, Ill., on the sixth inst., a man named Curran, while in a field attending to some cattle, was struck and instantly killed. On the 8th inst., at Hampton, Iowa, a farm house was struck, and three small children playing on the kitchen floor, aged between four and eight years, were instantly killed. It has been noticed by observing persons, who have given the matter attention, that a majority of the buildings struck and destroyed, which I have noticed above, were protected (?) by lightning rods—some of them of the latest improved patterns.

It is reported that an *arolite* fell in Springfield, Ill., a short time ago, and struck within a few inches of a lady, who was standing at her gate. It was quite warm when picked up, and measured about two inches in length. The theory has been advanced that its fall was due to electrical disturbances.

Is it not a wonder that some of these lightning rod pedlers don't get struck? It must be because men are not punished for lying.

The Burlington *Hawkeye* is responsible for the yarn "that the same flash of lightning that killed a dairyman's best cow also opened up a beautiful spring of

clear water near the house. That man don't drive around by the river now, and, of course, small fish have not been found in the milk recently." It's true, of course.

I understand a picked nine from the Western Union night force left here to-day to play the "Dots and Dashes," of St. Louis, to-morrow. Will try, if possible, and get the result of the game for your issue of the 17th.

OCCASIONAL.

The Visit of Chicago Boys to St. Louis.—The Visitors Win the Game of Base Ball.

ST. LOUIS, Mo., July 12.

TO THE EDITOR OF THE TELEGRAPHER.

THE deed has been did, and the St. Louis boys are a defeated crowd.

As arranged, the Chicago boys, eleven in number, as follows: Sam Braeken, captain; Delaney, Kemp, Scates, Batcheler, Curt Meserve, McCulloch, Andrews, Kerns, players, and Dave Anderson and Ed. Whitford (to keep them straight and urge them on to "victory") arrived at eight o'clock yesterday (Sunday) morning, and were met at the depot by Messrs. Nelson, Newton, Irwin, Day and Moxon—a self-appointed reception committee. They party proceeded to the Everett House, where they had breakfast and met another delegation of St. Louisians. After breakfast, at which Mr. Whitford is said to have distinguished himself, the party took the cars for the Grand Avenue Park. A drizzling rain was falling and black clouds darkened the horizon, which made the prospects for a game very bad. All were in good spirits, however. After waiting awhile, as the weather showed no signs of clearing up, it was decided to play in the rain. The game was called at eleven o'clock. Mr. Dan Devinney, of the St. Louis Empires, was chosen umpire, and he discharged the duties of his position through the long and tedious game with remarkable satisfaction, and received high compliments from all. Ed. Whitford kept the score. St. Louis, losing the toss, went to the bat. In the first inning they tallied two; Chicago, five. Many of the Chicago boys were provided with base ball shoes, which prevented, to a great degree, their "skating" over the wet and slippery grounds. The game went in favor of Chicago from the start, principally on account of the St. Louis fielders' inability to manage the ball, as before stated, on account of slippery ground. They also failed to run bases in proper style. There was a fine exhibition of "muffingism" on both sides, Mr. Sam Braeken, of the Chicago, making the only creditable play. Mr. Batcheler, of that nine, did good execution with the willow, and, aided by St. Louis' poor fielding, made a good score. Delaney played an honest game at first base, but scarcely a good one. Scates' pitching was slow, and under different circumstances would have been severely punished. Curt Meserve at "third" and Johnnie Kemp at "second" made several stops, but were slow in getting the ball to "first." The outfield play was not noticeably bad or good. On the St. Louis side, Captain Nelson distinguished himself in running bases, not otherwise. Carroll was weak behind the bat, and Al. Marsh caught several innings. Lenhardt at "third," Bell at "second" and Deering at short, made the most errors. Charlie Cummings at "first" did beautifully, his play being almost without error.

The game was interrupted several times by rain, and towards the close grew exceedingly uninteresting. Considerable money changed hands on the result. It is a somewhat singular fact that in Chicago the betting was in favor of the St. Louis Club, and in St. Louis in favor of the Chicago. Five double plays were made by the Chicago boys; none by St. Louis.

It had been expected that there would be quite a number of spectators present, but the rain prevented a great many from attending. Prominent among those who were present were Billy Spink, who represented the *Globe-Democrat*; John Cassidy, Charlie Day, Charlie Newton, Jim Murray, Tom Wheeler and J. W. McDonald.

The game was telegraphed, by innings, from the grounds to Chicago and all the principal cities of the country, and all the St. Louis papers contained accounts of it. The following is the score:

CHICAGO.		ST. LOUIS.	
O.	R.	O.	R.
Delaney, 1 b.....	4	Carroll, c.....	3
Kemps, 2 b.....	5	Marsh, 1 f.....	2
Scates, p.....	1	Bell, 2 b.....	3

Base hits—St. Louis, 8; Chicago, 9.
Passed balls—Braeken, 2; Marsh, 1; Carroll, 6; Lynch, 3.
Left on bases—Chicago, 6; St. Louis, 2.

After the game the visitors were escorted to the

office, and also paid a visit to the bridge. After supper all had a short rest, and at 7.20 P. M. were bidden good-bye by the whole nine, besides many others from the office, including Messrs. Cummings, Topliff and Van Tyne.

The visitors expressed themselves well pleased with everything, including the result of the game, and promised to do as well for the St. Louis boys when they visit the Garden City for the return game, which will probably be some time in August.

TOO MUCH CED.

Weather.—Welcome.—Personals, etc.

PHILADELPHIA, Pa., July 20.

TO THE EDITOR OF THE TELEGRAPHER.

WE are still alive in this part of the universe, notwithstanding that it has been 103 deg. in the shade, and I think our office is especially a warm place, as there is very little pure, fresh air that penetrates into our office, it being mostly hot air from the numerous engines, tracks, etc., and, not speaking of the numerous dust storms we are often greeted with, you can imagine our "feelings."

Feeling hot and uncomfortable one day, I took a trip up the road and called on Mr. Sellers, the genial and active agent at Sellersville, who presented me to his partner in the blessings of this life and his little "sunder," and had the extreme pleasure of feasting on a luxurious dinner, prepared at the hands of Mrs. S. and her sister, to which I did ample justice; and after having been further entertained with some excellent music, rendered by Mr. Sellers, and a good talk, as only operators can talk, I soon left there and concluded my journey home. Any one wanting to take a rest from office duties and have a pleasant time I advise them to call on Mr. S.

Miss Lees is still managing the affairs at N. P. Depot here in the city, for Bentley's City Line, and is doing her very best for the interest of said company.

We heartily welcome among our ranks Mr. T. Frazier, "D. C.," formerly messenger for the W. U. Co. at Doylestown, Pa. Give us your hand, Tom.

A message for Pittman was delivered to Hillman. The chief operator at this office kindly permitted me to have the day and evening of the 5th inst. at my leisure, after having worked only two hours and a half in the morning. I tried to make myself agreeable to the numerous young ladies at a pic-nic in the afternoon, and towards evening several of us young men wended our way to Fairmount Park, taking the P. & R. cars at Ninth street and Reading R. R. near Erie avenue, and soon thereafter arriving at destination. Whether cakes, pies and healthy edibles were not allowed in the park I don't know, but I do know that after a long and vain search we were obliged to go supperless, as we had not the time to spare to go to one of the crowded hotels or restaurants in that vicinity. There were, however, plenty of peanuts to be had, and a sort of reddish looking water, called by the vendors lemonade, but we had had enough of that stuff.

After the conclusion of the beautiful fireworks (which I leave to a more capable person to describe) we had the pleasure of walking fully thirty squares, after having been on our feet nearly all day; and after partaking of some excellent cream and ices we boarded the street car for the remainder of our journey, and thus I passed the fifth of July. EX-PROF.

A Difficult Problem.

TO THE EDITOR OF THE TELEGRAPHER.

WE all know, as a matter of course, that electricity is a mighty force (called for convenience a fluid), and that it appears to exist in every substance of nature, and may be developed by a variety of causes, such as friction, heat, and chemical action.

Now, the question is with me, and which I would like to have answered, Why is electricity excited or developed by these causes? W. A. S.

[NOTE.—We should be pleased to afford the information desired by our correspondent, but his question is a difficult one to answer. Able electricians in this and other countries have studied it for many years, but have not arrived at a satisfactory explanation. If any of the electricians who read THE TELEGRAPHER can solve the problem intelligently and satisfactorily we should be pleased to hear from them on the subject.—EDITOR OF THE TELEGRAPHER.]

A NEW SOURCE OF MAGNETISM.—M. Tommasi states that, when a current of steam under a pressure of 8 or 6 atmospheres is driven through a tube of copper 500 to 600 of an inch in diameter, rolled in a spiral about an iron cylinder, the latter becomes so highly magnetized that an iron needle, placed at a fraction of an inch from it, is strongly attracted and remains magnetized during the passage of the current.

Express Messages.

OUR contemporary, the *Journal of the Telegraph*, in its last issue reviews the argument against the adoption of the system in use in some European countries, of express messages, or messages accorded priority of transmission over telegraph lines on payment of a special rate therefor.

It is true that there is much to be said on both sides of this question, and it is therefore a fair subject for discussion in telegraphic journals. We have carefully considered the arguments and assertions of our contemporary, but we are yet unconvinced of the untenableness of the position which we have taken in regard to this matter.

The first, and as it is evidently considered by our contemporary, an unanswerable argument, advanced and reiterated, is that transmission of messages in the order of reception is imperative and fundamental under the laws of most of the States in the Union. We do not understand that the State laws prohibit special contracts between telegraph companies and their customers. If this be so, then the half rate system for night service, now universally adopted and equally popular, is illegal. At night messages are given priority of transmission and delivery upon the payment of double the rate paid, when taken under a special contract to be transmitted and delivered within a certain specified time, at the convenience of the telegraph company. There has been no complaint of illegality or unfairness in this matter, and we can see no valid reason for such complaint applicable to other business which is not equally so to this.

We are by no means convinced by the argument of our contemporary that the application of the half rate night service to telegraph business generally, would lead to such a universal protest as he asserts. It would be merely a classification, not by the telegraph officials, but by the customers themselves, of their messages, as regards the relative importance and value of immediate or less prompt transmission, for which they would pay accordingly. Much of the business requires prompt transmission and delivery, or it is of little or no value to the customer. A considerable percentage, if sent and delivered at any time within from five to ten hours, will answer the purpose just as well. Under the present arrangement all messages, except the half rate night messages, are taxed to furnish immediate transmission and delivery. Is not the proposed priority sys-

tem more fair and equitable to all parties? If a message is of immediate importance it would pay accordingly, if prompt transmission is not essential, it would have the benefit of the fact, which, with the exception before noted, it does not now.

There is a general demand for lower rates for telegraphic service. Under the present system the rates are probably about as low now as telegraph companies can afford to make them. By scaling the tariff and giving priority of transmission within certain limits to those whose business requires it, and who desire and are willing to pay for it according to its value, a less important class of messages might be taken to be transmitted and delivered within a specified time, lower rates could be accepted therefor, and to our mind this would be but simple justice to all parties. It would moreover leave the wires free during the business hours of the day to carry such preferred business, enabling telegraph companies to perform the business more satisfactorily and advantageously to themselves and their customers. The lower rate would, when the system was understood by the public, undoubtedly increase considerably that class of business, and thus furnish additional employment to the lines, when otherwise they would for much of the time be idle. This has been the result experienced with the half rate night message system, which, it should be said, was not introduced by the Western Union Company, but forced upon it by the action of the Pacific and Atlantic Company, when it originally extended its wires to this city. At that time the Western Union officials regarded the half rate night service with as much disfavor as they now do the proposed express message service.

We have no doubt but that this system will eventually be introduced generally in this country, and after it has been in use for a year, will be as popular with the public, and as much in favor with our Western Union friends as the once despised duplex of Mr. STEARNS, and the half rate night service now are.

The Direct United States Cable.—Where is the Faraday?

NOTHING reliable has been heard from the steamer Faraday, which, at the last advices, was engaged in repairing a fault which had been developed in the long section of the Direct Cable. This was some three weeks ago, and the prolonged silence, and the fact that no communication has been had with the ship from either end, causes some uneasiness, and gives rise to reports and rumors of a discouraging character. On Tuesday and Wednesday last the quotation of Anglo-American shares largely advanced in London, and that of the shares of the Direct Cable Company declined to 8 on a par value of 20. A report was circulated in London that the attempt to get the Direct Cable in working order again had been abandoned, but from what authentic information we have been able to obtain we do not think there is reliable foundation for this report. Up to the time this is written absolutely nothing has been heard from the Faraday, and there is no communication through the cable. We understand that the steamer Hercules was, on Monday evening last, despatched from St. Johns, N. F., in search of the Faraday, with instructions for her, if found.

European and East India Telegraph Agency.

MR. E. C. VAN HOVENBERGH, formerly clerk to Mr. E. F. LUDWIG, Supt. of the C. N. D. of the Gold and Stock Telegraph Company of this city, has established a European and East India Telegraph Agency at No. 21 Wall street, New York.

Those who may have occasion to forward messages per Atlantic cable as above, will find it to their advantage to arrange with Mr. VAN HOVENBERGH for their transmission. His arrangements are very complete for this business, and those who may patronize him will save money by so doing.

Literature.

The Electrical News and Telegraphic Reporter.—Edited by WILLIAM CROOKES, F. R. S., etc. London: Boy Court, Ludgate Hill, E. C. 1875.

This is a new weekly electrical journal, of which the first number of July 1, 1875, has just reached us. It is conducted by Mr. Crookes, the well known editor of the *Chemical News* and *Quarterly Journal of Science*. The new publication is modeled somewhat after the *Chemical News*, and evidently aims to occupy the same position as an exponent of electrical, as that valuable publication does of chemical science. In his salutatory the editor makes the somewhat remarkable assertion, that "journals have been started with the professed object in view of making public all that is known or can be learned of electricity in all its branches, but they have degenerated into unscientific records of unimportant events, and the purpose for which they have been started has been lost sight of; thus it comes that while engineering, chemistry and other applied sciences have all their representative recognized organs, the electrician finds himself without any current journal from which he can learn the events which are daily occurring of peculiar interest to himself." If this is so, we trust the new comer will be able to supply the deficiency.

Washington, D. C., Fire Alarm Telegraph.—Application for an Injunction.

JOHN ESPUTA, JOHN THOMAS YOUNG and CHARLES STEWART have filed a bill for an injunction against the Commissioners of the District of Columbia and the firm of GAMEWELL & Co., of this city, to prevent them from putting up the new fire alarm telegraph for the District. The grounds upon which the injunction is asked for are that the contract is illegal—the consideration to be paid extravagant; that the title to the patents for the machinery is incomplete and imperfect, etc. It is also stated that the GAMEWELL system is not in successful operation anywhere.

There has been a very bitter contest for the Washington contract, and it is supposed that this action has been instigated by parties who failed to obtain it. We understand that the libellants are a Spaniard and two negroes residing in Washington.

We do not know as to the legality of the contract, but in view of the fact that the GAMEWELL system is now in successful operation in seventy-one cities in this country, the assertion to the contrary is rather startling. We do not take sides in contests between rival inventors or claimants of inventions in this matter, but we are bound to refute such statements as are made in this case in regard to a system so valuable and useful, and which has been so extensively introduced as the American (or GAMEWELL & Co.) Fire Alarm Telegraph.

The preliminary hearing on the application for the injunction was to take place Friday, the 23d inst. Meanwhile the erection of the new fire alarm telegraph is actually proceeding.

Handsome Business Cards.

WE have received from Messrs. JOSEPH MODRE AND SONS, the well known manufacturers of insulated telegraph wires, 535 and 537 China street, Philadelphia, a series of cards, five in number, giving excellent lithographic views of the several buildings and grounds included in the Centennial Exhibition, and which are combined with their business card. This is a very good idea, as the excellence of the views will insure the cards being preserved and exhibited.

In this connection we would refer to the fact that this house was established in 1820, and has, therefore, passed its semi-centennial, but it is not by any means antiquated or behind the age in its manufactures and business. All wire furnished by this firm may be relied upon as being of the best quality, reasonable in price, and just what it is represented.

Tillotson & Co.'s Manufactory of Car Trimmings, etc.

In addition to the extensive business of Messrs. L. G. TILLOTSON & Co. in electrical and telegraphic apparatus and supplies, in which they are largely engaged, they are probably the largest manufacturers, importers and dealers in railway machinery and supplies in the country.

They have recently added to their facilities, as a result of the greatly increased demand for these goods, a separate and extended branch of manufacture of car trimmings, lamps, etc., devoted specially to this class of work. They have also purchased the patterns and machinery of W. C. MARSHALL & SONS, of Hartford, Conn., and will continue the manufacture of all styles of goods formerly manufactured by that firm.

Personals.

Mr. MILLER, formerly assistant agent and operator at Quakertown, Pa., N. P. R. R., has been appointed agent and operator at Hartsville, Pa., N. E. P. R. R.

Mr. THOMAS FRAZIER, formerly messenger W. U. Tel. Co. at Doylestown, Pa., has been appointed assistant agent and operator at Quakertown, Pa., N. P. R. R., *vice* MILLER, promoted.

Mr. FRANK SCHUMAKER is the gentlemanly operator at the Western Electric Manufacturing Co.'s office on Kinzie street, Chicago, Ill., and copies all his business as it is sent on the Sholes & Glidden type writer.

Mr. J. L. MANSFIELD officiates at the Sherman House, Chicago, Ill., while his brother, Mr. J. P. MANSFIELD, takes a few weeks' vacation in the country.

Mr. A. FARQUHAR, an old Pacific and Atlantic operator, has charge of the C. & P. R. R. passenger depot, on Larrabee street, Chicago, Ill., as ticket agent and baggage master, in conjunction with his duties as operator.

Miss EMMA BONSALE, formerly operator at Racine, Wis., Western Union office, was married July 13th to Mr. W. H. DILWORTH, of New York City, and has left for her future home.

The Telegraph.

By Cable.

ADVANCE OF ANGLO-AMERICAN AND DECLINE OF DIRECT CABLE STOCKS.

LONDON, July 21.—The stock of the Anglo-American Telegraph Company advanced £2 10s. yesterday. Some of the papers state that the rise was on account of a rumor that the efforts to repair the Direct United States Cable had been abandoned, while others say it was in consequence of heavy purchases to cover speculative sales. The stock further advanced £1 10s. to-day, but fell 10s. The price is now 63. The stock of the Direct Cable is declining, and is now quoted at 8, which is a fall of 20 per cent. since the 8th inst., when it was quoted at 10. Its par value is 20.

The Franklin Telegraph Company.

AT an adjourned meeting of the Franklin Telegraph Company for the election of directors, held at Boston, Mass., June 15th, Mr. Alfred Nelson, of New York, presided, and said that the statement of the company's finances could not be presented as it was not completed.

The following directors, who were on the ticket presented by the New York interest, were elected: Messrs. Sidney Dillon, Jay Gould, W. J. Symms, John H. Mortimer, Thomas T. Eckert, Henry M. Faber, Fred. L. Ames, E. T. Atkins and E. H. Rollins. Messrs. Dillon and Eckert received 7,833 votes, their election being unanimous, and the others 5,544 each. Mr. James G. Harris was unanimously reflected clerk, and Mr. Alfred Nelson was chosen treasurer.

A preamble reciting that the Atlantic and Pacific Telegraph Company fraudulently assumed the control of the Franklin line, decreased its rates and injured its business by gross mismanagement, and a resolution directing the directors to bring an action in behalf of the company in law or in equity against the Atlantic and Pacific Telegraph Company, to recover damages therefor, was defeated by a vote of 5,446 to 2,295. The meeting was then adjourned.

The Maine Telegraph Company.

THE annual meeting of the Maine Telegraph Company (whose lines are leased to and form a part of the Western Union Telegraph Company's system) was held at Bangor, June 30, when the following directors were elected: Messrs. Wm. Gallupe, Albert Holton, Albert N. Paine, Jacob A. Smith, Bangor, Me.; Edwin F. Littlefield, Winterport, Me.; Hiram O. Alden, Wm. H. Simpson, Belfast, Me.; Bion Bradbury, Wm. P. Merrill, Portland, Me. The board subsequently elected Hiram Alden, President, and W. P. Merrill, Secretary and Treasurer.

Telegraph Business at Saratoga, Regatta Week.

THE business of regatta week at Saratoga was something enormous, and Wednesday, the day of the great University race, the number of messages and specials exceeded anything ever experienced before at that "Baden-Baden of America." With the quadruple of the Western Union Company had the equivalent of six wires to New York, and they were crowded to their fullest capacity during the afternoon and until late Thursday morning. After three P. M. 49,641 words of press were sent, which is nearly half as much as in the whole amount of press in the month of July last year. During the same time, Wednesday evening, between 1,200 and 1,800 messages were handled and despatched without any delays. The operators there relate that they were not crowded all day, but say that the bulk of the work came in in the afternoon after the races. The press sent Sunday, Monday and Tuesday aggregates considerably over 100,000 words. The regatta arrangements have been pronounced a signal success by the New York press, and we think the telegraph companies can exalt their horn considerably and claim a good share of the honors of the occasion. Without the splendid facilities afforded the regatta would have been as unsatisfactory as last year, and this is another instance of what timely provision and good management can do.

Gold and Stock Company's Extensions.

THE Gold and Stock Telegraph Company of this city have lately completed a line of fifty foot poles, extending from Old Slip and Water street, through South street to James street, to Water street, and thence to Cherry street, connecting there with the main line. This new line will carry mainly the Brooklyn wires of the company, now numbering forty-three, and enable the company to devote those in use for those wires now running through and along Cherry street to the up town circuits. By the erection of this line the last chance for down town pole lines is gone, no other street being vacant.

A further extension is also in progress and will shortly be completed from Jackson and Cherry streets, through Cherry, Corlear, Mangin and Houston streets, to Avenue D, through Avenue D to Fifteenth street, and thence to First Avenue; with another branch line from Avenue B and Fifteenth street, along Avenue B to Twentieth street, thence through Twentieth street to Avenue A, through Avenue A to Twenty-third street, and thence joining main line and Twenty-third street and First Avenue. The poles on this latter extension are forty-five feet long and very heavy, and will be a valuable addition to the facilities of the company for their many wires running in that direction.

These lines are built for the company by Mr. Robert Brown the veteran contractor, who has built a large portion of the lines of this company in New York and Brooklyn.

Western Union Notes.

THE night force at the new Western Union building now consists of twenty-six men. When the list is complete, the first four men are exempt from duty on Sunday evening. The list moving along one every day, the first man becoming last and the second man first, it gives each man an off night once a month, which makes it very pleasant for all concerned, as the pay goes on regularly. However, if any one of the force are late Sunday night they are put on the "reserve," and, as a penalty, are docked for the time late, and have to come on duty when it would otherwise have been their night off. No elevators run Sunday night, and as five o'clock draws near there is a good deal of perspiration (and induced profanity) as the crowd toil up the eight flights of stairs.

It is exquisitely funny sometimes to see the boys at the Western Union building, in the middle of a message or special, suddenly open their key and say "min," "blot," and move quickly away towards the end of the switch, obviously going for a drink of water. It is rich, too, to see their closely compressed

lips, and the way they roll their eyes in the direction of the manager's desk as they slip along, and when the water tank is reached, to see them bend carefully over as if to examine closely the style and finish of the tank faucet, and then suddenly let loose a quart, more or less, of mucous, highly impregnated with tobacco, into the slop pail underneath. Sometimes they seem to have a high opinion of the landscape outside, and admire it frequently from the window, and vent their admiration in floods of expectoration in lieu of applause. The filthy habit of chewing tobacco has gained such a hold on most of the operators that even amid the elegant surroundings of this palatial office they cannot abstain therefrom. To such, then, the stringent rules against spitting upon the floor or from the windows are most burdensome. They are having a good effect, though, we are glad to say, and are doing a great deal of good. Many have given up the habit altogether, and others are striving towards the same end.

A day or so ago the following was going around the office, written upon a blank by one of the operators, who evidently had a keen appreciation of the humor of the situation:

THE OLD WATER BUCKET.

Oh, dear to my ease and comfort, while chewing
The narcotic weed of my brothers so free,
Is the thought that the bucket, besmeared with my spewing,
All coated with mucous, is waiting for me.

Oh, blissful indeed is my sweet rumination,
With never a dread of soiling the floor,
Or raising beneath me a young inundation—
The bucket's my safeguard, my prized cuspadore.

The old water bucket, the ice water bucket,
The bucket we buck at, that stands on the floor.

Reduction of Western Union Force and Salaries in the South.

THE palmy days of telegraphy in the South have almost, without its being known, gradually slipped away—that is, the days when the South was looked upon as a never failing refuge for operators out of a job, or looking for immense salaries.

Within the past six months there has been a general overhauling throughout the Southern division of the company. Expenses have been cut down, which involved reduction of force in many places and material reduction of salaries in others. Texas has been, up to within this short space of time, looked upon by operators as a perfect Eldorado—large salaries and not much to do—besides affording a chance for outside speculation (bar rooms, etc.) But it is so no more. A position in Texas is no longer the sinecure it was, and the boys going there will find just as much work and no better compensation than in the northern and western offices. To afford an idea of the extent of the reductions we will cite a few.

New Orleans formerly paid operators \$125 per month, now pay \$115, besides a reduction in force of two men. Galveston, formerly \$125 (at one time in gold), now pays \$105 and \$110, reduction of two men. Memphis, Tenn., formerly \$125, now \$115. Houston, Texas, formerly \$125, now \$115, reduction of three men. Little Rock formerly paid report man \$120, now \$105, reduction of two men. Dallas, Texas, formerly \$110 to two operators and \$140 to manager, now gets along with one operator (besides manager) at \$90, manager's salary remaining unchanged. Austin, Texas, reduced from \$110 to \$90. Shreveport, La., from \$125 to \$100, reduction of one man. Besides these, many smaller offices, such as Marshall, Sherman, Long View, Jefferson and others have had force and salaries reduced considerably. For instance, Long View paid manager \$100, now pays half receipts, which amounts to about \$50 per month. The reduction only affected the managers of the smaller offices. It will readily be seen that some of these reductions could have been made before, but it was probably the idea of the company to make one sweeping move, which would affect the entire south simultaneously.

Our motive in publishing these facts is merely as a matter of information.

The men who were relieved on account of reductions, at least in Assistant General Superintendent Clowry's district, were provided with situations as rapidly as possible, and probably not one of the number who desired one is now out of a position in his district.—*The Electric.*

M. SELIM MENSTROM writes to *Les Mondes* that the diffused lights seen over the summits of the mountains of Lapland and Spitzbergen are of the same nature as the aurora borealis. In the spectrum of those lights and in the spectrum of aurora there are nine rays, which appear to agree with the lines given by the component gases of the atmosphere.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less.....	7 50	5 65
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00

No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	3 00	2 55
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 3/4 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense.

Other goods will be sent C. O. D. as usual, on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application.

All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to

J. N. ASHLEY,

THIS SYSTEM OF

FIRE ALARM & POLICE TELEGRAPH

WITH A CENTRAL OFFICE,

OR

UPON THE AUTOMATIC PLAN,

is now in operation in the following Cities, to which references

made for evidence of its great

SUPERIORITY, VALUE

AND

UNIFORM RELIABILITY.

Albany, N. Y.,
Alleghany, Pa.,
Boston, Mass.,
Bridgeport, Conn.,
Buffalo, N. Y.,
Baltimore, Md.,
Chicago, Ill.,
Cincinnati, Ohio,
Columbus, Ohio,
Cambridge, Mass.,
Charlestown, Mass.,
Covington, Ky.,
Detroit, Mich.,
Dayton, Ohio,
Elizabeth, N. J.,
Fall River, Mass.,
Fitchburg, Mass.,
Hartford, Conn.,
Indianapolis, Ind.,
Jersey City, N. J.,

Savannah, Ga.,
Syracuse, N. Y.,
Troj, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THEIR CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES;

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection. Introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERs made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

[Written for *The Telegrapher*.]

The Reporter's Growl.

SEQUEL TO THE "LATE MAN'S LAMENT."

I'll give you thirty bye and bye,
So don't go off just yet,
It's lively times 'round town to-night,
And I am rushed, you bet.

I'll strike the coroners first, I guess,
A floater's found, I hear—
Some boatman hitched a rope to him
And moored him to a pier.

The Station house comes next—there's been
A big fight in "Bull Run,"
And a woman in "Hell's Kitchen"
Stabbed some drunken son of a gun.

I haven't got particulars yet,
But I'll take a little turn
Up around the Barbary Coast, and see
What further I can learn.

Then there's a grand mass meeting
At Union Hall to-night,
When the Democratic war horses
Commence the campaign fight.

I hear it rumored in the street
That Ralston has suspended—
Must hunt him up and get the facts,
That all doubt may be ended.

There goes a gun—I'll bet four bits
The China steamer's in;
If I don't send the news to-night
J. W. 'll growl like sin.

Hark, there's a fire bell—ninety-three,
Corner of Turk and Jones,
A pretty waltz for a man that's got
Rheumatics in his bones.

A suicide on Broadway,
And a shooting scrape on Pine;
I'll give you thirty at eleven,
And now it's only nine.

So keep your spirits up, but not
By pouring spirits down;
You see it keeps me humping
When things are brisk round town.

Original Articles.

Love and Lightning.

BY JOHN OAKUM.

G. GREGORY JONES had been courting a girl by wire for about three years, and had corresponded with her by mail until an engagement of marriage had been finally settled between them, "sight unseen," it being inconvenient for them to meet, on account of the distance, she being located some four hundred miles away from him.

"What could be expected when we note their common labors, What when we consider that the two had long been neighbors, Not so near that they had met, but near enough—'Tis true, Little distances may lend enchantment to a view."

In the same office with Jones there worked a stylish youth by the name of John Birdsong, and so partial was the fair telegrapher to Jones that whenever he went to dinner and she was compelled to work the wire with Birdsong they invariably quarrelled about something or other, and became, in the course of time, as cordial enemies as she and Jones were friends. Birdsong lost no opportunities to wound her feelings, and she often told him that if she ever laid eyes on him she would tell him to his face what she thought of him in such terse and vigorous English as to leave no doubt in his mind about the position he occupied in her estimation. Thus matters stood, when one day Jones attired himself in gorgeous plumage to go and see his own true love, and left on the evening train. He arrived in due time, and they were mutually pleased with each other. I will not stop to dwell on the subject of their hilling and cooing—there was no end to it, it is safe to assume. But his furlough ran along like the wind and all too soon came the sad hour of parting. He was to return by the midnight train, and they had long since closed the little office at the depot and adjourned to the old farm house—her father's residence—in the suburbs of the village.

It was a beautiful moonlight night in the early September, and the scene out of doors upon which they had long been gazing, talking of their happiness and the prospect of quick coming nuptials, meantime, had wrought them up to the sublimest pitch of ecstatic bliss. You nor I, reader dear, will ever know the half they had said that night; no indeed. As the last half hour of Jones' stay was wearing on, she arose and lighted the lamp, and then went and brought from an adjoining room his natty light overcoat and glossy beaver. She sat the latter on the table while she assisted him on with his coat, her hands lingering lovingly on his shoulders, and then while he was settling himself into his coat she went and took up the hat and stood looking into it, waiting to pass it to him. Her sweet face flushed, her eyes downcast, she looked almost heavenly in his eyes, and he said: "Ah! darling, you are more beautiful than Phryne, and —"

At that moment, the hat sped across the room and she fell to attacking him in the choicest epithets of abuse that ever fell from a pretty woman's lips. He tried to sooth her but she would not answer any questions, and Jones hearing his train whistle and knowing he must positively return home that night, went and picked up the shako and ran mournfully to the depot, as she sat weeping as if her heart would break in the old room which had witnessed so many scenes of love and devotion between them. Probably no man was ever more wretched than Jones as the night express rumbled out of the quiet village and sped onward. But he was a philosophic young man, withal, so he went into the smoking car, lighted a segar and began to think the matter over. But the more he thought about it the more he was puzzled. He pictured her standing there, pretty and patient, holding his hat, and suddenly he said to himself: "I wonder if there is anything about that hat which disturbed the little girl?" and he took it off and looked at it. It had a great dint in the side of it to be sure, but that wasn't there when she had it. Then he looked inside and he grew pale, for there in capital letters appeared the unhappy name—John Birdsong. It all came to him then; he had borrowed Birdsong's new fall tile, at the last moment, to make his *tout ensemble* altogether irresistible, and, as he knew very well, Birdsong had often told her, when she and he had indulged in a difference, that if she didn't behave better he would come down some day, tell her he was Jones, and let her say "pretty things" to him.

I will not weary you with the details of the explanations which followed or the conciliation afterwards. Our's is an age in which people clamor for results, not particulars, for the sum total and not for the items of an account, so I will conclude by just stating that Birdsong helped to bring the matter to a happy settlement, and finally stood up with Jones at the wedding in the same old parlor where his hat had gone skurrying from an angry hand. And if you ever pass Jones' house and see a five year old boy, swinging on a gate, who looks like his father and speaks like the echo of his mother's voice, bear in mind that your happy eye is resting on the figure of Master John Birdsong Jones.

Burmah.

BY MEPHISTO.

RANGOON is the chief town of British Burmah, and is situated about 80 miles from the mouth of the Irrawaddy River. Time was when it was called the white man's grave, so pestilential was its atmosphere; but by dint of clearing jungle and draining swamps it is now a healthy place enough, even in the hot season, the nights being comparatively cool. The mosquitos there beat anything I ever saw for size and viciousness. I remember once— But no; the readers of THE TELEGRAPHER would not believe me if I told them, and my reputation for veracity is as yet unimpugned. It was a burning hot day in May (the hottest month in the year) that I landed from my steamer—I was then third lieutenant of the gunboat "Pluto"—to send a despatch to a friend, who was an officer of one of the Government river steamers, then wooding at Thayetmyoo, the frontier town. Calling a hack *gharree*, I was run up to the telegraph office in style. These Burmese hacks are very handy, comfortable and cheap. They consist of a body like a large chest, with eight windows, mounted on four wheels, and drawn by one of the strong, hardy ponies of the country. The driver runs at the pony's head, leading and guiding him by a short check rein. You need not have any conscientious misgivings about the driver. He has been doing nothing else but running all his life, and can run down and utterly wear out two or three ponies in the hottest day. The telegraph office of Rangoon is not a very imposing edifice; rather the reverse. Picture to yourself a long thatched barn, old and rickety in the extreme, mounted on piles to raise it out of the mud. The flooring is so conveniently laid that one can see all that goes on beneath through the wide interstices of the boards, can view the twenty or thirty *pariah* dogs that growl, and whine, and howl under its shelter; can

watch the graceful movements of the deadly *cobra* as it glides to and from its lair, and can enjoy the balmy breezes that are wafted through the chinks, bearing with them the odors, not of Araby the Blest, but of good, honest, genuine Rangoon mud. 'Tis not a gorgeous palace; but then in that hot climate a few chinks here and there are rather agreeable than otherwise, and it can be and is (or rather was, for I presume it has by this time been replaced by a brick building), made delightfully cool by the constant application of water to the *cus-cus* *tatties*, or mats, with which it is surrounded. Strolling in, I found the two or three operators (there are four wires, I believe) lounging in the peculiarly graceful attitudes incidental to hot weather, lassitude, slack work and laziness generally. Calling for a blank, I was writing my despatch, and had got near the "sig." when my shoulders were almost dislocated by a hearty blow, and a voice as of a roaring lion bellowed, "Mephisto, old fellow, is it you?" and turning more in sorrow than in anger I faced the burly form, and was caught in the vice-like grip of my old cronie, chum and bosom friend, George Doughty, developed into manager of the Rangoon telegraph office, and weighing some fifty or sixty pounds more than when last I gazed upon his jolly old phiz. Fancy a modern Hercules, six feet two in his stocking feet, with an arm like a gladiator, a fist like a sledge-hammer, and a voice like a volcano; yet withal, as gentle as a dove, as tender as a woman, and as chivalrous as a knight of the olden time.

"Come along, old boy, come into my den and check perspiration. It's so confounded hot here that it takes one all one's time to keep the blood decently below boiling point." And so retiring into his private room we made ourselves comfortable, lit our cigars, and inaugurated the process of "checking perspiration," which I knew of old consisted of imbibing a bottle of soda water with a handful of crushed ice and a soupcon of cognac in it, "to kill the animalculæ," as George said. He had much to tell—how he got sick of the sea; "denced hard life, you know, for a fellow of my weight and inches;" got friendly with a telegraph operator, mastered the dots and dashes, and went to work at telegraphing; how he graduated from a plug to a first class operator, until he woke one morning to find himself, not like Byron, famous, but manager; how the life suited him to a T, "nothing to do; you know, and lots of fellows to help you. And now, old boy, I have been working like a nigger these last three years (he had, I presume signed the pay roll thirty-six times in that period), and I have applied for a month's leave and am going for a holiday. Where would you recommend me to go?" "Come with me, George," I said; "come with me; come where the jungle has ne'er been trod by the foot of white man; come where the buffalo roams at large, where the rhinoceros is at home and the elephant holds his grand levee; come where the tiger, grim monarch of the forest, lies in wait for the timid *sambur*; come, in a word, to my station; take a cruise with us over our cruising ground, and I will warrant you more fun than in any other show, and it shan't cost you a red cent." We shook hands on the arrangement, and in ten days more we were steaming down the river on our way to the cruising ground. How we got on and what we did I will tell you in my next if you care to hear it.

Damage to a Telegraph Cable by a Vessel.

IN the Vice-Admiralty Court at Quebec, Canada, on the 16th inst., Judge G. Okill Stuart gave the decision of the Court in the case of the Montreal Telegraph Company, against the *Czar* vessel, Scollaw master, for negligence in breaking a submarine telegraph cable of the plaintiff, across the river St. Lawrence, on the 5th of July, 1874. One end of the cable was fastened at Victoria Cove, near the City of Quebec, and the other extremity near the Chaudiere, on the south. The *Czar*, laden with a cargo of lumber, was lying close to a wharf known as Rockett's wharf, within Victoria Cove, where one end of the submarine cable was fastened. The vessel was insufficiently moored, of which, as the evidence showed, the persons in charge of her were aware. Although warned of danger attending her being thus moored, no precaution was taken to secure her. About eight o'clock on the morning of the 5th of July she broke away from her fastenings, went adrift and came to anchor about a cable's length from the wharf. Although warned again that she was in a dangerous place, and likely to take the ground at low water, she remained there and the assistance of tug steamers close at hand, which could have placed her in a safe anchorage, was refused. At the fall of the tide she did take the ground and was then abandoned. With the rising of the tide she floated, and by dragging her anchors and chains over the submarine cable she broke it; all of which was owing to the negligence of the persons on board the vessel.

The respondent denied that the cable was broken by the *Czar*. He asserted that she was properly moored at her wharf from the 4th of June to the 5th of July, when a heavy squall struck her broadside, which, with

the additional force of the flood tide, caused her to break away from her moorings. That the occurrence was an inevitable accident, occasioned by an overpowering, irresistible force; and, further, that the submarine cable was in an improper place, and that, therefore, the promoters had no right to complain.

In a lengthy opinion the Judge reviews the evidence and the law in the case, and gives judgment in favor of the plaintiff, and condemns the vessel in damages and costs, and the usual order of reference to the Registrar is made.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

A Proud Parent.—Hot Weather and Heated Excuses.—Lexicographical Conversation.—Personals.

CHICAGO, ILL., July 15.

TO THE EDITOR OF THE TELEGRAPHER.

YE'OD orter see him—whew! Proud? Why, that's no name for it at all. The floor ain't good enough for him to walk on. He lays down No. 1 blanks to step on. Why, he's a foot taller. Who? Why, Charlie Thayer, of course, our day report operator. Boy, nine pounds, born to-day. Why, he's the happiest dad in these States!

Ring the drum, watchman,
And beat the bell's for joy,
For Thayer is the father
Of a bouncing baby boy.

That's partly original. Please put it all in without quotation marks, just as though I composed it all myself.

Yes, it's getting a little hot now, or has been. It ain't so hot as it was the morning of the 7th, when the boys rendered their several excuses to Manager Maynard for not being able to be around on the 6th. Some who saw the testimony given in say it was warm work. One of the boys had three handkerchiefs wet with perspiration, and we "Hurd" by the way one of them didn't get around for a week. Oh, George! but they all had excuses. One of the boys, who hadn't been used to it, said he just took a *lemonade*, and the ice being frozen gave him *cramps!* Well, we thought we noticed him *cramping* to a lamp post as we were on our way home; but we didn't know that *cramps* brought on by *frozen ice lemonade* made a "feller" sing, "We wo(hic)n't go home till (hic) mornin' 'till day(hic)light doth (hic) appear. Smore be(hic)er." I might fill your paper full of just such very *valid* (?) excuses as that.

Then it's so warm now that a fellow can "meet his darling Josie at the gate" (provided the old gentleman is absent) without an overcoat on (sometimes). We understand one of the boys (who has been to college) has been in the habit of treating his fair dulcinea to a good deal of sentimentality all along during the winter and spring months. When it was *cool*—well, she could stand it, and being she was a lady of refinement and culture, would coolly reply with a smile. One of those sultry evenings recently, however, the youth undone himself completely. Having donned his best bib and tucker, he says he thought he saw thunder and lightning in those black eyes, although she languidly remarked "what an extremely warm evening it was." As near as we can ascertain he addressed her as follows: "Miss —, can I have the exquisite pleasure of rolling the wheel of conversation around the axle-tree of your understanding for a few moments this past meridian?"

It immediately broke upon her hitherto beclouded vision that he was "Brown," of South Bend, Ind., and that he had an attack of Studebaker's wagon manufactory on the brain. He says he shall never forget that moment the longest day he lives. Her false hair "riz," her store teeth dropped to the floor, as she grasped the knob of the street door, and (with a voice that sounded like his Aunt Sal's, after the brindle cow kicked all her teeth out) exclaimed, "Mr. —, elevate your golgotta to the summit of your pericranium, and allow me to present to your ocular demonstration that scientific piece of mechanism which constitutes the egress portion of this habitation!" He hasn't been there since, and he's ready for a fight if you ask him "How about that sixty thousand dollar girl on Ashland avenue, Jim?"

"He's gone, he's gone, as meek as any lamb. They took him"—no, not to the arms of Abraham, but on the day force. Yes, "Stanbury" has been placed on the Detroit duplex with "Jack" Martin, and Audru

Jaxon Long has been assigned to duty on the Montreal wire.

No more will the "night owls" hear "Stan's" voice blending with "Austin's," "McRobie's" and "Bill" Long's in those beautiful (?) quartettes in the lunch rooms. By the way, that reminds me Harry Anstin is taking a short vacation in the country. "Stevenson" has taken one side of the New York duplex nights along with "Eitemiller," "Teirney" having left us, and "Sam" Wallace taken Cincinnati wire nights since "Stanbury's" promotion to the day force. "Jake" Tallman takes "Eitemiller's" place on Salt Lake duplex, working it and Omaha wire alternate nights with "Rool." WESTERN UNION.

The L. N. and G. S. R. R. Telegraph.—Personals.

TO THE EDITOR OF THE TELEGRAPHER.

NOT having seen any communication from this section in your columns recently, I have concluded that a few items might not prove uninteresting to some of your readers at least. This is the first attempt I make at journalism, and I would not dare to trespass on your readers' patience if I did not know that items are a little scarce now, since most of your correspondents are disinclined to write this hot and dull season.

The Clarksville Division of the Louisville, Nashville and Great Southern R. R. extends from Bowling Green, Ky., to Paris, Tenn., a distance of 133 miles. There are five wires over this road, four commercial and one R. R. wire, which latter I shall make my principal subject to-day. There are about 16 offices on the R. R. wire, and I am sorry to be obliged to say it works generally very poorly, and weak for so short a circuit as it is; one reason being insufficient battery and the wire being old and rusty; while the commercial wires are all galvanized. Mr. T. C. Harvey is Train Despatcher of this division, with headquarters at Bowling Green, Ky. He has held that responsible position for a good many years, and has always managed everything satisfactorily. He is very attentive to business and a courteous gentleman, though he is sometimes not very pleasant to get along with when anything has ruffled his equanimity of temper.

Clarksville, Tenn., used to be the headquarters of this division up to about a year since, when our former Superintendent, Mr. R. Meek, left us, and Mr. Jas. Montgomery, the present superintendent took charge. He makes a good officer and is very zealous in the discharge of his duties, and does all in his power to promote the interests of the company. Within the last year the salaries of operators on this division have been gradually reduced about 33 per cent., which reduction is far in excess of that made in any other department, which is rather heavy on the boys. Several of them have quit, and their places have been filled by *cheap phumes* who can "frite gerse" with a vengeance. There is a certain young man among others on this string who has got the chronic dot affection. I suppose this is a new disease, in name at least, to most of your readers. When he takes hold of a key and has any dot letters to make, he is like a train on a heavy down grade, hard to check, and no telling how many dots he will frantically string on. There has also been a reduction in the number of operators employed on this division, some offices having been temporarily closed and some night offices being discontinued. Business is and has been very dull on this road for some time; we hope for improvement soon.

Mr. J. R. Glover, agent and operator at Paris, Tenn., is up home (Canada), visiting his relatives and friends. He has been gone some time, and we shall all be glad to see him back and hear his genial voice once more. Mr. Geo. Evans who has been working nights in the despatcher's office at Bowling Green, has accepted a position at Nashville, Tenn., with this company. He is succeeded by Mr. Hunt. Mr. C. H. Huckleberry has returned to this line and is now holding forth at Auburn, Ky. Mr. J. S. Thomas has been appointed agent and operator at Russellville, Ky. Mr. E. W. Harper from Mumfordsville, Ky., is operator and ticket agent at the passenger depot, Clarksville, Tenn. He is a clever boy and liked by everybody. Vic. Albitz, formerly night train dispatcher on this division, got tired of the business, and is now digging ore in the silver mines, at Rosita, Col.

We have been having some heavy storms and rains, temporarily prostrating the lines, but doing us no serious damage. Having written much more than at first intended, I will close by wishing you success.

ELMWOOD.

Correction.—Personal.

ALBANY, N. Y., July 27.

TO THE EDITOR OF THE TELEGRAPHER.

THE list of the Saratoga force, as given in my letter of last week, was sadly twisted out of shape as it appeared in your columns. Mr. J. A. Ashurst (not Ashwist), of New York, being one of the operating force,

not cashier, Mr. F. H. Patrick handles the cash, Mr. D. H. Patterson the delivery department, and Mr. Wm. G. Hill keeps the accounts straight.

We were favored on Monday with a brief visit from Mr. Henry Van Hooeverbergh, Superintendent of "C. N. D.," the man whose house was not despoiled by burglars.

Mr. S. W. Raukin, night report man at Troy, and Mr. G. E. Hinman, of Saratoga, have "changed off" for a couple of weeks.

The Western Union expect to move into their new office in the Museum building on Friday or Saturday of this week. DOUBLE SIX.

The Penn. R. R. Telegraph.—Local Telegraphs, etc.

IN THE WILDS OF JERSEY, July 12.

TO THE EDITOR OF THE TELEGRAPHER.

LIKE Micawber, I have been waiting for something to turn up, but as nothing of any very great interest to your readers has turned up, I have not written lately, nor have I anything so very interesting yet, but think a few lines from this section will not hurt your readers.

I will not condemn the weather, but really it is not fearful warm?

"Man is never contented with his lot—
When it's hot, he wants it cold,
And when it's cold, he wants it hot."

Times on the Penn. R. R. are not quite so lively now as before the railroad war, but still operators are kept quite busy, and I do say that it has never been so hot to work on a railroad where operators have so much responsibility thrown on their shoulders for so little pay, as there is on the N. Y. Division of the Penn. R. R.

The *block system* of signals used on the above road appear very complicated to outsiders, but as soon as one gets fully posted, it seems very simple, yet it is very tedious to the brain, especially in the afternoons, when trains run two, three and five minutes apart, for an hour or two.

The reader will easily see that an operator has no time to call offices more than once; he must report trains to both the offices, each way from him and then must lookout for their signals, the trains, and the rear train signals; and as no passenger train can pass a signal station until the preceding train has passed the signal station in advance, which stations are generally two miles apart, it will be seen then that operators have no time to fool away. We don't think that there is any other railroad in this country that uses the block system, the principle of it is taken from the English Railway Block System.

Our batch of news is not very great nor yet very interesting, it's too hot, you know!

The old P. and A. lines are being transferred from the turnpike to the W. U. poles on the line of the Penna. R. R. between New York and Philadelphia. I have heard it remarked that the W. U. and Penna. Co. are not the best of friends, it however may be only an idle rumor. The A. and P. are doing a very good business in Newark and Paterson. In Newark the A. and P. have placed two signs crosswise on their poles, near the tops, in front of their offices, which look very neat and tasty. They also prove to be a good advertisement. The W. U. have refitted their office in Newark, on the corner of Broad and Market streets, and have placed a set of duplex in the office to work with New York. In Elizabeth the A. and P. are not prospering as well as they might. We are told that the company gave the office at that place to a young man, promising to give him what he took in as his salary, for the sake of establishing an office there, but he resigned after his first month's stay, because, as he says, he received a message from headquarters, saying, "send in the amount which is charged against you for messages transferred to W. U."—he did not think that the money he was taking on messages transferred to W. U. belonged to the W. U. and not him. We will let them settle the difficulty between themselves.

An enterprising doctor (Franklin), of Newark, converses with his patients in different parts of the city by telegraph, over a line which he had constructed, and now runs it on his own hook, as a pleasure wire. He uses old U. S. and P. and A. keys and sounders. He styles his line "The Eastern Union." There are two other private lines in the city, one of which is "The Owl," the name of the other being forgotten. These, together with W. U., A. and P., and Fire Alarm wires, make quite a nest of spider webs overhead. I have been looking over some back volumes of THE TELEGRAPHER, which has brought back to me again the old times out west. I think the "Humors of the Telegraph column" would be welcomed back, as well as the old "Facetia" column. I only wish that I had saved more of the volumes of the paper than I have, for a more valuable reference for the operator can hardly be found. Looking back I find that all the talk about the "student question," "train despatching," and the "Telegraphers' Organization," amounted to almost nothing. Only one

railroad telegraph department ever did much of anything towards the "student question," and that one was the D. L. and L. M. R. R., of Michigan, who did a good thing towards it, and which the writer is proud of as being one of three who originated it.

Times over on the N. J. Midland R. R. have improved somewhat since the Hon. G. A. Hobart took hold as receiver. The operators have all been changed around lately, and 'twould be hard to find them now. Poor Erie! she, too, has had a Receiver appointed, but it is really surprising how little anxiety the operators on the Eastern Division feel over their situation.

We will close for this time and write a shorter one the next. P's AND Q's.

Personals.—Promotion of Mr. E. B. Brown.—Telegraphers' Base Ball at St. Louis, New Nines Organized.

ST. LOUIS, Mo., July 8.

TO THE EDITOR OF THE TELEGRAPHER.

'Tis hot—red hot—98° in the shade, and yet we are not happy! Some people think it's 9,800. Shaved heads are in vogue; Messrs. Hayes, Irwin and others have had their craniums sand papered, so the flies can have a fair show.

Messrs. French and Gritchett, of the night force, have been on the sick list for the last few days, but have recovered sufficiently to resume duty. The old war horse, Dave Ryan, has been indisposed for the past two weeks, but manages to keep on his pins. Mr. W. W. Cummings, our worthy and estimable chief, has returned from a brief visit and is looking splendidly. The boys all welcomed his return with a hearty shake of the hand and with a "glad to see you back." Messrs. Van Tyne and Parmelee acquitted themselves nobly during Mr. C.'s absence, performing their respective duties in a highly commendable and very satisfactory manner. Mr. E. A. Keene has returned from a six weeks' vacation, and resumed his position on N. Y. duplex. Mr. Charles Patch, the well known telegrapher, passed through here last Thursday, on his way to San Francisco. Wm. T. Loper, night press man, has resigned, and gone home to Oshkosh, Wis., for a brief visit, after which he goes to New York. In his resignation St. Louis office loses one of the best operators that ever graced it. Mr. Loper is not only a fine and accomplished telegrapher but is a perfect gentleman in every respect and an honor to the profession. He carries with him the best wishes of his host of friends here.

Mr. T. P. Wheeler succeeds Mr. Loper on report and turns out a copy that can't be surpassed. Mr. E. B. Brown, for several years operator in the City Fire Alarm office, has been appointed superintendent of that department, vice Saml. Howard, retired. Chas. W. Hammond, the old well known telegrapher, is constructing and rebuilding thirty miles of city fire alarm.

The much talked of game of base ball between the nines under Mr. W. W. Cummings and Capt. Nelson was played on July the 5th, and James was badly scooped. Five innings, and the score 24 to 5 in favor of Mr. Cummings' nine was too much for the gentle James, and he threw up the sponge.

Two nines have been organized from the day force, and will play evenings for exercise and amusement. They will be governed by Mr. W. W. Cummings and Mr. A. E. Van Tyuc. The following list will show the respective positions:

FIRST NINE.	SECOND NINE.
W. W. Cummings.....Catcher.....	H. Luckings.....
Charles Cummings.....Pitcher.....	A. E. Van Tyne.....
T. P. Cooke.....1st base.....	Jno. McNevin.....
John L. Cassidy.....Short stop.....	J. C. DeLonge.....
Geo. W. Huddleston.....Left field.....	E. L. Parmelee.....
Chas. T. Day.....Centre field.....	E. A. Keene.....
H. H. Eckert.....Right field.....	Jos. Purcell.....
Jno. F. Stansifer.....2d base.....	J. McMichael.....
Chas. E. Burroughs.....3d base.....	Wm. J. Foy.....

Look out for black eyes, disjoined fingers, stiff knees and all such. But 'tis a noble game. C.

Boston Telegraphers on a Fishing Excursion.

BOSTON, MASS., July 19.

TO THE EDITOR OF THE TELEGRAPHER.

PERHAPS no city in the country has such natural advantages for yachting and other aquatic sports as Boston; and the large number of yachting and fishing clubs bear evidence that these advantages are fully appreciated. To telegraphers a sail down the harbor and out on the restless bosom of the broad Atlantic is particularly exhilarating, giving as it does a relaxation from the constant round of every day confinement which cannot fail to be both pleasurable and beneficial. As the clock struck the hour of 12 a few evenings ago, several telegraphers embarked from Central wharf for a midnight cruise in the yacht "Mattie," owned and commanded by that veteran telegrapher and follower

of Neptune, Commodore C. L. Pope, of the South Boston squadron. All safely on board, and favored by wind and tide, the little craft swiftly glided from her moorings out towards the ocean.

Hardly a ripple ruffled the surface of the water, which, beneath a cloudless sky and a full moon, shone like a mirror. Behind us lay the city, hushed in silence, reflecting the moonbeams from many a tower and dome. Before us was spread the beautiful panorama of Boston Harbor and Bay, dotted with its many islands, standing like grim sentinels of the night, to challenge our outward progress. The entire party gathered on deck—the ever changing beauties of the scene droye sleep from every eye.

Anchoring off Hull at 2.30 o'clock A. M., it was discovered that the bait for fishing operations had been left behind; consequently the "cabin" passengers were impressed, or rather improvised as amateur clam diggers on Hull Beach. Pope, McFarland, Kelley and McGee, arrayed in nondescript garments, and armed with various instruments of death to the genus clam, sallied forth to capture the inoffensive but sorely needed hivalves.

To a superstitious or imaginative observer this clam digging, story telling, piratical looking coterie of telegraphers, at such an untimely hour, might easily have been taken for some of the Genii of the vasty deep, who had emerged from their watery habitations bent on a mission of evil in the upper world. However, the boys got the clams, "little" Tom Kelley carrying off the laurels as a successful clammist.

Again setting sail, we arrived on the fishing grounds near Minot's Ledge Lighthouse about 5 o'clock. A pool was made up for the purpose of giving prizes to the two luckiest fishermen of the party. McFarland carried off the first prize, and Thomas the second.

After indulging in the piscatorial sport for three hours with good success, we turned our prow towards home. Becoming becalmed off Hull the muscular Keating, the celebrated athlete, volunteered to act as a tug, which duty he performed satisfactorily, towing us into port. Deharking, we had breakfast, after which we visited the Observatory on Telegraph Hill, and were reported by telegraph to the Boston Marine Exchange as a distinguished party. Having accomplished this imposing feat, we again weighed anchor, and were soon flitting over the wave towards Hingham, which place we reached about noon. Here we purchased all the Sunday papers we could find—amusing ourselves in various ways—strolling about the town and visiting all the points of interest in this beautiful suburb. We re-embarked for Boston at 4 o'clock P. M., where we arrived about 6 P. M. Although tired, by reason of our long jaunt, we were exceedingly well pleased with our experience of "life on the ocean wave." With three hearty cheers for our gallant commander, Pope, we separated for our respective homes, looking forward to a recurrence of the enjoyable trip at an early day.

NAUTILUS.

A Bull.—Excess of Politeness.—A Suggestion to Correspondents.—A Prospective Telegraphic M. D.—Improvements in the A. and P. Office.—Personals.—Atmospheric Electricity.

CHICAGO, Ill., July 19.

TO THE EDITOR OF THE TELEGRAPHER.

'Tis an old saying that "coming events cast their shadows before;" but in the following error a change in the phraseology of the old saying would no doubt be appropriate, that PAST events leave shadows behind them. The message as sent read "yours received, will come on morning train." As received it read "Your sister will come on morning train." Inasmuch as the party to whom the message was addressed had no sister, the error was rather ridiculous, and as a pure case of guessing, it stands almost without a parallel, and looks as though the receiver was troubled with a bad case of the "your sister" disease which finds a partial remedy in "moonlight walks," etc.

I have heard of a good many cases where the extreme pinnacle of politeness was about reached; but I think the man who addressed his message to "Mrs. Joseph A. W—, Esq., deserves to have his name recorded above all the rest.

Our "old time friend" Mr. Crary, of Dubuque, still holds things level in the Western Union office there as night manager, and although suffering somewhat with partial paralysis of his right arm, occasioned by long and arduous labor at the key, is still able to "warm up" the W. U. boys when he gets "waked up."

During a stroll for exercise a few days ago, I chanced to pass the telegraph office of the C. and N. W. Railway, at the Round House of that road, and was very agreeably surprised to find our friend "Billy" Washburne in charge. Billy expects ere long to have an M. D. attached to his name, and hang out his shingle in the Garden City, having made rapid progress, for a young man, in the study of medicine the past two years.

We very often see communications in the correspondence column of THE TELEGRAPHER without dates or the name of the place they emanate from, and I have often thought that a livelier interest might be awakened in the paper in the locality where they originate if made more personal, and if operators in that part of the moral vineyard knew they had a representative who was looking out for THE TELEGRAPHER and their interests at the same time. Please consider the matter, boys.

The A. and P. operating room has been removed from the basement of the Major block to the fifth floor of the same building, while the receiving room remains in the place formerly occupied by the receiving room and operating room jointly. This change was necessitated by the rapidly increasing business of the company here, the old quarters being too restricted.

Supt. Towler's office was moved to the fifth floor of the Major block some time ago, but my inability to write at the time prevented noting the change before. Under the new order of things the company have a large commodious receiving room, or will have when it is thoroughly remodelled, and the operators, who so faithfully look after the interests of the company here, have a large, and well aired and ventilated room. It fronts directly on Madison street, while Supt. Towler's rooms are connecting and front on Lasalle street.

The furious storm of last Thursday night did immense damage to the crops all around us. This of course only affects the fraternity in as far as it increases the price of provisions, of which telegraphers (who are mortal and can't live on air) must have their share. Electricity of a high tension became low very suddenly and in some cases destructively. At Aurora, Ill., a number of buildings were struck, and a charge passing into a kitchen along the water pipes, was so heavy as to melt them and start a fire near the sink. A number of houses and barns were struck in close proximity to where a picnic party had taken shelter from the elements at Green Bay, Wis., some of the party being badly stunned.

A church at Oshkosh, Wis., was struck and considerably damaged. A house near Dwight, Ill., was also struck, but the inmates escaped unhurt. At Sloan, Iowa, however, the inhabitants were not so fortunate, Mr. J. H. Boyer, postmaster of that place being struck and instantly killed, while several other persons were seriously injured.

OCCASIONAL.

Base Ball.—A Pneumatic Tube.

ST. LOUIS, Mo., July 16.

TO THE EDITOR OF THE TELEGRAPHER.

ON the 14th instant the base ball nines organized by Messrs. Cummings and Van Tyne played their first game on the grounds of the Samuel C. Davis and Co.'s mine.

Game was called about 5:30 P. M., and six innings were played, which resulted in a victory for Mr. Cummings' nine, by a score of 30 to 10.

The pitchings and catchings of the Messrs. Cummings were decidedly good, both working together like clock-work.

Keene and Luckings done justice to the other side, and displayed skill.

Both sides played exceedingly well for new hands, and done good batting. Huddleston is a sure batter, but not a success as a fielder. Cassidy made three nice base hits, and secured three home runs. Cook batted a hot sky flyer, which Van Tyne took in. Parmelee took in a hot liner to left field, but finding it a little warm let go rather suspiciously, and examined his hands in a surprised manner, something like the man who sat down on a pin.

Both sides displayed the ability to become good and substantial players, and when "Chicago" wants to give the St. Louisianians another whirl, they will find something better than a "mud bath," if not a victory.

The Western Union Company will soon commence to erect a pneumatic tube from the main office to the new Merchants' Exchange, now being completed on the block bounded by Pine, Chestnut, Fourth and Third streets, which is built of handsomely cut stone, and when finished will be one of, if not the finest exchange in this country.

Mr. Brackens' base ball nine from Chicago W. U. office played Captain Nelson's nine here on Sunday, and got away with our boys nicely. It rained nearly all day, and mud was in abundance. Captain Nelson will play a return game soon, when it is hoped he will make a better showing. Jim is good, but some of his staff are wanting. C.

ELECTRIC.—"Armored" cables are to be experimented with on board the torpedo school ship Vernon, at Portsmouth, England, in connection with the torpedoes laid down for harbor defence. Should these invulnerable cables prove a success as a means of connecting torpedoes with the shore, the value of these machines for defensive purposes will be considerably increased.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, JULY 31, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.)

38 VESEY ST., New York.

The Profits of Telegraphic Enterprises.

THE organization of a new telegraph company upon the Pacific coast, which proposes to build lines throughout the country, and announces in advance the intention to materially reduce telegraph rates from what they now are, naturally leads to the consideration of the profits of telegraphing as a business. Of course the profits made by contractors in the construction of lines do not enter into this consideration, as these are an entirely different matter, as those who have invested their money in such enterprises have had ample opportunity to discover.

The extent, and sparsely settled character of much of the territory covered, makes telegraphing in this country exceptionally costly. Thousands of miles of line have to be kept up, over which the local business is not, and is not likely to be for years to come, remunerative at any rate which can be charged. Skilled labor, too, is higher here than in Europe, or even in the adjoining British Provinces, the cost of living being relatively greater. For these reasons higher rates must be charged even to pay expenses. We know that it is a popular delusion that telegraphing is a "big bonanza," which in some undefinable way enriches all who are so fortunate as to be interested in it. Those who have invested money in telegraphs, as a general thing, relying upon the legitimate profits of the business as their reward, do not share in this delusion. They know by painful experience that telegraph investments are not such a "big bonanza" as the public suppose. Even the Western Union Co., with its great extent of lines and its thousands of employes, has only within this last year commenced paying dividends after a suspension of six years, and many doubt whether the dividends declared are actually earned. The Atlantic and Pacific, and Southern and Atlantic Companies have never paid any dividends. The dividends paid by the old United States Company were fraudulent, and paid out of capital.

Telegraphic rates have been reduced about fifty per cent. in the last few years, and under the circumstances we do not see how they can at present be further materially reduced without bankrupting the telegraph companies.

It is true that the capital stocks of most of the leading telegraph companies are very much watered, and this complicates the matter by requiring so much additional net income to pay dividends. To further divide up the business, however, is not, so far as we can see,

likely to improve the situation. The old companies will naturally retain a considerable share of their present business, but if they are now making any profit, that which is diverted, and the effect of a further material reduction of rates, will deprive them of this profit, while the business of the new company will not even pay expenses.

It may be that the cost of doing the business may be reduced by economical management, and a cutting off of all unnecessary expenditures. The system of doing business may perhaps be simplified, and much of the "red tape" which has been introduced unprofitably, done away with. This should be done in any event, and the patrons of telegraph lines given their fair share of the result of such economies and improvements.

It is not for the interest of telegraphic employes that rates should become unremunerative. In such an event they may be sure that no inconsiderable part of the loss will be assessed upon them. While we believe in, and advocate now, as heretofore, reasonable competition in telegraphy, in the interest of the public and the employes, we do not desire to see a cut-throat policy inaugurated, which can be in the interest of nobody. To maintain the telegraphs of the country in an efficient condition, and to properly remunerate those who are engaged in telegraphic service, reasonable tariffs must be maintained. Any other policy will prove unfortunate and damaging to all concerned. We do not mean to say that the present rates are as low as they can be made, but any further reduction should be made only upon careful consideration of all the facts and premises. With the full development and introduction of improvements which shall increase the capacity of the lines for business, and relatively reduce the cost of telegraph service, it is probable that still further reductions may be made. Until these are assured, however, we do not see how such reductions can be advantageous or desirable.

The Telegraphic Situation.

THERE is but little of special interest in connection with the telegraphic situation generally to communicate to our readers. In our news columns will be found the record of what the telegraph companies are doing or propose to do. The Direct Cable is still dumb, and nothing has been heard from the Faraday. Until some further definite information is received, it is, perhaps, useless to indulge in speculation. A more unfortunate telegraphic enterprise has probably never been known, and it is not strange that the public has become somewhat incredulous in regard to the probability of the line ever being actually in operation for public use. We are satisfied, however, that the stories and surmises in regard to any arrangement by which the threatened competition with the old Atlantic Cables was to be prevented are without foundation. In fact, the blunders and misfortunes which the enterprise has met with would seem to preclude the necessity for any such arrangement. It is, of course, annoying and damaging to the last degree to the company that there should be such delay in getting the cable in working condition, but as it is yet in the hands of the contractors, they are powerless to remedy it.

All sorts of rumors and reports in regard to the position of Mr. JAY GOULD towards the Western Union Company are in circulation. It is understood that Mr. GOULD is long of Western Union stock to a large amount, but what truth there is in this, or what his ultimate purpose is, it is not his habit to inform the public. The election in October will, no doubt, solve many perplexing questions which now annoy those who speculate in telegraph shares.

We do not hear much additional in regard to the new National Telegraph Co., whose organization in San Francisco was recently announced. There is considerable doubt felt and expressed in telegraphic circles in regard to the real purpose of this organization—whether it is really intended to build new lines, as stated, or whether it is not intended to operate speculatively upon existing companies. There is no

doubt but that the corporators have the means to build any extent of lines they desire, if they are willing to invest them for that purpose.

If it is really their purpose to establish a national telegraph system, they would probably make more rapid progress by obtaining the control of one of the two principal telegraphic organizations of the country, which could undoubtedly be done if the necessary investment were made. Time will develop this as all other matters, telegraphic or otherwise, and those who have not the means of obtaining reliable information must be content to wait and watch.

Upon the whole, telegraphic prospects for the future appear to be somewhat improved, and we believe that telegraphic interests may look for better times in store for them at no very distant period.

Almost Another Panic.

MONDAY forenoon last the city was startled by the announcement of the failure of DUNCAN, SHERMAN & CO., the great banking house.

The extensive business of this house, and the great wealth and resources which it was supposed to have, and its hitherto undoubted credit, made the announcement of their failure the occasion for the time of almost another panic similar to that of 1873. Gold rapidly advanced to 16½ premium, 3 per cent. above the opening price, and stocks tumbled generally. The excitement on the street and in the Stock Exchange and Gold Room was intense, and there were fears of a general smash. Western Union ran down in a few minutes from 82 to 73—or 9 per cent. It soon after recovered, however, to 97, but there is an uneasy feeling in the market, and fears that this failure will drag down other firms with it eventually. The liabilities of the firm are said to be about \$6,000,000, but the amount of their assets is not yet known.

There seems to be no special reason why this failure should so seriously affect the price of Western Union shares, even temporarily, but it was probably additionally influenced by a repetition of the lying report of the death of Com. Vanderbilt at Saratoga.

Call from a Southern Superintendent.

MR. J. T. THORNTON, Assistant Superintendent of the Southern and Atlantic Telegraph Company, whose headquarters are at Macon, Ga., favored us with a call this week.

MR. THORNTON is here with his family on a visit to MR. GEORGE H. GRACE, General Supt of the S. and A. Co. He returns South in a few days, but his family will remain during the summer at Mr. GRACE's residence at Fanwood, N. J.

Electrical and Telegraphic Works Supplied.

WE have made arrangements with publishers and booksellers by which we are enabled to supply electrical and telegraphic works postpaid on receipt of the price of the same. This will no doubt be a convenience to many persons who cannot readily obtain such books in their locality. The advertisement, which will be found in our advertising columns, will supply a list of the more important works of this class. We will, however, furnish any such work that can be obtained in this city, whether included in the published list or not. All orders will be promptly filled, and the latest editions of such works forwarded.

Combined Blank and Envelope.

WE have received some specimens of a patent combined telegraph blank and envelope. It is intended to facilitate the delivery of messages, the address being written on the envelope as received by the operator, and the message on the blank attached, thus saving clerical labor, and enabling a boy, if necessary, to inclose the same for delivery. The idea does not strike us as an improvement over the present style, and we are inclined to think that in practice it would be found objectionable.

The Fire Alarm Contest.

AT the hearing of the petition for an injunction against the District Commissioners and GAMEWELL & Co., at Washington, D. C., on Wednesday last, to restrain them from carrying out the contract for the construction of a fire telegraph, the petition was dismissed. From this the plaintiffs appealed.

Messrs. GAMEWELL & Co. have, we are informed commenced actions against CHESTER & Co., of this City, L. H. McCULLOUGH, of Richmond, Indiana, and POND & Co., of Detroit, Michigan, for infringement of their patents on Fire Alarm Telegraphs.

Call and See Us.

AT this season many telegraphers from different sections of the country visit New York, while on vacations or trips for pleasure or business. We would cordially invite all such to give us a call at the office of THE TELEGRAPHER. They will be cordially welcomed, whether subscribers or not, and any information or aid that it may be in our power to give them will be cheerfully rendered. We are always pleased to meet telegraphers and make their personal acquaintance, and are never too busy to welcome them.

Personals.

Mr. W. M. TALCOTT, State press operator on night force, Western Union Office, corner Broadway and Dey street, New York, has been transferred to day work.

Mr. W. T. LOPER, late of St. Louis, Mo., has accepted a situation on the night force of the Western Union main office, New York.

Messrs. THOMAS, ASHURST, and WILLIAMS, who were temporarily transferred to Saratoga, N. Y., during the rush of business consequent upon the late college regatta, and who so efficiently discharged their duties on that occasion, have returned and resumed their former positions in the Western Union building at 197 Broadway, New York.

Mr. CHARLES E. BURROUGHS, of St. Louis, Mo., has been appointed manager of the Western Union Company's office at St. Joseph, Mo., vice Mr. W. H. WOODRING, resigned.

Mrs. A. V. CARR, manager of the Jacksonport, Ark., W. U. office, has resigned.

Mr. FRED. B. MOXON has resigned his position with the W. U. Co., at St. Louis, Mo., and accepted a position with the same company at New Orleans, La.

Mr. LESTER BRADLEY, of the New Orleans, La., W. U. office, has accepted a position on the night force of the same company at St. Louis, Mo.

Mrs. KIT BARNUM is subbing at Jefferson City, Mo., W. U. office for Miss ANNIE GRIGGS, who is visiting at Topeka, Kas.

Mr. LUCKINGMEYER, of St. Louis, Mo., is subbing at Leavenworth, Kas., during the illness of Miss FLORA COATES.

Mr. ED. F. SHEETS, late manager of the depot office at Wichita, Kas., has resigned, and accepted a position with the Texas Pacific R. R. Co. at Marshall, Tex.

Mr. E. L. SMITH, manager of the Topeka, Kas., W. U. office, is visiting at Atchison, Kas. Mr. SPINAGLE acts as manager during his absence.

Mrs. J. N. COONS (formerly Mrs. J. C. MORRIS), operator in P. and A. Fifth avenue office, Pittsburg, Pa., is now residing at Bloomington, Ill.

Mr. J. N. COONS, formerly station agent P. and K. C. R., Petrolia, Butler county, Pa., is running a book and news business in connection with the Great Western Telegraph office, at Bloomington, Ill.

THE telegraph operator at Pine City, Minn., has sued *The Pioneer Press* for \$10,000, because that journal copied an item from another paper that copied it from still another paper, and that paper got it wrong because its informant was a little "crooked" in his statement. The item said that the Pine City operator outraged a lone Swede woman, when the paragraph should have read "the Hinckley operator." The man's name was not mentioned.

A COUNTRY store in Virginia was the other day struck by lightning, the fluid making a large hole in the roof, and passing through a feather bed, the recognized non-conductor.

The Telegraph.

By Cable.

REPORTED RETIREMENT OF MR. SCUDAMORE FROM THE BRITISH POST-OFFICE DEPARTMENT.

LONDON, July 26.—The *Standard* reports that Mr. Frank Ives Scudamore, the Secretary to the British Post-office, specially in charge of the postal telegraph administration, will retire from the department, and go to Turkey to organize a postal service for that country in accordance with the Bern Convention.

THE DIRECT UNITED STATES CABLE.

LONDON, July 26.—The manager of the Direct United States Cable Company, in a communication to the *Times*, referring to its remarks in its financial article of Thursday, the 22d instant, in regard to the cable, says no stockholder has been denied information.

He also says a small portion of the cable has been injured, probably by ice. The contractors are now engaged in cutting out and replacing the injured part.

The Atlantic and Pacific Telegraph Company.

THE Atlantic and Pacific Telegraph Company are doing a large amount of work this season in the construction of new lines, and in putting in order the old wires. The new line from Philadelphia to Pittsburg, Pa., will probably be completed this week, and the office in Pittsburg be opened for business by the first of next week. The Pittsburg office will be under the charge of Mr. E. W. Firman, as manager, with an efficient corps of assistants. The new wire will be continued west from Pittsburg via Wheeling and Columbus.

The new A. and P. wire from Chicago to Milwaukee has been completed, and the line is doing an excellent business. The wire to St. Louis from Chicago is also being pushed ahead as rapidly as possible. Arrangements have also been made for the construction of an additional wire from Buffalo to Suspension Bridge, and it will be commenced within a few days.

Work has been steadily progressing also in overhauling the existing wires of the company, and putting them in good shape, so that they now work much better and more satisfactorily than ever before.

During the recent Regatta at Saratoga the arrangements of the A. and P. Co. were very complete, and a large amount of business was done from that point during the week.

Notwithstanding the general dulness and depression of business, the business of the company is steadily increasing. The automatic instruments have been introduced on the main circuits, and are doing good service in enabling the company to handle satisfactorily its increasing business.

General Eckert, the President of the Atlantic and Pacific Co., is convalescent from his severe attack of pneumonia, but is not yet in condition to resume the active discharge of his duties. In the meantime the active direction and general management of the affairs of the company devolve upon Mr. Albert B. Chandler, who is his chief assistant, and whose ability and untiring industry, combined with his long telegraphic experience, amply qualify him to discharge satisfactorily the arduous and exceedingly important duties which have so unexpectedly devolved upon him.

The general management of the Western Division is in the able hands of Mr. E. D. L. Sweet, whose head quarters are at Chicago.

Extension of the Southern and Atlantic Lines.

THE Extension of the line of the Southern and Atlantic Telegraph Company from Jessup, Ga., to Jacksonville, Fla., over the Great Southern Railroad, has been completed. The office at Jacksonville was opened on the 22d inst. Mr. T. D. Gibbens is the manager of the Jacksonville office. By this line the distance by telegraph between Jessup and Jacksonville is reduced from 246 to 96 miles, and it will doubtless prove a valuable addition to the facilities of the Southern and Atlantic Company. Other offices on the line will soon be opened for business.

The American District Telegraph Co.

Mr. H. W. POPE, Superintendent of the American District Telegraph in this city, has arranged to give to each District Manager a vacation of six days, furnishing relief for that purpose without expense to the manager. This favor is duly appreciated as an evidence not only of the fact that promotion has not caused forgetfulness on the part of the Superintendent of the wishes and necessities of his subordinates, but also of the liberality of the company by whom they are employed. It

is understood that all employes of the company who desire it will be offered an opportunity for a vacation during the season. The Superintendent is deserving of credit for his action in this matter, more especially in view of the fact that vacations for telegraphers, except at the cost of extra labor or money on their part, are the exception and not the rule at the present day.

The Board of Fire Commissioners of this city have granted permission to the American District Telegraph Company to connect their system with the Fire Department; the work to be done under the supervision of the Superintendent of the Fire Telegraph.

New York City Telegraphic Notes.

THOSE clocks in the operating room of the new Western Union building are a little off, it seems. One of the fellows on Chicago duplex last night was getting it handed to him a little soon, when he opened and casually remarked, "Min, till I find a clock, they move 'em every day and — hello! I see one but I'll be dash dashed if I can tell whether its off or not." But the clock was off and way off too, for the seven clocks told seven different times. Looking towards Jersey, the bleared faced electric said 4.10, another 3.55, another 3.20, another 3.06, another 3.08, another 2.10, and the old original chief cook and governor, father of them all, on the wall over the switch was remonstrating with his followers to the tune of 2 A. M. But then it is all right, independence is a good thing and when a clock gets on a rant "it can't help it" as the boys say.

But be it as it may, every morning when the dim shades of night are fading and the sun is just sending his golden rays over the heights of scandalized Brooklyn, a spectral, majestic form is seen to hover below the enchanted timepieces and then quickly mount upon a crazy ladder to the discontented faces, and with deft fingers to straighten their distorted countenances. Ye clocks have ye no bowels?

Under the new arrangements now, the Western Union Company have on the eighth floor of their new building a restaurant for employes, which is not excelled by any in the city. The food furnished is nicely cooked, and served in an excellent manner, by a corps of efficient and obliging waiters. Three meals a day are furnished—noon, 6 P. M. and 9 P. M., and a pleasing variety is always presented. The dining room is spacious and has about eighteen tables, seating four each. None but employes are allowed to eat there, and they must hold non-transferable tickets, which are sold at three dollars each, having various amounts printed upon the face which aggregate five dollars, and which are punched out in payment for meals. Five dollars' worth of sustenance for three dollars, is a very handsome reduction, and the operators generally, take most their meals there. The whole is under the charge of the able and obliging steward, Mr. P. J. Murtagh, who makes every one happy by his obliging and gentlemanly ways. Mr. Dennis is the urbane cashier who puncheth ye tickets.

The Atlantic and Pacific and Franklin Companies have adopted a new blank for receiving business upon at their general office, No. 198 Broadway. It is about three inches longer than the ordinary sender's blank, and has the rules printed across it lengthwise; next comes a line divided up into squares for number, time, sending operator's letter, receiver's letter, and, finally, check, which we understand is to be sent the first thing after the number of the message, as it should be. The remaining part of the blank, which is all but the inch occupied as described above, is left for the message, and is ruled in squares, accommodating thirty-five words in all, allowing five words to a line. At the ends of the lines are the figures 5, 10, 15, 20, 25, 30, 35, in a column, so that the receiver can tell at once without counting how many words he has, and can compare with the check without the slightest difficulty, as he has that the first thing. It is the simplest, neatest and most satisfactory blank yet in use, and all operators are loud in their praises thereof.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended July 3, 1875, was 419,871, an increase on the corresponding week last year of 32,813.

"The duties of telegraph clerks in Australia," says the *Electrical News*, "would seem to be as strictly apportioned as in England, and mistakes are as vigorously punished. From a printed copy of the rules and regulations for the guidance of railway clerks in South Australia we find that a fine of £100 is inflicted for divulging a message, or, in default, imprisonment with hard labor for any period not exceeding six months. The rules apparently leave nothing unnoticed from the hours of attendance to the important duties of signalling trains. The clerk is provided with the calls for 101 stations, instructions for charging the main and local batteries, the future signals to be used in inter-office

communications relating to the general business and working of the line, and he is also provided with all the abbreviations."

It has been decided that the next International Telegraph Conference shall meet in London in 1878.

A message from Montevideo announces the completion of the last section of cable between that city and Cluny, close to the Brazilian frontier, where the Western and Brazilian Telegraph Company's system begins. The portion just finished belonged to the Montevideo and Brazilian Telegraph Company, which was taken over by the Platino-Brazilian and Western and Brazilian Companies. Direct communication from England is now opened, not only with the River Plate region by way of Brazil, but also by the overland wire with Chili, which is traversed by telegraphic lines from Valparaiso southwards to Talcahuano, and north to Caldera.

The West India and Panama Telegraph Company have received intelligence that their steamship "Investigator" has repaired the cable between St. Vincent and Barbadoes, and that all stations on their system are now in telegraphic communication with England.

The Indo-European Telegraph Company announces that the average time in transit between London and India of all outward messages to India and beyond, during the week ended July 9th, *via* Teheran, was 1 hour 31 minutes.

The Globe Telegraph and Trust Company recommends a final dividend of 3s. per share on the preference shares, making 6 per cent. for the year, and 2s. 6d. per share on the ordinary shares, making 5 per cent. for the year.

The Eastern Telegraph Company's traffic receipts for the month of June, 1875, amounted to £30,211, against £29,819 in the corresponding period of 1874.

The traffic receipts of the Brazilian Submarine Telegraph Company for the month of June last amounted to £9,478.

The number of messages sent by the Cuba Submarine Company's lines during the month of June was 2,471, estimated to produce £2,500, against 1,874 messages, producing £2,000, in the corresponding month of last year.

The average time occupied in the transmission of messages, by the Direct Spanish Telegraph Company, between Madrid and England, *via* Santander, during June, was 3 hours and 5 minutes, including transmission over Spanish land lines. The traffic receipts for the month of June, 1875, amounted to £1,464, against £1,442 for the month of May.

The traffic receipts of the Eastern Extension, Australasia and China Telegraph Company for the month of June last amounted to £20,183, and for the corresponding month in 1874, to £19,026.

The half yearly report of the Eastern Telegraph Company to the 31st of March gives the net revenue for the six months at £147,293, the ordinary expenses being £52,756. Of this amount £12,832 was absorbed by "special expenditure." During the half year £46,212 was paid as interim dividend, and a final dividend is now recommended of 2s. 6d. per share, making 5 per cent. for the year. This and other charges absorb all save £35,934, which is carried to reserve, raising it to £159,522. The traffic receipts for the month of June last amounted to £30,211, and for the month of June, 1874, £29,819.

The traffic receipts of the Great Northern Telegraph Company for the month of June amounted to 393,080fr., against 386,374fr. last year, and the total receipts from 1st January to 30th of June were 1,995,477fr., against 2,076,371fr. last year.

The Fire Alarm Telegraph Case.—The Bill for an Injunction Dismissed.

In the Equity Court this morning, Judge Wylie presiding, Gen. Henkle, counsel for the petitioners for an injunction restraining the District Commissioners and Gamewell & Co. of New York, from carrying out a contract for the reconstruction and extension of the Fire Alarm Telegraph in the District, concluded his argument, claiming that the Commissioners were acting outside of the law, and that neither Congress nor the Legislature had given them power in the premises.

E. L. Stanton, Esq., replied on behalf of the District Commissioners. He claimed that the work was absolutely essential and important for the proper protection of the lives and property of the citizens of the District; that the authority of the Commissioners to make a contract for the work was full and complete, and that in this case the petitioners had no good and sufficient ground for the relief prayed for; that the award of the contract was regular; and that the amount to be paid was within that appropriated by Congress.

Judge Wylie then rendered his decision, the main points of which are: That the Acts of Congress creating the Commission give them full power to expend money raised by taxation for the support of schools, police and fire departments, &c., and the fire telegraph is generally recognized as indispensable to the proper working of the fire department, and the Commissioners have the same authority to extend and improve it as they have to purchase horses for the department or steam engines. He also declared that the court held large discretionary power in a case of this kind—that no injunction should issue unless some serious and irreparable injury was likely to follow its refusal—that in this case the total amount of tax which could be imposed upon the petitioners, if the amount to be paid for the new telegraph was divided among the property owners of the District, would be four dollars and sixteen cents; that the petitioners were not entitled to an injunction, for the reason that they, or other parties represented by them, were disappointed bidders, and had shown no disposition to question the action or authority of the Commissioners until the contract had been awarded to another party. For that and some other reasons, which Judge Wylie gave at considerable length, the motion was dismissed.

Counsel for the plaintiffs entered an appeal. During the hearing an affidavit in support of the motion was offered from Stephen Chester, of New York, but was withdrawn without being read, his honor intimating that he, being a disappointed bidder, it could have but little weight.—*Evening Star*, Washington, D. C., July 28.

Scene on a Way Circuit.

(N. Y. sending), "Ship ten hhd's."

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended June 22, 1875, and bearing that date.

164,723.—ELECTRIC TOYS.—Wm. J. Decker, New York, N. Y. [Filed May 12, 1875.]

Electrical excitation in the glass, resulting from rubbing, causes the figures to dance and execute various gymnastic feats. The electric toy composed of the glass plate A, which is supported on legs B, and of the rubber C, combined to affect the figures D D, which are placed beneath the glass, substantially in the manner herein shown and described.

164,807.—GALVANIC BATTERIES.—Theophile Chutaux, Paris France. [Filed May 12, 1875.]

For withdrawing the spent liquid. The tube J, provided with an exhaust globe, K, and extending down into and secured in a tube f, which is secured in and extends to the bottom of the porous cup, and is made of non-conducting material, substantially as and for the purpose set forth.

REISSUE.

6,508.—DUPLEX TELEGRAPHS AND CIRCUITS THEREFOR.—Jos. B. Stearns, Boston, Mass., assignor to the Western Union Telegraph Co., Patent No. 132,932, dated Nov. 12, 1872. [Filed March 20, 1875.]

"Bridge duplex" circuits arranged to pass currents of sending station around receiver of such station.

1. A duplex telegraph having a receiving instrument placed between the main line and an artificial line, and a connection from the transmitting key to both sides of the receiving instrument, so that such receiving instruments may be at a neutral point with reference to the electric pulsations produced at that station, substantially as set forth.
2. A duplex telegraph containing a receiving instrument placed at a neutral point, and an electro-magnet in the artificial line, substantially as set forth.
3. The combination of the receiving instrument with the resistances R R R², in the manner and for the purpose set forth.
4. The combination of the receiving instrument and the resistances R R R², with a series of smaller resistances, r, as and for the purpose set forth.
5. The combination of the receiving instrument A with the electro-magnet B, as and for the purpose set forth.

For the week ended July 29, 1875, and bearing that date.

164,921.—ELECTRIC FUSERS.—C. L. Kalmbach, Richmond, Va. [Filed June 24, 1874.]

1. A fulminate primer constructed by sealing a glass vial containing the fulminate of mercury hermetically in a chambered wooden block, substantially as set forth.
2. In combination with the firing wires, a quill with which the ends of the wires are adjusted in proper relation to one another, substantially as set forth.

164,940.—TRAIN TELEGRAPHS.—A. Ryder, Oakland, Cal. [Filed Jan. 18, 1875.]

Designed for use with that class of signals in which the breaking of an electric circuit extending from end to end of the train sounds a signal upon the engine.

The plugs or pistons E moving in the case A A, and provided with a guiding slot, c, and spring a, so that after the plug has been drawn back the spring arms causes the two ends of the cable to become reinitiated, and perfect contact to be between the wires of the cable, substantially in the manner as herein set forth and specified.

165,055.—TELEGRAPH WIRE COUPLINGS.—Samuel M. Barbour and Frank A. Page, Philadelphia, Pa.; said Page a signor to said Barbour. [Filed April 29, 1874.]

A block of metal having two apertures for the passage of the wires, and provided with shouldered chambers adapted to retain the ends of the wires after they are bent back upon themselves, as set forth and described.

165,164.—ELECTRO-MAGNETIC ENGINES.—Theophile Chutaux, Paris, France. [Filed May 26, 1875.]

The two parts of the armature are acted upon successively, the lower drawing down the upper to a point where the electro-magnet can act forcibly upon it.

In an electro-magnetic engine, the armature lever B, constructed in two parts, hinged at one end to the frame of the apparatus, one part being connected at its opposite end to the connecting rod S of the walking beam, and the other provided with a hook, h, adapted to work within the first mentioned part, substantially as herein specified.

165,090.—BURNERS FOR ELECTRICAL GAS LIGHTING.—Samuel Gardiner, Jr., Washington, D. C. [Filed Nov. 6, 1873.]

1. The insulated globe holder I, in combination with the wires J and K, the one connecting with one burner, A, through its electrode E, and the other with the next succeeding burner by the electrode F, with the said holders in the circuit throughout the series of burners, substantially as described.
2. The negative electrode E, as a part of, and a prolongation of the separate metallic nipple C, and in combination with the burner tip D, substantially as and for the purposes herein set forth.
3. The combination, with the burner and the metallic globe holder I, of the wires J K, connecting said globe holder with the negative electrode E and the insulated wire G' of the positive pole passing through and beneath the globe holder, whereby a single burner may be lighted through the medium of said globe holder, as herein set forth.

Obituary.

GEORGE HART MUMFORD.

ON Monday last the telegraph unexpectedly announced the death in Paris of Mr. GEORGE HART MUMFORD, Vice-President and Secretary of the Western Union Telegraph Company.

Mr. MUMFORD, on the 8th inst., left this city for Europe for a few weeks' vacation. He had not complained of any special illness, but was fatigued by close application to his duties, which it was supposed a few weeks' rest and recreation would remedy. After his departure symptoms of disease of the kidneys were developed, with the fatal termination above stated.

Mr. MUMFORD was born in Rochester, N. Y., September 23, 1840, and was consequently in the thirty-fifth year of his age. He was the only son of Mr. George H. Mumford, one of the pioneers in telegraphy and the first Vice-President of the Western Union Telegraph Company.

He was educated at Harvard University, and graduated from the excellent law school of that University, and subsequently entered the law office of his uncle, Judge Palmer. He did not practice law long, however. In 1868, when but twenty-five years of age, on the recommendation of Judge Palmer, he was delegated as the representative of the Western Union Telegraph Company to go to California and reorganize the California State Telegraph Company, in which the Western Union had a controlling interest. At the reorganization Mr. MUMFORD became President of the California Company, and upon its subsequently being merged in the Western Union organization, he was appointed General Agent of the latter for the Pacific coast, which position he held until he was recalled to New York and made Secretary of the Company in 1870, and in 1872 he became its Vice-President also. When the Western Union Company acquired a controlling interest in the International Ocean (Cuba cable) Telegraph Company, he became traffic manager of that company, also, which position he held until his death.

Mr. MUMFORD was a man of much ability, and was highly esteemed by his official associates. His natural abilities and his personal advantages had enabled him to take a position in the telegraph service seldom attained at such an early age.

His sudden and unexpected removal from his sphere of duty was a shock to his official associates, who had expected in a short time to welcome him, with renewed strength and vigor, on his return, and to have once more the benefit of his counsel in the management of the interests committed to their charge.

Mr. MUMFORD leaves a wife and four children to lament his loss. He was accompanied abroad by his sister and her husband, Dr. Fowler. His body will be returned immediately to this country for interment.

ORTON'S PATENT PENCIL HOLDER

"SAVE THE PIECES."

THIS HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread and will hold the pencil perfectly firm.

Price, 10 cents each.

Sent by mail on receipt of price.

Price per doz., 60 cents.

GEO. H. BLISS & CO., Gen'l Agents,

220 Kinzie Street, Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

PONY RELAY, PRICE \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. See above Cut.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. discount from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 34
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 1/4 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Calland battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense. Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application.

All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to
J. N. ASHLEY,
38 Vesey street, New York.

Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

in the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The coöperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDER made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

SATURDAY, AUGUST 7, 1875.

VOL. XI. WHOLE No. 473.

Original Articles.

The New, Albany, N. Y., Western Union Office.

At last the new office of the Western Union Telegraph Company in this city is finished, or so nearly so that they have moved into it. Nearly six months have elapsed since this office was totally destroyed by fire, and, though it seems a long time to look back upon, we are now fully compensated for our waiting, and for the inconveniences to which we have unavoidably been subjected, by the improvements which have been effected during these months.

About four years ago the office was remodelled and fitted up in first class style, with eight quartette tables, a new sixty wire switch and other improvements. This for a while seemed to meet the requirements of the business, but with the introduction of duplexes, quadruplexes, etc., came the necessity for more room. The enlargement of the operating and battery rooms was under consideration, and undoubtedly would have been carried out had not the fire stepped in and relieved the company from the necessity of patching up a set of old rooms, whose days of usefulness and comfort had already passed away.

The boys used often to remark, in a joking way, that they would like to see the old building cremated; but, of course, no one really desired to see any such wholesale destruction of property. However, in the light of subsequent events, no one seems inclined to question the wisdom of Providence in allowing it to go as it did. We bore our loss with a resignation equalled only by that of an old gentleman in one of our rural townships, whose pathway through life had not been strewn with roses. The trouble seemed to be one which appears to be quite common now-a-days, i. e., the incompatibility of temper which existed between himself and his better half. In the course of time she passed away to that land where it is either no trouble or all trouble, and "Daddy," as he was commonly known, was left alone. The next morning he came down town, and meeting a friend, he remarked confidentially, "Well, Rosy is dead, and I'm not sorry." But I am wandering from my subject.

The Museum Building, in which the new office is located, stands at the junction of Broadway and State street, facing south. It is built of white marble, which in course of time had become weather stained and badly discolored by smoke. These stains were removed by rubbing with sand and water, and now the building presents a very creditable appearance. At the top of the fourth story a heavy galvanized iron cornice extends entirely around the building. Above this story rises the French roof, surmounted by an ornamental cupola, which is built in a half circle facing the street, the rear portion being a half square. The whole is covered with galvanized iron and filled in with brick, thus making it comparatively safe against fire. The heavy cornice and the fancy window cornices are painted white, to correspond with the main body of the building, while the plain portions of the roof and cupola are a slate or drab, thus making a pleasing contrast, and setting the fancy work out in bold relief. The top of the building is ornamented with a gilded cresting of fancy iron work.

The eastern, western, northern, southern and city wires, sixty-nine in number, come together in State street, east of Broadway, and are carried on sixty-five foot poles to the corner opposite the office. And now, contrary to the general custom, we propose to give your readers a glimpse of our new office, commencing at the top instead of the bottom. The reason for this departure is that it will save us climbing five flights of stairs, which any telegrapher will acknowledge to be quite an object.

From the corner of Broadway the wires are carried up to the circular front of the cupola and attached to three parallel horizontal rows of insulators, which are not visible from the street. From these outside insulators they are carried through hard rubber tubes by means of sections of korite wire to the lightning arresters inside; from this point they are connected by cotton covered wire with the switch.

Entering the operating room by the private entrance on the north side, near the Broadway end, the visitor finds himself in a room about fifty feet in length,

by about thirty feet in width, and fifteen in height, lighted by windows on three sides by day, and by eight elegant four-light chandeliers by night. Above each chandelier is a ventilator, about two feet six inches in diameter. In addition to these ventilators there are several registers (not the old style paper and weight machines) set into the wainscoting, leading to flues extending to the top of the building, thus insuring an upward draft of air, and effectually clearing this room of all the impurities in its atmosphere. During the warm weather a current of cool, pure air from the river passes through the room, making it cool and comfortable for the toiling "blacksmiths" who occupy it. Twelve quartette tables fill up the greater part of the room, leaving a small vacant space in the circular end on Broadway, which will be used for light gymnastics by the "boys" (when the chief is out).

The number of instruments is somewhat larger than in the old office, it being found necessary to have some in reserve, to be used in case of emergency. There are twenty-seven sets of single instruments, all furnished with the new style nickel base sounders, which, by the way, present a very handsome appearance, and if in practice they fulfil the conditions of the old saying, "Handsome is as handsome does," they will certainly prove an important improvement on the Phelps sounder. There are also seven sets of Milliken's repeaters, one set of Edsonian, Prescottian, Smithsonian, etc., etc., quadruplex, and two sets of differential duplex; these latter being so arranged that they can be used as four sets of single Morse instruments, two separate duplexes, or a duplex repeater. Each table is furnished with a glass ink well, sunken into the table, thus doing away with the troublesome, always upsetting inkstands. The chairs are, perhaps, the most striking feature of the room, being built entirely of wood, the seats being carefully tested before the chairs were put together, and invariably placed with the soft side up. The backs curve out gracefully and are quite ornamental. The whole arrangement is painted a delicate straw color: it is believed they are not patented.

On the north side, about midway between the Broadway and west ends of the room, placed about four feet from the wall, stands the switch, of which we are all justly proud. It is of brass, finely polished, and set up with Mexican mahogany, rosewood and black walnut, and is the most beautiful piece of furniture in the room. It is enclosed in an elegant black walnut framework, with doors at each side. The material is the same used in setting up the new switch in 145 Broadway, New York, and having been thoroughly renovated, is now as good as new.

This switch will accommodate eighty wires and sixty instruments. The instruments are connected with the switch by cables running under the floor; not a wire is to be seen except where they are attached to the binding screws of the instruments. A pneumatic tube and a speaking tube connect the operating with the receiving department. Electric bells are attached to the pneumatic tube in both rooms. When a box containing a message is sent up, upon arriving at the top it strikes and throws back a spring, which closes a local circuit, and setting in motion both bells, or "buzzers," as they are technically termed, these continue to ring until the attendant comes and takes out the despatch and opens the circuit, by placing the spring back in its first position. An eight inch drop pipe and a speaking tube connect with the delivery department. At the west end of the operating room are two smaller rooms, one being used for the files of business and a lunch room, and the other as a store room for stationery and other light supplies, and also as a cloak room. A door on the north side of the main room, and at the left of the switch, opens into the hoistway. From this door are to be pitched all operators who fight circuit or read almanacs during office hours.

On the same floor in the rear is located a well arranged and handsomely furnished room, used as a wash room and water closet.

On the floor below, and right under this is located the battery room, in charge of the veteran batteryman, Anthony Hodley. The room has a capacity of 1,600 cells, but at present only about 900 cells are to be used. The Callaud Gravity Battery is the only kind used.

In one end of this room is fitted up a small office, occupied by Mr. George Thompson, foreman of repairs. Down two flights, of stairs and directly in front of the main stairway, is located the delivery department, which is not as yet entirely completed. It is to be fitted up with handsome black walnut desks for the book-keepers and delivery clerk, and seats for the boys, who are hereafter to be kept entirely clear of the receiving department. A pneumatic tube and a speaking tube connect this room with the office below. The front corner of the building on the ground floor is again occupied as a receiving office. This is also still incomplete, but is to be fitted up with elegant black walnut counters, now in course of construction at the company's factory in New York. Manager Rugg's private office is to be located in a room on Broadway, off the operating room. Here reporters will be allowed to

prepare their despatches, as hereafter the operating department is to be kept strictly private.

The transfer from the Exchange building was effected on Saturday night, July 31st, between nine and ten o'clock. The arrangements for moving were so complete that it was done without any mishaps or delay to business, which is highly creditable to those who had it in charge. It would be unjust to close without referring to the skilful and intelligent manner in which the wires were shifted from the old Exchange street line and carried into the building by Mr. Wm. Gage. The whole sixty nine wires were shifted and arranged on the State street line and in the cupola without a single mistake—a thing which has not been done before in the memory of the oldest inhabitant. The working force of the W. U. Company at this point is as follows:

- | | |
|---|---------------------|
| J. H. Rugg, Manager. | |
| M. J. Morgan, Chief Operator. | |
| S. C. Rice, Assistant Chief Operator. | |
| H. V. Shelley, Night Manager. | |

Seventeen messenger boys make up the remainder of the force.

Hoping that we have been successful in the endeavor to give your readers a fair description of this establishment, without tiring them out or patting them to sleep, we domino this letter with a DOUBLE SIX.

Poetry of the Telegraph Wires.

ARCHITECTS come, and architectural horrors go up, but the telegraph lines go on forever. They are the one sure picturesque element of our nineteenth century city building. They are lines of beauty, that fall in pleasant and unpleasant places alike, and every once in a while they give us a bonning reminiscence of childhood when a forlorn city kite gets stranded across one or more of them, and hangs there dragged and picturesque against the unpitiful sky. There is so much evident poetry in the telegraph wire that it is a difficult subject to handle poetically. We once heard a Methodist preacher do very well by it, however; he had it waiving above the Colosseum, the realm of superstition. It was a good point, and would have brought down the house under other circumstances. A great many of the newspaper poets, we believe, have tried it, but generally with much the same fate as that of the city kite above mentioned. You will recall Mrs. Julia Ward Howe's "Telegrams;" very suggestive, certainly, and with something of the telegraphic rattle and surprise—but a poem more, perhaps, of the telegraphic office than of the telegraph wire—or if of the wire, then chiefly of its psychology:

"Let him hasten, lest worse befall him,
To look on me, ere I die;
I will whisper one curse to appeal him,
Are the black flood carry me by,
His bridal? The fends forbid it;
I have shown them his proofs of guilt;
Let him hear, with my laugh, who did it;
Then hurry, Death, as thou wilt!
On, and on, and ever on!
What next?"

Mr. George P. Lathrop, however, has given us "The Singing Wire," itself:

* * * * *
"I listened to the branchless pole
That held aloft the singing wire;
I heard its muffled music roll,
And stirred with sweet desire.

'O wire, more soft than seasoned lute,
Hast thou no sunlit word for me?
O, thou so long, so coyly mute,
Sure she may speak through thee!"

I listened; but it was in vain.
At first the wind's old wayward will
Drew forth again the sad refrain;
That ceased, and all was still.

But suddenly some kindly shock
Struck flashing through the wire; a bird,
Poised on it, screamed and flew; the flock
Rose with him, wheeled and whirled.

Then to my soul there came this sense:
 ' Her heart has answered unto thine;
 She comes, to-night. Up! hence, O hence!
 Meet her: no more repine!'

Mayhap the fancy was far fetched;
 And yet, mayhap, it hinted true.
 Ere moonrise, love, a hand was stretched
 In mine that gave me—you!

* * * * *

So now, according to the newspapers, the telegraph wires are to be taken down and buried, with all their music in them, just as if they were some of your old classic statues—Venus of Milo or Laocoon! O, Mrs. Howe and Mr. Lathrop! O, all ye poets of New York—you who sang the death of the flowers and of the musical leaves of the forest; you who sang of Pan in Wall street; you who mourned so tenderly for the youth that goes and never comes again—come forth and bewail! Where were ye, nymphs, when the remorseless deep closed o'er the head of your loved Lycidas? O, winds, sweeping in from the sea, weep and moan, for your harp of many strings is taken from you! O, my poor tenement house child, living in the sixth story back, no more at night you shall wake and listen to the songs of angels!—*Scribner's Monthly Magazine.*

Express Messages.

TO THE EDITOR OF THE TELEGRAPHER.

In the last number of the official *Journal* of the Western Union Telegraph Co., the editor returned again, for the third or fourth time, to the subject of Express Telegraph Messages. In the *Journal* of May 15th the editor wrote in strong language of general condemnation of the principle of express messages, assuring his readers that "the system, if established, would be perilous, and destructive, and disastrous." In the number last issued the editor characterizes this "subject" as "dangerous and impracticable," and we are also assured that no more objectionable proposition could be suggested, nor one "which would sooner kindle the anger and the opposition of the people."

The editor is kind enough to state, in the editorial under the review, the objections of the managers of the Western Union Co. to express messages, and, stripped of their verbiage, they are as follows:

1. The law—which is imperative and fundamental—requires telegraph messages to be transmitted in the order of reception.

2. The acceptance of a message for which a pledge of priority in transmission is given, would be hostile to public law and to public justice.

3. A telegraph company has no right to pronounce upon the relative value of messages, or to entertain any system which makes a right of selection a part of its operations.

4. There cannot be express messages as well as express packages, because "the mail and the night service already provide for slow messages."

The editor closes his argument with a story of his own imagining, in which a wife, at Newburgh, is supposed to telegraph to her husband, in this city, to meet her, within an hour or so, at the depot. She requires the message, necessarily, to be sent at once, and makes the mistake of supposing that an "express" message is entitled to go over the wires at the minimum charge made for an ordinary message—a very natural blunder for any one to make once, or until explained, but not at all likely to occur a second time, or to cause any possible dissatisfaction after fully understood.

1. 2. If, as the editor supposes, the law imperatively requires all telegraph messages to be transmitted in the order of reception, then the Western Union and every other telegraph company glaringly violates the law every day under what is called the "night service," which entitles the party wishing to telegraph to a reduction of half the regular day tariff, provided he writes his message upon a certain prescribed blank, by which he is pledged to be satisfied if the telegraph company transmits his message during the ensuing night. But, of course, this order of business is distinctly assented to by the writers of the messages intended for night service, and I cannot imagine that any sane person would for a moment doubt its legality or its propriety; and if it is legal, and I happen to think it will serve my purpose (the telegraph company assenting) to write a message at 8 o'clock A. M., to be delivered at New Orleans by 6 P. M., at half the rates charged for an express message, why should I not save \$1 and let my

neighbor, who has a hurried message, but who is behind me in handing in his telegram, have the instant use of the wires, and pay for the service rendered him \$2? I am thus served within 10 hours, which is all I require, and save \$1; and my neighbor is served, perhaps, in one hour, which was necessary for his business, and he pays twice as much as I do.

Who hat those astute old fogies of the Western Union Co., who so triumphantly proved to their own satisfaction that it was impossible to telegraph over 60 words per minute in circuits of 250 miles, would think of condemning the principle of express messages on such a flimsy pretext as is set up in the *Journal's* first and second count?

3. This objection seems to presuppose that those who advocate express messages propose to leave it discretionary with the telegraph company as to which form of blank the party wishing to telegraph shall use; but of course it cannot be necessary to say to any one outside of the *Journal's* office, and the executive offices of the Western Union Co., that no such idea was ever advocated or entertained by any one who has written in favor of express messages. The public would be quick to learn the advantages and the disadvantages of "express" and "ordinary" messages, and the telegraph company will have discharged its legal and moral obligations when it fixes a fair scale of charges for "express," "ordinary" and "night" messages, and provides blanks with clear conditions and obligations attached, and leaves to its patrons the selection of that one which most nearly corresponds to their necessities.

It is, of course, easy to see that a soulless corporation like the Western Union Co., which is run primarily in the interest of speculators in its stock, might add another to its many tricks and devices to entrap the credulous public, and so manage as to force all its patrons to select "express" blanks to write their messages upon, by needlessly withholding all messages written upon "ordinary" blanks; and I suppose it is the most natural thing in the world for the official *Journal* of the company to assume, as it does in its editorial of May 15th, that telegraph companies would resort to this species of knavery to enhance their revenues. But I assume that the public of America are not yet prepared to risk their business inter-communication to any one telegraph company, and I, for one—and I believe I speak for nineteen twentieths of the business community—feel quite willing to trust to competition to regulate the speed, cost and precision of telegraphing in this country.

4. This objection, coming from the Western Union Co., commands notice, but only because of its origin, for what there is of argument in it is utterly beneath contempt; whilst its statement of alleged fact is in keeping with a previous assertion of the President of the Western Union Co., who caused it to be published in the editorial columns of his *Journal*, that "Duplex" and "Automatic Telegraphy" were altogether inferior to the Morse system, and that not over 60 words per minute could be telegraphed automatically, and not even that number, except over single wires upon poles, owing, as the distinguished electrician of the company had discovered, to "inductive influences."

The editor of the *Journal* does not seem to comprehend what is meant by "express packages." In Mr. Latimer Clark's address before the Society of Telegraph Engineers, which has been criticised by the Western Union editor, Mr. Clark says: "In order to obtain the full benefit of telegraphic communication, any reduction in the cost should be accompanied by the introduction of express messages—a species of message bearing the same relation to ordinary messages that passenger trains bear to goods (freight) trains." Perhaps the editor of the *Journal*, at a future time, will explain his present foggy ideas about "express messages" in connection with "the mail and night service." No doubt the night service, at half rates, is of great advantage to the telegraph companies and the public; but it is not forgotten that the managers of the Western Union Co. did all they could to make it unpopular, whilst the Atlantic and Pacific Co. were popularizing the service.

The Western Union Co.'s managers are the direct, however illegitimate, descendants of the Morse and Kendall promoters of Morse telegraphy, and neither they nor their direct descendants ever adopted, sanctioned or paid for any real improvements in telegraphy until absolutely forced to do so; and if it had rested with Morse and his descendants, down to and including the Western Union Co., to make or pay for improvements in telegraphy, the system of to-day would have been the system of Morse in 1847, without addition or improvement. The really able men of the Morse fraternity have been the operators and subordinate managers, who, often in spite of their ignorant, conceited or stupid superiors, have invented without pay and improved without reward, or even the sense to appreciate on the part of the executive managers, until the Morse system of to-day compares with the Morse system of 1847-1850 as does the express railway train with the old stage coach. But, I repeat, these vast improvements are in no sense due to conceited executive managers or to their backers, with more money than brains. There

is, therefore, special fitness in the present opposition of the Western Union Co. to express messages, and, indeed, to every advance toward the full utilization of telegraph wires.

Improvements in telegraphy have now, in defiance of the hostility, deception, and even the glaring misrepresentations of the Western Union Co., reached a point which admits of round profits in telegraphing, day and night through, in any circuit of 1,000 miles, for 10 cents per 100 words; and the managers of the Western Union Co. will be compelled to do telegraphing at something like these rates so soon as the public become educated up to the conveniences and the capabilities of the present actual improvements in automatic telegraphy. How Mr. Orton is to bring his present alleged cost of more than 33 cents per message of 10 words down to 10 cents per message of 100 words is a problem which he will do well to begin soon to solve; and it is one which, I apprehend, will never be even half solved by any system of telegraphy now within the reach of the Western Union Co. D. H. C.

The Improvements in the Chicago, Atlantic and Pacific Office.—The Automatic System Working Satisfactorily.—Personal.—Base Ball.—Arrested.

CHICAGO, ILL., July 22.

TO THE EDITOR OF THE TELEGRAPHER.

In a former communication I briefly mentioned the removal of the A. & P. operating room to the fifth story of the Major block. I did not have time and space to give as full a description as I had intended, and, in writing from hearsay, made several errors. Superintendent Towler's room is not directly on the corner adjoining the operating room, but several doors south on the same floor, fronting on La Salle street. Mr. Robert C. Minot, familiarly known as "Bob," still operates as Mr. Towler's chief clerk, apparently to the entire satisfaction of all interested. Having been promoted from time to time since he clerked for the P. & A., five years ago (being about a year ago appointed to the position he now holds and fills so creditably), of course he knows the whole routine of that branch of the service.

The location of the superintendent's office is a very desirable and sensible one, as parties having business with the superintendent are not obliged to pass through the operating room to get there, as would have been the case had it been where I erroneously stated heretofore. The elevator being still south of the superintendent's room, it (the latter) is reached before coming to the operating room. The corner room mentioned heretofore as Superintendent Towler's room, is used for the automatic punching room. This room is very light and airy, having a frontage on both Madison and La Salle streets. Directly south of this room, and connecting to it, is another fronting on La Salle street, which is also used for automatic purposes, and connects by a door on the east side of the room with the operating room, which, from its peculiar location, is never directly under the rays of either the morning or afternoon sun; thus, by opening the windows of the last mentioned automatic room and the door to the operating room, when those windows are open a delightful current of air can be made to pass through both, making them as cool and delightful as any in the country. I was kindly shown through the rooms recently by chief operator Sweet, who took considerable pains to make everything plain. According to Mr. Sweet's theory, it takes experienced persons, and not mere children, to work the automatic. He says a good puncher can punch out the messages a great deal faster than the best Morse operator can send or receive business; and the same rule which makes a Morse operator who can receive a few words behind (safely and easily) an expert, is also applicable to the punching process. A puncher who is a well informed person—who can at a glance take in whole sentences easily, on account of being well educated and well read, can do much better service than a person of ordinary intelligence and little or no experience as a reader of copy. In this respect it seems that there is some similarity between a Morse operator and an automatic puncher. The automatic is worked daily and gives satisfaction here. I hope at some future time to be present when it is working in all its various branches, and then give you a minute description of the whole system, as I think many of your readers would be pleased to know how it works.

The main battery room of the new operating room of the A. & P. Co. is situated on the same floor with the operating room, and is light and airy, fronting on Madison street, just east of the operating room. The wires cross Madison street from the buildings opposite the battery window, and are very nicely strung. The switch board will be on the east side of the operating room, next to the battery room, when completed, and I understand will be a very handsome affair. The wires will come through the wall which separates the battery room from the operating room, directly to the

switch, and passing directly down to the floor and from there to the different tables, no wires will be in sight in the operating room. The partition in the receiving room, which (from the fact that the operating room had to be crowded into the latter) extended so far out towards the door as to very much restrict the space for customers' accommodation, has already been removed, leaving a large comfortable room for customers and ample space for the receivers, back in the same place that it was heretofore. The manager's office occupies the same position as heretofore in the south part of the room, only it has been very much enlarged. A rotary engine, worked by hand, drives the messages up to the operating room through a pneumatic tube, while the messages for delivery are dropped down an ordinary pipe from the operating department. Everything seems to be working systematically, and no doubt the company will be greatly benefited by making such sensible changes.

Mr. Wm. Hubbard is the gentlemanly Superintendent of Telegraph and Train Despatcher of the Chicago and Pacific Railroad. The road is rapidly extending westward ho! and Mr. H. has his hands full filling the arduous duties of the two positions.

There was a general prostration of telegraph poles, fences, etc., along the line of the C. B. & Q. R. R. during the storm of the 19th, and three men named Ohlson, Andrew and H. Nelson, were killed by lightning at Altona, Knox Co., Ill.

A nine from the W. U. office (known as "Billy McMillan's nine") beat the Western Base Ball Club of this city to-day, by a score of 5 to 4. I understand they go to St. Louis shortly to play the Telegraph nine there.

A gang consisting of telegraph operators, brakemen and others, 29 persons in all, were arrested here to-night for boarding a train on the Pittsburg, Fort Wayne and Chicago Railroad, contrary to the orders of the road.

OCCASIONAL.

British Columbia Telegraph.

TO THE EDITOR OF THE TELEGRAPHER.

Our line runs from Victoria, on Vancouver Island, to Barkerville, in the Cariboo mining district, a distance of 650 miles. Mr. R. B. McMicking, our worthy and estimable Superintendent, passed through here a few days ago on his annual trip of inspection. The line is in excellent repair, and it is not necessary to call any office more than once when he is in the upper country. Our two chiefs are Miss Sarah Maclure at Matsyni and "Mike" O'Connor at Clinton. "Mike" got married this spring, and has not yet fairly recovered from the effects.

Barkerville is the only office north of Victoria that receives "press;" but "Dick" Allen is an old hand at it, and one that won't be frightened at a Chicago duplex.

The principal office is at Victoria, and is under the able management of Mr. A. Leonard Meyer, assisted by Mr. J. H. Carmichael, universally known as "Old Car."

Capt. Fravel, well known on this coast, is located at Saanish. Jimmy Gilliland, alias "The Growler," is repeating at Swinomish, and Aleck Lindsay at Vanwinkle. This latter gentleman also acts in the capacity of constable, notary public, coroner, collector, express agent, mining secretary, and I don't know what else, so that he must be making \$500 per month.

Alfred Peace runs the Yale office. He got his name from an exclamation a young lady was heard to make years ago, "Please don't."

At some future time I shall give you the names of the remainder of our staff, and also anything of interest that may transpire between now and then. B. C.

Changes Present and Prospective in Chicago W. U. Office.—Personals.—A Gentle Admonition.

CHICAGO, ILL., June 24.

TO THE EDITOR OF THE TELEGRAPHER.

CHANGE seems to be the order of the day here. Probably there is no office operated by the Western Union Company where in the course of a year so many operators come and go. Mr. Tom Weiler, who has been sick for some time past, has fully recovered, and been promoted to a position on the regular night force, having heretofore been on the "sub" gang. Charlie Robinson manages to fight his old enemy—the rheumatism—off long enough to get around and work occasionally on a fine day. Mr. F. M. Lester has sufficiently recovered his protracted indisposition to be able to grace the office days with his presence, and is working the "Bx" branch office (sugar broker) line until fully recovered. Mr. George Hurd has resigned on account of continued ill health and gone to his home in Canada, where he, no doubt, will meet a hearty welcome, his father being a leading Methodist minister of the Gospel in the Old Dominion.

Several resignations of first class men both on the day and night force, are rumored, they being dissatisfied with the salaries paid here. As this is only a rumor, I am not at liberty to give the names of those who intend leaving.

I like politeness, but I hate toadyism, as it is generating to quite an alarming extent in certain quarters. The shorter and more concise a business letter is the better it is appreciated by the recipient, and we are very much mistaken if those in authority like to have it spread on so thick, for be assured, boys, they can see as far through a millstone as some of the smartest of you can. It's all very well to use "Mr.," "Esq." and "Dear Sir," but when it comes to using all these and saying, "I have the honor, my dear sir," etc., etc., and "I am, dear sir, with great respect, your obedient servant, etc., etc.," it's too much; it spoils a good thing; it's too military. If you don't drop on it, boys, we'll have to call you "Major Generals," "Lieuts.," "Corporals," "Privates," etc. Let's have a rest.

WESTERN UNION.

An Amusing Incident.

NINTH BANK, August 2.

TO THE EDITOR OF THE TELEGRAPHER.

AN amusing incident occurred here a few days ago. An old soldier and pensioner had occasion to use the wires for the first time in his life upon some important business, and the whole family were interested in getting a quick reply. Frequent discussions took place between the family and neighbors as to the mysteries of telegraphing, and various modes were suggested as to the manner in which it worked. It happened that the reply was delayed on account of the party to whom the message was addressed being hard to find, and no reply could be got that night. This caused some talk, and the sender and his friends at once came to the conclusion that telegraphing was a "mighty" swindle. At last one of the children, a bright little boy of about six summers, suggested that their reply might have been knocked off the wires some place. "You're right, my boy," replied the father, "I never thought of that!" "Well," said the youth, "I know where it is—there's a pair of old boots hanging on the wires near the station—they've been hanging there over a week, and they must have knocked our message off." Those present coincided with the boy, and they retired to their beds after having come to the conclusion that the telegraph company could not be held responsible for the damage done by a pair of old boots.

ONCE MORE FOR THE CIGARS.

A Telegraphic Base Ball Victory.—Bulls.—Personals, etc.

CHICAGO, ILL., July 31.

TO THE EDITOR OF THE TELEGRAPHER.

THERE was no meeting of the American Electrical Society on the third Wednesday of this month, as it was ascertained that none of the officers could be present. At the last meeting it was understood that hereafter notices would be served by the secretary on all the resident members (and as many others as would be likely to attend) several days previous to the meeting, so that the forgetful ones might be reminded of the time of the meeting, and as none were received no one was disappointed by preparing for the meeting.

Mr. Edwin Spear, the enterprising agent of Holmes' burglar alarm telegraph, house and hotel annunciators, call bells, etc., has quite an extensive stock on hand at his new place, 141 La Salle street, in this city. Mr. Spear is an old resident of Chicago, having been here

A match game of base ball was played to-day between a nine composed of check clerks of the Western Union office, known as "Billy" McMillan's nine and a club made up of clerks from the *Inter-Ocean* office, resulting in a victory for the W. U. boys.

I was unable to obtain any points of the game, the name of the umpire, nor the time occupied in playing it. I understand the Western Union club intend challenging the "Dots and Dashes" of St. Louis, to play them at that city at an early day.

"Suit against *Bolls & Tale* is postponed; don't go to-morrow" was caught on the fly recently by one of our first class Chicago receivers, because there were too many words in the message, but the check was all right after it was changed to "*Bolls' estate*."

Mr. O. D. Knabenshue, operator at the general freight office of the Baltimore and Ohio Railroad, in this city, is one of the many operators in this section who cannot do without THE TELEGRAPHER. Mr. "Warby" Cooper is looking as happy as a nigger with a new shirt with a bosom pocket in it, in his new office in the B. & O. general ticket office, corner Clark and Washington streets. Give him a call, boys.

We thought our friend "Pete" Rowe, who was in town a short time ago, looked unusually happy about something that had happened, or was going to happen, and well he might, for on the 29th inst. he was made the happy father of a twelve pound boy, and it wasn't

a very good day for boys, either. "Pete" has something to *Rowe* for now, you bet!

Of all the nice little offices we have seen lately, the L. S. and M. S. R'y branch office in the Sherman House, presided over by the gentlemanly Mr. E. C. Edson, takes the linen off of the highest bough (that's original). A nice little strap switch, with reflecting mirrors between the perpendicular straps, and heavy walnut mouldings with furniture to match, makes it a little palace, indeed, and Mr. E. well knows how to take care of it.

Mr. Charlie Fortier, recently of the W. U. day force here, but more recently of the A. and P. branch office, known as "Bx" office, has resigned and gone to Milwaukee to engage in other business. I understand Mr. E. B. Ludlow, an old timer, takes Charlie's place at "Bx" A. and P. office. The A. and P. folks now have a Milwaukee wire in full blast, and I suppose your correspondent at Milwaukee will soon give you a full account of the A. and P. opening there. The connection was made about a week ago.

"Why, how do you do, John? What makes you look so happy?" etc.; that's what we said to Johnny Mason when we met him a few weeks ago. Johnny is one of the "old timers," you know, but is now engaged at Moberly, Mo., with his brother Stephen, on railroad lines.

"Well, I've gone and done it, Jim," says he. "What! got married?" "Yes," he replied. Well, we wouldn't believe him at first, but such is the case; married and settled down. "Good enough." "Shake," and we did just shake as only Johnny knows how to shake.

Hav'n't told you about "Whitcomb's" baby, have I? Well, it ain't my fault if a fellow will become the father of a ten pound son, and then only manifest it by walking around proud like and say nothing to anybody about it. Why, of course the boys have a right to laugh at him and tell him it's about time, etc., etc. But you must "cheese it," boys, for "Whit" has one of the finest boys in this "neck of woods." He seems a head taller, and hardly recognizes us "common herd" as he passes us on the street now.

"50 Havenne." How's that for "5th avenue?" That's on one of the W. U. boys.

Mr. T. F. Tracy is the W. U. operator in charge of the segar and news stand in conjunction with the "operatorial" (that's mine too) duties of the Tremont House. If you want a good segar, boys, give him a call.

Mr. Frank Cargill, who has been taking a few weeks' vacation in Canada among his friends, passed through here en route for St. Paul on Saturday, to take his old position on that end of the Chicago and St. Paul wire.

OCCASIONAL.

Weather.—Changes in the W. U. Office.—Personals.

CHICAGO, ILL., August 2.

TO THE EDITOR OF THE TELEGRAPHER.

WE have had all sorts of weather for the past week; yesterday and also several days of last week it was so damp and chilly that a fire would have been very comfortable.

A number of changes take place to-day or to-morrow here. Mr. Minor, of St. Paul, who has been "subbing" there for Mr. Cargill for some time, takes Mr. Sam. Bracken's place on the St. Paul wire, nights, while the latter, accompanied by Mr. Cushing, of the Pittsburg duplex, nights, take a six weeks' vacation, hunting, fishing and sight-seeing through different parts of Minn., Wis., Iowa and Michigan. Mr. Hazleton left us to-day, having resigned some time ago, to take effect the 1st instant, intending to take an extended tour through Iowa, and probably visit Milwaukee. Mr. Tatge, of the day force (Burlington wire), took a few days' vacation along the Mississippi River recently and returned looking very fine. He says those Burlington girls are handsome, and the boys generous to a fault. Messrs. Wilson, Grey and King have been added to the list of "subs" in this office, and seem to be very fine gentlemen and good operators. Tommy Knox and Jim Fish have gone on days regular. Mr. F. M. Crittenton takes Fish's place on the 12.30 A. M. to 8 A. M. track. Whitcomb, of the Quincy wire, takes "Crit's" place on the Milwaukee duplex; while A. J. Long takes the Quincy wire, worked formerly by Whitcomb. Mr. Eddie Dennis is making quite a protracted visit with his friends in Indiana. Mr. Henry Stanbury has taken the St. Paul wire days, while W. C. Long has been stationed on the Detroit duplex, along with Mr. Guthborl, who is still "subbing." Jack Martin has been sick a week. It's hoped he will be around soon, as the boys can ill afford to spare Jack. Talk about your efficient and witty operators! The boys tells us that Messrs. Thomson (fatty), "G." and Mills, "Ms.," of the Detroit office, who work that end of the duplex, are the jolliest fellows and wild as some of the wittiest in the biz. This is all I can think of in the

WESTERN UNION.

The Telegraphic Situation.

THE telegraphic situation has not been materially changed during the past week. Reports have been rife of a sale or lease of the Atlantic and Pacific lines to the Western Union Telegraph Company, but they are without foundation. They have sufficed, however, to give additional strength to the quotations for Western Union Stock. It is scarcely necessary for us to contradict these reports in detail, and as they are usually started merely for stock jobbing purposes, we seldom allude to them in the columns of THE TELEGRAPHER. The impression, however, has gotten abroad that where there is so much smoke there must necessarily be some fire. It is understood that Mr. JAY GOULD is heavily "long" of Western Union stock, and that he is not without aspirations for the control of the great telegraph organization of the country. That he can get such control, if he is able and willing to pay money enough for it, we think quite probable. At any rate from now until after the annual meeting and election of Western Union officers in October, we may expect that reports similar to those above referred to will constantly be circulated.

It is not unlikely that some parties heavily interested in both the leading telegraph companies may be desirous of arriving at some understanding or arrangement for their mutual advantage, but as yet nothing, so far as we have been able to ascertain, has been accomplished, or, in fact, seriously contemplated in this direction.

The new National Company of San Francisco comes in as a disturbing element just now in telegraphic calculations. That company has issued the following

(CIRCULAR.)

"SAN FRANCISCO, July 12, 1875.

The National Telegraph Company asks the favorable consideration of the public for the enterprise about to be inaugurated.

Cheap telegraphy is almost as much a necessity of the present age as cheap water or cheap gas-light, yet the rates now demanded by existing organizations are, for all but important business messages, nearly prohibitory, and in their effect quite as detrimental to the interests of holders of stock in telegraph companies as to their patrons.

It will be the policy of THE NATIONAL TELEGRAPH COMPANY to commend itself to public favor by a low tariff of charges, the directors believing that they can best make the business profitable to their stockholders by rendering the use of their lines profitable to the public, and that the present rates can be so materially lowered as to increase seven fold the volume and the net earnings of the business.

Sufficient of the company's capital stock having been subscribed to warrant the board of directors in undertaking the construction of its lines, the work will very shortly be commenced on both the eastern and western sides of the continent, and carried on with all the energy that is consistent with judicious economy."

A news despatch from San Francisco, of Monday last, to the American Press Association, states that the company has contracted for 60,000 telegraph poles, and that operations are to be commenced soon, simultaneously at San Francisco and New York, for the construction of lines.

New companies generally commence operations by proposing to "materially lower" the charges for telegraph service, but how this new company expects to do this profitably to themselves, as promised, remains to be explained. They certainly can't do it unless the capacity of the wires can be utilized to a greater extent than by the ordinary Morse system.

As will be seen by the cable reports in our news columns, the Faraday has arrived in England, and the new cable has not been got in working order. No details of the Faraday's experience have come to hand as yet, and nothing definite is known as to the actual condition of the cable, further than that it has not worked since it was reported out and buoyed by the Faraday. The Faraday is to be refitted and sent out again as soon as possible to complete the work. The opening of the new cable for business, and the commencement of competition in Atlantic telegraphy, is meantime indefinitely postponed.

Philadelphia Telegraphs and Telegraphers.

A RECENT visit to Philadelphia was made the occasion of renewing acquaintance with our old telegraphic friends, and of a hurried inspection of the telegraphs of that city.

It is scarcely necessary to remark that Philadelphia is an enterprising city, and, of course, is not behindhand in its telegraph facilities or a liberal patronage of the telegraph. In consequence of the brief time that we could devote to our visit, we cannot speak as fully as we could desire of telegraphic matters, etc., there.

We are under obligation to Mr. O. W. STAGER, manager of the Philadelphia, Reading and Pottsville Telegraph Company, in Philadelphia, for attentions and courtesies received from him. The new main office of this company, at No. 204 South Fourth street, is very conveniently and handsomely fitted up. The battery room, which is in the basement of the building, is kept perfectly clean and dry. The battery, which is of the Callaud pattern, has the cells closely fitted with wooden covers, which checks evaporation and waste. Mr. STAGER informed us that by the arrangement which is used the battery requires very little attention, is seldom renewed, and the current is always good and constant. The appearance of the office and battery room certainly reflects much credit upon Mr. STAGER and his assistants. The Philadelphia, Reading and Pottsville Company are doing a large and constantly

increasing business. It has now forty-four branch offices within the limits of the city.

The Western Union office on the corner of Chestnut and Third streets is, of course, a busy place. The receiving office on the ground floor is very conveniently fitted up. The office of the Sup't of the District, Mr. JAMES MERRIHEW, is over the receiving office. We had the pleasure of renewing an old time acquaintance with Mr. MERRIHEW, who, although very busy, is never too much so to cordially welcome his old friends. He has charge of one of the largest, best and most important districts of the Western Union Company. He is the right man in the right place.

The operating room, which, as usual in the large W. U. offices, is near the roof, is a good sized room and well filled with desks, instruments and operators. Messrs. JACOB WOODRUFF and GEORGE SNYDER were found, as we last saw them some years since, busily engaged in working the printing telegraph events. They bear their years and labors well, and are likely to be similarly employed for an indefinite period in the future.

Mr. HEBER C. ROBINSON is the able and efficient manager of the Western Union office, to which position he was promoted when Mr. MERRIHEW was made superintendent, he having been for eight years previously chief operator. This was another merited promotion.

On the opposite corner of Chestnut and Third streets is the office of the Atlantic and Pacific, and Franklin Telegraph Companies. Mr. JAMES T. MAXWELL, who has been for some years chief operator, was, on the 1st instant, promoted to be manager, in place of Mr. JOHN WINTROP, who has resigned to engage in other business. This office does a very good business, and under Mr. MAXWELL's management we have no doubt the prosperity of the company will be increased. In this office two automatic instruments are worked advantageously. A little money expended in fitting up the operating department would be judiciously invested.

The Local Telegraph Company, an auxiliary of the Gold and Stock and Western Union Companies, is managed by our old friend, Mr. HENRY BENTLEY, and is, we understand, doing a good business. As Mr. BENTLEY was not at his office when we called, we failed to see him.

The American District Telegraph Company is being very successfully introduced in Philadelphia, and new districts are constantly being established by Mr. W. H. SAWYER, whose experience as General Sup't of the company in this city has given him superior qualifications for the business. It is intended to have the city entirely covered by the American District system before the Centennial celebration next year. The American District office, in the depot of the Pennsylvania R. R., on Market street, is very handsomely fitted up with large plate glass mirrors and elegant fixtures and furniture, and reflects much credit upon the taste of Mr. SAWYER, under whose directions it was done.

Mr. W. J. PHILLIPS still manipulates the Fire Alarm Telegraph of Philadelphia as its superintendent—a position which he has held and efficiently discharged the duties of, ever since it was first established in that city. He is also interested in the American District Company. The Fire Telegraph of Philadelphia sadly needs reconstruction, and Mr. PHILLIPS hopes to succeed in accomplishing it before the Centennial. An ordinance making the necessary appropriation for the work has already passed the lower branch of the Municipal Council, and is expected soon to be agreed to by the upper. Philadelphia should by all means have GAMEWELL AND Co.'s latest improved fire telegraph system in operation for the Centennial year.

We regretted very much that our necessarily very limited stay prevented our making a more detailed inspection of the Philadelphia telegraphs and seeing more of the Philadelphia telegraphers.

The depression in business generally affects telegraphic interests there as elsewhere, but a call on Messrs. PATRICK & CARTER, at No. 38 South Fourth,

near Chestnut street, showed that business was not entirely at a stand still. This firm has a full stock of telegraphic and electrical goods, and they say that business is fair for the times.

The branch establishment of Messrs. L. G. TILLOTSON & Co., at No. 54 South Fourth street, under the management of Mr. CHAPIN, is also in successful operation, with a good stock of goods.

We had not time to visit the establishment of Messrs. JOSEPH MOORE & SONS, No. 535 and 537 China street, whose specialty is insulated and office wires. This firm are well known for the excellent quality and reliability of the wires manufactured and furnished by them.

Many of the old time telegraphers will remember Mr. ROBERT J. BLACK—"Bobbie," as he is more familiarly known by his numerous telegraphic friends. We found "Bobbie" in the order department of the mammoth clothing and goods establishment of Messrs. WANNAMAKER & BROWN, with which he has been connected for some years. He is the same genial, whole-souled fellow as when he fingered the keys of the Printers so deftly in years gone by. Nothing in our visit gave us more pleasure than the renewal of our acquaintance with our old friend and associate at 21 Wall street of more than twenty years ago.

Owing to the absence of Mr. DAVID BROOKS, we were unable to obtain the latest information in regard to insulators, or learn what progress was being made with the electrical department of the Centennial Exhibition, which will be under his superintendence and direction.

"The Electric."—Change of Proprietor.

WITH the issue of *The Electric*, published at St. Louis, Mo., for July 20th, the connection of Mr. FRED. B. MOXON, who has been transferred from the St. Louis, Mo., to the New Orleans, La., Western Union office, ceased. Mr. MOXON has disposed of his interest in *The Electric* to Mr. J. W. COOK, of the St. Louis office, and it will hereafter be published by him and Mr. J. W. HAYES, also of that office.

The Electric is an interesting and neatly printed paper, and has our best wishes for its continued success and prosperity. It has been published with a view to interest its readers, and has been kept free from the objectionable features which have characterized one or two other similar publications. The connection of Mr. COOK with the paper will, we have no doubt, prove advantageous to it, and it will be read with interest and profit by the telegraphers of the section which it especially represents.

Patent Pocket Relay.

WE take pleasure in calling attention to the improved Patent Pocket Relay, an advertisement of which, by the Western Electric Manufacturing Company of Chicago, may be found upon our last advertising page. It has several marked improvements over old style pocket relays, and gives a clear and distinct sound. It is supplied at the very reasonable price of \$18, with a discount of 20 per cent. upon this amount when the money accompanies the order.

Annual Exhibition of the American Institute.

THE forty-fourth annual exhibition of the American Institute of the City of New York will be held in this city, opening September 8th and continuing until the latter part of November. It is designed to make this exhibition unusually interesting, special efforts being made to have the leading industrial operations carried on upon the premises.

It is to be hoped that exhibitors will cooperate with the management in having the exhibition really ready when the opening day arrives, instead of, as heretofore, having it commence in a disorderly and incomplete condition, and days, and even weeks elapse before the display is in proper shape. This has been a serious drawback in previous years.

The American Institute is the oldest of the societies of its character now in existence, and is a public, not a private corporation, its charter providing that its earnings shall be devoted to the encouragement of domestic industries.

For blanks and all desired information, address General Superintendent, American Institute, New York City.

The New Blanks of the Atlantic and Pacific Telegraph Company.

BY an executive order of the Atlantic and Pacific Telegraph Company, both the new counter and receiving blanks are to be exclusively used on and after the first instant, and all old Nos. 1 and 2 blanks on hand to be returned to Mr. EDWARD C. COCKEY, Supply Agent, No. 198 Broadway.

These blanks were briefly described in the last number of *THE TELEGRAPHER*, and are believed to be a great improvement on the old forms generally used by telegraph companies. The number of the message, the initial of the sending operator, time of transmission, initial of receiving operator and check, are required to precede the message, and are entered in spaces ruled off for the purpose. The heading of the "sent" or counter blank is similarly provided with spaces for similar entries, so that both the "sent" and "received" messages correspond throughout.

The body of the receiving blank is ruled for five words on a line, so that the instant a message is completed the receiver can at a glance ascertain whether the number of words received corresponds with that called for by the check previously received.

Personals.

Mr. M. M. HERRINGTON, Supt. of Telegraph, Atchison, Kansas, has resigned, and engaged in mercantile business at Jewell City, Kansas.

Mr. GUS. D. SINGER, formerly of Sedalia, Mo., has been appointed manager of Monroe, Mo., Western Union office, *vice* Mr. SAM. Q. SEVIER, resigned, to accept a position with the same company in New Orleans, La.

Mr. CHARLES C. PONSONEY has been appointed Supt. of Telegraph, Central Branch, Union Pacific R. R., with headquarters at Atchison, Kansas.

Mr. ERASTES D. MOORE has resigned his position with the Atlantic and Pacific Co., at Cincinnati, Ohio, and accepted the position of special agent of the St. Louis, Mo., Mutual Life Insurance Co., at Quiney, Ill.

Mr. JOS. F. HIBBARD has resigned his position on the Erie R. R. telegraph at Jersey City, N. J., and accepted a position in the main office of the Phila., Reading and Pottsville Telegraph Company, at 413 and 415 North Third street, Philadelphia, Pa.

Miss ELLEN F. GILLET has been transferred from the Clinton, N. Y., to the Rome, N. Y., office of the Western Union Telegraph Company.

MESSRS. C. H. SMITH, L. BRADLEY and THOMAS O'NEAL have resigned their positions in the New Orleans, La., Western Union office.

Mr. C. H. SMITH, late of New Orleans, La., is working on the Western Union night force at 197 Broadway, New York.

Mr. THOMAS O'NEAL, late of New Orleans, La., W. U. office, is in Cincinnati, Ohio.

MESSRS. ED. FULLUM, of New York, and SAMUEL SEVIER, of Monroe, La., fill vacancies in the New Orleans, La., Western Union office.

Mr. D. W. H. VOORHIES has been subbing for Mr. A. T. TAYLOR, Galveston, Tex., Western Union office, for the past month. Messrs. J. L. MORRIS, of Austin, Tex., and FRANK LYON, of everywhere, are subbing in the Houston, Tex., W. U. office.

Mr. ALLEN, manager, and Mr. C. M. STEWART, a^d operator in the Key West, Fla., office of the International Ocean Telegraph Company, have recently died from yellow fever.

Mr. SAMUEL H. EDWARDS has been appointed chief operator of the Atlantic and Pacific main office at 198 Broadway, New York.

Mr. WILLIAM APLIN, late agent of the New York Associated Press in London, arrived in this city on Saturday last. Mr. APLIN is an old telegrapher, and his return to his native land will be cordially welcomed by his numerous telegraphic friends and acquaintances.

The Telegraph.

By Cable.

CHEAP TELEGRAPHY IN ENGLAND A FINANCIAL FAILURE.

LONDON, Aug. 2.—The *Times* says the system introduced by the Government for sending messages over telegraph lines in Great Britain for one shilling has disappointed anticipations. It says the time is coming when this rate will cease to pay, and unless a great change is made the service will become a heavy and increasing permanent charge on the country's finances.

RETURN OF THE FARADAY TO ENGLAND.

LONDON, Aug. 2.—The steamship *Faraday*, which has been engaged in laying and repairing the Direct United States Cable, has arrived at Deal.

THE STEAMSHIP FARADAY AND THE DIRECT U. S. CABLE.

LONDON, August 3.—Nothing is published or current here concerning the steamship *Faraday*. No London papers, except the *Shipping Gazette*, announced her arrival at Deal.

Inquiry fails to develop information negating the strong probability that the *Faraday* has failed to repair the direct cable, as heretofore rumored in London.

QUOTATIONS OF ATLANTIC CABLE SHARES.

LONDON, August 3.—The *Standard*, in its financial article this morning, says: "The principal variation in telegraph shares was a rise of 15s. in Anglo-American, which is attributed to the steamer *Faraday's* arrival in the Thames, after an unsuccessful attempt to repair the direct cable."

The Attempt to Repair the Direct U. S. Cable.

CAPTAIN DUNKERTON, of the ship *Eliza Everett*, arrived at this port on Tuesday from Yarmouth, Nova Scotia, and reported that on Sunday, July 11, in latitude 49, longitude 43 15, the officers of the *Faraday* boarded his vessel, and informed Captain Dunkerton that they had picked up the defective part of the cable about four miles from that point a few days previous, and had set a number of buoys. On account of a boisterous sea they were, however, compelled to drop the cable again. It was discovered that some defect existed in the cable, and that it had not parted, as reported.

The International Telegraph Conference.

THE broad results of the recent International Telegraph Conference will be that the International Telegraph Code will be more elastic than it has hitherto been, and therefore capable of adapting itself more rapidly to new requirements. The tariff, which was greatly reduced in 1865 and 1868, will not on this occasion be lowered, and the unit of charge will remain fixed at twenty words, including addresses. Between such countries, however, as choose to admit it, provision has been made for a "telegraph card" of ten words at three fifths of the charge for twenty. Under a similar restriction urgent messages at treble charge will be transmitted, and will have precedence of other private messages between the countries that admit them.

Foreign Telegraphic Notes.

Mr. RUSSELL GUNBY, the arbitrator of the claim of the Great Eastern Railway Co., of England, which claimed from the postal telegraph department over half a million pounds for its interest in the telegraph lines along its route, and damages, has awarded £77,000 in full for the same.

The Directors of Hooper's Telegraph Works announce that, owing to the absence of new contracts since the first of January, they have decided not to pay an *ad interim* dividend for the half year ended the 30th of June last. It is added, however, that negotiations are pending for several important contracts, and that one of considerable magnitude has been provisionally arranged.

Advices from Lima, Peru, of the 5th inst., *via* Panama 17th, state that the steamer "International" had arrived at Africa with a portion of the cable on board intended to unite Peru and Chili, and to connect them with the telegraphic systems of the old world—a result to be attained by means of the wire crossing the Andes to Mendoza, and thence to Buenos Ayres and Montevideo.

The steamship "Caroline" has been chartered by the English Post-office, and is engaged in effecting the repairs to the Channel Islands and the Isle of Man cables, which have been interrupted for some time.

Mr. James A. Brand, the liquidator of the Panama and South Pacific Telegraph Company has given notice that he is prepared to make a return of £1 10s. per share to all shareholders who have paid up £2 10s. per share.

The receipts of the Submarine Telegraph Company for the month of June amounted to £9,376, against £9,188 for the corresponding month of last year.

The traffic receipts of the Western and Brazilian Telegraph Company were £10,829 for the five weeks ended July 2.

At the meeting of the Eastern Telegraph Company, the directors' report was adopted. The dividend of 3s. 6d. per share, making 5 per cent. for the year, is 1 per cent. less than in the previous year.

The traffic receipts of the Anglo-American Telegraph Company for—

July 2	amounted to.....	£1,340

The Society of Telegraph Engineers in England now has 717 members of all classes.

The Meyer quadruplex is working well on the Paris and Lyons line. Two instruments working from each station on the one line.

An interruption has occurred to the Scilly Islands Cable. The fault is supposed to be about 200 yards from the landing place in the Scilly Isles. During the interruption messages are forwarded *via* Port Penzance.

Professor Cornu, of the *Ecole Polytechnique*, Paris, has put into successful use a new instrument for measuring the velocity of light between two stations, in which an electrical registering apparatus is used, giving, it is believed, more accurate measurements than the well known toothed wheel arrangement of Fizeau. Foucault fixed the velocity of light, by his instrument, at 185,157 miles per second. Professor Cornu, by his new instrument, fixes the velocity of light at 186,660 miles per second, or 1,503 miles faster per second than Foucault.

The number of messages passing over the Cuba Submarine Telegraph Company's lines during the month of June was 2,471, estimated to produce £2,500, against 1874 messages, producing £2,000 in the corresponding month of last year.

Two sets of Professor Wheatstone's Automatic Printing Instruments have been set up for traffic between Sydney and Melbourne.

Telegraphic and Electrical Brevities.

In the Cook County Circuit Court, held at Chicago, Ill., on the 24th ult., Judge Farwell granted permission to Mr. O. H. Horton, receiver of the Great Western Telegraph Company, to sell the property of that corporation on the 1st of October.

The headquarters of the Second district of the Southern Division of the Western Union Telegraph Company, of which Mr. Geo. W. Trabue was recently appointed superintendent, and Mr. J. B. Tree, assistant superintendent, have been removed from Louisville, Ky., to Nashville, Tenn.

A commercial news despatch was received in this city on Wednesday last by the Atlantic cable in seven minutes from the time it was filed in London. This is the quickest time yet made.

The recent storms have caused a good deal of trouble to the telegraph wires south. The lines in Virginia especially have been very seriously damaged, and many poles have been prostrated.

On Tuesday last the three Western Union and the Southern and Atlantic cables at the drawbridge across the Potomac River at Georgetown, D. C., were carried away by a vessel which was drifting, causing an interruption for some hours to communication south by that route.

The Atlantic and Pacific line from Philadelphia to Pittsburg has been completed, and works well. The office at Pittsburg has been opened for business. It is in the office on Fifth avenue, formerly occupied by the Pacific and Atlantic Co.—a most excellent and central situation—one of the best in the city.

Cost and Deficiency of the British Government Telegraphs.

THE *London Times* recently stated that the capital stock (consols) created in respect of money raised for the purchase of post-office telegraphs, etc., amounts to £9,790,198. The sum of £293,706 was required to pay the interest on that amount for the year 1874; but the year's surplus of receipts from the telegraphs was only £109,161, or £184,545 less than the interest payable, and there was a previous deficiency of a like kind amounting to £288,607, so that the accumulated deficiency of telegraph revenue to meet the interest on the capital amounted to £473,152 at the end of 1874. The deficiency was really larger, as there are some telegraph charges borne by the Office of Works, or not yet exactly ascertained.

Postal Money Order Arrangement Between the United States and Canada.

A CONVENTION has been concluded between the postal departments of the Dominion of Canada and the United States, establishing an exchange of money orders between the two countries. Money orders, payable in either country, will be issued at the money order post-offices, from the 2d inst., for sums not exceeding \$40 Canadian currency.

A First Class Telegraph Operator.

THE superintendent of a New England telegraph line has forwarded to us the following specimen of an application for a situation under him, which we print *verbatim et literatim* as received. In a private note which accompanies this the superintendent says: "It's one of dozens which superintendents are bored with daily, and might open the eyes of some unsophisticated chap to see himself in print to his unfitness for a place anywhere, even after his experience of seven years, and possibly induce him and others like him to get out of the business for its general good."

"DEAR SIR—if you remember On the 4th Day of May Last I was in your office and Laid in application for a situation as Operator On your Line but as all was fitted "and No room at that Present Time." I am at Present Working for the — R. R. but am Not Pleased as I Would be there in the East. My Salary here is but — Per month. Of course that is no discouragement for an Operator. I have had Nine years experience in the busnes and can furnish you With good Responsible Letters up to the Present date. Enclosed finde my address and I Will Wait for an answer.
"Yours With Respect, _____"

Soon after the telegraph was put in operation on the line of the Ohio and Mississippi Railroad, in Martin County, one of the natives stepped into the office and desired to know the price of pork in Cincinnati. In a few minutes an answer came, with a charge of thirty-five cents for the information. But the rustic was too smart to be caught in that way, and replied: "Oh, no, Mr. Telegrapher, you can't fool me in that way! I'm not as green as you think I am. That darn tickin' thing of yourn hain't been out of this room! I watched it all the time."

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS.

NEW YORK, July 26, 1875.

ASSESSMENT No. 76.

- 17, 23, 46, 55, 65, 91, 136, 138, 139, 140, 148, 215, 328, 334, 344, 346, 352, 371, 372, 466, 468, 469, 470, 471, 475, 514, 516, 560, 617, 642, 690, 717, 761, 800, 943, 1099, 1102, 1144, 1164, 1175, 1193, 1194, 1210, 1221, 1267, 1289, 1292, 1295, 1440, 1532, 1603, 1637, 1653, 1655, 1657, 1672, 1678, 1699, 1708, 1718, 1864, 1953, 1968, 1994, 1996, 1997, 2033, 2040, 2048, 2074, 2075, 2094, 2136, 2147, 2165, 2169, 2178, 2190, 2192, 2233, 2242, 2256, 2258, 2261, 2266, 2289, 2304, 2323, 2348, 2354, 2363, 2380, 2414.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended June 29, 1875, and bearing that date.

165,063.—DIAL TELEGRAPHS.—C. T. Chester, Englewood, N. J. [Filed March 30, 1875.]

One train, controlled by electro-magnetic escapement, actuates pointer, another, controlled by the keys, the transmitting break wheel, both brought to a common axis, N. On lid containing box is placed ordinary key and bell magnet. Lug on lid, when closed, taking on switch, breaks circuit to dial magnets, and closes circuit to bell magnet and key.

1. The combination of a shaft turning within a fixed tube or sleeve, and another hollow or tubular shaft turning about the said fixed tube, with mechanically driven trains of wheels, for the purpose of causing independently driven shafts, wheels, or devices to revolve upon a common axis of motion.

2. In connection with electric telegraphic circuits, the combination of two independent motors, carrying, respectively, a circuit breaking device and recording or receiving devices controlled by a magneto escapement, and so arranged that the shaft governing the motion of the circuit breaking device and the shaft causing the recording devices shall have a common axis of motion for the purpose of electro-telegraphy, substantially as set forth.

3. In combination with any electro-telegraphic apparatus contained in a box, wherein two or more devices having separate magnets may be alternately called into use, an attachment fastened to and moving with the lid of the box, and a switch or commutator within the box, so that the movement caused by the opening or closing of the box shall cause connections with the circuit to be made alternately with one or the other magnets, substantially in the manner and for the purposes hereinbefore described.

For the week ended July 6, 1875, and bearing that date.

165,156.—AUTOMATIC TELEGRAPHS.—Patrick B. Delany, Jersey City, N. J. [Filed October 21, 1874.]

The combination with an automatic transmitter of a relay which connects the line on one movement of its armature to the signaling battery, and upon the other to the earth or to a reversing battery, substantially as and for the purposes set forth.

165,157.—TELEGRAPH RELAYS.—Patrick B. Delany, Jersey City, N. J. [Filed December 11, 1874.]

The combination with a fixed armature, plain or electro-magnetic, of an electro-magnetic coil, movably suspended above the same, substantially as herein shown and described.

165,183.—ELECTRIC SIGNAL APPARATUS FOR STEAM VESSELS.—Charles A. Stearns, Boston, Mass., assignor to himself, Wm. H. Torbert, Philadelphia, Pa., and Edmund B. Vannor and C. H. Dolbear, Boston, Mass. [Filed November 27, 1874.]

The shaft or other moving part of the machinery has a stud affixed to it, which operates upon a circuit closing apparatus, so arranged that one circuit is closed when the shaft moves in one direction, and the other circuit when in the other. An indicator is placed at any distance to show the direction, which will also show the rapidity of the revolution.

The combination of the shaft E, projection F, bent lever D D', sliding bars A A', plates m' n' n', battery M B, circuits w w', and indicators I I', substantially as and for the purpose set forth.

165,396.—ELECTRIC WINDING MECHANISMS FOR CLOCK WORK.—John William Wignall, Manchester, Great Britain. [Filed December 7, 1874.]

Running down of motor allows battery plates to lower into liquid, sending current around magnets, operating, when charged, to wind up the motor and withdraw plates.

The combination in a clock operated by a weight, of an armature, L, of an electro-magnet, connected to the shaft of the winding drum with mechanism, substantially as described, for putting the battery into and out of action, as for the purpose set forth.

ORTON'S PATENT PENCIL HOLDER

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread and will hold the pencil perfectly firm.

Price, 10 cents each.

Sent by mail on receipt of price.

Price per doz., 60 cents.

GEO. H. BLISS & CO., Gen'l Agents,

220 Kinzie Street, Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

PONY RELAY, PRICE \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. See above Cut.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 10
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 31
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 1/2 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without blinding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Calland battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense.

Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application.

All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to

J. N. ASHLEY,
P. O. Box 5,503. 38 Vesey street, New York.

WESTERN ELECTRIC MAN'G CO.

220 Kinzie Street,

CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

C **HARLES T. CHESTER,**
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection. Introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Burma.—How a Telegraph Manager spent his Vacation, and how we did not Bag the Tiger.

By MEPHISTO.

(Continued from p. 181.)

AWAY down the muddy waters of the mighty Irrawaddy, scaring the alligators from their noon-day siesta on the many sand banks that render its navigation so dangerous, and startling the hundreds of monkeys that run wild and chattering along its banks, under easy steam, and in the usual nonchalant manner of a man of war on a cruise on her own hook, our smart little gunboat sought her native element—the deep blue waters of the Indian Ocean. Our cruising ground was bounded by the Gulf of Martaban on the north, the Tenasserim coast on the east, the Andaman Islands on the west, and the Equator on the south, and a prettier cruising ground, or one more abounding in possibilities of amusement it would be hard to find. George enjoyed it immensely. Having been a long time ashore, I observed that he once or twice found it absolutely essential to discuss some important matter with old King Neptune, which necessitated a leaning position over the bulwarks, and resulted in a grand feed for the fishes; but having got rid of his long shore bile, he was left free to enjoy the weather and the scene. The Captain had headed her for Mergin, a small town at the mouth of the Tenasserim river, and forming an island of the Mergin Archipelago. Now this same Tenasserim river abounds with large game all along its banks; deer, buffalo, rhinoceros, elephant, and tiger, and was a favorite hunting ground for us jolly tars. And Captain Baker had kindly decided to go there first, in order to give my friend a week's sport up the rolling Tenasserim. George was delighted with the idea, and vowed he would not leave the place without a handsome tiger skin for a trophy of his prowess—a vow which like many others has gone to pave the road that leads to a certain tropical country that shall be nameless. Now I too was possessed with a strange desire to obtain a tiger skin; but it is no fool's work to go and face the monarch of the Asiatic jungles on his native heath on foot and alone; and so I had cast about in my mind for some patent plan by which his majesty might be circumvented, spite of the heavy odds in his favor, and yet be honorably shot and not meanly trapped. And so one fine evening as we neared our destination, I unfolded my ideas to the redoubtable George, to be enthusiastically slapped on the back and dubbed, “a regular artful dodger, by Jove!” by this gushing disciple of Morse. Anchoring off the village the next afternoon we proceeded to put our plans into execution. There was a certain old Nimrod in those parts who was always ready to lend a hand to the promotion of sport, who kept a pack of dogs and endless native “beaters” for no other end, and who I knew would give us any assistance we needed. And taking two or three of his men along, we set out that very evening with guns, blankets and a few provisions, to visit a certain open glade some four or five miles from the village, where I had first seen the Royal Bengal Tiger in his freedom and sovereignty.

Camping right in the center of the glade, an open patch of about seven acres in a dense jungle, we passed the night anticipating a hard day's work on the morrow, and a good night's sport to succeed it. Breakfasted off some green parrots George shot, and then went to work to survey the ground and fortify our position. Care was taken to select two good sized trees as nearly opposite each other as possible, and on different sides of the glade; these trees were then cut down, leaving some thirty feet of stump, (and a mighty tough job it was with the thermometer away about 130°, and not a breath of wind in all the heavens), and on these stumps were rigged two square platforms of interwoven bamboo and rattan, made very strong and fixed firmly in their positions by bracket supports, so as to hold the weight of any two ordinary men. This task accomplished by four in the afternoon we rested from our labors, and sent the native help away, directing one of them to return with a kid, or lamb, or calf, or some animal that tigers love, to serve as a bait for “his royal

nibs.” We had a hearty supper of dove-and-squirrel stew, and by the time we had smoked our post-prandial meerschaums the darky arrived with a fine young kid which he presented to us, and departed, happy at having sold a kid for about five times its value, and rejoicing in considerable *bucksbeesh* given by my impulsive companion. Then staking our kid right in the middle of the glade we mounted with difficulty our respective perches and awaited the coming of night and the tigers as philosophically as we might. I did not conceal from myself that we had cut out for ourselves what might prove to be a pretty ugly job. A wounded tiger on the rampage is no respecter of persons, and is entitled to every mark of respectful consideration; and if we should only succeed in wounding one he might turn rusty and attack us on our perches, and though the tiger is no tree climber, he can jump considerable, and he might make things lively for us. But we were both young, healthy, and hot headed, and we thought more of getting the tiger's skin than of saving our own; and so we lay on our platforms, with our guns ready, and waited, longed, hoped for the tiger that would not come. Hour succeeded hour; the darkness had deepened until it was only possible to discover a form in motion, and as our bait kept up a continual movement and considerable of a noise we could make him out splendidly, but he looked like a shadow in a sea of darkness. I was just beginning to think of home, and mother, and the “girl I'd left behind me,” when I heard the click, click, of a rifle being cocked, and pricked my ears and held my breath in anxious suspense for further developments. But no further sound came out of the darkness, and I had just relaxed my nerves, and eased the tension of my muscles, when I felt a twinge of pain dart from my leg to my brain as the nerves telegraphed to the main office in the head the fact that I had been bitten or stung in the leg. Soon another, and another, and yet another sting set my nerves all jumping, and I realized the terrible fact that I had been stung upon by a colony of the big tree ant, the largest, most vicious, and most poisonous of the ant tribe. Reader, fair or otherwise, did you ever sit down on a hornet's nest? If you never did, take an old man's advice and don't. But if you did you will have some faint idea of what I was suffering in that awful hour. I was soon covered with the cursed red pests, and I felt like rolling on the points of millions of red hot needles. Heavens! how they did bite, and however could I get rid of them? Presently I heard a yell from the other stump, “Ants! by thunder! Millions of 'em! let's git.” Poor George, he was fat and well liking and the ants were having a high old time with him. “Run for river,” I cried. He understood me; we both dropped from our perches and in five minutes' time were standing up to our necks in the mud and water. Ants, like Irishmen, hate water, thank God! and so we got rid of our tormentors. Then leaving our guns where they were, we walked back to the village, and there heavily bribed a native boatman to convey us to the ship. We got on board and into our cabins unobserved save by the lookout man, in the corner of whose eye I twiggled a lurking smile, and whom I straightway silenced with a glass of grog. And so to bed. But if we thought we had covered up our tracks we were doomed to disappointment. The whole yarn had to be told, and a most unmerciful roasting we got about our brave retreat before our insignificant conquerors. “Went to beard the lion in his den and ronted by an ant.” Well we had a good laugh over it and vowed better success next time; we had many an adventure before George's time was up; but you may believe me we took good care never again to choose the thorny Acacia (a tree of which the red ant is inordinately fond) for a roosting tree when watching for tigers.

The Reports of Telegraphic Consolidation.—Views of Leading Telegraph Officials.

WILLIAM ORTON, President of the Western Union Telegraph Company, returned last week from his Western trip, and a reporter of *The Tribune* called upon him on Saturday to obtain his views in regard to the rumored attempted consolidation of the Atlantic and Pacific Telegraph with his Company, and in regard to the opposition line recently organized in California. Mr. Orton made substantially the following statement:

In relation to the formation of a new telegraph company in California, all I know about the matter is what I have read in the despatches in the daily press. It looks to me, however, as if they were making a great deal of talk before anything is done. It does not have the ring of a business enterprise to hear men talking about having bought a given number of poles and so many miles of wire, and all the other little items of detail, and that no business will be done until such and such things are accomplished—as, for instance, that they propose completing the line to New York and Washington before beginning to operate it. When men really mean business, they generally go about it quietly, and nothing is publicly known at least until work has been begun. There is no question about the pecuniary ability of the gentlemen engaged in the enterprise, if

they really wish to invest their money in such a way; but while I do not know anything positive about the matter, I must say, if it has been gotten up as a stock-jobbing scheme, the location selected is a good one. If I wanted to start a rumor factory, I should certainly locate it as far away as possible from the centre of interest, and where any definite information upon the subject could only be obtained with difficulty. There is no need at present of a third line between the East and West, as a large increase over the business of to-day could be done by the Western Union and the Atlantic and Pacific. The lines of the latter run to Ouden, where they connect with those of the Central Pacific Railroad, thus forming a through competing line with the Western Union.

As to the consolidation of the Atlantic and Pacific Telegraphy Company with the Western Union Telegraph Company, there has been, I think, considerable conversation between prominent stockholders of the two Companies upon the subject of a union of their interests, and some plans or outlines of arrangements have been discussed; but no scheme has been matured or so far advanced as to enable me to speak of the probabilities of its success with any reasonable degree of certainty. No proposition has yet been made to us that will be accepted by us. The scheme to sell the Atlantic and Pacific outright is practically impossible, as no one has the right to dispose of the stock belonging to others. Any one can sell his individual stock, but he cannot vote away the stock of another person. Whatever is done will doubtless have to be upon the basis of a division of the net earnings of the two Companies, but the profits of an old company that has been doing a successful business for years past must necessarily be much greater than those of a new concern whose business and lines are only being established, and some equitable division of the net earnings will have to be made. The possession of the Atlantic and Pacific is, of course, desirable to us if it can be procured upon a satisfactory basis. We are in the telegraph business, and as our business is yearly increasing we shall need more wires in the future; if we can buy a ready made article as cheaply as we can make it, of course we stand ready to make the purchase. It must also be borne in mind that we can do the whole business of the country at less cost on the single message than we can do only a part of that business. Call it monopoly or what you will, there has been no other business in the country of equal magnitude with ours, or anything nearly to compare with it, that has trebled the amount of business done during the past seven years, and at the same time reduced the expenses to the public to one-half the original figure. As to the automatic arrangement which is used by the Atlantic and Pacific Company, it is of no value whatever to us. We should not use it if we had it.

In regard to the amount of stock of the Western Union held by Jay Gould, I will say that I am without any information whatever upon the subject. For aught that I know, he may have 10 or he may have 1,000 shares. I am inclined to believe, however, that the amount held by Mr. Gould has been largely overestimated. A year ago the same rumor regarding his holding a controlling interest in the Company was current. At the time of the last election he voted on a large amount of stock, but I am disposed to believe he did not own all that he represented at this time. Whether or not he is repeating the tactics adopted last year I am entirely unable to say.

A. B. Chandler, Secretary of the Atlantic and Pacific Telegraph Company, stated to the reporter that he was in possession of no news whatever about the rumored consolidation of his Company with the Western Union. The only thing he could say was that if his Company were let alone for a short time, the managers would be able to show a much better condition of affairs than any that has yet been made public. The Company not only has been paying running expenses out of its earnings, but it has also paid in the same way for a large amount of extraordinary work. The Eastern lines are now in excellent condition, and the Company is rapidly putting those in the West in equally good shape. When this is done, said Mr. Chandler, the income may be made to exceed the expenses largely, as, by the automatic system in use by the Company, a very large amount of business can be done over the existing wires. Mr. Chandler admitted, however, that the automatic arrangement was probably of more value to his Company than it would be to the Western Union, as the latter has already a large number of wires put up, and there cannot be therefore the same necessity for using one wire for several different messages at the same time that there is with the Atlantic and Pacific.

Mr. Chandler was not acquainted with any of the gentlemen who have recently organized a new telegraph company in California, and knew nothing about their plans. The scheme of building a third line between the East and West, when the two that are now in existence could do much more business than comes to them, did not, however, impress him favorably. He thought that there was a great deal of risk attending such an investment.—*The New York Daily Tribune*.

Gould's Next Move.—The Great Speculator of the Age Reaching Out to Grasp Western Union.

THERE is a general conviction in Wall street that Jay Gould will be in possession of the Western Union Telegraph Company before next October. The annual election takes place at that time, and it is believed that Mr. Gould has secured a sufficient number of votes, in the hands of himself and friends, to elect a Board of Directors, all, or nearly all of whom will be in his interest. The reasons for this belief in Wall street are manifold, but some of them run as follows:

1. It is well known that Mr. William Orton has had difficulties with the so-called Vanderbilt party among the directors of Western Union—Schell, Banker and their associates. They are in the interest of Vanderbilt, and they have objected to the personal use made of the telegraph by Mr. Orton. The Vanderbilt party cannot see why Mr. Orton should have so many quarrels with the press, or rather with that portion of it which does not belong to the New York or its affiliated press associations. This has caused a soreness on his part, and fearing that a new President of the company will be chosen, he, it is understood, has struck hands with Jay Gould.

2. It is believed that Mr. Gould has long had his eye upon Western Union stock. He has speculated in it extensively, and has had a great deal to say among the minority of the stockholders; but the Vanderbilt party has hitherto been the strongest, and has succeeded in keeping control of the management. Then Mr. Gould has several lawsuits pending against the Western Union Company respecting certain patent rights covering telegraphic instruments and processes. It seems that when he gained control of the Atlantic and Pacific Telegraph Company he thought he had secured the undisputed right to the quadruplex and other important patents—a right which would place Western Union at his mercy. Through the action of Senator Conkling and the minor authorities at Washington he has so far been unable to establish his claims; but it seems that to perfect his plans he finds it necessary to get control of the Western Union, thus putting an end to all disputes between the two companies, and giving what would be in effect a consolidation of the two companies the monopoly of the telegraph business of the country.

These two influences—Mr. Orton's desire to get rid of the Vanderbilt dictation and Mr. Jay Gould's desire to get possession of Western Union—have led to a league, offensive and defensive, between these two gentlemen, and they are determined to so engineer matters that the next election shall be carried in their joint interest. Assuming that they succeed, it will be followed by the practical consolidation of Western Union with Atlantic and Pacific, the latter being leased to the former at a low rate, and made one of the assets of the larger monopoly.

It is not to be supposed that all this can be effected without a severe struggle. The press of the country will not exactly like to be at the dictation of Mr. Jay Gould, and a very lively contest in the stock of Western Union is likely soon to occur. It does not follow that the stock of the company will go up; speculators know how to keep stocks down in the midst of the fiercest struggles.—*The Graphic*.

A Government Telegraph in Operation.

MR. GEORGE B. PRESCOTT presents, in another column of this journal a very succinct statement of the practical financial operation of the government telegraph system in England. The result has shown how far short the most careful efforts to estimate the first cost of the telegraph to the government came of the exact amount, and how unprofitable, in a business sense, the property under government management has been. The extreme estimate of the cost was \$30,000,000; the actual cost up to the end of 1874 has been nearly \$50,000,000, with outstanding claims amounting to \$20,000,000 more. The estimate of the cost of working was \$1,895,000 a year; the actual cost in 1874 was more than \$5,000,000, exclusive of more than \$150,000 additional for repairs and new offices. The net revenue predicted from the business was \$1,400,600; the report of July 3, 1875, shows that the net revenue has failed by more than \$1,000,000 to pay interest at the rate of three per centum on the stock by the issue of which the purchase of the lines was made. Thus, after a practical trial, in a country whose civil service is almost entirely removed from the reach of the politicians, it has been found that a telegraph system controlled by the government does not pay its expenses. It might do this and yet be a failure because of the poor quality of the service, and because of the additional opportunity which it would give the professional politicians, under such a government as ours, for interfering with the public business, and thus increasing the political corruption of the country. But to fail financially is to fail radically, unless we accept the soundness of the doctrine that it is right to tax a whole na-

tion to support a business the benefits of which accrue to a small minority.

The *Witness* referring to a recent editorial article in the *Evening Post*, says:

"The *Evening Post* points to the collusion, corruption, swindling and stealing in connection with the New York canals, and says that this should deter us from government telegraphy. If this argument be good against government management of telegraphy, it proves too much, for it is equally good against government management of the post office."

We might reply that the *Witness* proves too little. Financially considered, our postal service is a failure, every annual report showing a deficit. This is the case, too, without a necessity on the part of the government of owning and keeping in repair long lines of railroads and a vast amount of rolling stock, as it would have to own and repair long lines of telegraph wires with their equipment if it undertook the business which the *Witness* proposes. It is by no means an undisputed question whether the mail service could not be as efficiently and more economically performed by a private corporation. It has, however, in its present shape grown with the government, and its existence as a government business is no argument at all in favor of other projects to increase the taxes.—*New York Evening Post*.

A Line Repairer's Dangerous Experience.

THE following communication from Mr. Joseph P. Furlong, line repairer of the Southern and Atlantic Telegraph Co., to Mr. J. G. Thornton, assistant superintendent, narrates a rather dangerous adventure which was recently encountered by him.

Mr. Furlong writes from Charleston, S. C., near which the affair took place, under date of August 4th. He certainly displayed good courage, and showed himself to be the right man for a country where robbery and murder await those who are unprepared to defend themselves.

He says: "On the night of the 29th of July, on the Savannah and Charleston Railroad, seven and a half miles from this city, I struck a camp for the night. At 9.40 P. M. a negro came up to me and told me I was in a bad place, and that several men had been murdered there, and to keep a sharp lookout. I told him they had better leave me alone or I would hurt some of them. The negro left me and I went to a place where some railroad ties were and got myself a pretty good club. At 1.20 A. M. I heard somebody say in a low tone, 'He is laying down on them ties; walk light!' Another says 'Let us go over here and fix ourselves. He is asleep now.'

"I then rolled over and took up my coat and hat, and spread my coat over my provision bag, and my hat on top of it. Pretty soon a negro came creeping on his hands and feet. When he got along side of the ties he opened a dark lantern, and I put myself in trim to fight and run for life. I raised my club and brought it down on him heavy. I struck for his head but missed it, but hit him on the shoulder and laid him out on the ground, when he hollowed for help, shouting 'Quick! I am down!' By that time two other negroes came rushing out. I then got excited and went for the two new comers—made another crack at one of them, but it was pretty dark and I missed him, and his companion got the first one I struck away. Me and the other negro then went for the other again. I made another crack at him, and he got my stick in his hand. I then struck him with my fist and brought him to the ground. He hollowed for help and the other came running up for me. I then went and got my hatchet out of my bag, and when I turned I saw the two running down the track. It's a hard place to travel in."

The Anglo-American Telegraph.

THE reduction in the rates for messages over the lines of the Anglo-American appears to be producing, as we anticipated would be the case, a considerable addition to the business of the company. As there are five lines of cable laid and four are available for work, it would appear to be but reasonable that the directors should endeavor to keep them as fully employed as possible. Judging from the results of the three months' working since the reduction to 2s. per word came into effect, it will not be long before the number of messages will have so far increased as to produce the same amount of revenue as under the 4s. per word tariff. The reduction in rates came into effect on the 1st of May. The average daily receipts for the month at the reduced rate were £1,095. For the month of June the average daily receipts increased to £1,222. The four weeks of July, the returns of which have been published, show for the first week a daily average of £1,061; for the second, £1,191; for the third, £1,256; and for the fourth week, ending Thursday the 29th, £1,327. From the figures given below it will be seen that the highest receipts for one day was on the 28th July (the receipts were £1,730); the lowest was on 5th July (£720), business being interfered with by the celebration of Independence Day.—*The Railway News*.

The Globe Telegraph and Trust.

THE meeting of this company was held yesterday, a lengthened report of which, owing to the pressure upon our space, must be postponed until next week. Mr. Ford, one of the directors who had taken an active and leading part in the promotion of the Trust, pointed out very clearly the advantages which would result from extending the principle upon which the Globe Trust was established. It does seem an anomaly that the board of the Globe, which is constituted by representing members from the boards of the Eastern, Eastern Extension and Anglo-American, cannot devise some plan by which the various companies can be brought under one great administration. At the present power we cannot have separate action, and great waste results from a number of separate boards and officials, and we hope that Mr. Ford will continue his efforts at the board to make the Globe Trust the great institution which it was originally intended to be.—*The Railway News*.

The Telegraph in Senegal.

THE Senegal Telegraph Service comprises three lines: the first from St. Louis to Dogana is the most important and is 126 miles in length. It is constructed with a single wire, connecting six offices. The region it traverses is for the most part uncultivated, without any road, intersected by large and deep morasses, slightly undulating, with impenetrable thickets of palms and bushes of different kinds scattered over it. It has a total of 23 employes.

The second line is from St. Louis to Dogana. Its length is 77 miles, and connects four offices. Total, 6 employes.

The third line is from St. Louis to the Bar, at the mouth of the Senegal river. It is nearly seven miles in length and traverses a region intersected by morasses and by the tributaries of the river. It unites to St. Louis the pilot station placed at the mouth of the Senegal.

The native employés of these lines are recruited by means of examinations. The military employés are put by the marine infantry at the disposal of the telegraphic service. They receive instructions at St. Louis and Dakar, and they are then sent to the interior stations. The native superintendents form a very good staff, many of them having been in the service since its organization, twelve years ago; they are well up in their duties, thoroughly disciplined, and capable of bearing the fatigues and privations of a journey on foot in this unhealthy climate.

The offices are open every day from 7 to 10 o'clock in the morning, and from 2 to 6 o'clock in the evening.

The total number of messages transmitted in 1873 was 8,531.

The surveillance of the lines, especially during the winter season, is very trying; the torrents of rain and the violent tempests overthrow the poles and break the insulators. Notwithstanding these difficulties only three days' interruption have taken place during the year. The thunder storms, notwithstanding their great electrical intensity, lead to no durable perturbation over the lines and in the apparatus. Disarrangements of the line from malevolence are rare. The blacks, very superstitious, fear to touch the line; they believe generally that it serves only to indicate to Europeans the road to follow in going from Dakar to St. Louis.

Miscellanea.

EDLUND'S THEORY OF THE NATURE OF ELECTRICITY.—In a report on the theory lately advanced by Prof. Edlund as to the nature of electricity, Dr. Emsmann states that apparently Edlund has, in this matter, taken such a step forward as was made when previous investigations were able, by means of one ether, to explain both optical and thermal phenomena. Edlund's theory consists essentially in ascribing to the ether itself an inertia which requires a slight interval of time in order to affect its movement. The flow of ether from one body to another explains the electrodynamic phenomena, while its abundance or deficiency in any body serves to explain the electrostatic phenomena. As regards the chemical influence of the galvanic current, it is deemed that the electricity has an equal influence upon the bodies that are to be separated or combined by it. The rotation of the plane of polarization of light is elucidated by the simple assumption that the electric ether is not different from the optical ether, and in general it is to be acknowledged that Edlund's theory is based upon well known facts, and is distinguished by its simplicity and sufficiency.

SIMPLE METHOD OF MAKING CARBON CELLS.—Mr. Symons gives the following method, as practiced by himself, for constructing plates or cells of carbon of any required shape and size, such as are used in galvanic batteries. With a syrup of equal quantities of lump sugar and water, mix wood charcoal, in powder,

with about equal parts of a light powder called vegetable black. The mixture should hang well to the moulds dipped into it, and yet be sufficiently free to form itself into a smooth surface. Moulds of the cells required are made of stiff paper, and secured by wax or shellac. These moulds are dipped into the carbon syrup, so as to cover the outside only, and then allowed to dry. This dipping and drying ought to be repeated until the cells are sufficiently thick; when well dried they are buried in sand and baked in an oven hot enough to destroy the paper mould. After being cleared from the sand and burnt paper, the cells are soaked for some hours in diluted hydrochloric acid, and again well dried, then soaked in sugar syrup. After dried, they are packed with sand in an iron box, gradually raised to a white heat, and left to cool. If some of the cells be cracked they need not be rejected, but covered with paper or plaster and dipped in melted paraffine. Rods of plate or carbon can be made by a similar process. The carbon thus made will be found to have a good metallic ring and a brilliant fracture.

THE POWER OF THE ELECTRIC LIGHT.—The most powerful artificial light at present in existence is that employed for the great lighthouse on Souther Point, on the coast of England, near the mouth of the Tyne.

On both banks of this river there is an immense number of manufactories of all kinds, the smoke from which, under the influence of the west wind, seriously obstructs the approaches from the sea. Fogs at this part of the coast are also frequent; and the problem of lighthouse illumination required that such light should be secured as would penetrate through any slight fog or haze, it having been generally acknowledged that not even the sunlight itself can penetrate an ordinary dense fog. The electric light established at Souther Point is considered to be equal in power to 800,000 standard candles, being eight times as powerful as the best American fixed lights. The electric spark passes between slender pencils of carbon, which are themselves consumed at the rate of about one inch per hour. The electric current is generated by two of Prof. Holmes's patent rotary magneto-electric machines, driven by steam engines of six-horse power. The number of revolutions made by each machine is 400 per minute and 12,800 sparks pass per minute when both machines are at work. These sparks are, of course, formed so rapidly that the eye does not separate them, and the result is an intense beam of light, so dazzling that the eye of a person within the lantern cannot rest upon them for an instant without intense pain. As observed from a distance of several miles, this light is so bright as to cast a well defined shadow upon the deck of a vessel.

PREPARATION OF EBONITE.—The use of ebonite, one of the newer preparations of India rubber, is constantly increasing, on account of its better applicability to many purposes in the arts than its near ally, vulcanite. The two substances are quite similar, being composed of India rubber and sulphur, with some preparation of gutta percha, shellac, asphalt, graphite, etc.; although these latter are not essential. In vulcanite the amount of sulphur does not exceed 20 to 30 per cent, whereas in ebonite the percentage of sulphur may reach as high as 60. An increased temperature is also required for this preparation. The approved formula consists in mixing together 100 parts of rubber, 45 of sulphur and 10 of gutta percha, with sufficient heat to facilitate the combination. In manufacture, a sufficient quantity of this mixture is placed in a mould of a desired shape, and of such material as will not be affected by the sulphur contained in the mass. It is then exposed to heat of about 315°, and a pressure of about 12 pounds to the square inch, for two hours. This is done most readily by placing the mould in a steam pan, where the requisite pressure and temperature can easily be kept up. When cold the ebonite is removed from the mould, finished and polished in the usual manner.

Correspondence.

No notice will be taken of anonymous communications.

Good Effects of Telegraphic Competition.—The Telegraphs and Railroads of Southern California.—The U. S. Military Telegraph Lines.—Personals, etc.

LOS ANGELES, CAL., July 28.

TO THE EDITOR OF THE TELEGRAPHER.

COMPETITION is said to be the life of trade, and it certainly has the effects of stirring up the latent energies of the competitors. When I came here very recently as the agent of the Atlantic and Pacific Telegraph Co.,

the Western Union hadn't a letter out in the way of a sign, not even one of the regulation boards. The first week they put up one sign, the next another, and yesterday one with the letters two feet long; but signs won't serve them. The Western Union Co. is unpopular in this section by reason of arbitrary monopoly of all Southern California business heretofore, and for other reasons of a personal nature.

The office of the Atlantic and Pacific Company has been neatly fitted up, and by Saturday next we will have as nice an office as the country can show—one side eight feet partition and seven feet glass above for 25 feet; new Tillotson instruments, two sets, new instrument tables, and all complete, compact—and nice as they can be made for money for office use. We open to fair business and have secured the patronage of some of the leading merchants, who are glad of opposition by any corporation, and more glad because its part and parcel of the Central Pacific and Southern Pacific Railroads, Wells, Fargo & Co., etc.

The Southern Pacific Railroad have a road to Caliente, first-class in every respect, and make the 250 miles from Lathrop in nine hours. At Caliente they are tunneling one tunnel almost directly over another. This is caused by the height of the mountain, and after they go through the first they run in almost a complete circle and pierce the second, then down through the Tehachepe Pass to the San Fernando mountains. Here they are also engaged in running tunnels, one of which is to be a mile and a half long. Three thousand Chinamen are digging, etc., while Americans, or white men, are doing all the skilled labor. Immense gangs, immense work, and thousands of dollars per month expended. One year from this time will see the through trains from San Francisco at Los Angeles, thence via San Geronimo Pass to Yuma, on the Colorado River, within the same time.

The Southern Pacific Railroad have now a branch in operation from here to Wilmington, one from here to Tnaheim, which is being extended south in the direction of San Diego, and one to Colton, which is now the end of track towards Yuma; but building is going on, as also an Anaheim branch.

Wilmington is the seaport burg, being at the head of the slough, which admits light draught steamers and sailing vessels to the S. P. R. R. wharf. Larger vessels remain outside in what is called San Pedro bay (a roadstead), and lighter their freight and passengers ashore.

The S. P. R. R. has also a branch to San Fernando, 25 miles north towards San Francisco. Passengers for San Francisco now go to San Fernando by mail, thence take stage to Caliente, 103 miles—six-horse Concord coaches, which make good time, with excellent and well provided eating places. The scenery in the mountain passes is beautiful, and terrible on the desert. A corner of the Mohave desert having been crossed and a splendid mirage seen, arriving at Caliente, passengers are again transferred to the railroad. Sleeping cars and all the attendant luxuries are provided to Lathrop. From Lathrop passengers go by the main line of the Central Pacific R. R. to Oakland wharf, when the trip is completed by boat across the bay, eight miles to San Francisco. Or they can take the Southern Pacific to San Jose, around the southern end of the bay, and thence along the western shore to San Francisco.

The telegraph line is the prettiest I have ever seen stretched. It is of steel wire, about No. 12, I think, and weighs 300 lbs. to the mile, glass insulators, with some of the largest and most taut stretches I have ever seen. Great credit is due Mr. Hayes, the builder of the line, for the excellent manner in which the work has been done. The building party suffered somewhat in crossing the desert. The wire was conducted at San Fernando on Saturday, the 16th inst., and has worked as perfectly as a short circuit since. The line is 444 miles direct to San Francisco, with about 15 offices on it north of Los Angeles. The line from San Francisco is grounded here after passing through a 50 cup electro-pole battery. No repeater is used between Los Angeles and San Francisco. The railroad line is built with two loops to bring all into one circuit and save battery. There are many little places on all their branches which have local business with us, and it brings quite a little rush. At present the office is rather short handed, but as business increases will have more help.

Arrangements have been made with two of the three daily papers to furnish them with report by the A. and P. line.

Los Angeles is a town of 12,000 to 14,000 inhabitants, the population comprising Americans, Spaniards, Jews, and foreigners of all nations, from Pekin to St. Petersburg. It was the seat of government under the old Mexican rule, and Don Pio Pico, the last Mexican Governor, is still here, hearty as ever. Being the residence of the Dous, it was beautified by cheap Vaquero labor, and now is almost a paradise. It is very hot here from sunrise until about 11 o'clock, A. M., when a breeze comes up and continues until evening, but at noon the sun is about vertical, and boils me almost—95° to 100° daily. We have nice cool nights—45°. There is a luxuriant growth of trees, shrubs, plants, etc. Orange groves are the rule. Semi and tropical plants flourish,

as well as all northern fruits, except apples and cherries.

On my recent trip I met Lieut. Reade of the United States military line, en route to San Diego, to relieve Lieut. Smith, as Superintendent of the military line. The latter preparing to join his company soon, preferring it to the responsibility, expense and inconvenience of signal service duty on special orders. Lieut. Reade appears to be an affable, polished officer, but is not a telegrapher. He assumed charge at once and will make a tour of inspection and commence work on the line from Tucson, Arizona, to Camp Grant and Camp Apache, 217 miles; thence from Camp Grant, via Silver City, Forts Bayard and Richardson, to Mesilla, New Mexico, thence to Santa Fe, N. M., 293 miles. The line will be completed when further appropriations are made by Congress, unless Lieut. Reade can cut under and build cheaper than the estimate of Lieut. Smith, whose estimate shows the appropriation will admit of building beyond Mesilla, towards Fort Richardson, on the Texas line of the U. S. M. Telegraph, 69 miles only. The operators on the military line are all well and seem to enjoy their respective positions. The only civilian on the line is Mr. P. Kearney, at Prescott, Arizona, retained by special request of Gen. Kantz, commanding the department of Arizona.

Several changes have taken place: John Carrol, a graduate of San Diego, under my management, enlisted and is at Stanwix, A. T., for the next 4 years, unless transferred at San Diego. Henry E. du Soucheto, of New Orleans, was doing duty at San Diego as relief sergeant, an easy billet. O. K. Tomkins, at Yuma, G. A. Ochus, at Maricopa, Wm. T. Burbridge as assistant, relieved Mr. Allen, now on the S. P. R. R. at Spadra, Cal. Sergeant Boutelle, relieved J. B. Smith, now here at leisure, but waiting for the completion of the Los Angeles and Independence R. R. line from here to Santa Monica, 15 miles, where he is promised superintendency.

Operators on the military lines receive \$97.72 per month, currency; Sergeants \$104 to \$108 currency, and board themselves.

I hear that there have been a number of changes in the Western Union force at San Francisco lately. Of these you will, no doubt, be informed by your San Francisco correspondent.

CLIX.

Appreciation of The Telegrapher.

CARIBOO, BRITISH COLUMBIA, July 10.

TO THE EDITOR OF THE TELEGRAPHER.

ALLOW me, now that I am renewing my subscription, to express my appreciation of your paper (our paper too), and of the principles on which it conducted. It has afforded me an amount of pleasure and instruction that I would not lose for ten times the money.

The fact of a high class paper like THE TELEGRAPHER being a favorite with the fraternity, should be gratifying to those who wish to see the professional standard raised.

D.

New Electric Clock at the London Post-office.

Messrs. T. COOKE & SONS, of York, have just completed the erection of an electric motor and clock dial in the telegraph gallery of the new buildings of the London General Post-office, St. Martins-le-Grand, which, in some points, is novel and interesting. The hands of the large dial, which are driven by the motor, are at a distance of about forty five feet from it, and are connected to it by means of iron rods and several pairs of bevel wheels for turning the hands. The dial itself is six feet in diameter, and such is the sensitiveness and power of the motor that the connecting rods, bevel wheel work and hands are driven by a single Leclanché cell, the current from which is transmitted to the motor every second by the standard clock in the gallery. The motor consists simply of what we may term a polarized pendulum, vibrating between two pairs of electro-magnets, and carrying a double ratchet at the upper end. The same firm have erected a corresponding dial at the opposite end of the gallery for showing the direction of the wind, the pointer of which is worked by a vane at the top of the buildings.—The Telegraphic Journal.

The ingenious French have contrived a novel way to impress the barbaric mind. M. de Brazza who has charge of the expedition to Senegal, carries an electric battery in his pocket communicating with two rings on his hand and with other apparatus scattered about his person. When he shakes hands with a savage chief, that chief will be very much astonished, for an electric shock will run up his arm and he will see lightning playing about the head of his visitor. Naturally he will think he is being interviewed by the devil and he will be ready to consent to anything in order to get away.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, AUGUST 14, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

The Telegraphic Situation.

We print elsewhere from the New York Tribune a detailed statement of interviews of a representative of that journal with President ORTON, of the Western Union Telegraph Company, and Secretary CHANDLER, of the Atlantic and Pacific Telegraph Company, which will be read with interest. The statements made by these gentlemen to the Tribune representative are substantially the same as they have made to us, and we have no doubt correctly and fairly represent the relations and proposed relations between the two companies.

It has been well known for some time past that leading stockholders of those companies have been discussing the possibility of an arrangement being made which shall obviate damaging competition, and naturally the terms of such an arrangement, which should meet the views of the different parties, have been suggested and discussed. Up to this time, however, there is no reason to believe that any mutually satisfactory basis has been arrived at, and, considering the positions of the companies respectively, and the motives and interests by which they are governed, the difficulty of arriving at such a basis will be realized. The Western Union Company not unreasonably, feels very strong in its position, and is not, therefore, inclined to sacrifice or concede very much to its competitor in order to effect an amicable arrangement. What the managers of the Atlantic and Pacific Company regard as their most effective advantage in competing with the Western

Union Company, the possession and use of the Automatic telegraph system, is practically ignored by their opponent as of no, or at most, very little value. That we do not agree with Mr. ORTON and the Western Union Company in this estimate of the automatic system is well known; but the fact that it is so regarded by them has an important bearing upon the probable result of any negotiation between them.

It is unquestionably true in actual service, that the automatic system is of greater practical value to the Atlantic and Pacific than it would be to the Western Union Company. The limited number of wires of the former company renders the automatic system of great use to it in disposing of an increasing business, for which additional wires cannot readily be provided. Even if it gave them no additional advantage than enabling them to utilize more fully the wires already erected, and for the present, at least, relieve them from the necessity of constructing new lines over routes already occupied, under existing conditions this would be a most important consideration. It enables the Atlantic and Pacific Co. to devote its available means to the construction of lines over new routes, and the extension of its system over territory which it is desirable to cover, and this is exactly what is being done. The Western Union Company has already a large number of wires covering all important routes throughout the country; and on main routes, where additional facilities are required to meet increasing business, duplexing and quadruplexing existing circuits will for some time to come adequately supply the facilities demanded. It will thus be seen that to the former company automatic telegraphy is a necessity, while to the latter it is not as essential.

It is not, of course, impossible but that some amicable arrangement between the two companies may be arrived at, but we do not consider it very probable. It is not likely that there will be an actual consolidation of the two companies similar to that of the Western Union with the United States, American and Pacific and Atlantic Company, even if an understanding should be reached between them. It has become evident to the managers of the Western Union Company that absorbing competing lines into its system will not establish a telegraphic monopoly. New competing lines will be built speedily, and the work of consolidation has to be constantly repeated with an accumulating burden upon the great company, already sufficiently heavily weighted. There can be no such thing in this country as a permanent telegraphic monopoly, so long as the telegraph business remains in private control. The public demand and will have telegraphic competition.

In this connection the new National Telegraph Company of California comes into prominence, and very probably it would exceedingly gratify the managers of that company if the Western Union would as speedily as possible take the companies now competing with it under its own management. There would then be no important obstacle to its going ahead and extending its lines over the country as rapidly as they could be constructed and put in operation.

It will be noted that in his interview with the Tribune representative Mr. ORTON is disposed to regard this California movement as a stock jobbing operation. In this he may be correct, but we are in receipt of private advices from San Francisco which assure us that it is an enterprise established and intended to be carried out in good faith. There is no question in any quarter of the pecuniary ability of the promoters, and at this distance it seems to have this advantage over new telegraph schemes generally in that it is initiated by capitalists who propose to build the lines themselves instead of being started by contractors who first elaborate the scheme, make exceedingly favorable contracts with themselves, and then organize companies to furnish the money to pay them for the work. The nominal capital of the company, \$25,000,000, is adequate to construct and put in operation a national telegraph system if it is actually subscribed and paid in. If however, with a nominal capital of \$25,000,000 only two to three millions

cash are actually realized it will be in no better condition than other similar enterprises whose actual means inadequately represent the nominal investment.

One of the worst features of corporations in this country is the tendency to water stocks and burden them with obligations for which no adequate consideration has been received. It is to be hoped that this new company will avoid this error, and that its capital issued shall represent something like the amount actually invested and expended. If so, it will in this have a decided advantage over its competitors generally.

One reason, and perhaps the principal one for the negotiations and reports of negotiations for consolidation is the approach of the annual meeting and election of the Western Union Company, which takes place in October. Every year about this time there are reported combinations for obtaining the control of the organization of that company, which are effective in causing fluctuations in quotations for its stock, and which thus serve the purpose of those who speculate in it. After the election is past there is usually some months of quiet until the approach of another gives opportunity for profitable renewal.

The mystery which attaches to the financial operations of Mr. JAY GOULD, and in which that gentleman probably finds profit as well as pleasure, is also an element in this annual disturbance. There is no doubt but that he would like to obtain the control of the Western Union Company, and would do so if it could be had on profitable terms. That he can effect this object if he is willing to pay the price, we have no doubt, but that he is ready to invest the amount required is not so certain.

In any event one thing may be regarded as assured, and that is, that whoever may control existing telegraph organizations; or whatever consolidations or agreements may be effected or entered into, telegraphic competition will exist so long as the telegraphs of the country are not owned and controlled by the government.

An Exceptional Year.—Electrical and Telegraphic Disturbances.

THE present year has been an exceptional one in many respects. There has been but little complaint of drought in any but very limited sections in this or other countries. On the contrary, there has been an overplus of water almost everywhere. From Europe, as well as from our own country, come accounts of unprecedented rainfalls, floods and inundations. Atmospheric electricity has been in superabundance, and much loss of life and damage to property has resulted from the constant and severe thunder storms. Instead of drying up, the prospect is more imminent of the earth being drowned out.

The electrical disturbances in the atmosphere seem to have extended also to the interests connected with the utilization of the electric fluid. Disquieting rumors of consolidations, absorption and new telegraphic enterprises are rife, and those who are dependent upon telegraphy for a livelihood, especially in this country, are in a state of uncertainty as to the future, which is anything but pleasant.

Eventually the atmospheric phenomena will be duly regulated, and matters resume their wonted course. It is to be hoped that matters telegraphic will also settle down into a state of quietude and progress.

Our personal connection with telegraphic interests extends back for nearly a quarter of a century. During all that time the telegraph has been subject to these ever recurring perturbations. The work of consolidation has gone on until from a multitude of companies, with comparatively limited extent of lines for each, a few now own and control the telegraphs of the country. This, from the nature of the business, was inevitable, and in its progress of course there must be a constant rearrangement and adjustment, which would interfere with existing interests.

The Western Union-Telegraph Company has been the grave yard of many promising telegraphic enterprises, and has steadily grown with what it fed upon

until it has become the largest telegraphic organization in the world. It is popularly believed that it has not yet been sufficiently gorged, and that it aspires to further alimont of that description. This is but natural, and we have no doubt that so long as it continues ready to absorb the material will be provided. It is supposed to be now preparing to bolt the Atlantic and Pacific Company as its next victim. Whether it will succeed in this is yet a question, but in anticipation of such an event our Pacific coast friends are preparing even a larger and more extensive arrangement to take its place. As we have said, the present is an exceptional year, and the electrical element in an excited and perturbed state; but what has been shall be, and there is no danger of competition in telegraphy ceasing in the land.

Packard's Business College.

We have received the circular of Mr. S. S. PACKARD, proprietor of PACKARD'S Business College, which is established in the Methodist Building, 805 Broadway, New York. This institution has been in operation under its present proprietor for over 17 years. It is one of the very best of the numerous similar institutions throughout the country. The business education imparted is of the most thorough character, and its graduates are sought for in important and lucrative positions in business houses. Mr. PACKARD is thoroughly conscientious and an enthusiast in his profession, and has an able and efficient corps of assistants in the several departments. The regular school year commences Sept. 1st.

Promoted.

Mr. J. C. HINCHMAN has been appointed General Superintendent of the Eastern Division of the Western Union Telegraph Company in place of Mr. GEORGE H. MUMFORD, deceased. Mr. HINCHMAN has been Assistant General Superintendent of this division since the resignation of Gen. T. T. ECKERT, and his numerous friends will be pleased to hear of his promotion.

Personals.

Mr. FRANK NOEL, formerly of Corning, Mo., has accepted a position as manager in the Colorado Central R. R. office, at Fork's Creek, Colorado, vice Mr. ED. SCHERMERHORN, who takes charge of Floyd Hill, Colorado, office. Mr. M. L. ANGELL has been appointed to a position as operator at Kansas City, Mo., Western Union office. Mr. M. S. BACON, of the Kansas City, Mo., Western Union office, has resigned, and accepted a position with the Atlantic and Pacific Telegraph Company. Mr. L. W. BRADLEY, of St. Louis, Mo., Western Union office, has resigned and gone West. Mr. JAMES O'TOOLE, late of St. Louis, Mo., has accepted a position with the Western Union Company at San Francisco, Cal. Mr. J. LEVIN, formerly assistant operator at Atchison, Kansas, Western Union office, has been appointed manager of Denison, Texas, office of the same company, vice Mr. C. E. SMALLS, resigned. Mr. W. T. DOWNS succeeds Mr. LEVIN in the Atchison, Kansas, Western Union office. Mr. CHARLES CUMMINGS, of St. Louis, Mo., has been transferred from the LaClede Hotel to Brookmire and Rankins. Mr. STEVE FRAZIER has been transferred from the St. Nicholas to Barnum's Hotel office, St. Louis, Mo. Mr. R. J. NICOD, of Milwaukee, has accepted a position as night report operator at St. Louis, Mo., Western Union office. Mr. CHARLES E. SHERLING, of Albany, N. Y., W. U. office, is enjoying a two weeks' vacation. Mr. F. H. W. COOLEY, of the New York W. U. office, has just returned from his summer's vacation. Mr. THOS. J. TOMN, of the night force W. U. Building, New York, has laid aside telegraphic duties for a month to come, and is rusticating and rejuvenating at his old home, Auburn, N. Y. Messrs. W. P. BAKER, of Cincinnati, Ohio, and CHAS. CARTER, of Middleport, N. Y., have lately been

added to the day force of the W. U. Company, Buffalo, N. Y. Mr. J. W. LARISH, night report man at Buffalo, N. Y., W. U. office, who has been rusticating in Pennsylvania, is back again reording dots and dashes in true Spenserian style, with all the vigor and freshness of youth. Mr. GEO. H. BOWKER is now the manager of the A. & P. Buffalo Dock office. Mr. GEORGE WOODWORTH has resigned his position in the Albany, N. Y., Western Union office, to engage in other business. Mr. JOHN H. CUMMINGS has been appointed to fill the vacancy in the Albany, N. Y., Western Union office, caused by the resignation of Mr. WOODWORTH. Mr. DENIS BROWN, late of Augusta, Ga., is now working on the night force in the New York Western Union main office. Mr. PATRICK WALSH, agent of the C. N. D., and editor of the *Chronicle and Sentinel*, at Augusta, Ga., visited New York this week.

The Telegraph.

By Cable.

THE STEAMSHIP FARADAY PREPARING TO SET OUT FOR THE WORK OF REPAIR. LONDON, August 7, 1875.—The *Pull Mall Gazette* says: We are informed by the Direct United States Cable Company that the steamship Faraday returned to this country for supplies—principally grappling irons. She is to sail again early next week to resume operations for the repair of the injured part of the cable. The company are determined to have the work completed this season.

American District Telegraph.

THE American District Telegraphs have made connection with the headquarters of the New York Fire Alarm Telegraph, and now transmit their fire signals direct. The District Telegraph system has been extended to Harlem. The Company have leased an office at 124th street and Third Avenue, Harlem, and opened a district office there on Wednesday last. A new district is to be opened at Sixty-third street and Third Avenue, to extend from Fifty-eighth to Seventy-second streets. The Company will also establish an office within the Rink during the continuance of the American Institute Fair.

The Direct Cable.

THE steamship Faraday, it appears, returned to England to refit and obtain additional apparatus, especially grappling irons, and will immediately proceed to resume her attempts to remedy the fault in the Direct Cable which interferes with its being successfully operated. Mr. G. Von Chauvin, the manager of the Direct United States Cable Company, writing to the *London Times* in reply to the complaints about the silence maintained by the officials as to the position of the cable, says that all persons whose names appear on the register of shareholders, and who have made inquiries, either personally or by letter, at the offices of the company, have received the information that the laying of the cable has been completed, that messages were transmitted over it at a high rate of speed between New York and London, but that a small part of the cable had been injured, probably by ice, during the laying of the last portion of the deep sea cable, and that the contractors were now cutting out and replacing the injured part.

New York City Telegraphic Notes.

PRESIDENT ORTON'S office at the Western Union building is draped in deep mourning, as is also the office of the late Secretary Mumford, for the honored dead. Messrs. O'Reilly, Bronson, and Cromwell, of the Western Union main office, are whiting the happy hours away "far from the madd'ning crowd"—in fact, they are taking a vacation. Last week the spectacle of Nine big clocks, all in a row, Learning to be good and go "so so," was presented behind the switch at the W. U., but now the last bug having been shot, they occupy their old positions on the walls and gladden ye knights of the key with correct time. Striking an averaging between the different times of each, to obtain the true or mean (and it was mean) time, is now unnecessary. For the information of the uninitiated we would say that the "bugs" referred to on these timekeepers are not a specimen of the Colorado genus, who are said to jerk an ox cart around a ten acre lot for a few hours before dinner time, in order to get up an appetite; but

on the contrary are perfectly harmless, as they exist only in the lively brain of the fraternal brotherhood. We are sorry to note that W. Mayer, Jr., of the W. U., is on the sick list. And now, in the small hours of the night, as the foree begins to thin out in the great office at Broadway and Dey streets, the still, small voice of the mosquito is heard as he buzzeth, fresh from Jersey, in at the open windows. They must come over by the boat load, ear load, or some kind of load, for they are blood-thirsty and merciless, and can become greater agitators of bands and arms than anything of their size which we know of. One must keep up a continual slapping, always striking the place where the 'sketer last was, and indulging in an amount of hard swearing quite sufficient to cover the winged blood sucker with eternal obloquy if he would only stay covered—but he won't. One man was observed to raise partially from his seat last night, and in an excited manner slap his hip, ejaculating with smothered fervency, "Down, down to hell, and say I sent thee!" We think this man must have reveled in the Beecher trial, or fed on classic literature in his youth.

The Late George H. Mumford.

A NUMEROUSLY attended meeting of the telegraphic friends and associates of the late George H. Mumford Vice President of the Western Union Telegraph Company, whose sudden death in Paris has been announced in THE TELEGRAPHER, was held in the office formerly occupied by him, on Tuesday afternoon last. Mr. Wm. Orton was chosen chairman, and Mr. Geo. B. Prescott Secretary. Addresses were made by President Orton, Vice Presidents Corneli and Green, Grosvenor P. Lowery, Esq., Hon. George Walker, Gen. O. H. Palmer, and others, and the following resolutions were unanimously adopted:

Whereas, It has pleased our Heavenly Father, in His infinite wisdom, to remove from this life, suddenly, in a foreign land, our late cherished colleague, George Hart Mumford, one of the Vice Presidents of the Western Union Telegraph Company, who, by his manly qualities, had won the sincere respect and affectionate regard of his official associates; and, Whereas, We, who have for many years been connected with him in the management of a great business, desire to express our feeling of sorrow, and record a tribute of respect to his memory, it is hereby Resolved, That by Mr. Mumford's death our Company has lost an officer of inestimable value, one whose superb intelligence, improved by a careful and thorough education, and an enthusiastic devotion to the business in all of its varied details, and supplemented by an unimpeachable integrity, genial courtesy, and rare dignity, of character fitted him to discharge all official duties with wisdom and discretion remarkable for one of his age. In him the community has lost a citizen of the highest character, devoted to the best interests of society, loyal to his country in her darkest hour, and respected by all good citizens; one whose brilliant career, which had not yet reached its meridian, gave promise of the greatest future usefulness and influence. Resolved, That, by his early death, in the prime of vigorous manhood, his family has lost an affectionate and devoted husband and father, who was the pride and glory of a happy home; and we tender our warmest sympathy and condolence to the stricken wife and tender children, whom we commend to the care of Him who is the refuge and shield of the widow and the orphan. We also tender our respectful sympathy to the widowed mother and affectionate sister, to whom he was a dutiful son and loving brother.

Resolved, That as a tribute of respect a committee, consisting of Norvhu Green, John Van Horn, Anson Stager, John C. Hinchman, A. S. Brown, W. J. Holmes, S. B. Gifford, John B. Van Ivery, J. D. Reid, and A. H. Watson, is hereby designated to receive the remains on arrival in New York, escort them to Rochester, attend the funeral, and, if agreeable to the family, serve as pall bearers. Resolved, That these resolutions, appropriately engrossed and signed by the officers of this meeting, be presented to the bereaved family, and that copies thereof be furnished for publication to the several telegraphic journals, and to the daily press of New York, Rochester and San Francisco.

Foreign Telegraphic Notes.

THE total number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended July 24, 1875, was 446,532, an increase on the corresponding week of last year of 39,181. At a special general meeting of the Western and Brazilian Telegraph Company, held in London, July 29th, a resolution was adopted to increase the capital of the company £48,200, to enable the company to fulfil its obligations under the agreement of May 23, 1873, between the company and the River Plate and Bra-

zilian Telegraph Company. The authorized capital of the company is now £1,398,200.

A prospectus has been issued by the directors of the Eastern Extension, Australasia and China Telegraph Company, offering 3,200 debentures, amounting altogether to £320,000, at £100 each, and bearing interest at the rate of six per cent. This amount is required to furnish the cable which is to connect Australia with New Zealand. Shareholders are allowed the option of subscribing in the first instance.

Estimated gross receipts of the Anglo-American Telegraph Company:

July 21 amounted to	£1,570
22 " "	1,600
23 " "	1,500
24 " "	1,400
25 " "	530
26 " "	1,120
27 " "	1,590

against an actual average in July, 1874, at 4s. per word, of £1,826.

The Italian Government has contracted with the firm of Erlanger & Co. for the laying down and maintenance of a submarine cable from the Continent, near Orbstello, to the island of Sardinia.

Mr. John Pender, M. P., stated at the meeting of the Eastern Telegraph Company, that the Suez and Aden section of the company's cable has improved in insulation by no less than 38 per cent, and the other cables of the company from 45 to 77 per cent. The cables which have been laid the longest have improved the most. All these cables have been laid by the Telegraph Construction and Maintenance Company.

The International Telegraph Conference at St. Petersburg was closed on Tuesday, July 20th. The President delivered a farewell address, in which he enumerated the results of the deliberations.

The number of messages forwarded from postal telegraph stations in the United Kingdom for the week ended July 10th, 1875, was 425,136—an increase on the corresponding week last year of 27,898: for the week ended July 17th, 1875, was 445,294—an increase on the corresponding week last year of 34,943.

A general meeting of the members of the Société du Cable Transatlantique Français (French Cable Co.) was to be held in London on Thursday, the 5th inst., for the purpose of receiving an account of the liquidations, showing the manner in which the winding up has been conducted, and the property of the company disposed of.

The East India Telegraph Company announce that the bonds falling due on August 10th will be paid off at the Bank of England, as provided for on each bond, and in order to replace them the Board will shortly raise by tender £1,000,000 on 4½ per cent. debentures.

The traffic receipts of the West India and Panama Telegraph Company for the month of April amounted to £4,485, as compared with £2,802 in the corresponding period of 1874.

On the 8th of July last the number of messages passing through the chief London telegraph office was 36,560, and on the 9th, 36,554, being the highest number passing through the office during 24 hours.

The Western and Brazilian Telegraph Company announce that communication by cable is complete to Monte Video, and that telegrams will now be forwarded direct to the River Plate, without transmission by land lines between Brazil and Monte Video, as heretofore.

The Platino Brazileira cable has been at last finished, and messages pass direct from the Plate to Rio. As yet the line is not open to the public, but it was expected to be in the course of the week.

Result of the International Telegraph Conference.

THE new convention and working regulations of the International Telegraph Conference will come into operation on the 1st of January next. The Convention, which is an International Treaty, and practically unalterable between two Conferences, has been reduced from about 60 to 20 articles, and now contains only the bare principles upon which the contracting Governments agree that their lines should be established and their messages interchanged. The working regulations, which can be modified at any time by common consent, have been augmented by the 40 articles from the Convention. The following are the principal clauses of the new Convention: The terminal charge of Germany for correspondence with France and Russia will be 3 francs; the terminal charge of Austria for correspondence with Great Britain will be 2fr. 50c.; the other terminal charges for European countries remain unchanged. A new rate of 7fr. 50c. is agreed upon for

Spain by the Direct Spanish Cable Company, and the transit rate by the cable between Barcelona and Marseilles is fixed at 4fr. A word-rate has been agreed to for all extra European countries, and uniform terminal rates are fixed for telegrams between Europe and India, viz.: For stations west of Chittagong, via Turkey, 5fr. per word; to the east of Chittagong, 5fr. 25c.; and Madras, 3fr. 75c.; via Russia, the rates are respectively 5fr. 50c., 5fr. 75c., and 4fr. per word. Between such countries as choose to admit it, provision has been made for a "telegraph card" of ten words at three-fifths of the charge for an ordinary 20 word message, and under a similar restriction urgent messages at treble rates will be transmitted, and will have precedence of other private messages between the countries that admit them. By the payment of £1 per year, the names and complete addresses of two correspondents can be inscribed in the books of two telegraph departments, and be thenceforth represented by a single word, which alone will be telegraphed and charged for.

The Conference is the fourth of a regular triennial series, the first of which was held at Paris, in May, 1865; the second in Vienna, in 1868; and the third at Rome in 1872. As we stated in a previous number, the next Conference will be held in London in 1878.—*The Electrical News.*

The Telegraph Construction and Maintenance Company.—Half Yearly Meeting.

At the half yearly meeting of the Telegraph Construction and Maintenance Company, Limited, held on Tuesday, July 20th, at the Cannon street Hotel, London, Sir Daniel Gooch said that the work they had had in hand during the present year had been very small. In the course of a few days, however, he hoped that the company would conclude a contract for a cable, 1,380 miles long, from Sidney, New South Wales, to New Zealand, and he trusted that for the rest of the year they would be well employed. They knew of no other work like the one he had mentioned coming forward, but they were quite prepared to take work should it present itself. He did not think it was unfortunate, even for them, that there should be a cessation for some time in the construction of these long cables. He thought this work had gone on now for some time, and with a little rest he hoped the existing cables would remunerate their shareholders better than they had in the past.

For the week ended July 6, 1875, and bearing that date.

165,210—GALVANIC BATTERIES.—Joseph C. Clamond and L. A. Gaffie, Paris, France. [Filed November 6, 1874.]

An artificial carbon is produced by calcining a mixture of graphite, tar and sugar. The carbon thus prepared is immersed in a solution of perchloride of iron, or of another salt of sesquioxide of iron, and then in ammonia. The sesquioxide of iron is precipitated and incorporated in the pores of the carbon. By this means the porous vessel is dispensed with, and the depolarizing agent is chemically produced in the pores of the carbon itself.

- The improved sesquioxide of iron battery, containing sesquioxide of iron in combination with zinc and an ammoniacal salt, as specified.
- The method herein described of preparing a sesquioxide of iron battery by mixing sesquioxide of iron with coke, or fixing it in the pores of carbon, substantially as specified.

165,263.—DUPLIX TELEGRAPHS. G. Smith, Astoria, N. Y. [Filed December 22, 1874.]

- The two batteries a and b of unequal power, connected with the same poles to the line, in combination with the adjustable rheostat between the larger battery and the line, the receiving instrument between the smaller battery and the line, and the key for simultaneously opening and closing the circuits from both batteries, substantially as specified.
- In a duplex telegraph the arrangement of the batteries a and b, receiving instrument f, and rheostat, substantially as specified, so that the batteries shall neutralize each other at the receiving instrument and act together on the line, substantially as set forth.

165,281—CIRCUIT CLOSERS FOR RAILWAY SIGNALS.—Saml. Weeks' New Orleans, La. [Filed June 5, 1875.]

A circuit closing device for signaling the passage of railway trains over the track, composed of a spring supported connecting plate insulated from the ground, and placed in communication with the line wires, and of a central contact plate supported below the connector, and connected to the earth for closing the circuit with the station by the contact of connector and central plate, substantially in the manner and for the purpose set forth.

165,312—POLES FOR GALVANIC BATTERIES.—Howd. P. Dechert, New York, N. Y. [Filed June 26, 1874.]

A battery pole consisting of a conducting skeleton or perforated frame or jacket, containing broken carbon or a carbon plate, substantially as and for the purpose described.

165,379.—PRINTING TELEGRAPHS.—John E. Smith, New York, N. Y. [Filed May 21, 1875.]

Type wheel revolved both on make and break of circuit. One coil of printing magnets in a local closed by escapement lever on prolonged closure of main circuit, other in a local ditto on prolonged break ng. Unison applied to stop transmitter automatically at zero.

- In a printing telegraph the arrangement of one half or portion of the wire of the printing magnets in a local circuit or branch of a local circuit, and the other half or portion of the wire of said magnets in another local circuit or branch of a local circuit, in combination with a circuit breaker that acts, during the rotation of the type wheel, to open and close the circuit or circuits alternately through the two parts of the printing magnet, substantially as set forth.
- In a printing telegraph, a printing magnet in a local circuit or circuits, a type wheel magnet in a main circuit, and an escapement wheel that allows the type wheel to advance a whole character at a single movement of the escapement pallet, in combination with a lever that serves the double purpose of liberating the type wheel and closing the local printing circuit, to effect an impression by either a prolonged opening or closing of the main circuit.
- In a printing telegraph, the ratchet wheel l and the pawl m, in combination with the lever f, substantially as described.
- The springs c and e, in combination with an electro-magnet and a train of wheels for letting into an electric circuit a resistance either measurable or infinite.
- The magnet C, pallet B, springs e and e, resistance k, lever f, ratchet wheel l, and pawl m, in combination with a train of wheels, substantially as set forth.
- In the transmitter of a printing telegraph, the combination with a train of wheels of the arm P, and the loosely fitted lever E, substantially as and for the purposes set forth.
- The lever U in combination with the lever R, substantially as set forth.
- In printing telegraph apparatus, a self-locking transmitter, in combination with a self-locking printer.

For the week ended July 13, 1875, and bearing that date.

165,413.—ELECTRIC THERMOSTATS.—Edwd. J. Frost, Philadelphia, Pa., assignor of one-half his right to J. Hoehnen, same place. [Filed Dec. 24, 1874.]

- The thermostat consisting of a compound strip formed into a flat spiral, a central adjusting screw, and the casing or covering, substantially as set forth.
- The combination, with the spiral compound strip and central adjusting screw, of the index plate and index concealed in a hollow in the base of the thermostat, substantially as set forth.

165,452.—GALVANIC BATTERIES.—George L. Leclanche, Paris, France, assignor to H. L. Roosevelt. [Filed Dec. 16, 1874.]

- Incorporates the depolarizing substance with the negative element in the manner specified in claims, thus dispensing with the use of a porous cup.
- A galvanic battery in which the use of a porous cup is dispensed with, and in which an insoluble or slightly soluble depolarizing substance, as above defined, rendered solid (with or without cement, by pressure), is combined with a conductor and negative pole, substantially as and for the purposes set forth.
 - A depolarizing body for connection with the negative pole of a galvanic battery, consisting, in whole or in part, of an insoluble or slightly soluble depolarizing substance, rendered solid, with or without cement, by pressure in a mould, substantially as and for the purposes set forth.
 - A galvanic battery in which the use of a porous cup or diaphragm, or its equivalent, is dispensed with, and in which the negative element consists of a mixture of an insoluble or slightly soluble depolarizing substance, as hereinbefore defined, and a conductor, with or without cement, rendered solid by pressure, substantially as and for the purposes set forth.
 - A negative element for a galvanic battery, consisting in whole or in part, of a mixture of insoluble or slightly soluble depolarizing substance, as above defined, and a conductor with or without cement, rendered solid by pressure in a mould, substantially as and for the purposes set forth.

165,535.—UNDERGROUND TELEGRAPH LINES.—David Brooks, Philadelphia, Pa. [Filed June 2, 1875.]

- An underground telegraph wire or cable clothed with absorbent material, covered with insulating substance, and contained within a pipe, in combination with a liquid insulating medium maintained under pressure within the said pipe, all substantially as set forth.
- An underground telegraph wire or cable surrounded by pipes arranged in sections, each section being bent upward at the ends, as set forth, and terminating in a box or receptacle, B, for the purpose specified.

ORTON'S PATENT PENCIL HOLDER

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread and will hold the pencil perfectly firm.

Price, 10 cents each.

Sent by mail on receipt of price.

Price per doz., 60 cents.

GEO. H. BLISS & CO., Gen'l Agents,

220 Kinzie Street, Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

PONY RELAY, PRICE \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. See above Cut.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 34
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 1/4 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Callaud battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense.

Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application.

All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to

J. N. ASHLEY,
38 Vesey street, New York.

P. O. Box 5,503.

WESTERN ELECTRIC MAN'G CO.

220 Kinzie Street,

CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

Toledo, Ohio,
Toronto, Canada,
Washington, D. O.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the **People, Municipal Authorities,**

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, the **ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

[From the Polytechnische Zeitung of June 26, 1875.]

Remarks on the Combination of Telegraphic Double-speaking with Counter-speaking.

By Prof. Dr. K. E. ZETZSCHE.

A GREAT deal of noise has been made in America for some time past respecting the "Quadruplex Telegraph," by which term is to be understood a combination of telegraphic counter-speaking, with simultaneous double-speaking. Mr. J. B. Stearns, of Boston, when introducing his counter-speaker or Duplex Telegraph, seemed not to have been aware of what had already been accomplished in this direction in Germany, and to this he really added but little of undoubted merit. (Vide Dingler's Polytechnic Journal, 1874, vol. 202, p. 111.) So also the Americans seem to be quite as little aware that the combination of counter-speaking with double-speaking, has for a long time been the subject of theoretical investigations, and practical tests elsewhere. For this reason I beg leave to transcribe some historical remarks from my work, "The Copying Telegraph, the Type-Printing Telegraph and the Double Telegraph." Leipzig, 1865, page 168.

The first to assert the possibility of a simultaneous combination of counter-speaking with double-speaking was Dr. Stark, not only in his paper of October 15, 1855 (Journal of the German-Austrian Telegraph Union, vol. II, p. 224), but also in his communication to the Vienna Academy of Sciences, in which he pointed out the possibility of transmitting simultaneously four communications between two stations upon the same wire, although he did not give any detailed explanation, or plan of arrangement. Thereupon Dr. Bosseha, in his communication of October 27, 1855, made the same statement. Wartmann also expressed his opinion (Annales Telegraphiques 1861, p. 161) in regard to his own double-speaker (mentioned in the same pamphlet and illustrated in fig. 95), that in order to combine double-speaking with counter-speaking the relays should be connected directly with the line wire, each of the electro-magnets being provided with double coils, one of which should be traversed by a compensating current, and the other by the current going out to the line. Arrangements for double and counter-speaking at the same time were also devised by Maron and Schlaak about the end of 1863.

When a telegraph line is to be used for simultaneous double and counter-speaking, it is necessary that the receiving instrument, as in counter-speaking only, should be connected directly with the line, in order that it may be traversed at any time by the arriving currents. For this reason it is essential that the effect of the transmitted currents upon the receiving apparatus at the home station should be in some manner counteracted or destroyed. If we consider the use of an equating battery or of several relays as objectionable for this purpose, then we are generally obliged to use a relay with a double coil—as for example in the plan invented by Siemens and Halsko—or else the method of branch or divided circuits suggested by Maron. In combining double and counter-speaking, the only requirement is, that the circuit of the line be not interrupted by the movements of the transmitting keys. This is of the more importance, for the reason that this interruption must be avoided, not only with respect to currents received from the distant station, but also the currents transmitted by the other key at the same station. In addition to this, the danger of interference is much increased on account of there being double the number of keys in actual use at the same time. For these reasons, the best we can do is to make use of the method of connecting the key shown in fig. 1 and connect both poles of battery B1 or B2 with the points 2 and 3 of key T1 or T2. Both batteries at the same station are connected with either like or unlike poles to the axis of the key, accordingly as there are to be used for double-speaking several strengths of current of the same or different polarity, and this will also determine the kind of receiving instru-

Fig. 1

ment to be selected. If now, in view of what has been said heretofore, the receiving apparatus be made to consist of three properly arranged relays, either polarized or non-polarized, with two recording instruments properly connected thereto, and if each of these three relays be provided with a double coil, the three inner coils being connected together with an adjustable resistance W, in a branch circuit (which, in distinction from the main line might be termed a local line), then the currents transmitted either by T1, T2 or T1 and T2 together will divide between the main or local lines, and thus their action will be neutralized upon each of the three relays. It is obvious that the neutralization of the effect of the currents in this method of connecting the key is even less difficult than in ordinary counter-speaking, because in this case only two positions of the key, viz., the resting and the working position, have to be provided for.

So long as only one station is transmitting, the course of the current at the receiving station is exactly the same as in the case of ordinary double-speaking, and therefore the receiving instruments are subject to precisely the same conditions that have previously been stated in regard to double-speaking, in order that the received signals may not be interfered with by the armatures falling off. The conditions are very much complicated when both stations are double-speaking. First of all, we may note two cases in regard to the manner of connecting the battery at the two stations; the batteries may be connected with either like or unlike poles to the line. For example, B1 may be connected with the same pole to the axis of the key T1 and the line at each station, or the positive pole may be connected to it at one station and the negative at the other. In the former case the current from the batteries B1 at both stations would oppose and neutralize each other, while in the latter case one would reinforce the other. In considering, however, whether simultaneous double and counter-speaking is possible, we need not dwell upon this distinction; it is only necessary to answer the question: What will happen at both stations, when, in addition to the current proceeding from the first station, there is thrown upon the line a current of like or unlike polarity from the second station? If this additional current has the same polarity or direction as that already present, then the effect of one will be added to that of the other. At the first station, therefore, the current of the main line will exceed that of the local line by an amount equal to the additional current, and accordingly all of the relays will be operated, which are capable of being operated by the additional current alone, supposing that the first current—the effect of which is neutralized upon the relays—were not present. At the second station the current is also increased on the main line to the same extent, but in this case its action upon the three relays is rendered null by the opposing local current, which is increased exactly in the same proportion. Therefore, the previously existing condition of the relays caused by the current from the other station remains unaltered.

When, on the contrary, the additional current is in an opposite direction to the previously existing one, the two currents will partially or wholly neutralize each other, according to their respective strengths. This will also operate to destroy the balance previously existing at the first station between the main and local circuits in the three relays, by neutralizing the line current either partially or entirely, and thus leaving the local current free to operate the relays. They will therefore respond in this case precisely as they did before to the additional line current of the same polarity. At the second station the action will be similar, and nothing will be changed as far as the operation of the relays is concerned.

I find, in No. 459 of the American journal, THE TELEGRAPHER, of May 1, 1875, a lecture delivered before the American Electrical Society at Chicago, by F. W. Jones, in which is contained the following communication in reference to the quadruplex:

Toward the close of 1874 it was noised abroad that a quadruplex had been put into successful operation between New York and Boston by Messrs. Prescott and Edison, electricians. More recently it has been put into actual use between New York and Chicago, through a repeater at Buffalo, and between Chicago and Cincinnati—the former distance being nearly one thousand miles, the latter three hundred miles. It has for its foundation the bridge duplex. In the bridge wire of the duplex there are two relays—one is a common relay of very short cores and moderately low resistance, capable of being affected only by strong currents. The other is a Siemens polarized relay, which is sensitive to feeble currents, and is so constructed as to allow the tongue to be thrown on the back or open stop when a current of a certain polarity passes through its coils, and on the front or closing stop when a reverse current passes. There are two separate transmitters brought into use in double transmission from either end. The double transmitter is a pole changer having one spring connected to line and the other to ground. The contacts with each spring are connected crosswise with the smaller portion of main battery through the spring and lever of the single transmitter, which has an additional section of battery inscribed between the lever and its closing contact point. When both transmitters are open the smaller part of the battery will be presented to the line. The current flowing therefrom will

divide between the sides of the bridge—one part passing to rheostat and earth, the other passing over line and dividing between the bridge wire and the transmitter ground at receiving end. The portion crossing the bridge will push the tongue of polarized relay on the back stop, but will not affect the common or neutral relay for reasons before stated. If the double transmitter at sending end be closed the same portion of battery is reversed in circuit, deflecting the tongue of polarized relay at distant end to the front or closing stop, thus recording a signal. The second transmitter merely cuts in or out of circuit an increased portion of battery, sufficient to close the distant common relay, and the movements of the first or double transmitter wholly determine the polarity sent to line; when the double transmitter is up and the single one closed the latter cannot record a signal on the polarized relay at the remote station, for the reason that the current is on the wrong polarity; the same effects take place at the home station under similar manipulations at the distant end.

Under the supposition that the batteries are divided into proportions of 50 cells and 150 cells, the following changes of polarity and quantity will take place on the line during transmission from both stations:

Table with 4 columns showing cell counts and polarity changes: +50 and -50 cells, -50 and +200 cells, etc.

These constant variations and reversals taking place through the relay coils tend to produce in them an unsettled magnetic condition, causing the movements of their armatures to be unsteady and unreliable for signals. To remedy this the bridge wire is supplied with a condenser which is charged by the same currents that work the relays, and so soon as they are withdrawn from relays the condenser discharges before a reversed current reaches them, thus prolonging the signals and preserving a magnetic equilibrium of the cores.

The condensers connected to the equating rheostat require the nicest adjustment to exactly neutralize the static discharge from line.

Dr. H. Nicholson, of Mt. Washington, near Cincinnati, has also constructed a quadruplex on the differential principle. When one key is depressed a positive current or given tension is sent to line, the second one sends a negative current of the same tension, while both keys, simultaneously depressed, send a positive current of double the tension of a single key. The relay has two oppositely polarized armatures, of which the one responding to positive current depresses a spring in addition when under the influence of a current of double strength, thus closing not only its own sounder, but also the one in connection with the opposite armature, recording simultaneous signals.

Jones does not explain in what manner Nicholson connects his keys, but the three different strengths of current required for double-speaking have the same relation to each other in Nicholson's method as in the plan of combining double and counter-speaking invented by Maron, except that Maron makes use of strengths of current +S, -S, and -3S. Furthermore, Maron also makes use of only one relay, which is, however, provided with three magnetic armatures.

The method of Prescott and Edison is, however, characteristically new, inasmuch as they give to the line a constant current of +S, but for telegraphing make use of -S, +2S and -2S. We regret that Jones does not give a diagram of the arrangement of the connections of the keys and batteries. But my own plan, given in the annexed diagram (fig. 2) fulfills in every respect the conditions above stated.

Fig. 2

The copper pole of the battery B1 is connected through the front contact 6 and the back contact 3 of the double key T1 with the key axis 2, and thence through the wire x to the angle of a Wheatstone's bridge. On the bridge wire p q are placed the two relays R1 and R2. The point p is connected with the line L, and the point q through the rheostat W and wire u with the earth at E. The zinc pole of battery B1 is connected through f and h with the back contact 4 and key axis 5 of the double key T1, and thence through wire v to the earth at E. Both keys are provided with contact springs so arranged that the front contact is closed at the instant the back contact is broken, whenever the key is depressed, and vice versa. If now the lever of the key T2 is depressed, then in addition to the battery B1 another section of battery B2 is brought into action through the wire n, front contact 7 and axis 8 of the key. The relay R2 at the other station now responds to the increased positive current, while the armature of the polarized relay R1 still remains against its insulated local stop. If, on

* This is the arrangement for counter-speaking which Maron of Berlin described at the same time with his double-speaker, in the Journal of the German-Austrian Telegraph Union, volume X, page 3.

the other hand, key T_2 is at rest, and T_1 is depressed, then the copper pole of battery B_1 is put to earth at E , while the zinc pole is connected with the line L through $f h 9 8 d 1 2 x$ and r . The line current is therefore reversed, and thus gives a signal at the other station upon the polarized relay R_1 . Lastly, when both keys are depressed simultaneously, then the copper pole of battery B_1 still remains to earth, while the zinc pole of battery B_2 is also connected to the line L by way of $n 7 8 d 1 2 x$ and r , and therefore both the relays R_1 and R_2 at the distant station are compelled to respond to the signals of T_1 and T_2 , in consequence of the increased strength of the negative current.

This arrangement possesses a not immaterial advantage over the previously known methods, inasmuch as it requires but two receiving relays, but it unites with this two points of inferiority. At the transmitting station there occurs, at each motion of the key (however short it may be), an interruption of the line, or what amounts to the same thing, a short circuiting of the battery, which is liable to cause a break in the signals. On the other hand, if the key T_2 is kept depressed at the sending station, while the key T_1 is operated, the relay R_2 ought not to let its armature fall back, however often the polarity of the current may be changed.*

We regret to say that these two defects are of such a nature that it is much to be feared that they will prove to be the rocks on which the practical application of this invention will split, and this is the more to be regretted, as the first mentioned advantage of this arrangement gave promise that through it an additional successful step might be taken to combine double-speaking with counter-speaking. The great value of such a combination lies perhaps not so much in the fact that it renders possible the simultaneous transmission of four messages on one wire, as in furnishing each receiving operator with a key by means of which he may break the sending operator, and each sending operator with an apparatus by which he may be informed of these interruptions.†

[From the *New York World*.]

The First Achievements of Telegraphy as a Detective Agency.

THE announcements have appeared on successive days that Carl Vogt, the man accused of a murder in Belgium two years ago, had sailed for that country, and that the international telegraphic conference had opened at St. Petersburg, and that the Czar would entertain its members at a grand banquet.

At first sight it might appear as though these two events could not possibly have any sort of connection, but in a certain way they have, for telegraphy has been among the most fertile agents in the discovery of crime, and it is very doubtful whether Mr. Vogt would now be en route for the scene of his alleged crime but for Mr. Cyrus Field and some of the other gentlemen who partake of the Czar's hospitality.

But for the cable these days would indeed be halcyon for a criminal. Steam had enabled him to hurry to the seaboard, and once afloat he was safe. Those who can carry their recollection a few years back will remember a number of cases in which crimes were committed with impunity. To mention one, there was the instance of "the Count de Miranda," who, by admirably executed letters of credit from Barings & Coutts, drew no less than £20,000 from the banks in Sydney, remained weeks there, was feted on all sides, from government house downward, and one evening was, in the refrain of a popular Australian song, "Off to Callao, my boys," never to be heard of more.

It is a singular feature in the history of the telegraph that an invention capable of such practical uses should so long have been regarded as little more than a philosophic toy. In July, 1837, the directors of the London and Northwestern railroad sanctioned the laying down of wires between their passenger station at Euston Square and their goods station at Camden Town, and late in the evening of the 25th of that month a man sat by the light of a flaring dip candle in a little room near the booking office, with a beating pulse and a heart full of hope—this was Prof. Wheatstone. In another little room at Camden Town were Mr. Cooke, his co-patentee; Mr. Charles Fox and Mr. Stephenson, the great engineer. "Never," said Wheatstone, "did I feel such a tumultuous sensation as when, all alone in the still room, I heard the needles click, and as I spelled the words I felt all the magnitude of the invention." It might have been supposed that this wonderful proof of applied science would forthwith have made a stir in Christendom; but when the directors of the London and Birmingham railroad soon afterward proposed to lay it down to the latter town if the Birmingham and Liverpool directors would continue it on their line, these latter refused, whilst not

long after that, at a meeting of the proprietors of the Great Western railroad at Bristol, a certain enlightened person, by name Hayward, denounced the invention as "a new-fangled scheme"—a frightful charge, and one which, in such an assembly, he doubtless knew full well bore death in it, and managed to obtain a resolution repudiating an agreement entered into with the patentees to extend it to Bristol. Meanwhile Brunel, had immediately recognized its importance, and managed to convey the wires in tubes to Slough Station, three miles from Windsor Castle. But, strange to say, here again for some time it was only used for railroad messages, until Mr. Cooke, the co-patentee, proposed to maintain it at his own expense, on condition of doing the company's business free, and in return being allowed to send the messages of the public. This, then, was the first popular use of the electric telegraph. The little office stood perched up high above the line, near the railroad station, and has, we hope, been preserved as it deserves. The charge for a message was at first what, after many fluctuations, it has come to be at last—one shilling. At length that time-honored and curious festival, the Eton Montem, the last ever held, in 1844 brought the Slough telegraph into some prominence. The telegraph book for 1844 at the Great Western terminus, Paddington, states that:

"The commissioners or police have issued orders that several officers of the detective force shall be stationed at Paddington, to watch the movements of suspected persons going by the down train, and give notice by the electric telegraph to the Slough station of the number of such suspected persons, their dress, names, if known; also the carriages in which they are.

The plan was perfectly successful, for presently came the entries:

PADDINGTON, 10:20 A. M.—Train just started; contains three thieves.

SLOUGH, 10:48 A. M.—Arrived. Officers have cautioned three thieves.

PADDINGTON, 10:50 A. M.—Special just left; contained two thieves; one, Oliver Martin, is dressed in black, crape on his hat; the other, Fiddler Dick.

SLOUGH, 11:15 A. M.—Thieves in custody, a lady having lost her bag; one of her sovereigns in Fiddler Dick's watch fob."

The thieves must have been terror-struck. An entry dated Slough, 11:15, records:

"Several of the suspected persons who came down are lurking about Slough, uttering bitter invectives against the telegraph. Not one of those cautioned has ventured to proceed to the Montem."

But it was reserved for the following year to bring the value of the telegraph far more vividly before the public, and it was through the detection of crime, not through its value as a political or commercial agent, that it bounded into fame. The traveller on the Great Western railroad may observe, just after he flits by Slough, in the fastest of express trains, the towers of Windsor in the horizon on his left, and in the foreground a group of cottages around a large timbered red brick mansion. This is the hamlet of Salt Hill, the scene of Eton Montem, Salt Hill being the "Mons," and the tribute levied on the occasion the "salt." The huge mansion is a famous hostelry, at which in coaching days seventy coaches daily changed horses. In a cottage beside it was committed in January, 1845, the crime destined to bring the detective power of electricity before the world. A Quaker killed a woman with whom he had secretly cohabited. He was tracked to Slough station, and being suspected, five minutes after he had taken his seat the news was flashed to London. He was "shadowed" for several hours, to discover his haunts, and at length arrested, and, being brought to trial, found guilty and hanged. From that hour dates the rapid and enormous growth of telegraphy. By the end of 1845, 500 miles were in operation in England. The following year the Electric Telegraph Company commenced operations, and a few years later the wires ran over more thousands of miles than in 1845 they did over hundreds.

The Difficult Problem.

KENTON, KENTON CO., KENTUCKY.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR correspondent, "W. A. S.," July 24, 1875, asks why is electricity excited or developed by friction, heat and chemical action? I will submit a few thoughts on the chemical cause, which may possibly lead some one out in the discussion of the problem that

may prove more satisfactory and beneficial to your many readers.

To have an intelligent understanding it will be necessary to consider the nature of the elements entering into the battery, or medium, as well as some of the properties of electricity.

Electricity is an imponderable fluid, possessing certain properties, viz., attraction and repulsion; it also emits heat, and light, and force under certain conditions. If a fluid, it is also a material, being an element composed of atoms, each atom of electricity possessing properties peculiar to the bulk; then each atom must have polarity, its north pole and its south pole, or negative and positive. It unites with other elements to form compound bodies, as sulphate copper, sulphate zinc, water, etc., etc. No chemical union can exist without its presence.

The battery is composed of two metallic elements of different affinities (say zinc and copper), also sulphate copper in solution, and a conductor from the zinc to copper to complete the circuit.

The battery is set up and the circuit closed. The first action necessary is the decomposition of the vitriol, the sulphate acid gives up the copper and liberates the electricity required to hold it in chemical union with the copper, because it, the sulph. acid, has a greater affinity for the zinc than it has for the copper, it is attracted to the zinc by means of their polarities, negative and positive being uniform, and there it forms a new body called sulph. zinc. The new body also requires the presence of electricity in its organization, probably in different degree from the sulph. copper, and as the needle points to the pole, so does each atom of electricity that is free from chemical union point to the zinc, because of the chemical union that is taking place between sulph. acid and the zinc, and because each atom of electricity possesses polarity, each one affecting its neighbor—the north pole of the one atom attracting the south pole of the other; thus the entire battery and circuit is affected; and then we have what may, as a matter of convenience, be called a current. The electricity is developed or disturbed, and instead of exerting its attractions north and south, exhibits its presence on the line and in the core of the magnet in the same order as in the battery.

We will sum up and say that the electrolyses in the battery (the decomposition of the sulph. copper and the composition of the sulph. zinc) are the exciting causes, acting through the medium of electricity and its own polarity to produce its general effect.

H. C. N.

The Attractions of New Orleans.—Telegraphic Changes.—Telegraphic Tournament Proposed, etc.

NEW ORLEANS, LA., Aug. 11.

TO THE EDITOR OF THE TELEGRAPHER.

IT has been many months since a letter from this sunny clime has brightened the pages of THE TELEGRAPHER, and its only simple poor I, who have at length seized upon my insignia of office, and resolved by one stroke to undo that which an overwhelming lassitude, a lamentable lack of energy, has prevented a more gifted writer from doing—that is, to let the fraternity know that New Orleans still exists, and that there is such a thing as a telegraph office there; to let our feeble light shine, that it may perhaps interest, and at least instruct the intelligent portion of the telegraphic world, who read THE TELEGRAPHER.

"The deal has chapped, and things are not as they were," in the South, yet there still remains many attractions to the weary operator, who after having labored at a small rate of compensation, and undergone the rigorous discipline in the larger Northern offices, seeks the salary that is at least sufficient to live upon, without the constant drudgery of "extra" work, which is absolutely necessary in the North, and the more congenial atmosphere which surrounds the Southern office; the pleasant, courteous, and gentlemanly superior officers, and the less rigorous, though equally efficient discipline; the hospitable manners of the Southern people, and the pleasant climate; all these advantages combine to make, in our humble opinion, New Orleans one of the most delightful cities in which to live. There is a great hue and cry raised about the yellow fever as the summer months approach, which has the effect of frightening off many of the boys who come in the fall and remain during the winter season, at which time New Orleans is in its glory, and life one round of gaiety and pleasure. The yellow fever has not prevailed as an epidemic since 1867; there are not, nor has there been any cases reported this season, and there has been only an occasional victim to this dread disease since 1867. The last of the fraternity (and one of the very few) who fell was Taylor Adams, which was three years since. In our opinion (which is that of most of the sane residents here) the yellow fever, like the heat and White League, are "big bugbears." The weather is quite cool, the thermometer seldom indicating over 90°; at night a fine breeze from the south renders sleep easy and delightfully refreshing.

* This was the same difficulty which attended the first arrangement devised by Boscchi.—*Journal of German-Austrian Telegraph Union*. Vol. III, p. 27.
† *The Copying Telegraph*, etc., p. 107.

The natural course of events always brings a considerable number of changes when the spring and summer time comes, and methinks that an enumeration of the present force in New Orleans office will be the best means of conveying an idea of the numerous changes. There are on the night force, including the chief operator, seven men. Messrs. Chas. R. Chase, chief; W. Dean West, H. H. Hunt, T. J. Woolf, Sam'l O. Sevier, J. H. Riddick, and Fred. B. Moxon; of these gentlemen, all but the first two are new-comers, having been in the office but from one to three months. The day force is composed of the old men in the office principally, as follows: Messrs. Hu. Irving, chief operator; Chas. Fisher, E. V. Wedin, A. D. Babbitt, C. F. Curtis, Paul Leloupe, J. F. McHugh, and E. T. Fullum. Of this number McHugh and Fullum are recent arrivals.

Besides the reductions of salaries and force already noticed in THE TELEGRAPHER, operators at Mobile, Ala., who formerly received \$125, have been reduced to \$115; at Augusta, Ga., from \$118 to range from \$80 to \$105; at Louisville, from \$110 to \$100. Besides these many other reductions have taken place throughout the entire South, and it is stated that new acquisitions to the force of this office will only receive \$100.

The following item recently appeared in the *Picayune*, this city, which will be of interest, as a matter of information to the mass of the fraternity to whom Mr. Jones is unknown:

"Mr. T. W. Jones, of Cleveland office, is entitled to the blue ribbon for rapid telegraphing in this country. In May, last year, he averaging forty-eight words per minute for an hour."

Mr. G. Jones may have accomplished this remarkable time, and is, I believe, willing to wager \$50 that he can do it again, but if he did, and can, no time has ever been recorded which exceeds that of Mr. E. C. Stewart, of Washington, D.C., who carried off the gold medal at the tournament, quite a number of years since, by sending an average of 47½ words per minute for an hour, which the famous Nick Snyder copied.

Would it not be a great idea, now that there are so many candidates for telegraphic honors, to have another tournament and another tussle for the prizes for rapid sending and receiving? It would give Mr. Jones, as well as such men as Boilcau, De Graw, Merrill and others, of New York; J. W. McDonald, St. Louis; Eitemiller, and Curt Meserve, Chicago; Geo. Armstrong and "Patsy" Ayres, Cincinnati; with Ed. Smith, of Dallas, Tex., and Billy Soward, of Augusta, Pa., an opportunity to distinguish themselves, and do credit to their respective localities. Philadelphia, July 4th, 1876, would be a suitable time and place for such an affair.

Mr. A. G. Taylor, of the Western Union office, at Galveston, Tex., has returned from a visit to his home in New York State, where he went for the purpose of getting married. We wish him any amount of happiness. Too Much Cud.

Consolidation Rumors.—Atlantic and Pacific Expecting to Absorb the Western Union.—A Raid on Telegraph Poles.—Base Ball.—Telegraphers Victorious.—A Telegraphic Visitor from New Orleans.—Corrections.

CHICAGO, ILL., August 11.

TO THE EDITOR OF THE TELEGRAPHER.

The chief topic of discussion here recently has been the reported absorption of the Atlantic and Pacific Company by the Western Union. Although it was generally looked upon as a stock-jobbing rumor there were not wanting quite a goodly number of the fraternity who gave the rumor credit.

A rumor was afloat at the Atlantic and Pacific office that the order of things in regard to telegraphic monopoly was reversed, and that the Atlantic and Pacific stockholders had secured a controlling interest in the Western Union! and one of the Atlantic and Pacific boys seemed dead in earnest when he told us that ere long the Western Union signs around that office would be replaced by those of the Atlantic and Pacific. However ridiculous this may seem, that such a report did actually come over the wires of the latter company I am creditably informed by those who have a right to know all about it.

Quite a stir has been created among leading telegraph men here by the introduction into the Common Council of a resolution requiring all the telegraph wires in the city to be placed under ground. It is not likely, however, that there is any real cause for alarm, as such a measure could hardly be passed without meeting with serious opposition. The Western Union don't seem to apprehend that such an order will go into force very soon, as I notice they are replacing the ungainly poles on east Madison street, between Fifth Avenue and the bridge, by fine, large, handsome poles. The grading and repaving of the street at this point made such an improvement necessary.

The Atlantic and Pacific are not slower in extending their lines in this section of the country than in the east. I understand they are, as rapidly as possible, working their way to St. Louis down the Illinois river, and will probably pass through Pekin, Peoria and Alton. The boys seem very much elated over the news of the extension. I have been obliged to treat your readers to the Atlantic and Pacific improvements in small doses, kind of homœopathically. I thought I had about got through, but upon noticing the workman-like manner in which the wires are run west, from large poles on east Madison street, at the corner of Clark, to the buildings on the northwest corner of Clark and Madison streets, I thought it not out of place to mention it. When the wires reach a point directly opposite the operating and battery rooms on the supports, such as are generally used for this purpose, they are turned directly across the street southward, entering the upper part of the battery room window.

The A. & P. have, in the reconstruction of their office, etc. entirely discarded the gravity battery, and returned to the use of electro-pile for main battery. Mr. "Tom" Baruard still retains charge of that necessary adjunct to a telegraph office (the battery room), and to him in a great measure belongs the credit for the artistic manner in which the wires are run inside as well as outside the new office. In my account in a recent communication of the base ball game between the W. U. check clerks, known as Billy McMillan's nine and the *Inter-Ocean* men, in which the latter was defeated, I inadvertently called the *Inter-Ocean* men "clerks." They were compositors and not clerks. The game was played at Ogden Park. To-day the same nine from the Western Union played a nine picked from the compositors of the *Tribune* office on the same grounds, beating them 15 to 13. The following is the score:

TRIBUNE.			W. U. TELGH.

Left on Bases W. U., 6; Tribune, 5; double plays W. U., 1. Time of game, 2 hours, 40 minutes. Umpire, Mr. Gaskins.

Our friend Howther, of the Grand Pacific Hotel, Western Union office, became, on the second inst., the happy father of a fine daughter. He's as happy as a "lord," and says, after over five years of adversity prosperity now dawns upon him. Among the telegraph visitors to our city recently was Mr. James T. Alley, assistant manager and cashier of the Western Union office at New Orleans. This was "Jim's" first visit north, and he expressed much gratification with the sights and sounds of Chicago. He leaves to-morrow evening for a glance at Niagara Falls, carrying with him the good wishes of his many new friends and old. "Jim" says there's no hay seed in his hair, and he's afraid of no banco roper, but he has his doubts about the "wild Putes" in front of the segar stores. This being his first furlough for over ten years, and being limited to ten days, he is making the best possible use of it, sight-seeing, forming new and renewing old acquaintances.

In your issue of the 7th inst., in his communication regarding express messages, your correspondent D. H. C. credits the Atlantic and Pacific Telegraph Company with originating the half-rate system. I think he meant to give the credit to the Pacific and Atlantic Company, as it has never been disputed that this now defunct company originated the system, forcing its adoption upon the other companies. In my communication of July 22d your printer calls A. & P. Superintendent Fowler's chief clerk Minor instead of "Minor." He must not do so. "Bob" won't stand it. The operator's name at the Baltimore and Ohio General Freight Office is not "Kabenshire" but "Kniabenshue" but he won't stop his paper on account of the "bad spell."

OCCASIONAL.

Western Union.—Chicago.—Personals.

CHICAGO, ILL., Aug. 14.

TO THE EDITOR OF THE TELEGRAPHER.

"AYE, aye, Mr. Murrinan, here we are." "What will the young lady have?" "The double balloon?" "All right, the double balloon, you clown!" "Now for the music." *Pum! pum! pum!* "What's the matter with you? I ain't been to the circus, but "Jack" Martin has got back and taken his place on the Detroit duplex. Mr. Keeler (who has been working there since Cuthbert went on the Philadelphia wire nights) going on the Des Moines wire. Eitemiller ("Capt. George,")

has gone to New York. Some of the boys wanted the "Capt." to do as "Eddie" Dorval did on his way from the South, save his money and get a pass. "Eddie" is reported to have been refused a pass by one of the superintendent's down there, when he very complacently asked him if he "wouldn't please give him a time card." "What do you want a time card for?" inquired the supt. "Why, I'm going afoot, and I want to keep out of the way of regular trains," replied "Eddie." This was too much for the supt. He gave "Ed." the pass.

Frank Farley has also left us, intending to go home visiting—then South. "Johnny" Powers, on the W. U. force here at the time of the great fire, is working for the W. U. in Detroit. Messrs. Bracken, Hazleton, and Cushing, were heard of 12 miles out on the C. R. I. and P. R. R. by one of the boys, and "were strictly sober," so says the postal card.

Mr. Fisher, of the A. and P. force, has joined the noble army of "floaters," and "Billy" Manners has left rather unceremoniously and gone to work on the A. and P. day force. Mr. Miller, formerly of Denver, Colo., is also "subbing" here. Mr. Angell airs his wings on the "W." and "Bx." locals. Miss Annie Veazey, "Vz.," taking the Racine wire, "Billy" Walsh the Rock Island wire, and "Eddie" Dennis the Davenport wire. Mr. Lester was only able to be at the office a few days. Miss "Sue" Musgrove, of the Metropolitan wires, is absent on a vacation, Mr. Frank Casbill, filling her place, quite acceptably. "Tommy" Knox is on second N. Y. Duplex. "Jim" Fish, on the Omaha local. The "original John" (not "cheap John") Strong is working the Springfield wire, while Olin Hamilton helps Miss Lizzie Veazey to hold up this end of the St. Louis Duplex. Whitcomb is back on Dubuque wire, "happy as a clam at high tide." "Eph" Martin is on the Fort Wayne wire, and Lawson works things harmoniously (?) on Dubuque No. 2, with the numerous way offices on that string.

"Hoffman," our Frenchman, one of the "classic" boys, works with La Salle and tries to keep (jolly yet) Joliet from growling.

McCord, one of the extras, gets his work in on "Mix" local. Everham is ever hammering around wherever he can make himself useful. Mrs. Connors has returned (without any brogue on her tongue), looking as fresh as a rose, from her extended trip in Ireland, and was as joyously welcomed as the flowers of May by her many friends, to whom she is constantly making valuable additions by the kindness she shows those operators on the Great Eastern. Our friend Willis has returned and taken one side of the "Ux" St. Louis (Board of Trade) duplex with Mr. Amsden. Messrs. Hatch and Meeker continue to make themselves generally useful on the way wires; one call is sufficient to bring them when within hearing. Mrs. Tillotson is making hosts of friends by the lady-like manner in which she holds up this end of the Amboy line; and the Chicago and Pacific boys, as well as the C. D. and V. operators, think no one suits them so well as Miss Glasson. Although "Halley" only has that one arm left, and it is "left," he manages to keep it warm enough on the Pittsburgh duplex days, with Mr. Stevely, the old P. and A. manager. Mr. Beidler has been transferred from the W. U. night force at Philadelphia to the same force here. He is a perfect little gentleman and a fine operator. "Fatty" Stewart has been placed on the first N. Y. duplex nights regular, to fill the vacancy caused by Eitemiller's departure. Charlie Wilkinson, formerly of the Detroit wire, here days, is taking a turn with us as an extra man nights, occasionally. This isn't a good day for personals, so I'll stop. WESTERN UNION.

Mr. W. H. Woodring.

The departure of no gentleman from the midst of us could have occasioned more sincere regret than will that of Mr. W. H. Woodring, who has just resigned his position as Manager of the Western Union Telegraph office in this city. Mr. Woodring has been a resident of St. Joseph for more than ten years, and during that time has established here a reputation for strict fidelity to business, energy and honesty that he has every reason to be proud of, and that every young man would do well to emulate. In his social life, too, Mr. Woodring has attached himself strongly to the respect and hearty esteem and affection of our people. His genial, courteous manners, his accommodating ways and his gentlemanly bearing, at all times and upon all occasion have placed him high in the opinion of all. As an earnest worker in the cause of religion he has had few equals. For several years he has been a member of the Official Board of the Francis Street Methodist Church, and has for a long time conducted the excellent choir of that church. He has always enjoyed the reputation of a high-toned, Christian, charitable gentleman. We repeat, his departure from St. Joseph will occasion universal regret.—*The St. Joseph (Mo.) Gazette.*

Duplex and Quadruplex Telegraphy in America.

Dr. KARL EDWARD ZETZSCHE, of Chemnitz, Saxony, has recently published in the Polytechnische Zeitung, a paper upon the combination of telegraphic double-speaking with a counter-speaking, or as it is termed in this country, quadruplex telegraphy, for a copy of which we are indebted to the author. There is probably no person living who has devoted so much attention as Dr. ZETZSCHE to the history and development of simultaneous and multiple transmission, and other out-of-the-way branches of practical telegraphy. We republish Dr. ZETZSCHE'S paper in the present number of THE TELEGRAPHER, as our readers can hardly fail to desire to know what he has to say upon a subject of so much general interest to American telegraphers as the quadruplex. At the same time we wish to call attention to some errors into which the author appears to have fallen in his discussion of the subject.

It is unquestionably true that when Mr. STEARNS first introduced his duplex apparatus, he, like other American and even English electricians, was very imperfectly acquainted with what had already been accomplished in that direction on the continent of Europe, and it is also true that in some of its details, of which he at that time supposed himself to be the original inventor, he subsequently proved to have been anticipated by earlier experimenters. But the assertion that "he really added but little of undoubted merit" to the invention, as it existed at the time he took it up, certainly does him great injustice. It was STEARNS who was the first to

arrange the compensating rheostat coils in such a manner as to maintain the resistance of the circuit unaltered in every position of the key; and he was likewise the first to compensate the effects of the static discharge of the line, which he accomplished by the simple and effective device of the condenser. It is not too much to say that the latter is unquestionably the most important advance made in duplex telegraphy since the improvements of FRISCHEN in 1854. A leading German electrical writer, as late as 1863, asserted that "the operation of the duplex (Gegensprechen) on underground and submarine lines is utterly impossible by reason of the interference of the static charges." (Dub. Anwendung, etc., p. 468). Yet such lines are now operated successfully, and by Mr. STEARNS'S method. Above all, it is to Mr. STEARNS more than any other that the practical introduction of duplex telegraphy as a system of every day utility is due. Laying aside his other business, he has for a number of years devoted his time entirely to the improvement and practical introduction of that system, and thus it has been brought into use all over the world.

Nor is there much more reason for the intimation that we in America were entirely ignorant of what had been accomplished abroad in the direction of quadruple transmission prior to the year 1874. It is not reasonable to look for a very high degree of scientific or historical accuracy in the hasty, superficial and sensational reports of remarkable inventions and discoveries which appear from time to time in the daily newspapers. So when one of these first announced the Prescott-Edison quadruplex, with an unusual flourish of trumpets, we took pains to point out at the time, as Dr. ZETZSCHE will find by referring to THE TELEGRAPHER of July 18th, 1874, that these parties were not entitled to the sole honor of the discovery, inasmuch as the idea had suggested itself to Dr. STARK and Dr. BOSSCHA, in 1855, and had been practically worked out in 1863, in which connection, by the way, we referred to Dr. ZETZSCHE'S pamphlet of 1865, from which he quotes so liberally in his present paper. It was, therefore, certainly not the fault of THE TELEGRAPHER if its somewhat numerous constituency did not know something of what had been done elsewhere. Every intelligent person is of course well aware that these facts do not necessarily detract in the smallest degree from the credit properly due to the novelty, originality or intrinsic merit of the more recent invention.

It may, perhaps, be well for us in this connection to explain the reason why a complete diagram of the quadruplex apparatus was not published with Mr. JONES' paper, as suggested by Dr. ZETZSCHE. As most of our readers undoubtedly know, the title to the invention is in dispute, and the patent is still pending in the United States Patent Office, and until this is officially issued, the invention is of course private property, in every sense of the word; and although we had at that time, and still have in our possession, detailed drawings of the apparatus, yet it would be a manifest impropriety for us to publish them until the patent has been issued in due form. Such a premature publication might very possibly result in great pecuniary damage to the legal owners of the invention, as in the case of the English patent for Prof. MORSE'S telegraph, which, it may be remembered, was rendered entirely worthless by a similar indiscretion.

In regard to the practical objections pointed out by Dr. ZETZSCHE, it may be well to mention, what many of our readers already know, that they have been completely overcome by a very simple device, which has been in use upon a dozen different lines, varying from 100 to 500 miles in length, for many months, and with entire success. For reasons already stated, we do not yet feel at liberty to publish the details of this and other improvements which have been made in the apparatus. We would, however, certainly feel very much gratified to have the learned Doctor visit us during the Centennial year, and we will aid him to the best of our ability in astonishing himself by an investigation of our duplexes, quadruplexes, type-printers, automatics, fire alarms, district telegraphs and light-

ning sound operators, an occupation which will furnish him with abundant material for another of his excellent books.

The Telegraphic Situation.

It would require the larger portion of the space in THE TELEGRAPHER to record all the rumors and reports which have been rife during the past week in regard to the relations, present and prospective, of the Western Union and the Atlantic and Pacific Telegraph Companies. As a majority of them are mere surmises, or stated and circulated for effect upon the stock market, it is unnecessary to do this, and we shall endeavor to give the actual position of affairs as nearly as we have been able to ascertain it.

In preparing our statements of the telegraphic situation we endeavor to state facts so far as they are attainable, but the parties to negotiations, or supposed negotiations, between the two leading telegraphic organizations of the country are naturally somewhat reticent, and until a definite result is reached not disposed to expose their intentions, or give very definite information in regard to what is done or attempted to be done in bringing about more friendly relations between them.

In another column we reprint a communication from President ORRON, of the Western Union Company, to the Commercial Advertiser of this city, drawn forth by the statements and criticisms of that paper. It will be seen that Mr. ORRON denies the statements that he is in collusion with Mr. JAY GOULD for a change in the directorate of the Western Union Company, and expresses his decided preference to the present management of the company. He also intimates that his company would not be unwilling to acquire the lines of the Atlantic and Pacific Company, and is of the opinion that it may have occasion within the next year for 10,000 miles of additional wires, and if these can be obtained of its competitors cheaper than they could be built it would be better to purchase than to build them.

There is this much of truth in the reports which have been and are in circulation: that the Executive Committee of the Western Union Company recently appointed a committee, comprising Messrs. E. D. MORGAN, HARRISON DURKIE, and FRANK WORK, to confer with the representatives of the Atlantic and Pacific Company for such arrangements as should be for their mutual interests. The result of their labors, so far as is publicly known, is a return of both companies to the rates between Boston, New York, Washington, Albany, and some other places in operation previous to the reduction made by the Atlantic and Pacific Company when the change in its management took place. The Atlantic and Pacific thus practically abandons the stand taken under the new regime of reducing tolls, and will of course make no further reductions, as promised, except by agreement between the two companies. The reductions formerly made were not very large and the prices now charged are not excessive.

There has been as yet no consolidation of the two companies, and we adhere to the opinion formerly expressed that there will be none, for the present at least. It would require a vote of three-fourths of the stockholders to legalize such a consolidation, and that it would probably be difficult, if not impossible, to obtain. A lease of the Atlantic and Pacific lines to the Western Union would require the assent of a considerable majority of the stockholders, which it is not believed could easily be secured. The only practicable arrangement which could be made without an appeal to the stockholders would be a pooling of the receipts or profits of the companies, and it would be very difficult to arrange a basis for this which would be mutually satisfactory. Still, something of this kind may be done. This, however, would be likely to lead to litigation.

The situation at present is rather complicated, and it may be some time before matters work out. It is just about what we, and many others anticipated as the result of Mr. GOULD'S sudden and absorbing interest in telegraphic matters, and he is of course endeavoring to

manage things in such a way as shall afford him the largest profit.

There are no new developments in regard to what is popularly believed to be Mr. GOULD's desire and plans to secure a controlling interest in the Western Union Company. We hardly consider his chances of success in this as at present very promising. The rumors and excitement will be kept up until after the annual meeting and election which takes place in October. After that it will quiet down until the approach of another election. In the meantime *somebody* will profit by the fluctuations in the price of the stocks of both companies.

There are no new developments in regard to the California National Telegraph enterprise further than that the managers of that company continue to assert their intention of going ahead and building the system of lines as originally proposed. It would, no doubt, be decidedly to the advantage of the California company if the Atlantic and Pacific Company were really absorbed by the Western Union upon any terms. That there will be telegraphic competition in any event is indisputable. The public demand and will have it.

Death of Mrs. W. H. Sawyer.

In another column will be found a notice of the death of the wife of Mr. WILLIAM H. SAWYER, formerly General Superintendent of the American District Telegraph Company in this city, and now engaged in establishing circuits for the District Telegraph Company in Philadelphia.

Mrs. SAWYER has long been in declining health, and has been subject to severe suffering, which she has borne with exemplary patience and fortitude. It has for some time been evident to her, as well as to her husband and other relatives and friends, that she could be spared but for a brief time, but it was hoped that she would at least survive for some months yet. Her husband will have the heartfelt sympathy of his numerous friends and acquaintances in the severe affliction which has fallen upon him. He will have the consolation of knowing that nothing which he could have done to lessen her sufferings or prolong the life of a partner to whom he was deeply attached, was omitted, and that after the trials and sufferings of earth she has gone to a better world.

Personals.

Mr. D. W. H. VOORHIES, of Galveston, Texas, has accepted a position with the W. U. at St. Louis.

Mr. CHARLES L. SNYDER, has been appointed to a position on the day force, St. Louis W. U. office.

Mr. DAVID CAMPBELL, Jefferson, Texas, has been appointed to a position in Houston, Texas, W. U. office, *vice* Mr. FRANK GWYNNE, resigned.

Mr. ALBERT BREWER, who has been taking night report at Sedalia, Mo., W. U. office, has resigned.

Mr. E. D. MORTON, late of Philadelphia and Washington, is on the W. U. night force at 197 Broadway, New York.

Capt. GEORGE EITEMILLER, from Chicago, and who is undoubtedly the finest operator in the business, put in an appearance at 197 Broadway, New York, and goes to work at once on the day force, on the Cincinnati duplex, *vice* KEARNEY, for the present.

Mr. H. T. O'REILLY who works the Albany Quad. at 197 Broadway, New York, is working a few days at Saratoga.

Mr. J. MURRAY FAIRCHILD, manager of the New Haven, Conn., Western Union office, has resigned the Superintendency of the Fire Alarm Telegraph in that city, of which he has had charge from about the time it was first established.

The Telegraph.

By Cable.

SAILING OF THE FARADAY.

LONDON, August 13.—The steamship *Faraday* sailed to-day to renew operations for the repair of the injured part of the Direct United States Cable.

The Direct United States Cable.

THE *World*, of London, referring to the completion of the Direct United States Cable, says: "The Faraday went out in April to complete the laying of the cable. It started somewhat too early, but when the ice cleared away it laid its cable, and messages were transmitted between New York and the office in London at a speed of about twelve words per minute. There was, however, a trifling defect in the insulation about 250 miles from Newfoundland. A like defect exists in the French cable of the Anglo Company, and is rather a theoretical than a practical fault, for it does not interfere with the transmission of messages, and, curiously enough, rather increases the speed of transmission. The Faraday was, however, ordered on her return voyage to cut out this defect. She therefore broke the cable in two places, and separated about 35 miles from each other. On breaking the Irish end, last Saturday week, she called attention to the fact that she had only 50 miles of surplus cable on board, and that whilst 50 miles ought to be enough, even with slack, to lay 35 miles, yet that it might perhaps be safer to have more. The Company had about 70 more miles in London; and after some discussion between the ship and the office, through the cable, it was determined that she should return to England to take in these 70 miles. She will at once start again to the gap. Her business will be to take up the Irish end, to splice it to the cable on board, to run out 35 miles of cable, and then to effect the final splice to the American end in shallow water. There is no reasonable doubt, therefore, that the cable of the company will be open for public traffic in a few weeks."

New York City Telegraphic Notes.

Mr. RICHARD CHARLTON one of the night clerks at the W. U. general operating room, Broadway and Dey streets, is probably one of the best informed persons in regard to the city in New York. He brings forcibly to mind Dickens' great character, Sam Weller, in the Pickwick Papers. Sam Weller was probably (as delineated) the best informed youth amid the toil and moil of London. He could give the minutest directions for finding any place in that great city and never erred. So it is with the gentleman in question. He has for his nightly labor the routing of the entire city business of the company. When it is remembered that there are ever one hundred branch offices from which are delivered four fifths of the entire business of New York office, the magnitude of the undertaking will be appreciated. During the day and up to nine in the evening all offices are open and the business has a certain channel; at nine nearly half of the branches close, and the routes extend, and messages must be sent to different offices. Later more offices close and the routes widen again, and at twelve, when but six offices are left, they extend once more, and the six deliver from Harlem to the Battery. It will be seen that it is no feat of a job to route and mark this business, and do it in an expeditious and correct manner. A mistake is never made however by Mr. Charlton, who never consults the books, and tells at a glance the proper office at any hour of the night. He is even better informed on Brooklyn, and is as infallible as the eminently solid Muldoon. While he was a messenger, years ago, it is said that he knew every firm's location below Canal street, and could in most instances give their street number. Gen. T. T. Eckert, then general superintendent of the company, gave him a letter upon his promotion to a clerkship, characterizing him as the smartest boy the company ever employed. A bright future may easily be predicted for this precocious genius.

The Italian Telegraphs.

THE reports of the Italian Telegraph Service show that its development has very largely increased since 1861, when the present constitution of the empire was established. The following extracted statistical table of comparison will briefly show the increase:

	1861.	1873.
Length of lines.....	4,971 miles....	13,670 miles.
Length of wires.....	8,078 ".....	43,497 "
Number of offices.....	225.....	1,622
Number of instruments.....	400.....	2,800
Gov't messages per annum.....	180,000.....	300,000
Private messages per annum.....	600,000.....	5,040,000

Foreign Telegraphic Notes.

Mr. BURTON, Director-General of Telegraphs, conducted some highly interesting telegraphic experiments at the National Government House, Buenos Ayres, recently, in presence of President Avellaneda and a distinguished company. The chief attraction was the sending simultaneously different messages in opposite directions along the same wire. The President warmly expressed to the Director-General the great pleasure the experiments had afforded him.

The steamship Great Eastern has left the old moor-

ings in the Medway for Milford Haven, where she is going to be laid up for the present. The Telegraph Construction and Maintenance Co. have not renewed the charter they had of her, which has just expired.

The *Golos* announced the arrival at St. Petersburg of M. La Cour, assistant director of the Copenhagen Physical Observatory, in order to submit to the telegraphic conference a new invention in telegraphy. That invention gives the possibility of transmitting despatches between two telegraphic stations through one wire only, and by means of many instruments, so that transmission by one instrument cannot impede the action of the other. M. La Cour, whilst engaged some years ago in investigating the passage of electric currents through conducting media, found that electricity is transmitted from place to place by undulations analogous to those of sound. In consequence of this discovery, he hit upon an arrangement of electro-magnets and tuning-forks, by means of which a particular current passing through a tuning-fork pitched to a certain note does not become merged in or confounded with other currents which, after passing through differently pitched tuning-forks, are simultaneously transmitted along the same wire. This, of course, renders it possible to send many messages at a time through a single wire.

The directors of the Eastern Extension, Australasia and China Telegraph Company offer for subscription an issue of £320,000 in six per cent. debentures to bearer at par, repayable in 1891. The loan is rendered necessary to enable the company to provide the cable which is to connect Australia with New Zealand.

The Western and Brazilian Telegraph Company have received telegraphic communication announcing the completion of the cable to Monto Video: "Land lines between Brazil and Monte Video cut by revolutionist in Uruguay."

The total number of messages forwarded from postal telegraph stations in the United Kingdom, for the week ended July 31, 1875, was 463,360—an increase on the corresponding week last year of 55,074.

The Peruvian exploring vessel *Chalaco* has been engaged in taking preliminary soundings between Chorillos in Peru and Chaldera in Chili, with the view of laying the submarine cable between these two points. The route examined was on a line starting from Chorillos and passing within four miles of the Island of San Gallan, forming here a slight deviation towards the coast, and then running parallel to it for about twenty miles, about eight or ten miles off. The depth of the sea as far as San Gallan is not great, not exceeding a maximum of one hundred fathoms, the bottom being all along a mixture of mud and gravel. From thence the soundings began increasing as far as the Merre of Chala, where a depth of 600 fathoms was noted. The submarine exploration, so far as it goes, proved that no difficulties would be met with in laying the proposed cable.

In the financial year ending the 31st of March, 1871, the number of messages sent by the British Post-office telegraphs was 9,850,177; in the next year, 1871-72, the number rose to 12,473,796; in 1872-73 it was 15,535,780; in 1873-74, 17,821,530; and in 1874-75, 19,253,120.

Intelligence has been received by the India Rubber, Gutta Percha and Telegraph Works Company, by telegraph, of the successful laying and completion of their cable between Callao and Islay, in Peru. This section, about 460 miles in length, is the first of a series of cables, with stations at Arica and Iquique in Peru, and Chaldera in Chili, which will place those ports, as well as Lima and Valparaiso, in telegraphic communication with Europe—first, by the Transandine wires and the Brazilian cable system, and ultimately by the Isthmus of Panama, when a cable shall have been laid thence to Callao.

Telegraphic and Electrical Brevities.

THE Electrical Construction and Maintenance Company of San Francisco have contracted with the Los Angeles and Independence Railroad Company for the construction of a telegraph line from Santa Monica to Los Angeles, as soon as the material can be obtained. Mr. Haines will superintend the construction of the new line.

At the General Term of the Superior Court of New York, recently, Judge Curtis rendered a decision of interest to merchants and others, who have occasion to use the telegraph in their business transactions. The Court held that a telegraphic despatch agreeing to accept a draft is equivalent to a written promise to accept, and under the statute makes the person sending the despatch liable as acceptor. The law thus sanctions what could hardly be seriously questioned, that if a written promise is legally binding, it is equally so when sent by telegraph as when sent in any other manner.

On Saturday one of the employes of the Atlantic and Pacific Telegraph Company was engaged in fixing a wire on a pole at the corner of Ferry and South Market streets, Newark. He was near the top of the pole, when it suddenly fell to the ground, carrying him with it. He was removed to St. Michael's Hospital, when it was discovered that his spine was most seriously injured.

Good News for Telegraph Repairers.

The Chief of Police in Philadelphia has given notice that hereafter the ordinance prohibiting the flying of kites in the highways or public squares in that city will be rigidly enforced. Parents and guardians are earnestly requested to see that those under their control obey the law, so that accidents to persons and property may be avoided. The penalty for violation is \$5, and the Press says that the order has become necessary, in consequence of a number of accidents to persons or injury to property that have occurred within a few days. In addition to this, the wires of the Police and Fire-Alarm Telegraph have been so injured as to be useless for hours.

The Last Tribute of Respect to the Late George H. Mumford.

The remains of the late Vice-President of the Western Union Telegraph Company, Mr. George H. Mumford, whose death in Paris, July 22d, has been previously announced, arrived at this port on Tuesday evening, the 10th inst., on the steamship Gellert, of the Hamburg line. A committee appointed at the meeting of his friends and associates received the body, and it was temporarily placed in the receiving vault of the chapel of Christ Church, in this city.

On Monday morning last the remains were conveyed to his former home, at Rochester, N. Y., in a car appropriately draped by the master carpenter and other Western Union employes. The remains were accompanied by Vice-President Norvin Green; General Superintendents Stager, Van Horne, and Hinchman; District Superintendents Brown, Holmes and Gifford, and Messrs. Van Every, Reid and Watson, officers of the company. President Wm. Orton, Treasurer R. H. Rochester, and General O. H. Palmer, formerly Vice-President of the company, all proceeded to Rochester by the evening train to attend the funeral, which took place on Tuesday last.

[From the New York Commercial Advertiser.]

President Orton on his Reputed Relations with Mr. Jay Gould, and Proposed Consolidation of the Atlantic and Pacific with the Western Union Company.

To the Editor of the Commercial Advertiser.

SIR—For several weeks past the financial columns of the Commercial have contained frequent mention of my name in connection with allegations and insinuations to the effect, substantially, that I had entered into a conspiracy, or an arrangement, or was a party to an understanding with Mr. Jay Gould, looking to the turning out of certain of my present associates in the Western Union Board at the annual election in October and the substitution of Mr. Gould and his friends. Concerning these allegations and insinuations, the latest of which appeared in the Commercial of yesterday, permit me to say:

First—It is not true that I desire to be rid of any of my associates in the directory of the Western Union. If I have any cause of complaint concerning their conduct toward me, it is that they have been far too lenient and confiding in the adoption of my plans, and in putting upon me the sole responsibility of carrying them out.

Second—It is not true that I have an arrangement or understanding, expressed or implied, with Mr. Gould, or with any person in his behalf, or with any other person, concerning what shall be done at the annual meeting of the stockholders of the company in October, either in respect to directors or officers than to be chosen.

In view of the fact that I have been chosen President of the company by a unanimous vote at every election since the first, and that, too, without solicitation or effort on my part, it has not occurred to me that it would be necessary to enter into a combination now to prevent my "decapitation."

No one will question the right of Mr. Vanderbilt and his friends to sell their Western Union shares whenever they choose, nor the right of Mr. Gould to purchase such shares, even to the extent of a controlling interest. But I will say frankly that I should be sorry to part company in business with Messrs. Vanderbilt, Schell and Banker, whose names have been mentioned in the Commercial, and I would not willingly exchange them for any of the parties who have been named as their probable successors.

And now that I am, metaphorically, on my legs, let

me add, touching the rumors as to telegraph consolidations:

The Western Union Company can use to advantage, and may absolutely require, within the next twelve months, ten thousand miles of additional wires. If these additional facilities can be acquired of companies now using them in competition with us cheaper than we can erect them, clearly it would be for our interest to buy out such companies rather than to erect new wires. But we have made no proposition for the purchase of any competing lines, and no proposition has been made to us that would be for the interest of the Western Union to accept.

Very respectfully,
WILLIAM ORTON.

The Telegraphers' Mutual Benefit Association.

ASSESSMENT NOTICES.—No. 77, ISSUED AUGUST 2, 1875.

DEATH OF JOHN TREVOR.

JOHN TREVOR, of Rochester, N. Y. (Certificate No. 484, issued March 26, 1869), died in Rochester, July 5th, 1875, of peritonitis.

Mr. Trevor, formerly a telegraph line repairer, was at the time of his death a bank patrolman in Rochester, and was shot by a man who had escaped from custody and whom he was attempting to arrest.

One dollar for assessment 77 is due from members holding certificates numbered up to and including No. 2,468.

RECEIPT OF ASSESSMENTS.

NEW YORK, Aug, 10, 1875.

ASSESSMENT No. 77.

4, 16, 21, 28, 53, 64, 74, 77, 82, 86, 88, 90, 103, 131, 138, 140, 143, 157, 181, 208, 211, 217, 269, 274, 277, 289, 301, 319, 332, 361, 383, 416, 434, 464, 467, 476, 509, 526, 536, 547, 549, 553, 564, 565, 575, 594, 597, 604, 622, 626, 646, 649, 703, 721, 731, 740, 742, 787, 804, 830, 832, 843, 859, 901, 911, 915, 916, 917, 923, 977, 1011, 1024, 1039, 1054, 1081, 1126, 1143, 1148, 1154, 1173, 1178, 1183, 1182, 1185, 1199, 1205, 1225, 1252, 1266, 1289, 1298, 1300, 1306, 1333, 1345, 1357, 1394, 1398, 1402, 1403, 1404, 1407, 1409, 1410, 1490, 1502, 1503, 1516, 1527, 1560, 1568, 1571, 1579, 1615, 1623, 1625, 1635, 1830, 1831, 1852, 1894, 1901, 1944, 1957, 1964, 1986, 1995, 2019, 2029, 2030, 2049, 2066, 2069, 2082, 2097, 2133, 2135, 2141, 2162, 2164, 2172, 2174, 2175, 2178, 2212, 2214, 2228, 2229, 2233, 2239, 2240, 2242, 2259, 2279, 2281, 2282, 2283, 2287, 2305, 2322, 2337, 2343, 2346, 2352, 2359, 2390, 2391, 2896, 2397, 2400, 2403, 2412, 2413, 2414, 2427, 2428, 2435, 2442, 2444, 2445, 2450, 2455, 2468, 2469, 2470.

ASSESSMENT No. 76.

27, 39, 228, 237, 238, 242, 246, 258, 273, 294, 347, 392, 393, 394, 402, 441, 451, 453, 455, 457, 542, 556, 557, 652, 661, 692, 701, 710, 722, 766, 781, 783, 786, 802, 809, 835, 838, 871, 906, 926, 944, 980, 1000, 1002, 1014, 1016, 1041, 1135, 1138, 1136, 1141, 1196, 1255, 1256, 1277, 1281, 1283, 1284, 1285, 1286, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1366, 1385, 1390, 1391, 1405, 1427, 1430, 1432, 1433, 1444, 1465, 1469, 1471, 1474, 1476, 1481, 1513, 1558, 1573, 1586, 1616, 1619, 1649, 1666, 1673, 1700, 1701, 1704, 1715, 1716, 1731, 1737, 1746, 1747, 1778, 1785, 1786, 1828, 1854, 1974, 1976, 1982, 2023, 2037, 2050, 2063, 2085, 2120, 2177, 2182, 2227, 2257, 2269, 2280, 2284, 2286, 2293, 2309, 2320, 2325, 2326, 2328, 2353, 2360, 2364, 2365, 2398, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2425.

ASSESSMENT No. 75.

100, 569, 574, 870, 942, 1164, 1207, 1237, 1238, 1270, 1609, 1660, 1661, 1662, 1663, 1844, 1845, 2128, 2131, 2167.

Members of the Association who look to THE TELEGRAPHER for receipts of assessments paid, will please take notice that an acknowledgment of the receipts of one assessment should be taken as a receipt for all previous assessments.

Quotations of Telegraph Stocks at N. Y. Stock Exchange.

Showing Lowest and Highest Prices each day during week.

Table with columns: August, WESTERN UNION, ATL AND PAC, AMER. DIST., GOLD AND STOCK. Rows show price ranges for various dates from August 12 to 17.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended July 13, 1875, and bearing that date.

165,570.—CIRCUITS FOR ELECTRIC SIGNALS.—Thomas S. Hall and Geo. H. Snow, West Meriden, Conn. [Filed June 23, 1875.]

Designed more particularly for railroad signals, the purpose being that whenever the circuit is closed the current shall be compelled to traverse the same distance, and the resistance shall thus always be the same.

The combination, with a series of keys or circuit closers, C, D, of a battery and two line wires, A, B, one pole of the battery and one end of the line wire B being grounded, while the other pole of the battery connects with the line wire A, all constructed and operating substantially in the manner herein shown and described.

165,678.—POCKET TELEGRAPH RELAYS.—E. A. Hill, Chicago, Ill., and H. J. Schneider, Philadelphia, Pa., assignors to E. A. Hill, Chicago, Ill. [Filed June 18, 1875.]

1. The combination of the magnets C, piece E, for securing the magnets, and making a trannion support for the key, the stop plate N, and the key G, as specified.

2. The combination of the magnets C, stop plate N, sounder lever F, spring H, and inclined thumb-piece spindle I, as specified.

165,591.—NON-INTERFERING FIRE ALARM TELEGRAPHS.—Jos. W. Kates, Richmond, Va. [Filed April 23, 1875.]

To prevent operating instrument from locking itself, a rack bar carried by a pinion on a shaft of the clock mechanism comes into the path of the locking stop.

The herein described method of preventing interference of signals by connecting the instruments at the various signal stations by a second and independent electric circuit, which is opened or closed automatically, and operates the armature of an electro-magnet carrying a stop for the purpose of locking the clock mechanism to prevent the interference of signals, substantially as described.

2. The herein described method of automatically operating the armature provided with a stop for the clock gearing, by a non-conducting tape disposed and operated upon the same drums with the signal tapes, and having perforations at its extremity only, whereby the secondary circuit is closed when the instrument is not in operation, and is broken while the instrument is in operation, substantially as described.

3. The stop B, having the shoulder f, in combination with the rack bar g, spring i, and pinion h, substantially as and for the purpose described.

165,602.—CIRCUITS FOR ELECTRIC ALARMS.—George C. Maynard, Washington, D. C. [Filed April 24, 1875.]

For use with show windows, cases, &c., the breaking of the glass breaking the circuit controlling an alarm.

1. The combination, with a supporting base or plate of glass, in any desired form, of a metallic medium, applied thereto in the shape of letters, numerals, pictures, or ornamental work or device, and forming an electric circuit, or part of a circuit, adapted to be interrupted upon the breaking or cutting of the glass, substantially as and for the purposes set forth.

2. An electric conducting sign formed of a conducting medium or pigment applied for an insulating base, substantially as set forth.

B. A sheet of glass of any desired form, provided with an electric conductor, arranged in the form of letters, numerals, pictures, or other ornamental work or design, substantially as set forth.

165,620.—AUTOMATIC ELECTRIC TELEGRAPHS.—Wm. E. Sawyer, Washington, D. C. [Filed Feb. 2, 1875.]

Polarized relay adjusted to rapid work, and restored to normal condition by adjustable permanent magnet O. Throws into line currents, battery, and secondary of opposite polarities.

1. In a polarized needle telegraph relay, the combination of a polarized needle and a projecting contact piece operating with the needle, with a sliding bar magnet to act upon the polarized needle in the place of a spring, substantially as shown and described.

2. The combination of a line, transmitting battery and metallic contact point, brush or roller therefor, with a magneto-electric or induction coil apparatus, which throws into the line a current of one polarity and metallic contact point, brush or roller therefor, substantially as shown and described.

3. The combination in an automatic or chemical telegraph, with a transmitting apparatus, of a galvanic battery, so arranged that galvanic currents of one polarity will be thrown into the line, and a magneto-electric or induction apparatus so arranged as to throw into the line induced currents of opposite polarity to the galvanic battery currents, as and for the purposes specified.

THREE children, who were prostrated by a stroke of lightning that had first struck a tree, at Amerleus, Ga., all had more or less photographs of the tree imprinted on their persons.

Died.

SAWYER.—In Philadelphia, Pa., on the 15th inst., ANABELLA O., beloved wife of Mr. Wm. H. SAWYER, of the American District Telegraph Co., and daughter of W. H. and I. Baird, of Wilmington, Del.

ORTON'S PATENT PENCIL HOLDER

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread and will hold the pencil perfectly firm.

Price, 10 cents each.

Sent by mail on receipt of price.

Price per doz., 60 cents.

GEO. H. BLISS & CO., Gen'l Agents, 220 Kinzie Street, Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

pony relay, price \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. See above Cut.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 34
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 1/2 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Callaud battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties O. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense. Other goods will be sent C. O. D., as usual, or on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other instruments, Batteries, Supplies, Chemicals, &c., sent on application. All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to.

P. O. Box 5,603.

36 Vesey street, New York.

WESTERN ELECTRIC MAN'G CO.

CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

WESTERN ELECTRIC M'G CO.,

CHICAGO, ILL.

Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent **Platina Connection**, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

Burmah.—Hunting by Lightning.—The Alligator and the Telegraph.—How he "received" more than he "sent."

BY MEPHISTO.

(Concluded from page 193.)

"SCIENCE, sir, is a great thing. By the help of science we do in a few moments and with great completeness what brute force can never accomplish; science, sir, shall help us to overcome the monarch of the forest or the king of the turbid river. Electricity, sir, is the future power of the earth; when man has learned the laws that govern it he shall control a force which is Titanic in its tremendous energy, and infinite in its possibilities; and two or three hundred thousand years hence, friend Mephisto, when you and I are floating around in space, we shall pay a visit to our former abode, and see the fruition of thousands of years of profound scientific inquiry, in the utter annihilation of time and space; and it will be accomplished through the agency of the 'vril-ya,' a term which you will understand if you have read 'Bulwer's Coming Race,' and if you have not, I advise you to go and read it."

Thus the genial and profound George; and while I gazed at him in mute admiration of the gigantic intellect which directed the intricacies of the Rangoon telegraph office, I wondered within myself what he was doing. He had collected a select assortment of stone jars, glass jars, old pickle jars, all sorts of jars (except family jars, which, being single, he had as yet carefully avoided), all more or less demoralized, and in need of the cleansing influence of warm water. He had bored the engineers and ship's carpenters to death hunting up old scraps of zinc and copper; had coaxed the doctor out of his whole supply of sulphate of copper, and was now busy as a bee and happy as a clam when the tide is in, twisting wires, and suspending zincs, and arranging coppers, and making himself and the quarter-deck in an awful muss generally.

"Whatever are you doing, George?" I asked; "the First Luff will raise hair when he sees this mess on his clean decks, and it seems to me you're wasting a heap of time and energy on what is only a useless toy after all."

"Useless toy, sir," he retorts, with all the fury his gentle nature is capable of, "useless toy! do you say? Why, confound your impudence, sir, are you so utterly ignorant as not to know that copper, and zinc, and sulphate, and all these things go to make up a battery, and that in a battery is generated electricity—that power which I have before had the honor to point out to you is destined to move the world? Why—"

"There, there, old fellow, don't get excited; be calm, and explain to me what it is you are at."

"No, sir," he answered; "to explain to an ignoramus is to waste one's breath; but an ignoramus may watch me as I proceed, and pick up the crumbs of knowledge that fall from the table of science."

And so I humbly gazed in mute awe as he "rigs his battery." There is a complicated arrangement of zinc and copper and wire, and then the jars are filled with water, and a portion of sulphate of copper put in each jar, and then some sulphate of zinc is added, and after various manipulations and alterations my friend announces—

"She'll soon work splendid."

But *cui bono?* To what end all this fuss and preparation? I am consumed with curiosity, which does no good, as G. is inexorable, and I am to "wait and watch."

We had left Merqui, and were steaming up between the Archipelago and the main land of the Tenasserim coast, heading for the Savoy river, expecting to arrive at the entrance thereof the following day. Our hunting experiences in Merqui had resulted somewhat meagrely; a few deer and many snipe being the sole result of our many weary tramps; and my friend had not ceased to abuse me for the lack of sport, though for the life of me I could not see, and cannot to this day, what I had to do with our ill success. But such is the gratitude of the world! As an old Eastern proverb says, "Give a man a ladder to climb up by, and

instantly he will turn his back upon you." And now I could see George was brimfull of some grand scheme. I noticed that he and Captain-B. were getting very confidential, and held long consultations together; and the result of these scientific manipulations and consultations was very shortly to be revealed. Early one morning the gunboat entered the mouth of the Savoy river, and, as the ebb tide had just made, was obliged to anchor. She lay in the stream about three hundred yards from a long, low sand and mud bank, on our starboard beam, and shortly after anchoring a boat was lowered and moored about half way between the ship and the bank.

"And now, oh most potent Mephisto," said George, "you shall have an illustration of the triumphs of science over brute force. Be for once my satellite! Fly hence, and cause that ebony colored *chef de cuisine* of yours to take the life of a full grown rooster, or other gallinacious ornithological specimen, and utterly denude it of its plumage and carefully remove its internal economy, and then bring it to me. Away!"

Verily the man is mad, I thought, but I'll do his bidding. Here cook, you black son of a chiropodistical hexameter (always use long words if you want to floor a nigger), rush round and kill a fowl, pluck and clean it, quick. So said so done; the rooster crowed his last crow, and in the shake of a lamb's tail he was handed over clean, as per order. I bore him in triumph to George, who received him with all the airs of the great Tyeoon.

"Now George, if you'd only asked me I'd have had him cooked for you—spread eagled, deviled, what you would—but if you *must* eat him raw." "Hence! horrible shadow!" was the answer, "visions of dyspepsia vanish into air! Eat him? Why, my long-eared friend, you are positively trying to be facetious—see!" And taking the defunct chanticleer in one hand, he with the other thrust into his abdominal cavity a soda water bottle filled with a dark substance, which I subsequently discovered to be gunpowder. It had two wires coming through the cork, both what telegraph people call "insulated," i. e., covered with gutta percha. A boat was manned—George with a long coil of wire, his deceased and stuffed rooster and a few short stakes, got into the stern sheets, I volunteered for coxwain and we shoved off, paying out wire over the boat's stern as we went, the ends being fastened on board the steamer; pulling past the half way boat the wires were trained over her gunwales. This was rendered necessary, as otherwise the tide, in a span of three hundred yards, might have broken the wires with the heavy wash and rush of the water. Thence to the sand bank, by this time some six feet out of water with gradual slopes towards the river. Having landed, George drove a stake into the sandy mud, and took a round turn or two with the wires on it. This took the strain off and allowed about ten yards of slack wire with the rooster attached, like a tassel on the tail of a kite, to lay loosely on the ground. Then getting into the boat we returned to the ship, made our boat fast astern, and awaited developments. George got his instrument ready, and then I ventured to inquire to what end all this tended.

"Sir," said he, "when you beguiled me from civilized life to wander with you over seas and through jungles, you promised me some sport; fun you call it. Now my ideas of fun do not coincide with yours; for instance, I am unable to perceive the most microscopic atom of fun in being eaten by red ants while attempting to preserve one's equilibrium at an elevation of twenty feet from the ground on a rickety bamboo platform: neither do I see much sport in toiling all day in a broiling sun up to one's knees in mud and water, with a fourteen pound gun over one's shoulder, to be rewarded with one snipe and two paddy birds. But I do see sport in sitting here comfortably on Her Majesty's quarter-deck, surrounded by Her Majesty's officers, and under the meteor flag of old England." "Stop, Mr. D." chimed in the skipper, "for Heaven's sake don't gush."

"Well, the short and the long of it is just this, if I can't get a tiger's skin or an elephant's tusks I'll have the head of an alligator. Gaze on this apparatus; soon as I close this circuit the electric spark will ignite the powder which is in the soda water bottle, which is in the martyred gallinacean, which will be at that precise moment in the stomach of an alligator. That powder once ignited, our amphibious friend will be what Americans call 'a busted up concern,' and I, even I, will go and decapitate him, and I shall possess the object of my ambition, the head of a cayman."

Prostrating ourselves before the sublimity of scientific genius, we raise eyes and hands in bewildered astonishment at the gigantic dimensions of an intellect so superbly colossal. By noon the sand bank was dry for several hundred yards east of us, and it being a blazing hot day, some five or six large alligators had crawled out of the water and were basking in the sun—one of them, and ho a huge one, not twenty yards from our bait. Presently he seemed to sniff a sniff, and like a Chicago hummer he did not hesitate to go for a free lunch. Crawling rapidly towards the dead fowl he opened his enormous jaws and in a moment it had disappeared in the cavernous opening. But George had his eye on

him, and even ere his teeth had closed on the wires he touched the instrument, there was a loud report, the air was darkened with pieces of alligator reduced to mince-meat flying in all directions, and Mrs. Alligator was left a widow and her children fatherless. George was delighted. The boat was manned again, he bounded on to the sand bank, he rushed on his prostrate foe to take his head; but woe is me that I should live to tell the tale! there was no head! *It had been blown into atoms by the discharge!* Poor George! Poor alligator!

The Meanest Man.

BY O. H. KAY.

"SPEAKING of originality, I am reminded of a person with whom my own unworthy self once came in contact."

Thus spoke Bob Whiting, one of a party of half a dozen who had gathered around the fire in the large, roomy old office of F. one evening during the time I worked there. It was customary for us to gather around the fire there evenings after business hours and make ourselves as comfortable as possible, and to while away the time, frequently until a late hour, with relating our remembrances of times past. On this evening business had already begun to slack, and we had yet to get two brief reports of stock due next morning for the Union Yards, and a modest batch of reds for the Great Western Manufacturing Company, before cutting out and closing business for the night. One or two of the boys from the "opposition" across on the other corner had already taken their places, and the rest dropped in soon after.

Bob drew a few complacent whiffs at the meerschaum with which he was struggling, and continued:

"I had been out of work pretty much all winter and was not therefore over and above flush. I was, at just the particular time of which I am about to speak, interested in looking for a situation, and almost anything would have been acceptable. It therefore happened that I called in at the despatcher's office of the X. & T. Y. Railroad and inquired for the division operator. A man of thirty arose from a table in the centre of the room, strode over to the counter where I stood, and said: 'I am the division operator.' I stated that I was an operator out of employment and desiring a position. Almost anything would do. I had excellent references, was a first class man, had had a varied experience, and could do all kinds of work, I said. 'Well,' says he 'come in, I will talk with you.' He opened a gate at my left and I passed through and followed him to a cosy and sumptuously furnished apartment adjoining the telegraph office. Motioning me to a chair and seating himself in one, he said he would look at my references if I pleased. I 'pleased,' and handed him two or three folded sheets, which he read carefully and returned. He then fell to scanning me, taking me in from head to foot. He did indeed look at my feet, and it was plain to see that he was satisfied. There was nothing lacking there. Then he settled back in his chair and contemplated me in an abstract kind of way for a few moments. Finally he said: 'Yes, I have got a position, and I want just such a man as you represent yourself, this very afternoon. But I am not certain that I will employ you.' I told him I hoped he would give me a trial. I would surely do the best I could. He said, 'well it depended upon myself as to whether he employed me. He would be glad enough to do so, but he doubted if I myself would accept the position.' I modestly asked him what he desired to pay, thinking that unless he put it at less than thirty dollars a month I would not refuse it. He replied that he would pay me seventy-five dollars if I was satisfied. 'What!' I gasped. 'Seventy-five dollars, and pay you every Saturday night,' he replied coolly. I said I guessed I would take it. 'Yes, of course you do. Everybody guesses they will take it when they have heard just so much of the story. You see the matter stands just here. I have recently been appointed division operator of these lines, and I will say to you that I got my appointment through influence, of which I have an abundance. The man whom I succeed was a very much better man, both for the company and for those in his employ than I am, and he knew more about the management of lines and of men than I ever hope to. Well, when I accepted the appointment, it was with the understanding that I should have full swing here, and have everything precisely as I liked, and if I wished to indulge any of my whims or fancies, no one must molest me or interfere in any way, so long as the service was performed satisfactorily to the company, and the expenses of the department did not exceed a certain limit. Now it is one of my fancies that stands in the way, as I imagine. In this office there are employed three men. It has always been customary to let one work all day and the other two half and half, paying them extra for the night work. But I have two particular friends, who were friends of mine in youth, by whom I am determined to do a nice thing; therefore I am going to let them both

work all day at ninety dollars, and I am trying to get a man to do the all night work at seventy-five. The day work is easy and not worth fifty dollars, but so much the better. I am enabled to do the better thing by my friends. Neither of them is as good an operator as I have reason to believe you are; still they can get along without difficulty. Again, there is a good deal of copying sheets, etc., which rightfully belongs to the day operators, yet the night man has got to do it. In short, the night man must bear with a great many impositions, or leave the service. All his work together will be light, and other railroad companies in this vicinity do not pay more than fifty-five dollars for the same amount of service. Still it is mostly work that does not belong to him, except as I allow it to be imposed upon him. It has been the case so far that all the men that I have employed have become indignant or disgusted, and when I have said I did not want a dissatisfied man in my employ, they invariably left and accepted positions elsewhere with three times the work and at from fifteen to twenty dollars per month less. Now, if you want a night office at seventy-five dollars and are willing to do your work just as you would expect to do it elsewhere—uncomplainingly—you may commence at anytime. In the case you do this you will be treated with the same respect and courtesy that the rest are. Otherwise you will confer a favor by resigning.”

Well, I went to work and found it just what it had been represented—a tolerably good night job at fair remuneration, but the most of the work was what should have belonged to the day men. I worked along for six months and never worked for a better official in my life. He was always pleasant and kindly spoken, always very considerate and not very particular. It was not difficult to please him, and he gave full credit for everything that merited it. At the end of six months I had a better offer and went West, and have never since heard from the meanest and yet the best man I ever worked for.

State Service.—The Telegraphs.

THE Blue Book detailing the results of the Government's trading in the telegraph business confirms, on the unmistakable evidence of facts, the truth of the principle we have all along maintained, that the functions of a national administration are entirely apart from those connected with commercial enterprise. We have never admitted the assumption that there was even a neutral territory common to the individual and to the State, and which might be occupied by either. On the contrary, we have always advocated the necessity of drawing a hard and fast line between them, and ignored the idea of a State service. We believe that, according to the rules of economic science, strictly interpreted, even the post-office service is a mistake, and that the conveyance of our mails ought never to have been taken out of the hands of those who originally embarked their private funds in that business. The only palliation of the appropriation—for it was nothing less—lay in the consideration that private capital was not likely to be introduced into the business with sufficient liberality to develop it to an extent commensurate with the necessities of the public. As joint stock association was then a thing almost unknown, we admit the force and application of this consideration; but now that it is open to every man to contribute his capital in association with others to the largest undertakings, it ceases to have any force or application whatever. Still, we are not such strict doctrinaires as to wish to take the post-office out of the hands of the State. We cannot, however, refrain from calling attention to how often it has been made the narrow end of the wedge in the up-tearing of private enterprise. In the first place, Government has become ship owners, and has carried passengers as well as letters in their mail steamers, an unfair invasion upon the legitimate business of private owners. Telegraph companies were established, and they proved prosperous, bureaucratic greed was excited, and forthwith private business was metamorphosed into a State service, with a loss of over a quarter of a million to the exchequer, notwithstanding that the number of messages has increased from six to twenty millions per annum.

Again, there has been a notable attempt, certainly tentative in its character, to bring the working of the railways directly under the management of some government official. When the late Mr. Dudley Baxter was the apostle of this movement we ventured to oppose his doctrine. We showed that, both socially and financially, such a scheme was indefensible—that it would foster corruption and speculation, and that it would result in a loss to the State, the operation of management being too great for any department of the Government. We now think that, as the experience of working the telegraph system has been such as we have just stated, we shall hear no more of the State purchase of railways; that it will henceforth be regarded as a delusion not one whit less preposterous than that put forward a few years ago by Mr. Scott Russell and some other dilettante social reformers, who main-

tained that the State should bake bread and butcher for the community, that it should be our grocer and our publican, our tinker and our tailor, and be to us a truly paternal government. Wild as are these day dreams, they are nevertheless the logical consequences of a violation of the principle that there should be a hard and fast line maintained between the functions of the Government and the commercial exercises of the community.—*The Railway News.*

The Life of Cables.

THERE is a very widespread notion that the life of a submarine cable is of very limited duration, and that investment in such property is very speculative and risky. Facts in their mere historical aspect tend fully to confirm these ideas. All the earlier cables that knit our coasts with the Continent, with Ireland and with the Channel Islands rapidly disappeared. A cable laid in 1852, and one in 1854, between Holyhead, and two in 1852 between Scotland and Ireland, were total failures. Two cables were lost between Sardinia and Africa in 1855. The first cable between Dover and Calais lasted only a day. The Crimean cable lasted but nine months. The first Atlantic cable remained entire but twenty-three days. The Channel Islands' cable of 1858 lasted three years. The Red Sea cable of 1859 lasted only six months. On the other hand many cables which are now in existence vary from twenty years old to twenty months. The Dover and Calais, laid in 1851, and the Dover and Ostend, laid in 1853, still speak, though perhaps in the former case, little or any of the original cable remains. The England and Holland cable, laid in 1858, is as sound as ever, while that laid to Hanover, in the same year, lasted but four years.

The existence of all these cables has been so fitful that some cause must exist to account for their irregular lives. So many cables have failed, and so many have succeeded, that sufficient facts have, however, been accumulated to justify some generalization on this point. There is no difficulty in learning lessons from the experience of the past. The materials used, the form in which these materials are fashioned into cables, the way in which they are submerged, and the localities on which they lie, have now had sufficient trial to justify some opinion as to the form of the cables of the future.

There is nothing to show that the main materials employed, whether gutta-percha or india-rubber, are destructible. On the contrary, in the case of gutta-percha everything points out that it is practically indestructible. Keep it away from oxygen and from the varying conditions of temperature and climate, and it seems as though it will last for ever. What action electric currents have upon it is not well known, but experience justifies the opinion that this action, whatever it be, is practically innocuous. In fact, gutta-percha wire actually improves in insulation in our deep seas. The Suez-Aden section of the Indian cable, which lies in comparatively warm water, has improved in insulation since its submersion no less than 38 per cent., and many other deep sea cables have improved from 45 to 77 per cent. in the same quality. Gutta-percha, taken up after twenty-five years' submersion in water, is as perfect as when it was first put down.

But the life of a cable does not always depend upon that of its core. It rather depends upon that of its sheathing, and far more upon the bottom on which it is laid. Those cables that have failed have done so because their sheathing was not adapted to their localities. Heavy cables were laid in deep seas, light cables were laid in shallow seas, rough anchorage ground was crossed by mere packthreads, rugged rocky bottoms and fierce tideways were spanned with slender ropes. The fact that the sheathing and structure of the cable must be adapted to the bed on which it is intended to lie is scarcely yet sufficiently followed. A cable is projected between two fixed points, a cursory examination is made of the depth of the water and of the nature of the bottom. So many miles of shore ends and so many miles of deep sea cable are specified to be used; sometimes intermediate sizes are introduced. But never has yet a cable been properly designed to meet the full requirements of its future bed. Heavy shore ends needlessly and uselessly rest upon safe and soft bottoms, light sea portions cross rocky bottoms with danger and risk. The great lessons taught by experience are these: that cables must be specially designed for the various portions of the seas they are intended to cross, and that more reliance must be placed on the careful surveys and examination of the bottom.

The durability of a cable does not depend upon the durability of its materials, but upon the special adaptability of its built-up parts to meet those great forces of nature which are present in its future home. Anchors, again, may be dropped when, when raised, strain it to its utmost limit. It is not altogether free from the attacks of insects and other assailants. Experience seems to point out fifteen years as about the average life of past cables; but if the lessons of practice have been care-

fully studied and followed, there is no reason why this period should not be doubled or even trebled in existing cables, and it is possible to construct, lay, and maintain cables so that they shall be practically permanent.—*The Telegraphic Journal.*

A Shrewd Trick.—How a Telegraph Operator Swindled the Bank of California Out of \$1,200.

IN January last P. S. Washburn was the sole agent of the Western Union Telegraph Company at Colusa as well as agent for Wells, Fargo & Co. and various insurance companies. Acting as clerk for him was a young man who went by the name of Charles Crowell, and who was employed by Washburn, and not by the telegraph company. He was frequently engaged to receive and transmit despatches to San Francisco and elsewhere, and had free access to the office and instruments. He was known to the various operators of the company to be the operator at Colusa, and was so recognized. On the 19th of January Washburn was absent, leaving Crowell in charge of everything, with authority to receive and transmit whatever despatches might be offered. Taking advantage of the opportunity, he telegraphed as follows to the Bank of California in this city:

“Pay Charles H. Crowley \$1,200.
W. P. HARRINGTON, Cashier.”

Mr. Harrington was then cashier of the Colusa County Bank at Colusa, and the despatch was accepted as genuine by the bank here. It was dated January 19th, and on the same day it seems Crowell left for San Francisco, having previously sent a telegram to one Charles H. Crowley at the Occidental Hotel, signed by a fictitious name, directing him to call at the Bank of California for money. Crowell, on his arrival in the city, obtained the despatch addressed to Crowley, and procured a young man named George W. Spencer to go with him to the bank to identify him. On reaching the bank he presented the despatch, and stated that he was the person named therein. Spencer, on being questioned as to the fact of identity, replied, “Yes, I know him,” and everything being considered satisfactory, the \$1,200 was paid. Crowell gave a receipt in the name of Charles H. Crowley, and Spencer certified “signature correct.” They then left, taking the money with them. The telegram to the bank was of course a forgery, but the discovery was not made until the 13th of March last, upon a settlement of banking transactions between the bank of California and the Colusa Bank. Crowell or Crowley has not been seen since he got possession of the money. Under the circumstances of the case, the Bank of California claims that the Western Union Telegraph Company is responsible for the loss incurred by compliance with the request of the telegram, and the company denies all responsibility in the matter. They have therefore mutually agreed to submit the matter to the decision of the Fourth District Court. The papers have been filed, and Judge Morrison has set August 5th for hearing argument.—*San Francisco (Cal.) Exchange.*

New Style of Telegraph Poles.

THERE has lately been erected at the junction of Broadway and 23d street, in this city, an example of a new form of telegraph pole of iron. It is said to be lighter than a wooden pole of the same height, stronger, and capable of supporting a greater weight. It is constructed of a number of wrought iron bars, rolled out the entire length of the pole, which bars are placed around light cast iron cores, arranged at proper intervals from each other. The cores have seats or notches to hold the bars in their places to prevent their moving sideways, and the bars also have notches, into which the cores fit to keep them from moving up or down. Around the outside, where each core is placed, a ring or band of wrought iron is tightly fitted, which holds the bars firmly in their places, and thus forms the whole into a light, open and graceful column. Any number or any size of bars may be used, but it is found that six very light bars of angle iron arranged in this way afford a strength that fully meets that required for a telegraph pole of fifty feet in height. The cores are large at the base and are made smaller as they approach the top, which gives the column a graceful taper, and the whole is surmounted by a suitable crosshead to hold the arms for the wires. Such a column is very simply constructed and is without a rivet throughout its entire length. No machinery or shop labor is required to put it together other than the making of the outside rings or bands by an ordinary blacksmith, so that the pole may be ordered in pieces and put together at the point where it is to stand. The column is suitable not only for telegraph poles but for masts for iron ships, derrick masts and booms, stringers for bridges, lamp posts, and a variety of other purposes.

Telegraphic Enterprise in New Zealand.

A correspondent of the *New York Herald* writes from Melbourne, Australia, under date of June 14th, as follows:

"Perhaps the most important question of a cosmopolitan nature, in this part of the globe, is the encircling of New Zealand within the telegraph route. Hitherto this flourishing appanage of the British Crown has been outside the pale of telegraphic communication with the outer world, but, thanks to the enterprise of the colonies of New South Wales, Queensland and New Zealand, a cable will shortly be laid between Sydney, New South Wales, and Wellington, New Zealand. Captain Nares, Royal Navy, of Her Majesty's ship *Challenger*, has completed the survey of the soundings and reported to the Governor of the colony of New South Wales, Sir Hercules Robinson, the result of his investigations on the conditions of the bottom of the sea with regard to its suitability for a telegraph cable.

"The contract for the construction of the cable has been brought about by Captain Audley Cooze, of Hobart Town, Tasmania, a gentleman who has evinced much ability in grappling with subjects of magnitude. Negotiations between the governments of the three colonies referred to and a syndicate in London, were conducted successfully by Captain Cooze, and cablegrams from London go to say that the contract has been ratified by the representatives of the colonial government in England."

Errors Corrected.—Details of the New Albany W. U. Office.—Bulls.

ALBANY, N. Y., Aug. 24.

TO THE EDITOR OF THE TELEGRAPHER.

To begin with, there are a couple of errors which, in the haste of writing the letter descriptive of the new office, found their way into that article, and which need to be corrected.

Firstly, to give the battery room (not his Satanic majesty) its due, there are about 1,100 cells of gravity battery in use, instead of 900, as previously stated. Secondly, that new switch, instead of being restricted to sixty instruments only, will accommodate almost any number—at least four times as many instruments as there are wires could be inserted if necessarily required it.

The lunch room has been fitted up in good shape, and is considered one of the improvements.

Those "yaller" chairs have been ignominiously hustled out and taken down stairs to the delivery room, to hold up the messengers. Yo operating room is now furnished with—well, they are not mahogany, they are not black walnut—in fact, it is impossible to determine exactly of what material they are constructed, on account of the superabundance of paint and varnish with which they are covered. Perhaps these chairs are an improvement on the old ones (of course they must be or the company would not send them), but aside from their looks, we have failed to discover it as yet. It may be that when our bodies have grown to fit them we shall appreciate them more. But really, all joking aside, is it not strange that in this matter of chairs so few (if, in fact, any) offices are furnished with an article designed on common sense principles and constructed with a view to the comfort of its occupant? An operator sitting all day at his table requires something to support his back, and not oblige him to sit bolt upright like a stick of wood. He may be forced to do his work in this position, but he will go home at night with aching back and weary limbs, feeling very much as though he had been run through a threshing machine. Chairs which incline backward are entirely out of place in an operating room, and if they were animate objects, endowed with reasoning faculties, and cherished any regard for the welfare of those who used them, they would cry out, in the language of the poet, "Saw my leg(s) off short" in front! One of the principal advantages of chairs thus "doctored" would be that the men would naturally be more inclined to their work.

A speaking tube has been put in between the operating and battery rooms, but Prof. Hedley insists that he is getting to be too old a man to be routed from his comfortable chair, pipe and paper at the front window by any false alarms on the circuit—we won't do so any more, professor. Plate glass mirrors have been placed at each end of the drop pipe which connects the operating and delivery departments, the one in the operating room being so arranged that the chief operator can see by a glance, while standing at the switch, whether business is removed promptly by the delivery clerk, or if anything has become lodged in the pipe.

"Lodington," Ky. is fathered by our editorial aspirant.

The name of a celebrated trotting horse who recently made the fastest time on record at the Rochester Driving Park, reached here the other day as "99." As the perpetrator of the above is a man of family, and one not given to horse racing, we feel that he is entitled to unusual consideration, and we therefore omit his name.

DOUBLE SIX.

Rumors of Consolidations.—The Improved "Quad."—Personals.—Telegraphic Base Ball Triumphs and Reverses.

CHICAGO, ILL., Aug. 23.

TO THE EDITOR OF THE TELEGRAPHER.

THE rumors which have been so prevalent recently regarding the reported consolidation of the A. and P. with the Western Union have gained more credence, and the fraternity in this section seem to have settled down to the fact that soon there will be no opposition to the great "monopoly." It was currently rumored during the week that all that was necessary to complete the arrangements was the appointment of committees from the two companies to meet and adjust any difficulties that might lie in the way to a successful consolidation. It being understood if the *right men* were appointed from the two companies that all further hindrance to the consummation of the plan would be at an end. I am informed that the *right men* have been placed on these committees, and that they are to meet at an early day. How true the foregoing is I cannot of course vouch for; you can probably enlighten us more on the subject. I give you what I hear for what it is worth.

I am creditably informed that the "Quad." as arranged with Gerrit Smith's improved instruments has worked quite successfully, all four sides recently working the polar side to Buffalo, and the other side to Detroit. Mr. Smith himself has been in the city, and besides his tour of inspection at the W. U. office took a trip on the lake, and, I believe, Messrs. Summers, Maynard, Jones, and others did all in their power to make his business visit one of pleasure also.

The regular meeting of the American Electrical Society was adjourned last Wednesday evening, the 18th inst., until Wednesday afternoon of this week, the 25th inst., when it is thought some action will be taken upon the proposition to form auxiliary local societies.

Billy Manners, who recently left the W. U. here to accept a position with the A. and P., has made another move and gone to the opposition company at his home in Montreal, Canada. He was succeeded by our friend, Ed. L. Cuthbert, of the W. U. sub. gang. If the A. and P. boys don't find out "Ed's" good qualities then they must be set down as poor observers of human nature; to say that he's a gentleman in every sense of the word and generous to a fault is only giving a deserved compliment to a first class man. The Western Union boys were loth to see him leave, but as his chance for regular work in the W. U. would not "come round" for some time to come, and having the offer of a regular situation with the A. and P. he determined to accept.

"Flem" Drake, one of the "old timers," known to all "the boys" who have been "out west," who has for several years been sec'y to Supt. Hibbard at Salt Lake, has been promoted to a position as clerk to Genl. Supt. Gamble, at San Francisco, and has departed for his new home. Your San Francisco correspondent will no doubt tell you how he looks and acts after he arrives.

"Charley" Moore, who has for a long time been "chief operator" of the Western Union office at Salt Lake, takes the position vacated by Mr. Drake's promotion; while "Bob" Hamilton, "Vi," the old reliable, has been appointed chief operator of Salt Lake office.

Billy McMilton's nine "*Baz Bam*," still keep on playing. On the 14th inst. they played the Union Stock Yards Nine, and got beat, 37 to 17. This is the first defeat they have met in playing five different clubs, and when it is taken into consideration that this Stock Yards Nine are all stout, grown up, muscular men, who rank among the best amateur players in the city, while one of "Billy's" best men was absent, and they are but mere youths at most, it cannot be called much of a defeat after all. On the 17th inst. they played *The Tribune* compositors, beating them 15 to 14 in 7 innings; the game being called then on account of the lateness of the hour.

The 21st inst. they played and beat the *Inter-Oceans* again, 17 to 6, in 5 innings; the *Inter-Oceans* not caring to play the remaining 4 innings. I understand they were to "*uckle*" the Stock Yards Nine again yesterday (Sunday), and were quite sanguine of a victory; but I have not heard the score; nor how they succeeded. They are a "gritty" set of boys.

OCCASIONAL.

Criticism of "The Telegrapher" Correspondents.

MONTREAL, CANADA, August 15.

TO THE EDITOR OF THE TELEGRAPHER.

HAVING read your paper for years, and followed it from the time it so nobly stood by the telegraphers in the winter of their discontent—the strike, now almost forgotten—I consider it my privilege to say a word. I am particularly pleased with the able manner in which it is conducted, and enjoy the correspondence immensely, but there are some of the correspondents who are dreadfully tiresome; others are just the contrary—sprightly and interesting. "NILH NAMELESS" never should have given up the ghost so easily. His letters were possessed of great literary merit, and were decidedly superior to the man who thought he vanquished him, John Sterling. From a personal acquaintance with the latter I know whereof I speak. His knowledge is superficial, and his ability scarcely sufficient to tide him over the numerous squabbles he has got himself into by his conceit and self assurance. Such is the man whom a late correspondent characterized as "heavy." I noticed in one of your issues of June a poem very prettily written, and greatly to the point, which seemed directed against the fast senders of Boston (I believe he is one), which he utterly ignores in his late communications to you. This poem, denouncing some one there as Filibuster the Mighty, and the whole crowd as fiascoes, seems to me too full of satire and bitter invective towards Boston men to be passed over by this would-be model correspondent and champion of female rights and liberties. I say, let him come to the front and repudiate the slander; let him defend his own vine and fig tree and not wade so deeply into metaphysics and female suffrage with a man like Nihil, whose shoes he is not worthy to unloose.

I await the action of this high-toned champion with impatience. We are disinterested up this way, and can view the wordy battle which will be sure to follow if he tackles Tom Quad with a good deal of enjoyment, and can perhaps add fuel to the flame. Ye valient quillist from "the Land of Crooked Places" come forth.

MINISTRO DE CULPEPPER.

A Telegrapher Married—Additions to Telegraphers' Families.

CHICAGO, ILL., Aug. 21.

TO THE EDITOR OF THE TELEGRAPHER.

JACK MARTIN, that's his name, or used to be; now it's Mr. John L. Martin, of the Detroit Duplex, Chicago, Ill., no cards; and there's a Mrs. John L. Martin also. If I had known this, maybe I wouldn't be so tickled, 'case he'd got well and was back to work; but you want to know all about it, I s'pose. You allers out a feller short, and want him to come down to biz; adjust now keerfully, little higher—higher, there. August 10th, 1875, as a solitary horseman was seen wending his way afoot—what? oh, that's so, I ain't writing for the *Waverly*, am I? Well, just scratch all after "1875," Mr. J. L. Martin, of Chicago Western Union office, was united in the holy bonds of matrimony with Miss Almyra Gaylord, of Chicago, by His Holiness the Right Rev. Most Worshipful—oh! you don't care to know that, do you? Well, I don't know any more about it, ha! ha!—that's all.

But there's more fun coming. Benson's folks have had a baby, one of the female persuasion. I wasn't to tell, but I have to; we "night owls" can't keep secrets.

Still they come! "Dad" Armstrong became the happy father, on the 18th inst., to a ten pound girl baby, and everything is lovely. The recent additions to the "floater" gang are Messrs. M. J. Burke, a young Canadian, who seems to be quite a good "op.;" J. S. Henderson, an old timer, and one who has been up to the top rounds of the ladder—a little old and stiff just now; and last, but not least by any means, H. M. Goewey. Now, you all know Goewey, and when I say he "*goewies* it" in his usual first class style, that's enough out of "WESTERN UNION."

An Electric Fish.

THE London *Times* of July 30 says: "Among the specimens lately added by the Zoological Society to their living collection in the Regent's Park is a small fresh water fish belonging to the family of silurids, and remarkable for possessing an electric organ, like the better known *gymnotus*, or electric eel. When touched by the fingers on the lower side of the body it gives forth a slight, but very perceptible, electric shock. The fish is from one of the rivers of West Africa, and is known to naturalists as the *malapterurus beninensis*, from its having been originally discovered in the river Beni. A closely allied species—the *malapterurus electricus*—inhabits the Nile, and has been long known for its electrifying properties. It is believed that no example of any of these singular fishes has been previously brought alive to this country."

THE TELEGRAPHER
DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, AUGUST 28, 1875.

THE TELEGRAPHER:
PUBLISHED EVERY SATURDAY at 38 VESEY ST.
ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

INDEX TO ADVERTISING PAGES.

Table listing advertisers and their corresponding page numbers, including Ashley, J. N., American Fire Alarm and Police Telegraph, Am. Compound Telegraph Wire Co., etc.

To Subscribers and Friends of "The Operator."

THE publishers of THE OPERATOR having decided to discontinue its publication and consolidate it with THE TELEGRAPHER, the unexpired subscriptions to that paper will be filled by THE TELEGRAPHER, commencing with the number for September 4th, which will be sent in the place of the former journal, which should appear in regular course September 1st.

The Telegraphic Situation.

THE history of telegraphic enterprises in this country for the last quarter of a century is one of combinations, consolidations and arrangements between the companies which have from time to time undertaken to establish and conduct them. Originally each company covered a comparatively limited territory, and their relations, sometimes friendly, often antagonistic, were not such as to be advantageous to the public or to themselves.

organizations, covering more extended territories. From that time the work has proceeded, and has resulted in the present Western Union Telegraph Company, the largest telegraph organization in the world, owning more miles of telegraph line and operating more offices than any other. It has been the desire and intention of the successive managers of that company for many years to establish a practical telegraphic monopoly.

But there is a wide spread sentiment in the public mind opposed to telegraphic monopoly, and although investments in competing companies had not proved directly remunerative, the means have been provided from time to time to build other lines. Of these the Pacific and Atlantic (which is frequently confounded with the Atlantic and Pacific, a separate and entirely different company), the Bankers and Brokers and some other smaller companies, after an unprofitable existence, largely due to mismanagement, have since been absorbed by the Western Union.

A few months since the country was electrified with the information that Mr. JAY GOULD had taken the latter organization into favor, and that now a competing company would be found with ample financial means and first class management, which would be enabled to maintain competition with the Western Union Company upon something like equal terms.

In due time the curtain rose on another act of this telegraphic drama, and for some weeks past the air has been rife with rumors and reports of coming consolidation, and the intention of the master spirit to obtain the control of the Western Union Company at the election which takes place in October next.

The names of the committee acting on behalf of the Western Union Company were given in the last number of THE TELEGRAPHER. The committee on behalf of the Atlantic and Pacific Company is Messrs. T. T. ECKERT, President; JAY GOULD, SIDNEY DILLON and W. J. SIMS. This committee were to meet on Thursday last, but it was not expected that any definite action would be taken at that meeting.

We are yet of the opinion that no actual consolidation will take place, and that all that will be accomplished will be a working arrangement by which costly competition will be avoided in the future. As usual in such cases, where such large interests are involved, there are numerous and conflicting rumors of what has been and is intended to be done.

these are mere surmises, and not unfrequently purposely circulated for effect upon speculation in the stocks of the company. We have stated candidly, from time to time, all that has been done, so far as it was possible to obtain the information, and the real purposes which underlie the complicated movements of the parties.

The new National Company of San Francisco is undoubtedly proving a disturbing element in their negotiations and manipulations. Mr. COHEN, the President of that company, left San Francisco on Saturday last for New York on business connected with the enterprise, and will probably arrive by the time this reaches our readers. It is understood to be the desire of the managers of the new enterprise to purchase the property of the Atlantic and Pacific Company if it can be had on reasonable terms, and that Mr. COHEN is authorized to obtain the control of that company if it can be done.

In the meantime the employes of the Atlantic and Pacific Company are somewhat disturbed, and in a state of uncertainty as to the future, which is anything but pleasant. There seems to be no help for this, however, and it is only a repetition of telegraphic experience, from time to time, for the last twenty-five years. They can console themselves with the reflection that telegraphic competition will exist in any event, whatever may be the result of the present situation; and they are powerless to affect the result, however much their interests may be involved.

The Duplex Printing Telegraph Instruments.

WE have before referred to the successful duplexing of the Combination Printing Telegraph Instruments by Messrs. GEO. M. PHELPS and GERRIT SMITH, on the New York and Boston circuit of the Western Union Company. The arrangement continues to work well, and is likely to prove of great value to the Western Union Company. It has been the desire of some of the managers of that company to dispense with printers altogether, and but for the improvement made in the development of the motor printer of Mr. PHELPS, and the subsequent adaptation to duplex use upon the wires, they would probably have soon been retired from the service altogether.

It is probable that eventually duplexed printers will be introduced on most of the main circuits of the Western Union Company.

We understand that in view of the probable extended use of printing telegraph instruments in the future, the Western Union managers have acted upon our suggestion in THE TELEGRAPHER of July 3d, and have a number of young men in training in order that the additional instruments may be properly worked when ready for use by expert operators.

An exhibition of all kinds of electrical and telegraphic apparatus will probably be opened in Paris in December.

A Centennial Telegraphic Tournament Proposed.

OUR New Orleans correspondent, TOO MUCH CEB, in his communication published last week, suggests an idea which is worthy of consideration. It is that there should be, during the Centennial Exhibition at Philadelphia next summer, a telegraphic tournament, which shall be open to all operators who may desire to compete, with suitable medals and prizes for such as shall excel in expertness in transmitting and receiving by telegraph.

It is now several years since there has been any competitive trial of skill by telegraph operators, and consequently the stories of telegraphic achievements of expert operators are not restricted or limited by any record, and are becoming somewhat inflated and exaggerated. An actual competitive test, under rules and regulations and the supervision of disinterested umpires, would afford an opportunity of testing the actual ability of operators, and afford recognition and fame to the deserving which could not but be gratifying and advantageous.

A series of competitive trials could be arranged which should include not only sending and receiving on the regular MORSE, but also on duplex and quadruplex, and on printing telegraph circuits.

We have no doubt but that Mr. DAVID BROOKS, who has charge of the electrical department of the Centennial, would cooperate to make the suggestion a success. We should be pleased to hear from any of the readers of THE TELEGRAPHER who may have further suggestions to make in reference to this proposition, and as to the best means of carrying it out and making it not the least interesting feature of the Centennial Exhibition.

An Ex-Telegrapher Becomes a Successful Artist.

LAST week we passed a few hours in the beautiful and pleasant city of Hartford, Conn., and while there we fell in with our former telegraphic associate on the old New York and Boston House Telegraph line, Mr. J. W. STANCLIFF. To those who have the pleasure of his acquaintance it is needless to say that the time spent in the company of our genial friend was pleasantly passed. He is the same jolly good fellow as when he fingered the keys, and will be remembered by many of the old time telegraphers, and such of the present generation as have been located in Hartford. Besides the ability displayed as a telegraphic artist, he was always more or less, as opportunity was afforded by other employments, devoted to the pencil and brush, and there were not wanting indications of artistic talent of no common order.

Some years ago Mr. STANCLIFF retired from the telegraph service, and has since devoted himself enthusiastically to his favorite art. He chose the pleasing but difficult department of marine painting, and his subsequent success has amply justified the wisdom of his choice. We found his studio crowded with sketches, studies and finished paintings, each representing the sea in some of its characteristic and varied moods. It is at once evident that Mr. STANCLIFF has studied and labored with that highest of motives—a true and genuine love of nature and of his beautiful art. It would be almost wearisome to adequately describe all that we saw in his studio, though it was anything but wearisome to see them. There are gently sloping beaches of hard beaten, shining sand, where

“The breakers come and the breakers go
Along the silvery sand,
With a changing line of feathery snow
Between the water and land.
Sea weeds gleam in the sunset light,
On the edges of wave-worn stone,
Orange and crimson, purple and white,
In regular winrows strown.”

Again, we look far away across a waste of heaving waters, dotted here and there with sails that glitter in the sun

“Like planets in a mellow evening sky.”

Perhaps the finest work in Mr. STANCLIFF'S studio, all things considered, is a composition which he calls the “Coast of New England.” It is a harbor mouth,

with the tall white shaft of a lighthouse on a sloping green hill. A brisk breeze is blowing, and the emerald waves are crested with “white caps.” The scene is alive with coasting craft, steamers and tugs; just such a scene as the frequenters of “the summer isles of Eden,” that lie along the southeast coast of Massachusetts, are so familiar with.

These pictures should be seen to be appreciated and we hope that the artist will soon arrange to have his works exhibited in New York. If they were but brought to the notice of the connoisseurs in art in the metropolis, we have no doubt but that they would speedily secure for Mr. STANCLIFF the recognition of his genius and artistic talent which they deserve.

Hochhausen's Telegraphic and Electrical Instruments.

WE desire to call the attention of our readers to the new advertisement of Mr. W. HOCHHAUSEN, which will be found on the last advertising page of THE TELEGRAPHER. The standard main line relay, of which an illustration is given, is a highly finished and excellent instrument, and from its peculiar construction possesses many advantages.

Mr. HOCHHAUSEN'S telegraph instruments, bells, etc., are well made, and calculated to satisfy and please those who may purchase and use them.

Personals.

Mr. CHARLES E. SMAILS, ex-manager of Denison, Texas, W. U. office, has been appointed to a position on the night force at St. Louis, Mo., same company.

Mr. J. L. SPONAGLE, W. U., Topeka, Kansas, has resigned.

Mr. ROBERT MARSH, operator in the general office of the Kansas Pacific Railway Company, Kansas City, Mo., has been transferred to Los Animas, Colorado, same company.

Mr. THOMAS P. WHEELER, of St. Louis, Mo., W. U. office, is enjoying his annual vacation at home, Walnut Station, Kansas.

Mr. FRED LUCHTENMEYER, of St. Louis, Mo., has been appointed night report operator at Sedalia, Mo., W. U. office.

Major DAVID S. RYAN, assistant night chief operator, W. U. Telegraph Co., St. Louis, has resigned and accepted a position on the editorial staff of the Galveston News, at Galveston, Texas. Mr. RYAN is an old and well known Southern telegrapher. He served in the army from the beginning to the close of the war, where he earned his title.

Mr. T. KAHOE has been appointed assistant operator in the W. U. office at Topeka, Kansas.

Mr. W. B. SIMS, formerly of the M. K. & T. Railroad office, has accepted a position with the W. U. Co. of Denison, Texas.

Mr. P. J. FLYNN, operator at Quakake Junction, P. & R. Railroad, has resigned his position for the purpose of attending school.

Mr. L. C. SMITH has resigned his position as night operator, Ringtown, P. & R. R. R., and accepted a position as day operator at Quakake Junction, with the same company.

Mr. GEORGE S. HUGHES has been transferred from Mooresburg night office to Ringtown night office, P. & R. Railroad.

Mr. T. P. THORNTON has accepted a position as night operator at Mooresburg, P. & R. Railroad.

The Telegraph.**The American District Telegraph System in New Orleans.**

THE American District Telegraph system, so familiar and popular in New York and other cities, will go into operation in New Orleans, La., on the 1st of September. The organization of the company which has its introduction in that city in charge has already been noticed in THE TELEGRAPHER. The New Orleans office of the company is at No. 128 Gravier street, and the system is under the direction and management of Capt. W. H. Bofinger. The New Orleans newspapers have printed lengthy and commendatory accounts of the system, and it is understood to have been received with much favor by the citizens, merchants, hotels, etc.

Comparative Statement of Receipts of the Anglo-American Telegraph Company.

STATEMENT of amounts received by the Anglo-American Telegraph Co. during the months of May, June and July, 1874, under the tariff of \$1 per word, and the receipts for the corresponding period of 1875, with the tariff at 50 cents per word:

Months.	1874.		1875.	
	No. of Messages.	Amount Received.	No. of Messages.	Amount Received.
May.....	21,354	£56,216	27,184	£33,940
June.....	22,093	58,758	28,892	36,650
July.....	20,905	56,593	28,897	38,270
Total.....	64,292	£171,567	84,973	£108,860

It thus appears that the reduction of tariff to 50 cents per word has caused a falling off in the revenue of 36.55 per cent. for the three months in which it has been in operation, and that the messages have increased 32.17 per cent.

New York City Telegraphic Notes.

STEREOSCOPIC views of the interior of the general operating room at Broadway and Dey street are now published and for sale at the post office of the building at the modest price of thirty-five cents per one. It is but just to say that they are much better than the larger ones heretofore spoken of in those columns, and generally give better satisfaction among the operators.

Most of the night force at the W. U. are now “scooping” extra days, as business is heavy and the day force is insufficient to handle the noonday rush. At least twenty owls put in five hours a day as regularly as the festive, yet peripatetic cats upon our neighbor's roof repeat their tales of sorrow and invoke the *meuses* from night's plutonian shore.

A Law Reporting Telegraph System in Newark, N.

HERE is a new telegraphic wrinkle. A line telegraph is now in operation between the Sheriff's office at Newark and the residence of Prosecutor G. N. Abeel, and it is stated that arrangements are being perfected for the establishment of a Law Reporting Telegraph Company, to connect with offices of all legal gentlemen who desire to become subscribers to the enterprise. The plan contemplates that each subscriber will control a separate wire to communicate with the courts, and can be placed in instant communication with any law firm in the city using the telegraph. At each office will be placed a printing telegraph instrument which can easily be operated and capable of transmitting and receiving from fifteen to twenty words per minute. Messengers will at all times be at the service of subscribers, and can be summoned from the central office in three minutes. An operator will be stationed at the courts; and will report progress of all cases and answer all questions of subscribers. Exertions are being made to have the lines in working order by opening of the September term of court. By and bye it won't be necessary for people to go to court at all. To law court we mean, of course, as we don't believe the telegraph will ever supersede the old-fashioned way in the other.—*Pater-son (N. J.) Daily Press.*

Foreign Telegraphic Notes.

It is contemplated to connect the Kangra Valley, India, with the general telegraphic system at an early date. This measure, states the *Times of India*, besides serving the military stationed at Dhurumsala, Dalhousie, and Fort Kangra, will be a boon to the large tea planting interest in the valley.

The report of the Cuba Submarine Telegraph Company states that the net profits for the half year ended the 30th of June, were \$11,302. Of this sum £3,155 has been placed to reserve, raising it to £5,000, and the balance, after providing for the preference dividend, admits of a payment at the rate of 6 per cent. on the ordinary shares, leaving £852 to be carried forward.

A project has been set on foot to connect all the public clocks of Paris with the chief clock of the Observatory. A telegraphic wire will unite it to the Luxembourg clock, which will in turn, by means of a series of wires, communicate its time to the exchange, law courts, town halls, churches, and most of the public buildings. The Observatory regulating time-piece is placed in the catacombs, so as to be away from the trembling influence of the ground; the time piece scarcely varies one tenth of a second in a year.

The average time occupied in the transits of messages by the Indo-European Telegraph Company between London and India via Teheran, including messages for Penang, Singapore, China, Japan, Java, and Australia, during the week ending August 6, 1875, was 1 hour 23 minutes.

There is at length a fair prospect that telegraphic communication with the Channel Islands and the Isle of Man will be reestablished in a very short time.

The traffic receipts of the Western and Brazilian Telegraph Company for the four weeks ended 30th July, 1875, were £3,733, showing an increase of £710 over the corresponding period of 1874.

The receipts of the Eastern Telegraph Company for the month of July, 1875, amounted to £31,419, against £27,247 in the corresponding period of 1874.

The receipts of the Eastern Extension, Australasia and China Telegraph Company for the month of July last, amounted to £20,225, against £19,641 for the corresponding period of 1874.

The receipts of the Brazilian Submarine Telegraph Company for the month of July, 1875, were £10,230, against £8,037 for the corresponding period of 1874.

Table showing traffic receipts of the Anglo-American Telegraph Company for August last, with dates from July 28th to August 10th and amounts in pounds.

The actual daily average for the month of August last year was £1,676.

The traffic receipts of the Great Northern Telegraph Company for the month of July last were 414,831 francs, last year 410,355 francs. Total traffic receipts 1st January to 31st July this year 2,409,858 francs; last year 2,486,726 francs.

By means of the Wheatstone Automatic system between 30,000 and 40,000 words were transmitted during the trial of Capt. Baker, at Croydon, England, recently.

A despatch, dated August 1st, from Vienna, announces that—in compliance with the resolution passed by the St. Petersburg International Telegraph Conference—cipher despatches, whether inland or outward, are now received and transmitted by all Austro-Hungarian Telegraph offices.

The receipts of the Direct Spanish Telegraph Company for the month of July, 1875, were £1,834, against £1,349 in the corresponding period of last year. The average time occupied in the transmission of telegrams between Madrid and England, via Santander, during July was three hours and nine minutes, including transmission over Spanish land lines.

The number of messages transmitted over the lines of the Cuba Submarine Telegraph Company during the month of July last was 2,440, estimated to produce £2,400, against 1,820 messages, producing £1,762 in corresponding month of last year.

The receipts of the West India and Panama Telegraph Company for the month of May last, amounted to £4,500 as compared with £2,878 in the corresponding period of 1874.

Prof. Hughes' Printing Telegraph.

PROF. HUGHES' printing telegraph apparatus has recently been adopted by the Spanish Administration. This system was first used by the American Telegraph Company in the United States, and was adopted by France in 1861; by Italy and England in 1862; by Russia in 1865; by Prussia in 1866; in 1867 by Austria, Hungary and Turkey; in 1868 by Holland; in 1869 by Bavaria and Wurtemberg; in 1870 by Switzerland and Belgium; in 1871 by Peru; in 1872 by Buenos Ayres; in 1873 by the Submarine Telegraph Co.; in 1874 by the Argentine Confederation; and in 1875 by Spain. The inventor, David Hughes, was born in 1831, at Louisville, Kentucky. From a boy he devoted himself to physico-mathematical and mechanical studies. At the age of nineteen he became Professor of Physical Science in the College of Kentucky, and the same year (1850) he began his studies on the type printer, the perfecting of which cost him twenty years of study and experiment.—Electrical News.

A Surprised and Aggrieved Telegraphic Artist.

MR. THOMAS DOLAN, the night manager of the New York W. U. office, is noted for his witty sayings and pleasant way of reproving a fault. Recently he overlooked the shoulder of one of the knights of the key, who, being intently engaged in perusing the solid columns of the last number of the Scientific American, did not notice the approach of his worthy superior, and consequently was rather startled to hear "T. D." say:

"I guess you may as well put up that paper. The rules of this office are as unalterable as the laws of the Medes and Persians. We are not supposed to relent only so far as to send night messages at a reduced rate."

As the speaker withdrew the young offender was heard to murmur faintly "'Tis true, 'tis pity; pity 'tis, 'tis true."

Marriage of an Indiana Telegrapher.

MISS LINA GODFREY, of Middletown, was married last Thursday evening to Mr. Charles Link, of Peru, Ind. There is nothing unusual in this, such things happen frequently, but there is something unusual in the fact that the parties never saw each other until Wednesday evening. A little over a year since, through mutual friends, the parties commenced a correspondence which finally culminated in the young man's proposing marriage. The young lady gratefully accepting, Thursday was fixed upon as the happy day, and the young man arrived here Wednesday evening on train No. 8. The young lady met him at the depot. From out the crowd they selected their destinies, and rushing to each other's arms were folded in a long embrace. Miss Godfrey is well spoken of by all who know her. Mr. Link is a telegraph operator at Peru, Ind. Both parties are evidently very romantic, and although romance is but a poor foundation on which to base hopes of future happiness, they have our best wishes for pleasant future.—Middletown N. Y. Mercury.

A Telegrapher's Base Ball Match.

THE fourth game of base ball was played on the 19th inst.; between the day force nines of the W. U. office at St. Louis, resulting in the defeat of Capt. Van Tynne's team by Mr. Cumming's nine; score, 10 to 6 and a whitewash.

Quotations of Telegraph Stocks at N. Y. Stock Exchange.

Showing Lowest and Highest Prices each day during week.

Table with columns for August, Western Union, Atl. and Pac., Amer. Dist., and Gold and Stock, showing bid and asked prices.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

165,700.—ELECTRIC BOILER-ALARMS AND REGISTERS.—William C. Baker, New York, N. Y. [Filed June 23, 1875.]

Circuit closed by high or low pressure through magnets, controlling a dial and step-by-step escapement, thus registering how often the rules as to maximum and minimum of pressure have been violated. An intermediate magnet in same circuit closes branch circuit to self-acting magnetic bell.

1. The combination, with a low water or pressure alarm and an electric circuit-closing apparatus, of an electro-magnet, stop-by-step movement, and dial, to indicate the number of times the boiler has been neglected, substantially as set forth.

2. The combination, with a boiler-alarm and electric circuits substantially as specified, of 6 branch, circuit, electro-magnet alarm-bell, and automatic circuit-breaker, operated by the hammer, substantially as and for the purposes set forth.

165,728.—TRANSMITTERS FOR ELECTRO-HARMONIC TELEGRAPHS.—Elisha Gray, Chicago, Ill. [Filed June 28, 1875.]

For securing greater uniformity of action of the magnets upon a steel reed vibrating to produce a certain note, and to transmit upon the line electrical impulses corresponding to the number of vibrations necessary to produce such note.

1. The combination, substantially as hereinbefore set forth, of the vibrating electro-tone and magnets arranged on opposite sides thereof, of such relative capacity as to impart impulses of equal force at equal intervals upon each side of the vibrating electro-tone alternately, whereby its isochronous vibration is secured.

2. The combination, substantially as hereinbefore set forth, of the vibrating reed, its counterpoise-magnets, a local circuit, and the shunt-wire, whereby the current is automatically changed, to each set of magnets.

For the week ended July 27, 1875, and bearing that date.

165,918.—SIGNAL BOXES FOR FIRE ALARM TELEGRAPHS.—Moses G. Crane, Newton, Mass. [Filed July 9, 1875.]

Boxes in normally closed circuit. On the breaking of the circuit, the armature levers are withdrawn by a spring. On taking against the fingers, closes a short circuit outside of magnet and circuit breaking wheel, thus preventing a signal being given by any except the box first operated. In such box the mechanism is released by raising a lever having a lug in recess of the wheel, a tooth taking against a lever and locking it, to prevent the formation of the short circuit in such box.

1. In a fire alarm signal box the lever G, with its lug V and hook E, the flange p and its notches V', the lever b, insulated plate e, and magnet D, all combined and operating as and for the purpose specified.

2. The combination of the lever H, the lever G, and the wheel F, whereby the said wheel is liberated and allowed to revolve under the stress of the motor C, as and for the purpose specified.

165,923.—TELEGRAPHIC FIRE ALARM REPEATERS.—John N. Gamewell, Hackensack, N. J., M. G. Crane, Newton, and E. Rogers, Boston, Mass. [Filed July 9, 1875.]

1. The combination, with a break circuit wheel of a telegraph repeater, upon which the lines of two or more circuits converge, of a governor, whereby, when a signal is being given over any one of the circuits, and repeated over the other circuits, the armatures of the magnets in such other circuits are locked in position, thereby preventing interference between the several circuits, as and for the purpose specified.

2. The auxiliary escapement movement, in combination with the governor J and the break circuit wheel, whereby the reverse movement of the governor is not permitted to take place during several successive revolutions of the said wheel, as and for the purpose specified.

3. The auxiliary escapement movement, the circuit wheel and its shaft, and the lever 25, combined and operating as described, whereby, after the winding up of the escapement by the revolution of the circuit wheel shaft, the reverse motion of the said lever is prolonged and graduated, as specified.

4. The combination, in an electro-telegraphic repeater, of two electro-magnets in the same circuit, one of which has a larger core than the other, whereby there results an appreciable difference in the periods required for them to be charged and discharged, respectively, as and for the purpose specified.

5. The device described, whereby the breaking of any one of several circuits connected with the repeater for the purpose of signaling occasions the break circuit wheel to be cut out from that circuit by closing the same over auxiliary fingers x x', all combined and operating as and for the purpose specified.

6. The auxiliary magnets F F', with their armatures and hooked lever M, in combination with the armature lever H and swinging lever D, as and for the purpose specified.

7. The combination of the swinging lever D with its two stop pins, and the arm l, with its two fingers s s' upon the break circuit wheel shaft, as and for the purpose specified.

8. The combination of the cam 28, levers 22 and 25, and sliding bar 18, as and for the purpose specified.

9. The combination of the governor J, bar 18, lever 25, and latch 37, as and for the purpose specified.

10. The lever I, with its short arm 10, the armature lever H, and lever D, and the governor J, combined and operating as and for the purpose specified.

11. The auxiliary escapement y y', with its train 31 32, in an electro-telegraphic repeater, employed to graduate the movement of the mechanism by which said train is actuated relatively to the movement of another telegraphic repeating mechanism.

166,012.—GALVANIC BATTERIES.—J. Kidder, New York, N. Y. [Filed April 24, 1875.]

1. A cell casing for galvanic batteries having interior cell forming partition walls, made at less height than outer walls, for enabling rapid filling and emptying of cells substantially as and for the purpose specified.

2. A cell casing for galvanic batteries provided with outer walls of greater height than the interior partition walls, and having a supply reservoir with flanged gutter and spout for the more rapid emptying and filling of the cells with the fluid, substantially as and for the purpose set forth.

3. The subdivided guide frame seated in main cell-case, and connected with vertically moving element carrying top plate, as shown and described, thus admitting of the lateral removal of cells and insuring the insertion of each element in its proper cell when depressed, substantially as set forth.

4. The diagonal pivoted straps E E, to command the parallel immersion of the elements into the solution of the coils, substantially as and for the purpose specified.

166,094.—RECEIVERS FOR ELECTRO-HARMONIC TELEGRAPHS.—Elisha Gray, Chicago, Ill. [Filed June 28, 1875.]

The combination, substantially as hereinbefore set forth, of the vibrating receiving spring, the elbow lever circuit interrupter and mechanism, substantially such as described, for adjusting the rate of vibration of said lever.

166,095.—ELECTRO TELEGRAPHS FOR TRANSMITTING MUSICAL TONES.—Elisha Gray, Chicago, Ill. [Filed Jan. 19, 1875.]

Depends primarily on fact that the core of a magnet expands and contracts, causing vibrations as it is made and unmade. Currents corresponding in number to the vibrations necessary to produce any particular note are transmitted, causing corresponding vibrations in core of magnet, which are transferred to a sounding box placed in the magnet.

The combination of a telegraphic circuit, a series of circuit breakers capable of producing musical tones of different pitch, a series of keys for simultaneously or successively throwing said circuit breakers into or out of operation, and an electro-magnet receiver, which is thrown into operation by the transmitters, whereby tones of different pitch may be reproduced at the receiving end of the line by the employment of a single circuit.

ORTON'S PATENT PENCIL HOLDER

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread and will hold the pencil perfectly firm.

Price, 10 cents each.

Sent by mail on receipt of price.

Price per doz., 60 cents.

GEO. H. BLISS & CO., Gen'l Agents,

220 Kinzie Street, Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

PONY RELAY, PRICE \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. See above Cut.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 34
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 3/4 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Galvan battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense.

Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y. Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application.

All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to

J. N. ASHLEY,
38 Vesey street, New York.

P. O. Box 5,503.

WESTERN ELECTRIC MAN'G CO.

220 Kinzie Street,

CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the
apparatus may be distributed in a combination of circuits, and
the entire system successfully worked, without the constant per-
sonal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers,
adapted to produce the full tone of the largest church or tower
bells.

Fourth—The Electro-Mechanical Gong Striker,
for hose and engine houses, by means of which the location of
the fire is instantaneously communicated to the members of
each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by
the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of
practical use, and that the efforts which have been repeatedly
made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to
adopt other systems having demonstrated their insufficiency
and unreliability, and resulted in their abandonment, and sub-
stitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the
original FARMER & CHANNING PATENTS, one of the most
important of which has just been extended for seven years, and
during the past seventeen years have spared no expense or effort
to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have
adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little ex-
pense, compared to the benefit which it confers, that even small
communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of
the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POS-
SIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruc-
tion, and the number of lives which have been preserved
through the general adoption of this system, throughout the
UNITED STATES and the DOMINION OF CANADA,

CANNOT EARILY BE ESTIMATED,

but that, in every community where it has been introduced for
any considerable length of time, they have been enormous, THREE
CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its in-
troduction into their localities is cordially invited, and

their efforts will be duly appreciated and
compensated.

Any information desired in regard to the above
system will be cheerfully and promptly furnished
upon application at the office.

A pamphlet, setting forth more fully its advantages and
superiority, has been printed, and will be supplied to Municipal
Authorities and others interested in Fire Alarm and Police Tele-
graphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at
\$120 and \$135 a set, consisting of two Relays, two Sounders, two
Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-
locked connection between any number of wires, occupying for
each different connection only one square inch of space, and
though made of the largest size, not subject to the warp and
contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three
years, an insulated Wire which can be buried in the earth or
exposed to rain and sun, or to the vapor of acids, without injury.
Professor SILLIMAN, who has exposed it to the most destructive
agencies, finds that it remains uninjured in an atmosphere of
ozone, which would destroy gutta-percha in a few hours. It
exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article
for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will
exceed, in insulation for submarine purposes, ANYTHING
HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and
size of cable, which will be found to compete with any other
construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY,
with Patent Platina Connection. Introduced by us eight years
since; also, THE ALPHABETICAL OR DIAL TELEGRAPH,
now extensively used in this and other cities for private lines
being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that
will work practically with a single DANIELL cell, a BATTERY
which does not require to be taken down but once a year, and the
very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter
and description, is now ready for distribution.

Friendship—So Called.

AN ACROSTIC.

Who is Dame Fortune's child and hath no friends,
And to whose will the fawning courtier bends?

Look now, in vain, among the throng to find
The man who, poor, can boast of friends as kind.

Each lout's a pilot on a summer's day;
Returning storms will drive the churls away.

Proud sailors all—in calms—but squalls will test
How many work to steer the craft to rest.

In lev'ling storms still one advantage lies;
Like little crumbs of bread, they make us wise.

Let light upon this maxim—old but true—
If I may quote to one as learned as you—

"Proud should he be who hath a friend indeed,
Still prouder he who ne'er a friend doth need."

Philadelphia, Aug. 19, 1875.

The New York and New England Union Telegraph Company.

A CONTRIBUTION TO TELEGRAPHIC HISTORY.

WITHIN a very short time after the completion and successful operation of Morse's first experimental line from Washington to Baltimore in 1844, some of the most sagacious and public spirited citizens of different parts of the United States began to perceive the advantages which would result from the general extension of this new and important means of communication to the principal cities. The Morse patent was then owned by Professor Morse himself, Prof. L. D. Gale, Alfred Vail and F. O. J. Smith, the latter having one fourth interest. In 1844-45, Mr. Smith, aided by a few friends, labored indefatigably to enlist the public interest sufficiently to raise the necessary funds to construct a line of telegraph from New York to Boston, and thence to Portland, Me., of which city he was himself a resident. This proved a difficult task, but he at length succeeded in inducing some of his friends, as well as a limited number of public spirited citizens in some of the intermediate towns, to advance a sum, which, supplemented by the means which he himself was able to furnish, served to construct the pioneer telegraph line between New York and Boston. These gentlemen were organized into a company under the title of the "New York and Boston Magnetic Telegraph Association."

The original New York and Boston line, which was built by this association, was completed in 1845. The conductor was of No 16 copper wire and the insulation of glass. The route was by way of the Bowery and Third avenue, in New York, to Harlem, and thence along the Harlem Railroad for a distance of seven or eight miles, and thence by turnpike through Stamford, Norwalk and Bridgeport to New Haven, the railroad between these points not being then in existence. Thence it followed the line of the railroad from New Haven, via Hartford, Springfield and Worcester, to Boston.

This line, as originally constructed, was not remarkably successful. In fact it was disabled more than half the time. Every heavy storm broke the copper wire in hundreds of places. In 1846 Mr. Smith, in his annual report, advocated the substitution of iron wire for the copper, which was shortly afterwards commenced. During the following year such a great amount of trouble was experienced from the improvements upon the Harlem and Western railroads, in the way of double tracks and new station buildings, that the directors finally became disgusted, and in 1848 flanked the Western Railroad by building a new line across the country from Clappville near Worcester to Euclid Bridge, Conn., with thirty-five poles to the mile, No. 9 iron wire and brimstone insulators, to which one of the through lines was connected. The Harlem railroad was dodged in a similar way. The line must have paid a Hibernian dividend in 1848, the receipts for the year ending August 1st being \$34,835, and the expenses \$36,034.

The improvements which had been made had, however, increased the reliability of the line to such an extent

that there was now a fair prospect of some return to the stockholder during the ensuing year. But unfortunately the managers of the line, feeling secure in their patented monopoly, had treated its patrons, especially the newspapers, somewhat arbitrarily, and much dissatisfaction existed. In consequence of this mistaken policy, the merchants of New York were quite ready, not to say willing, to embark their capital in an opposition line, which was projected by Henry O'Reilly in the fall of 1848. Mr. O'Reilly had secured the Bain patent for operating his line, which was pushed forward with great energy, having been completed in September and opened for business in October, 1849. A company was formed embracing a number of the leading New York merchants of that day, prominent among whom was Marshall Lefferts, Esq., now president of the Gold and Stock Telegraph Company, under the corporate title of the "New York and New England Telegraph Company," though the line was popularly known as the "Merchants' Line."

This line was built along Eighth avenue, crossing the Harlem river at High Bridge, and thence by turnpike to New Haven, much of the way alongside the old line. At New Haven it diverged and followed the turnpike through Middletown and Norwich to Providence, and from thence into Boston by the Boston and Providence railroad. It was well built with large chestnut poles, No. 10 English galvanized wire, and iron-protected insulators, and worked much more reliably than the Morse line. Mr. Lefferts, the president of the line, was a business man and managed it on business principles, and it succeeded in a very short time in building up a comparatively profitable business. During the same year, 1849, a second competing line, using the House printing instrument, was constructed between New York and Boston, via New Haven, Middletown, Hartford, Springfield and Providence, having two wires and running upon the turnpike.

The Merchants' Line made a dividend the first year after its opening, but during the following two years the competition between the rival lines became so fierce, and the tariffs were so reduced, the rate between New York and Boston being only 10 cents, that neither of the three made any money. The final result of this state of things was that Messrs. Lefferts and Smith entered into negotiations which terminated in the consolidation of the Morse and Bain lines, a new company being formed on the 1st of July, 1852, under the corporate title of the "New York and New England Union Telegraph Company." The original stockholders in the consolidated company were F. O. J. Smith, J. M. Clark, John McKesson, John McKinney, J. J. Haley, A. B. Sands, H. M. Schieffelin, A. A. Pettingill, C. H. Seymour and P. Naylor. John McKinney was the first superintendent, but in less than a month he disposed of his interest in the concern to Marshall Lefferts and resigned his position. He then leased the House line, which, from having been poorly built in the first place, had grown more and more dilapidated and demoralized, and at once proceeded to reorganize it and make competition lively for his former associates. In August, 1852, H. M. Schieffelin was elected president. John A. Lefferts, superintendent, and L. L. Sadler, secretary and treasurer. Gustavus Swan, who learned the art in Utica, N. Y., in 1845, in the line then running from Albany to Syracuse, was appointed chief operator at New York. The board of directors held a meeting in September, adopted a new alphabet, "to go into use as soon as the operators have had sufficient time to perfect themselves therein," and fixed the salaries of the principal employes. It is to be presumed that the operators never perfected themselves in the new alphabet, as it does not seem to have gone into use. The salaries of the superintendent and treasurer were fixed at \$125 per month. The Providence operator got \$50 per month. New Haven, Hartford and Worcester, \$41.66, while the operators at Bridgeport, Middletown, New London, Norwich, and Springfield were obliged to work for \$33.33 per month, and the fun of it. In order to promote economy it was resolved "that the superintendent be instructed to cause the operators on the Morse registers to write out the messages *themselves* as they receive them."

In the latter part of 1852 Mr. Lefferts resigned the superintendency of the line, and Mr. Swan was appointed in his place. He had considerable trouble in getting matters arranged so as to work smoothly. The consolidation of the offices of the two lines, using different systems of telegraphing and different alphabets, made a great deal of confusion. The alphabet question was especially troublesome. The board of directors voted to have all the operators use the Bain alphabet, but the operators of the Morse line did not take very kindly to the proposition. The insulator question was also a great bother, as it has been ever since. Mr. Swan favored John A. Lefferts' plug insulator, then recently invented, and carried his point. They were at all events much better than any of their predecessors. The New York offices of the respective lines were at 5 Hanover and 29 Wall street. The operating room at the latter place was an ill ventilated apartment, about twelve feet square, into which operators, copyists,

clerks and messengers were closely packed, regardless of health and comfort, to say nothing of conveniences for transacting business. The offices were however shortly afterwards consolidated and removed to 23 Wall street, on the corner where the Drexel Building now stands, which afforded much better accommodations.

By this time, however, John McKinney and his friends had got the rival "House Line" into first rate condition. They had secured the associated press report, which was alone worth fifteen or twenty thousand dollars per year, besides a large share of the private business. They were extending their connections in all directions, and their energy and enterprise began to disturb the complacency of the managers of the Union line very seriously. The latter company therefore pushed on their improvements in the way of rebuilding and reinsulating with considerable vigor.

During the spring of 1853 they also purchased the line of the Rhode Island Magnetic Telegraph Company, a rather rickety concern, extending from Worcester to Pawtucket, Providence, Taunton, Fall River and New Bedford, and annexed it to their own lines, which gave the company a total mileage of 663 miles of poles, 1,281 miles of wire, and 18 offices. The gross receipts at this period averaged from \$6,000 to \$7,000 per month. The whole number of messages sent and received from the New York offices from July 1, 1852, to July 3, 1853, was about 145,000.

About this time Mr. Swan conceived the idea of establishing branch offices at some of the principal hotels in New York. As an experiment he built a branch line at his own expense from 23 Wall street to the Astor House, and opened for business on a commission of the receipts. This was the beginning of the system of branch offices and city lines, which has since become so extensive and popular. Mr. Swan's Astor House line may have cost him, all told, perhaps \$250, and it has probably been the most profitable telegraph line, in proportion to its cost, that was ever built. He still retains the ownership of it, or did at a very recent period.

In September, 1853, Mr. Swan resigned the superintendency of the line, and Chas. F. Wood, of the Magnetic Line office, was appointed in his place. Mr. Wood went to work energetically to improve the condition of the lines, rightly judging that continuous and reliable working would bring a large increase of business from the many flourishing cities throughout the territory covered by the company's lines. By the summer of 1854 matters were very much improved in this respect. About \$10,000 had been spent in reconstruction and the reinsulation of the lines with the Lefferts' plug insulator. The Grove batteries hitherto in use had been abolished and replaced with Chester's improved Smce battery. New instruments were placed in most of the offices, and the switches, connections and leading in-wires overhauled to the great improvement of the working of the line. The wires between Harlem and Stamford were transferred to new poles on the New York and New Haven railroad, which completed the reconstruction of all the main routes between New York and Boston. By an arrangement with the House Line the tariffs were restored to something like a living rate, and an era of prosperity began to dawn upon the enterprise. As Mr. Wood remarked in one of his annual reports, "The secret of its success lies in keeping the wires at all times in good working order, doing business expeditiously, serving the public faithfully, and giving them what they have ever wanted, and are willing to pay for, viz., reliability." The success of John McKinney's House Line probably served not a little to "point the moral and adorn the tale."

The correctness of this theory was proved by the gross receipts, which by another year had increased from \$6,000 to \$9,000 per month, enabling dividends amounting to 10 per cent. per annum to be regularly declared, whereat the directors were so delighted that they voted to present President Schieffelin with a service of plate. In 1856 the company succeeded in getting control of the Worcester and Nashua line, as well as arranging for the use of two wires between Boston and Fall River, one belonging to the Old Colony railroad, and the other to the Boston and Cape Cod Marine Telegraph Company.

In the meantime, however, the opposition had not been idle. About the year 1855, the American Telegraph Company was formed, which immediately leased the lines of the Maine Telegraph Company, extending from Boston to Calais, which was one of the most profitable telegraphic enterprises in the world, on account of the large revenues derived from the transmission of the European steamer reports. This company then proceeded to absorb the existing lines with great rapidity. They leased the New Brunswick line from Calais to Sackville, and the Troy and Canada Junction line, and the northern line extending respectively from Troy to Montreal and Boston to Burlington, Vt. In 1855, they purchased the house lines from New York to Boston, and Springfield to Albany. They also purchased the patent of the Hughes' printing instrument, which had then just

been brought out, attracting a great deal of attention. In 1856 they built a new line from New York to Boston, via Brewster's, Waterbury, Hartford, Springfield and Worcester, for commercial business, and equipped it with the new instrument; extended the Montreal line from Troy to New York by the way of the Harlem Railroad, and proceeded to make the competition very warm for the Union Company. The final result was that in 1860 the victorious American Company succeeded in consolidating all the lines between Sackville, N. B., and New Orleans, and the New York and New England Company, whose history we have briefly endeavored to trace, terminated its existence as a district organization.

A few words as to the operators and managers of the Union line may not be out of place. Many of them are still in the service, and are among our best known telegraph men at the present day. John A. Lefferts, the first superintendent, is still a resident of New York City, and is engaged in manufacturing. Gustavus Swan continues to run his Astor House office and branch line which he established in 1853, which affords him a very snug income. Chas. F. Wood is still actively engaged in the service of the Western Union Company as District Superintendent of the lines between New York and Boston, having held this position continuously ever since his appointment in September 1853, a period of twenty-two years. During this time the mileage of wire under his charge has increased from 1,251 to nearly 8,000, and the number of telegraph offices from 18 to somewhere in the neighborhood of 300! It is probable that the business handled, and the receipts for transmission have increased in even greater proportion. Geo. B. Prescott, who was chief operator of the Bain line at Boston, and with the Union Company after the consolidation, is now electrician of the Western Union Company. Henry H. Ward, of Boston office, is Secretary and Treasurer of the Gold and Stock Telegraph Company, of New York. H. N. Williams and W. P. Potter, who operated the old Rhode Island line at Providence were transferred, one to Worcester, and the other to Fall River in 1853. The latter is still in charge of the Fall River office, a position which he has held for 22 years. Mr. Williams, after a long term of service, retired three or four years since on account of impaired health. Another of the old settlers is J. D. Raymond, who was one of the inspectors of the Union line from the beginning, and still holds a similar position with the Western Union. His associate, W. W. Sadler, brother of the Secretary and Treasurer of the Union line, died some years since, as did also R. W. Raymond, of the Springfield, Mass., office, and that jovial old philosopher, Dan Smith, of New London. S. B. Fairchild, of New Haven, is now a chief operator in one of the principal Western cities. Thus we have endeavored, hastily and imperfectly, to preserve some historical reminiscences of one of the old telegraph companies, and some of the items which have been recorded may not be without interest and value to the future telegraphic historian.

The Telegraphers' Mutual Benefit Association.

ASSESSMENT NOTICE No. 78, ISSUED SEPTEMBER 1, 1875.

DEATH OF ABRAHAM KERN.

Abraham Kern, of Cincinnati, O., (Certificate No. 153, issued November 30, 1867), died at the Long View Asylum, near Cincinnati, O., July 23, 1875, of chronic maniacal exhaustion.

One dollar for assessment 78 is due from members holding certificates numbered up to and including No. 2476.

Members who have not yet remitted for assessment 77 (notice of which was issued Aug. 2, 1875), will please consider this a duplicate notice that that assessment is due and should be paid at once.

RECEIPT OF ASSESSMENTS.

ASSESSMENT No. 77.

5, 33, 46, 52, 54, 58, 61, 65, 67, 72, 75, 80, 91, 93, 95, 99, 121, 129, 134, 141, 142, 144, 153, 179, 182, 184, 215, 220, 235, 244, 247, 254, 257, 267, 276, 278, 279, 280, 281, 282, 283, 285, 302, 312, 349, 360, 367, 379, 380, 392, 393, 402, 405, 406, 413, 425, 426, 431, 463, 466, 468, 469, 470, 471, 475, 511, 512, 514, 532, 533, 545, 546, 548, 554, 560, 573, 576, 577, 587, 603, 618, 672, 678, 680, 685, 708, 734, 735, 750, 751, 756, 769, 791, 831, 855, 858, 874, 876, 883, 886, 905, 922, 932, 943, 952, 976, 995, 998, 1001, 1005, 1013, 1023, 1040,

1055, 1074, 1076, 1093, 1100, 1101, 1102, 1147, 1152, 1196, 1200, 1226, 1227, 1232, 1233, 1248, 1251, 1260, 1274, 1276, 1303, 1304, 1325, 1364, 1366, 1368, 1385, 1390, 1391, 1437, 1440, 1449, 1453, 1482, 1483, 1484, 1517, 1518, 1524, 1532, 1537, 1546, 1550, 1554, 1555, 1569, 1572, 1582, 1589, 1593, 1594, 1596, 1620, 1634, 1637, 1656, 1663, 1676, 1681, 1695, 1699, 1710, 1714, 1721, 1728, 1735, 1732, 1736, 1745, 1775, 1791, 1810, 1811, 1812, 1815, 1817, 1847, 1864, 1881, 1907, 1911, 1913, 1914, 1916, 1919, 1938, 1943, 1950, 1965, 1973, 1999, 2000, 2001, 2021, 2024, 2027, 2057, 2083, 2094, 2114, 2138, 2142, 2165, 2181, 2191, 2195, 2196, 2199, 2201, 2202, 2204, 2205, 2206, 2213, 2215, 2216, 2220, 2224, 2230, 2231, 2241, 2244, 2256, 2262, 2268, 2269, 2272, 2295, 2296, 2297, 2298, 2300, 2301, 2303, 2323, 2330, 2331, 2333, 2334, 2335, 2336, 2345, 2350, 2351, 2354, 2355, 2356, 2371, 2374, 2378, 2379, 2386, 2392, 2393, 2416, 2418, 2419, 2421, 2424, 2431, 2432, 2433, 2434, 2436, 2437, 2439, 2440, 2441, 2443, 2447, 2453, 2467.

ASSESSMENT No. 76.

496, 499, 506, 508, 600, 1104, 1375, 1553, 1677, 1743, 2150.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid, will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Assignment of Automatic Patents.

TO THE EDITOR OF THE TELEGRAPHER.

I APPRISE you and your readers of the fact, that on the 26th inst. I transferred my United States patents for my "American rapid system of Automatic Telegraphy" to the Atlantic and Pacific Telegraph Company, in order to secure some portion of about eighty thousand dollars salary, and other liabilities incurred by the President and others of the late Automatic Atlantic Telegraph Company.

GEORGE LITTLE,
Passaic City, N. J.

August 30, 1875.

A Fire Alarm Telegraph in Oregon.—Progress of the New Telegraph Line.—A Telegraph Instrument Manufactory.—Telegraphic Experts.

PORTLAND, OREGON, Aug. 13.

TO THE EDITOR OF THE TELEGRAPHER.

IF I were as gifted in making excuses as some telegraphers I am conversant with, I imagine I could fill a few columns as an apology for my long silence, but I don't propose to do anything of the kind. I have been sick; out of sorts; off on a jaunt, health-seeking—and found it; besides there has been a fearful seeking of news in this section interesting to the telegraphic fraternity.

Since my last, Portland has acquired a fire alarm telegraph apparatus, sixteen boxes, scattered around town, "where it will do the most good," at an outlay of \$7,500. One of the dailies says, "Our city fathers have a fire alarm at last, at an outlay of \$7,500, and now they can't find any one competent to run it." This is very complimentary to the array of telegraphic talent of which Portland boasts, but the Ethiopian behind the woodpile some explain is, that the principal movers in this are trying to use it as a political influence and don't care about any one who they can't use. Sabbe! This line was put up by Mr. S. D. Field, of San Francisco, of the E. C. & M. Co., agents for Gamewell & Co., and is now under supervision of Mr. J. L. Hallett, the railroad contractor of the Pacific coast, as supt., &c., *pro tem*. The alarm was sounded for a fire for the first time last night, and the firemen don't seem to have the hang of it exactly as they went to the wrong place. The next thing of interest, to telegraphers especially out of a situation in Oregon, is the rapid construction of the new line from Winnemucca, Nevada, to Portland, Oregon. The holes have all been dug between Boise City, Idaho, and Walla-Walla, W. T., the only gap remaining, a distance of 150 miles, and the poles are now being set. Eighteen thousand pounds of wire were shipped from Winnemucca last Monday out on the line, and it is the intention to have the line working from Portland to California and Eastern States (connecting at Winnemucca with

tho A. & P. Co.) inside of two months at farthest. Mr. Platt Burr, the supt., is now in this city, looking after the interests of his company. The boys have it that a man from Chicago will be manager. Who is it? That's the "kontumdrum" now that excites the average telegraphist here, and especially in Portland, as they anticipate lively times in the telegraphic world, or the part contained in Oregon.

Our worthy supt., C. D. Faling, Esq., of O. & C. R. R. telegs., is now on a trip to California for his health, which for some time has been in rather precarious condition. We sincerely hope he may have a safe and pleasant trip, and return entirely recuperated by the balmy breezes of the Golden State and mighty tossings of old Neptune while *en route* to and from Frisco.

Telegraphic matters along the various lines are very quiet, very little business being transacted; but now that the new wheat crop is coming into market it will be certain to keep the hooks pretty well filled.

It seems that the fraternity will in due time turn out a disciple of Blackstone. I have reference to Thurman, "D. R.," in "Po.," W. U. office. The way he keeps a copy of Blackstone by him, and when business is slack pick it up and go to reading is pretty good. Go it, Bill, and when you're admitted you will be sure of the patronage of the telegraphers of Oregon.

You didn't know Oregon boasted of a telegraph instrument manufactory, did you? but such is the case. L. Ran, is his name, and Portland his head quarters. The instruments are not as finely finished as some we have seen, but they are good, strong and serviceable. Don't say we are not progressing, for I think the improvement in the last ten years is pretty fair. When Webfoot commenced learning the art of the dots and science of the dashes there were only two sound operators in this State; now, with the exception of a very few, all are good, sound operators, and some as good as they turn out any where in America. We cannot help being amused occasionally at some eastern boys coming out to the wilds of Oregon, as they call it, imagining they will have the preference and be certain of probably the best job on the line because they read by sound. These generally find out their mistake too late. They have to admit that we do have some sounders, and another very important thing to them is the places are all filled; but such is life. Experience is a hard school, but when a fellow learns a lesson therein he don't generally forget it, *you bet*.

WEBFOOT.

Farewell Presentation to Mr. Wm. Gage.

ALBANY, N. Y., August 31.

TO THE EDITOR OF THE TELEGRAPHER.

TUESDAY evening, the 24th instant, was the occasion of a presentation meeting, composed of operators, linemen, and others connected with the telegraph in this vicinity, who assembled in the ante-room off the operating room, to express, in a substantial manner, their appreciation of the worth, and regret at the necessity of parting with Mr. William Gage. Mr. Gage has for several years been employed as local repairer for the W. U. Co., and stationed at this place; his superior abilities as a "wire puller" have been mentioned heretofore in these columns. As his sudden withdrawal from the business might appear unaccountable, and possibly suspicious to those who are unacquainted with the circumstances of his leaving, a few words of explanation may not be out of place.

It will be unnecessary to enter into the details of the matter; it is enough to state that several weeks ago Mr. Gage was discharged on charges of a private and rather vague nature, and which, though doubtless made in all sincerity, are generally believed to have been unfounded in fact. Indeed had those charges been true, being of a purely personal character, and not in any way reflecting on his ability or faithfulness as an employe of the company, they could not possibly have formed the slightest ground for his removal. The case being brought to the notice of a higher authority, Mr. Gage was promptly reinstated, but he refused under the circumstances to return to work under the man who had treated him so unfairly, and verbally offered his resignation, which was reluctantly accepted. The testimonial which was in the shape of a finely finished imported double harrelled fowling piece, was presented by Manager Rugg, who read the following letter which was signed by a large number of "Bill's" friends:

MR. WILLIAM GAGE:
Dear Sir: For the past three years we have, in the discharge of our respective duties, met you almost daily. To-night we meet, it may be, for the last time on earth.

In saying to you good bye, we desire to testify to your faithfulness and integrity, and to bid you goodspeed. We ask you to accept, with our best wishes, the accompanying fowling piece. It is warranted, if aimed right, to be sure fire against partridge, woodcock, bears or Indians.

May all the "crosses" and "troubles" you meet

with in this life be easily "repaired" and when the final "break" occurs may you have a well grounded hope for the future."

On the "stock" of the gun is a neat silver tablet with the inscription "William Gage, from his Albany friends."

Bill's thanks [which were too plainly visible to require any words to corroborate them] were expressed in a few characteristic remarks.

Prof. Headley thought the occasion a very proper one to give a little friendly counsel, and therefore advised him, in the language of the lamented Horace Greeley, to "go West, young man."

As friend Gage is the owner of a snug farm of eighty acres, situated among the finest prairie lands of Iowa, he has seen fit to accept this advice, and on the 25th inst. left with his wife for their Western home. As a granger, we believe Bill will prove a success, at least he has the best wishes of the fraternity in this section for his future prosperity. DOUBLE SIX.

Telegraphic Changes.—Personals and News at San Francisco, Cal.

SAN FRANCISCO, CAL., Aug. 21.

TO THE EDITOR OF THE TELEGRAPHER.

SINCE the departure of your correspondent, "Clix," for the land of oranges and honey there seems to be no one willing to furnish the readers of "our" paper with anything regarding the telegraphers of San Francisco. I will therefore assume the responsibility and endeavor to furnish you a few items of general interest. The changes in the Western Union office have been very numerous recently, as follows: Jno. R. Yontz, late manager, having accepted a situation with the Electrical Construction Company, Mr. Chas. T. Dozier is acting manager, in addition to his duties as chief operator, no official appointment having as yet been made. Miss Susie W. Peck and Miss Rose Thomas have accepted situations in the main office, working the city lines. Miss Peck also running the "stock" printing instrument. Miss Fanny Wheeler has been transferred from San Francisco to Los Angeles, and Miss Norcross from the Grand Hotel to the Santa Barbara office. Mr. Geo. Sawyer, night chief operator, is absent on sick leave, his position being filled by Mr. Arscott Venton. Mr. J. B. Sheldon has been ruralizing at Paso de Robles Springs, and returns to his duties in the San Francisco office on Sept. 1st. By the way, Shel, did you "bag any snipe?"

New additions to the W. U. force here are as follows: Wm. H. Gloyer, of Detroit; James O'Poole, of St. Louis; and O. A. Stevenson. John A. Campbell has resigned and gone to Los Angeles for his health. Hope you will find it, "Q." We miss your cheerful face and bad jokes, and would rejoice to have you with us once more. R. M. Talbot, formerly of Cleveland, is working in the A. & P. office in this city. "Brick" Kenny has returned from the east, and is also working for the A. & P. Co. Brick says he only "tackled a hox car" once on his return trip. Mr. Chas. W. Patch, of Memphis, made us a short visit, but owing to poor health did not accept the position offered him in the W. U. office; the summer fogs and winds being too much for him. Charlie Lawson showed him the city. Patch consenting to walk around on condition they kept on the sunny side of the streets. Despite all Lawson's efforts we could not get him to the top of Telegraph Hill, and after a few days he became disgusted and started east, but accepted a situation with the A. & P. Co. at Ogden.

Mr. M. S. Bacon, a well known telegrapher, from—well, *everywhere*, is in the city looking around, and expresses himself as being much pleased with the "Golden City."

The W. U. Co. have opened a branch in the American District Co.'s office for the convenience of bankers and brokers, and are doing a lively business. Joo H. Thatcher is in charge with Wm. F. Archibald as assistant.

The American District Co. are rapidly extending their wires throughout the city, and are meeting with great success. ROMEO.

The Atlantic and Pacific, Chicago, Ill., Office and Employes.

CHICAGO, ILL., Aug. 25.

TO THE EDITOR OF THE TELEGRAPHER.

THE force of the Atlantic and Pacific Co. in this city consists of the following named persons:

Manager.—D. E. Sweet.

Chief Operator.—H. H. Scobell.

Night Manager.—M. A. Huyck.

Manager Board Trade Office.—Edward W. Farnham.

Operators.—Ed. L. Cuthbert; Ed. Cloud; B. E. Sunny; Ed. G. Everson; Lu. Bradley; Charlie Bloomfield; Geo. T. Richardson.

Check Clerk.—Geo. Chandler.

The automatic force consists of seven persons all told:

Chief Perforator.—Wm. Batchelder.

Assistant Perforators.—H. S. Waters; W. E. Bodley.

Copyists.—Mrs. Rogers; Miss Ella Harwood; W. J. Hopkins, E. B. Conklin.

Down stairs Mr. A. G. Stolbrand is Manager, Mr. R. B. Bentley is Receiver. Perhaps a few remarks about the above named gentlemen would not be amiss.

Mr. Sweet presides in the operating room. He is a thorough gentleman, and is generally liked by his subordinates. Mr. Scobell is the chief, and there never was a better one. You will always find him with a smile on his face, and a pleasant word for all. Ed. Farnham, the gentlemanly and business like manager of "Cx," is always on hand at 7:30 A. M. Never misses it. Ed. is fond of—of—coffee, and is the father of a bouncing boy. Sunny, beams and smiles as he wades through the business "On 'Change," and "puts it down" in a style that is hard to beat. Ed. Cloud "sushes" the boys in Cincinnati and on the Omaha line. He makes a brag that he can eat more peanuts and pears in less time than any man in town. Ed., it's your turn to "set 'em up." Farnham works the New Milwaukee wire, and the rapidity at which business is done on that wire is astonishing. Ed. Cuthbert takes it easy on Detroit. He finds plenty of time to play with the message boys, eat peanuts (Cloud's), and "shoot" the lady visitors in the gallery. George Richardson works Omaha at the main office, and "Cranks" "Automatox" in good shape. Everson works the city wires, he is a young operator of great promise. His hair, however, is cut too short. Mr. Huyck is night chief; he does his share of the work, and is a very fine sender. "Chawles" Bloomfield is an old timer. Lu. Bradley takes report like a little man. Lu. is a good boy, but he never has any tobacco of his own. Mr. Batchelder, chief perforator or "puncher," is one of the finest in the business. He can punch from 60 to 70 words of press per minute, and has punched as high as 103 from his head, which is considered very rapid work. Mrs. Rogers and Miss Harwood are both experienced copyists, and do excellent work. Mr. Conklin and Mr. Hopkins perform their duties in a satisfactory manner. Chandler is check clerk. He is called "Brick-top" for short. He does not chew tobacco; he is not noisy; neither is he very cheeky. We may want to borrow money of Chandler some day, and I hope he will remember all this.

The St. Louis wire (now in process of construction, and completed to Streator, Ill.) will soon be finished, as the work is being pushed forward at the rate of 20 miles per day. There is also a wire being built from Davenport to St. Louis, and when these two routes are completed 'tis hoped the A. and P. Co. will get their share of the business in St. Louis. Nearly all the press handled in this office is done by the automatic system, which has just been put in operation at Des Moines. Several hundred words of report are sent to Omaha and Des Moines in a few minutes, thus leaving that crowded wire clear for way business. The business of the Milwaukee wire is increasing so rapidly that a duplex will soon be necessary to handle business promptly. It's understood a duplex has been purchased for this purpose, and is now on the way here.

The main topic of conversation among the A. & P. boys is "the uncertainty of their business life" in case the two companies consolidate. I understand all arrangements have been made between the two companies for consolidation, but it is hoped that the W. U. will provide for the operators of the opposition if they are thrown out by the consolidation.

OPPOSITION.

Excessive Telegraphic Labor.

TO THE EDITOR OF THE TELEGRAPHER.

IN reading the proceedings of the meeting of the friends and associates of the late George H. Mumford, Vice-President and Secretary of the Western Union Telegraph Company, I could not but observe, in most of the speeches, that Mr. Mumford had been overworked, and "had assumed to do more than any one man could or ought to undertake," and Mr. James D. Reid's "second thought" plastered the executive officers all over with "oppressive, official care." No doubt there is a great deal of truth in what he says, and that there is a very heavy strain upon the brain of some of the officers, but that it is a strain unto death and "murder" I cannot think. But if it is, what must we think of the system which the executive officers have inaugurated for the operators. Theirs is as a strain, not upon the brain, but upon the muscular and nervous system. They are compelled to seat themselves at the desks at early morning, and there remain the entire day, with the exception of a few minutes at noon for dinner when they are allowed to go into the next room and "bolt" down a hurried meal, and then go directly back to their desks, and there remain in an almost fixed position the balance of the day. If this is not murderous, I don't know what is.

No doubt the company, in opening an eating room and establishing a list of prices which are certainly very reasonable, did a very commendable thing so far as the pecuniary interests of the operators are concerned; but when the company prescribed the time for eating to be just long enough to take the meal in a very hurried manner, it struck a blow at the health of the operator which, in its results, must be very injurious, not to say murderous. Had the company, in connection with the eating room established a gymnasium, and given the operators time for exercise, an opportunity to relax the muscles which are under constant strain at the key, they would have been the almoners of great good to the operator which in the end would result to the great advantage of the company. In fact I think the company would be the most benefited, as the operator would be refreshed both inwardly and outwardly, and would resume his labors with a will and energy which would more than compensate for the time.

As Mr. Reid has so forcibly called the attention of the executive officers to their overworked condition (and I have not a word to say against it), I trust that in providing for their own relief, which they certainly should do, they will at the same time take into consideration the propriety of affording to the operators such exercise as the nature of the business demands.

This is a subject upon which much should be said, but I will not enlarge at this time, as a word to the wise may be sufficient; and perhaps others will follow up the subject much more acceptably than I can.

JUSTICE.

English Patents.

AMONG the specifications of patents issued in England, printed in the *Electrical News* of August 19th, is the following:

Improvements in Duplex and Multiplex Telegraphs. Thomas Alva Edison, of Newark, N. J., U. S. A., February 2, 1875. No. 384.

This invention relates to improvements in telegraph instruments and circuits, whereby one wire can be used simultaneously by two operators at both terminal stations, one to send and the other to receive, usually known as a duplex telegraph; also one wire can be simultaneously used by two operators to transmit, and two operators to receive at each end, called a quadruplex telegraph. A circuit pressing key brings into operation the whole battery, or only a portion, to operate one set of electro-magnetic instruments by the rise and fall of tension. Another key reverses the current without breaking the circuit, and a polarized relay magnet responds to the reversal. Rheostats, condensers, and induction coils are inserted to neutralize static discharges, to equalize and neutralize the action of the currents sent on the receiving instruments at that station, and leave them free to respond to the currents from the distant station; also to establish artificial lines of equal resistance to the main line, and thereby to balance the electrical forces. The polarized relay and differential electro-magnet operate by local circuits the instruments that receive the messages, and indicate the same by sound or marks. At intermediate stations the instruments are arranged so as to work to either terminal station, or by connecting them a relay is effected, so that on long lines the operator at a terminal station works a relay at an intermediate station to send to the distant terminal station, and this is used either in the duplex or quadruplex telegraphs.

A Painting Wager.

THERE was considerable excitement yesterday between one and two o'clock on Dock street, below Second, occasioned by parties who were engaged painting the poles of the Local Telegraph Company. It has usually taken from three to four hours for the painting of a single pole, and upon the subject of completing the job in a much shorter time a lively discussion took place. Mr. James Grace, line-man, who for many years was employed in the City Police and Fire Alarm Department, asserted that he could paint a 55-foot pole, with six cross-arms, in thirty minutes, and there were plenty of wagers that he could not. The crowd on Dock street gathered to witness what all at the outset predicted would be a failure. He was exactly twenty-six minutes, finishing the job in that time, much to the surprise of the lookers on. He did some tall reaching, and each dash of the brush covered a deal of space. He descended once to supply his paint pot. This same person once on a wager strung a mile of wire in thirty-four minutes and fifteen seconds, climbing in that time forty-one poles thirty feet high, and winning the wager by three-quarters of a minute. Upon another occasion he put up a large cross-arm in a minute and a half. He is a tall fellow, and his hailing from Jersey cannot discount the fact that he can do some "tall" work.—*The Press, Philadelphia.*

Nothing more than write—editorial work.

The Telegraphic Situation.

THE telegraphic situation appears to be a good deal "mixed" just at present, and it is somewhat difficult to express an opinion that will fit the circumstances as they may be on the day THE TELEGRAPHER makes its weekly appearance. The changes are kaleidoscopic in their rapidity. To-day consolidation, to all outward appearances, may be all but consummated; to-morrow the negotiations are off, and the prospect of consolidation anything but promising. After our last week's article was in print it was announced semi-officially that the conference committees of the Western Union and the Atlantic and Pacific companies had come to an understanding for a consolidation on the basis of a lease of the wires of the latter to the former company on a rental of seven per cent. upon a valuation of two and a half million of dollars. This was generally credited, and the belief was entertained that for the time at least telegraphic competition was practically dead. It has since transpired that this report was erroneous, but that in fact the committees had talked matters over, and that the propositions or suggestions would be submitted to the executive committees of the two companies. At a meeting held on Tuesday last the executive committee of the Atlantic and Pacific rejected all the propositions submitted. The conference committees are again at work as we write, but with what prospect of agreement we are unable to say.

After the conference committees shall, if they ever do, come to an understanding, the matter goes to the

executive committees, and if it passes that ordeal, remains to be acted upon by the directors, and in case of consolidation being agreed upon, will undoubtedly be taken into the courts for final adjudication.

We might fill columns of THE TELEGRAPHER with the conflicting rumors and reports, but with no profitable result. A reporter of the New York Times interviewed Mr. SIDNEY DILLON, who is one of the committee on the part of the Atlantic and Pacific Company, on Tuesday. He said that the statement that any terms had been agreed upon, or any definite proposition made on either side, was untrue. The committees have met several times and conversed generally about what would be fair to both companies. At the last two meetings the views of the opposing interests have harmonized better than heretofore, and on Monday the conference was so satisfactory that it was agreed to report to the directors of the two companies. Mr. DILLON denied that any proposition involving a sale or lease of the Atlantic and Pacific lines on a basis of twenty or twenty-five per cent. of its capital stock had been suggested or accepted. In regard to the reported effort of the new National Telegraph Company to obtain control of the Atlantic and Pacific, he stated that some months ago Mr. COHEN, on behalf of the new company, made a proposition to the Atlantic and Pacific Company, expressing a desire to purchase the latter's lines or to fuse interests, but nothing more has been heard from him since. The best interests of the company Mr. DILLON represented would be subserved, and the parties who bid high enough will get the lines, no matter who they are.

Western Union stock has declined heavily—six per cent. or more within the last few days. This is chiefly attributed to very large sales on account of Mr. JAY GOULD, it being stated that he had sold 130,000 shares. The financial crisis in California has unfavorably affected the stock market, and endangered Union Pacific Railroad interests, in which Mr. GOULD is deeply involved. It is currently reported that he has thrown over his telegraph stock in order to be better able to protect his railroad interests. As a matter of fact, this whole telegraph business has become a mere stock-jobbing operation, and negotiations are conducted, and combinations made mainly with a view to depress or advance the stock quotations.

The President of the new National Company did not leave San Francisco a week ago last Saturday, as reported. The financial difficulties there probably prevented, but it is stated, on apparently good authority, that he did leave on Tuesday last. Telegraphic advices from San Francisco received in this city are to the effect that the financial difficulties will not interfere with the telegraph project, but that it will be carried out notwithstanding.

We still adhere to the opinion that we have hitherto expressed, that there will eventually be no consolidation. In this many of those who are best informed concur, and it is believed that some of the parties actively engaged in the negotiations have never really intended that they should amount to anything practically.

The Faraday has succeeded in recovering the eastern end of the direct cable, and it is hoped in a few days the gap will be filled and the cable in working order. This event might have an important influence upon the negotiations. We have never known telegraph interests to be in such a muddle as they appear to be at the present time, and with apparently no immediate prospect of being straightened out.

The Latest Phase of the Telegraphic Situation.

SINCE the preceding article on "The Telegraphic Situation" was written matters have assumed a definite shape, and the muddle, for the present at least, appears to be cleared up.

The origin of the whole matter was a written proposition from Mr. JAY GOULD to the Western Union Company to appoint a conference committee to meet a committee of the Atlantic and Pacific Company, in

order, if possible, to arrange terms of consolidation, which was acceded to. Of what has occurred since our readers have been informed from time to time. The terms discussed were not acceptable to the directors of the latter company, and on Wednesday afternoon President ORTON received another communication from Mr. GOULD withdrawing all propositions for negotiation, which of course is the end of the matter, until the exigencies of stock speculations make a renewal of it advisable.

The result shows the reliability of the opinion which we have adhered to throughout, and have repeatedly expressed in these columns, that there would be no consolidation, and confirms our belief that the whole thing has been merely a stock-jobbing operation on the part of one of the parties.

How to Dispose of a Newspaper and Still Retain It.—A Queer Business Transaction.

THE announcement which appeared in our last number that the publishers of The Operator had decided to discontinue its publication, and that the unexpired subscriptions would be filled by THE TELEGRAPHER, caused considerable surprise, which will doubtless be increased when it is known that the arrangement is not to be carried out. In justice to ourselves and to our readers we are compelled to make the following statement of the facts connected with that remarkable business operation, and having done so, we leave the reader to draw the necessary inferences therefrom.

On the 17th of August last we received through the post-office the following note:

"N. Y., Aug. 16, '75.

"Mr. JAMES N. ASHLEY.

"Sir: I desire to see you on newspaper business. Will you be good enough to say when you can grant me an interview.

"Respectfully,

"THOMAS ALLEN,

"Box 3332."

Knowing Mr. ALLEN to be one of the publishers of The Operator, and further, being aware that the proprietorship of that paper had been hawked around, without finding a purchaser, for some time, we inferred the nature of his business to be a desire to get rid of it, and replied, appointing an hour the next forenoon for the interview. Nothing further was heard from him for several days, and we concluded he had thought better of it; but on Tuesday of last week Mr. ALLEN appeared at our office and opened negotiations for the discontinuance and disposition of his journal. He stated to us that on account of the positions of himself and partners as employes of the Western Union Company, it was very unpleasant to be the publishers and editors of such a paper; that it was not profitable, the receipts just about paying the actual cash expenditure, and that the circulation had decreased (a fact of which we were previously well aware), and that some 400 or 500 subscriptions had expired with the last number. Without coming to any definite conclusion the interview was adjourned until the next (Wednesday) afternoon, when we were to make a proposition. Mr. ALLEN was promptly on hand according to appointment. The matter was again talked over; his partner's name being brought up, he assured us that since the previous interview he had seen Mr. WILLIAMS, that he desired to be rid of the paper, and would agree to any arrangement that he, ALLEN, might make. After further discussion of the value of the paper, etc., we made Mr. ALLEN a proposition, which included our filling the unexpired subscriptions, as announced. The brief announcement which appeared at the head of our editorial columns last week was drawn up, read by Mr. ALLEN, and he said, "All right, let it go in."

Soon after THE TELEGRAPHER appeared there were indications that everything was not as satisfactory as had been represented. The mail books were not turned over to us as promised, and there seemed to be a hitch somewhere. On Monday we learned that Mr. WIL-

LIAMS had stated that *The Operator* had not been disposed of—that he had not agreed to ALLEN'S arrangements, and would not, etc.

Mr. WILLIAMS called upon us on Tuesday last, and utterly repudiated ever having authorized his partner to make the arrangement with us, declared that the statement that he had so done, and the subsequent statements made by Mr. ALLEN in regard to what he required to satisfy and carry it out, were false, etc. There has evidently been some pretty steep lying in the matter somewhere.

The result of the whole matter is that the arrangement will not be carried out, which is perhaps only unfortunate for the subscribers to *The Operator*. The paper was tendered to us by Mr. ALLEN. We have never sought to acquire it, or in fact had any intercourse with its publishers, who, previous to this negotiation, were personally strangers to us.

We have stated above that the proprietorship of *The Operator* had been hawked about without finding a purchaser. It was, however, sold once to the great professor of duplicity and quadruplicity, EDISON, but the arrangement was broken off by the absconding of an employé of the professor with his entire cash capital, some 300 to 400 dollars, which had been appropriated for its purchase. It has been the organ of the professor during and since his connection with the Western Union Company, and he has been allowed to use its columns to vent his spite, slander and blackguardism at will, the reason repeatedly given therefor by the publishers being that he *paid for it*, which certainly indicates a high toned principle of journalism!

Personals.

Mr. JAMES W. STACEY, supt' of telegraph for the A. T. and S. F. R. R., Topeka, has resigned.

Mr. R. E. FARRINGTON, formerly manager at Newton, Kansas, succeeds Mr. STACEY as supt' of telegraph for the A. T. and S. F. R. R.

Mr. F. W. MARSH, of Pittsburg, Pa., has accepted a position as operator in the general office of the Kansas and Pacific R. R. Co. at Kansas City, Mo.

Mr. ED. SCHERMERHORN is subbing at Cheyenne, Wyoming Territory, Western Union office.

Mr. RICHARD P. HALLOIAN, of the St. Louis, Mo., Western Union office, has been assigned to the duty of looking after way business at night.

Mr. PETER GRITCHETT, all night operator at St. Louis, Mo., Western Union office, is rusticiating in Pennsylvania; Mr. BORN acting in his place during his absence.

Mr. J. LEVEN is manager of the Denison, Texas, Western Union office, with Messrs. W. B. SIMONS and L. A. SMALLS, as assistants.

Mr. H. W. RATHBUN, report operator at Oil City, Pa., Western Union office, has leave of absence for two months from July 1, to recuperate.

Mr. W. P. LUCAS, officiates as report operator in the Oil City, Pa., Western Union office, during the absence of Mr. H. W. Rathbun.

Mr. W. B. OGDEN, who has been absent for some time on a pleasure trip, has returned and entered upon the discharge of his duties in Oil City, Pa., Western Union office.

Mr. L. L. SMITH discharged Mr. OGDEN'S duties at Oil City, Pa., Western Union office, during the absence of the latter.

Mr. GEO. BROOKS, of the Oil City, Pa., Western Union office, has departed on a short leave of absence.

Mr. GEORGE O. SMITH, of the Oil City, Pa., Western Union office, has also left for a pleasure trip, during which time, it is rumored, he will take unto himself a better half.

Mr. J. W. N. GILD, of the Western Union Oil City, Pa., office, has returned to duty after an absence of five weeks on a visit to the West and South.

Mr. GEO. E. FOSTER, Manager of the Oil City, Pa., Western Union office, left Sept. 1st, for the West, to visit friends, and indulge in pleasure at the same time.

Mr. C. O. BOLTON is officiating in the capacity of relief operator at Oil City, Pa., Western Union office.

The Telegraph.

By Cable.

FLUCTUATION IN QUOTATIONS OF CABLE SHARES.

London, Aug. 30.—Shares of the United States Direct Cable Company to-day advanced one shilling on a rumor that the Faraday had succeeded in repairing the cable, and shares of the Anglo-American Company declined two shillings.

THE UNITED STATES DIRECT CABLE RECOVERED.

LONDON, Aug. 31.—The steamer Faraday has recovered the end of the eastern portion of the direct cable, and is now in telegraphic communication with London. She has not yet succeeded in finding the western section of the cable, and reports that unfavorable weather retards operations.

The Dominion Telegraph of Canada.

A NUMBER of changes have lately taken place in the Toronto, Ontario, office of the Dominion Telegraph Company. Mr. N. Burke, formerly night manager of that office, has been appointed manager of the London, Ontario, office of the same company, in place of Mr. L. B. McFarlane, resigned. Mr. Burke was very popular with the employés of the Toronto office, and will be much missed. Before he left, his associates presented him with a very handsome amethyst ring, as a slight expression of the esteem in which they held him. The London office will doubtless prosper under his management.

To compensate for the loss experienced in Mr. Burke's departure from Toronto, the office has had quite an acquisition to its attractions through the appointment by Mr. Neilson, the efficient and popular superintendent, of an additional lady operator, Miss E. McDroy, formerly of Guelph, Ontario. As she is said to be both pretty and amiable (rather a rare combination is it not, ladies?) the staff will probably forget to mourn for their departed friend and associate in pleasure at the new acquisition.

Mr. Wm. Manners, late of the Atlantic and Pacific force at Chicago, Ill., has also accepted a situation in the Toronto office. A correspondent of THE TELEGRAPHER mentioned a few weeks since his having left the Western Union company rather unceremoniously, so he should probably be regarded as a *wandering* "star" operator.

Mr. J. Velleau, of Trenton, has also joined the force at the Toronto office. He is young as yet, but very ambitious, and in time will doubtless make an excellent "Vet" if he only keeps at it long enough.

Mr. S. E. Gibbs, chief operator, it is understood was in New York a few weeks ago, and it is to be regretted that he did not call at the office of THE TELEGRAPHER and make the acquaintance of the editor.

Mr. P. W. Snider, assistant chief of the Toronto office, is now taking his vacation. If Gotham lies in his route he will be heartily welcomed at the office of THE TELEGRAPHER, should he favor it with a call.

The Dominion Telegraph Company is rapidly extending its lines and facilities in all directions, a large number of new offices having been opened this season. It is enterprising enough for a Yankee institution—almost, and has nobly outgrown the sobriquet "lectle," which was so generally applied to it a few years ago. For several years the Montreal Telegraph Company had the field to itself, practically, but since the competing company has been started, and come under its present careful, energetic and efficient management, it has received a very liberal share of patronage, Canadian business men evidently understanding and appreciating the advantage derived from the support of two systems of lines, thus securing that healthy competition which is the life of trade.

Appointments of Western Union Officials and New Distribution of Duties.

THE following special executive order has been issued by President Orton of the Western Union Telegraph Company:

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, August 31, 1875.

SPECIAL EXECUTIVE ORDER.

Mr. Abijah R. Brewer has been appointed secretary of this company and Mr. John C. Hinchman has been appointed general superintendent of the Eastern Division, in place of George H. Mumford, deceased.

The following business of the executive office will hereafter be conducted as follows:

The money transfer service will be under the direction of Vice President Cornell, who will also receive for approval all requisitions for money drawn upon the Treasurer. Mr. Cornell will also have charge of all

leases to or by the company and a general supervision of the department of supplies. Mr. Leonard Cox will continue to act as superintendent transfer service.

Estimates for construction, reconstruction and repairs, and reports of finished work, will be referred to George B. Prescott, Esq., Electrician. Reports of the condition and working of the lines will be sent to the electrician, who is also charged with the general supervision of the operating department, including apparatus and office supplies.

Vice President Green will continue to have charge of the department of complaints and claims, including the general supervision of the law business of the company. Also, until otherwise arranged, he will have charge of the business arising under contracts with railroad companies, including the free message service.

WILLIAM ORTON,
President.

An Enterprising Telegraph Operator.

A KEEN perception of the advantages of telegraphic communication was displayed recently by the operator (who also fills the position of clerk in a general store) at a village in the Catskill mountains, where an office has this summer been opened. A gentleman in New York, whose family are visiting in the neighborhood, wishing to inform his wife on Saturday morning that he would not be up in the evening, as usual, sent a message to that effect, which was duly received and deposited in the post-office by the operator, and received by the lady on Monday with the mail matter, started from New York on Saturday at the same time as the telegraphic despatch.

Electrical Cremation of a Dominion Mouse.

A VERY singular thing occurred recently on the Stock Reporting Telegraph lines at Montreal, Canada. The galvanometer used would vary so much that it was necessary to take out or put in at times 500 ohms resistance to steady it. There is about 3,000 ohms resistance in the line. A peculiar smell was also observed, which became so strong that the operator could scarcely stand it. Upon an examination being made under the transmitting table the remains of a mouse, which had got in between the two battery thumb screws, was discovered burned to a cinder. It is rather singular that during the whole time only one or two of the instruments were seriously affected. It is not known how long the mouse was thus caught, but it must have been for some time to have been so thoroughly cremated by the battery current.

Foreign Telegraphic Notes.

WE have, says the *Electrical News*, already informed our readers of the satisfactory settlement of the dispute between the Chinese Government and the Great Northern Telegraph Company. We have now to record the establishment of an imperial college of torpedo engineering, of which Mr. J. A. Betts, M. S. T. E., (who acted as arbitrator for the Chinese Government in the settlement of the above mentioned dispute) is the engineer-in-chief. Already there are about forty students, and the course of instruction includes the manufacture of torpedoes, mooring and placing them in position, the use of the "firing arc" in torpedoes fired by observation, lime light signalling, etc. There is also a class for instruction in practical telegraphy, testing, etc. At the arsenal inside the city the mechanical parts necessary for the completion of a stock of torpedoes are being manufactured.

The practice of hanging linen to dry on the telegraph wires has, according to the *Pall Mall Gazette*, lately become general in that country, and revealed the hitherto unknown fact that the Armenian peasantry are in the habit, occasionally, of washing their clothes. Much dismay has however been caused by an order that has been issued by the authorities forbidding the continuance of this arrangement. It seems that the wires have, on more occasions than one, been broken by awkward washerwomen, and Shekret Effendi, who has just been appointed director of the telegraph at Erzeroum, has solemnly declared that no more shirts, stockings, or other garments shall be hung on the wires on any pretence whatever.

It is, says the London *Examiner*, suspected that the Government mean to act upon the report of the Committee on Telegraphs, and raise the rates for postal telegrams at once.

The India Rubber, Gutta Percha and Telegraph Works Company have heard from Mr. Gray, who is in charge of their expedition, that the second section of their west coast of South America cables has been successfully completed, namely, that from Islay to Arica, both in Peru. This section is about 200 miles long, and increases the total length completely laid to 660 miles. The report of the directors states that during the half year ended the 30 of June last the cable sales

mounted to £72,573, against £63,933 in the same period of 1874, and £34,285 in the same period of 1873. The general sales for the half year amounted to £96,225, against £87,906 in the same period of 1874, and against £80,784 in the same period of 1873. The business at Porsan for the half year also shows an improvement upon the corresponding period of 1874. With regard to the cables now being laid in Peru and Chili, each length of cable as it is completed, and also of each section after it is shipped and covered with water, are tested by Messrs. Clark, Ford & Co. The cable which was made for the West India and Panama Telegraph Company, after the settlement of the suit with them, was tested and accepted by their engineer, Sir Samuel Canning. The cables made for the Direct Spanish Telegraph Company continued to work well, and were earning an increasing income for that company.

The traffic receipts of the Anglo-American Telegraph Company for

August 11	amounted to	£1,330
" 12	"	1,300
" 13	"	1,330
" 14	"	1,300
" 15	"	300
" 16	"	1,130
" 17	"	1,340

Mr. J. B. Stearns has successfully introduced duplex working into France. The system he has inaugurated is capable of six combinations, viz: Morse single working, Hughes single working, Morse duplex, Hughes duplex, Morse-Hughes duplex, Hughes-Morse duplex. The bridge system is used, and the results upon the Hughes are very satisfactory, because it is found that the instruments work better duplexed than on the ordinary single method, from the fact that the outgoing currents do not pass through the house instruments, and therefore disturb them. Paris has been working to have uninterrupted since the commencement of the year.—*The Electric News.*

Telegraphic and Electrical Brevities.

The Western Union cable under the Mississippi, from Vicksburg, Miss., to Delta, La., has been repaired, and is again working after several weeks' interruption.

During a severe thunder storm in the District of Columbia on Sunday last, three telegraph poles on the line between Georgetown and Tennytown were struck by lightning, and communication interrupted.

At a meeting of the Board of Directors of the International Ocean Telegraph Company on Friday, August 27th, a committee consisting of Dr. Norvin Green and Mr. Cambridge Livingston, was appointed to draft and record in the minutes suitable resolutions on the death of Mr. G. H. Mumford, a Director and Secretary of that company.

General Supt. Stager's House Burglarized.

On Tuesday afternoon the residence of General Anson Stager, general superintendent of the middle division of the Western Union Telegraph Company, was robbed at Chicago, Ill., during the absence of the family. At about four o'clock P. M. four men drove up to the house. Two of them, under the pretense of looking at the gas metre, entered the house. They then overpowered the servant and demanded the key of the closet containing the silverware. They threatened to take her life if she refused to deliver up the key. Upon being told that Mrs. Stager had the key in her possession, in the east, they broke in the doors of the closet and secured the silverware—the value of which is not now known—and left the premises.

It is narrated that certain Chinese fishermen brought up to the surface a submarine cable; that they cut it in small pieces and planted it, hoping it would grow.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended July 27, 1875, and bearing that date.

166,096.—ELECTRIC TELEGRAPHS FOR TRANSMITTING MUSICAL TONES. Elisha Gray, Chicago, Ill., assignor of one half his right to Samuel S. White, Philadelphia, Pa. [Filed Jan. 19, 1875.]

Uses induced current. By any suitable circuit breakers, pulsations are sent upon the line, corresponding in number to the vibrations necessary to produce any given note or sound. At receiving station operator is placed in circuit, and in electrical connection with a vibrating resonant plate, also in the circuit. The transmission, then, of these vibrations through the lining tissue to the resonant substance causes an audible note, corresponding to vibrations sent.

1. The hereinbefore described art of transmitting musical impressions or sounds telegraphically, by producing musical impressions or sounds at the transmitting end of a telegraphic circuit by causing interruptions in the electric currents of sufficient frequency to produce musical tones, transmitting said tones through an electric circuit composed in part of animal tissue, and reproducing them at the receiving end of the line by means of a resonant body, which is also a conductor of electricity, substantially as set forth.

2. The electro-harmonic telegraph apparatus, hereinbefore set forth, consisting of the combination of a telegraph circuit, composed in part of animal tissue, a circuit breaker capable of producing a musical tone, and a resonant conductor of electricity capable of reproducing that tone at the receiving end of the circuit.

3. The combination, substantially as hereinbefore set forth, of a telegraphic circuit composed in part of animal tissue, a resonant receiver, which is also a conductor of electricity, a series of circuit breakers capable of producing musical tones of different pitch, and a corresponding series of keys for throwing the circuit breakers into or out of operation, whereby several tones simultaneously may be transmitted through a single wire.

166,168.—AUTOMATIC TELEGRAPHS. Charles Wheatstone and J. M. A. Stroh, London, England. [Filed March 16, 1875.]

The means for sending a weak current into the line at the end of a dash or space, for preventing an undue elongation of short currents, consisting of the lever K, operated from the transmitting levers, the contact points F E, and the resistance and branch circuit, substantially as set forth.

166,169.—MAGNETS FOR ELECTRIC TELEGRAPHS. Charles Wheatstone and J. M. A. Stroh, London, England. [Filed March 16, 1875.]

The combination, with an armature pivoted between and acted on by two electro-magnets or coils, of a spring and means for adjusting the tension thereof, and causing it to exert its force upon either side of the pivotal bearing of the armature, substantially as set forth.

For the week ended Aug. 3, 1875, and bearing that date.

166,304.—ELECTRIC GAS LIGHTING APPARATUS.—Frank V. Sandford, Chelsea, Mass. [Filed July 14, 1875.]

The combination, with an electrical gas-lighting apparatus, of a time registering mechanism, substantially as herein described, for the purpose specified.

166,305.—TELEGRAPHIC CIRCUITS.—Wm. E. Sawyer, Washington, D. C. [Filed June 19, 1875.]

1. The method of operating a line of telegraph, consisting in placing the transmitting battery at or near the receiving end of the line wire, and effecting the record or actuating the receiving instrument by making and breaking the line-wire circuits at the transmitting end, whereby the battery current passing through the receiving instrument is alternately, equally, or unequally divided, and restored to its normal strength or required maximum value, as set forth.

2. The method of operating a line of telegraph, consisting of the employment of two circuits, the line wire circuit and an artificial line circuit, in the latter of which is placed the receiving instrument, which is actuated, or in which the record is effected, by causing an increment and decrement, through breaking and making the line wire circuit of the quantity or force of the battery current flowing in the artificial line circuits, as set forth.

3. The artificial circuit at the receiving end of a line of telegraph, in which the battery current flows at its required maximum of quantity or force, excepting when a greater or less portion of the battery current is diverted into the line wire by establishing the line wire circuit, as set forth.

4. The method of effecting a record at the receiving instrument, or of actuating the receiving instrument, consisting in wholly or partially short circuiting the main battery, which is placed at the receiving station, by wholly or partially diverting its current from an artificial circuit into the line-wire circuit.

166,431.—ELECTRO-MAGNETIC ENGINES.—Alexander Tittman, Chamcey, assignor to himself and Henry S. Daggett, Lafayette, Ind. [Filed April 15, 1875.]

1. In combination with an unequal number of magnets and armatures, arranged, respectively, on a stationary cylinder and a revolving disk, a stationary ring provided with a series of keys and plates corresponding with the number of magnets, and a revolving disk provided with a series of recesses corresponding with the number of armatures, substantially as and for the purposes herein set forth.

2. In an electro-magnetic engine, the combination of the bell crank shaped keys k k', &c., plates P P', &c., springs s s, and central disk provided with recessed edge, all arranged to operate as set forth.

REISSUES.

6,575.—HOTEL ANNUNCIATORS AND FIRE ALARMS.—Edward A. Hill, Chicago, Ill. Patent No. 114,007, dated April 25, 1871. [Filed July 19, 1875.]

Numbers left unpainted on an opaque ground, tilting shields same color as ground normally behind the numbers, practically concealing them until withdrawn by magnet.

1. The combination of the pivoted armature O, and tilting blinds or curtains B, when constructed and operating in an annunciator, substantially as and for the purposes specified.

2. The dial S, provided with transparent figures, in combination with the tilting blind, as and for the purpose as specified.

3. The slide-bar V, for restoring the curtain or blind B or the pivoted armature O, as described.

6,577.—HOTEL ANNUNCIATORS AND FIRE ALARMS.—Edward A. Hill, Chicago, Ill. Patent No. 114,007, dated April 25, 1871. [Filed July 19, 1875.]

The combination of the thermostat and call key or knob in a circuit with an electro-magnetic annunciator, as described.

TO WHOM IT MAY CONCERN.

I, GEORGE LITTLE, of Passaic City, in the County of Passaic, and State of New Jersey, have had a writ of attachment issued on an UNASSIGNED INTEREST in certain UNASSIGNED PATENTS now in my possession, and heretofore held by me for GEORGE HARRINGTON, of Washington, D. C., to wit: For Great Britain—Patents 2,634, Sept. 7, 1869; 1,207, April 22, 1872. For the Dominion of Canada—Patents 2,039, January 9, 1873. For the Russian Empire—Patent of Dec. 6, 1874 (said Harrington having, on or about the first day of May, 1875, left the United States for parts unknown to me.)

The above Patents were issued to me for my "AMERICAN RAPID SYSTEM OF AUTOMATIC TELEGRAPHY," the right and title to which I am now ready to assign or responsible parties.

GEORGE LITTLE,
PASSAIC CITY, N. J.

August 27, 1875.

FOR SALE.—CEDAR TELEGRAPH POLES.

In lengths of twenty-five, thirty, thirty-five, and forty feet; five to six inches at small end, and bark pulled off. In car loads or by vessel loads, delivered at any of the lake ports between Oswego and Chicago as may be agreed upon. Thirty-foot poles for fire alarm telegraph a specialty.

A. A. COLBY,
Toronto,
ONTARIO, Canada.

TELEGRAPH REQUIREMENTS.

Our INSULATORS, made of Berlin-pressed, tempered porcelain, with screw thread and supports of hardened iron, which are screwed into the interior threaded portion of the insulators, acknowledged to be the most durable, are sold at lowest manufacturers' market price. We sell also telegraph wire of every kind at reasonable discount at wholesale. Address,

ACT. GES. FOR TELEGRAPHEN-BEDARF,
v. H. SCHOMBURG,
BERLIN (Germany), Moabit 20.

BRADLEY'S

APPARATUS FOR

ELECTRIC MEASUREMENT,

COMPOSED OF HIS

Tangent Galvanometer and Rheostat.
(Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING

WHEATSTONE'S BRIDGE,

Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED

NAKED WIRE HELICES,
for Electro-Magnets, wound to any given size and resistance.

Manufacturers of Telegraphic and Electrical Instruments supplied at low rates.

For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

OFFICE, FOOT OF SHELBY STREET,

DETROIT, MICHIGAN.

ORTON'S PATENT PENCIL HOLDER

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread and will hold the pencil perfectly firm.

Price, 10 cents each.

Sent by mail on receipt of price.

Price per doz., 60 cents.

GEO. H. BLISS & CO., Gen'l Agents,
220 Kinzie Street, Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

PONY RELAY, PRICE \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. See above Cut.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. discount from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 34
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 1/4 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Callaud battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense.

Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application.

All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to,
J. N. ASHLEY,

P. O. Box 5,508.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OR
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,
AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for other purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection. Introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

Catching a Tartar.

By DOUBLE SIX.

SOME years since there appeared in New York office one day a man "all tattered and torn," upon whose features were plainly visible the effects of a dissipated life; his garments hung about him almost literally in shreds; his shoes were in a sadly dilapidated condition, leaving his toes to battle with the outside world alone and unprotected; certainly a more unpromising looking specimen had never before found his way into a telegraph office. He was evidently laboring under a heavy burden of materialized spirits, yet the manner in which he bore it proved that it was not an unusual occurrence for him to carry it.

This was long before the time of duplexes and quads., and consequently those wires which did a heavy business were manned with "lightning" operators. Considerable rivalry existed as to who was not only the fastest receiver but the one who could hold out the longest without breaking. George W—, at that time well known for his expertness, had about established a reputation for being the longest winded man in the office; to prove this to the satisfaction of all, he happened on this particular morning, while in conversation with a number of operators, to offer to stake a certain sum that he could receive more messages without breaking than any other man in the office.

Our chance visitor overheard the remark, and seeing that no one seemed disposed to accept the challenge, staggered up to the group, saying, "See here (hic) mister, I han't got nary red (hic), but I'll try that thing with you." All ridiculed the idea and laughed at the presumption of the new comer, none suspecting him to be possessed of any ability as an operator. However, it would not do to refuse to make the trial before so many, so our friend W—, sure of an easy triumph, agreed to stake his money against nothing, as the affair would at least afford him an opportunity of showing off his talents, which, by the way, were really of a superior order.

The Pittsburg and New York circuit, which was at that time one of the liveliest, was selected as the scene of the trial. W— sat down and very confidently went to work, receiving some fifty messages in fine style, when he lost a word, and the game was up for him.

Our visitor, whom we will call Dick, for short, now sat down, and after fumbling around for a while, got hold of the key and greeted the Pittsburg man familiarly with "Hello, Jack, let's have 'em now." Back came the recognition "G. M.; is that you, Dick? guess you are good for 'em." The party who were crowded around the table, ready to see the greeny get rnsed out of his boots, began to smell a large sized *mice*, and to think that for once they had caught a Tartar, and were not going to have quite so much fun after all. Dick was at home now, as he knew the sender's writing by heart, having worked with him for months in another office before interpenance had lost him both friends and position. The messages came rattling in in true Pittsburg style, sounding to the uninitiated ear like Blind Tom's rain storm, still no breaks for Dick; pretty soon, as if impatient with the monotony of copying message after message in the usual way, he commenced executing a series of pen and ink gymnastics which rather astonished his audience; commencing at the period he would wait until four or five words (as many as he wished to put on one line) had been sent, and then begin copying them backward, writing the fourth word first, then the third, and so on through the message. This was one of Dick's peculiar accomplishments. After amusing himself in this way for a while he would copy as usual again. In this way he went on until some seventy messages had been received, when he got the "back-stroke" on a word and would have been obliged to break; to cover this he coolly threw open his key and got up, remarking, "What's the use of my working away here? I don't get any pay for this." His triumph was complete, but he refused to take the stakes, remarking, as he did so, "Here, take your money, I don't want it, but you musn't always take a man for a fool simply because his clothes are ragged

and his shirt isn't clean." He had won not only the wager but the hearts of the crowd, and none shook his hand more warmly than did his defeated opponent, who took him out and bought him a suit of clothes, set him on his feet (not barefoot now) and procured for him a position commensurate with his ability. Dick used often to say afterwards that he never had a warmer friend than George W—.

The above incident is not imaginary, but is one which actually took place in New York main office some years ago. Dick was one of the finest operators in the country, and it would be a difficult task to find his equal even at this time, but (and how often that little word *but* is placed before the secret of a misspent life) his dissipated habits, which had grown too strong to be conquered, brought him finally to an outcast's grave.

This example is but one of a hundred others. How many of our profession, whose talents are above the average, ruin their prospects, break the hearts of their loved ones, and send their own immortal souls down to perdition by their indulgence in intoxicating drinks! little by little they may have been led along the downward road; a glass of ale to-day, something stronger to-morrow, and slowly but surely they are bound by chains from which they are powerless to release themselves. "Touch not, taste not, handle not," is the only way in which we can elude this demon. As a class we are too self-indulgent and careless. We need to get more out of ourselves and to live with some higher, nobler end in view than the mere satisfying of the desires of our animal natures or the attainment of our own personal pleasure.

The Perils of Telegraphing in the Far West.

By BEN. BREESE.

SOME years ago, and during my early telegraphic career, I was employed as night operator at a small railway station in the interior of Massachusetts. My hours were exceedingly long, and, as I had but little to do, were very irksome to me, as they are to most young operators. I was, to a great degree, ambitious, and longed for a larger and better field. I was considered a tolerably good operator for one so young, for I was but in my sixteenth year. I had made several applications to the superintendent of telegraph for an office where I might work days and have more telegraphing to do, but with no avail. The only reply I received was "wait a while, you are young yet." My ideas did not exactly harmonize with his on this particular subject, and every day the position became more and more depressive.

It was when in one of these despondent moods a friend of mine at B— called me, and after conversing for a time, said, "Well, Ben, I'll have to say good bye, as I leave for the west next week. By the way, how would you like to go out on the Union Pacific? there's a party of us going; can get you a good place." I was not a moment making up my mind that I would go. My parents and friends were very much surprised when I made my intentions known, and were greatly opposed to my going. Notwithstanding, when the party were ready to start, I found myself one of the number, bound for the far West. We had a pleasant trip, and in a few days arrived at Omaha, where we reported for orders. I was to go to W—, about eight hundred miles west of Omaha.

After a long and tedious journey I arrived at my destination. The chief operator of the road had accompanied me to install me in my new quarters; the train only stopped a moment, and was soon out of sight. After giving me all the necessary instructions, and procuring me a boarding place, the best the town could boast of, the chief operator took the next train east.

The moment I stopped from the cars and surveyed the surroundings a sense of disappointment came over me, and I must confess I felt a little homesick. I said nothing to the chief operator, however, determined to keep my disappointment to myself. A description of the place would undoubtedly prove uninteresting, but I will endeavor to relate, as concisely as possible, my first impression the morning after my arrival. As I stood in the door of the rude shanty, which the residents had the audacity to call "the depot," the track was only visible for about a dozen rods, and was then lost from view in a dense forest; to the rear of the shanty rose high boulders of rock, extending as far as the eye could reach, and at its base ran a small stream. Two boards were stretched across this, to enable the villagers to reach the depot. The village, if such it could be called, was distant about half a mile, and contained three rude huts, occupied by two white families and a family of half breeds. I had had my choice of the three, and wisely chose a German family, named Heiners, with whom I was to take my meals, and sleep in the shanty—I should say *depot*! This was not just my idea of a sinecure; but I had only one thing to do, and that was to take it as cool and comfortable as possible.

What they wanted a telegraph office at W— for was a mystery to me. The only train that stopped was

a freight and emigrant train; and half the time that train forgot to stop, probably because they could not see the station. I was obliged to report every train that passed between the hours of 7 A. M. and 9 P. M. I had almost forgotten how a train order looked, and one day, when I received an order for a construction train, I placed it over the small mirror I had brought from the east, and which was of no value in that uncivilized country, for of course one was not particular about his appearance in such a locality. The order completely covered the glass, and I kept it there for nearly six months as a curiosity.

The Heiners were far from possessing any social qualities. They seemed to have a great dread or fear of Indians, and that was about the only subject they ever allowed their conversation to dwell upon. To tell the truth, I began to feel somewhat anxious about the matter myself, although I had not seen a dozen redskins since my arrival. The stories told of the maraudings and attacks by Indians in the adjacent counties so affected my thoughts of safety, that I finally sent to Laramie and purchased a seven shooter, which I always kept near at hand.

I had been at W— about eight months, when, one night, I was suddenly awakened by an unusual noise at the rear door of the depot. It was raining quite hard and was exceedingly dark. I had, as usual, left the light burning dimly. Reaching over to the table, I turned on the light—all was still. I listened for some time but heard nothing, turned the light down again, and was soon soundly sleeping. I must have slept half an hour when I was again awakened by a heavy rapping at the door, and looking in the direction from whence the sound came, saw two faces, which, by their dusky appearance, I readily recognized as redskins, gazing through the small window directly over the door. They made signs for me to open the door. I got up and partially dressed, and was particular to search the pocket in which I always carried my revolver, and found it safely in its place. I did not open the door as soon as they desired, for in a moment the door came in with a crash, and four as unctuous looking Indians as I ever beheld entered the room. They did not appear to be hostile, and after gazing about the room for some time, they began moving their hands to their mouths, as if in the act of drinking. I soon perceived what they wished; they expected to find some liquor. The previous day I had received a few pounds of smoking tobacco; thinking this might pacify them, I took the tobacco from one of the drawers of the table and handed it to the nearest Indian. He divided the tobacco with the three others, and then began searching the table drawers. While this was going on I stealthily approached the side door and quietly removed the bolt. They ransacked the closets, but finding nothing, began muttering to themselves. I closely scanned their persons and felt satisfied that they carried no shooting irons. I could discern by their actions that they were greatly incensed at not finding any liquor, and I momentarily expected an attack. I knew it would be useless for me to attempt to resist such odds. Now was my time for escape. I quickly threw open the door and in an instant dropped into the outer darkness; it was none so soon, for the moment I passed out of the door I saw the Indian nearest me in the act of raising a heavy club. I made my way along the banks of the stream, closely pursued by the redskins; it was intensely dark. Nearer, nearer came the pursuers; by the sound of their footsteps I judged that only two of the Indians had joined in the chase. They were rapidly gaining on me. Drawing my revolver I turned suddenly, and, when the foremost approached within a yard, I fired twice in rapid succession. He threw up his arms and fell helpless to the ground! The second Indian slackened his speed at the sudden fall of his companion, but only for a moment, and then dashed madly at me. I fired and only succeeded in wounding him—the bullet had taken effect in his right arm, which hung useless at his side. We clinched, and in the darkness I succeeded in breaking from him; he was entirely at my mercy. I was in the act of binding his arms when I discovered drops of blood coursing down my left arm. I had received a slight stab; the savage had undoubtedly aimed at my heart. My intention had been to bind him and leave him, but finding he had resorted to the knife, I loosened my hold, and the moment he regained his feet I sent a bullet through his brain. He never uttered another word but fell heavily to the earth.

Fearing the other Indians might follow after their companions, I hurriedly crossed the stream and concealed myself in a crevice of the rocks, where I remained until daybreak, and then made my way to the house, where my arm was bandaged, and with Mr. Heiners visited the depot, where we found everything demolished and several articles missing. We followed the stream for some distance and found the dead bodies of the two Indians, but a few yards apart. We buried their bodies near the bank of the small stream, leaving a large flat stone as the only monument to mark their resting place. No trace of the other two Indians could be discovered. That afternoon I took the first

train to Ogden, where I related the circumstance to the railroad officials, and most emphatically declined to again return to W—. The following day I left for home, completely satisfied that the far West was not a wholesome place for telegraph operators. My arm gave me some pain, but it was a satisfaction, even with that lame arm, to caress a sound scalp.

The Jovial Spirits in Hoboken.

THE announcement that a contest at the national game would take place on Thursday, Sept. 2d, at the Elysian Fields, Hoboken, N. J., between the Associated Press Nine, composed of Messrs. Degraw, Gore, Jones, Boileau, Meyers, Roberts, Mears, Fisher and Ellis, and The W. U. Invincibles, Messrs. McKeldin, Leslie, Sawyer, W. J. Landy, Ashhurst, McDermott, Richmond, Catlin and Welch, drew quite a concourse of interested spectators to witness it. The weather was all that could have been wished for, and everything pointed favorably towards a well contested game. At three o'clock, P. M., both nines were on the field, and the Press men winning the toss sent the Invincibles to the bat for the first inning. The game progressed uninterrupted up to the fifth inning, when Mr. Landy, being disabled, relinquished his position to Capt. Geo. Eitemiller, who deserves great commendation for the excellent manner in which he acquitted himself during the remainder of the game—not allowing a single ball to pass him, and displaying superior skill at the bat. Nothing further of interest occurred, and 5:50 o'clock, P. M., the ninth inning closed a hard fought battle, as the appended result shows:

	1	2	3	4	5	6	7	8	9	Total
Associated Press..	0	2	1	2	0	1	0	0	0	6
Invincibles.....	1	0	1	0	0	1	1	1	0	5

After the conclusion of the game a series of running matches was organized. The first, 100 yards, open to all the urhins upon the ground, was participated in by nineteen; and a sixteen year old, glorying in the high sounding cognomen of "Feet," carried off the prize, consisting of two bats. The second race was similar to the first, except that the winner of the first was barred the privilege of entrance. The victor, a sunny haired youth, giving his age as fourteen, and enjoying the aristocratic title of "Blubber," took away another pair of the bats. Capt. Eitemiller then proposed to run any man or boy in the crowd, the conditions being that his antagonist should run backwards. The challenge was accepted by Mr. Sawyer, and at the word a fair start was made, but the race was given up by Mr. Sawyer before half the distance (50 yards) was accomplished. The captain, however, succeeded in "hoopin' it up" to the end, obliging his opponent to do the segars. The last race was a 100 yards challenge race, between a little fellow twenty-eight years old and the winner of the first race, which was easily won by the latter, who added a prize of \$1 to the proceeds of his former triumph.

This concluded the field sports, but the crowning event was yet to come. The whole party, under the guidance of the courteous Mr. Mears, proceeded to Grove's, on Washington street, when they found a solid spread awaiting their arrival.

After entering the large hall connected with the establishment the doors were closed, and the party formed into a sort of "free and easy meeting," with Mr. D. W. McAneeny as chairman, who stated briefly that the object of the meeting was simply an evening's fun, and wished to see all enjoy themselves to the fullest extent. After an artistically performed overture on the piano by Mr. Jno. Ashhurst the first keg was tapped, and the good old lager began to flow freely. Messrs. Jones and Gore, who came over from Philadelphia to take part in the ball game, being the only strangers present, were made the special guests of the party, and appeared to enjoy themselves hugely. The first toast, "Our Quaker City guests," proposed by Mr. Ashhurst, was responded to in a very neat manner by Mr. Jones. Then in order "Our Texan brothers," ably but briefly responded to by Capt. Geo. Eitemiller, the latest arrival from Galveston.

"The New York office," responded to by Mr. J. H. Lyman. "The Associated Press Nine," responded to by Capt. Degraw. "The Invincible B. B. C. of 187," responded to by Capt. Sawyer, after which Chairman McAneeny, being called on to favor the company in a vocal way, rendered, in very effective style, "The Last Rose of Summer." Mac possesses a very sweet tenor voice and his audience showed its appreciation of his efforts by long and continued applause. Mr. McDermott being called for, appeared and sang an Irish localism, entitled "Since Terence Joined the Gang," and for an encore he and Mr. McAneeny dueted "Excelsior." Mr. Conly then appeared in "the Hamtown Students," and Mr. Mears followed in a very comic ditty. Waltzing was next in order, and the boys were soon whirling in pairs over the large smooth floor to Prof. Ashhurst's fine music. After dancing until all were pretty tired the vocalisms were resumed by Mr.

Fred Catlin, who sang with great taste "The Cottage by the Sea," succeeded by Mr. Singleton in a beautiful ballad. Somebody then yelled for "Terry Joined the Gang," and, after repeated calls, Messrs. McDermott and Landy rose to respond. They created much merriment by their imitations of the Hibernian element of Gotham. Mr. Jas. H. Lyman was then called for and favored his auditors with a pathetic ballad in good style. A quartette, "The Two Roses," by Messrs. McAneeny, Landy, Ashhurst and McDermott, "The Regular Army, Oh!" and "The Skidmore Guards," by the whole company, wound up the evening's festivities, and at midnight all hands took the boat for New York, where, after "one bumper at parting," each jovial spirit took up the uncertain tread to his dowry couch, vowing it was the grandest racket ever known.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

A Challenge from Mr. W. E. Kettles for a Trial of Skill and Speed in Transmitting Morse.

BOSTON, MASS., Sep. 6.

TO THE EDITOR OF THE TELEGRAPHER.

BELIEVING that the Philadelphia Centennial, bringing, as it were, the whole world to the great exposition in Philadelphia, in 1876, would offer grand facilities and an unprecedented opportunity to show the world what can be done in the way of rapid telegraphing by American operators, I hereby challenge any man in the world to compete with me in "sending" 25,000 words, solid matter, in Morse, against time, and for a prize, the selection and value of which to be hereafter considered, and for the

CHAMPIONSHIP OF THE WORLD.

The whole number of words to be sent at one continuous trial, and also to be "received" in good legible copy by a receiver, or receivers which will be hereafter agreed to.

I would, however, prefer Mr. Chas. D. Stanford, of Boston office, as my competitor, and I hereby give as my reasons for putting a challenge in this way for the championship, that Mr. Stanford's ability and record is far above the average, as is well known to eastern operators, and that it would be impossible for me to do otherwise than to select my man in such a case as this, and encourage starting a tournament, as undoubtedly such an interest would be manifested, and we have so many good men, that time would simply not allow more than two days' "sending."

Hoping that this will be followed by my brother operators in America and Europe with communications to the winner similar to this, enabling the telegraphers of both countries to unite their skill and talent in the various departments of the profession in a grand tournament, which will be an event of the Centennial, I am, very truly yours,
W. E. KETTLES.

Too Many Orders.—Tyranny and Oppression in Chicago Office.

CHICAGO, ILL., Aug. 29.

TO THE EDITOR OF THE TELEGRAPHER.

"For ways that are dark,
And tricks that are vain,
The chief operators of Chicago are peculiar."

How applicable the above is to the chief operators of Chicago office few persons outside of this city can have but the faintest conception. Go where you will, where can another such office be found? Is there another one like it? The new management have inaugurated a system that falls but little short of slavery for the operators, and the number of "orders," notices, etc., posted on the bulletin are perfectly astounding, so much so in fact that one is almost struck dumb with astonishment and wonders "what next?" You are told to do this and do that until you are almost lost in a perfect labyrinth of "doings." It seems as though every new idea that flashes through the mind of some "chief" is put in writing and "slap" she goes on the bulletin board. "Operators must not talk with each other while busy." "Operators must not go beyond hearing of their instruments," are two of the latest, and will show for themselves. It would appear as though the management did not think an "operator" capable of exercising the least judgment at all, and that it was necessary to stand over him with a lash at all times. I have yet to find another office where an operator who goes to the manager with a grievance can get no satisfaction, but is sent back to his instrument like some school boy, or, as was the case a few nights since,

told by the night manager, "I have no sympathy for you, and don't want to argue the matter. If you don't like it you can go home." How pleasant it is to receive such an answer as that from one high in authority, and of whom one would naturally expect something different! Again, we are told "you must do better; there are plenty of operators wanting work." Now I ask, "where are they?" Why don't they get them, and not press in men who have worked all day and make them stay until eleven or twelve o'clock at night, and night men, after working hard until one and two o'clock at night, make them come around at eight or nine the next morning? Why don't they get their men if there are so many idle? The truth of the matter is there are but very few first class men idle, and what few there are do not care to come here. It is only necessary to mention one fact to show the cause of such general dissatisfaction as at present exists among the "operatives of Chicago office." One year ago there was on the night force twenty-six men in what is known as the Ring. That is, one night you were "first" off, and so on through the entire list. Then there were also several twelve o'clock men. But how is it now? There are only nineteen men in the Ring and one twelve o'clock man, and as a consequence, day men are pressed in to work extra until late at night, and the regular night men suffer. Can you wonder at the general feeling of dissatisfaction? Business has not decreased, but on the contrary has increased fully one third. Operators never were worked so hard before, and for so small a salary. The management will probably find out their error after a number of their best men have left, and we can name fully a dozen that intend doing so as soon as circumstances will permit.

HARKAWAY.

A Reply by "John Sterling" to Criticism and Personalities.

BOSTON, MASS., August 31.

TO THE EDITOR OF THE TELEGRAPHER.

SOME writer has said that life is too short for us to notice all the unpleasant things said of us. I do not propose to notice all the malicious things that have appeared in your correspondence columns during the past summer about "John Sterling." About the worst thing a man can do is to allow himself to be drawn into a personal controversy during the "dog days." He is sure to get heated over it, and then he's liable to say things not strictly within the bounds of courtesy, especially if he says them in the columns of a journal under a *nom de plume*.

I do not object to criticism, so long as it is made in a courteous way, but when it degenerates into personal abuse and insult, it loses the name of criticism and sinks into libellous scurrility.

I have "taken in" all that has appeared in your columns, Mr. Editor, and noticed the last *post mortem* communication from "Nihil Nameless," in which I was sorry to see him spoil an otherwise well written and interesting article by a piece of coarse and insulting personality, which no gentleman would have indulged in. If the living should speak well of the dead, the dead should return the compliment when they descend to speak at all. I didn't know Nihil was dead when I wrote my last reply to him, or I wouldn't have written it.

It may be said that I provoked and deserved this abuse, yet none who will take the trouble to glance again over my first reply to Nihil can say there is anything in it inspired by malice. His opinions on the "woman question" seemed to me utterly ridiculous, and devoid of that common sense which should enter into a man's opinions on any subject, and the lack of which has ever been considered a fair ground for criticism. Added to this, I thought I detected in his article a shade of hypocrisy. Under the fair mask of a pretended solicitude for the moral welfare of the other sex I thought I saw the grinning skeleton of selfishness—a selfish fear of future encroachments by that sex upon our profession, a sordid fear of a future reduction in salaries in consequence of that encroachment. Had Nihil shown his true colors at the outset, and based his objection to the female element in our ranks upon its real grounds, while differing from his sentiments I should have respected him for his candor and honesty; and on those grounds he might have made a presentable case, for there can be no doubt that the large increase in the number of female operators has had a material effect on the standard of wages paid for our labor. Knowing, as they do, that women stand ready to perform for \$40 and \$50 per month work which they are paid \$60 and \$75 for doing, the large class of men who receive the latter salaries cannot hope for increased wages. The result of this is that these men, in their turn, are willing, for a small increase in wages, to perform the heavy work for which \$90 and \$100 have heretofore been paid, and thus we can account for the gradual decrease in the scale of prices paid for our labor. Yet it must be borne in mind that if this result

was not brought about by the increase of female operators, it would be, more slowly but none the less surely, by the increase in the number of operators of our own sex—an increase which has been greater for some time than the demands of the business can provide for. The consequence is that to-day not only are there large numbers of ladies who are willing and anxious to work at much lower than the lowest salaries paid to men in the past, but there are large numbers of men who have no choice but to accept low salaries or leave the business. The women, therefore, cannot justly be held responsible for the present state of things.

The high wages paid in the past have been a great inducement to young people to learn the business, and hardly a city of any importance in the land but has had its "telegraph institute," whose "professors" has thriven upon the credulity of those who were eager to learn telegraphy.

It is safe to say that no other profession ever existed in which a boy of sixteen could command the same wages as a man of forty, and high wages at that, as has frequently been the case in ours.

The active state of the telegraph business, and the rapid extension of lines, served to keep the hundreds of new recruits yearly added to our ranks in employment, and never until the panic of 1873 had a time been known when an operator of character and ability could not find employment at good wages. Since that time, however, a great change has occurred. The demand for operators has not been equal to the supply, and we must not be surprised to learn that our labor is governed by the same laws of supply and demand which govern all other labor. Corporations, proverbially, have no souls, and the question with most of them is not, "Can we not pay our employés a good salary, and still pay a fair dividend to our stockholders?" but "Can we not get our work done more cheaply and pay larger dividends?"

The Western Union Telegraph Co. has shown its ability to answer the first question affirmatively. Except by the recent equalization of salaries south, no direct reductions have been made, and let us hope such a policy will not be found necessary. There are many operators who have been in the employ of that company for from ten to twenty-five years. Their salaries are now none too large for men of their character and intelligence, and it would be unjust, after all those years devoted to the service of the Western Union and its predecessors, to reduce their salaries, unless the profits of the telegraph business should fall far below the present figures.

Your correspondent, "Ministro," of Montreal, is evidently laboring under a mental hallucination of the gravest kind in regard to that poem by "Tom Quad." I hardly think the author of that amusing imitation of Longfellow's style intended any reflection upon the operators, or upon any individual operator of Boston. By the way, if your readers will procure "Pluribus-tah," a satire by the late "Doesticks," they will find it a still more amusing parody on this style.

The personalities which your correspondent was pleased to address to me I can afford to pass over in silence, as they show the character of the man in stronger colors than I could portray it, even if I knew him personally, which I do not. J. S.

Important Meeting of the American Electrical Society.—Proposed Changes in the Constitution and By-Laws.—Mr. F. W. Jones's Paper on the Quadruplex.—Personal.

CHICAGO, ILL., Aug. 30.

TO THE EDITOR OF THE TELEGRAPHER.

THE adjourned meeting of the American Electrical Society, held last Wednesday afternoon, was a grand success in point of numbers present as well as in the importance of the business transacted; several important communications were read and appropriately referred.

Quite an animated discussion arose in regard to the feeling in certain parts of the Union in regard to the society being too local in its nature, and corresponding members not having the same opportunity to know of the deliberations of the society at its monthly meetings, nor the communications read before such meetings, as the resident members, although they paid as much for the society's support as did the resident members. Several letters from corresponding members in regard to the matter were read. There were present Col. J. S. Wilson, Mr. C. H. Summers, Manager Maynard, Assistant Managers F. W. Jones and Plann, and Board of Trade Manager Robinson, and Assistant Manager Pettit; also, Operators Lawson and W. C. Loug, of the Western Union; Wm. Henry Smith, General Manager of the Western Associated Press; Messrs. Bliss, Dr. Hill, Barton and Kellogg, of the Western Electric Manufacturing Co.; Messrs.

Chandler and Woodford, of the Fire Alarm; C. S. Jones, Supt. Ill. Central Lines; Supt. Thayer, of N. W. Lines; Supt. Merriweather, of the New Orleans Western Union; Supt. Diekey, of Omaha, and a number of others whose names I cannot recollect, knowing them but casually. The meeting was called to order with Col. Wilson in the chair, and C. S. Jones Secretary, who is always on hand, "like a finger nail." The session lasted two hours. The question of local organizations at different points, which should be auxiliary to the main organization, was rather unanimously agreed upon as being a necessary adjunct, and one which should do great good. In regard to the moving of the headquarters from one city to another (thus changing the headquarters from Chicago from time to time, to any other city which could, by a majority vote of its members, get possession of it), the members present were considerably divided; some thought monthly meetings too frequent to have them all interesting; some were in favor of quarterly meetings, some only yearly. Col. Wilson was in favor of opening the doors and being liberal in this matter; if enough members in any other city were to be found who could vote the headquarters there, why give them the chance, at the same time we would do all we could by fair means to keep it here; but we could afford to be liberal; we had the honor of originating the society, which was glory enough for one year for us, and we had taken good care of the society for one year; we had had interesting meetings and could still have them, so let us show the rest of the world that we were not going to pursue the niggardly policy of keeping the headquarters here, let come what may. Quite a number coincided with Mr. Wilson, while others were in favor of having an officer, such as a secretary and treasurer, permanently established with the headquarters of the society at Chicago, so as to give it a legal status, but to hold the annual meetings at different cities, each previous annual meeting electing officers who shall be residents of the city where the next annual meeting shall be held; and also appointing committees in those cities to arrange each time for the annual meetings.

Mr. Kellogg having presented a series of resolutions in effect pretty nearly as above, a resolution was passed directing the chair to appoint a committee of five to meet with as many members of the committee who originally framed the constitution and by-laws as could be got together, and draw up a set of resolutions embodying such changes as has heretofore been suggested, also changing the number necessary for a quorum to transact business at regular meetings to five instead of fifteen, and arrange regarding local societies, etc., and get them ready so as to have another special meeting before the next regular meeting, the third Wednesday of next month, so that the changes might be decided upon before that meeting, in order to give the secretary time to inform all the members, as required by the constitution and by-laws, thirty days previous to the annual meeting, at which time the proposed changes will be voted upon. Accordingly, the chair appointed Messrs. Kellogg, Maynard, Woodford, Chandler and Hill as such committee.

In the extract you make from *The Polytechnische Zeitung* in regard to the quadruplex, Prof. Dr. K. E. Zetsche handles Mr. F. W. Jones rather roughly because he did not more fully "explain in what manner Dr. Nicholson connects his keys," etc., rather giving the readers of that paper to infer that Mr. Jones did not know what he was talking about. Your editorial remarks as to why complete diagrams of the quadruplex were not published with the paper are equally applicable to Mr. Jones' case, as from his having materially assisted Dr. Nicholson in arranging circuits for experiments with his quadruplex, he probably knew more about it than any one else here in Chicago, unless probably Mr. Summers, who also assisted the Doctor. Those of us who were present at the meeting when Mr. Jones read his paper and explained the diagrams made for him (under his direction) by Mr. Lawson, will remember the numerous questions put to him about this quadruplex of Dr. Nicholson's by the different members, and how guarded his answers were. Mr. Jones referred to it more as a matter of placing it on record as a quadruplex invention than to give a detailed description of it, although he was fully able and competent at the time, had he deemed it prudent, to have given a detailed description of all its various points, and had he done so, I am of the opinion that the learned professor would hardly have ventured the assertion that "the three different strengths of current required for double speaking have the same relation to each other in Nicholson's method as in the plan of combining double and counter speaking, invented by Maron," etc.

Among the telegraphers who are at present taking a vacation from Chicago I clip the following notice of one of them from a paper printed at Galena, Ill.:

"Miss Lizzie Veasy, a prominent telegraph operator of Chicago, is the guest of Mrs. M. Dean in this city." Miss V. is the lady who works one side of the St. Louis duplex in the Western Union office, this city, Mrs. Dean being the manager of the W. U. telegraph office at Galena.

Dominion Telegraph.—News and Personals.—Bulls.

TORONTO, CANADA, Sept. 3.

TO THE EDITOR OF THE TELEGRAPHER.

NOTHING having appeared in THE TELEGRAPHER for some time past from Canada, and having heard a good deal of grumbling amongst your Canadian subscribers, I thought I would take it on myself to give you a few items. It's rumored here that the Dominion Company are to have a new office before long (but that's so old I hardly credit it); something however will have to be done shortly, as our present office is in a very bad state, and hardly large enough to accommodate the rapidly increasing business. Mr. Gibbs, our chief operator, returned last week from a short vacation in the States, looking as well and happy as ever. Mr. Snider, his assistant, left on Mr. Gibbs' return for a short vacation. Very few of the operators have as yet been away on holidays, but I believe two or three of them intend leaving at the end of this or next week for a short time.

A few weeks ago all the operators in this office, headed by Mr. Gibbs, called on Mr. Burke, our late night manager, while on duty, and presented him with an address, accompanied by an amethyst ring, set in gold, and a silver water piteber, on his leaving to take charge of our London office; Mr. L. B. McFarlane having resigned the management of that office. Mr. Burke made a short but appropriate reply, thanking them all and hoping to see them all soon again. Mr. Burke left on the following evening for his new home, carrying with him the best wishes of all. Mr. A. J. Pattison has been appointed his successor. Mr. S. E. Garvey, for a long time manager of our Montreal office, has resigned that position and has been appointed travelling inspector for this Co. Mr. J. Quelch, lately operator in Montreal, has been appointed his successor. Business has been very brisk here lately, and we have had all we could do to keep things clear, especially west, there having been a very heavy rush in that district. Our new arrivals are Miss E. McElroy, lately of Guelph (we have not such a prejudice against lady operators as "Nihil Nameless" has, and gladly welcome this addition to our staff); Mr. W. Manners, of Chicago (a very musical man, who sings over his work); Monsieur Vallean, of Brighton; Mr. F. Robertson, of Pt. Hope; Mr. J. Neilson, of St. Catharines; and Mr. A. C. Terry, of Montreal. Miss Schofield, "Jo;" Rattray, "R.;" Merryfield, "Rm.;" Bennett, "A.;" Pingle, "Pi.;" J. Wilson, "W.;" H. Wilson, "Wn.;" Anderson, "J.;" Stratton, "Ws.;" Knapp, "N.;" Raymond, "R.;" and Carlisle, "H.;" are still in this office.

He said he didn't drink, but I don't believe him. 'Twas he that copied "send one barrel of bottled ale" for one barrel of *boiled oil*—guess he was dreaming about Heintrod's lager. The same day he got "Birds-eye" for "Birdicks," and managed to make J. B. Bal engraver out of J. B. Bal, engraver. Oh! he's bad, but we forgive him. Weather very warm here just now. More anon. INFANT.

Not a Joke Towards the End.

A GRANGER from Macoupin County stepped into a local telegraph office at Nilwood the other day, and asked for the operator. A slim looking individual, of the pin-back order, without looking up from his instrument, informed him that he was the "wire jerker."

"Well," said the granger, "my name's Jerry Hogan, and you see—the fact is, my old woman's had another gal, and I want to despatch to Aunt Nancy, in Zanesville."

"Very well, sir," said the operator. "The rate is 30 and 3. Just write your message." The look on the granger's face was one of bewilderment. "Well," he said, "you see my larin' ain't—"

"Oh, I see. Can't write."

"Not exactly that, but Aunt Nancy's eyes are very—well, I reckon she could read your handwrite better'n mine."

"All right, sir; in that case I will send it by our 'Duplex,'" at the same time handing the granger the end of a wire. "Now, all you have to do is to wrap this wire around your hand, and take this in your mouth," and he handed him the end of the ground wire.

The granger wrapped the wire several times around his hand, and, leaning over the table, took the ground wire in his mouth, when—bif—one hundred and fifty cups of Callaud's battery went through him like hot grease through a gridiron, and in just twenty-eight seconds by the dial Mr. Hogan was monarch of all he surveyed.

Now that granger had been a granger, and had built hog-pens and planted corn all his life, and when he bought boots he always got the worth of his money, while the operator was an operator by birth, and when last seen was counting railroad ties between the Summit and Bridgeport, and feeling in his pocket for \$20 with which to take lessons on the health-lit.—*Chicago Tribune*.

A Special Premium for Subscriptions to "The Telegrapher."

The summer season is about over, and we expect that the friends of THE TELEGRAPHER will now renew their efforts to increase its list of subscribers. The subscription list has been very well sustained during the summer, but as the days of vacations and excursions are over, we look for the usual increase of interest in the only truly independent telegraphic journal published.

It has been our custom for years past to share with those who kindly interest themselves in obtaining subscriptions by offering valuable premiums.

We propose this season to excel our former liberality in this direction. We desire to offer something of real and permanent value. We have accordingly made arrangements by which we are enabled to offer to the person obtaining 60 subscribers for one year, at the regular subscription price, \$2 per year, or their equivalent in shorter subscriptions, a

No. 1 WEEB SEWING MACHINE;

for 65 subscribers a

No. 2 WEEB SEWING MACHINE,

and for 70 subscribers a

No. 3 WEEB SEWING MACHINE.

The price of these machines is respectively \$60, \$65 and \$70.

The machines will be boxed and shipped without extra charge.

This affords an excellent opportunity for female telegraphers, or for telegraphers who have wives or relations that need these exceedingly useful machines, which are in every respect first class, to obtain them at comparatively little trouble or expense.

Send in subscriptions as obtained, and they will be credited until the necessary number to entitle the sender to the desired premium is obtained.

To prevent disappointment, should any canvasser eventually fail to obtain the requisite number for a machine, they will be allowed other premiums proportionate with the amount collected, or if preferred, 20 per cent. in cash on such amount. To whom shall we send the first machine?

Telegraphic Situation.

We recorded in THE TELEGRAPHER last week the fact that the negotiations for a practical consolidation of the Western Union and Atlantic and Pacific Telegraph Companies had been broken off, and that the chance of consolidation, if there ever was any, which is to say the least doubtful, was over for the present. We were in error in stating that the letter to Mr. ORTON, withdrawing all propositions for negotiations on the part of the Atlantic and Pacific Company, was from Mr. GOULD; it was from Mr. A. B. CHANDLER, the Secretary of the company. Since then a great calm has fallen upon the telegraphic interests, how long to continue remains to be seen. The new work and the repairs of lines, etc., of the A. & P. Company, which during the negotiations had been suspended, has been actively resumed, and is being pushed forward vigorously once more. The employés of the company are relieved from their anxiety and are happy again, and their faith, and the faith of the telegraphic public generally in THE TELEGRAPHER, has been increased, as our repeated predictions that there would be no consolidation have been verified by the result.

We are assured by a person who was in a position to know, and in whose statements we place credence so far as he speaks from his own knowledge, that we and the public have misapprehended Mr. GOULD's position and intention in this matter, and that he was sincerely in favor of consolidation, as advantageous to his personal interests and purposes, but that he was overruled by his associates in the management of the company. We do not desire to do injustice to any one, and we therefore give Mr. GOULD the benefit of this statement. The almost universal belief is, and in this as our readers know, we have shared, that it was merely a stock-jobbing operation of that gentleman to market his Western Union stocks.

Nothing further of a definite character has been heard from the California party, and the oft started Mr. COHEN has not yet made his appearance at the east.

The most important telegraphic event of the week is unquestionably the successful completion of the direct cable, of which we speak more at length elsewhere. This is undoubtedly a very important fact, not only to the cable company, which has suffered from hope deferred for so long a time, but especially to the companies competing with the Western Union, who will now in a few days have independent communication with Europe. It strengthens their position very much, and greatly lessens the danger of future success in attempted consolidations.

The Direct United States Cable in Operation.

The delays, blunders and misfortunes which have attended the laying of the Direct United States Cable have made it historical in the annals of cable telegraphy. They have done more than this, for they have

caused it to be regarded practically as a myth, and excited widespread distrust on both sides of the Atlantic in the good faith of the persons having the enterprise in charge. In this connection it should, in justice to the managers of the Direct United States Cable Company, be understood that the company is not responsible for either the blunders or delays which have occurred. The Cable Company had nothing to do with it until it was laid and turned over to them by the contractors, Messrs. SIEMENS BROS., of London. The long delay has of course greatly damaged the prestige of the company, besides necessitating large expenditures in maintaining for more than a year full corps of operators at the several stations, in addition to the loss caused by sacrifice of business which they would have had if the cable had been laid and delivered to them at the time anticipated.

The Faraday, on this last and successful trip, sailed from London on the 12th of August for the location of the fault in the cable. On the 22d of August, ten days after leaving London, she arrived on the ground, and up to Friday of last week had had only two days of moderate weather. On the 29th of August the eastern end of the cable was recovered from 2,500 fathoms of water, the fault cut out and the cable buoyed. The western end was raised from 1,800 fathoms of water and buoyed on Friday, September 2d. The two ends of the cable were connected and spliced at 7 o'clock A. M. on Sunday, the 5th inst., and the cable was completed.

The cable is now reported to be in perfect condition, the tests being most excellent. Messages have been passed through it constantly since, and a speed of transmission of fifteen words per minute between Balinaskellig Bay, Ireland, and Tor Bay, Nova Scotia, is reported to have been obtained.

On Wednesday last the following congratulatory message from Sir WM. THOMSON, the eminent electrician, to Professor PEIRCE, of the United States Coast Survey at Washington, was received:

"LONDON, Sept. 8, 1875.

PROFESSOR PEIRCE, United States Coast Survey, Washington, D. C.

Through the Direct United States Cable, now happily completed, I congratulate you on this new bond between the new and old countries, and express hope that it may be some time useful in communication of scientific results.

SIR WILLIAM THOMSON, University of Glasgow."

The new cable will probably be opened to the public on the 15th inst, although this has not been fully determined upon as we write.

President THOS. T. ECKERT, of the A. & P. Co., was at Rye Beach, New Hampshire, on Monday last, and inspected the working of the new cable, and expressed great pleasure that this important telegraphic enterprise had at last been successfully completed, and the competing telegraph organizations of the country likely to be put in communication with Europe, from which such important advantages might reasonably be expected.

Summer Recreation.

"JOHN OAKUM" has written so much of a peculiarly telegraphic nature for the delectation of our readers that we hope the appended sketch, though rather out of our line, will not be unacceptable. We clip it from *Hearth and Home*. Its appearance has elicited the following comment from ORPHEUS C. KERR: "The true bucolic flavor is in this cheery and natural sketch, and will be enjoyed even by the few city people who did not enjoy the ecstasy of being born in the rural districts." Another *litterateur* of acknowledged good taste, though scarcely so well known as the author of the "Mackerel Brigade," has written: "There isn't one single word in 'Summer Recreation' that I didn't fall straight in love with! I buckled over it heartily; its atmosphere was perfect. I almost caught my fingers combing for hay seed in my hair." Altogether, we think Mr. PHILLIPS may feel proud of his little pastoral:

It was a long, long time ago, perhaps; but you, my middle-aged friend, writing incessantly from morning until night, and you, my merchant prince, or Wall street man—and you, and you, and you—remember it; for, despite your city ways to-day, you are all country bred, and know something of cows and sheep, woods and glens, mountains and meadows; the music of birds and the fragrance of flowers and hay. One day you were playing “barn tick” with Sammy Smith, when your father came out and said: “Come, Henry, go and catch Jenny.” Jenny was the family horse. You threw down the bat regretfully, not so much because you were loath to give up your rums, technically speaking, as because it was so natural to fetch that old ball of stocking yarn, with a cork in the middle, a blow which would send it soaring into space and land it in the stubble field; and it gave you such unalloyed pleasure to see Smithy pick up his foot every few seconds, and nurse a toe with a big crevice underneath, which was sure to suffer as he went bonding into the rough field beyond. But you went into the barn, and found a peck measure and a few ears of corn, and proceeded over into the seven acre lot where the old mare was lazily grazing. You approached her cautiously, saying: “Kajock! Kajock!” And she took one of the ears of corn so confidently that a stranger to her idiosyncrasies might have inferred that she was perfectly enchanted with the idea of being caught. And when you attempted to engage her neck in the halter you thought you had accomplished it, when—pshaw! you never knew how she did it; but somehow she eluded you and went skipping over the hill, with you in hot pursuit. It was a sweltering July day, and at the end of a half hour spent in a useless chase you found yourself standing on a side-hill, with the perspiration starting from every pore, and the blood oozing from a slight bruise on the top of your sun browned foot, where the old mare had stepped on it a moment before. A mocking brook bubbled hard by, the tantalizing chirrup of birds was distinguishable from a clump of trees in the distance, and the light wind itself, which blew out your embryo overalls and played with your calico jacket, seemed to be whispering distracting things to a honey bee hovering near. Perhaps you cried a little at your ill success, for you were a little fellow then; and as you wondered what to do next, a well known voice was heard in the rear, and it said: “Well, Henry, ain’t you caught that mare yet? I want to use her to-day.” You had no heart to answer the sarcasm in the last sentence, and you yielded up the measure and the ear of corn passively to your sire, and he walked down to where Jenny was standing. She came up to the measure when your father said “Kajock,” because she, in common with your mother, yourself, and all other dwellers on that dear old farm, knew that when the old gentleman spoke he meant business. So you were not surprised a moment later when they passed by you, one dignified but triumphant, the other submissive. You were told, as you trotted along behind, that there was no trouble about catching a mare, and talked to in a manner prompting in your breast the wicked hope that Jenny would, some time in the near future, elevate the author of your being about seventy-five feet towards the blue canopy of heaven and take the conceit out of him! You stood around while she was being harnessed, intending to experiment further with Smithy, his toe and the stubble; but as the head of the house prepared to drive away he remarked: “Henry, you had better weed out that carrot bed this afternoon.” His word was law, and a law that no member of the family had ever defied; so you obeyed implicitly; but as you knelt between the rows angry tears were falling beneath a rude palm hat, and you offered a brief but vigorous prayer that your parent might ultimately be scalped by a Penimore Cooper red man; and then you went on weeding, and wishing that husbandry was not.

Bradley’s Electrical Apparatus and Helices.

THE decease of Dr. L. BRADLEY will not necessitate the closing out of the business which has been so successfully conducted by or for him at Jersey City. Those who have been associated with the Doctor in the business for some years past have become fully competent to conduct it, and furnish apparatus as perfect and reliable as when he personally superintended the business, which he has not been able to do for more than a year past. The business will be continued for the benefit and in the interest of his family, as heretofore.

Mr. Latimer Clark telegraphed through both Atlantic cables with a battery formed in a lady’s thimble, and Mr. Collett said, “I have just sent my compliments to Dr. Gould, of Cambridge, who is at Valencia, with a battery composed of a gun cap with a strip of zinc excited by a drop of water, the simple bulk of a tear.”

Personals.

Mr. F. B. RAE, of the W. U. office at Broadway and Dey streets, is quite an expert printing operator, and is, we understand, “solid” for the first vacancy in that direction.

Mr. CHARLES THOMAS has been transferred to the cable department from the night force of the Western Union building, in this city.

Mr. THOMAS J. TOBIN has returned from a “bumy tigg” in Central New York, looking as happy and contented as possible. He enjoyed himself hugely.

Mr. ROSCOE SPRAGUE, late of the cable department, W. U. building, is now working on the regular day force.

MESSRS. HURLEY and SMITH, of the W. U. night force, have resigned, to take effect shortly, when they will go south.

Mr. GEO. EITEMILLER, having finished his engagement as sub. for Kearney, will soon return westward to seek fields and pastures new. The W. U. officials should look to their interest and retain Mr. E., who has no superior, and few, if any, equals in the telegraph business.

Mr. T. H. O’REILLY is back from his Saratoga trip, looking well.

The Telegraph.

Gray’s Electric Telephone.

DURING the past week Mr. Elisha Gray, of Chicago, has had his telephone on exhibition in the Western Union building in this city, where it has been visited and examined by many prominent scientific men and telegraphers. Since Mr. Gray’s original discovery of the principal of this apparatus, some two years since, he has made many improvements in its details, and the results which he has exhibited during the past week are exceedingly curious and interesting. What is of more importance, these results seem likely to lead to practical applications of great value.

The most attractive and interesting part of the exhibition to the ordinary observer, is the process of transmitting musical sounds through a telegraphic wire from one part of the building to another, though it is by no means certain that this will be the most valuable application of the invention in practice. The transmitting apparatus consists of a piano key-board, each key being connected with a self-acting electrotone, the vibrations of which are so regulated as to produce a musical tone of a certain pitch, whenever the circuit is closed upon it. These different rates of vibration are of course transmitted in the form of electrical waves or pulsations to the distant end of the circuit. The receiving apparatus consists merely of an electro-magnet without an armature mounted upon a hollow sounding box. A molecular disturbance is set up in the cores of this magnet by the passage of the electrical waves through its helices, the effect of which is to lengthen and shorten the core with great rapidity. The vibrations of the core are thus communicated to the sounding box, producing corresponding musical tones. When the transmitting apparatus is well played the effect upon the receiving instrument is to produce music very similar to that of a violin. As several different tones, or sets of vibrations, can be simultaneously transmitted through a wire at the same time, it is easy to see that herein is a foundation for a system of multiple telegraphy. In fact, the experiment of sending three simultaneous messages in three different keys over one wire was tried the other day, and they were all copied from the same instrument at the same time by three different operators without difficulty. By means of an apparatus termed an “analyzer,” which takes the place of the ordinary relay, four, and even six different tones have been made to operate as many distinct sounders, as was satisfactorily demonstrated a few days since in the presence of Mr. Orton and a number of other telegraphic officials.

We shall at an early day give our readers a detailed description of this curious invention, together with the results of further experiments which are now going on in reference to its application to multiple transmission in telegraphy.

New York City Telegraphic Notes.

THE Duxbury cable to France is now working as usual.

The most interesting occurrence of the past week for all New York operators was pay day. The hot weather which has prevailed lately necessitated an unparalleled consumption of cooling draughts, and as beverages and wealth go hand in hand, nearly, if not quite all of the pocketbooks (and pockets without books) were as flat as Mrs. Mulligan’s foot. We can’t imagine how flat

that is, but if Mulligan is solid what must his wife be? The basement floor was filled with the company’s employes, all eager for a sight of the cherished greenback, and soon the average telegrapher might have been seen meandering forth with a smile upon his face, a pocket filled with rocks, and a strange light in his eyes, which shone perceptively upon a modest yet alluring sign reading “Beer;” only this and nothing more.

A few days since the battery on the Chicago quadruplex instrument at the W. U. operating room became short circuited through the double transmitter points, and in attempting to throw the battery off by means of the ground switch on the table, Chief S. S. Bogart had three fingers of his left hand quite badly burned. The whole power of the large battery of 300 cells was discharged through his hand, and as the switch touched the ground button a great amount of heat was generated, which ignited the gutta percha insulating button and wire covering, and in a moment more the under part of the table was all ablaze. Mr. Bogart’s hand had a sheathing of melted gutta percha as he hastily withdrew it, which he has an undimmed recollection of still. The fire was extinguished by the application of the contents of “the old water bucket” before mentioned in these columns, which, being strongly impregnated with tobacco expectorations, must have produced a perfume which grated unpleasantly upon the olfactories of those present.

Foreign Telegraphic Notes.

THE report of the Submarine Telegraph Company for the half year ended June 30th last, states the ordinary receipts at £54,122. This has enabled the directors to declare a dividend at the rate of 15½ per cent., and to add £2,251 to reserve, carrying £325 forward. A sum of £12,552, obtained from the Post-office, has been nearly all spent in laying twenty miles of new cable between Boiling Gap and Dieppe.

The estimated traffic receipts of the Anglo-American Telegraph Company for

August 18 amounted to	£1,230
“ 19 “	1,330
“ 20 “	1,450
“ 21 “	1,350
“ 22 “	260
“ 23 “	1,150

The directors’ report to the thirty-sixth ordinary meeting of the Mediterranean Extension Telegraph Company, stated that the Board have much pleasure in stating that the cables and land lines of the company continue in perfect working order, and they were enabled to recommend payment of the half yearly dividend on the eight per cent. preference stock, less income tax, as usual; and of a dividend at the rate of three per cent. per annum, free of income tax, on the ordinary share capital of the company, payable on and after September 1. There will remain a sum of £500 13s. 4d. to be carried to the reserve fund, which will then stand £7,848 7s. 7d. Mr. H. Moore, the chairman, in moving the usual formal resolution for the adoption of the report, said the receipts were about the same as last half year, whilst the expenditure was about £100 less—although they had during that time to supply new instruments.

Poisoning of Mr. Hiram Sibley.

ON Saturday last, at a party given in honor of Mr. Hiram Sibley, of Rochester, N. Y., at the house of Mr. Blackinton, in North Adams, Mass., among the dishes on the supper table was a custard, and all who partook of it, among whom was Mr. Sibley, were taken seriously ill. One of the party, Mr. Wm. S. Blackinton, one of the largest woollen manufacturers in the country, and son of the host, died shortly afterwards, and another of the party is so low that he is not expected to recover. Other cases are doubtful, but it is thought most of them, including Mr. Sibley, will eventually recover.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended August 3, 1875, and bearing that date.

REISSUES.

6,576.—HOTEL ANNUNCIATORS AND FIRE ALARMS.—Edwin A. Hill, Chicago, Ill. Patent No. 114,007, dated April 25, 1871. [Filed July 19, 1875.]

1. The combination of the magnet A and shunt with the special magnets B' O', when so constructed and arranged that the electric circuit passes alternately through the magnet and shunt automatically, for the purpose of strengthening the currents to the magnets B' O' when the magnet A is shunted.

2. The permanent magnet K', in combination with the shunt circuit and the alarm bell, when constructed and arranged substantially as and for the purposes specified.

3. The combination of the permanent magnet K', the vibrating arms L', E', and A', when constructed and arranged substantially as described, for the purposes of opening and closing the circuit of the shunt.

6,578.—ELECTRIC SIGNALING APPARATUS FOR RAILWAYS.—Frank L. Pope, Elizabeth, assignor to himself, Jas. N. Ashley, Greenville, N. J., S. C. Hendrickson, Brooklyn, N. Y., and James D. Lincoln, Greenville, N. J. Patent No. 130,941, dated Aug. 27, 1872. [Filed July 23, 1875.]

1. A semaphoric signal constructed with disks or targets of alternate contrasting colors, in combination with an electro-magnet, substantially as specified.

2. An electro-magnet actuated partially or wholly by axial magnetism, in combination with a semaphoric signal, substantially as and for the purpose described.

3. An electro-magnet having an armature so arranged as to be held in contact with its poles by residual magnetism until released by an opposing or demagnetizing current emanating from any suitable apparatus for generating electricity, in combination with a semaphoric signaling apparatus or an alarm, substantially as specified.

4. The combination of a semaphoric signal operated by electro-magnetism, and a secondary signal actuated or controlled by said semaphoric signal, with a reversing or releasing apparatus so arranged that when the said signals have been set by an operator at one point or station they can only be reversed or released by an operator at another point or station, substantially as herein specified.

6,579.—ELECTRIC SIGNALING APPARATUS FOR RAILWAYS.—Frank L. Pope, Elizabeth, assignor to himself, Jas. N. Ashley, Greenville, N. J., S. C. Hendrickson, Brooklyn, N. Y., and James D. Lincoln, Greenville, N. J. Patent No. 130,941, dated Aug. 27, 1872. [Filed July 23, 1875.]

1. The combination, with a visual signal, of an electro-magnet and an armature operating to display the signal by direct magnetic attraction, and to hold the same displayed by residual magnetism, substantially as set forth.

2. The combination, with a visual signal, an electro-magnet, and armature operating to display the signal by magnetic attraction, and to hold the same displayed by residual magnetism, of a circuit closer and opposing circuit for throwing a releasing or demagnetizing current through the coil or coils of the actuating electro-magnet, substantially as set forth.

6,581.—ELECTRIC ANNUNCIATORS.—George W. Shawk, Cleveland, Ohio, assignor, by mesne assignments, of part interest to C. F. Uhl, John Gribben, H. A. Crossley, and W. H. Crowell. Patent No. 139,826, dated June 10, 1873. [Filed March 20, 1874.]

1. In an electric annunciator, the combination of an electro-magnet with an armature, which is actuated by magnetic attraction, and retained in direct contact with the cores of the electro-magnet by residual magnetism, in connection with independent mechanism, substantially as described, whereby the armature is forced from the cores by positive mechanical action, substantially as set forth.

2. In an electric annunciator, the combination of a numbered or lettered plate with the armature of an electro-magnet, the armature adapted to be retained in direct contact with the cores of the magnet by residual magnetism, substantially as described.

3. In an electric annunciator, the combination of a weighted arm with the armature of an electro-magnet, to which a lettered or numbered plate is secured for the purpose of counterbalancing the weight of the said plate, and thereby insure the attraction of the armature to the magnet by a light electric current, substantially as described.

4. In an electric annunciator, the combination of a crank shaft, having an arm secured thereto, with the armature of an electro-magnet, to which a lettered or numbered plate is secured, for the purpose of releasing the armature from the electro-magnet, and allow the letters or numbers to move away from view, substantially as described.

For the week ended Aug. 10, 1875, and bearing that date.

166,471.—GOVERNORS FOR ELECTRIC MOTORS.—Augustus McConnell, Cambridge, Mass. [Filed April 15, 1875.]

The combination of the rotatory electro-magnetic engine, the circuit closer K having projecting arms a, the slotted arm D upon the shaft S of the motor, and the conical petroleum H, constructed and operating substantially as and for the purpose set forth.

166,488.—INDUCTION COILS.—Jos. C. Vetter, New York, N. Y. [Filed August 27, 1874.]

1. The handles E E', constructed to telescope and to pass over the exterior of the induction coil through opening in the box, substantially as herein set forth.

2. The elastic bail like attachments F F', in combination with the handles E E' and conductors, substantially as and for the purpose specified.

Obituary.

DR. LEVERETT BRADLEY.

DR. LEVERETT BRADLEY died suddenly at his residence in Jersey City, N. J., on Monday afternoon last, in the 77th year of his age. The immediate cause of his death was probably an affection of the heart. He was in his usual health on Sunday, and attended church in the evening. On Monday he partook of breakfast and luncheon with his family as usual. Soon after the latter meal he complained of a burning sensation around his heart, laid down upon his bed, and in half an hour had entered upon his final rest.

For the last fifteen or sixteen years Dr. BRADLEY has been well known in this country and in Europe as an able electrician and an ingenious and skilful inventor of electrical and telegraphic apparatus of great utility and value. It is fitting that the decease of one who has held so prominent a place as an electrician and inventor should be appropriately noticed in the columns of THE TELEGRAPHER.

In February, 1861, an excellent likeness of Dr. BRADLEY, and a sketch of his biography and achievements in telegraphy up to that time, was published in the *Physiological Journal*, and to it we are mainly indebted for the facts in regard to his early history.

Dr. LEVERETT BRADLEY was born November 25, 1798, at Milton (now Genoa), Cayuga County, New York. His father, Milton Bradley, was a carpenter by trade, and also cultivated a small farm. It was necessary that the son should contribute by his labors, as soon as he was able, to the support of his father's family, and his early years were employed upon the farm. At fifteen years of age he commenced to learn the carpenter's trade with his father. His school opportunities were limited, and he was practically a self-taught man. From his boyhood he was, however, a student, investing his small means, from time to time, in books, which were thoroughly studied. The natural bent of his mind was to the investigation of mathematical and scientific truth, and this characteristic continued prominent until the end of his life. In addition to his other labors and studies, a small portion of his time was spent in teaching.

Being desirous of seeing something of the Western country, which then had been but partially developed, at the age of twenty he made a tour to what was then known as the "Far West," most of the journey both ways being made on foot. He travelled as far as Fort Stephenson, at Lower Sandusky (now Fremont, Ohio), which was then regarded as the extreme of civilization. His funds giving out he proposed to establish a school, which proposition was eagerly acceded to by the settlers. A log school house was speedily put up for him, and some months were passed in imparting the rudiments of education to their children. At the end of that time he returned to his home in New York State, having earned sufficient to return to his father the amount furnished by him for his journey, which was just seven dollars. Upon his return home he for a time resumed work at the bench. March 16, 1820, he married Miss Maria Sheldon, of Genoa, and in the fall of the same year, in company with his father-in-law, Joseph Sheldon, and a brother-in-law, he emigrated to the State of Ohio, finally settling in the township of Clinton, then practically a wilderness, but now the flourishing city of Tiffin. His excessive labors and the malarial climate so impaired his health that he returned to his native State, where he remained some months until it was restored.

In the fall of 1822, having taken two courses of study in medicine, he graduated with credit at the St. Louis University. In demonstrative anatomy especially he attained the highest honors of his class. He afterwards settled at Laporte, Ind., in the practice of his profession. He was successful as a physician, but the profession was distasteful to him, and in 1850 he emigrated to California, which was then the Mecca of those who were of an enterprising character and desirous of securing fortunes. His journey to California was made by the overland route, and he experienced the toils and privations inseparable to the journey at that early period, when no regular means of transportation had been provided. On his arrival at Sacramento he met his eldest son, Joseph F. Bradley, who had reached there by way of Mexico the previous year, and who was subsequently associated with and materially aided him in his enterprises. His first venture in California was in mercantile business with his son at Weberville, Eldorado County.

Soon after he engaged in civil engineering, and was a pioneer in the great work of conducting the waters of mountain streams by means of canals to the mines. The enterprise was successful, but in 1854 the stock of the "corporation of Bradley, Berdan & Co.," of which he was president and chief engineer, was ruinously depressed, and Dr. BRADLEY was obliged to go into liquidation. At this time he lost his most faithful and valued assistant by the death of his son.

In 1856, having purchased a press and types, he established the *Granite Journal* newspaper at Folsom, Cal., which was so successful that he was enabled a few months afterwards to sell it out at a handsome advance. Having by this and other enterprises acquired a moderate competence, the declining health of his wife induced him to retire from business and devote his personal attention to her care until her death.

About this time his attention was attracted to the electric telegraph, and with a view to increasing its speed of operation he studied electrical science and tried many experiments in electricity and electro-magnetism. He soon brought out a rudely constructed automatic instrument, by which he could transmit and legibly record, on short circuits, 7,000 to 8,000 words per hour; and in December, 1858, he came to New York to perfect and patent his instrument. In 1859 he secured a patent for an automatic telegraph apparatus, the transmitting devices of which consisted of metal type, representing the Morse characters, which were set up in a port rule similar to the original plan of Prof. Morse, and passed rapidly beneath a lever circuit closer. The recording apparatus consisted of a moving cylinder, around which a sheet of paper was wrapped, which being under a syphon pen, the movement of the latter being controlled by the receiving magnet. With this apparatus he succeeded in legibly recording 15,000 words per hour on short circuit, but on trial between New York and Washington its speed was found to be greatly reduced by the defective action of the relay. After many experiments he at length invented a new form of relay, having but one helix and double counteracting springs upon the armature, which recorded signals with remarkable rapidity, and was regarded by many of the best operators of that day as far superior to the ordinary relay in quickness of action and range of adjustment. He also devised a main line sander upon the same principle.

In 1865 Dr. BRADLEY patented a method of winding magnetic helices with naked or uninsulated wire—an invention which has proved to be of great practical value. For a number of years he carried on the business of manufacturing telegraphic instruments in Jersey City, N. J., in which his peculiar helices were employed. In 1868 or 1864 he invented a tangent galvanometer on an entirely new principle, to which he subsequently added a complete apparatus for electrical measurement. He was the first to establish the manufacture of this kind of apparatus in the United States, and the demand for it, and also for his patented helices, at length became so great that he relinquished the manufacture of other apparatus and devoted himself entirely to those two branches of his business, which he carried on until his decease.

Dr. BRADLEY was a man of the most sterling excellence of character. His honesty and integrity were proverbial. He scorned to wrong a fellow man in the smallest particular, nor did he willingly submit to anything of the kind from others. Tenacious of his own opinions, and even obstinate in a marked degree, he was a devout believer in the motto, "Be sure you are right, then go ahead," and when he had once decided upon his course, opposition only served to render him the more determined. It is only the few chosen friends who, like the writer, were privileged to know him in his every day life, that will ever be

able to realize what a kindly character was his, or how numerous were the unostentatious deeds of benevolence and charity which he performed.

On the 6th of April, 1868, Dr. BRADLEY married for his second wife Mrs. Jane A. Reed, of Jersey City—a most amiable lady, who survives him. Three children by his first wife also survive him.

Up to the end of his 75th year he retained his mental and physical vigor in a remarkable degree, but for the past year and a half he has been failing, and it was evident that the machinery of life was nearly worn out, although no one anticipated so sudden a termination to his earthly existence.

Dr. BRADLEY was a member of several of the leading scientific societies, and of the Masonic Order, in which he had attained the highest degree. He was a member of Varick Lodge of F. and A. M., by whom his funeral rites were conducted.

His funeral, which was largely attended, took place on Thursday last, at three o'clock P. M., at his late residence, No. 1385 Jersey Avenue, Jersey City, N. J.

Birth.

RILEY.—To Mr. GEORGE P. RILEY, cashier, Western Union Telegraph office, Albany, N. Y., August 21st, a daughter.

Died.

BRADLEY.—At Jersey City, N. Y., Monday, September 6th, 1875, very suddenly, Dr. LEVERETT BRADLEY.

DAWES.—At Saugerties, New York, Saturday, September 4, 1875, Mr. VAN ZANDT DAWES, of this city, was accidentally drowned while bathing in the river.

FOR SALE.—CEDAR TELEGRAPH POLES.

In lengths of twenty-five, thirty, thirty-five, and forty feet; five to six inches at small end, and bark peeled off. In car loads or by vessel loads, delivered at any of the lake ports between Oswego and Chicago as may be agreed upon. Thirty-foot poles for fire alarm telegraphs a specialty.

Address

A. A. COLBY,
Toronto,
ONTARIO, Canada.

TELEGRAPH REQUIREMENTS.

Our INSULATORS, made of Berlin-pressed, tempered porcelain, with screw thread and supports of hardened iron, which are screwed into the interior threaded portion of the insulators, acknowledged to be the most durable, are sold at lowest manufacturers' market price. We sell also telegraph wire of every kind at reasonable discount at wholesale. Address,

ACT. GES. FOR TELEGRAPHEN-BERDARF,
v. H. SCHOMBURG,
BERLIN (Germany), Moabit 20.

BRADLEY'S APPARATUS FOR ELECTRIC MEASUREMENT, COMPOSED OF HIS

Tangent Galvanometer and Rheostat. (Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING

WHEATSTONE'S BRIDGE,

Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED

NAKED WIRE HELICES, for Electro-Magnets, wound to any given size and resistance.

Manufacturers of Telegraphic and Electrical Instruments supplied at low rates.

For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,
9 Exchange Place, Jersey City, N. J.

ORTON'S PATENT PENCIL HOLDER

"SAVE THE PIECES."

This HOLDER is intended to save the last half or third of the pencil.

DIRECTIONS.

When the pencil becomes too short to write with comfortably, shave down the butt and screw into the Holder. The screw makes its own thread and will hold the pencil perfectly firm.

Price, 10 cents each.

Sent by mail on receipt of price.

Price per doz., 60 cents.

GEO. H. BLISS & CO., Gen'l Agents,

220 Kinzie Street, Chicago, Ill.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

PONY RELAY, PRICE \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. see above Ent.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 34
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 60	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 1/2 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working

equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Calland battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense.

Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application.

All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,

CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to J. N. ASHLEY,

P. O. Box 5,503,

38 Vesey street, New York.

WESTERN ELECTRIC MAN'G CO.

220 Kinzie Street,

CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished.

It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cnp Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Liberal terms to Agents.

Somerville, Miss.,
Troy, N. Y.,
Taunton, Mass.,
Toledo, Ohio,
Toronto, Canada,
Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

**FIRE ALARM TELEGRAPH
IN THE WORLD.**

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

**EFFICIENCY,
RELIABILITY and
ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor,

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection. Introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

Adventures of a Military Telegraph Operator in South Carolina.

By E. S. CAPE.

In the year 186-, during the rebellion, the following incident occurred in the department of South Carolina:

"Come, Joe, here are some important despatches to go North, don't you want to go up to Beaufort with them?" (Beaufort was a town some sixteen miles distant, where all despatches were sent by special messengers by a steamboat, by reason of defects in the Broad River Cable.)

"No, siree! I don't care to go down on the dock and receive any more of that harbor master's insolence."

"Fie, Joe, that is his way! Captain K. is a nice man, and will give you a boat immediately."

"Yes, I know," replied Joe. "He is an 'ice man,' apparently, toward me; I don't like him, and prefer remaining here with my old 'Cremoua.'"

"But," interrupted the first speaker, "the sail will do you good!"

"Perhaps it may," said Joe, "but if it's all the same to you I will stay here."

"Very well, let it be so. I will take them myself." And the elder left "Quarters," proceeding to the wharf where the dreadful harbor master presided.

Capt. K. soon espied and greeted him thusly: "Well, 'ole telergraf, I s'pose ye've come for a boat, but ye'll hev to wait er'while. Ye see ev'ry tug is engaged; take a seat and I'll histe a signurl." The "signurl" was soon answered by steam tug "Blanche Paige," Capt. Harding, who entered the office, and noting the lightning speculator, took in the situation at a glance. "So, so! its you that's here, is it? Well, I am not at all anxious to go to Beaufort to-night, 'cause we are going to have a big thunder storm in a few minutes, and it's not very pleasant to be caught in a narrow place like Beaufort River."

"Good evening, Cap.," said the chief, laughing, "I admit the prospect is not inviting, but important despatches from the general, you know, and 'Cap.' you and I have experienced some rough times within the past year."

"That's so. Well, come on; I see I can't scare ye," rejoined the good hearted captain, and the two jumped on board the tug, which proceeded at once toward St. Helena, distant some four miles, it being a convenient harbor, providing we could reach thus far before the storm. The chief took a position in the pilot house and endeavored to cheer up the captain.

"By George, 'Cap.,' we are going to have a blow 'look yonder, ain't that black?"

"Yes, sir" (ringing a small bell to inform the engineer to crowd her a little). You may depend upon it we won't reach Beaufort in a hurry."

"Why, do you really think the storm will last long?"

"Yes, sir, I think it will be very severe, and probably last two to three hours."

"Well, let it come, we will be near St. Helena, and that is a good harbor for us, besides we can go on shore and see some of our friends."

"Yes, if we can get on shore, but from present appearance I think we will be miles from there, and I begin to think we were foolish to start."

"Why, 'Cap.,' you are getting timid in your old days. I am sure the lightning will enable you to see your way."

And here let me mention that the captain began to give me very short answers to my inquiries, at last advising me to go to bed; as in all probability it would be near morning when we arrive at Beaufort, as he should run very slowly during the storm. So to please him I went in his "state room" and tumbled up the berth, but little sleep was enjoyed, as it was now blowing a gale and raining hard.

I could hear "Cap." scolding his assistants continually, with an occasional adjective addressed to "Govt. Telegraph." I had tried several times to go out but was prevented. So soon as the storm subsided,

which had lasted two hours, I walked to the pilot house, and addressing "Cap." said, "Hello! why we are near Beaufort!" "Yes, goll hang it; we are just opposite the Fort; we will probably have to remain up here till morning, for I wouldn't take the boat back through such a storm for all the money Government pays the owners, and I am pretty sure we will have more rain."

"I hope not, Cap.," said the chief, "and see, Cap., there-is the moon! Hooray! now we will be all right."

So as soon as the boat reached the Beaufort wharf I sprang ashore, telling Cap. I would be back soon as possible. It was near midnight, and all was still. I was challenged by guard on Post No. 2, a short distance from the landing. Being provided with passes I produced them, but the guard being an American of African descent, he could not read them. I was informed "dat I mus jess go to de gaard house." This was annoying, but he called for "De Corporal de Gaard," who also was mahogany, and I was marched to "De Gaard House." The officer on duty being white, quickly gave me an escort to the telegraph office, distant a mile, and, as I did not deem it necessary to keep the guard waiting at the telegraph office, I was particular to tell the posts as we passed that I should return alone in a short time, to note me well, so that I could pass direct to the boat.

I arrived at the office, dismissed the guard and entered; transacted the business, and was ready to return in an hour; after laughing heartily over my adventure, and remarking to the "operator" that the life of a "Telegrapher" was full of incidents, I bade him good night, and walked rapidly towards the steamboat landing. I passed three guards; was recognized, and was near the fourth and last, when I observed he was sitting down; did not receive the challenge, and knowing I was on dangerous ground, I stopped a moment. Perhaps the poor man, being fatigued, had fallen asleep! I was puzzled. He was in danger, so was I; should he open those Black eyes, and see a man so near him, he certainly would wing me.

It was necessary to act cautious but quickly, so I made a circuit around him, keeping an eye on him: fortunately for me there was considerable sand in the street, and I contrived to reach the top of the hill leading to the wharf; I went cautiously down a few yards and then took to my heels, running to the boat. I cried out to the captain thusly: "Cap." let her go, quick! He did not wait long; in a minute and a half we were clear of the wharf and speeding down the river. I then told the "Cap." my adventure, and we laughed loud and long over our midnight trip to Beaufort. To conclude, some of my readers will probably recognize a character introduced here. I respectfully submit this as a True incident of the rebellion.

Lovely Woman.—An Operator's Matrimonial Experience.—She ain't what she's cracked up to be.

By MEPHISTO.

My friend B—, a very nice young man, and a most eligible party, committed (not suicide but) matrimony; his too susceptible heart was captured by a fascinating lady operator, and he gave himself away! Poor B— was deserving of a better fate; as good an operator as ever pounded brass, and as genial a fellow as ever breathed, he believed all women were angels; that they could do no wrong; that they and they alone rendered this earth inhabitable. I had reasoned with him against this folly; I had endeavored to point out to him the rocks and shoals that studded the ocean of matrimony, but in vain; he rushed headlong to destruction and I was powerless to save him. "I love her," he said; "she is to me as the apple of my eye, the sunshine of my life! So good, so gentle, so kind;" and so on, *ad nauseam*; from which you will perceive, oh astute public, that he was very far gone—a hard case. Well, he married; and I saw him not again for two or three years—I met him one day quite accidentally, and asked him, of course, how he liked double harness. "Twas then he heaved a heavy sigh, and spake as follows:

"Oh! woman, in our hours of ease
Uncertain, coy, and hard to please;
But let dull pain assail our brow,
A ministering angel thou."

Thus the poet—I have no doubt that whoever he was he was a poet, because no one but a poet would have written such trash. The eternal truth of the first two lines is drowned in the utter falsity of the two last. The stanza should read thus:

O woman, e'en in hours of ease
Uncertain, coy, and hard to please,
And when grim pain assails our brow,
A harassing tormenting thou!

The uncertainty, the coyness, the hardness to please, and the cursedness generally of the miscalled softer

sex are too well known to you, friend Mephisto, to need much amplification at my hands. Did anybody ever know what it was to please a woman? If there be a man who has ever achieved this feat let him go and hire out to Barnum as a curiosity, and I'll pay fifty cents to see him. Please them! Just try it. The first time you have a hundred dollars to spare go and buy your wife a nice watch or a bracelet, or some other token of your undying and undiminished affection, and as you take it home hug yourself with the thought how pleased she will be with it; how she will smile, and frisk, and kiss you for it; think how it will call back to her the pleasant days of your courtship and honeymoon, when all was sunshine and flowers, and spooni-ness generally. Deluded wretch, think you she will be pleased? Present your offering, and I'll bet you a brown stone front on Calumet avenue against your old hat that she'll call you a fool for throwing away your money! Or, if your circumstances are such that a hundred dollars is but a bagatelle to you, she will grumble because it is not a stem-winder, or because she's sure it's some tumpetry plated thing you have been fooled into buying (men are so stupid, you know); she'll do anything in the world but thank you for it. Did you ever buy a suit of clothes, or a hat, or a pair of boots even for yourself, and, in the pride of your heart at having driven a good bargain, display your goods for her admiration, and was she ever one little bit pleased with them? Would she not turn and twist you round and round, and twitch your new vest one way, and the sleeves of your new coat another, and find as many flaws in them in five minutes as there are holes in a cullender?

Again, go home to her with a racking headache, and think upon those lines about "ministering angel." Think how she will soothe the aching head, and be a ministering angel in the paradise of whose presence no headache can live, and see if you don't find yourself a picture of misplaced confidence. She'll "minister," it is true, any amount. She'll tie up your head in an old handkerchief saturated with vinegar which is ice cold, and which trickles down your back, and percolates through your whiskers on to your shirt bosom, and which gets into your eyes to your great discomfort, the while she tells you she knew just how it would be: she knew very well you would have to come home and lose half a day's work, and wrorit her soul out of her; and did not she tell you only last night, when you would sit right in the draft of the kevhole of that horrid door at Mrs. Perkins', that you would get the rheumatics in the back of your neck, and the neuralgia in your teeth (from neither of which ailments, by the way, are you at present suffering), and is not she always saying how you'll go down to a premature grave because you won't take care of yourself like other people; won't put on an overcoat when the thermometer is 130° in the shade, and when you know very well you'll get a chill coming home in the night air and nothing on you (a statement which you vigorously but uselessly combat)? And is not she always in a constant worry and fidget about you lest you should catch your death of cold, or be run over by the cars (men *are* so venturesome), or leave your umbrella at the office and then walk home in the rain (men *are* so forgetful)? and so she will rattle on till you feel your hair standing on end, and your scalp lifting clean off your skull. And is not your last state worse than your first? You will go back to the comparative quiet of your office, and you will think about that poet fellow with feelings opposed to anything like friendliness, and wonder if he ever really had a "ministering angel" all to his own cheek!

Of course, there *was* a time when she would gently run her fingers through your hair, and with cool, soft coaxing hand soothe the dull, throbbing ache; when with much billing and cooing, and gentle fomentations of eau de cologne or rose water she would lull your vexed spirit to repose; but it did not come natural to her. She was acting a part. She was baiting her hook; and now that she has landed her fish she throws off the mask, and you need not go to her to be ministered to. And then these wretched poets rave about "lovely woman," and "ministering angels," and so forth, till it's enough to make a dog throw his father in the fire, or to make a man kind to his mother-in-law! Well, let them go ahead and spoon all they want to, but *I've been right there, and they can't fool me!*

From all which the intelligent reader will gather that the views of my friend B— had altered somewhat since he ventured on the thorny path of "domestic felicity."

THE telegraph editor of a Lexington (Ky.) paper got sleepy the other night and went home. A foreign despatch came just after his departure, and the intelligent compositor (of course he has to stand it) wrestled with it after this fashion: "Despatch from Vienna reports that radicles been victorious in elections in Seria Deutechez Sutizung States radicles will move in skuptchina hut Sevia send army to Herzogevina to assist in Sugenes."

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

The Difficult Problem.—A Reply to "H. C. N."

CLEVELAND, O., Aug. 25.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR correspondent "H. C. N.," Aug. 21st, 1875, in reply to "W. A. S.," July 24th, submits "a few thoughts on the chemical cause" of the development of electricity by chemical action, and "considers (?) the nature of the elements entering into the battery, or medium, as well as some of the properties of electricity," that we may "have an intelligent understanding."

Your correspondent "H. C. N.," in his reply to "W. A. S.," who asks *why* electricity is excited by chemical action, undertakes to show *why* by attempting to tell *how*, which require answers differing widely from each other.

Why electricity is excited by chemical action is not at present the question of vital importance, but *how* is what we need to investigate, that we may know the immediate cause and the laws by which it is governed.

To know that electricity is developed by chemical action is not enough, the inquiring mind goes further, and asks what chemical action develops it, and what the conditions necessary for its development. Do all chemical changes excite electrical action, or is there one certain condition necessary for its development? Then, if there is, after understanding the laws which govern this condition, we may then ask *why*.

Tyndall, in his "Heat as a Mode of Motion," shows *how* heat is produced by the chemical union of certain elements—by the clashing together of atoms—but that does not explain *why* the clashing together of atoms produces heat.

How solves the immediate problem, *why* goes beyond and gives us another more difficult. It leads us on step by step to the one great cause, and then, as if to show us our insignificance, gives the great and final problem *why*.

It is the first business of the scientist to solve the problem already at hand before attempting one more difficult. To first show *how* electricity is excited by chemical action, and then comes *why*.

Deep hidden and various as the causes may appear that disturb the electrical equilibrium, I believe that it has but one source in chemical action, and that is unchangeable and invariable in all the chemical changes that develop this condition of force.

It will be seen by the following that I have taken a few exceptions to the communication of your correspondent "H. C. N.," not intending, however, to excite a feeling of animosity, but to arouse the spirit of inquiry:

1st. Electricity does not emit heat or light, is not a material, and does not unite with elements to form compounds.

2d. The battery need not be composed of two metallic elements.

3d. The first action in the battery is not the decomposition of sulphate of copper.

4th. Sulphuric acid has no affinity for either zinc or copper, nor can it be made to combine with either of them.

5th. Neither the decomposition of sulphate of copper nor the formation of sulphate of zinc is the exciting cause of electrical action. A. W. D.

"Perilous, and Destructive, and Disastrous."

NEW YORK, Sept. 5.

TO THE EDITOR OF THE TELEGRAPHER.

SOME months ago the editor of the official *Journal* of the Western Union Co. put his steel-clad heel upon my modest advocacy of "express messages," and denounced the suggestion in the thrilling adjectives placed at the head of this letter.

Several weeks subsequently the official editor, having quieted his nerves, returned to the subject, and contented himself by denouncing my "express message" views as "dangerous and impracticable." And, in the *Journal* of September 1st, the editor again returns to the subject, and tells us, in that elegant and logical language for which that scientific paper has become famous, that there is no "danger connected with the telegraphic system of the world so utterly dangerous as the one of paid priority, and to which we objected." As I understand this lucid sentence, the editor asserts that there is no "danger so utterly dangerous as paid priority." There is such an oracular air about the editor's dictum upon this point that I cannot but feel extremely diffident in putting my

opinion on record against that of one who swings such cogent arguments, and fortifies them by such utterly incomprehensible language.

I regret that my own sense of what is due to the managers of the Western Union Co. does not justify me in speaking of them with the awe and reverence claimed for them by the editor of the official *Journal*. I must speak of them as their acts seem to merit—and I simply assert that I have never made a charge or insinuated a fault which I am not prepared to justify and sustain, without the least discount. For more than five years the managers of the Western Union Co., from the President down, have been constantly referring to me and to my business interests in language and by innuendo disgraceful to the intelligence of its authors.

Even within the last few days the President of that company publicly stated that the automatic system of telegraphy which I brought out in 1869-'70 was only a slight improvement on the old Bain system, whilst he knows that the Bain system was incapable of transmitting and recording over a wire 250 miles long more than about 60 words per minute; whilst 1,000 to 1,500 words per minute was entirely practicable by the system which I brought before the public; and there are several other differences quite as marked as in the speed of transmission. The managers of the Western Union Co., at that time, by bold assertions to their stockholders and the public, sought to strangle the new system at its birth. But the system was too good and had too much vitality in it to be crushed. It has been growing in importance every day since, until, as is well known, a large minority, if not a majority, of the directors of the Western Union Co. have become impressed with its importance, and admit the controlling power of the new system in the near future of telegraphy. Mr. Orton and his assistants might as well attempt to dam up the Hudson as to prevent the success of automatic telegraphy; and the automatic system of to-day is the identical system of 1869-'70, which the managers of the Western Union Company then asserted to be incapable of telegraphing over sixty words per minute, and which Mr. Orton still asserts to be valueless, as all telegraphic systems or improvements are valueless until the W. U. Co. possesses them.

There is proof that Mr. Orton estimated the value of the quadruplex system (by which, at the most, eight operators could telegraph over one wire as much as six operators could telegraph over three wires by the ordinary Morse system) as worth to the Western Union Co. \$1,000,000. But Mr. Orton asserts that the automatic system is valueless, though he knows that two operators with one wire can transmit more intelligence in ten hours than can be transmitted by the quadruplex system in sixty hours. In truth, telegraphing by quadruplex, or Morse, or combination printing (the three systems in use by the W. U. Co.), is simply highly educated hand labor competing against machine labor, of which automatic telegraphy consists. The contest between the two systems is aptly illustrated in the hand needle of the last generation and the sewing machine of the present. The executive managers of the Western Union Co. publicly proclaim their determination to crush out all opposition, and maintain a monopoly of the telegraph correspondence of this country; and they know very well that this will be easily accomplished if they can by any means, fair or foul, strangle automatic telegraphy. Singularly enough, even the Morse operators are aiding and abetting the great monopoly by joining in the opposition to the development of the automatic system, which, if they had a grain of common sense, they would recognize as the only possible barrier that now exists to one of the most corrupt and crushing monopolies of this or any other age—a monopoly which looks to low salaries and extra hours of service for the operators, and the instant adoption of the automatic system and every other possible device by which the cost of telegraphing can be reduced and the greatest possible profits can be extorted from the public necessities.

The early promoters of automatic telegraphy knew very well what they were about when, in 1869-'70, they entered the field of competition. Twenty years of active life in the telegraph and press business of the country taught them that successful competition upon an equality of telegraph facilities with the Western Union Company, aided by its twin monopolies, the Gold and Stock Telegraph Company and the seven leading newspapers of this city, whose close association, aided by the W. Company, has held the whole press of the country for twenty-five years by the throat, was utterly futile, and that it was useless to attempt to maintain a competing telegraph organization unless it possessed some special advantages. These advantages were found in 1869, in the Little system of fast telegraphy, which, as compared with the Morse system, possesses advantages fully equal to fifty per cent. for very large or for moderate traffic.

Unfortunately, after I had practically and fully demonstrated the success of the new system, I was induced, by the seductive statements of a former Assistant Secretary of the United States Treasury, to turn over to

him the power of putting the new system of telegraphing into practical operation, and for five years past he has been running the automatic machine for the sole purpose of advancing his own interests, and at last, after extorting from his associates, as I am told, over \$400,000, has secretly sold out his fictitious or fraudulent "improvements" to Mr. Jay Gould, and has left the country. As soon as the managers of the Western Union Company discovered that the bogus automatic improvements had fallen into Mr. Gould's hands, there commenced between Mr. Orton and Mr. Gould the extraordinary manipulations of which the whole city press has been filled for a month or two past, looking to the consolidation of Mr. Gould's A. & P. Telegraph Company with the W. U. Company; Mr. Orton's chief if not only motive being in that roundabout way to clutch enough of the automatic system to render it impossible to sustain an opposition telegraph organization. As soon as Mr. Orton ascertained, as he did by an official notice from the *bona fide* owners of the automatic and quadruplex systems, that Mr. Gould had no valid title to anything of importance in connection with those systems, the "consolidation" movement was quickly abandoned, and is not likely to be renewed, as, if Mr. Gould's company should ever obtain a valid title to automatic or quadruplex telegraphy, the title will be conveyed in such a form as to render a consolidation of the two companies impossible, except by the restoration of the automatic system to its present owners.

It just now occurs to me that I set out to write a brief reply to the editor of the official *Journal* in regard to "Express Messages," though I feel quite sure the readers of the controversy cannot need a word more of comment. The only shadow of an argument thus far adduced by the *Journal* is the intimation, very broadly and repeatedly made, to the effect that it would never do to trust to the Western Union Company to manage the express message business, for the reason that they would *purposely* hold back all ordinary or low priced messages, and thus force the public to do business under the "express" or high tariff plan.

The only other apology for an argument of the *Journal* is that the Western Union Company would never think of such a thing as to accept a message at 8 A. M. to be delivered at New Orleans within the ensuing ten hours. At a future time I will endeavor to sustain the opposite of these, as I believe, unreliable insinuations of the official *Journal*, my firm belief being that if the W. U. Company does any business between New York and New Orleans, a short time hence it will do ordinary messages of fifty words or less for ten to twenty-five cents each, and "express" messages of twenty-five words for about double these figures, day and night—the ordinary messages being delivered in one to five hours and the "express" messages in ten to thirty minutes. These rates are now entirely practicable with the present improvements—*properly utilized*—in telegraphy. D. H. CRAIG.

Desirability of Regular Correspondence.—Reflection, Determination and a Nom de Plume.

PHILADELPHIA, PA., Sept. 4.

TO THE EDITOR OF THE TELEGRAPHER.

IT has always seemed deplorable that somebody with lots of wind, and the happy faculty of blowing in just the right kind of way, did not come to Philadelphia and make it their object to inform THE TELEGRAPHER sudden and fitful gusts and demonstrative hurricanes, that come and go, and spend themselves and die away and rise up after they are lost to memory, and startle us with their sudden and unexpected reappearance, are not the desired thing. Something more volcaic, more constant—something that can flow on and on, is the requirement. For instance, Chicago has the right kind of wind. There is a steady onflowing (or should I say onblowing) current—and it is an easterly current, too—that wafts unceasingly in upon THE TELEGRAPHER, fraught with all the fragrances that Chicago intelligence affords, and never varies or seems to weary or grow less constant. Other places have in their time been similarly blessed. And I say I have always regretted that Philadelphia could not produce a correspondent who would keep us regularly informed. Philadelphia stands prominently among the cities of the United States, telegraphically speaking, and a correspondent here with the enterprising spirit of "Occasional," "Western Union," or many others who have favored us, would find a wide field and a fruitful one.

It never entered my mind that I was capable of a delivery every week, nor am I quite positive even now that I am. It never occurred to me that my mission might be to confer a benefit upon any reading public by placing before them, *regularly*, reliable communications of intelligence from any source, great or small, and even now I tremble with apprehension at my own suggestion to myself to constitute myself a weekly, or a bi-weekly or a tri-weekly correspondent to these columns, and yet I do not know but I shall

even attempt as vast a thing as this. Indeed, I have been thinking of this for a whole two hours and thirty minutes, off and on, and have almost resolved that I even will. The immediate prospect is good. There is the Western Union main office; I will tell you just where it is, and how high it is, and how wide; and there is the Atlantic and Pacific office, of which I can give similar information, even to the color of its walls. Then there is another place here that I shall be enabled to expose, and that is the office of the Philadelphia, Reading and Pottsville. Besides these there is a multitude of smaller objects, that might last me two weeks if I used them economically and sparingly, and I will try and learn to economize.

The next difficulty, then, is to select a suitable *nom de plume*. For thirty minutes more I have thumbed a superannuated spelling book for a name. Israel, and Jeremiah, and Ezekiel do not seem just in good keeping with the coming Centennial. Uriah has snap and vigor to it, and unquestionable vim, but I do not court too much vigor in my name, as I apprehend a possible lack of it in myself. Methusalem is spicy, but it likewise is vigorous. Hiawatha seems like a digression, for it is not my purpose to sentimentalize. What then of Micawber? That is it exactly. There is appropriateness in that. Like him I shall always look out for "something to turn up." I have known Dickens to help out those similarly circumstanced before. Well, then, it is all fixed, and I will next devote myself to searching for an air current that deviates a little from the main volume, and which will waft my profundity nor-east-by-east to the Grand Reflector, whose radiating light will diffuse it even to the ends of space, maybe. Oh, my!

Rapid Telegraphic Inventions.—Gray's Telephone Likely to Supersede the Quadruplex.—Rapid Transmitters, etc.

BOSTON, MASS., Sept. 13.

TO THE EDITOR OF THE TELEGRAPHER.

THE age we live in is eminently an inventive one. Mankind are following the advice of Bacon, and are delving deeper and deeper into the hidden mysteries of Nature, analyzing and appropriating her forces for the advancement and lasting benefit of the race. In no department of invention is this activity more apparent than in that of electricity, and its most beneficial application—telegraphy. The Duplex and Quadruplex have each in their turn been looked upon as wonderful inventions, and hardly have we become familiarized with their employment when a still more wondrous application of electrical discovery is announced, which, if successful, will throw in the shade all former inventions for increasing the carrying capacity of a single wire, leaving scarcely anything to be wished for in that direction.

Mr. Elisha Gray, of Chicago, a well known electrician, made the discovery that the vibrations of sound were transmissible by the electric current, and following up his discovery, he has found that by imparting sound vibrations of different pitch or velocity to electric currents, it is possible to send many distinct signals through one wire at the same time without interference; each receiving instrument responds to the current having a particular vibration, and to no other. It is said that as many as thirty-two distinct messages can be sent over a common conductor at the same time and in the same direction—the vibratory scale extending a distance of two octaves, and every half tone having a definite velocity of vibration of its own. If the hopes of the inventor are realized, as seems quite probable, all fast systems will necessarily be superseded.

In the course of the trials made last week under the auspices of the Western Union Co., between Boston and New York, four separate series of signals were sent from Boston and received in New York simultaneously. No doubt the system is still in its infancy, so to speak, and it will take much time and experimental research to develop it to a high degree of efficiency and reliability.

In the way of rapid Morse sending we have lately had a veritable "tempest in a teapot." An item appeared in the Boston and Portland papers, stating that Mr. C. D. Stanford, of Boston, had made the fastest time on record in the annals of telegraphing, having sent eighty-seven commercial messages, in the regular course of business, to Mr. D. C. Shaw, in Portland, in one hour. This statement was taken exception to by certain telegraphers, and another paragraph was published in the Boston papers to the effect that Mr. W. E. Kettles, formerly of Washington, D. C., had sent ninety-six messages, of twenty words each, exclusive of date, address and signature, from Washington to Plaister Cove, a distance of 1,000 miles, in an hour, thus eclipsing Mr. Stanford's very creditable achievement. It is proper to say in this connection that the former gentleman did not send regular, but business arranged for the occasion. Still another item in a Boston paper brought to mind the fact that Mr. Kettles

was once worsted in a friendly contest with the celebrated Pat Burns, the lightning sender of long ago, and consequently Mr. Kettles had no right to claim the championship.

There is some talk of a trial of speed between the two rivals for fame, and opinions are about equally divided as to the result. It is likely that the Boston telegraphers will have a tournament before long to settle the respective merits of aspirants for telegraphic laurels.

We have received an accession to the ranks of the operating force in the person of Mr. O'Connor, of Springfield. He works the second press wire to New Bedford.

I think the attack on "John Stirling" unmerited and extremely discourteous. He is a well educated gentleman, a fine telegrapher, and will doubtless give his cowardly opponent a severe drubbing if he considers him a foeman worthy of his steel. More anon.

A Pertinent Inquiry.

ERIE, PA., Sept. 10.

TO THE EDITOR OF THE TELEGRAPHER.

WHY is it that manufacturers of good lightning rods (if there are any such) do not advertise? I have been for months striving to add lightning rods to my other business, if I could get a good rod, such as common sense and some knowledge of electrical science shows to be a protection and not a fraud. Have hunted for such advertisements but find none. Have written several letters, and received answers from copper bot-tomed, double twisted frauds.

GEO. W. MOORE, Repairer, P. and E. R. R.

Opening of the Chicago Industrial Exhibition.—Telegraphers not Interested in the Business.—A Victorious Telegraphers' Base Ball Club.—Births.

CHICAGO, ILL., Sept. 8.

TO THE EDITOR OF THE TELEGRAPHER.

THE Exposition opened to-day with a great flourish of trumpets, etc., but I can only refer to it incidentally, as nothing, telegraphically speaking, has been arranged as yet except the opening of the branch offices of the different telegraph companies in the building—a description of which I hope to be able to furnish you in my next.

Very often in our wanderings we meet with men who can't take any interest in their business, or anything connected with it; and we think they should be known to the fraternity, so that they may not be disturbed in the even tenor of their way, but be allowed to pursue a business that has no attractions for them until, years hence, when in the sere and yellow leaf, they will still be found in the business; either not having the ambition to make an effort to get into other business, or else be satisfied to trot along behind the mass of energetic telegraphers who are ever striving to be up to their business. Such a gentleman is to be found at the Tremont House, in this city, in the person of Mr. Tracy. His segars are splendid, though, and in time, should he rise to a position of eminence, he will probably have for his coat of arms something that will designate what business he did become interested in (so as to rise above his fellows), that they may follow his example. The foregoing remarks are made in no spirit of unkindness, as the gentleman is one of our warmest personal friends; but we are meeting so many operators lately, who disclaim any interest in the business, that we have made up our minds to give their names to THE TELEGRAPHER and its readers as fast as we find them out. Mr. Harris, at the Commercial Hotel, continues to serve the patrons of the hotel and the business public in that locality to their satisfaction, as well as to the interest of the Western Union, his employers.

Mr. Paul Bossart, who came here to work on the extra force in the Western Union office, only remained a few days in that position. Being offered a regular position in the W. U. office he resigned and accepted.

Base Ball is still raging here, and if "Billy" McMillan's nine keep on improving they will soon be able to cope successfully with some of the professional clubs. They more than covered themselves with glory on the 29th ult., playing the Stock Yards nine (by whom they were beaten for the first time this season a short time ago), and beating them by a score of 16 to 36.

Their third game with the Tribune nine was played the 31st ult., on the grounds corner of 27th street and Wentworth avenue. The game was very interesting, the score standing at the end of ninth innings 10 to 10. Another inning was played to decide the victory, when the Telegraphers came off victorious, for the third time, by a score of 12 to 11. The catching of Furlong for the Telegraphers was noticeably fine, as was also the playing of Bliss for the Tribune. The following is the score:

TELEGRAPHERS.			TRIBUNES.		
	R.	O.		R.	O.
Furlong, c.	3	3	Ogden, c.	2	4
Kearns, l. f.	1	2	Bliss, s. s.	2	3
Ryan, s. s.	1	5	Householder, l. b.	1	3
Hart, 3 b.	0	4	Brock, 2 b.	0	4
Casey, 1 b.	2	4	Fallon, l. f.	1	3
Murphy, r. f.	2	3	Bamford, c. f.	0	6
Flanders, p.	1	5	Snow, r. f.	0	6
Birmingham, 2 b.	2	1	Sheildham, p.	5	0
Gallagher, c. f.	0	3	Kahler, 3 b.	0	2
Total	12	30	Totals	11	30

Left on bases—Telegraphers, 7; Tribunes, 5; double plays—tribunes, 1; Telegraphers, 1. Time of game—2 hours 40 minutes. Umpire, Mr. Eikins.

INNINGS:

	1	2	3	4	5	6	7	8	9	10
Telegraphers	0	0	2	0	0	5	0	1	2	2—12
Tribunes	0	0	2	3	0	1	2	2	0	1—11

Some unpronounceable and very hard words sometimes come across the cable, and are very long ones, also, but "Lebensfristwahrscheinlichkeit," which is actually said to have been in a cable message which passed through the Western Union office here, beats anything on record.

The population of this city was increased on the 6th instant by the presentation by Mrs. F. M. Crittenton to her husband (the assistant all night man "O," of the Western Union office of this city) of a fine ten pound daughter. "O" has two daughters now, and will soon be ready to start and stock a first class ladies' boarding school.

We omitted noticing at the time (five weeks ago) the birth of Mr. D. S. Foot's daughter, first edition. "Dell," being so bashful he did not mention it at the time. He still graces the Western Union night force here, I believe, when he is not obliged to hire a sub. on account of his extensive real estate transactions during the day. If you want to know what real estate is worth in and around Chicago, just ask "Dell."

OCCASIONAL.

The Management of Chicago Office Criticised.

CHICAGO, ILL., Aug. 30.

TO THE EDITOR OF THE TELEGRAPHER.

I AM averse to writing, but I cannot resist having a word to say as to how matters are managed in this office. There is undoubtedly cause for complaint, or else there would not be the grumbling there is under the present management. It no doubt takes a great deal of ability, etc., to manage an office like this, more especially the class of men that there is employed, but this can be done more beneficially to the company than it is at present. What I mean is to compare other large offices to this, and the method by which they are induced to appreciate those in charge. There is no existing doubt but what those in charge here are "smart," as far as electricity and the management of wires are concerned, but they show very poor judgment in regard to handling of the "operators." It speaks well for an office, no matter what the size, when a man can say, "They have the best men to work under there I ever saw." Take an office of this kind, and the changes that occur are very few, but I defy any one to say it of Chicago. Every one is discontented, not alone that they make no effort to remedy it, but say, "if you don't like it, leave." It is their prerogative to do this, and what is the consequence? They cannot get good men to stay here. Of course they have good men here, but how long do they stay?

Passing on to another matter, "The orders." I wonder if the executive in New York, or the General Supt. or Supt. of this district ever had the "temerity" while inspecting the office, to read them. If so, they would derive a great deal of benefit, more so than the employes. It would be folly to tell what these orders are, for they would be of no benefit to any one, and those who are in charge of other offices would only laugh at them as a good joke, and think how lucky they were in not having to issue any such under their management.

There is no denying the fact that operators as a class are a very shiftless set, but that should not debar them from having a little independence about them, and if they would show more of this spirit they would be better appreciated. The good old days of telegraphy are past, and the business is being managed by a set of men whose souls are like a sheep's tail in the crotch of an apple tree.

BEESSWAX.

Charitable and Creditable.

On Thursday of last week the expense of the excursion of the series which have been continued through the summer, under the management of Rev. Alvah Wiswall, of St. John's Guild, for the benefit of the poor sick women and children of this city, was defrayed by the contributions of the officials and employes of the Western Union Telegraph Company. Several hundred of this class participated in the excursion, which was in every respect a success.

All the officials and employes, from the President down to the messengers, contributed to the fund collected for this good work.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, SEPTEMBER 18, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

A Special Premium for Subscriptions to "The Telegrapher."

THE summer season is about over, and we expect that the friends of THE TELEGRAPHER will now renew their efforts to increase its list of subscribers. The subscription list has been very well sustained during the summer, but as the days of vacations and excursions are over, we look for the usual increase of interest in the only truly independent telegraphic journal published.

It has been our custom for years past to share with those who kindly interest themselves in obtaining subscriptions by offering valuable premiums.

We propose this season to excel our former liberality in this direction. We desire to offer something of real and permanent value. We have accordingly made arrangements by which we are enabled to offer to the person obtaining 60 subscribers for one year, at the regular subscription price, \$2 per year, or their equivalent in shorter subscriptions, a

No. 1 WEED SEWING MACHINE;
for 65 subscribers a

No. 2 WEED SEWING MACHINE,
and for 70 subscribers a

No. 3 WEED SEWING MACHINE.

The price of these machines is respectively \$60, \$65 and \$70.

The machines will be boxed and shipped without extra charge.

This affords an excellent opportunity for female telegraphers, or for telegraphers who have wives or relatives that need these exceedingly useful machines which are in every respect first class, to obtain them at comparatively little trouble or expense.

Send in subscriptions as obtained, and they will be credited until the necessary number to entitle the sender to the desired premium is obtained.

To prevent disappointment, should any canvasser eventually fail to obtain the requisite number for a machine, they will be allowed other premiums proportionate with the amount collected, or, if preferred, 20 per cent. in cash on such amount. To whom shall we send the first machine?

Insular Egotism.

At the annual meeting of the British Association for the Advancement of Science, held at Bristol, on the 25th of August last, Sir JOHN HAWKSHAW, F. R. S., the newly elected President of the Association, as usual, delivered an address. In the course of this address he took occasion to review the history of the invention and progress of the electric telegraph. This portion of his speech is as perfect a specimen of the insular egotism for which his countrymen are noted as we have seen for some time. He completely ignores, in this connection, the discoveries and inventions made by Americans, merely incidentally referring, in a foot note, to the date of the first patent of Prof. MORSE, issued in October, 1837. With this exception no mention is made of any American, and so far as can be learned from his address, nothing has ever been done in this country for the development of electrical science or of the telegraph.

In view of the fact that the first practical telegraph line of any extent was built and operated in this country by Mr. HARRISON GRAY DYAR, in 1826, on Long Island, in this State, over which despatches were actually transmitted, and that most of the more important telegraphic inventions and improvements have been made here, and by Americans, this omission is discreditable either to the speaker's fairness or to his intelligence. While we have no disposition to withhold from the many eminent electricians and telegraphic inventors of great Britain the credit which is due them, we are certainly not willing to allow such a slight as that which President HAWKSHAW has shown to go unnoticed or unrebuked.

It is in this country that most of the useful improvements and new adaptations of the telegraph have been made, and these have been gradually adopted in Europe until most of their telegraphs are worked upon American systems.

The comparatively slow and inefficient needle telegraph of WILLIAM FOTHERGILL COOKE, not "WHEATSTONE and COOKE," as President HAWKSHAW has it, has been generally superseded, even in England, by the MORSE system, and this is supplemented to some extent by the printing telegraph of Prof. HUGHES, an American, which is also very extensively used on the continent of Europe. The duplex system of Mr. STEARNS, an American, is also being generally adopted on the English and Continental lines. The automatic system of Prof. WHEATSTONE, which is highly praised, is known to be as much behind the American automatic system of Mr. LITTLE, in successful operation in this country, as is the needle telegraph behind the Morse and printing telegraphs. The fire alarm telegraph system is the invention of Messrs. FARMER and CHANNING, both Americans; the quadruplex has been made practical by Americans; all the printing telegraph instruments which have proved of any value are the exclusive inventions of Americans; the quotation telegraph systems; the automatic fire telegraph system, by which instant notice is given of the commencement of fires, which has proved of great importance and value, is the invention of an American; the district telegraph system, by which messengers can be summoned, policemen called, etc., has been invented and perfected by Americans; and the harmonic electric system, by which not merely four, but there is every reason to believe at least sixteen communications can be simultaneously transmitted through a single wire, is the invention of Mr. ELISHA GRAY, of Chicago, also an American.

Some of the first electricians of the world are also

Americans. Prof. HENRY, of the Smithsonian Institute at Washington, an American, invented the intensity electro-magnet, by which the transmission of telegraphic signals on long circuits became practicable. Messrs. FARMER, CHANNING, HOUSE, PAGE, the latter the inventor of the so-called RUHMKORFF coil, and many others eminent for ability as electricians, are Americans; but these are all coolly ignored by the orator, who has never heard of any achievements in electrical science except those of certain British scientists whom he names, save by a few Germans, to whom he grudgingly accords some small credit.

In no other country has telegraphy acquired such perfection in actual use or been so universally adopted and used by the people as in the United States and Canadas. More actual business is transmitted daily on a single circuit by two operators in this country than by four operators on two circuits on the English lines. Business is dribbled over the English lines slowly by means of needle telegraphs or by Morse registers, the use of which is universal there but exceptional here; and the automatic telegraph of WHEATSTONE gives a speed of seventy to eighty words per minute in actual business against 1,200 to 1,500 words per minute by the American automatic system. Only in cable telegraphy can any practical superiority be shown on the part of British electricians and telegraphers, and this arises from the fact that in the United States we have had no long submarine cables to operate. We consider it quite probable, however, that if the speed of transmission is hereafter materially increased over such lines it will be through American inventions, and had the cable telegraphs of the world centered in New York, as they have in London, we believe that our electricians would, before this time, have devised some method of transmitting through long submarine cables more than seventeen words per minute.

Atlantic Telegraph Competition Inaugurated.— Great Reduction of Rates.

ON Thursday, the 15th inst., the Direct Cable was opened to public business, and for the first time in several years competition in Atlantic telegraphy has been established. We stated in the last number of THE TELEGRAPHER the date at which the new line would probably commence to take business, although it had not then been fully decided upon.

We understand that the new line is being liberally patronized, and has been fully occupied with business almost from the first hour its facilities were offered to the public. The cable and the lines connecting with it from London to Ballinskelleg Bay, in Ireland, and from Rye Beach, N. H., to New York, are all in the best order, and working as well as was expected or could be desired. The insulation of the cable is perfect since the fault was cut out and new cable substituted by the Faraday.

It has been stated by some of the daily newspapers in this city and elsewhere that messages were transmitted by this line direct from London to the office in this city, which is at No. 16 Broad street, and vice versa, inferentially without repetition. This is not exactly correct. Messages from London are sent first to the cable station at Ballinskelleg Bay, they are then repeated to Tor Bay, in Ireland, and from thence to Rye Beach, from whence they are sent to this city. The Direct Cable Company lease from the Franklin Telegraph Company two wires from Rye Beach to this city, and from the British post-office wires from London to Ballinskelleg Bay, Ireland, so that the whole system is worked by their own employes. In this city the Cable Company connect with the Atlantic and Pacific and the Southern and Atlantic Telegraph Companies, and through the Atlantic and Pacific with other lines competing with the Western Union.

The Anglo-American Telegraph Company anticipated the competition of the new company by the announcement of a further reduction of rates to one

shilling, English, or twenty-five cents per word, gold, which went into operation on the 15th inst.

Instructions have been issued to the Atlantic and Pacific and Franklin offices in Maryland, District of Columbia, Delaware, Pennsylvania, New Jersey, New York, and the New England States, to take cable messages at the following rates:

To Great Britain and Ireland, 25 cents, gold, per word—everything being counted except the name of place from.

Beyond Great Britain and Ireland the charge, in addition to the above rate, is as follows, for 20 words or fraction thereof, everything being counted, including the name of place from, for the following countries, is,

France.....	\$0 84	Alsace and Lorraine.	} \$1.50
Holland.....	0.94	Austria.....	
North Germany.	1.10	Baden.....	
Denmark.....	1.25	Bavaria.....	
		Wurtemberg.....	

The Western Union Telegraph Company announce the following reduction of rates:

	For each word.	
	IN GOLD.	
From Nova Scotia, New Brunswick, the New England States, New York, New Jersey, Pennsylvania, Delaware, Maryland, and District of Columbia.....	25 cents.	
From all points in Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan, and Wisconsin, from St. Louis, Mo., and from Western Union Company's offices in Florida.....	35 cents.	
From all points in Texas, Arkansas, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Minnesota, Colorado, Dakota, Wyoming, New Mexico, Utah, Idaho, Montana, Nevada, California, Arizona, Oregon, and Washington Territory.....	50 cents.	
British Columbia.....	60 cents.	

The name of the place at which messages for the Atlantic cable originates will in all cases be transmitted without charge.

Those who have been so persistently demanding cheap ocean telegraphy ought to be satisfied with these rates. The reduction from \$10 gold per word, in 1866, to 25 cts. gold per word in 1875, can scarcely be paralleled in telegraphic history. It remains to be seen whether sufficient business can be done over the cables to make them pay operating expenses and maintenance at this price. We do not believe that there can be, and so far as we are informed, no one connected with either company anticipates any profit to the stockholders. Undoubtedly the charge will have to be advanced eventually to at least fifty cents per word, and not improbably still higher, unless some means can be devised to greatly increase the capacity of the cables for transmission.

In the meantime the cable telegraph business will be greatly stimulated, and the public may profit by the low prices while they last.

Messages for the Direct Cable are received in this city at the office of the company, No. 16 Broad street, and at the offices of the Atlantic and Pacific Company.

The Harmonic-Electric Telegraph.

THE Harmonic-Electric Telegraph invention (now commonly known as the Telephone) of Mr. ELISHA GRAY, of Cleveland, is undoubtedly destined to prove a very useful and important one. On Friday of last week we saw four despatches transmitted simultaneously from Boston to this city, on one of the Western Union wires, as rapidly and distinctly as though sent on separate wires. It is believed, and with good reason, that at least sixteen messages can by this invention be transmitted simultaneously over a single wire, and with more ease and rapidity than by the much vaunted and oft sold quadruplex of the great professor of duplicity and quadruplicity. In fact, the quadruplex will be superseded by this invention. It has another

advantage over the quadruplex in that the messages can all be sent in one direction or in any proportion that the requirements of business may render desirable. Mr. GRAY has made a discovery and invention which will be likely eventually to revolutionize the present Morse telegraph system.

The Electric.

THIS sprightly little telegraphic journal is meeting with much approval among the telegraphic fraternity, especially in the section where it is published. It has been conducted in a gentlemanly and courteous spirit by Messrs. HAYES and MOXON, its publishers and editors.

We cheerfully call attention to the advertisement of the paper, which will be found in our advertising columns, and hope it will meet with generous support.

Worthy of Attention.

THE new advertisement of Mr. A. B. LYMAN, of Cleveland, Ohio, which will be found on our second advertising page, is worthy of attention. His prices are very reasonable, and the instruments and supplies furnished by him are of good quality. Those who may have occasion to purchase will do well to communicate with him, and favor him with their orders.

Personals.

MR. JOHN F. MILLS, train despatcher at Crestline, Ohio, on the Pittsburg, Fort Wayne and Chicago road, died at Crestline, September 4, from an overdose of morphine, taken to allay the pain of an acute attack of asthma from which he was suffering.

MR. R. E. FARRINGTON has been appointed Superintendent of Telegraph of the Atchison, Topeka and Santa Fe Railroad, in place of Mr. JAMES W. STACEY, resigned.

MR. W. E. SMITH has resigned the position of manager of Los Angeles, Cal., Atlantic and Pacific office, and goes to Prescott, Arizona Territory, to engage in mercantile business.

MR. JOHN CASSELMAN has been appointed night manager of the Los Angeles, Cal., office of the Atlantic and Pacific Company.

MR. F. A. TRABANT, formerly of the New Haven, Conn., Western Union office, has been appointed assistant day operator of the Los Angeles, Cal., Atlantic and Pacific office.

MR. R. F. WEISS has been appointed assistant operator, nights, of the Los Angeles, Cal., Atlantic and Pacific office.

MR. J. S. WILLIAMS, manager Union Depot office, East St. Louis, Ill., has resigned, and accepted a position on the night force of the St. Louis, Mo., Western Union office.

MR. C. H. WHITE, for the past two years night report man at Kansas City, Mo., Western Union office, has resigned, and goes to San Francisco, Cal.

MR. GEORGE MILLAR, of Toronto, Canada, has accepted a position with the Western Union Company at Omaha, Neb.

MR. HARRY BIRD, of Adrian, Mich., has returned to his first love and accepted a position with the O. & M. Company at Vincennes, Ind.

MR. J. H. SHRYOCK, manager of the Los Animas, Colorado, Western Union office, has resigned, and accepted a position with the same company at Kansas City, Mo.

MR. WALTER S. PIERSON, of the Denver, Colorado, Western Union office, has resigned, and retires from the telegraph business.

MR. JAMES C. DELONG, the bird of passage, has been transferred from the St. Louis, Mo., to the Denver, Colorado, Western Union office.

MR. SEP. STAUNSFER, of Montgomery, Ala., has accepted a position with the Western Union Co. at North Vernon, Indiana.

The present address of Mr. JOHN G. POLLOCK, telegraph operator, is wanted. Any reader of THE TELEGRAPHER who may know his address will confer a favor by answering through its columns, as some of his friends are very desirous of learning his whereabouts, having lost track of him.

MR. JAMES STARK, of Vincennes, Ind., has been transferred to the O. & M. R. R. transfer office at St. Louis, Mo.

MR. C. C. POFSONBY, Supt. of Telegraph, Central Branch U. P. R. R., Atchison, Kansas, has resigned, and accepted a position in the freight office of the Atchison and Nebraska Railway, same city.

MR. W. A. JOHNSON has been appointed Supt. of Telegraph, Central Branch, U. P. R. R., at Atchison, Kansas.

MR. J. W. HAIGHT, late of the Atlantic & Pacific Co. at Cincinnati, Ohio, has accepted a position with the Western Union Co. at Omaha, Neb.

MR. GEORGE W. WHELOCK, of Newport, R. I., and more recently of Saratoga, N. Y., office, has been appointed manager of the Parker House, Boston, Mass., Western Union office, vice Mr. COVEY, resigned. Mr. Wheelock's gentlemanly deportment, with his abilities as an operator, will make him a popular and efficient manager of this important office.

MR. HARRY J. NICHOLS, a well known operator in the West and South, has been appointed to a position in the Galveston, Texas, W. U. office.

MR. JOHN WILKIE, who has been waiting for something to turn up, in New Orleans, has secured a position as night operator at Canton, Miss.

By Cable.

DEFALCATION OF THE SECRETARY OF HOOPER'S TELEGRAPH WORKS.

LONDON, Sept. 11.—The *Times*, in its financial article this morning, has the following paragraph: "The defalcations of the Secretary of Hooper's Telegraphic Works, which were announced yesterday, consist in the forging and negotiation of a bill for \$35,000. This appears to have brought matters to a crisis. We believe an appeal will be at once made to the shareholders, there being no more capital to call up."

Western Union Quarterly Dividend and Annual Meeting.

AT a meeting of the Directors of the Western Union Telegraph Company held on Friday, Sept. 10, a dividend of two per cent. on the shares of the Company, for the quarter ending the 30th inst., was declared, payable Oct. 13th.

The annual meeting of the company will be held at the executive offices in this city on the 13th of October. The transfer books will close on the 20th inst., and will not be reopened until Oct. 15th.

Extension of the Atlantic and Pacific Lines.

THE Atlantic and Pacific Telegraph Company, in addition to the new lines previously under way, have commenced the construction of a line from Pittsburg, Pa., to Columbus, Ohio, some 200 miles in length. At Columbus it will connect with the existing lines of the company. This will complete the new route from Philadelphia via Pittsburg.

The new line will be built by the turnpike route, and will be pushed forward energetically, and is expected to be finished before cold weather sets in, as construction parties are working from each end. The material for the line has already been purchased.

New York City Telegraphic Notes.

IT occasionally happens that, by an unusual influx of business, the Phelps combination printing instruments are called upon to exert themselves to their full capacity of transmission. Monday, the 13th inst., was the date of such an occasion, when the four printing circuits, two to Boston and two to Philadelphia, sent and received, up to 5.30 P. M., 1858 messages, with a reserve appetite rapacious for more. The greater part of the work was done between the hours of eleven and three, the supply of messages not being sufficient to keep the instruments employed throughout the entire day.

Perhaps the most interesting feature of the performance was the sending by Mr. Fallon of 199 messages in two consecutive hours.

Foreign Telegraphic Notes.

MESSRS. MORTON ROSE & Co., of London, announce the payment on the 1st of September of the interest due on the 6 per cent. bonds of the Western Union Telegraph Co.

Mr. F. J. Scudamore, C. B., whose retirement from the office of Secretary to the Post-office of the United Kingdom, and management of the postal telegraphs, was recently announced, has ceased his duties, and shortly leaves for the East. A handsome testimonial—a purse of four hundred guineas—was presented to him by his brother officers. His vacancy as Secretary to the Post-office will not be filled.

Mr. F. E. Baines, well known to all telegraphists, Mr. Scudamore's chief assistant, has been appointed "Surveyor General for Telegraphs." Mr. C. H. B. Parry succeeds Mr. Baines as principal clerk of the telegraph branch.

The cable between Dartmouth and Guernsey has been repaired, and communication with the Channel Islands is now restored. It was found necessary to use a large amount of entirely new cable.

A new cable is now being manufactured at the Silvertown Works for the Isle of Man, and it is expected communication will be reopened in the early part of this month. The original cable, which was laid in 1859, was found to be so deteriorated that a complete renewal was necessary.

The manufacture of the New Zealand cable has been commenced at the works of the Telegraph Construction Company.

Telegraphic and Electrical Brevities.

Mr. STANFORD, an operator in the Boston, Mass., Western Union office, on Monday sent eighty-seven messages to Portland, Maine, in one hour, beating the best time yet made. They were received by Mr. Rand, of the Portland office. The feat will be better appreciated when it is known that the messages had to be translated instantly from the telegraphic alphabet, and written out in full at the rate of forty-two words per minute.—Boston Daily Advertiser.

The Military Telegraph Line from Brownsville, Texas, up the Rio Grande, has been completed, and is open for business as far as Rio Grande City, Texas. The construction party were frequently harassed by Mexican marauders.

A New Commissioner of Patents.

THE President has appointed Hon. R. Holland Duell, of Cortland Village, New York, Commissioner of Patents, vice Thatcher, resigned. The new commissioner entered upon the duties of his office on the 1st instant.

According to a recent estimate there are now 50,000 miles of submarine telegraph cables in working order, and 20,000 miles (belonging to 58 different cables) that are useless.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS.

NEW YORK, September 11, 1875.

ASSESSMENT No. 78.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Aug. 10, 1875, and bearing that date.

166,527.—ELECTRO-MAGNETIC ENGINES. C. A. Hussey, New York, N. Y. [Filed May 15, 1875.]

- 1. In electro-magnetic engines, the stationary magnets having radial arms with T shaped ends, being arranged in alternating position, so that the pole ends of one face the intermediate space between the pole ends of the other, for the purpose set forth.
2. The other stationary magnets having widening pole ends of T shape at right angles to the arms, substantially as described.
3. The central revolving magnet provided with widening pole ends of double T shape at right angles to the radial arms of the same, as set forth.
4. The stationary and revolving magnets having radial arms and widening pole ends whose face width is somewhat larger than the distance between two adjoining pole extremities, so as to lap on the pole ends across the intermediate space, substantially as described.

166,557.—ELECTRIC RAILWAY SIGNALS.—David Rousseau, New York, N. Y., assignor, by mesne assignments, to William F. Smith and Samuel Samuels, same place. [Filed July 21, 1875.]

- 1. The combined index and clapper E, arranged between two gongs or sounders, F and G, substantially as and for the purpose herein shown and described.
2. The lever H, pivoted to the index clapper E, and combined with the armature lever, to transmit the motion of the armature to the index clapper, substantially as herein shown and described.
3. The pins or projections h and i, applied to the vibrating index clapper E, and combined with the springs j and k, substantially as herein shown and described.
4. The annunciator I, combined with the vibrating index clapper E, and with the gongs or sounders F G, substantially as herein shown and described.
5. In combination with the vibrating index clapper E, the insulated plate J and conductor prongs or springs r s u v, etc., substantially as herein shown and described.

166,558.—CIRCUIT CLOSERS FOR RAILROAD SIGNALS.—David Rousseau, New York, N. Y., assignor, by mesne assignments, to William F. Smith and Samuel Samuels, same place. [Filed July 21, 1875.]

- 1. The combination of the tube H, formed on the circuit closer, with the inner rings or plates h i, and with the sliding sleeve or plate L, substantially as described.
2. The rod I, placed within the cushion C, and through the rings i h, and combined with the sleeve l and plate B, substantially as and for the purpose specified.

- 3. The cushion C, flanged on top and bottom, and combined with the plates B and D, and screw rings E and G, substantially as set forth.
4. The conductor Fb, carrying the plate g, combined with the conductor Fa, carrying the plate p, and with the cushion r and screw s, substantially as and for the purpose specified.
5. The combination of the upper and lower movable plate h i with the intermediate plate or sleeve l, which is capable of motion, all arranged to constitute a circuit closer, substantially as specified.

166,559.—ELECTRIC RAILWAY SIGNAL.—David Rousseau, New York, N. Y., assignor, by mesne assignments, to William F. Smith and Samuel Samuels, same place. [Filed July 21, 1875.]

- Improvement on his patent No. 141,387.
1. The trigger f, pivoted to the armature lever F, and combined with the lug a, that projects from said armature lever, substantially as and for the purposes shown and described.
2. The projecting hook w, attached to the armature lever F, in combination with the projecting stop x on the arm b of the signal, substantially as and for the purpose specified.
3. The friction rollers u v, combined with the projecting arms g h of the signal shaft, and with the springs p q r s a, etc., substantially as and for the purpose specified.
4. The slide H, carrying the slotted arm y, and combined with the rope E, which has the knot z for the purpose of raising said slide, as specified.

166,606.—ELECTRO-PLATING GLASS, CHINA, ETC.—Eilev Hansen, Copenhagen, Denmark. [Filed Jan. 9, 1875.]

The herein described process of forming a metallic covering on glass and like substances, consisting in first painting the surface with a solution containing sulphur, then baking or burning the article to drive off the sulphur and other volatiles, and to fix the metallic base thereon, and finally making a deposit by the electro-chemical process, all substantially as specified.

166,616.—ELECTRIC TRAIN TELEGRAPHS.—H. C. Keyes and J. P. Clark, Philadelphia, Pa. [Filed June 9, 1875.]

- 1. In an electric signal apparatus for railway trains consisting of an open metallic circuit, two wires and an interrupting bell magnet, the plate B, with post C, in combination with the arm a and link E, and with the eye F of the insulating cord, substantially as and for the purpose set forth.
2. In an electric signal apparatus for railway trains consisting of an open metallic circuit, two wires and an interrupting bell magnet, the hinged arm H and spring J, in combination with the plate f e, and with the eye G of the insulating cord.
3. In an electric signal apparatus for railway trains having an open metallic circuit, which, when the train is ruptured, will be closed, the hinged arm H, with point L, in combination with the plate B with point L', substantially as and for the purpose set forth.
4. The eye F of the insulating cord c, in combination with the link E and spring b, substantially as and for the purpose set forth.

Married.

KNOX—STEVENS.—At No. 22 Aberdeen street, Chicago, Ill., August 26, 1875, by the Rev. Dr. Charles H. Fowler, of Evanston, Mr. THOMAS R. KNOX, of the Western Union Telegraph office, to Miss M. ISADOR STEVENS, of Washington, D. C. California and Washington papers please copy.

TO ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystalzes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

- No. 1 Cell, \$5.00.
No. 2 " " 10.00.

FOR SALE.—CEDAR TELEGRAPH POLES.

In lengths of twenty-five, thirty, thirty-five, and forty feet; five to six inches at small end, and bark peeled off. In car loads or by vessel loads, delivered at any of the lake ports between Oswego and Chicago as may be agreed upon. Thirty-feet poles for fire alarm telegraph a specialty.

Address A. A. COLBY, Toronto, ONTARIO, Canada.

LANNERT & DECKER

will not be undersold by any firm competing in price or quality.

PONY RELAY, PRICE \$5.63.

A reduction of 25 per cent. from our former prices on all Relays and Main Line Sounders.

	Former Price.	Red. Price.
No. 1 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	\$15 00	\$11 25
No. 2 Relay, a superior d'ble adj. inst., and standard res., and finely finished.....	14 00	10 50
Pony Relay, a superior inst. for lines of 15 miles or less. See above Cut.....	7 50	5 63
No. 1 Main Line Sounder, d'ble adj., finely finished, standard resistance.....	16 00	12 00
Fifteen per cent. from our former low prices on keys.		
No. 1 Key, improved standard size, heavy platinum, finely finished.....	4 00	3 40
No. 2 Key, improved standard size, heavy platinum, iron base.....	2 75	2 34
Ten per cent. discount from our former very low priced Local Sounders.		
Acme Local, No. 1, large and loud, works well with one cell local.....	5 00	4 50
Acme Local, No. 2, small size, round base, one cell local sufficient.....	4 75	4 28

ELECTRICAL BELLS

of various styles and sizes at a reduction of 25 per cent. from former prices.

No. 1 Alarm Bell, 3 1/4 inches in diameter (see cut), works well with one cell local; single stroke or continuous ringing, as desired, changed by lever; thumb-screws with check nuts, for adjusting spring and stroke, large and hard platinum connections; binding posts for holding wires; Bell finely polished, and base extra ornamented. Former price, \$4 50; reduced price, \$3 38.

No. 2 Alarm Bell, without binding posts, and cheaper finish, but working equally as well. Former price, \$3 50; reduced price, \$2 63.

All other standard improved instruments proportionately as cheap. Also, Batteries, Supplies, Chemicals, &c., at lowest rates.

PRICE REDUCED!!

THE POCKET GALVANOMETER,

finely finished and Nickel Plated, will be sent by mail, to any address in the United States, on receipt of one dollar (\$1 00). Canada, 10 cents extra to pay postage. Send for Circular.

X-L-C-R.

20% discount from former price.

The X-L-C-R outfit for learners consists of instrument finely finished, levers, binding posts, thumb screws, &c., of brass, finely polished, platinum points; one cell Callaud battery, Manual, office wire, chemicals, &c. Price, \$5.44.

Until further notice, when desired, instruments of our own make will be sent to responsible parties C. O. D., with instructions to the express agent to show instruments before receiving pay, and if not satisfactory they can be returned at our expense. Other goods will be sent C. O. D. as usual, or on receipt of money order, registered letter, or draft on N. Y.

Price List and Circular of other Instruments, Batteries, Supplies, Chemicals, &c., sent on application. All orders will receive prompt and careful attention, consigned to

LANNERT & DECKER,
CLEVELAND Ohio.

THE POCKET GALVANOMETER.

PRICE REDUCED.

The Pocket Galvanometer manufactured by LANNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to

New York City,	

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,

RELIABILITY and

ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE.

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPHONE BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single DANIELL cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made.

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

VOL. XI. WHOLE No. 480.

Original Articles.

Smith's System of Duplex Telegraphy.

THE well known arrangement of circuits which was originally devised by Poggendorff for the comparison of electro-motive forces, and first described in his *Annalen*, vol. 54, page 161, has been ingeniously applied by Mr. Gerrit Smith, the Assistant Electrician of the Western Union Telegraph Company, to an improved system of duplex telegraphy. A set of apparatus upon this principle has been for some time in successful operation upon the circuit from New York to Buffalo *via* Albany, a distance by the line of 450 miles, and on a circuit of this length its operation is said to have been more satisfactory than that of any of the methods hitherto in use.

To those not familiar with Poggendorff's method of comparing electro-motive forces, a few words of explanation will be required. Fig. 1 represents the arrangement of circuits employed. Suppose E is the battery whose electro-motive force is to be measured, and E₁ is a standard battery whose electro-motive force is known. R and L are known resistances; L being greater than R. The currents of both batteries will obviously go in the same direction through the resistance L, which is then adjusted until no current passes through the galvanometer M. The electro-motive force of E is then found by the formula

$$E = E_1 \frac{L + R}{L} \quad (1)$$

in which the internal resistance of the battery E is included in R.

It is obvious that it is entirely immaterial whether the resistance of the battery E₁ or of the galvanometer M is greater or smaller, as it does not affect the balance of the system.

On the other hand, if the electro-motive forces of both E and E₁ are known, together with the resistance of L, it is easy to determine the resistance required in R to balance the needle. The formula in this case is

$$R = \frac{E L}{E_1} - L \quad (2)$$

The resistance of the battery E is included in R as before, and must be deducted therefrom to arrive at the rheostat resistance required.

In applying this arrangement of circuit to the duplex telegraph, Mr. Smith puts the line in place of the resistance L, a relay in place of the galvanometer M, and arranges both batteries E and E₁ so that they are simultaneously inserted into and withdrawn from their respective circuits, without interrupting the continuity of these circuits. This will be understood by reference to fig. 2, in which the corresponding parts are lettered as in fig. 1. A transmitter T, which may be operated in the customary manner by a local magnet, battery and key K, is provided with two insulated spring contacts s and s¹, which, when the key K is depressed, connect the batteries E and E₁ to the line through the wires 1, 2 and 3, 4, respectively. The receiving relay M is placed in the wire 4, between the battery E₁ and the line, and the rheostat R in the wire 2, between the battery E and the line. If, therefore, the resistance of the line is represented by L, and the battery E is greater than the battery E₁, the resistance R can be so adjusted that no current will pass through the relay M, even when both batteries are simultaneously connected to the line by the movement of the transmitter T. For example, suppose the battery E to consist of 175 cells, having an internal resistance of 350 ohms, and the battery E₁ of 125 similar cells. On a circuit like that from New York to Buffalo the resistance in good weather is not far from 6300 ohms. The resistance required in R to effect a balance would therefore be as follows: Suppose

$$L = 6300, \quad E = 175, \quad E_1 = 125,$$

substituting these values in formula (2) gives us

$$R = \frac{E L}{E_1} - L = \frac{175 \times 6300}{125} - 6300 = 2520$$

From which we deduct 350, the internal resistance of E, leaving a remainder of 2170 ohms, the resistance required in R to balance the line. Any variation in the resistance of the line from time to time is easily compensated for by a corresponding alteration in R, which should be increased as L decreases, in order to maintain the balance in M. The amount of current C, going out over the line in this arrangement, will be represented by the equation

$$C = \frac{E}{R + L}$$

and is, of course, entirely irrespective of the resistance of the receiving instrument M. This instrument may therefore be made of any sized wire or number of convolutions which produces the best effect with the current from the distant station. The relay which has been used in the circuit referred to has a resistance of about 300 ohms. In this case the resistance opposed to the incoming current will be the joint resistance of R and M, and of the batteries in their respective circuits

$$\frac{2520 \times 550}{2520 + 550} = 379$$

ohms. The incoming current will divide between the

FIG. 1.

receiving instrument M and the resistance R in the proportion of 2520 to 550, so that the former gets nearly four fifths of the arriving current. When the key K is up the transmitter T is in the position shown in the diagram, both batteries being out of circuit. The arriving current then finds its way to the earth through the wire 5 and spark-coil r, the resistance of which should be equal to the joint internal resistance of batteries E and E₁.

So far as the operation of the duplex principle itself is concerned, nothing but an ordinary relay is needed at M, but Mr. Smith has found that in order to effectually compensate for the effects of the inductive discharge from the line after each signal, it is preferable to make use of

FIG. 2.

a differential relay wound with two equal wires, as shown in the figure. One of these is used for the working current and the other is connected in the circuit of the wire 6, which is attached to the main wire between the battery E and the rheostat R, and leads to one side of a condenser C, the other side of which is to the earth. When the current goes out to line the condenser is charged; when the return charge comes back from the line it passes through one wire of the relay M, and at the same instant the condenser discharges itself in the opposite direction through the other wire of the relay, and consequently the latter is not affected.

It is not absolutely necessary to use the continuity preserving transmitter, as shown in the diagram, as the same effect could be produced by keeping the batteries E and E₁ short circuited, when the key K is open, and breaking these short circuits by the depression of the key, thus allowing the current of both batteries to go to line.

Incidentally it may be mentioned that this arrangement also served to indicate the resistance of the line L. The resistance of E and of R, together with the electro-motive force of E and E₁ being known, the following equation gives the line resistance:

$$L = \frac{R E_1}{E - E_1} \quad (3)$$

Like all other systems of duplex telegraphy, it makes no difference theoretically whether the batteries at opposite ends of the line are arranged with like or unlike poles

towards each other. In practice it would probably be better to arrange them with unlike poles, in order to avoid the injurious effects of reversed currents upon the batteries.

The duplex system above described was patented by Mr. Smith on the 6th of July, 1875.

"Oh, That Ale!"

THEY called him "Towser," and he was making frantic efforts to get up a reputation for never breaking. One day as he was passing a certain desk he heard a call, and gracefully vaulted on to a high office stool to answer it. This is how he copied the message:

"To John Brown, wholesale druggist.—Please send per express one barrel bottled ale immediately. Seaton Bros."

Bottled ale was not in Mr. Brown's line of business, but Seaton Bros. were old customers of his, and so, willing to oblige them, he procured the ale and forwarded it without delay. Next day, in return for his kindness, they sent him the following message:

"To John Brown.—What do you mean by sending us ale? We refuse it. Hurry up our oil. Seaton Bros."

Surprised and indignant at their apparent ingratitude, he hastened to the office and wrathfully exclaimed: "What in thunder is the meaning of this? There's been a lovely blunder made somewhere! Get that message repeated quick!"

So they got it repeated, and it turned out that it was a barrel of *boiled oil* Seaton Bros. wanted, instead of bottled ale. When this was explained to Mr. Brown—they broke it to him as gently as possible—he did not fly into a rage with the long suffering manager, as they expected him to do. He merely remarked: "That operator must be pretty fond of ale when he takes to dragging it into messages so promiscuous like. However," he added grimly, "he shall have his fill of it for once, for he's got to take that barrel and pay for it, too. Yes, sir, pay for it!" he repeated, with savage emphasis.

So it came to pass that Towser found himself the happy possessor of a barrel of beer, and in consequence became the hero of the hour among those of the staff who worshipped Bacchus. But he did not seem to enjoy the honor much, and in response to the boys' oft repeated entreaties to "bring forth that bottled ale," he invariably growled out something that sounded like—well, not exactly a benediction, and since then he has given up the ambitious notion of becoming a second Bismarck.

Be Careful of Your Lightning Rods.

A FEW days since an inspector in the private line service of the Gold and Stock Telegraph Company in Chicago discovered a fault upon one of his lines. The fault seemed to be a cross with another private line. A repairer failing to find the trouble, the inspector made another test, which located the fault between the instrument at one end of the line and the ground connection at that end. Upon examination, it was found that the line took ground from a lightning rod at one end of the building. At the other end of the building was another lightning rod, which furnished ground for another line terminating in the same building.

The trouble was readily explained. The rods were parts of a system of rods, and this system had not, all together, sufficient connection with the earth to carry the current offered by the lines; therefore a round circuit was formed by the lines, through which a portion of the current flowed.

The lightning rod agent explained the *low conductivity* of the rod by saying that the men putting on the tar roof had smeared the rod, *where it ran over the roof*, with tar. The only way to remedy the trouble, in his opinion, was to put on between five and six hundred feet of new rod.

The owner of the building, at last accounts, was taking the testimony of experts on the subject.

Magnetic Railway Locomotives.

In an arrangement lately devised by M. Burgin, the entire axle, with its wheels, is made into one electro-magnet. The wire is wound with increasing thickness from the middle towards the wheels in the case of external cranks, but uniformly in the case of internal. With coupled wheels the wire is so arranged that there is an alternation of poles, the piece of rails between two poles forming the armature. A locomotive model (without engine or boiler), having three pair of wheels and internal cranks, was placed on a line with 30 per cent. incline. Five Bunsen elements supplied the force, and a weight of 25 lbs., with cord, passed round the

axles. The machine weighed 18 lbs., and, with no current flowing, the wheels merely slid on the rails in position; but when the circuit was closed, the model ran up the incline. When the brake was applied (and weight detached) the model could be held on the steep incline if the current were passing; but if not, the wheels began to slide and the locomotive went downwards with increasing pace; but this descent was promptly stopped when the current was made to flow again.

A Cold Shake.—Chairs for Operators.—The Eastern Attraction for Knox.—The Chicago "Times" on the Atlantic and Pacific Company.—Holmes' Burglar Alarm Agency, etc.

CHICAGO, ILL., September 12.

TO THE EDITOR OF THE TELEGRAPHER.

THE telegraphers here think "Fatty" Gooding rather gave them the "cold shoulder" in going away out to Evanston, Wyoming, to practice law, and never even writing to one of them, although nearly six months have passed since his departure.

Your Albany, N. Y., correspondent, "Double Six," in his communication of the 24th ult., gives a telling home thrust at the kind of chairs generally used in operating rooms, and his remarks on the subject are very sensible and well timed. In a former article in this paper I had a few words to say on the same subject, and explained my ideas about the way the arms were placed on the chairs preventing operators from getting close enough to the table, so that they could rest their backs against the back of the chair; and also in regard to the way the chair was made to pitch, which was exactly the reverse of what it should be. The new management in both the Western Union and Atlantic and Pacific offices here, in purchasing new chairs, have corrected the matter of "pitching back," by getting chairs that are as near level on the seat as can be. Whether my suggestions had any weight I do not care to argue, but hope the ball in this matter will be kept rolling until the arms of the chair shall be arranged also in a sensible manner. The back of a chair can be made just as strong and secure with the arms reaching only from the rear to the middle of the seat as to come all the way front.

It is generally supposed that the climate of San Francisco is much better than Chicago or Washington, D. C., and when a person goes to the Pacific coast, gets well fixed in point of situation, etc., and then in a hasty manner leaves all and comes east again—especially the second time—it looks as if there was something more of an attraction than climatic or even monetary consideration. We have often wondered in this connection what brought Tommy Knox, of the Western Union day force, back to Chicago, but the announcement of his marriage to Miss M. Isador Stevens, of Washington, D. C., has explained satisfactorily the mystery. Mr. Knox and his beautiful and accomplished bride are now on their wedding tour; having visited Niagara Falls and other points of interest, they will visit some of the groom's relatives in the provinces, when they return to Chicago and settle down to the stern realities of life.

The Chicago *Times*, in its Sunday issue of the 20th ult., in speaking of the Major Block, southeast corner of La Salle and Madison streets, and the different banks, insurance companies, etc., which occupy the different rooms as their headquarters, mentions the Atlantic and Pacific Telegraph Company's office in flattering terms; and although quite an extended account of the location of the wires, officials, operators, etc., has been given recently in THE TELEGRAPHER, probably it will not be uninteresting to your readers to hear what the leading independent daily of Chicago has to say about it. It is as follows:

"ATLANTIC AND PACIFIC TELEGRAPH COMPANY.

"This is decidedly the most important interest that has its headquarters in this block. From this local point, as it were, its ramifications extend all through the country, or we might more properly say all over the world, as its pulse-beats are felt and bounded only within the compass of civilization. This is an important institution, and one whose influence upon commerce and commercial relations cannot be too highly appreciated, and although in the short space allotted for this article full and complete justice cannot be done its merits, yet a few words must be said in its favor. The lower office is situated in the corner, directly under the Bank of Montreal, and is

devoted exclusively to receiving and the delivery of messages.

"The book-keepers' rooms are on the fifth floor, as also are the battery and operating rooms, where may be seen, at any hour of the twenty-four, a large corps of experienced operators dealing out the forked lightning. On the fifth floor is also located the office of Mr. E. D. L. Sweet, the Vice-President, and Mr. J. N. Tower, the Superintendent.

"The wires of this company enter into a keen competition, at all leading points, with those of the Western Union. This company has just finished putting up a new line to Milwaukee, and another is in process of construction, which will be finished in a few days, from here to the village of Saint Louis. Another line has also just been completed from New York to Pittsburg, and is being rapidly pushed forward to Cincinnati and St. Louis, while other important extensions are in progress. The wires of this company reach from the Atlantic to the Pacific, from which fact it derives its name.

"To sum up, we may say that this company, for the efficient manner in which it conducts the business entrusted to it, as well as for its enterprise in the way of enlarging facilities, and building new lines, is entitled to much credit and great praise. As a sample of their progressiveness we may mention that they have introduced the automatic system between all principal points on their lines as far west as Omaha, and arrangements are being made for its introduction to the "far west" as fast as employes can be educated to its use. The wonderful improvements in the rapidity and precision of the telegraphic science that this invention has effected are incalculable. Between all automatic offices the increase in capacity over the Morse system is unlimited."

Mr. Edwin Spear, agent for Holmes' Burglar Alarm Telegraph, of whom a brief notice was badly "bulled" by your printer in a recent number of THE TELEGRAPHER, is also spoken of in the same issue as follows:

"HOLMES' BURGLAR ALARM TELEGRAPH.

"Mr. Edwin Spear, one of the first occupants of this block, is the agent for this ingenious contrivance, with his office in the basement of No. 141 La Salle street. This burglar alarm telegraph is no new and untried thing, but a machine of proved utility and character. Mr. Spear has been in this city for over eight years, during which period he has applied the alarm to hundreds of our best residences, and is now engaged putting it in many houses in process of construction in addition to those already built and occupied. In every case in which this invention has been tried it has proved a success; and during the past ten years experience has proved that in no case where it has been used, on house, bank, or store, has any burglary taken place. In fact it can be called a sure cure for burglars, and it will assure the inmates of a house to which it is applied from any fear or uncertainty about robbery or murder. The supplying of house and hotel annunciators, call-bells, etc., is also another important portion of Mr. Spear's business. The list of testimonials from institutions and private citizens who are using this burglar alarm telegraph is very long, and universally in its favor."

The telegraph repairer of to-day is so skilful in his movements that it rarely occurs that we have to record an accident to any of their number. The imminent danger they are hourly subjected to when at work was rather practically demonstrated on the 3d inst., by the seriously, if not fatally, injuring of one of Gilmartin's force of line men, named Isaac Hooper, at Stanwood, Mich. It seems the pole he had climbed where they were changing the wires broke while he was upon it, throwing him to the ground with such force as to injure his spine and hurt him internally. As he had to ride fifty miles to reach medical aid, his case was considered hopeless.

OCCASIONAL.

Fast Morse Telegraphers.—Mr. C. D. Stanford, the Champion Morse Transmitter.—Rumors of Removal of Boston Office.—A Birth, etc.

BOSTON, MASS., Sept. 22.

TO THE EDITOR OF THE TELEGRAPHER.

THE rivalry between Mr. C. D. Stanford and Mr. W. E. Kettles, of this office, has culminated in Mr. Stanford's accepting the latter's challenge, as published in THE TELEGRAPHER, and on the afternoon of Monday, the 20th instant, the trial took place, occasioning considerable excitement in telegraphic circles. The matter sent messages in the regular course of business, that had been sent to Portland in the early part of the day, averaging over ten words each in the body. Each operator sent for the space of one hour, Mr. D. E. Shaw, in Portland, doing the receiving. Mr. Stanford commenced sending at 1 o'clock P. M., and at the expiration of his hour was in the middle of his 106th message. Mr. Kettles started at

2.10 P. M., and at 3.10 P. M. stopped in his 102d message, Mr. Stanford thus winning a decided victory over his opponent and receiving the congratulations of his associates for the marvellous celerity of his sending. This remarkable feat, I think, is without a parallel in the history of Morse transmission, and with either of the contestants as the representative of Boston at the proposed centennial tournament, our interests will be well taken care of. It is proper to say that both gentlemen are very fine as well as rapid senders. In common with other telegraphers, I should like to see another trial of speed with solid printed matter, as it admits of no abbreviations, and, consequently, would give a more satisfactory result.

There are vague rumors afloat of a removal of the main office to a finer building in a more central location. It is whispered about that the late visit of Mr. Orton had some connection with a new telegraph building. Time alone will tell if there is anything in these rumors.

In the way of vital statistics I am pleased to record the birth of a 9½ lb. son to Mr. Frank T. Lemoine. Congratulations and so forth are in order.

We should like to hear from some of the fast senders in other parts of the country, claiming that, until satisfactorily disproven, the "Hub" has at least the two fastest Morse senders in the world. ARISTIDES.

A Disappointed Scribe.—Lively Telegraph Business.—Bulls.

ALBANY, N. Y., Sept. 21.

TO THE EDITOR OF THE TELEGRAPHER.

WE have been cruelly and shamefully disappointed. We expected to be able to furnish your readers with a first class sensation this week, but have been completely "slipped up" on it. Last Saturday evening, between nine and ten o'clock, we were sitting quietly under our own vine and fig tree, looking over the telegraphic literature of the week, when we heard an alarm of fire. Now, there is nothing so very unusual or interesting about that, but the fact of its coming from Station 9 was what gave it an unusual significance. Our head was out of the front window in about no time, and the sight which met our eyes sent us up on the roof with a rush which made our coat tails snap with unwonted vigor. Perched on the highest attainable point, regardless of soot, and turning our gaze eastward, like a true fire worshipper, a spectacle presented itself which filled your correspondent's heart with joy. From a point, as near as could be judged, about at the corner of Broadway and State street, arose a large volume of flame and smoke, carrying with it great clouds of sparks, and illuminating the whole neighborhood. Visions of a panic stricken night force, ruined switch, burning quads, and other calamities flashed through our mind, showing us *such* a chance for "copy" as was not to be lost. In the effort to catch a passing horse car we feel justified in saying that we made the fastest time on record—not even excepting that made by the famous "99" at Rochester this summer.

Arriving at the scene of the conflagration, we hurried down State street on the lookout for something startling, only to have our fond expectations dissipated as completely as were those of "Old Stox," when he bought Erie at 28 to sell at 50. The fire proved to be on the south side of State street, nearly a block from the Western Union office, hence, Mr. Editor, you see the "because why" of our present disappointed state of mind. We are not, however, entirely run ashore for items, but you see, of course, that what we *have* dwindles down to insignificance beside what we *expected* to send to you.

The amount of business done here this season has been largely in excess of that of any previous year. Even that well known individual, the oldest inhabitant, cannot remember another such continuous "roast" as we have had for the past few months. The boys are congratulating themselves on the prospect of having a "jotty dum" time for a couple months at least.

The doleful accounts of bad management, oppressive rules, etc., which we hear from Chicago and other cities, remind us of some of the good points which characterize the management of this office. Before we were installed in our new "apartments" there was considerable curiosity expressed as to the new rules which all expected would be put in force then, and be of the strictest kind. To the honor of the gentlemen who have charge of the Co.'s interests here, let me say, that not a single written rule of any kind has been bulletined.

The result has shown that their confidence was not misplaced, and that quite as good order can be maintained without rules as with them. Of course this system would not do in all offices, as it is a well established fact, that there is a class of operators whom it is necessary to keep in straight jackets, if we are to live with them at all, and the presence of this very class is what necessitates such orders as we have seen quoted in these columns. It's no use grumbling, boys, you might as well "grin and bear it;" you know we always have to suffer the consequences when we get caught in bad company.

Some of our artists have again been dealing in live stock, which they, no doubt, would be pleased to see in print, so here you have them.

"Regis Try Dept. N. Y. Post Office," is very easily made if you only "Try" hard enough.

"Piper Union" is the way it came on paper as sent by one of our "sudden" young men, original copy reading "Cooper Union." Still another by the same author; it came addressed to "J. J. Congen & Co., N. Y." New York reported couldn't find, and asked for better address, which was given in the shape of "J. J. Coneseo, N. Y. Stuffed club for one. DOUBLE SIX.

All About Stiffs.

NEW YORK, Aug. 31.

TO THE EDITOR OF THE TELEGRAPHIC.

"A STIFF! What is that?" asks some one unacquainted with the mysteries of the metropolis and the unique slang of the Gothamite telegraphic fraternity. By all means, my friends, do not go to a model New Yorker for information on this subject, or you will undoubtedly receive light in a way that you will not relish, and receive for an answer that "a stiff is a stiff, of course." Very lucid, isn't it? Well, it is the purpose of this paper to enlighten just such benighted heathen as you, my questioners, on this matter. A stiff is a joke, a hoax, and the more absurd and exaggerated it is the more it is worthy of the title. There are all kinds of stiffs. A "little stiff" is to attract some new man's attention by a cough, a clearing of the throat, or the exclamation "Say!" and then when he looks around to be vigorously declaiming to some friend near at hand. Another kind of "stiff" is to have a man answer on a wire that is cut in at the switch board, and get some expert to send him a heterogeneous mass of stuff, or perhaps a conglomeration of Bain and Continental. This is kept up, of course, until he "tumbles." You see those "stiffs" vary decidedly. Perhaps the most approved method now extant is to start some absurdity in the way of a supposititious bull, refer it to the next man for "investigation," be adding fuel to the flame, pastes on another blank; and so it goes the rounds until the incongruous mass of manuscript has assumed herculean proportions, made up of slang, "local gags," cartoons, "snide poetry," and what not. Now, gentlemen, is it not time to put a stop to this nonsense? Can't you quit being boys and try to be men? This sort of thing is too much like child's play; besides, it is cruel sport, which, like the old fable of the boys stoning the frogs, although fun for the thoughtless youths, is death to those who have to jump to get out of the way of your heartless shafts of very weak sarcasm. Now, I don't propose to be a champion for any one, but I appeal to you as men, as persons of sense, is it not about time you throw away this folly? Is it not about time for you to quit thus emulating village gossips? Is it not about time you stopped concocting absurd inventions for tormenting your fellow laborers? We will suppose the case of a young man who comes to you willing to be friendly and hail-fellow-well-met with you all, and just because he is a little self-conceited and somewhat ignorant of your ways, you say "He's too fresh!" "He's got too much chin!" etc., etc. Is self-conceit a sin? Is it necessarily coxcombry and snobbery? Did you ever ask yourself whether this brother of yours is worthy of your friendship? Did you ever try to get at a true conception of his character and try to find out his good qualities? Did you never reason that he must as necessarily have his faults as all the rest of us? Will you not try and make his stay with us more of sunshine and happiness than of bitterness and full of gall towards the members of the fraternity? This may all seem what I did not intend to make it, a special mission of protection for one individual. It is not so intended, but only to show how far you, as operators, fail in your duty towards your fellow men, and how little you aspire to be gentlemen in the true sense of the word. I have "been all through the mill" myself, and know whereof I speak. Shall it always be your highest aim and greatest ambition to trifle with and trample on the feelings of others?
CANDOR.

A Fast Receiver Comes to Grief.—Personals and Squibs.

CHICAGO, ILL., Aug. 23.

TO THE EDITOR OF THE TELEGRAPHIC.

"It was a party by the name of Johnson," and he hailed from Peoria; "he wanted a job;" he could take anything—that's the kind of a "hair pin" he was. Although Manager Maynard politely informed him he had no vacancy, he wanted to "try his hand;" he was aching for glory; he saw the Milwaukee Duplex working. "Oh, he could take that fast easy." New York Duplex was shown him, and "Curt" Messerve was turning out his copperplate message a minute, while "Jemmy" Meerneess was giving the feller in N. Y. some

good square Morse about as rapidly as it was comfortable for most any one to put it down.

"Those fellows take it very steady," he remarked. Armstrong and Miller were piled up on the Cincinnati Duplex, and they were just burning up spark coils by the dozen, more or less (less, I guess), they were going so fast. "Well, he'd just like to take all day at that gait."

Buffalo and Detroit on the Quad. were "very slow writers." St. Louis Duplex was very steady circuit, that's the reason they had a gal working on it." Buffalo Dock, "ah! that's the wire he'd like to try his hand on," so they let him sit down to it. Somebody told "Lapey" there was a fast mau at this end, and to get some fictitious messages and hurry him up a little. Well, Lapey just "ate him up;" Whitford says, out of six messages, "the party by the name of J." didn't get a word; he tried to break, but such a shower of dashes and dots as followed his breaks were enough to have terrified one of the boss osixerators, to say nothing about a novice. Well, he got up and blandly remarked, "he could take that fast mau they had at Chenoa, but he guessed that fellow was too much for him." We ain't seen him since.

I "Haight" to tell, but then I must. Business has increased so rapidly on the overland route since the Bank of California "busted," that Omaha had to have some extra men;" accordingly, Messrs. Haight and Muller will start to-morrow morning for that city to help the boys out. "Jake," Tollman is the only operator, so far as heard from yet, who lost by the failure of the Bank of California, and he withdrew his gold just before he came to Chicago and deposited here. Some of the other boys are losing (flesh) on account of the failure, being stuck till relieved by the day men in A. M., if they happen to be last or next to last man.

If somebody don't fix the roof to the building our office is in before the nicely frescoed ceiling of our room is spoiled entirely by its leakiness (that's original), why, I shall speak of it—I'll mention it in THE TELEGRAPHIC—but I won't speak of it now. Wasn't it cruel in that St. Louis man, when Mr. Gray and Jake Tollman were working the Duplex the other day, to say that "that wire worked mean enough to make even a "tollman gray?"

The latest addition to the "sub gang" is a Mr. Gould—no relation of Jay's, I believe. He looks rather sad, as if he'd had trouble. "Cheer him up boys."

A new order is about to go into effect, "that no one will be permitted to see an operator while on duty except by written permission of the Supt., and such permission will only be granted upon the most urgent business." This will save some of the boys a great deal of trouble who have been in the habit of getting "dunned" every pay day, and some of the newly made Benedicts will have to go a whole day without seeing those little angel wives of theirs, "from early morning till late at night," as the "dear creatures," will be too timid to bother the Supt. every day for a permit, and their business will hardly be considered as of the "most urgent" nature.

WESTERN UNION.

Telegraphic News Reporters.—Disappointed Expectations.

LOS ANGELES, CAL., Sept. 3.

TO THE EDITOR OF THE TELEGRAPHIC.

THE Western Union Telegraph Co. have for some time paid their managers on the Pacific Coast a quarterly salary for compiling "Press Despatches," allowing them about $\frac{1}{2}$ cent per word. They have also established "Associated Press" agencies at the principal towns, the compilers receiving $\frac{1}{2}$ cent per word. As the business is almost always new to the appointee they fall back on the stereotyped style, which the *Alta* of San Fran. "takes off" as follows. In many cases the would-be newspaper sharp takes the *Daily* or *Weekly Advertiser*, and sends enough of the local columns to "make up a dollar's worth," and then figures largely on what they will do with the "extra" or "perk," but is doomed to disappointment when the voucher comes, to find that some of his choicest effusions or selections have not been counted in, or else the "uncollectible dept." has cramped on the "perk," and they receive only what is squeezed out between the fingers of the sordid Executive of the "dept." They are willing to swear that whoever should credit them with those "extras" cannot appreciate goodness, or else has orders to allow no one, except specially favored ones, to exceed a certain benefit from their compilations.

The *Alta* thus discourses on the subject:

"The wild, untamed telegraph operator is having a splendid chance to display his enthusiasm in this campaign. Whenever a little crowd of people gather together in an interior town to listen to a fourth rate stamp speaker, no matter what the political com-

plexion of the meeting may be, the t. o. sits himself down and telegraphs to the *Call*: "The largest and most enthusiastic assemblage ever held in this county is now in progress in front of the Aureole Saloon. Anvil firing is incessant, and bonfires illuminate the Cross Roads. The Hon. Sol. McGeachy is now speaking to an audience wild with delight, and is to be followed by General Bradall." Every one of these despatches escapes the waste basket which yawns for it, and is religiously printed in the *Call*, for that paper believes that nothing but good can come from a Western Union operator. Some people complain that there is no enthusiasm in this canvass; but assuredly, if there be none elsewhere, there is an overflowing abundance in the 'interior telegrams' of the *Call*. The rural telegraph operator is chuck full of patriotism."
CLIX.

"Don't Give it Away."—Sunny Prospects.

CHICAGO, ILL., Sept. 6.

TO THE EDITOR OF THE TELEGRAPHIC.

WHEN in the course of human events it becomes necessary to admonish a confidential friend to secrecy, I advise everybody to avail themselves of Charlie Thomas' parting salute to the chief operator of the A. & P. in this city, viz: "Scobell—don't give it away." The efficacy of this injunction must be tested to be fully appreciated, and I assure you it never fails.

Scobell never gave anything away(?) since the receipt of the postal card bearing the above quotation upon it, and consequently the peanut stand will ever be a monument to his unexampled reticence.

I have a suggestion to make to printers of legal documents. Instead of commencing them as follows: "Know all men by these presents, etc.," which is the present form, make them read "Know one man (Scobell) by these presents, etc.," for if he knows it all men will.

In the communication from Mr. "Opposition," I noticed several omissions of "Minor" details pertaining to the A. & P. office here, but as he will probably take this hint, and embody them in his next epistle, I will not encroach further on your space.

As the "Cloud" of consolidation disappears below the horizon, we have every prospect of a "Sunny" future, and that this "Sweet" consolation may never be denied the hosts of Morse's votaries (not forgetting "Half Rate Chandler"), is the fervent prayer of all operators here, including yours Egg-otistically,
Zo-Zo-Zo-ALL OK.

Vacation Observations.—Bulls.

PHILADELPHIA, Sept. 21.

TO THE EDITOR OF THE TELEGRAPHIC.

AFTER enjoying a vacation of twelve days I am again in my accustomed place, listening to the familiar click of the "masheen," and trying to keep cool whenever there is a "rush."

During my vacation I had the pleasure of forming the acquaintance of several gentlemanly manipulators, amongst which are John J. Thomas, at Coal Dale, Pa., who bids fair to become an operator to meet the demand of the times. I here met an old schoolmate, by whom I was cordially received. Claude Whetstone, at Summit Hill, Pa., is getting to be quite an expert at the biz. Mr. Birch is still holding forth at Lansford, "K.," as also are Mr. Thibbitt at Hauto, "H. U.," Mr. Hagger, at Nesquehoning, "G.," and Mr. Reed at Manch Chunk, "D. X." The latter is also superintendent of the Tamaqua branch (over which I passed), in addition to being operator on that line at "D. X."—so I was informed by one of the operators on said line. Mr. Fulton, at Manch Chunk, L. V. R. depot, greets you with a smile and a "How are you?" At this place I enjoyed a ride over the famous Switchback R. R. John B. Shine still shines forth at Pittston, Pa., for the W. U. Tel. Co. I also made a "short stop" at Plymouth, Pa., where I went "down in the coal mines," examining them to my satisfaction, remaining underground for about an hour.

I suppose the register wouldn't work when Mike read and copied "Erio losed," when it should have been "closed;" nor was the message written plain when he sent the word "forwarded," which should have been "found." "Guy" proved to be "Geary." "Hellertown," after repetition, proved to be Heberton. Mike is not in fault for the two latter. I think he had better lay aside his centennial pipe when he works on the wire with the boys.

Business is getting to be brisk in this office. The company has kindly furnished us a messenger, whose name we find to be John Cooke. Next. Ex-Prof.

There are twenty-three miles length of pneumatic tubes now in use in London, used for transmitting telegraph messages.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, SEPTEMBER 25, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

(P. O. Box 5503.) 38 VESEY ST., New York.

A Special Premium for Subscriptions to "The Telegrapher."

THE summer season is about over, and we expect that the friends of THE TELEGRAPHER will now renew their efforts to increase its list of subscribers. The subscription list has been very well sustained during the summer, but as the days of vacations and excursions are over, we look for the usual increase of interest in the only truly independent telegraphic journal published.

It has been our custom for years past to share with those who kindly interest themselves in obtaining subscriptions by offering valuable premiums.

We propose this season to excel our former liberality in this direction. We desire to offer something of real and permanent value. We have accordingly made arrangements by which we are enabled to offer to the person obtaining 60 subscribers for one year, at the regular subscription price, \$2 per year, or their equivalent in shorter subscriptions, a

No. 1 WEEB SEWING MACHINE;
for 65 subscribers a

No. 2 WEEB SEWING MACHINE,
and for 70 subscribers a

No. 3 WEEB SEWING MACHINE.

The price of these machines is respectively \$60, \$65 and \$70.

The machines will be boxed and shipped without extra charge.

This affords an excellent opportunity for female telegraphers, or for telegraphers who have wives or relatives that need these exceedingly useful machines which are in every respect first class, to obtain them at comparatively little trouble or expense.

Send in subscriptions as obtained, and they will be credited until the necessary number to entitle the sender to the desired premium is obtained.

To prevent disappointment, should any canvasser eventually fail to obtain the requisite number for a machine, they will be allowed other premiums proportionate with the amount collected, or, if preferred, 20 per cent. in cash on such amount. To whom shall we send the first machine?

The Telegraphic Situation.

THERE is but little to be said in regard to the telegraphic situation which is not already known to our readers. Nothing more is heard at present in regard to consolidation, and the Atlantic and Pacific Telegraph Company is vigorously pushing forward its work of construction and reconstruction, and the officials of the company say that there will be no more shilly-shallying, but that their plans for making the company a real competitor for the telegraph business of the whole country are to be energetically carried out.

President ECKERT has returned to the city with greatly improved health, and has resumed the discharge of his official duties, which were suspended for several weeks, in consequence of his protracted and severe illness. He says he takes no stock in consolidation schemes, but aims to make his company a worthy and efficient competitor of the mammoth Western Union organization. There have been the usual street reports of what Mr. JAY GOULD intended or desired to do, but it is conceded that if he had any expectation or intention of controlling the Western Union election at the coming annual meeting they have been defeated and abandoned.

The completion and operation of the Direct Cable undoubtedly strengthens the position of the companies competing with the Western Union very materially, and renders less practicable or probable any project or scheme for a consolidation of interests in the future.

As it is conceded that the present managers of the Western Union Company will control the pending election, there is but little interest felt or expressed in regard to it. There is a curiosity to see Mr. ORTON's report to the stockholders, as it will doubtless give very full information in regard to the business of the company during the year ended June 30th last, and an insight into the present pecuniary standing and an idea of the future policy and prospects of the company.

Mr. ORTON's reports are always interesting and able, and if we cannot agree with all his conclusions, especially with regard to the practical importance and value of telegraphic systems and improvements, we are willing to concede the honesty with which they are held.

The telegraphic prospects generally, we think, are improving, and there is reason to believe that the business for the next year will be an improvement upon that of the year which has just passed. There is a gradual improvement in the general business of the country, which cannot but be beneficial to the telegraphic interests.

The Atlantic Cable Competition.

THE great reduction in charges upon messages by the Atlantic telegraph cables, consequent upon the completion of the Direct Cable and its opening for business, has resulted, as was anticipated, in an immediate and marked increase in the number of messages offered for transmission. Whether this reduction prove profitable to the cable companies or not, it is unquestionably very satisfactory to the public who have occasion to make use of cable telegraph facilities, and if the capacity of the cables could be increased, might be advantageously permanently maintained.

The Direct Cable Company have no occasion to complain of the amount of patronage bestowed, so far at least as the number of their patrons and messages are concerned. From the first day on which the doors were opened for the reception of public business the cable has been kept fully occupied day and night, and their patrons express themselves as well pleased at the correctness and promptness with which business is done. The en-

tire service between London and New York being under the sole management and control of the Direct Cable Company, is unquestionably an advantage.

The numerous messengers employed by the Direct Cable Company in this city make quite a noticeable display in their peculiar uniforms, and attract much attention.

The business of the line is being thoroughly organized and systematized, and such improvements as may be available to increase the capacity of the line, and expedite business, will be adopted from time to time. The representatives of the company in this city are courteous gentlemen, and afford all requisite or desired information to their patrons and others who call upon them.

In another column will be found a detailed tariff list for European, Eastern and South American stations, which will prove of value to the public as well as to offices which are likely to have cable business to transmit, and should be carefully preserved for future reference.

The peculiar form of conductor used in the cables of this company, although it has been ignorantly criticised heretofore by some parties, is proving to be scientifically and practically correct and successful, and it is believed facilitates the transmission of signals, especially through the very long cable between Ireland and Nova Scotia. The tests of the cables, we are informed, are perfect, and the insulation and conductivity all that could be expected or desired.

The company and the contractors are to be heartily congratulated upon the success which has crowned their efforts after so many damaging and discouraging misfortunes and delays. Probably when they come to lay a second cable, which we understand is to be done next season, the experience gained in this initial enterprise will enable them to do it promptly and advantageously.

We understand that the Anglo-American cables are experiencing a considerable increase of business, also, as a consequence of the reduction of rates. If the low rates can be made profitable and continued, the increase of business would doubtless necessitate the laying of several additional cables within a comparatively short time.

The Western Union Telegraph Co. have fitted up and opened a new office, especially for cable business, at No. 14 Broad street.

The Resignation of Mr. Wm. E. Smith, Manager of Los Angeles, Cal., Atlantic and Pacific Office.

THE "Personal" column of THE TELEGRAPHER last week contained the announcement of the resignation of Mr. WM. E. SMITH, Manager of the Los Angeles, Cal., office of the Atlantic and Pacific Telegraph Company, and his proposed retirement from the telegraph business, to engage in mercantile pursuits at Prescott, Arizona.

Mr. SMITH has been long and favorably known to the readers of THE TELEGRAPHER, through his interesting communications over the *nom de plume* of "Clix," and has exhibited a lively personal and practical interest in the success of the telegraphers' newspaper, which we are happy to acknowledge.

He has occupied several important telegraphic positions, which he has filled with advantage to his employers, satisfaction to the public and credit to himself.

A few months since, upon the extension of the Atlantic and Pacific lines to Southern California, Mr. SMITH resigned his position with the Western Union Company at San Francisco, and was appointed Manager of the Los Angeles office of that company. He entered upon his new position with his customary zeal, energy and ability, and in a very brief time has built up and organized an excellent business for the new lines.

Very advantageous offers to engage in mercantile business at Prescott, Arizona, have induced him to resign his connection with telegraphy, and although we regret to lose him from the telegraphic ranks, yet we congratulate him on his excellent prospects and wish him abundant success.

In regard to the success of the Atlantic and Pacific

office at Los Angeles, under Mr. SMITH's administration, the *Herald* of that city says:

"The Atlantic and Pacific Telegraph line has done a fine business since it reached this city. On the first of this month the office here transmitted ninety-three messages and sent and received eight thousand words of news report for the *Herald* and *Express*, the San Bernardino *Guardian* and *Argus*, and the Anaheim *Gazette*. All this work was done by two men. The business of the office averages three hundred dollars per week. This is a flattering appreciation of low rates and prompt despatch. The people of Southern California have reason to rejoice at their release from the meshes of that grasping old monopoly, the Western Union, which, prior to the opening of the opposition, kept up the rates and furnished despatches as often behind as ahead of the railroad and stage."

Of Mr. SMITH's resignation the Los Angeles *Evening Express* remarks:

"Mr. Smith, Manager of the Atlantic and Pacific Telegraph Company in this city, is about to remove to Prescott, to engage in the mercantile business. If Mr. Smith proves as successful as a merchant as he has as a telegraph manager, he and his friends will have grounds for rejoicing. We wish him success in his new line of business."

The French Telegraph Service.

A STATEMENT is travelling the rounds of the press in this country that in France the telegraphic service has yielded in the past year a surplus of \$400,000 over expenses. The previous year receipts and expenses balanced, but always before there was a deficit. This is cited as a demonstration of the fact that cheap Government telegraphy will ultimately pay.

The actual state of the case in France, as elsewhere, is, that Government administration of the telegraphs at low rates was financially a failure. After the war with Germany the immense losses consequent thereupon compelled the Government of France to utilize every possible source of revenue. It was decided to be impracticable and inadvisable to continue the telegraph administration at a loss. Under these circumstances telegraph rates in that country were advanced forty per cent. on messages between stations in separate departments (which correspond to our States), and sixty per cent. on messages between two stations in the same department. With this advance the deficiency in the telegraph receipts has been overcome, and last year a small surplus over actual expenses realized.

We do not see much encouragement for the advocates of Government telegraphy in this country from these facts.

Personals.

Miss E. D. MOORE, of Quincy, Ill., and MICHAEL FULLY, of New Orleans, La., have been appointed to positions on the night force of the St. Louis, Mo., Western Union office.

Mr. JACK MAGILL is the "night press" man at Kansas City, Mo., Western Union office.

Mr. W. P. DINSLEY has accepted a position with the Western Union Co. at St. Joseph, Mo.

Mr. GEO. M. MYERS, of Toledo, Ohio, has been appointed to a position in the Kansas City, Mo., Western Union office.

Mr. GEO. R. BICKNELL is "Micawbering" in St. Louis, Mo., like a great many others.

Mr. FRANKIE FARLEY, late of Chicago, Ill., has gone to San Francisco, Cal.

Mr. J. H. MCGUIRE, of the St. Joseph, Mo., Western Union office, has resigned, and accepted a position with the same company at Omaha, Neb.

Mr. J. CASSELL, formerly of Louisville, Ky., Western Union office, has accepted a position as night operator, Union Depot, East St. Louis, Mo.

Mr. SYLVESTER STOUT, formerly assistant agent and operator, No. Penn. R. R. Co., at North Wales, Pa., has been promoted to a similar position with that company at Abington, Montgomery Co., Pa., vice "H." resigned.

Mr. WM. THOMAS has been appointed assistant agent and operator for the N. P. R. R. Co., at North Wales, Pa., vice Mr. S. STOUT, promoted.

The Telegraph.

The Franklin Telegraph Company.—Adjourned Annual Meeting.

AN adjourned annual meeting of the Franklin Telegraph Company was held on Wednesday, September 15th, at room 41, Sears' Building, Boston, Mass. Ten gentlemen were present. General T. T. Eckert, President, presided.

The President said that by reason of sickness he was not able to present such a report as he desired, but his assistant, Mr. Chandler, had prepared a memorandum which he would read.

The memorandum stated that the receipts for the year ending April 30, 1875, were \$290,156; that additions made to the company's lines aggregated \$26,652; purchase of the Fall River line, \$4,500; construction of the Springfield and Athol line, \$1,981; construction of the Rye Beach line, to connect with the cable, \$18,996; sundry loops, chiefly in New York City, \$1,173; making a total expenditure of \$26,652. Since April the Atlantic and Pacific Company had advanced an additional sum of \$24,733.08 for improvements and new lines. In concluding the memorandum stated that the prospects for the company were more favorable than at any time heretofore, notwithstanding the loss of Government business and an indebtedness to the Atlantic and Pacific, which has now to be provided for.

On motion of Mr. Bullard, representing the minority, Messrs. Horace B. Wilbur and George Holbrook were appointed and authorized to audit the treasurer's accounts, and also to examine into the relations with the Atlantic and Pacific Company and report upon the same.

On motion of Mr. Bullard the report of Messrs. Greenough and Wilbur on the late treasurer's account was taken from the table and accepted. Adjourned.

Mr. W. C. Barney's System of Rapid Telegraphy.

THE following account of trials of Major W. C. Barney's system of rapid telegraphy has been translated for THE TELEGRAPHER from the *Independence Belge*, published at Brussels.

In our number of 16th of April last we made mention of a new system of rapid and simultaneous telegraphy, invented by an American engineer, Major Barney, and which had been tried on the Government lines.

The results of trials made since then have been very satisfactory. Since that time, with the consent of Mr. Barney, modifications have been made in the system by a Frenchman, M. Godenor, a pupil of Breguet, and the experiments since have given still more satisfactory promise than those previously made.

The following are some of the results obtained: On the 1st of July a despatch was transmitted by single transmitter from Brussels to Ostend, and to Antwerp at the same time, with a speed of 600 words per minute. These trials took place on the wires connecting Ostend and Antwerp, in order to lengthen the lines, the first of which was 153 miles, the second 57 miles.

On the 17th of July messages were sent from Ostend to Brussels at a speed of 1,092 words per minute. The despatches as received were easily read by all the telegraph employés present.

On the 25th of August despatches were sent from Brussels, via Arlau and back—a distance of about 235 miles—with a speed of 600 words per minute, and were read by all the employés in the office.

The Key West and Punta Rasa Cables.

THE cable of the International Ocean Telegraph Company, between Key West and Punta Rasa, Fla., has not worked well of late, the borers having impaired the insulation. The new cable for this section, which was ordered by Mr. Orton during his late visit to England, has been manufactured and forwarded to Key West, and is now being laid, and in a few days communication will be fully restored.

Foreign Telegraphic Notes.

DURING the meeting of the British Association for the Advancement of Science, at Bristol, there were two soirées in the Colston Hall. At the second several electrical inventions were exhibited. The display of telegraphic apparatus, which to a certain extent was a historical one, contained the original instrument of Cooke and Wheatstone, which was used on the first telegraphic circuit, viz., that between Paddington and Slough.

It is proposed in France by the telegraphic administration to encourage the introduction of private wires, and to offer such inducements that no great factory and no rich man's house in the country will be without its wire.

The Eastern Company's traffic receipts for the month of August show a decrease of £1,260.

Telegraphic and Electrical Brevities.

THE Nevada and North Telegraph Company have completed their lines to Boise City, Idaho.

The annual break in the French cable between Duxbury, Mass., and St. Pierre, has been repaired, and the line is working as usual.

Recently a chimney fell on a city line in Montreal, Canada, breaking it. The operator at a suburban office fixed it up, but as the line didn't work, the repairer went out from the main office to investigate. He found the wire mended with a piece of string. The difficulty was explained, and the substitution of a piece of wire for the string had a beneficial effect.

The Board of Police Commissioners in this city have ordered the Sup't of Police Telegraph to connect the Chambers street Hospital by telegraph with the Fifth Precinct Station House.

Mr. D. O. Mills, of San Francisco, Cal., has been elected a director of the Western Union Telegraph Company.

The system of cables *via* the West Indies, connecting South America directly with the United States, is now complete and open to the public. There are now two routes of telegraphic communication with South America, the other being *via* the Atlantic and the Brazilian cables.

The Sword of Washington.—How a Rural Agent and Telegrapher Obeys Orders from the Commander.

SOME time ago there was an order issued from the General Superintendent's office of the Chicago and Alton* railroad, requiring all agents and other employés connected with the trains upon that road to wear badges when upon duty, designating the position they have, that the travelling public might, without mistake, know who to apply to for any information or protection required. This order in due time was sent to the different agents along the line of the road, together with the badge they were to wear.

Among the agents that received this order and badge was Mr. J. R. Madison, at Washington, upon the western division of the road, who immediately carried out the order. He was very much pleased with the badge, as it was quite ornamental, and showed to every one the position held. He thought it would save many questions as to the rank he held upon the staff of this large corporation, so he wore it continually—not only around the town, but to church and other places of amusement—and when he took off his hat he would place it in a very conspicuous position, that it might draw attention.

The young men of Washington began to feel quite taken aback by the attention given the young railroad agent; therefore they set their heads together to get a rig on him, which they saw fully carried out yesterday to the delight of all the citizens of the above named city. They purchased a very fine sword and belt down the road somewhere, and then wrote a letter purporting to come from the General Superintendent, informing all agents that in future they would be required to wear the sword and belt, as it would add greatly to the appearance of the leading official at the station, as well as giving him something with which to defend the patrons of the road from the confidence men and pickpockets that are always to be found at a railroad station. This was taken up and given to the train men, who, on the arrival of the train at Washington, delivered it to Mr. Madison, who promptly put it on; and yesterday he was seen promenading the streets in full dress, strutting about as proud as a major general. The novelty of the thing created considerable laughter among the citizens, who began to ask him about the cause of all this display, whereupon he showed the instructions. Some one told him that the whole thing was a joke put upon him, and that he had better see if the thing was general throughout the line; so he repaired to the office and by telegraph asked the agents at Lacon and Wenaona if they had got their swords, etc., to which they replied they had, that they were the laughing-stock of every one, but that they did not mind it, as they would soon become used to it. Getting the assurance that there was no joke about it, he resumed his business without any further trouble.

Before night the joke had gone the length of the wires on every division of the road, and a ripple of laughter was continuous from Chicago, Louisiana and Washington to Chicago, and probably has spread by this time to every telegraph line in the Union. If Mr. Madison ever hears the end of it he may bless his lucky stars.—*Bloomington (Ill.) Pantagraph.*

A lightning rod man named Ira Smith, aged seventy, received a mortal kick from a mule last week in the stomach—also in the Pan Handle region of Virginia. *Dies Ira.* Whom the gods love die young.

"A very capable lightning slinger and a good fellow generally," is the graceful compliment paid a telegraph operator by the Newburg Journal.

FRANKLIN imagined electricity to be an element of glass—remove electricity and glass would lose its virtues and properties!

Married.

KURTZ—KNOFF.—Tuesday evening, September 14th, at the residence of the bride's parents, 260 Perry street, Cleveland, Ohio, by the Rev. C. F. Paulus, assisted by Rev. J. S. Broadw-ll, Mr. JOHN C. KURTZ, manager of the Western Union Telegraph Company's office, Berea, Ohio, to Miss ANNIE M. C. KNOFF, of Cleveland.

HENRICI—IRONS.—At Indiana, Pa., Thursday, September 16th, 1875, by the Rev. A. C. Ehrenfeld, JACOB F. HENRICI, late of the Western Union office, Pittsburg, and Miss VIOLA IRONS, of the Western Union office, McKeesport, Pa.

DIRECT UNITED STATES CABLE COMPANY.

TARIFF for transmission of Telegrams via DIRECT CABLE to Great Britain and Ireland, the Continent of Europe, Turkey, Egypt, Persia, India, Penang, Singapore, Cochin China, China, Japan, Java, Australia, New Zealand and the East generally.

The name of place from which messages originate is transmitted free of charge.

Messages will be received at the Company's offices, 16 Broad street, New York (always open), or at any of the offices of the Atlantic and Pacific and Franklin Telegraph Companies throughout the United States, and at any of the offices of the Dominion Telegraph Company of Canada.

The word system of charging is adopted for all messages.

All messages to be prepaid by sender.

This Company will register the names of firms in Great Britain and Ireland free of charge. By this arrangement the sender of a message is only required to use two words for the address—for instance, a party cabling to "James Smith & Sons, 126 Bishopsgate street, within, London," can address his message to "Volo, London." These addresses will be registered at any of the above mentioned offices on application.

The Direct Cable rate in gold between New York city and Great Britain or Ireland is 25 cents per word.

1. The rate from and to Great Britain or Ireland and points in New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, New England States and Dominion of Canada is 25 cents per word, gold.

2. Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Mississippi, Louisiana, Tennessee, Kentucky, Ohio, Indiana, Illinois, Michigan, Wisconsin, St. Louis (Missouri) and Florida—35 cents per word, gold.

3. Texas, Arkansas, Minnesota, Dacotah, New Mexico, Idaho, Montana, Arizona, Oregon, Washington Territory, Missouri (except St. Louis), Kansas, Nebraska, Iowa, Colorado, Wyoming, Utah, Nevada and California—50 cents per word, gold.

British Columbia—60 cents per word, gold.

The list below contains the tariffs in GOLD from London only, therefore, in reckoning the charges on telegrams, the DIRECT CABLE TOLLS above must be ADDED to these rates.

ADEN.	(Special rate) ten words.....	\$10 00
	The first additional ten words or less, up to twenty words.....	5 00

L. OLIPHANT,

Representative of the Direct Cable Co. in America.

TO ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystallizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

- No. 1 Cell, - - - \$5.00.
- No. 2 " - - - 10.00.

L. BASTET,

607 Broadway, New York.

THE ELECTRIC.

A "can't do without" Journal of Telegraph News and Gossip. Published semi-monthly. Correspondence of Telegraphical interest solicited.

SUBSCRIPTION PRICE:

- Per year, - - - - - \$1.00.
- Single copies, - - - - - 5 cents.

Specimen copies furnished gratis on application. All communications should be addressed to

HAYES AND MOXON,

N. E. COR. MAIN AND OLIVE STS.,

ST. LOUIS, Mo.

FOR SALE.—CEDAR TELEGRAPH POLES.

In lengths of twenty-five, thirty, thirty-five, and forty feet; five to six inches at small end, and bark peeled off. In car loads or by vessel loads, delivered at any of the lake ports between Oswego and Chicago as may be agreed upon. Thirty-foot poles for fire alarm telegraph a specialty.

Address

A. A. COLBY,

Toronto,

ONTARIO, Canada.

GEO. H. BLISS & CO.,

220 Kinzie Street,

CHICAGO, ILL.

Telegraph instruments and supplies in great variety, of the

best patterns and highest finish.

Prices always as low as the lowest.

The usual twenty per cent. discount is still allowed on instruments of our manufacture when remittance accompanies order.

Manual and price list free.

GEO. H. BLISS & CO.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes.**

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the **UNITED STATES** and **CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES** and the **DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The coöperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE.

SUBTERRANEAN & AERIAL WIRES,

OF THE
HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor **SILLIMAN**, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article or office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection. Introduced by us eight years since; also, **THE ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, - - - - - PUBLISHER.

SATURDAY, OCTOBER 2, 1875.

VOL. XI. WHOLE No. 481.

The Ownership of the Fast Telegraphic Systems.

A REPORTER of the *Graphic* recently interviewed R. W. Russell, Esq., who claims to represent the owners of the Automatic and Quadruplex Systems of Telegraphy, and the report of the interview, as published in that newspaper, is given below.

It is stated in the *Graphic* that "A short time ago it was announced that the Atlantic and Pacific Telegraph Company had purchased or obtained the control of the chemical automatic telegraph system, founded on the inventions of Mr. Edison and Mr. Little, and which system, it was claimed, had recently been perfected so that from three to five hundred words per minute were transmitted regularly over circuits of 250 miles.

It was confidently predicted that with this system the public would be enabled to send long messages by telegraph at very low rates.

It appears that the right of the Atlantic and Pacific Company to use this system is now denied. We have ascertained the facts of the case from the representative of the parties claiming the patent rights, and have at the same time obtained from him several interesting items of information respecting the automatic and other systems of telegraphy.

Formal notices have been served upon the directors and officers of the Atlantic and Pacific Company and others, and circulated in printed form, to the effect that the Atlantic and Pacific Company having failed to comply with the terms of the contract entered into with them for the sale to them of the said inventions, they must discontinue the use of them. These notices having been given by Mr. R. W. Russell, on behalf of the owners of the patents, our reporter applied to him for an explanation of the matter, which he gave to the following effect:

A few months ago an arrangement was entered into by Mr. Jay Gould on behalf of the Atlantic and Pacific, and Mr. Reiff and Mr. McManus on behalf of the owners of the patents, for the sale of the latter to the company for a proportion of the capital stock of the Atlantic and Pacific.

In the expectation that this sale would be consummated, the Atlantic and Pacific were put in possession of the telegraph line from New York to Washington, which had been worked by the Automatic Telegraph Company, and were allowed to use the automatic system of telegraphy on all their lines, and they have continued to exercise that right up to this time. Deeds of transfer of the patents agreed to be sold were executed by Mr. George Harrington, in whose hands the patents were placed on behalf of Mr. Edison, and of Messrs. Reiff, McManus and others who had supplied the funds for the development of the inventions. These deeds were put in the hands of Mr. Jay Gould, with written instructions to deliver them to the Atlantic and Pacific on payment of the consideration to the parties named in the instructions and in the shares, and proportions therein specified. Mr. Harrington's name is in that list, and he sold to Mr. Gould the individual share of the proceeds coming to him (Harrington) under that sale, which was all that he could convey.

The Atlantic and Pacific now deny that they are bound by Mr. Gould's bargain with Mr. Reiff and Mr. McManus (which was confirmed by Mr. Harrington).

The Atlantic and Pacific are reported also to claim that Mr. Gould can give them all they want in disregard of the instructions accompanying the delivery of the deeds to him and without paying the consideration agreed upon. And furthermore, they allege that the vendors have failed to perform a portion of the bargain relating to certain railroad contracts. That allegation is denied by the patent owners.

As to the claim said to have been set up that Mr. Gould has the legal title, Mr. Russell stated to our reporter that he did not believe such a claim had been advanced; that the transfers to the Atlantic and Pacific were wholly inoperative by reason of the failure to comply with the conditions upon the performance of which—and not before—those transfers were to take effect, and consequently, that the owners of the patents can dispose of them to other parties.

Our reporter availed himself of the opportunity to elicit the following information:

Q. The President of the Western Union Company insists that the quadruplex system is better than the automatic, and he claims that the former system is owned or controlled by the Western Union. Do you consider those statements to be correct?

A. By the quadruplex they can make, as they say, one wire do the work of three. By the automatic one wire does the work of twenty or more. Very skillful operators are required for the quadruplex, but ordinary operators suffice for the automatic. The Western Union do not own the patents for the quadruplex; they are owned by the parties whom I represent. They would be very valuable if we had not got the automatic system. The Western Union are using the quadruplex with printing telegraph machinery quite successfully. Mr. Orton claims that the invention is of immense value to his company because of the saving of wires effected by it, and yet assumes that the greater saving of wires effected by the automatic system is of no consequence. He argues in that way because the Western Union have no claim of title to the automatic system but do set up a claim to the quadruplex. When Mr. Orton discovers that his company has no title to the quadruplex I think he will announce to the public that there are no real merits in that system.

Q. I understand that the Atlantic and Pacific Company promised to give the public cheap telegraphing with the automatic system. Do you consider they have finally abandoned that idea? They have recently revoked their action in reducing the tariff.

A. I do not know what the Atlantic and Pacific Company propose to do. They are now using the automatic system on their lines, but the parties interested in that system have no voice in the management of the affairs of the company. That system has in fact been placed in the hands of lukewarm friends. They might have used it to revolutionize the telegraph business, but have merely used it as an auxiliary on their routes where there is a deficiency of wires. And it has encountered the opposition of the skilled Morse operators, who, of course, do all they can to prevent the introduction of machinery to supersede their hand work. The automatic system is of comparatively small value if the old telegraph companies desire to continue the telegraph business on the old basis—ten-word messages and high prices. But sooner or later the automatic system will be established to give the public the advantages both of long messages and low rates. Before long it will become a general practice for newspaper correspondents and others to prepare long messages on perforated paper, to be sent to the telegraph offices to be run off by the automatic machinery at so much per 1,000 words. By no other system can the business be done in this way. Many parties are desirous of having the exclusive use of wires for private lines. The automatic system supersedes the necessity for private lines. As to way offices, one wire will suffice for a great number of way offices. Each office being allowed the use of the wire at fixed periods for a few minutes can write off all its business. The operator is engaged in preparing his messages whilst the wire is being used at other offices. All the business of the country can be done by this system upon inexpensive lines, and the old companies will be unable to stand up against this competition. It is machinery against hand labor.

Q. Mr. Orton is reported to have said that his company could not be persuaded to use the automatic system; that it is inferior to the Morse system, and moreover, that there is no novelty in the automatic system—that it is public property.

A. The courts are not likely to sustain that proposition. More than fifty patents have been recently issued at Washington for improvements on the automatic system, all of which are owned or controlled by my clients. As to the comparative merits of the Morse and the automatic systems, I may observe that I have for a long time past held that hand telegraphy would be superseded by automatic telegraphy. I often discussed the subject with Professor Morse when we were together in the Board of Directors of the American Telegraph Company. I was the standing counsel of that company and a member of the Executive Committee of Three by which the business of the company was managed. It was mainly through my efforts that the consolidation of the Morse House and Bain lines, from Maine to Texas, was effected. In the West I caused the Morse and House patents to be united, and the Western Union Company was founded on that action, the nucleus being the New York and Mississippi Valley Printing Telegraph Company. The automatic system would, I think, have been established on the lines of the American Telegraph Company if I had remained on the Executive Committee. But as my policy in regard to the New York Associated Press was not sustained by the Board of Directors, and I was deserted by those who had agreed to act with me in breaking up the monopoly of that association, I became disgusted and left the destinies of the company to the control of others. Since that time I have repeatedly ad-

vised parties who were desirous of going into the telegraph business that the fortress already built was too strong to be successfully assailed until the assailants could perfect and control the automatic system. Professor House, the inventor of the printing telegraph, became convinced that automatic telegraphy would supersede all other systems, and consequently refused to continue his efforts to improve his printing telegraph, for which improvements I and my colleagues had paid him several thousand dollars. Professor Morse recognized the importance of the automatic system, and looked forward to its development and adoption. Before Mr. Orton took the presidency of the United States Telegraph Company it was offered to me, and I declined on the ground that the automatic system was not then sufficiently developed to be run in opposition to the Western Union Company. I considered that the great monopoly held by that company could not be subverted except by the introduction of the automatic system. Mr. Orton took the presidency of the United States Company, and soon afterwards turned the concern over to the Western Union. I did not choose to be the medium of such a transaction. Subsequently Mr. Orton became the President of the Western Union.

Q. If the automatic system has the merits you claim for it, is it not strange that the Western Union have not tried to purchase the patents? What do you consider to be the special advantages of the automatic system over all others?

A. Some of the patents for the automatic system were for a considerable period controlled by Mr. Craig and other parties, who were so opposed to the Western Union that it would have been impossible for that company to acquire those patents. Hence the Western Union took the position that they were of no account. Having taken that position, they have felt bound to adhere to it, and they have undertaken to magnify the importance of the quadruplex as a rival of the automatic. As to that rivalry, you might as well compare a stage coach with a locomotive and train of cars. An operator who transmits a message by the Morse system which is used for the quadruplex has to touch the finger key nearly four times to make each letter, and he must carefully distinguish each time the dot from the dash, allowing a longer time for the latter than the former. The operation is slow, and the operator is, of course, liable to make mistakes, and so also is the operator who receives the message by sound. To send twenty words in a minute the operator must manipulate the keys six times in a second.

By the automatic system, instead of breaking and closing the circuit with a finger key worked by the hand of an operator, the pulsations are regulated by mechanical action, the speed of which is practically unlimited. The circuit has been broken and closed more than 70,000 times in a minute.

It is now the common practice to send from three to five hundred words per minute between New York and Boston. This result was not obtained at once. Many ingenious devices and contrivances, means and appliances, had to be invented and discovered, and conflicting claims of inventors had to be adjusted; but at last all the difficulties have been remedied, and now the public may be assured that within the next two years, unless the automatic system shall be throttled by the Western Union Company, the telegraph rates will be reduced more than fifty per cent, and the business more than quadrupled.

A Slight Mistake.

FUNNY things often happen in printing and telegraph offices, and the editor or operator who keeps his eyes and ears open can store up a never failing fund of story and anecdote to draw upon in his leisure moments for the amusement of his friends. As for instance:

One night last week T. Dixfield Maguire, an operator in the Western Union office, was busily engaged in receiving a "special" from Pascoag, and wishing for shutting up time to come. The streets were still and deserted. The largest sized hour on the dial had been passed, and the heavy, monotonous tick of the office clock alternated with the sharp click of the instrument—the only sounds that broke the silence. Slowly the time went on. At last a shuffling, unsteady footstep was heard on the sidewalk, the door was pushed open hesitatingly, and a human head poked inside. After a moment's delay, as if for the purpose of surveying the premises, it was followed by a body and the legs belonging to it. Takou altogether they went to make up an individual of about fifty summers. From a cursory glance one might easily have mistakou him for a near relative of the famous "bully boy with the glass eye," for not only one, but both his visual organs wore that shiny look peculiar to that condition which results from a too frequent indulgence in a bad quality of fire water. His nose was of a fine strawberry color, and as he approached the desk with devious steps, the gas-light falling full upon it, it irresistibly reminded the operator of the headlight of an engine. Placing both hands—in one of which he held a piece of scrip—upon

the edge of the counter, which reached nearly to his chin, and fixing his glassy orbs upon Dixfield, he ejaculated:

"Whisky—glasher whisky."

"What?" said the operator, not understanding for a moment the request.

"Whisky—gimme glasher whisky. Fill 'er up. Tend to your bishness and pash on 'er bottle. Heresher money," and he deposited the piece of scrip on the counter.

The operator saw through the mistake in a moment, but without undeceiving him, gravely assured him that they were not allowed to sell after that hour of the night. This explanation was not received with a very good grace by the thirsty applicant, who, nevertheless, could do no better than gather up his scrip again, and turn his face downward.

"Seems'er me you have thundrin' high counters here'n Providence. Why don't you eut'm down? Little cuss like you can't reach'er bottles. No whisky! Providence great place!" and he meandered out with a dignified stagger, while Maguire went back to his instrument, reflecting on the many weaknesses to which humanity is heir.—*Providence Paper.*

The Foote and Randall Improved Automatic Telegraph System.

NEW YORK, Sept. 27.

TO THE EDITOR OF THE TELEGRAPHER.

IN THE TELEGRAPHER of Sept. 18th I noticed an article in relation to the invention of Mr. Elisha Gray, of Chicago, called the Telephone, or Electro-Harmonic telegraph, in which you say, "It is believed, and with good reason, that at least sixteen messages can be by this invention be transmitted simultaneously over a single wire," etc., etc.

THE TELEGRAPHER has also been running over with descriptive articles relating to the Little-Edison automatic system, the quadruplex, etc., setting forth their great respective merits, giving the facts in regard to the speed obtained, which, I must say, differs materially with different writers. With regard to the Little-Edison automatic system, it is generally admitted that a speed of from 200 to 300 words per minute on 500 mile circuits, and 500 words per minute on 250 mile circuits, is practically accomplished.

In your article on the Telephone, or Electro-Harmonic, you do not state the speed or any of the details of the system, such as the expense of sending and receiving, apparatus, amount of battery, class of operators required, etc., etc.

Leaving, however, the matter of expense out of the question, as that is a matter of detail, and, excepting "Morse, simple," quite as expensive in the main, perhaps, in one system as another, I desire to make a few comparisons of the different systems as regards the actual speed obtained by them, and their capability of utilizing a single wire, which seems to me to be the great consideration for telegraph companies and for cheap telegraphy.

Now, in the Electro-Harmonic telegraph, the receiving is by sound, and therefore limited, let us say, to 30 words per minute, as a maximum, which, for 16 simultaneously transmitted messages, would make 480 words per minute, on one wire, by the employment, I presume, of 16 sending operators and instruments, and 16 receiving operators and instruments. Now, pray tell me how this invention "will be likely eventually to revolutionize the present Morse telegraph system" when its record of speed is not equal to the automatic, and certainly not less expensive? But omitting all details and comment, the record is:

Morse.....	35 to 40 words per minute.
" duplex.....	60 to 70 " "
" quadruplex.....	90 to 100 " "
" Electro-Harmonic . . .	480 " "

(allowing for 16 simultaneous messages.)

Little-Edison Automatic 500 words per minute, and there is claimed for it from 800 to 1,000 words per minute on 250 mile circuits.

Now I am quite familiar with all the telegraph systems except the Electro-Harmonic, and as a practical electrician and mechanic, familiar with all the details, and I cannot see why the automatic is not the system for telegraph stockholders and the public.

But I digress, and as my communication is intended to be mainly in relation to speed of transmission (everything else being presumed to be equal), allow me to give you a few points in relation to the Foote and Randall automatic system, and the speed obtained thereon.

Their system differs from the Little-Edison system in an open and closed circuit, while the Foote and Randall system is worked by polarity or alternating currents and consists—

- 1st. In the method of using the battery.
- 2d. In the specially perforated paper.
- 3d. In a new chemical paper.
- 4th. In the perforator.
- 5th. In the automatically governed sending and receiving apparatus.

As regards the speed, at a test made in April, 1875, between New York and Boston, of the Little-Edison and Foote and Randall automatic systems, the former obtained a speed of 340 words per minute, and the Foote and Randall 480 words per minute.

Since that test was made, and while the Western Union Company have been trying to secure the "much sold" quadruplex, which has no particular value if obtained, as compared to a decent automatic system, and while the "professor of dupliety and quadrupliety" has been seeking new fields to develop his wonderful "will you walk into my parlor" powers, and actually inveighing those who ought by this time to know him thoroughly, Messrs. Foote and Randall have not been idle, and they now represent that by an invention and discovery they have made in automatic telegraphy, they can actually and practically double the speed obtained in the test above mentioned, without any increase of operating or other expense, and under a similar condition of circuits as before (which was very bad, there being but one wire out of thirty or more between New York and Boston in operation), making 960 words per minute to 340 by the Little-Edison system.

They further represent that they have improved the system, so that in the receiving there is no "tailing" or running together of the characters, nor can there be except, perhaps, on very long circuits.

They further represent that they have improved and simplified the perforator—a vital feature in automatic telegraphy—and that they can work longer circuits than are now worked automatically; and that they can work any circuit worked by the Little-Edison system two or more times as rapidly, so that if by that system 1,000 or more words per minute can be transmitted, by the Foote and Randall system 2,000 words can be transmitted per minute.

Now, with your knowledge of the details connected with the Quadruplex, the Electro-Harmonic, and the automatic, does it not seem to you a waste of time and money working circuits at from 90 to 100 words per minute when they can and should be worked at 1,000 or more?

Our friend Craig is greatly exercised on "express messages," and, as usual, he is about right; but by a good automatic system, properly utilized, why may not all messages be express messages, and a cent a word at that?

C. A. RANDALL.

A Reply to Mr. D. H. Craig and Defence of the Morse System and Operators.

TO THE EDITOR OF THE TELEGRAPHER.

IT IS NOT MY purpose to reopen a useless discussion of the relative merits of automatic and quadruplex telegraphy. I am constrained to write you, simply to record my protest against a libel upon the intelligence and independence of "Morse operators."

IN THE TELEGRAPHER of September 18th appears a letter from the pen of Mr. D. H. Craig, the well known advocate of automatic telegraphy against the world! In this communication he asserts that "telegraphing by quadruplex, Morse, or combination printing (the three systems in use by the Western Union Co.) is simply highly educated hand labor competing against machine labor, of which automatic telegraphy consists." So far, so good; but he also says, "The contest between the two systems is aptly illustrated in the hand needle of the last generation and the sewing machine of the present!" Here I beg to differ materially with him. The sewing machine is entirely made up of a positive motion, when one part works all work; not necessarily so with automatic telegraphy, because the apparatus will work right on when the wire (a part of the whole machine) has given out. Again, the operator of a sewing machine can see stitch by stitch if the work is progressing satisfactorily. Not so with the operator of the automatic. He must trust to luck until the communication is received entire, as it is utterly impossible for him to distinguish the words, as the machine writes them, upon the receiving strip, because of the rapidity with which it is drawn through the instrument. It might better have been likened to a locomotive running at a high rate of speed at night without a head light. If the track is clear the passage will be made as safely as it could be with a head light. If an obstruction should occur the injury is irreparable, should there be lives lost; but in automatic telegraphy, if the track (or wire) becomes obstructed during the transmission the injury is merely loss of time; not

irreparable, perhaps; but then the public have a harsh way of judging a delay by the telegraph.

But I am wandering from my subject, as much perhaps as my friend Craig did in the letter referred to on express messages.

After making the statement that Morse and printing telegraphy is educated labor against machine work, he says:

"Singularly enough even the Morse operators are aiding and abetting the great monopoly by joining in the opposition to the development of the automatic system, which, if they had a grain of common sense, they would recognize as the only possible barrier to a monopoly that looks to low salaries," etc.

With all due respect to Mr. Craig, I beg to ask, who advocates low salaries now? Could his ideas be carried out, or were they practical to any extent, he would (by his own statements) have the telegraph business of the country transacted by children, at baby wages! No, Mr. Craig, it is simply the presence of common sense, and more than one grain at that, that causes intelligent Morse operators to oppose the introduction of machine labor against their own educated hand labor.

With no desire to advocate monopoly I must in justice say, that the Western Union Company have paid, and do pay as good salaries as any company ever did. Their good, reliable men are kept as long as they wish to stay, and if their services are no longer needed at a given point, an effort is generally made to provide for them somewhere else. Mr. Craig should, "after twenty years' experience in telegraphy and press business," respect the ability of Morse telegraphers better than his assertions seem to indicate.

In closing, I cannot refrain from making a prediction, and that is this: should the practical workings of Gray's Telephone prove satisfactory (now highly probable), it will knock the automatic system so high that there will not be enough of it left to make even a smoke!

The automatic is a beautiful toy—but it is only in theory that its value is found—practically it is a failure, and must prove so except in instances where the wire can be crowded at its highest rate of speed continuously (a thing that never occurs except after a prostration of lines), and cannot be figured upon in regular business, no matter how heavy it is, as every practical telegrapher knows.

It disappointed the Atlantic and Pacific Company so much that, after reducing rates with a flourish on account of automatic telegraphy, they were glad to confer with the Western Union and restore the old figures again, because reduction did not pay!

I have merely written this letter to protest against Mr. Craig's libel (for such I consider it) upon Morse telegraphers, and for nothing else. If I have wandered somewhat, pardon me. I came to the conclusion, nearly a year ago that the discussion of the merits and demerits of automatic telegraphy through the papers was useless. It is easy to claim superiority or make wild statements without accompanying them with proof! MORSEITE.

The Philadelphia, Reading and Pottsville Telegraph.

PHILADELPHIA, PA., Sept. 19.

TO THE EDITOR OF THE TELEGRAPHER.

THE PHILADELPHIA, Reading and Pottsville Telegraph Company is probably third in importance among those represented here, but I will speak of it first, as I am better prepared to tell you about it now than I am of any of the others. The lines of this company, as they are traced upon the map, resemble a huge spatter. They include most of the Schuylkill mining region, and comprise a most complete tangle and labyrinth of loops and branches. The longest circuit owned by this company is the wires from here to Williamsport, which is some two hundred miles. Then there are several wires to Reading and to Pottsville, and two to Harrisburg. A line has recently been constructed to Easton, which loops up to Catasauqua, and takes in Allentown and Bethlehem. The total number of miles of wire owned is 1,925, the number of miles of poles 880, and the number of offices 286. I do not know whether this includes the eastern line or not. Number 34 has also been extended to Chester, and an office opened there for public business. Mr. C. T. Sellers is the Superintendent of these lines, assisted by Mr. H. W. Spang, with headquarters at Reading. Mr. Sellers has the reputation of being an efficient and able official, and he is a truly excellent man.

The main office of this company in this city is at 204 South Fourth street. It is very attractive in appearance and a model of neatness. The instruments are arranged on four tables of Western Union pattern, i. e., quartered with plate glass partitions, are of black walnut, and of very handsome and serviceable design. The switch board is constructed after a plan of Mr. Sellers', and is conveniently arranged for the accommodation of loops. Mr. O. W. Stager is manager, and Mr. F. W. Griffin chief operator. And I will pause here a moment to say

that the Philadelphia, Reading and Pottsville have exercised good judgment in the selection of their chief operator at this place. First, he understands and is eminently fitted to discharge his duties, and second, and of by no means least importance, he is in the fullest sense of the word a gentleman. He is quite as well pleased with accomplishing a desired thing by requesting it quietly and pleasantly, as he is if he is required to speak more decidedly. His pleasant and kindly manner gives an air to the whole room, for it is not lost upon his men. I wish there were more chief operators of this kind. At present, during a short absence of Mr. Stager, he is acting manager, assisted by Mr. Mayer.

The office has two drawbacks, otherwise it would be the most complete and nicest in the city. It is a long room, with windows only at each end, and those at the rear shaded by brick walls rising above them at the distance of only a few feet; so that it is only when these walls and the pavement in front are glaring in the sun that the room is sufficiently lighted, but so that the strain upon the optics is painful; and if the day is cloudy the gas is indispensable. Another trouble arises from the selection of instruments. The sounders are of the Partrick and Bunnell design, and the sound is so sharp, aided by the plate glass, that it seems that the inevitable result of a day's work among them must be to have one's head torn to atoms. Besides, it is very hard to distinguish the one particular instrument before you from the din and clatter of the rest. For instance, you give your sounder more stroke, deluded by the belief that you cannot hear it. The racket becomes deafening, and you find that you have been hearing it all the time, but it is so precisely like all the rest that you are unable to distinguish a dot from a dash or a space. The Phelps instruments used by the Western Union Company are undoubtedly the most suitable kind for large offices. Indeed, almost anything would be preferable to these, which were calculated for railroad offices where there is a great deal of other noise.

The force here consists of, besides those already mentioned, five operators, a delivery and a receiving clerk, an office boy and seven or eight messengers.

There are some eight branch offices in the city, besides numerous coal offices at which only the business of the company is done. As I have forgotten to say it before, I will conclude by saying now that the Philadelphia, Reading and Pottsville Telegraph Company and the Philadelphia and Reading Railroad Company are very near and dear kin; and then the Philadelphia and Reading Coal and Iron Company, not being farther removed than second cousin, at the farthest, makes it quite a strong and solid little corporation. MICAWBER.

Monthly Meeting of the American Electrical Society.—Proposed Amendments to the Constitution.—The Chicago Industrial Exposition.—F. W. Jones' New and Improved Quadruplex.

CHICAGO, ILL., Sept. 22.

TO THE EDITOR OF THE TELEGRAPHER.

THE regular monthly meeting of the American Electrical Society was adjourned this evening over until the third Wednesday in October, when the annual meeting takes place. There was no business transacted, as there were but three members present. There seemed to be a misunderstanding as to the time of the meeting. Nothing official was said or done at the preceding meeting in regard to having the meetings in the afternoon hereafter, instead of the evening, but a number of the members left the preceding meeting under that impression. Again, it seemed to be understood that a notice of the meeting would be given in some way, although this would, of course, seem unnecessary, and a number were expecting a meeting to be called previous to the regular meeting, for the purpose of deciding on what changes should be made in the constitution and by-laws at the annual meeting in October; but no special meeting was called, as it was probably thought unnecessary. This will explain the slim attendance at the regular meeting, and the failure to transact any business on account of not having sufficient members to form a quorum. The special committee, however, to whom was entrusted the arranging of the proposed changes in the constitution and by-laws for presentation to the society, to be acted upon at the regular annual meeting in October, have not been idle, but have gotten up the constitution and by-laws in the proposed revised form, and forwarded a copy to every member by mail, in order to prepare them in time to come to the annual meeting intelligently prepared to act on the proposed changes.

The proposed amendments provide for holding the annual meetings of the society at other places than Chicago each year (the place of holding the meetings to be decided upon from time to time at each annual meeting), the

formation of local or auxiliary societies at any point where three or more persons can be found sufficiently interested in the matter to form such societies; papers read before these societies to be forwarded to the main society. The local society to frame a constitution and by-laws in harmony with the main society. The headquarters of the society are still to remain at Chicago, the secretary and treasurer to be stationed here permanently, so that the society can have a legal standing, etc. All the other officers can be residents of other places. No doubt the society will aim, should these amendments be adopted, to have the President or a Vice-President elected in the locality where the next annual meeting shall be held; also the Board of Directors, or trustees, as the amendment calls them. It is thought by the members here that should the proposed amendments be adopted, it will be the means of greatly benefiting the society. No doubt a large local organization will be immediately formed here as soon as the changes are made.

As I promised your readers an account of the Exposition in this letter, I will have to keep my promise; but there is very little to write about, telegraphically speaking. There is not a single telegraph instrument manufactory represented in the building. Why this is I am at a loss to know, unless that the premiums have not been arranged so as to include this class of goods, or it may be proprietors of electrical machinery manufactories may consider the cost and labor, etc., not sufficiently remunerated in the advertisement their goods would get at such a place. The Western Union have a branch office at the grand entrance, just inside the doors; and the proprietors of the *Exposition Daily News* have a branch line run into the building to their printing press, from the A. & P. city wire, where they get copies of the American Press Association's despatches for their different issues. Mr. T. G. Rowan, formerly of the "floating gang" in the Western Union office here, is the operator for Messrs. Simms & McCormick, the proprietors of the spicy little *News*. They give the daily markets and all the leading news, and furnish quite a readable paper.

Outside of telegraphic and electrical apparatus the Exposition is a grand success, much better this year than any year heretofore.

"Tall oaks from little acorns grow," is a saying that is being verified from year to year (I believe the acorns ripen every year). You will doubtless remember that in your issue of February 27th, 1875, under date of February 8th, after speaking of a drawing made of the Prescott-Edison "Quad," to be explained by Mr. F. W. Jones (now the ass't manager of the W. U. office in this city) before the American Electrical Society, I remarked, "It is also expected that Mr. Jones will explain a new system of "Quad," his own invention, which I understand worked very satisfactorily in the Western Union office here on the evening of the 6th. I hope to be able to give you all the essential electrical points of this new "Quad," shortly, and probably a wood cut, by which it can be fully explained to the readers of THE TELEGRAPHER." After a few experiments, Mr. Jones became dissatisfied with the working of his "Quad," and began making improvements on it. Just about this time some different arrangement of the wires and switch board in the office were deemed necessary (an account of which I gave your readers at the time), which took up Mr. Jones' time entirely. Almost immediately following the completion of the office arrangements came the sudden changes in the management of the Chicago office; so that Mr. Jones had no time to devote to the improvement of his "Quad," until about two months ago, when he again went energetically to work. As the result of his labors he has mastered every obstacle, and has now one of the simplest and yet most perfect "Quadruplex" ever invented. For the past three weeks it has been worked almost every day in the Western Union office here on all four sides; Chicago working with Buffalo on one side, while Detroit and Chicago worked the other end as a local wire to Buffalo, having a repeater in at that point—Detroit. Thus one wire has been made to do the work of six Morse circuits between Chicago and Buffalo by the insertion of a repeater at Detroit. The circuits thus arranged have not taken as much balancing as a duplex generally does, very seldom having to be balanced after being started working in the morning, and sometimes not for several days. *It is without doubt a perfect "Quad."* Some of our best electricians in this vicinity, who have seen it work, have pronounced it such. Mr. Jones has great reason to be proud of his success. I am not at liberty at present to give your readers the electrical points of this "Quad," but will do so as soon as I am at liberty, and they can rest assured that they will get them through the columns of THE TELEGRAPHER before any other publication, as they have been accustomed to getting all important telegraph news heretofore. OCCASIONAL.

New and Unpopular Regulations.

CHICAGO, ILL., Sept. 23.

TO THE EDITOR OF THE TELEGRAPHER.

"It's nice to be a father;" yes, it is nice; and as to us

who are blessed with those little responsibilities, we can say so with a decided relish; but never, until the 17th day of September, 1875, did we know how peculiarly happy we were; oh, it is nice. It is also nice to be told by the management that they are doing all they can to effect a change in the workings of the office that will benefit the men; and after having this "stuffed" into you for two or three weeks, just when one might hope that there was to be some change for the better, to have the following "order" posted on the bulletin board:

"Notice.

"Hereafter seven hours will constitute a night's work. Operators will be credited with any excess of, or debited with any less than that at the rate of their present salaries.

"For the present the noon hour will be continued and paid for the same as though it was put in at night."

There, sir, you have the matter in a nutshell. The deed is done; the night force are captured, "rag-tag and bobtail;" the egg is laid, and when hatched, found to contain—nothing. The oldest men in the business have had the wool pulled over their eyes, and succumbed to the "superior wisdom" of the management. But the above order does not tell all the story; it doesn't say that the night men are to have their Sunday night "off" deducted—that must necessarily be omitted, to see if some one with an inquiring mind would not ask about it. Bah! Out upon such penuriousness. Now, it would seem as though the W. U. Company might allow the night men to have one Sunday off in five or six without deducting it, especially so, when the day men are off every Sunday, and Sunday day work paid extra for. It was amusing to see with what various feelings the night men read the notice. Beidler actually laughed until he dislocated one of his eye teeth; Cushing resembled a Dutch segar sign; Sam Wallace gave us the "French shrug," and said, "See them kick in a month or two;" Stoner, "that man of money," executed a flip-flap and stood on his ear at the idea of making fifty cents extra during the month; Root mimicked the management, and said "I've caught them again;" Fatty Stewart didn't want any extra, had no use for any since that tailor came from Elgin; Tallman said, "They were always kicking and will now;" Jake has good clothes and don't want any extra; Stevenson immediately squandered ten cents and had his boots blacked; Dorval said, "It won't help me get an overcoat; guess I don't want one any way, got used to doing without in Texas;" Goodrich felt his prospects "loom up," and immediately began telling us about "that girl;" Weller wanted to bet any man in the office a month's salary he could beat them a game of billiards; Austin increased the amount of tobacco in his mouth, and lectured us in the Sioux language; Kemp made arrangements to sell a corner lot, but has concluded to wait and see how the extra pans out; MacRobie takes one side of N. Y. duplex with Sam Wallace—Mac always has money, and, therefore, doesn't want the extra; Bracken looked serious, and has thoughts of engaging as clerk for a "three ball" friend on Madison street.

No one questions but what this "new departure" would have been a good one had it been taken early in the season; but coming as it does just when the dull part of the year is before us, and when the men expect to get off early, it is considered no more nor less than a piece of foolishness, and one that will be annulled early next year, as soon as business opens, when there would be some slight chance for the men to make something extra.

Now here is where the "kick" came in the first night: Kemp didn't believe he was off at 11:20; Cushing was frantically answering every call in the office in his efforts to stay until one o'clock; Beidler didn't want to go home, and asked to be kept till his seven hours were up. It is perfectly safe to say that the saloons will be none the richer at the end of the year if they depend on the extra money of the operators. Some one has said, "The longer you live the more you will find out;" whoever it was he spoke the truth, and we see it illustrated right here. The management have adopted a general system of espionage; they have placed in position and thorough working order one of the regular, old fashioned threshing machines, that is to say, registers, with all the necessary papers, etc., etc. The instrument is switched on some wire, and the mill set in motion to see what kind of Morse some unlucky artist is making in his endeavors to get off business. The next move in this childish game is for some chief to come over and tell you to "spaco your letters more," etc., etc., etc. The above arrangements are on a par with every other move of the manager towards benefiting the operators in this office. Will it hereafter be written of him that he, like Icarus, sought to fly too high, and had the wax which cemented his wings melted, causing him to fall a mass on the earth beneath. HARKAWAY.

A Special Premium for Subscriptions to "The Telegrapher."

THE summer season is about over, and we expect that the friends of THE TELEGRAPHER will now renew their efforts to increase its list of subscribers. The subscription list has been very well sustained during the summer, but as the days of vacations and excursions are over, we look for the usual increase of interest in the only truly independent telegraphic journal published.

It has been our custom for years past to share with those who kindly interest themselves in obtaining subscriptions by offering valuable premiums.

We propose this season to excel our former liberality in this direction. We desire to offer something of real and permanent value. We have accordingly made arrangements by which we are enabled to offer to the person obtaining 60 subscribers for one year, at the regular subscription price, \$2 per year, or their equivalent in shorter subscriptions, a

No. 1 WEED SEWING MACHINE;

for 65 subscribers a

No. 2 WEED SEWING MACHINE,

and for 70 subscribers a

No. 3 WEED SEWING MACHINE.

The price of these machines is respectively \$60, \$65 and \$70.

The machines will be boxed and shipped without extra charge.

This affords an excellent opportunity for female telegraphers, or for telegraphers who have wives or relatives that need these exceedingly useful machines which are in every respect first class, to obtain them at comparatively little trouble or expense.

Send in subscriptions as obtained, and they will be credited until the necessary number to entitle the sender to the desired premium is obtained.

To prevent disappointment, should any canvasser eventually fail to obtain the requisite number for a machine, they will be allowed other premiums proportionate with the amount collected, or, if preferred, 20 per cent. in cash on such amount. To whom shall we send the first machine?

Dominion Telegraphic Legislation.

WE have received a pamphlet entitled *A Review of Recent Telegraphic Legislation in Canada*, by Mr. F. W. CHESSEON, of London. It is a review of the recent telegraphic legislation of the Parliament of the Dominion of Canada, which is intended to force the surrender by the Anglo-American Telegraph Company of the monopoly which it holds, as the assignee of the New York, Newfoundland and London, and the Atlantic Telegraph Companies, of a monopoly of landing and maintaining telegraph cables upon the coast of Newfoundland. This is attempted in the interest of the Direct United States Cable Company, which also desires to land its cables and maintain stations in Newfoundland. The grant to the New York, Newfoundland and London Telegraph Company was made in 1854 for fifty years, but terminable at the end of twenty years by the Newfoundland Government upon a purchase of the property of the company. This the Newfoundland Government was not in a condition financially to make, and it is sought to force an abandonment of the exclusive right aforesaid, by withdrawing from the Anglo-American Company the right which it had acquired under an arrangement with the Nova Scotia Telegraph Company to land its cables and maintain its stations in the province of Nova Scotia.

An act for this purpose was passed by the Dominion Parliament in 1874, which was reserved for the Royal assent before it should become a law. The Royal assent was not given, however, on the ground that the subject of the bill was "one of those with which the Dominion Legislature has been, under the 91st and 92d sections of the Imperial 'British North America Act, 1867,' expressly empowered to deal." The subject was, therefore, relegated to the Dominion Parliament for further consideration. On February 8th, 1875, a new bill was introduced in the Dominion House of Commons, and although strenuously opposed by the representatives of the Anglo-American Company, was finally passed.

This is ostensibly a general act, and intended to establish and determine the formation and government of all telegraphs and telegraph companies within the Dominion. The provision to which special objection is made is as follows: "But no such letters patent or grant of corporate powers, to be exercised within the jurisdiction of Canada, shall be made to or conferred upon any company or association which possesses any exclusive privilege of landing wire or cable for a marine telegraph in or upon the coast of any State, Province or County in America, Europe or elsewhere, unless an equal or reciprocal right or privilege of landing wire or cable, and establishing a marine telegraph upon the same coast, is conceded to any and each of the companies in the first section of this act mentioned, or which may become incorporated in Canada under this section of the act, so that any company, incorporated or to be incorporated in Canada, may enjoy the same advantages in maintaining its marine telegraph line in and upon the same coast as the said company, which may possess such exclusive privilege."

Mr. CHESSEON sets forth at length the injustice which is done by this legislation to the Anglo-American Company, as the assignee of the original cable companies, who established Atlantic telegraphy at great risk, labor and expense, and which is now to be forcibly deprived of its only valuable exclusive privilege, that of landing its cables upon the coast of Newfoundland.

He makes out a strong case, and we have never been able, from such consideration as we have been able to bestow upon the subject, to see the justice of such legislation. It may be that the Dominion of Canada has the

legal right to thus nullify the grants of a province not included in the Dominion Confederation, without which it is doubtful whether, even to the present day, ocean telegraphy would have been established, but it certainly does not seem to us to be either just or equitable.

While we are not advocates of telegraphic monopoly, and are in favor of telegraphic competition, we certainly do not believe in forcibly depriving the Anglo-American Company of vested rights, which, originally of little value, have in the course of time become of great value, merely because it is convenient to do so.

The experience in working the Direct Cable has already demonstrated the fact that this injustice is not essential (however convenient it might be) to competition in Atlantic telegraphy.

We have not space to treat of this subject at the length it merits. The case is very clearly and forcibly set forth in Mr. CHESSEON's pamphlet, and it should be generally read by those who are interested in the matter.

New City and Executive Offices for the Atlantic and Pacific Company.

SINCE the consolidation humbug was disposed of the Atlantic and Pacific Telegraph Company is manifesting renewed energy and vigor, which is gratifying to all who deem telegraphic competition desirable.

It has for some time been evident that the accommodations at present occupied for the main and executive offices of the company in this city, at 198 Broadway, were unsuitable and inadequate, and the present management of the company have for some months been looking for better quarters. These they have at last secured, and the basement, first floor and upper story of the building No. 145 Broadway, corner of Liberty street, so long occupied by the Western Union Company, together with half of the second story of the two buildings on Liberty street, in the rear of 145 Broadway, have been leased, and will be immediately fitted up for occupancy. Since the Western Union Company vacated the premises they have been entirely remodelled—in fact, rebuilt internally—handsomely painted, wide staircases substituted for the dark and dingy ones previously in use, and the buildings put in first class condition in every respect, and they now are as light and handsome as any similar business edifices in that vicinity.

The location is an excellent one for telegraph business, and the Atlantic and Pacific Company will at once proceed to fit up the premises in first rate style for the accommodation of the several departments of their business and of their numerous customers. The premises leased will afford ample room for the accommodation of the telegraphic and executive departments, and additional room can be had in the buildings as the increase of the business shall demand it. The officers and employes of the company, and the customers of the line are to be congratulated upon the improvement in their accommodations, which will be made as soon as the premises can be properly fitted up. The offices of the American Press Association will also be moved to new quarters in the same building.

Practical Suggestions.

THE opening of the Autumn season is bringing in a very satisfactory increase of our advertising patronage, in fact crowding our advertising columns to their full capacity. This is gratifying, not only to us pecuniarily but as affording renewed evidence that THE TELEGRAPHER is a good and paying advertising medium. We are also liberally supplied with correspondence and contributions to its reading pages, which is also gratifying as showing that the paper is appreciated, and that the number of those who are desirous of addressing its readers is increasing.

Its circulation is also increasing, but not as rapidly as could be desired. At this season there should be a very material increase of subscribers, and we hope that every friend of an independent telegraphic journal will aid us as much as possible in adding to its list of subscribers

and readers. The pressure of advertising patronage and of reading matter make it desirable, and almost essential, that the size of the paper should be increased, and this we are ready to do whenever the number of subscribers will warrant the additional expense.

Will not our friends without delay engage in obtaining additional subscribers, and forward them to us? We offer liberal premiums and commissions to those who desire them, and hope to receive speedily a liberal response. The more general the circulation of THE TELEGRAPHER, and the more numerous its readers, the more beneficial and influential will it be.

The Proposed Centennial Telegraph Tournament.

THE proposition for a Telegraph Tournament, to take place during the Centennial exhibition at Philadelphia, which has appeared in THE TELEGRAPHER and *Electric*, appears to have met with much favor from the fraternity, and we hope to see it carried out. Such a trial of speed and proficiency of leading telegraphers would be very interesting, and the honor conferred upon the successful contestants of being acknowledged the most expert members of their profession, well worth striving for.

We hope soon to see some steps taken to give practical effect to the proposition, and would like to hear from those who have any suggestions of a practical nature to make in this direction.

Personals.

Mr. ERASTUS D. MOORE has been transferred from the St. Louis to the Kansas City, Mo., Western Union office.

Mr. CHARLES E. SMALLS, of St. Louis, Mo., has been appointed to a position in Galveston, Texas, Western Union office.

Mr. SAMUEL M. ALLEN, a well known telegrapher, was married to Miss MAY GOODING, at Lockport, Ill., on the 16th of September.

Mr. J. W. SHRYOCK, of the Kansas City, Mo., Western Union office, has resigned.

Mr. ALFRED BREWER has been appointed to a position in the Western Union office at Denison, Texas.

Mr. A. E. TOWSLEE, of Ashland, Ohio, has accepted a position in train despatcher's office of the Atlantic and Pacific R. R., at St. Louis, Mo.

The Telegraph.

By Cable.

TEMPORARY TELEGRAPHIC INTERRUPTION.

LONDON, Sept. 27, 5 A. M.—The weather has been tempestuous, and the storm has deranged temporarily the telegraph wires in the North, and the communication of the Direct United States Cable Company's lines with the Ballinskelligs is interrupted.

THE LAND CONNECTION OF THE DIRECT CABLE AGAIN WORKING.

LONDON, Sept. 27.—The land lines connecting with the Direct United States Cable, which were temporarily interrupted yesterday, are again in good working order.

The Direct United States Cable Broken.

AT one o'clock P. M., on Monday last, the long section of the Direct United States Cable was broken, and the business of the line, which had exceeded the most sanguine anticipations of the company from the first day it was opened to the public, for the present suspended. This new misfortune is greatly to be regretted, but it will be only temporary, as the cable will be repaired as soon as a repair steamer, which has probably been despatched from London before this time, can reach the locality.

The Faraday, having completed the laying of the cable, and finding everything in first rate condition, had returned home, or the interruption would not have continued for more than three or four days.

The break in the cable has been located near the entrance to Placentia Bay, about fifty miles from Cape Race, where the water is shallow, and where little difficulty will be experienced in raising and repairing it. The French cable has been broken two or three times in this vicinity. The water is so shallow here that vessels frequently anchor on this ground, and it is supposed that

the damage was caused in that way. As only twenty-two of the thirty days for which the contractors guarantee the cable after its completion, had elapsed, the expense of repairing the break comes upon Messrs. Siemens Brothers, but the loss of business falls upon the Cable Company.

The section of the cable upon which the break has occurred had been laid fifteen months, and had been in perfect order during all that time, and the present difficulty is the more annoying on that account.

Up to the occurrence of this difficulty the entire system had worked as well as could be desired, and the tests of the cables were entirely satisfactory.

This interruption will no doubt demonstrate to the Direct United States Cable Company the absolute necessity of laying a second cable at the earliest possible time, and also of keeping a repair steamer on this side of the Atlantic ready to remedy any difficulty which may arise without damaging delay.

The International Ocean (Cuba) Telegraph Company's Cables.

AS was stated in THE TELEGRAPHER last week, a new cable is being laid between Key West and Punta Rasa, Florida, to replace present cables, which have been seriously damaged by the borers, an insect which is very troublesome to telegraph cables, especially in tropical regions. If from untwisting of the outer wires of the armor of the cable the smallest portion of the core is exposed, these borers soon eat away the insulation, and either entirely destroy or greatly impair the conductivity of the insulated conductor. The cables heretofore laid between Key West and Punta Rasa have been thus damaged, and the new cable has been specially manufactured by the India Rubber and Gutta Percha Co., at the Silvertown Works, near London, with a view to overcoming this difficulty, it being a compromise between the ordinary deep sea and shore end cable. The main body of the cable weighs four tons, and the shore ends twelve tons to the mile. It is 126 miles in length, and was shipped last June in the Western Union Co.'s steamship Prof. Morse, and arrived at Key West on the 25th of July last. On account of the prevalence of yellow fever at that port, it was not deemed safe or proper to expose the officers, crew and cable employes to the epidemic, and the steamer was, therefore, ordered temporarily to Port Royal, where she remained until about two weeks ago. In a few days it is expected the new cable will be laid, and reliable telegraphic communication reestablished. It should be understood that electrical communication between Key West and Punta Rasa has not been at any time entirely suspended, but the escape on the cable, from the cause mentioned, has rendered communication difficult to maintain.

The International Ocean Telegraph Company, in addition to the Key West and Punta Rasa Cables, which connect its system with that of the Western Union Company, have laid three cables between Key West and Havana. The first, which was laid in 1867, and which continued in operation for three or four years, has been entirely abandoned. The second was laid in 1870, and until recently has been working well, but is now out of order. The Prof. Morse, after laying the Punta Rasa cable, is to grapple for and repair this. The third and last was laid in 1873, and is in good condition. When the present Punta Rasa and Key West cable is laid, and the second Havana and Key West one is repaired, the system between these latter points will be duplicated, as it has been with the West India system to Demerara and other points. Beyond Demerara the cables are open for public business to Para, and from thence to Peruambuco, communicating with the Brazilian telegraph system, and also with the Brazilian cable across the Atlantic. Thus there is a perfect telegraphic circle between Europe and North and South America.

Annual Meeting of the Gold and Stock Telegraph Company.

THE annual meeting of the Gold and Stock Telegraph Company was held at the Executive office of the company, in this city, on Tuesday last. The following gentlemen were elected directors of the company for the ensuing year: William Orton, Norvin Green, T. R. Edson, J. H. Banker, Marshall Leferts, A. B. Cornell, H. R. Pierson, G. B. Prescott and Augustus Schell. The following inspectors of election were also chosen: C. Livingston, J. H. Fisher, S. M. Taylor.

After the election the new Board of Directors held a meeting, and elected Marshall Leferts, President; Geo. B. Prescott, Vice-President; Henry H. Ward, Secretary and Treasurer. The President's annual report, which was read to the meeting, stated the company to be in a satisfactory and flourishing condition, and its prospects for the future excellent. During the past year a dividend of three per cent. had been declared, although for a large part of the time, owing to competition in this city, a por-

tion of the business had been done at very low rates. Remunerative prices have been reestablished, and there is every reason to believe that hereafter the company will be able to declare regular semi-annual dividends of 3 per cent.

The service of the company is in excellent condition, its business large and increasing.

The old Board of Directors was reelected with the exception of George H. Mumford, deceased—Mr. Schell taking his place. The Executive officers of the company were reelected by the directors without opposition, the excellent condition and prospects of the company being their best recommendation and endorsement.

The Telegraph in Central and South America.

By a letter from Mr. S. McNider, dated at Guatamala, Sept. 8, information is received that he is still engaged in the construction of telegraph lines for the Government, but expects to conclude existing contracts within the present year. There will be about thirty offices on the line, and he expects to have new contracts as soon as the present one is completed. The work of telegraph construction is steadily proceeding in the Central and South American States, and they are being covered with a network of wires, which are owned and operated by the governments.

The Government of Nicaragua made a contract on the first of September for the construction of 200 miles of telegraph line to connect the two Pacific ports, Corinto and San Juan del Sur, with a dozen offices, including the principal towns.

Mr. McNider writes that the Guatamala lines have done well, better than could have been expected in a country not more fully developed, and accustomed to use telegraphic facilities. The tariff is low—25 cents. The receipts of the Guatamala office is \$600 per month in cash, in addition to which the Government messages amount to from \$300 to \$400 per month.

By advices from Panama to the 17th Sept., information is received that the submarine cable has been laid as far as Caldera, whence inland communication is established with Buenos Ayres and Rio Janeiro.

The Presidents of Peru and Chili have exchanged congratulations with the Emperor of Brazil and the President of the Argentine Confederation on the completion of the new link between the countries.

Foreign Telegraphic Notes.

THE receipts of the Submarine Telegraph Company for the month of August last amounted to £9,864. The receipts for the corresponding month last year amounted to £9,195.

The traffic receipts of the Eastern Extension, Australasia and China Telegraph Company, for the month of August last amounted to £20,072, and for the corresponding month of 1874 to £19,697.

The traffic receipts of the Brazilian Submarine Telegraph Company for the month of August last amounted to £10,032, as against £9,761 for the corresponding month of 1874.

The traffic receipts of the Eastern Telegraph Company for the month of August last amounted to £30,005, and for the corresponding month of 1874 to £31,265.

The directors of Hooper's Telegraph Company have notified the Stock Exchange that they have discovered certain defalcations on the part of their secretary, but they do not state to what extent his defalcations have been carried.

The number of messages sent over the lines of the Cuba Submarine Telegraph Company during the month of August was 2,279, estimated to produce £2,200, against 1,750 messages, producing £1,622 in the corresponding month of last year.

The traffic receipts of the Direct Spanish Telegraph Company for the month of August last amounted to £1,773, against £1,282 in the corresponding period of last year. The average time occupied in the transmission of telegrams between Madrid and England via Santander during the month of August was 3 hours 4 minutes, including transmission over Spanish land lines.

The average time which the messages occupied in transit from Calcutta was 66 minutes, and from Bombay 56 minutes; the average time in transit of outward messages between London and India for the week ending the 1st of August, 1 hour 23 minutes; week ending the 8th of August, 1 hour 26 minutes; week ending 21st, 1 hour 18 minutes; and week ending the 28th of August, 1 hour 22 minutes.

The directors of the Indo-European Telegraph Company, at their Board meeting, September 7th, declared an interim dividend for the six months ending the 30th of June last, at the rate of five per cent. per annum, payable on and after October 1st.

The traffic receipts of the Western and Brazilian Telegraph Company, telegraphed from Brazil for the four weeks ending the 27th of August, were £8,543 4s. 5d.

The traffic receipts of the Anglo-American Telegraph Company,

Table with columns for month (August, Sept.), day, and amount in pounds and shillings.

In a paper read before the Auckland Institute, on the best route for a submarine cable between Australia and New Zealand, Dr. Purchas gives a preference to the route from Botany Bay to Ahipara Bay, near the North Cape, Auckland.

Negotiations are said to have been opened between France and England for reducing the telegraphic rate between the two countries.

Telegraphic communication has been opened with Gladstone, in the northern agricultural regions of South Australia.

The number of messages despatched by the Great Northern Telegraph Company, in the first seven months of this year, was 416,468, as compared with 458,134 in the corresponding period of 1874, showing a decrease this year of 43,486 messages.

The Central American Telegraph Company announce that the cable between Para and Demerara, touching at Cayenne, is now open for public messages, thereby giving direct communication between North and South America.

Quadruplex telegraphy has very recently been accomplished on the Madras Railway Telegraph. The system which Mr. G. K. Winter, the telegraph engineer, invented in March last, proved perfectly successful on 80 miles of line, and its extension to lines of greater length is simply a question of additional condensers and battery power.

Direct communication has been effected between Continental Italy and the Island of Sardinia, by means of the new submarine cable laid between Orbetello and Terranova. The nucleus of the cable consists of seven copper wires, covered with thin layers of gutta percha, alternating with thin layers of Chatterton's composition.

The traffic receipts of the West India and Panama Telegraph Company amounted in June, 1875, to £3,482, as compared with £2,865 in the corresponding period of 1874.

It is stated that in consequence of a forged bill for £7,000 having been negotiated, the directors of Hooper's Telegraph works intend to appeal at once to the shareholders, there being no more capital to call up.

The Western and Brazilian Telegraph Company announce that messages for Valparaiso and Chili can again be accepted by the Eastern Company, or any postal telegraph office, if addressed and prepaid to their destination.

Telegraphic and Electrical Brevities.

St. Louis, Mo., Western Union office, is happy in the possession of five sets of duplex, which are kept in constant use on New York, Cincinnati, Kansas City, and two on Chicago circuits.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Aug. 17, 1875, and bearing that date.

166,712.—TELEGRAPH TRANSMITTERS.—H. Middleton, Charleston, S. C. [Filed June 10, 1875.]

1. The finger springs a2, in combination with the finger keys K and K' and insulated core; a1, substantially as and for the purpose described.

2. The finger keys K and K', having springs g applied thereto; as shown, in combination with the metallic letters V4, substantially as and for the purpose described.

166,859.—CHEMICAL TELEGRAPHY.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed July 25, 1874.]

Current passing through moistened paper causes evolution of hydrogen, which, uniting with tellurium of stylus, forms hydro-telluric acid, leaving red mark on paper.

1. The method of recording telegraph or other signals by the electro decomposition upon moistened paper or other material of a stylus tellurium.

2. A paper moistened with hydrates of lime, potash, or the cyanides of potassium, for use with a tellurium stylus, for the purpose set forth.

166,861.—CHEMICAL TELEGRAPHY.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed July 25, 1874.]

Oxygen evolved at stylus raises protoxide to a sesqui or peroxide, which combines with the sulpho-cyanide of potassium, to form red sulpho-cyanide of iron.

The combination of a protosalt of iron, sulpho-cyanide of potassium, and a non-oxidizable stylus, for the purposes set forth.

166,876.—COMPOUND TELEGRAPH KEYS.—Marcus L. M. Hussey, Menlo Park, assignor of one half his right to George W. Barker and William Ettinger, Jersey City, N. J. [Filed Aug. 5, 1875.]

In base of key is formed a switch board, so that by revolving the key it may be thrown into any desired one of the circuits connected thereto.

1. The combination, with a single key, of one or more anvils, each representing a different wire or circuit, and all so arranged that the movement of said key or its support serves to bring said key into suitable connection with any desired one of said wires or circuits, substantially as described.

2. The combination of a single key lever, contact point, and anvils, as described, with a connector and local contact, so arranged that upon the movement of said key to connect with any one of the line circuits the local battery and proper sounder connections are simultaneously made, substantially as and for the purposes set forth.

3. The combination, with the main or operative lever, of an auxiliary or spring lever, adapted to hold the main circuit closed when such circuit is not in use, whereby but a single contact point is needed, substantially as and for the purposes set forth.

4. The combination of two discs or plates, one provided with a single key lever and the other provided with one or more contact points, through which various telegraphic circuits pass, one plate being movable in relation to the other, whereby the movement of one plate upon the other brings the key lever into position to operate any desired circuit of the series, substantially as set forth.

5. The combination of the key, the table C, and spring O with posts M, circle connector M', and post N, substantially as and for the purposes set forth.

6. The combination of the key A and latch spring A' a with the circuit plate G, posts K and I, substantially as and for the purposes set forth.

166,877.—ELECTRIC LIGHTS.—Steven Alexandrovitch Kosloff, Paris, France. [Filed June 23, 1875.]

1. The carbon electrodes provided with insulated supports independent of the metallic conductor, substantially as herein described.

2. The combination of the carbon pins f, having the enlarged ends d, with the metal conductors e, inserted into the said enlarged ends of the carbons, substantially as shown and described, for the object specified.

3. The combination of the carbon pins f, having the enlarged ends d, the wires z, and the links a, flexibly connecting the said wires and the principal conductors, as herein shown and described.

4. The supporting column h, arranged within and filling a portion of the globe or cover k, substantially as and for the purpose herein specified.

166,911.—PRINTING TELEGRAPHS.—Alois Wirsching, Brooklyn, E. D., N. Y. [Filed Apr. 29, 1875.]

Circuit to printing magnet is through a metallic pin upon escapement wheel, and a metallic pin attached to insulated collar upon type wheel shaft, the two being brought together by the stopping of the escapement wheel. When the wheel begins to revolve the pin upon it is carried forward by the stress of the coiled spring against a non-conducting pin projecting from the insulated collar.

In combination with the escapement wheel, mounted loosely on the type wheel shaft of a printing telegraph, and connected to the same by a spiral spring, and with the armature of the line magnet, the pins g h k, insulated metallic collar j, spring m, and printing magnet C, substantially as and for the purpose set forth.

6,599.—ELECTRO-MAGNETIC HOUSE ALARMS.—Wm. G. Russell and Abraham Firth, Boston, Mass., executors of William Whiting, deceased, assignors to Edwin T. Holmes. Patent No. 20,970, dated July 20, 1853; extended seven years. [Filed July 23, 1875.]

1. The improved house alarm, substantially as hereinbefore described, consisting of the combination of the following elements, viz: First, a series of electro-magnetic circuits; second, an indicator to designate the respective circuits; third, an alarm apparatus common to all the circuits of the series; fourth, the window or door springs—the whole operating, as set forth, to put in operation the alarm apparatus that is common to all the circuits of the series, and to indicate the particular circuit of the series which is attacked.

2. The combination, substantially as before set forth, of the following devices, viz: the series of magnetic circuits, the alarm apparatus common to all the circuits of the series, and the switch for disconnecting a particular circuit of the series of circuits from the alarm apparatus without disconnecting the remainder of the series of circuits from the apparatus.

Born.

POPE.—At New York, Sept. 29, 1875, to the wife of Mr. H. W. POPE, Superintendent American District Telegraph Co., a son.

THOMPSON.—At San Diego, Cal., Sept. 9th, 1875, to the wife of Mr. J. W. THOMPSON, Manager of the Western Union Telegraph office, a daughter.

A GREAT REDUCTION IN PRICES!

I am now making a speciality of my PHIL. SHERIDAN SOUNDER AND KEY, and am manufacturing them in large quantities, so that I am able to offer them to the public at a very low figure.

PHIL. SHERIDAN, \$4.00.

The above cut represents a beautiful little Sounder. It is made of the best material and highly finished. It has a heavy lever, full sized magnets, and altogether is a first class instrument. The magnets are wound with green silk insulated wire.

A PHIL. SHERIDAN KEY TO MATCH,

PRICE, \$2.00,

is a first class Key in every respect. It is highly finished, has large platinum points, strong lever, friction circuit closer, spring adjustments, etc., etc. As a Learner's set they have no equal, as they are regular Telegraph Instruments, same as are used on all railroad and commercial lines.

And I will sell the Key, Sounder, 1 full sized Callaud Battery, 1lb. Blue Vitriol, 1 Double Connector, 1 Book of Instructions, 15 feet Connection Wire, etc., making a complete outfit for office use, for only \$7.50. These instruments will be made to work on a circuit from a few feet to five miles at the same price, and will be sent to any address on receipt of price, or will be sent C.O.D., subject to inspection. Don't fail to send for my Descriptive Circular and Prices. Address,

A. B. LYMAN,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

- First*—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.
Second—The **Automatic Signal Boxes**.
Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.
Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System
OF
FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the **People, Municipal Authorities,**

AND THE
PRESS

throughout the **UNITED STATES** and **CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY, RELIABILITY and **ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES** and the **DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

C HARLES T. CHESTER,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These Instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE.

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor **SILLIMAN**, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article or other purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with **KERITE COVER**, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine **ELECTROPOION BATTERY**, with Patent Platina Connection, introduced by us eight years since; also, the **ALPHABETICAL OR DIAL TELEGRAPH**, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a **SOUNDER** that will work practically with a single **DANIELL** cell, a **BATTERY** that does not require to be taken down but once a year, and the very best **MAIN LINE SOUNDERS** made

Our **CATALOGUE**, embracing a large amount of new matter and description, is now ready for distribution.

WHOLE No. 482.

Original Articles.

The American District Telegraph Company.

ONE of the greatest, if not the greatest desideratum in a city of such peculiar topographical conformation as New York, is a quick and certain system of intercommunication, by which term is not merely included the "rapid transit" of passengers, but, in a still greater degree, a means of rapidly forwarding communications of every nature. Five years ago a business man who desired to send an important communication to a distant part of New York, Jersey City or Brooklyn, and receive a reply thereto, had several courses open to him. First, he could write a letter and deposit it in the post-office or a lamp-post box. If he had ordinarily good luck, he might reckon upon receiving an answer nearly as soon as if his correspondent resided in Boston or Buffalo—say the next day, or perchance the day after. Secondly, he might have had recourse to the local telegraph lines. In this case the time required to procure an answer from any part of New York or the surrounding cities, would perhaps not exceed that required to accomplish the same feat with a correspondent in San Francisco or London—say from three to twelve hours—with a moral certainty that either the message or the reply would have suffered some extraordinary transformation, either ludicrous or exasperating, as the case might be, but in most cases tending to defeat the entire object of the communication. Thirdly, he could send his errand boy. It would be superfluous to enlarge upon the little idiosyncrasies of the average errand boy. Who has not seen his package, or what not, stowed carefully away on the steps of some house, while he pitched pennies or played marbles and leap-frog with his numerous companions, with a charming sense of utter freedom and lack of responsibility? Full well this experienced youth knows that his employer could not tell, very likely within two hours, how long the trip ought to take him, and even if he did, that in the multiplicity of his cares he is probably wholly un mindful of the flight of time. If this interesting juvenile is called to account for the delay, he is always ready with plausible excuses, as plenty as blackberries, which cannot be proved invalid without the expediture of more time and trouble than any one can afford to devote to it, and so he usually escapes detection and punishment. Fourthly, he might adopt Dr. Franklin's rule, that "if you want your business done, go yourself;" and in matters of immediate and pressing importance, this was really the only resource. No matter how valuable a person's time might be, or how great an amount of trouble it might involve, he was frequently obliged to sacrifice a considerable portion of a day in attending to some errand, trifling in itself, but which could not from its nature be entrusted to any one except a messenger who could be depended upon to perform it with promptness and accuracy. It is almost needless to say that messengers having these qualifications are not usually to be found at a moment's notice.

This great want of a city like New York is now completely supplied by the messenger corps of the American District Telegraph Company. The service is performed by them in a manner so thoroughly efficient, expeditious and cheap, as to have given, during the three years or more that it has been in operation, the most entire satisfaction in every respect to its patrons. The messenger service, although the principal part of the business of the company, by no means comprises the whole of it. The police, watch and fire service forms an important branch of the service, as will hereafter appear.

The general plan upon which the business of the company is organized is very simple. The city is divided into geographical districts, and in each district is located a central office, the arrangement being such that any point within the district may be reached by a messenger from the central office within three minutes. The telegraphic system of each district is complete in itself, and is very similar to that of a city provided with Channing and Farmer's fire alarm telegraph. Each subscriber within the district has a signal box placed in his house, and connected with an electric circuit, both ends of which are at the central office. The signal box consists merely of a small iron box, not larger than a coffee cup, with a

crank on the outside, which is capable of being moved so as to point to either one of three indications, viz., "Messenger," "Police," and "Fire." Each signal box is known at the central office by a designating number. When any box is pulled, a clock-work within the box is wound up, and in running down causes a break wheel to revolve, which inevitably transmits that particular number and no other to the central office, simply by breaking the circuit a proper number of times in succession.

This being understood, we will now glance at the arrangement in one of the district offices. This is almost precisely the same in all the offices, the only essential difference being in the amount of business transacted, which is, of course, much greater in some parts of the city than in others. A railing in the front part of the office encloses the manager and his clerks, together with the instruments. At the rear are provided accommodations for the messenger boys. These are under the charge of a sergeant, who for ability and good conduct has been promoted from the ranks. It is his duty to preserve order and to indicate to the boys their respective turns for answering calls. Upon the counter within the railing are placed several recording instruments, corresponding in number to the number of circuits connecting with the office. Each circuit starts from the office, takes in a certain portion of the territory covered by the district, including not more than 75 or 80 instruments, returning by a different route, so that both ends of the wire are attached to the two poles of the battery in the office. Each circuit is provided with its own battery, recording instrument and signal bell, and also with a case of small drawers, the latter corresponding in number to the signal boxes in the circuit to which it belongs. In each of these drawers are placed a quantity of small printed tickets, upon which is printed the address of the subscriber, the number of the city fire alarm station nearest thereto, etc.

The process of receiving and answering a call is as follows:

John Smith, of 147 Broadway, wants a messenger; he pulls the lever of the signal box to the corresponding indication. Instantly the bell connected with circuit No. 3 in the district office strikes *ting, ting, ting—ting, ting*, and simultaneously a corresponding indication is made upon a strip of paper by the recorder thus: — — — —

The manager instantly refers to the paper and reads the above indication, meaning "32." He then pulls out drawer 32 in case No. 3, taking therefrom a ticket, upon which is legibly printed "John Smith, 147 Broadway." The clerk announces the hour, say 10:15, and the number of the messenger, say 75. These figures are quickly written upon the ticket, and away goes messenger No. 75 with a rush, ticket in hand. The sergeant calls "next," and another messenger takes his place in the seat of the departed 75. Within three minutes the latter reports himself at the office of Mr. Smith, with a military salute, and presents his ticket. Mr. Smith orders him, perhaps, to take a package to some place in Brooklyn, and writes upon the ticket where the boy was sent. The recipient of the package is also required to sign a receipt on the ticket, and, when the errand has been satisfactorily performed, Mr. Smith countersigns the ticket, the boy returns to the office and delivers it up to the clerk, who marks the time of return and charges "No. 32," by which designation Mr. Smith is known in the office, at the rate of thirty cents an hour for the time occupied.

A "police" call gives precisely the same number as the messenger call, except that the signal box is so arranged as to repeat it twice, both on the bell and the register, while a "fire" call in like manner is denoted by three repetitions of the signal. When a "fire" call is received, a policeman, armed with a fire extinguisher, starts at once for the scene of trouble, while, if necessary, a messenger, provided with a red flag or signal lantern, goes at once to the nearest city fire alarm box, turns in an alarm to the department, and stands by the box ready to direct the fire department instantly to the point where they are needed, as soon as they arrive, so that no time is lost.

One of the most valuable adjuncts of the system is the patrol or private police service. The patrol force of the company is required to inspect the houses of the subscribers at stated hours during the night, not merely passing by and casually glancing up at the windows, but making a thorough investigation, to be certain that everything is secure. At each end of every patrolman's beat, and if necessary, at intermediate points, signal boxes are placed, from each of which a signal must be sent in by the patrolman at specified intervals. If any trouble is discovered assistance can be summoned from the district office instantly. Arrangements have also been made by which any subscriber is promptly notified by telegraph, at any hour of the night, of any occurrence in or about their place of business which it is desirable that they should know.

Another arrangement, which has been adopted by many large establishments, is that of placing a signal box within their building, from which the night watchman is

required to send in a signal to the district office at stated intervals during the night. In case any signal is not promptly received when due, a proper person is at once despatched from the office to ascertain the cause of the delay. A report signed by the manager is sent to the firm every morning, showing the time each signal was received, which serves as a perfect check upon the faithfulness of the watchman.

The ordinary domestic burglar alarm, which is now so extensively used, is often connected with the American District system, so that if any attempt is made to enter the house thus protected, whether occupied or unoccupied, an alarm is instantly sounded and recorded at the district office by the ever vigilant sentinel.

Thus we have briefly indicated the general nature of the service performed by the American District Company, but it is almost beyond the power of words to convey an adequate idea of the thorough system, order and promptness which distinguishes every department. Everything is carried out with military precision and accuracy. For example, when a new subscriber is placed in connection with the system, a form is required to be filled out, in which it is stated by whom the outside and inside wires were run, by whom the instrument was connected, number of the instrument, number of the signal, and many other details, including a diagram of the block in which the house is situated, showing the exact location of the wires, etc. This, after having been signed and approved by the proper officials, is placed on file, and the diagram transferred to the general map. A record is also kept of all interferences with the wires, defects in instruments, etc., showing the time reported, time remedied, and nature of the trouble, by reference to which the difficulties most liable to occur can be ascertained and provided against.

One of the most interesting features of the organization is the messenger department at 62 Broadway. All applicants for positions in the messenger corps are required to fill out a form, stating their name, age, birthplace and residence, where last employed, and references, together with a specimen of their handwriting. The ages are required to be between 14 and 16, and the references must be to well known and responsible parties. If accepted, they are equipped with a handsome uniform, consisting of a dark blue cap, coat and trousers; the two latter are neatly trimmed with red cord, and the cap bears a badge lettered "A. D. T. Co.," together with the messenger's number. A complete waterproof suit is also provided for wet weather. After having received his uniform the new messenger is assigned to duty in one of the district offices, and is sent out for a few days in company with an experienced one, until he becomes somewhat familiar with his duties. Each boy receives a salary of \$4 per week. If he is faithful, industrious and intelligent, he will probably, after a time, be promoted to the position of sergeant, clerk or assistant manager, with a considerable increase of pay. Each district manager is required to make a weekly report of the general conduct of the boys under his charge. This is arrived at by a system of marks, ranging from 1, "best," to 7, "intolerable," in each of the following particulars: Promptness, conduct, industry, obedience, cleanliness and dress. Each boy's record is entered up in a book at the superintendent's office, and if he falls below a certain standard, his services are dispensed with. This rigid and impartial system of discipline furnishes the best possible training for boys, and as an evidence of its great practical value, it may be mentioned that of the whole number of boys employed since the company commenced operations in 1872, numbering 3,300, the records show that not less than 70 per cent. have resigned in order to accept better positions with private parties and business firms, who had become acquainted with their good qualities while they were employed in the American district messenger service. Another remarkable evidence is in the fact that although the company has constantly in the service nearly 500 boys, who are being employed on all sorts of errands of trust and responsibility, the total amount of losses paid by them during the past year, arising from accident, negligence, incapacity, and dishonesty on the part of messengers, have amounted to only about \$100. The average length of service of each boy is found to be six months. None are ever discharged for any cause except incapacity or bad conduct. Those who resign to accept higher positions with private parties are always furnished with suitable recommendations. The system of supervision is so complete and effective, that the dishonest, indolent and incapable are quickly weeded out, and the result is that it would be hard to find a more active, intelligent, gentlemanly and generally well-behaved community of boys in any position in the world than those engaged in the service of this company.

The services which these messengers are set to perform are so numerous as to almost defy classification. They are frequently sent on errands to neighboring cities, even as far away as Philadelphia. In case of a run on a bank or a rush for concert tickets, they are often employed to keep a place in the line for some one. Frequently they are employed by the week to escort young girls to school

and home again; to take children to the park for an airing; as guides to show strangers about the city; and as detectives or "spotters" on stage or horse car lines. A prominent firm on Broadway has called in a boy for several days in succession to act as cashier; editors of morning papers frequently employ them at night to carry copy to the office. It is said that P. T. Baruum once signalled at eleven o'clock P. M. for somebody to play euchre with him; and that at another time a boy was called in to rock the cradle, and again to play the fiddle. Not long since one of these boys discovered a noted forger in a restaurant in the Bowery, who was "wanted" by the police. He quietly notified a detective and the criminal was arrested. It would require too much space to relate a tithe of the curious and amusing incidents that have occurred from time to time in connection with the messenger service of the company. One important branch of business that is carried on by means of the messenger corps deserves special mention, and this is the arrangement for delivering circulars, cards, etc., addressed and unaddressed. It will be obvious that when boys are employed by the week their time must be paid for whether they are busy or not.

Now it happens that the business fluctuates greatly, not only from day to day but more especially at different hours of each day. For example, the most active period in each day is probably from eleven to twelve or one o'clock, after which the business gradually diminishes till between five and six P. M., when there is comparatively little doing. Between six and eight P. M. it revives again, and then gradually falls to its minimum, which is from four to five A. M. By taking advantage of those periods during the day, when experience shows that few calls may be expected, a large portion of the force may be set to distributing circulars, wedding cards, advertisements, etc., at little or no extra cost to the company, which is thus enabled to do the work at very low rates.

During the past year more than two millions of these documents have been delivered by the force, of which 288,000 were delivered to parties addressed and duly receipted for. On one occasion 148,000 addressed circulars were delivered in a single day by the company's messengers, in addition to the regular business. The company have so organized their corps that, if required, they can deliver 50,000 unaddressed circulars in an hour's time, or, if necessary, can put one into every house in the city of New York. When delivered in this way they are sure to reach their intended destination, as any attempt by the messengers to evade their duty, by throwing away the circulars or otherwise, is morally certain to be detected and punished.

This company occupies sixteen offices in different parts of the city, in connection with the Western Union Company, and by a special arrangement with the latter, delivers all its messages from these points. The records show that the average time occupied in the delivery is but a little over seven minutes, which is remarkably quick work.

The offices and battery rooms of the American District Company are models of neatness, good taste and thorough workmanship. The office wires are strung as accurately and systematically as the wires of a grand piano; the batteries are of the unequalled spiral pattern, known as the Lockwood, which in endurance and economy is far in advance of any other in use, and they are not only beautifully arranged, but are kept in splendid condition.

The American District Company commenced operations in the spring of 1872. The telegraphic system employed, which is based upon the well known Channing and Farmer fire alarm, was originated by Edward A. Calahan. Many subsequent improvements have been made in it, especially by William H. Sawyer, a former superintendent. The present officers of the company are as follows: President, E. W. Andrews; Vice-Presidents, A. B. Cornell, J. N. Gamewell; Secretary, C. B. Hotchkiss; Treasurer, A. W. Greenleaf. H. W. Pope, a young but experienced telegrapher, is Superintendent, and F. D. Farrington, Assistant Superintendent. J. S. Ashhurst is Superintendent of the messenger service.

The company have 25 district offices and over 3,500 signal boxes in the city of New York, and employs in all about 550 persons. The American district system is rapidly becoming one of the most indispensable adjuncts of modern life, and before the lapse of many years a telegraphic signal box and burglar alarm will be as much a part of the regular equipment of an ordinary residence as the gas and water fixtures are at the present day.

The district telegraph system has been introduced in a number of other cities of the United States, although, as might be expected, the New York organization is much the largest and most complete of any. An inspection of its workings, at any of the different district offices, will well repay the curious visitor.

THE Signal Service Telegraph Line from Wilmington to Southville, N. C., authorized by the last Congress, is completed and ready for business. A cautionary signal station has been already established at the latter point for the benefit of the coast shipping interests.

Night Scenes in Chicago Office. — The Black Book.—Personals.—Bulls.—Poetry.

CHICAGO, ILL., Sept. 25.

TO THE EDITOR OF THE TELEGRAPHER.

It was night; the peaceful denizens of the west side who had no better accommodations had retired to their peaceful slumbers on the curbstones; south-siders, especially those nearest Bridgeport, had sturated their little sponges with Hoy's German Cologne, and fastened them to their olefactory organs, preparatory to being embraced in the arms of Morpheus. The "nord site" Dutchman had drank his fifty-sixth glass of lager, and had "yoost start home to Katrina," full of beer—well slightly—but it don't intoxicate, oh, no! it just makes you see three lamp posts when there's one, and makes out of every pigmy a giant. Well, it was about one o'clock "G. M." when "Wn." was "sushing" old "Crary," at Dubuque, with the worst dose of Morse that ever was forced through a man's ears. "Crary" stood it awhile, then kicked like a circus mule. "See, here, young fellow," says "C.," gently, "you must improve on that or I can't stand it." "4," "4," replies "Wn." Now, the regular route to D. was busted by the storm, and he was on by a long and circuitous route, but the idea of his "kicking" at "Wu's" sending! Well, "C." stood it awhile longer, then asked for the chief, but was denied an interview with that gentleman. A little struggling for circuit ensues. Wire opens in "Ch." End of scene 1st.

Scene 2d.—Circuit closes. Key rattles. Some one calls "D.," who responds quickly. A few exclamation points are made by "Ch.," then a few interrogation points; then the question is asked, "What's the row here?" "X.," "Ch.," "Who's 'X.,' D.?" "It's Duke, Ch." Now, thereby hangs a tale. "C." at D. knew that "X." in "Ch." was "Billy" Walsh, and "Billy" wasn't that kind of a fellow, so he says "G. A." The would-be "X." goes ahead manipulating in the disguised hand of "Wn." until out of copy. "Now," says "X.," "that was me all the time, and I know you could get me if you tried, 'Wn.'" "That's all right, boss." "Here's six hundred words of special," replied "C." "Let her come," says "Wu.," and "C." did "let her come," as he only knows how when he's waked up. No breaks occur, no shears went down stairs till it was all in, then there was a little by play not generally enacted by the stars. It was, "Say about fifty words from the first, what word's after so and so? Now, down about twenty words farther, is that 'granger's meeting' etc.; and down about fifty words farther, is—" "Oh, say, Jim," coolly remarked "C.," "I'll repeat it over for you. I'd just as soon. I'm not tired." "Just give me a few words more, 'Wn.'" After sundry repetitions the 3d scene ended, and this one serio-comical play was off the boards. As this is one of the many that are being nightly enacted in our office, I thought to begin the elucidation thereof with this one, while it was fresh. Others will follow as they occur, provided you can stand it. Let me know if your subscription list shows a falling off before I write again.

The "boys" are doing their best to be good now-a-days, since they ascertained that all their little errors, mistakes, etc., such as forgetting the rules, "speaking to operators when busy," "neglecting to time a message," or "having wrong check," was kept an account of in the little black book. No doubt this will have a salutary effect, and the result will be that Chicago operators will be so perfect they will never wait for a situation, and their only recommendation will be that they worked in Chicago office. "Let me alone, Jim, I ain't joking at all."

Miss "Lizzie" Vesey, of the day force, who has been taking several weeks' vacation, has returned, but looks very little better for her visit. Something has taken the bloom off "Lizzie's" cheeks. She don't seem as "Strong" as she might be. Her physician has forbidden her working so steadily at the key, and the management have kindly taken her off the St. Louis duplex and placed her on the "W." local wire.

Our friend Lester, who came back September 1st, expecting to work steadily, was only able to work a few days. "Charlie" Robinson was only with us a few days again.

Mr. Whitcomb, of the Dubuque wire (day), has been taking a vacation of a few weeks, and returns "stout as a buck." Kemp and Amsden have been "mashing" country girls' hearts and croquet mallets, and return sun-browned and happy.

On Miss Musgrove's return, Mr. Frank Cashill subbed

it on the Metropolitan lines in the main office, while Miss Snell took a few days' rest. Upon her return Miss Jennie Fox left for two weeks' vacation, Mr. Cashill also relieving her.

It's singular how soon some of these new men learn. One of them taking a special a few nights ago came running with it half finished to the chief, saying his wire was in trouble east of Laporte; he thought "it must be 'duplexed' with something there."

"Stoner," the moneyed man of the office, is still projecting railroads (in his mind). "Jr." says there's a hitch, "Zs," in the ditching machine, the rheostat or overflow dam being too voluminous for the electrical commutator to act in unison with the condenser in maintaining the equilibrium to sustain the retrospective motion of the cog wheel supporting the rotary upheaval on the off side of the cheese box, like— (Oh! thank you, Jim. That thump on the back has saved my life, but don't strike so hard next time.)

"Sig. D. A. P. Pleton & Co." looked decidedly too much initiated, and so it was when repeated, as it came the next time, "D. Appleton & Co." (You're another; 'twasn't me.) If he had ever "bin" there, then it would have been all right to make it Ingraham & Co. Cor Bin & May St., but he had no business to add "St." and "Co." to make it read right when it was "Ingraham, Corbin & May." Moral: Don't get too far behind.

I've found out something. There's a "poet" or some "poets" on the force here. I have acquired the habit of examining paper balls scattered over the floor and tables, and from among them I decipher a verse or two, the purport of which I can't interpret, but it's kind of highfalutin like, maybe some fellow writing to his inamorata. This is the way it reads:

"To be brief, and also to begin,
'Tis granted that those who care to trace
Their original (?) sentiments within,
Will bear in mind this is not fit place
For the presence of original sin;
And whether they do express in sighs,
In friendly lines, or in love for thee,
They cannot sigh for a brighter prize."

Underneath these lines some of the boys got off the following little bit of sentimental flattery:

"There are rich gems beneath the sea,
But the light that beams in beauty's eyes
Is far more sweet and dear to me
Than all the precious things that others prize."

The next paper ball unrolled was more of the obituary stamp, and read as follows:

"'Tis ever thus; in childhood's happy hours
Life seems to be a pleasant dream;
We, like sweet warblers 'mongst the flowers,
Ne'er think of wintry storm or blast,
Till manhood drifts us down the stream
To Death—our final rest at last."

I'll swear it's all original, and that it came from the

WESTERN UNION.

The Philadelphia, Atlantic and Pacific Offices and Employes.

PHILADELPHIA, PA., Sept. 24.

TO THE EDITOR OF THE TELEGRAPHER.

MY letter this week must necessarily be brief, and I am afraid, uninteresting. The trouble is, I haven't matter enough in available shape. As I pass up and down town, to and from the office, I observe, "Well, here is something that I will acquaint myself with when I get time, and I can make at least two inches of solid prut out of it; and over there is an inch and a half, and up here, two squares further, is an object of interest that I can throw in by way of a diversion, and turn to account some time when I am inclined to be unusually monotonous." But up to now I have not had time to any more than hastily glance at anything; hence my embarrassment.

I did drop in at the Atlantic and Pacific main office the other day and saw what it was like. Did I say I "dropped"? I will retract that, for I did not drop at all, I climbed up three flights of stairs (or four, I don't remember which), and found it perched in the top story of their building, upon the northeast corner of Third and Chestnut streets. The place is not particularly cheerful in aspect, but the low ceilings give it a rather dingy appearance, perhaps. However, it is well lighted, and I presume it is quite comfortable. Mr. J. T. Maxwell is manager, and Mr. Shain chief operator. Mr. D. M. Gibbs is night manager, and Mr. J. M. Sailer, cashier. The force consists of eight Morse operators, three of whom are ladies, a day and a night receiving clerk, a delivery clerk, and a dozen boys. Then the automatic employs an operator, Mr. B. F. Johnson; a copyist and two perforators. To just what extent the automatic is worked here I don't know, but I think only upon two circuits—one from New York to Washington, and another from here to Pittsburg.

It is of course understood that the A. and P. and the Franklin work in conjunction with each other, and they are domiciled together within these walls, and are as congenial and happy as two little birds. And a branch office of the one claims to be also a representative of the other, so that the city wires of both make them convenient to almost all parts of town. And if there chances to be a gap of a few dozen squares, the Reading folks generally have an office or two thrown in just here, and business for distribution to these places is generously turned over to them. I should have said, last week, that the Reading connects with the A. and P. and the Franklin companies, and *pro rates* with them to compete with the Western Union. As I forgot to mention it, I will say now that the A. and P. and the Franklin connect with the Reading, and *pro rates* with them to the disadvantage of their more formidable adversary.

It is late. The striking of a clock in a tower hard by, the strokes of which I count as I pause for a suitable idea with which to close, reminds me that time is even now fleeting—that even here, in the gloom and solitude of this chamber, so lofty that I often reflect that I am nearer heaven, up here, than I am anywhere else—even here Time does not pass me by. Bye bye.

MICAWBER.

The Buffalo Atlantic and Pacific Office and Force.

BUFFALO, N. Y., September 22.

TO THE EDITOR OF THE TELEGRAPHER.

THIS city and the resident fraternity are so seldom heard of through your columns that I volunteer the task of a few random remarks, hoping thereby to increase your subscription list in this vicinity, and at the same time put upon record the doings and whereabouts of some of the "old timers," who rarely give Buffalo the "cold shake."

The Atlantic and Pacific being the most prominent office here, has lately been putting on a new dress of red paint and other gorgeous colors, and making needful improvements, very gratifying and attractive to all concerned. They occupy the entire first floor and basement of the large four story brick building No. 222 Main street. The receiving and delivery departments, Morse operating room, and the automatic transmitting and perforating departments occupy the first floor, and battery facilities are provided in the basement.

Mr. M. A. McCoy, manager, always manages to have money for the boys on Saturday night, but will shortly remove to Omaha, Nebraska.

Mr. H. M. Scott goes "scott free" of night and Sunday duty by acting as chief operator.

Mr. W. W. Mead acts as night manager, when not attending church or studying Latin.

Mr. T. P. Dudley works the "Cx" Chicago wire, and does more work than any man in the office.

Mr. George A. Newton works the "Ax" New York wire, and does less.

Mr. C. F. Brown works the Cleveland wire, when he isn't grumbling at the difficulty of raising Dunkirk.

Mr. F. S. Vanvalkenburgh works the Syracuse and Rochester way wire, and at the same time cracks his South American jokes with Miss A. M. Mackenroth, directly in front, who works the city line.

Mr. Jack Spalding turns crank on the New York automatic, and wants money every night.

John H. Crane copies automatic, as does William H. Stanton.

George W. Mitchell and Frank Wilson do the perforating.

Robert Helm keeps the number sheets—grinds automatic to Detroit and Cleveland, and won't lend money to Jack Spalding or Fatty Stewart any more.

Mr. George H. Bowker is manager of the dock office, with John Bradt as assistant.

Mr. Timotheus Collins is counter man, and M. A. Strevor book-keeper.

Mr. M. G. Chipman "chips one" on the night force, and helps out on the automatic at noon.

This will strike any one that's posted as a good force, and competent to handle the large and increasing business promptly and correctly. More again. GLUEY.

Southern Telegraphic News and Personals.

MOBILE, ALA., Sept. 25.

TO THE EDITOR OF THE TELEGRAPHER.

WITH grief I confess it and with shame I write it, THE TELEGRAPHER has not fallen under my eyes for many a day. I hope, however, that this sin of neglect on my part may, like Uncle Toby's oath, be forgiven, and that the recording angel will blot it out with a tear. If I have not subscribed for our organ I have not borrowed it, and this I consider a point in my favor—a mitigating fact. I trust that you will not measure my interest in your success by my enthusiasm, for in that case I should stand below zero. I am ready now to enter the ranks again, and draw my pencil in the cause of right. You

will hardly be surprised to learn that telegraphic matters are dull down here. Now and then we feel a little wave of excitement, caused by some rumor of consolidation, or of grand enterprises in the way of new companies. The recent reduction in cable charges has brought a smile of astonishment to the faces of our large shippers, who find it hard to realize that messages which used to cost such enormous prices can now be sent almost as cheaply as ordinary New York business. The signs are more encouraging for opposition companies in this section than they have ever been, I think, and with good luck in keeping wires up this winter, they will begin to reap the reward of their efforts. It is a little remarkable that the wires of the Southern and Atlantic Company between Mobile and New Orleans withstood the shock of the recent severe storm, and were not interrupted a minute—very much to the surprise and chagrin of the W. U. people, who gleefully predicted "awful times" for them.

The American District Company has about completed its lines in New Orleans, and will open for business on the 1st of October. The Western Union Company will change offices in this city on the 1st proximo, leaving a stand, which they have held for many years, for one only a few doors off. The change is made, I understand, on account of the high rent demanded for their former office. Sam. Hoffman, the chief operator of the W. U. Union office, who has spent all this summer in Virginia, returns in a few days very much improved in health. Ed. Leloup is still managing for the Southern and Atlantic in New Orleans, with success. Barnes, the Western Union manager there, is an old time operator and manager in the South. He was the first manager the W. U. ever had in Mobile. After working many years, marrying and amassing a considerable fortune, he went to England (his native country) and invested his money in sheep. By one of those misfortunes which will come to the best of us, he lost everything, and about three years ago came back to America with a large family and no money. He took a place at Norfolk as manager for the Southern and Atlantic. In March, 1874, he accepted the management of Monroe, La., W. U. office, and from there he came to New Orleans last spring. Altogether he has been a lucky fellow, though he deserves to succeed. He is a fine manager and a clever gentleman.

Mobile is now represented by Wm. Sandford, W. U.; and K. C. Murray, S. & A. The robustness, rotundity, and general healthiness and good looks of the fraternity here is monopolized by the amiable and energetic Supt. of the W. U., Mr. Chas. G. Meriweather, who is "no shadder." J. G. Thornton, Supt. of the S. & A., keeps his headquarters at Macon, Ga. So far we have escaped yellow fever this year, and there is strong hopes of entire exemption.

Dr. Harvey Brown, of the U. S. Service, is now on a tour of inspection through this region, in the interest of a national quarantine system, suggested in Congress by our Mr. Bromberg.

MURAT.

An Absconding Telegraph Operator.

CHICAGO, ILL., Sept. 26.

TO THE EDITOR OF THE TELEGRAPHER.

LEWIS D. McADAMS, an operator employed at Aurora, Ill., on the Great Western line, absconded the other day, taking off with him about twenty dollars of the company's money, and leaving unsettled a board bill of forty dollars. Lewis is a tricky one. Superintendents look out for him.

PERI.

Another Richmond in the Field.

NEWARK, Oct. 5.

TO THE EDITOR OF THE TELEGRAPHER.

It seems almost cruel to prick the bubble which oozed from one of your correspondent's pens last week, relative to the Foote & Randall automatic system. Your correspondent must have been badly "sold" by somebody, as I am reliably assured that in a recent exhaustive test of the capabilities of the Foote & Randall system over the W. U. Co.'s wires, in the interest of D. H. Craig, their system was found to be greatly inferior to the "Edison," "Grace" or "Little" systems of fast telegraphy, except over very short circuits—but the fatal thing which was developed by the tests referred to was the fact, which was communicated to me by an eminent legal gentleman, who had critically examined their patents and system, who found no important novelty in their invention, and no novelty whatever not covered or coverable by legitimate reissues of several of the early patents belonging to the Automatic Telegraph Co.

As to the F. & R. Perforator, that is, I am creditably informed, a mere vision of the future visionary hopes of those inflated gentlemen, and your correspondent, in claiming a special chemical paper for his friends, claimed something which they never possessed of their own.

I will also say, on respectable rumor, that F. & R.'s

patent agent in Washington only succeeded in getting their patents allowed (with but very slight examination) by assuring the examiner that the patent was already owned by parties connected with the Automatic Co., with whose patents F. & R.'s alleged invention is believed to be glaringly in conflict.

ANTI HUMBUG.

The Difficult Problem,—Reply to "A. W. D."

KENTON, KY., Sept. 25.

TO THE EDITOR OF THE TELEGRAPHER.

I AM pleased with the reply of "A. W. D." to my article, Aug. 21. I will endeavor to meet him in the spirit manifested by him, and hope that we may arouse a spirit of inquiry that may prove profitable, although the question of "W. A. S." is somewhat difficult to answer.

I admit the difference between the "how" and the "why?" The dog is killed, why? Bad dog. How? with a bullet, which is a very different thing.

"A. W. D." says: "electricity does not emit heat or light." I said, under certain conditions, it did emit heat and light. I can prove it by the lightning rod man; he says it illuminates the earth and sky, burns houses, and I have felt the calorific effects myself from large batteries.

He says it is not a material, and does not unite with elements to form compounds. I think electricity is something; if so, it must have some of the properties of matter; if it is nothing, then there is no electricity—and our argument about why is electricity excited? is all about nothing. Electricity does exist, and is either an element or a compound. I prefer to believe it an element, because we have no evidence to the contrary.

It may be an element and not unite with other elements singly to form new bodies, as electricity and oxygen to form an oxide of electricity—but it does unite with oxygen and hydrogen to form water, and certainly does perform an important part in all compound bodies, directing their affinities and producing chemical union among the atoms of matter; and we are induced to believe it pervades the universe of God so as to control and regulate the entire system of His wonderful creation.

2d. He says "the battery need not be composed of two metallic elements." Grove's gas battery may be constructed without two metallic elements, but you cannot make a Callaud battery without copper and zinc.

3d. "The first action in the battery is not the decomposition of sulphate of copper." I think it is because the zinc has been oxidized before the circuit is closed.

4th "Sulph. acid has no affinity for either zinc or copper, nor can it be made to combine with either of them." Yes, it can be done; just oxygenate them and you will have no trouble.

5th "Neither the decomposition of sulphate of copper nor the formation of the sulphate of zinc is the exciting cause of electrical action." If not, what is the cause? I say that the electricity gives polarity to the electrodes, and that they excite by attraction and repulsion the atoms of electricity in the circuit, and that is why we have the current.

H. C. N.

Extraordinary Telegraphing.

BOSTON, MASS., Oct. 2.

TO THE EDITOR OF THE TELEGRAPHER.

THE Boston Herald of Oct. 5 contains the following item:

"TELEGRAPHING EXTRAORDINARY.

The dissatisfaction which prevailed among the Kettles men, with the result of the recent Stanford-Kettles contest, culminated last week in the signing of articles by these two gentlemen, whereby they agreed to send 'regular business,' averaging ten words in the body of each message, exclusive of date, address and signature, to Portland, Me., on a single wire for two consecutive hours; the usual technicalities, viz., 'from,' 'to,' 'period' and 'sig.' to be omitted; D. Devereaux and J. B. Griffith to act as judges. Yesterday morning at 9.30 Mr. Kettles grasped the 'key' and began. When 'time' was called it was ascertained that he had accomplished the almost incredible feat of transmitting 251½ messages in the allotted time—an average of 2.1 messages—or, counting addresses and signatures, 57.5 words per minute; which, it is needless to state, has no parallel in the annals of Morse telegraphy.

Mr. Stanford, who, owing to a 'base ball finger' on his dexter manus, cannot perform his part of the contest for several days, is confident of at least tying his formidable opponent; but sceptics are numerous even among his most ardent supporters, and it is not expected that he will far exceed his last creditable achievement.

In my opinion it is premature to say that Mr. Stanford will not equal this latest achievement of Mr. Kettles. The former gentleman has shown himself to be a very fast sender, and it is by no means improbable that he will even exceed Kettles' latest time.

ARISTIDES.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, OCTOBER 9, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

A Special Premium for Subscriptions to "The Telegrapher."

The summer season is about over, and we expect that the friends of THE TELEGRAPHER will now renew their efforts to increase its list of subscribers. The subscription list has been very well sustained during the summer, but as the days of vacations and excursions are over, we look for the usual increase of interest in the only truly independent telegraphic journal published.

It has been our custom for years past to share with those who kindly interest themselves in obtaining subscriptions by offering valuable premiums.

We propose this season to excel our former liberality in this direction. We desire to offer something of real and permanent value. We have accordingly made arrangements by which we are enabled to offer to the person obtaining 60 subscribers for one year, at the regular subscription price, \$2 per year, or their equivalent in shorter subscriptions, a

No. 1 WEED SEWING MACHINE;

for 65 subscribers a

No. 2 WEED SEWING MACHINE,

and for 70 subscribers a

No. 3 WEED SEWING MACHINE.

The price of these machines is respectively \$60, \$65 and \$70.

The machines will be boxed and shipped without extra charge.

This affords an excellent opportunity for female telegraphers, or for telegraphers who have wives or relatives that need these exceedingly useful machines, which are in every respect first class, to obtain them at comparatively little trouble or expense.

Send in subscriptions as obtained, and they will be credited until the necessary number to entitle the sender to the desired premium is obtained.

To prevent disappointment, should any canvasser eventually fail to obtain the requisite number for a machine, they will be allowed other premiums proportionate with the amount collected, or, if preferred, 20 per cent. in cash on such amount. To whom shall we send the first machine?

Telegraph Operators.

THERE is a tendency, which becomes more marked as the telegraph business is extended and developed, for telegraph operators to become divided into classes or divisions, which are becoming as distinctly defined as though established by authority. This was not the case in the earlier days of telegraphy, when an operator was expected to be proficient not only in the manipulation of the key and the reading of signals, but also in the running of circuits, making batteries, the management of offices, and the repair of lines when temporarily interrupted.

Of late years these duties have been more and more subdivided. Operators are no longer expected to go out and repair broken wires or take out crosses. At all the large offices, and at convenient stations along the lines, repairmen are kept, whose duty it is to attend to this business. This may be regarded as an improvement and an economical one, for only in an emergency which will admit of no delay should operators be taken from their legitimate duty for outside work. In all but the smallest offices battery men are employed to take care of the batteries, and thus the operators are relieved of what used to be another unpleasant duty.

The lowest class of operators are those who merely learn to manipulate the key and read telegraphic signals. From this class the staffs of the railroad lines are mainly supplied and the salaries paid are low. This class takes no interest in the business further than to get their salaries for as little work as possible. They learn to manipulate the instruments because it is easier than manual labor. This class is not confined to railroad lines, but many of them may be found on commercial lines as well. They have little or no ambition to rise above their subordinate positions, and but a small percentage of them ever do rise.

We do not wish to be understood as expressing the opinion that all railroad telegraph operators are of this class. There are many good and capable telegraphers working upon railroad telegraph lines, but they are in a decided minority.

There is a class above this of expert manipulators who command better salaries, but who have but little higher aim than the others, to get their pay for the least possible work.

Probably for ordinary railroad telegraphing these operators are just as good as a better informed class would be. In such positions they are not wanted to exercise any judgment, but to do just what they are told, and one of the best railroad telegraph Superintendents says, "we find the less operators known the better they mind." The higher class of telegraph talent is found in the despatchers of chief operators on such lines, and of course has to be paid for at higher rates.

In commercial telegraphy a higher grade of talent and ability is required, and, of course, is better compensated, but only a small percentage of those occupying positions on commercial lines are qualified for anything more than sending and receiving. They know but little, if anything, of the electrical science on which the telegraphic art is based, and what is worse, but few seem to care to learn. The truth of this is demonstrated constantly in the experience of managers of telegraph lines, who find it difficult to fill satisfactorily the positions requiring some electrical knowledge and ability, while there is a surplus of mere telegraph manipulators. In the telegraph, as in other business, knowledge is power and profit, and those who look beyond the present moment will seek to advance themselves in the science and art.

The telegraph business is constantly increasing in extent and importance, and it offers chances and positions

worth striving for. It should be the aim of every person who engages in telegraphic pursuits to make himself or herself master of it in all its branches, so that if opportunity offers, advancement may be secured. The world is always well supplied with hewers of wood and drawers of water, and those who desire to rise from the ranks of these and become something more, must do so by industry, study and application.

It is not to be expected that every telegrapher shall be a first rate electrician, but they should understand the rudiments of the science upon the practical application of which they depend for a livelihood.

The American District Telegraph Company.

WE devote considerable space in the present number of THE TELEGRAPHER to a very full and interesting account of the American District Telegraph, and the manner in which its business in this city is conducted. This organization, although less than four years have elapsed since it first commenced operations, has reached an extent of development, and a degree of efficiency and reliability in its daily workings, that is truly marvelous. The District Telegraph is a thoroughly and characteristically American enterprise. Nothing like it, or even comparable to it, is in existence in any other country, and it is hardly too much to say that the degree of despatch and celerity which is realized in its every day workings would be almost impossible of attainment elsewhere. Unquestionably, one great reason of the practical success of this enterprise is due to the fact that its administration is in the hands of young men instead of old ones. This may seem, at first sight, a somewhat singular assertion, but experience has repeatedly shown that, in undertakings of this kind, youthful ambition, energy and enthusiasm, if accompanied, as they not unfrequently are, with real organizing talent and executive ability, are the very qualities of all others needed to ensure success. Young men, and even mere boys, have always played an important part in the development of the telegraphic system of America; in fact, some of the most important telegraphic positions in the country are held to-day by men not over twenty-five years of age. It is a business peculiarly well calculated to give the most valuable faculties of a young man a chance to display themselves to advantage, and the practical success of the American telegraphic system is a triumphant vindication of the wisdom of the policy to which we have alluded.

Atlantic Telegraphs.—Advance in Tariff by the Anglo-American Telegraph Company.

IMMEDIATELY following the interruption of the direct cable, of which an account was given in THE TELEGRAPHER last week, the Anglo-American Co. announced an increase of the tariff from 25 cents to one dollar per word in gold. This is double the tariff which has been in operation since last May, and naturally the advance, coming as it does immediately upon the temporary cessation of competition, excites a good deal of indignation on the part of customers of the company.

The reduction to 25 cents a word was too radical to prove profitable, and probably the Anglo-American Company desire to make up the loss consequent upon that reduction while they have a monopoly of the business. The managers of that company probably understand their business, but this action has brought much opprobrium upon the company, and the newspapers in this city and elsewhere have denounced them indignantly for what is termed an imposition upon the public.

We think now, as we have always thought, that while capitalists in this country are unwilling to invest money in cable telegraph enterprises, and are content that foreign capital should own and control the cable telegraphs connecting us with the telegraph systems of Europe and the world, the violent denunciation of the so-called monopoly does not come with a very good grace from the press or public of this country. As we have before stated, and as is generally well known, all attempts hereto-

fore to induce American capitalists to invest in Atlantic cable telegraph enterprises have been futile, and even the Pacific cable, to connect the Pacific coast with the Sandwich Islands, Japan and China, and complete the telegraphic circle round the world, if laid at all, will be laid by foreign capital, and owned and controlled in Europe. This is not a creditable record or state of things for this country, and under the circumstances it seems to us that it would be rather more modest to moderate our denunciations of foreign companies for alleged monopoly and extortion.

It appears to us that the managers of the Anglo-American Company have made a mistake in quadrupling the rate, as they did in the other direction when they reduced it below a paying price. We do not know that there is any remedy for it, however, until the direct cable is again in working order, when the rate will go down again, though probably not to the former figures.

The representatives of the Direct Cable Company in this city assure us that there is no truth in the stories that a working arrangement and agreement between that company and the Anglo-American, for maintaining the cable tariff at one dollar per word, has been made. It is so far as they are informed, intended to maintain the independence of that company and fix the tariff at a reasonable figure upon the reopening of communication, which it is not anticipated will be long delayed.

The Faraday was to leave England on Wednesday last to repair the broken cable, and as the break is in shallow water and not far from land, no special difficulty or delay is anticipated. Unless the weather shall prove exceptionally unfavorable, we believe that within two or three weeks the direct cable will again be in operation.

Personals.

S. S. SCHROFF has been transferred to the night force, Mr. C. H. DAVIS taking his place upon the twelve to nine trick. DAVE MITCHELL, of New Orleans, is working in the W. U. Telegraph office night force.

The Telegraph.

By Cable.

ADVANCE IN CABLE TARIFF.

LONDON, Sept. 30.—The Anglo-American Telegraph Company announce that on and after Monday next the tariff will be raised to four shillings (one dollar) gold per word.

New York City Telegraph Notes.

SUNDAY last four elegant new electric clocks were placed in position in the Western Union operating room. They are larger than the old ones, and have cases made of cherry, and carved to match the general woodwork of the room. As yet, they have maintained a bugless regularity, which causes rejoicing and a better feeling between the collecting boys and the operators.

Hank Cowan is in town. Gib. Merrill hooped Wallace in Chicago eighty-six messages in an hour one night last week, on the first duplex, and it wasn't Gib's good day for sending either. The messages were unusually long, and partly ciphers and cables, and were all received and sent out by Wallace without a break. Considering the great length of the circuit, and about a dozen breaks by New York's receiving man, causing some loss of time, we think this compares favorably with the Boston feat, where the messages averaged but ten words, and were picked from old business. Though we do not like to brag, yet we believe there are several men in the Western Union office who can equal, if not excel, under similar circumstances, the speed accomplished by Stanford or Kettles, of the "Hub."

Protection of Telegraphic Lines from Lightning.

Supt C. G. MERRIWEATHER, of the fourth district in the Southern division, reports that the experience of the past season has proved conclusively that the application of lightning rods to telegraph poles is a matter whose importance should lead it to receive careful attention. On many routes under his charge, where a large number of poles were formerly destroyed by lightning every year, a dozen or more being sometimes shattered in a single day, the attachment of lightning rods has resulted most favorably, not a single pole having been damaged during

the present season. He also states that no trouble has been experienced from accidental contact between the lightning rods and the line wires, although serious apprehensions were entertained that this would prove an obstacle to their successful use. The rods were placed on every tenth pole, and also on the nearest pole on each side of every office.—*Journal of the Telegraph.*

Telegraph Extension in New Hampshire.

A NEW telegraph company was organized at Manchester, N. H., on the 5th inst., under the charter of the Northern Telegraph Company, to construct a line between that city and Goffstown. The line will be built at once, and there is a prospect of extension to Ware in the early spring. It will connect with the Atlantic and Pacific Company at Manchester.

Quadruplex Telegraphy in India.

IT will interest our readers, says the *Indian Daily News*, to learn that "Quadruplex Telegraphy" (that is, the art of sending four messages, two in each direction, simultaneously, by means of one wire) has this week been accomplished on the Madras Railway Telegraph. The system which Mr. G. K. Winter, the Telegraph Engineer, invented in March last, proved perfectly successful on eighty miles of line, and its extension to lines of greater length is simply a question of additional condensers and battery power. The first successful experiment on a public line was made on the 16th of April, 1875.

An Old Swindle Revived.

A BALTIMORE swindler went to a near-sighted merchant in the guise of a telegraph messenger, and got him to put his name in two places in what purported to be a receipt book. Really the fellow had got him to sign his name on a blank leaf in such a way that a note could be written with a genuine signature and endorsement. The profit to the swindler was \$223, and the merchant and the bank that paid the money are quarrelling about which shall lose.

Foreign Telegraphic Notes.

THE *Electrical News* says: "The iron telegraph poles in Persia are put to a novel use. A friend who has lately returned from that country informs us that between Teheran and Shiraz it is the common custom of the inhabitants to use the poles as targets for rifle shooting. Standing at one post and shooting at another, the people find the telegraph poles most convenient institutions for gun practice, and no doubt many believe that it is their proper and legitimate use. The poles are made of sheet iron, and the natives test their guns by trying whether the bullet will pierce the post. Some posts are thus riddled with holes, and some give way altogether. The reason why telegraph posts in Persia require frequent renewal is no longer a mystery."

The traffic receipts of the Anglo-American Telegraph Company,

Sept. 15, amounted to.....	£1,020
" 16, "	890
" 17, "	790
" 18, "	780
" 19, "	270
" 20, "	690
" 21, "	880

The report of the Direct Spanish Telegraph Company shows a balance of £6,118, which, after payment of the dividend on the preference shares, will be sufficient to allow of a dividend on the ordinary shares at the rate of four per cent. per annum, leaving the reserve fund standing at £1,011.

The Indo-European Telegraph Company have issued a circular giving the new rules and regulations affecting the transmission of messages, which, having been adopted at the conference held in St. Petersburg, will come into force from the first of January next. From and after that date messages of any number of words may be sent, the charge per word being uniform between India and all stations in Europe, except the Shetland and Orkney Islands and Russia. The same system has been adopted for messages originating in, or destined for countries beyond India and Europe. The length of a word has been limited to a *maximum* of ten letters. Code words are not to contain more than a maximum of ten characters, in lieu of seven syllables as at present, and any excess will be charged for at the rate of one word for every ten letters or fraction of ten letters. Artificially constructed words, not appearing in a dictionary, will not in future be admitted. Each group of figures will be charged as one word if containing five figures or less; groups of more

than five will be charged as so many words as they contain five figures, plus one word for the remainder, if any; but groups of figures, if manifestly used for code purposes, will cause the telegram to come under the heading of "secret messages," and subject it to compulsory registration. Groups of letters may be refused altogether by any administration, but if admitted they will be charged the same as groups of figures. Any combination of code employing in the same message groups of figures and letters is strictly prohibited, and telegrams so composed cannot be accepted. Addresses may be written in code at sender's risk, under arrangements with the administrations concerned. The signature may also be a code word, or the last word of the message may replace it. Abbreviated forms for expressing "reply paid," "acknowledgment of receipt," of "registration," "telegram to follow," &c., have been agreed to, so that only one word need be paid for to convey these instructions. The *via* or indication of route will be sent free of all charge.

Telegraphic and Electrical Brevities.

GOV. SHUNK, of Pennsylvania, vetoed the first bill that came before him for the incorporation of a telegraph company, on the ground that "it would interfere with the business of the United States mails."

The construction of a telegraph line between Prince Edward's Island, Magellan Island and Bird Rocks is in contemplation by the Canadian Government. The line, when completed, is expected to be of great service in saving life, and assisting shipwrecked vessels.

Charles H. Vawter, agent and operator at Smmer, Ill., while attempting to board a morning freight train, August 14, received injuries which resulted in his death two days later.

The Annual Meeting of the Telegraphers' Mutual Benefit Association.

THE annual meeting of the Telegraphers' Mutual Benefit Association will be held on Wednesday, November 10, 1875, at 7:30 o'clock P. M., at the general office of the Western Union Telegraph Company, corner of Broadway and Dey Streets, New York.

It is desirable that there should be as full an attendance of the members as possible, and it is hoped that those who cannot personally attend will be represented by delegates.

The Coming Telegraphers' Ball.

A MEETING of those interested in the great event of the season—the Telegraphers' Ball—was held at No. 66 Cortlandt street, on Monday evening last, for the election of officers for the ensuing year. The list of subscribers, which now numbers 106 names, having reached the number decided sufficient to insure success, those having the matter in charge called the meeting to order, and, on motion of Mr. Bolieu, Mr. J. A. Ashurst was chosen temporary chairman, with Mr. Roberts for secretary. Mr. Ashurst, taking the chair, thanked the meeting for the honor conferred, and stated the object of the meeting in a few brief sentences. Mr. Gordon followed with a few pertinent and brief remarks, and closed by asking the meeting to support the same ticket which was so successful last year, saying the opposition to the ball was so great that they had encountered many difficulties, but by perseverance and earnest cooperation had succeeded in making the affair a grand success. With so many drawbacks and obstacles the glory of the thing amounted to small wool last year, and he thought it was no more than right that the old officers should be given all honor possible this year, and allowed to bask in the glory which would certainly follow the perfect arrangements about to be made. He hoped none would weaken.

On motion of Mr. Lyman the meeting proceeded to the nomination of permanent officers by ballot. The two names having the most votes to be declared the candidates, and be balloted for in the regular manner. Adopted.

Messrs. Beard and Lyman being appointed tellers, the votes were collected and found to name D. W. McAnecny and J. A. Ashurst as the candidates for President, with a few scattering.

The meeting at once proceeded to ballot, but failed to make a choice between the two gentlemen, both being decidedly popular and fit men for the position. The second ballot was again a tie, but upon the third, after a good deal of electioneering all around, Mr. McAnecny came out ahead, with a slight majority, and favored the company with a neat speech upon taking the chair.

Then followed the election of the lesser officers, J. H. Edwards, of the opposition, being unanimously elected to the office of Vice-President; T. J. Singleton, and J. H. Lyman, Secretaries, and Jno. H. Dwight, Treasurer.

President McAneeny then announced the Committee of Arrangements as follows:

- J. A. Asburst, *Chairman.*
- Geo. H. Roberts.
- L. R. Hallock.
- W. H. McEnroe.
- Geo. Sawyer.
- Deunis Harmon.
- W. J. Landy.
- W. S. Williams.
- L. B. McCarthy.

The meeting then adjourned to Monday, October 11, at the Auditor's office, Western Union Telegraph building.

[From the American Journal of Science and Arts.]

Images Produced by Lightning.

A LETTER of Professor W. L. Brown, of the University of Georgia, to one of the editors, calls attention to a remarkable instance of the formation of impressions upon the human body by a lightning stroke, and encloses letters of Messrs. E. G. Simmons and T. N. Hawkes, of Americus, Ga., where the occurrence took place, describing the circumstances and some of the details of the phenomenon.

On the 12th of July, 1875, at about four P. M., as Mr. Simmons states, a stroke of lightning fell upon a house in Americus, rendering insensible for a time four persons who were seated in one of the rooms. The two outer sides of this room, which was at a corner of the house, had each one window, and nearly opposite these on the two other sides were the chimney and the door respectively. Outside, a tree stood in front of each of the windows, and about twelve feet from the house. A third tree, a locust, stood opposite the outer corner of the room and about the same distance from the house as the others. This tree was severed by the lightning, but the other two were not affected. A young child was sitting near the centre of the room, while the mother and a young lady were seated not far from the chimney, near which, and close to the wall, was another child.

All these persons were rendered insensible for a time by the stroke which severed the tree, and on their recovery there were found impressed upon the bodies of them all more or less distinct images of this tree. It was most distinct in the case of the child near the centre of the room. Mr. Simmons says, "the child is impressed upon its back and exactly opposite upon its stomach. The entire tree is plain, and perfect in *toto* ; every limb, branch and leaf, and even the severed part, is plainly perceptible. It is a perfect photograph of the tree, and could not have been made more perfect by a painter's brush. It impressed the young lady upon the left hip and right leg," the mark being quite as perfect as that upon the body of the child. The mother and other child also bore less distinct impressions upon the leg. Mr. Hawkes says, "I saw the youngest child and the marks upon it. The marks on the lower part of the spine are exactly of the shape of a branch of the locust tree. Where the leaves are, on the branch, the mark does not take the shape of the entire leaf, but only of the skeleton of a leaf. The mark was about twelve inches long, and had a fork, exactly like the locust limb. It looked as though the blood was drawn to the skin along the marked part." The marks were not permanent, as Prof. Brown, in his letter dated August 7, adds, "a recent letter informs me that the impressions are no longer distinct."

Although many similar cases have been reported, the phenomenon described is rare enough to make a well marked instance like this worthy of record. The formation of the images in all such cases is readily explained by a peculiarity in the mode of the electric discharge under certain conditions, by imitating which it is possible to produce similar figures artificially with an electrical machine, such as the Holtz machine, capable of giving electricity of very high tension. When the poles of the latter are strongly charged and are separated to the distance of a few inches, the discharge, instead of producing a spark or brush, sometimes consists of a very small jet upon the negative, and a sort of phosphorescent glow upon the positive. The space between them, though not luminous, is the seat of a discharging action which appears to take place along definite lines, like a stream or current, and is sometimes called the dark discharge. An object placed between the poles, and in the path of the discharge, interrupts this, and destroys the glow upon the positive pole in points corresponding to the lines thus broken; and in this way there is produced an image or shadow of the interposed object, which is often strikingly distinct and perfect.

In the case above described the phenomena are readily accounted for, if we suppose the thunder cloud to have been negatively charged, and the tree to have stood in the path of the dark discharge which preceded or accompanied the lightning stroke, the action having been sufficiently intense, and the quantity of electricity great enough to produce a visible impression upon the delicate tissues of the skin.

A more particular account of the subject may be found in two articles published in this Journal, May, 1870, page 381, and June, 1871, page 437. A. W. W.

Fishing with the Electric Light.

IN the Paris International Maritime Exhibition there is a small object deserving of notice. It is a platinum wire placed in a bottle and ignited by electricity from a bichromate battery. It is intended to be immersed in the sea, and the light emanating from it is said to attract an immense number of fishes. Experiments have been tried lately on the coast of the Cotes du Nord Department with a fishing boat, and have proved very satisfactory on a bank of sardines. The glass must be green or black, otherwise the fish are frightened by the glare, and do not follow the submarine light.

Improvement in the Mariner's Compass.

Mr. GEORGE ILES, of Montreal, has invented an ingenious improvement of the ordinary compass, by which its variation from the true north, from whatever cause, can be immediately detected and the amount of deviation accurately calculated. Mr. Iles's compass consists of a light bar of aluminium, nicely pivoted on the centre, having a number of minute magnets attached longitudinally. Of course this bar, when uninfluenced by other than natural causes, will point north and south. Above this bar is suspended another of similar construction, but with the small magnets arranged latitudinally. The effect is to cause the upper bar to point east and west, or, under normal conditions, at right angles with the lower. When the two bars are found varying from this right angle, local influences are indicated, and the amount of variation from the true north is determined by a comparison of the variation of the two bars. The invention has been patented in the United States, Canada, France, and England, and has received high commendation from such experts as have examined it.

Miscellaneous.

ELECTRICAL LIGHT IN SOLID BODIES.—Cadogan Morgan, in 1785, was the first experimenter who produced the electrical light in the interior of solid bodies. He inserted two wires in wood and caused the spark to pass between them. The wood was illuminated with blood-red or with yellow light, according as the depth at which the spark was produced was greater or less. Many of our readers have doubtless seen an egg or a series of eggs lighted up by being placed in the line of discharge of a Leyden jar. An ivory ball, an orange, or an apple may be illuminated in a similar way. According to Tyndall, a lemon is especially suited to this experiment, "flashing forth at every spark as a spheroid of brilliant golden light." The wires used for the discharge should be brought within about half an inch of each other inside the lemon.

ELECTRICITY vs. IRON ARMOR FOR SHIPS OF WAR.—There are persons sanguine enough of the near approach of the era of universal peace to hail the introduction of electricity into the domain of artillery practice as one of the heralding signs of the millennium. The simultaneous discharge of four Krupp's guns by electricity, the balls all hitting the same mark, has been found by repeated experiments to bring a force to bear upon the object of attack sufficient to break through the heaviest iron armor in which ships of war are ever clad. This fact will result, according to the arguments of the enthusiasts, in doing away with iron ships, and introducing wooden ones again into naval warfare. The withdrawal of iron ships from service will render the immensely heavy and destructive guns now manufactured in Europe quite useless, and cause their ultimate disappearance also.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Aug. 17, 1875, and bearing that date.

166,860.—CHEMICAL TELEGRAPHY.—Thomas A. Edison, Newark N. J., assignor to himself and George Harrington, Washington, D. C. [Filed July 25, 1874.]

Oxygen evolved at tin stylos forms protoxide of tin, which reduces the sesqui to a prout salt of iron, which combines with the ferrocyanide of potassium to form Prussian blue.

The combination of a sesqui salt of iron with the ferrocyanide of potassium, and a tin stylos, for the purpose set forth.

For week ending Aug. 31, 1875, and bearing that date.

167,162.—ELECTRO-THERAPEUTIC APPLIANCES.—Elizabeth J. French, Philadelphia, Pa. [Filed July 9, 1875.]

1. The galvanic element consisting of the triple strip A', formed of strips of zinc, copper and brass, substantially as and for the purpose set forth.

2. The triple-strip A', consisting of strips of zinc, copper and brass, combined at one end and formed into the shape of a horseshoe magnet at the other end, substantially as and for the purpose set forth.

3. The triple strip A, in combination with the eye E, substantially as and for the purpose set forth.

4. The triple strip A', consisting of strips of zinc, copper and brass, one of the strips being formed with the laps or folds a, holding or securing together all the strips, substantially as and for the purpose set forth.

167,173.—GALVANIC BATTERIES.—Edward A. Hill, Chicago, Ill. [Filed July 20, 1875.]

Prevents the flow of the sulphate of copper to the zinc by means of a tube and plate of lead suspended above the sulphate of copper. While finishing a plate upon which the copper will be deposited if the sulphate of copper solution rises too high, the tube and plate prevent also a convenient means for the introduction of the fresh sulphate of copper.

1. The device B, constructed of lead or other incorrodible metal, when supported above the bottom of the containing cell, substantially as and for the purpose herein specified.

2. The combination of the device B with the copper or — plate, having supports fixed or resting thereon, substantially as and for the purpose specified.

167,242.—AUTOMATIC TELEGRAPH APPARATUS.—Otto Heikel, Jersey City, N. J. [Filed June 5, 1875.]

1. The rollers 3 3 upon the wires 2 2, and within the grooved wheel or bar, in combination with the cord d and circuit closing mechanism, substantially as set forth.

2. The swinging circuit changer or needle e within the helix p, and the permanent magnets r and s, arranged as set forth, in combination with the bar x, that connects the said magnets r s and the helix w, surrounding such bar, as set forth.

3. The polarized roller l and ink roller z, operated by the magnets n n' and electric circuits, in combination with the blade m and rollers m', for moving a strip of paper in contact with such blade and contiguous to the ink roller, for the purposes set forth.

4. The combination, in a telegraph transmitting instrument, of movable circuit closing rollers or blocks, a key, a magneto-electric machine, and gearing connecting the parts, substantially as specified, for transmitting reverse currents alternately and at intervals, to form the message as set forth.

5. The combination of the globe k, the column h, and the valve n, surrounding said column between it and the globe, and constructed to permit the escape of the diluted air from the globe, and prevent the entrance of the external air, substantially as shown and described.

6. The combination of the thin sticks of carbon f, their enlarged ends d, the wires e, inserted in said enlarged ends, the flexible connections o, the insulating plate c, the plates r, screw pins p washers q, and nuts b, substantially as and for the purpose described.

7. The combination, with the series of carbon electrodes, and a flexible connection communicating with the electric conductors, and constructed to automatically pass the electric current from one carbon electrode to the other in case of the breakage of either, as set forth.

For the week ended Sept. 7, 1875, and bearing that date.

167,415.—LIGHTNING RODS.—H. W. Spang, Reading, Pa. [Filed Oct. 29, 1874.]

For the purpose of making good earth connection. The combination of pipe A with drain or gutter B and perforated pipe D, all electrically connected, and forming a lightning conductor, substantially as described.

167,510.—GALVANIC BATTERIES.—Benjamin F. Dawson, New York, N. Y. [Filed July 24, 1875.]

For the purpose of keeping fresh fluid in contact with the plates, and preventing the collection of effete matter.

The combination of the perforated positive plate A, negative plate B, and agitating device arranged between the same, substantially as described, whereby, when the agitator is operated, it will act to draw the fluid through and force it out of the perforations in the positive plate, as and for the purpose specified.

For the week ended Sept. 14, 1875, and bearing that date.

167,685.—ELECTRO-MAGNETIC TELEGRAPHS.—Jos. Olmsted, Providence, R. I., assignor of one half his right to Chas. G. McKnight and Geo. Chatterton, same place. [Filed May 15, 1875.]

The combination, with a telegraph line, of a commutator, charging the line with alternating currents, a pair or series of pairs of keys, and a pair or series of pairs of relays, one of the keys of a pair acting to cut off from the line the — currents only, the other to cut off the — currents, and one relay of each pair being arranged so as to vibrate by the passage there-through of + currents, and the other by the — currents, and both relays arranged to give a signal or close a local circuit upon the cutting off from the line of the currents affecting it, substantially as and for the purposes described.

Married.

ROSS—HUFF.—At Columbus, Ohio, at the residence of the bride's father, Tuesday, Sept. 21, 1875, by Rev. S. A. Keen, Mr. CHARLES W. ROSS, of the Western Union Telegraph office, to Miss CLARA HUFF.

New Motive Power.

It is announced in the newspapers that Chief Engineer Wood, of the Navy Department, has invented a new motive power, which he will exhibit at the Centennial. The power consists of carbonic acid gas, which is generated by means of electricity and galvanism. A caveat has already been filed. Meanwhile no application has been made for a patent for the Keely motor.

Are Beech Trees Lightning Proof?

It is a popular belief that lightning will not strike a beech tree. In a recent thunder shower at Goshen, Mass., a beech and maple standing near together, with branches interlocking each other, received the electric bolt, which shattered the maple and passed into the earth through a prostrate hemlock tree lying near, which was stripped of its bark nearly the whole length. No trace of the lightning was left upon the beech.

**DOMINION TELEGRAPH COMPANY.
TENDERS FOR WIRE.**

Sealed Tenders, addressed to the undersigned, and marked "Tenders for Wire," will be received until the 1st of December next, for a supply of Two Thousand Miles of No. 9 Birmingham Gauge, Best. Best Galvanized Patent Jointed Telegraph Wire, put up in half mile bundles, and delivered during the spring of 1876 at Halifax, Nova Scotia, St. John, New Brunswick, and Quebec, at the Company's option. Terms of payment to be specified in Tender.
The Company do not bind themselves to accept the lowest or any Tender. By order.

THOS. SWINYARD.

CELEBRATED

**PRIVATE LINE OUTFIT.
THE BEST IN THE WORLD.**

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished. It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....\$10 00
Instrument only..... 8 00
Bliss Reservoir Battery, per cell..... 2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by **MORE THAN TWENTY PATENTS.**

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THEIR CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,
BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE.

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor.

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS made.

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

THE TELEGRAPHER

A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, OCTOBER 16, 1875.

VOL. XI. WHOLE No. 483.

Annual Report of the President of the Western Union Telegraph Company.

To the Stockholders of the Western Union Telegraph Company.

The following report of the operations of the company for the fiscal year ended June 30, 1875, is submitted pursuant to the requirements of the by-laws.

The gross receipts for the year from all sources, except proceeds of bonds, were \$9,564,574.60; the gross expenses were \$6,335,414.77; the difference \$3,229,159.83 being net profit. All sums paid as rental for leased lines are included in the gross expenses.

Compared with the preceding fiscal year, there was an increase in the gross receipts of \$301,920.62; a decrease in the expenses of \$420,319.06; and an increase in the net profit of \$722,239.68.

There were in operation at the end of the year 72,833 miles of line, 179,294 miles of wire, and 6,565 offices.

The number of messages transmitted during the year were 17,153,710—being an increase of 824,454 over the preceding year.

The capital stock of the company is \$41,073,410, of which the company owns, and now has in the treasury, \$7,285,935. The difference, \$33,787,475, is the amount of the capital stock outstanding, which has been increased \$1,800 during the year by the issue of 18 shares in exchange for the stock of companies leased to the Western Union, and which have small amounts of capital outstanding on which interest is paid as rental.

The bonded debt of the Company, July 1, 1874, was \$5,946,900, of which \$1,498,000 is the seven per cent. gold building bonds, and \$4,448,900, seven per cent. currency bonds, which mature November 1, 1875.

To provide for the redemption of the bonds falling due in November 1875, it was decided, in January last, to issue sterling bonds bearing six per cent. interest in gold, to an amount which would produce about \$5,000,000 in currency, and arrangements were made for the sale of these bonds at 95, which, it was confidently expected, would result in disposing of the entire loan in Europe. But after purchasing these bonds, amounting to \$1,001,160, the parties with whom the arrangement had been made, availed themselves of an option in the agreement to cancel it. Subsequently it was decided to offer the remainder of the issue in seven per cent. currency bonds at 95, and the whole amount was subscribed for within a few days. The entire issue of new bonds will amount to \$5,001,160, and the product to \$4,751,102 in currency, of which sum \$4,448,900 will be applied, so far as it has not been done already, to the redemption of the bonds, amounting to that sum, which mature November 1st next, and the balance, \$302,202, will go to income account to restore a portion of the disbursements on that account, for the new building, in excess of the loan. As the bonds maturing on the 1st of November are now in process of redemption, and the subscriptions to the new bonds are payable at the option of the subscriber at any time before November 1st, it is difficult to state the exact present condition of the bonded debt account. But when the pending transactions are completed, the whole bonded debt will stand as follows:

Seven per cent. gold (dollar) building bonds, due May 1, 1902.....	\$1,498,000 00
Six per cent. sterling bonds, due March 1, 1900.....	1,001,160 00
Seven per cent. currency bonds, due May 1, 1900.....	4,000,000 00
	\$6,499,360 00

Less amount of sinking fund held by the Union Trust Company, trustees.....	87,800 00
Total funded debt.....	\$6,411,360 00

The net profit of the year.....	\$3,229,159 83
has been applied as follows:	
For four quarterly dividends of 2 per cent. each on capital stock outstanding inclusive of that payable July 15, 1875.....	\$2,702,354 00
For interest on bonds.....	424,334 18
	3,126,688 18
Leaving a surplus for the year of.....	\$102,471 65

From which an additional appropriation of \$30,000 has been paid to the Union Trust Company as Trustees for account of the Sinking Fund.

The following statements show the profits and dis-

bursements of the Company for nine years, from the date of consolidation:

The surplus of Income Account July 1, 1866, was.....	\$275,357 24
The net profits for nine years, from July 1, 1866, to June 30, 1875, were.....	26,068,698 79
Making an aggregate, June 30, 1875, of.....	\$26,344,056 03
During which period there was disbursed:	
For dividends of stockholders (including dividend payable July 15, 1875).....	\$8,235,167 34
For interest on the Company's bonds.....	3,159,851 18

The balance.....	\$11,394,098 52
is represented as follows:	\$14,949,057 51
Construction of new lines, erection of additional wires, etc.....	\$5,973,143 45
Purchase of Telegraph lines and of the stock of companies controlled by the Western Union Co. on which interest or dividend are paid as rental.....	1,394,185 85
Western Union Stock (72,859 shares).....	4,054,483 07
Gold and Stock Telegraph Co.'s Stock (47,710 shares).....	1,173,509 00
International Ocean Telegraph Co.'s Stock (10,384 shares).....	961,556 42
Anglo-American Telegraph Company's Stock (£1,308).....	10,000 00
Central District and Printing Telegraph Co.'s Stock (200 shares).....	10,000 00
Western Electric Manufacturing Co.'s Stock (500 shares).....	39,000 00
Western Union Bonds (redeemed and cancelled).....	1,072,345 00
Sinking Fund—Broadway and Dey Street Mortgage Bonds (amount not yet used for redemption of bonds).....	87,800 00
Real Estate (New York City and elsewhere).....	\$2,544,887 75
Less amount provided from the proceeds of bonds.....	1,802,202 00
	742,685 75
Miscellaneous.....	90,348 94
	\$14,949,057 51

THE INTERNATIONAL OCEAN TELEGRAPH COMPANY.

The capital stock of this company is \$1,500,000, represented by 6,500 shares of preferred stock, entitled to dividends at the rate of 15 per cent. per annum, and 8,500 shares of common stock. The Western Union Company own \$499,900 of the preferred stock, and \$478,500 of the common stock. Total, \$978,400.

The I. O. T. Co. also has the following liabilities outstanding:

BONDS.	
Bonds of 1873, issued July 1st, 1873, 5 years, interest 7 per cent. gold, due semi-annually.....	\$184,000
Bonds of 1879, issued April 1st, 1869, interest 7 per cent. gold, payable November 1st and April 1st.....	73,900

SCRIP.	
No. 1. Scrip Dividend to Common Stockholders issued May 1st, 1869, interest 7 per cent. gold per annum, payable April 1st and October 1st, redeemable at thirty days' notice. (Notice issued August 27th).....	56,000
No. 2. Scrip Dividend to Common Stockholders, issued April 13, 1870, interest 7 per cent. currency, payable yearly, October 1st; redeemable October 1st, 1879.....	68,000

The operations of the I. O. T. Company for the year ended June 30, 1875, have been as follows:

Receipts.....	\$298,932 83
Ordinary expenses.....	\$81,918 07
Reconstruction of Cables.....	53,150 43
	135,068 50
Net profit.....	\$163,864 33

which has been appropriated as follows:

Balance of loan from Western Union Telegraph Co. repaid.....	\$50,000 00
Interest on debt.....	27,831 78
Bonds purchased for Sinking Fund.....	9,400 00
Construction of new lines.....	4,642 40
Concession for Cable from Cuba and Porto Rico to the Bahama and Bermuda Islands.....	1,000 00
Expenditure on steamship "Prof. Morse".....	7,019 76
Payments on account of new Cable between Key West and Punta Rasa.....	27,921 84
	127,815 78
	\$36,048 55

The balance, together with the surplus of the previous year, is on hand in the treasury of the company.

A portion of the surplus has been recently used to purchase and cancel the \$56,000 of gold interest-bearing scrip, and it is in contemplation to retire the currency scrip also.

In my last Annual Report reference was made to the possible necessity of putting down a new cable between Key West and Punta Rasa. That necessity became so pressing that in March last, at the request of the Directors of the I. O. T. Co., I proceeded to London mainly for the purpose of contracting for the construction and shipment of a new cable for that line, superior in quality to any that had been previously provided.

A satisfactory contract for the manufacture of the cable was made with the India Rubber, Gutta Percha and Telegraph Works Company of Silvertown, according to specifications prepared by Sir Samuel Canning, under whose supervision the work was carried on, and in June

last the completed cable was put on board the I. O. T. Co.'s steamer "Professor Morse," which had been ordered to London for the purpose of receiving it. The steamer sailed direct for Key West, but during her voyage the yellow fever broke out at that and other gulf ports, and, believing it unsafe to permit the vessel to go to Key West at that time, she was met on her arrival at the outer bar by an agent of the company, with instructions to proceed to Port Royal, where she remained until a few days ago.

The Punta Rasa cable, which had been interrupted several times during the summer, involving a considerable loss of revenue and extra expenses for temporary repairs, gave out entirely a few weeks ago, since when communication has been maintained by steamer. While this is being written, information has been received that the "Morse" has successfully laid the new cable, which is working perfectly, and that telegraphic communication with Key West and Havana has been restored.

A fault has been discovered in the cable of 1869 between Key West and Havana, and although the use of this cable is not required for the present volume of traffic, the new and better cable of 1873 being capable of passing double the present number of messages, the "Morse" will proceed at once to discover and repair the fault. When this has been done, the other cable between Key West and Punta Rasa will be repaired, and when this is done the company will then have two lines of cable from Punta Rasa to Havana.

Although the development of telegraphic business with Cuba has been greatly retarded by the condition of affairs on that island, the extension of the West India and Panama Company's cable system to a connection with the cables to Brazil, and the recent establishment of cables along the coast of Chili and Peru, is bringing a handsome increase of traffic to the I. O. T. Co.'s lines, and the prospects for the future are most encouraging.

MONEY TRANSFER SERVICE.

The number of telegraphic money orders received during the year was 34,853. The amount transferred thereby was \$1,963,247.06, and the revenue accruing to the company was \$87,219.40—being an increase over the revenue received during the preceding year of \$6,889.54, or about 8½ per cent.

The increase in the number of transfers was about 11 per cent., but the average amount transferred in each case was but \$56.33, against \$61.83 during the preceding year. For the first six months of the year the increase in revenue was only 6 per cent.; but during the six months ended June 30, the increase was about 12 per cent., and there are indications of a much larger growth during the present fiscal year, the returns for July showing an increase of 13 per cent., and for August, of 16 per cent. over the corresponding period of the preceding year. The receipt at a large number of offices of small sums aggregating about \$2,000,000, and the payment of the same at other offices, has been accomplished without the loss of a dollar.

GENERAL REVIEW.

The growth of the company's property and business during the nine years which have passed since the consolidation with the other principal telegraph lines, is shown by the following statistics:

From 1867 to 1875, the extent of line has increased from 46,270 to 72,833 miles, and the wires from 85,290 to 179,294 miles—being an increase of 57 per cent. of line, and 110 per cent. of wire. The number of offices and stations has increased from 2,565 to 6,565—equal to 156 per cent. During the same time the number of messages transmitted has increased 192 per cent., the rate of tolls has decreased 51 per cent., and the gross receipts have increased 46 per cent. The average cost per message, during the same time, has been reduced from 67 to 37 cents, or about 45 per cent. The increase of 192 per cent. in the number of messages transmitted annually, while the mileage of wire has increased but 110 per cent., is explained by the fact that the number of messages transmitted per mile of wire has been increased 41 per cent.

The ability to make so large an increase in the carrying capacity of the wires, is due in part to improvement in their conductivity and insulation, and in part to the introduction of the duplex and quadruplex apparatus, by means of which one wire is made to do the ordinary work of two, three, or four wires. By means of this apparatus, during the past year, the company has had the use of more than 30,000 miles of what may be called "phantom wire," which has cost nothing to provide, repair and maintain, except the cost of the new apparatus, which is but little more expensive than that in general use, and is adapted to all the ordinary requirements.

THE TARIFF OF MESSAGE RATES.

No general change has been made in message rates during the year. In February last, pursuant to previous public announcement, the rates on the lines of the Atlantic and Pacific Telegraph Company between Boston,

Albany and Washington, and intermediate stations, were reduced to a uniform rate of twenty-five cents. A corresponding reduction was made by this company, which took effect on the same day. The reduced rates, after having been in operation about six months, were abandoned by an arrangement between the companies, and the former rates restored.

The fact that at the end of nine years, during which time the number of messages has increased 192 per cent., and the average cost per message has been reduced 45 per cent., it now costs this company an average of 37 cents per message for more than 17,000,000 messages, must be accepted as conclusive proof that a company possessing small facilities compared with ours cannot realize profit from transmitting messages at the rate of twenty-five cents each. It undoubtedly proves more than this—in view of the further fact that the cost to this company during the past year for operators and messengers' wages was an average of twenty-one cents per message, and the repair and maintenance of lines cost five cents per message—and that is, that the Western Union Company derives no profit from the transmission of messages at the rate of twenty-five cents, even within the short distance of twenty-five miles, which is the limit of that rate.

Previous to 1869 but little effort had been made to introduce order and system into the rates charged for messages. In October of that year a system was inaugurated for the computation of rates by air-line distances. But these rates were different for like distances in different sections of the country.

In May, 1871, all charges above \$5.00 were discontinued, and that sum was made the maximum rate for the greatest distances. Although some of the rates previously in force were as high as \$10 per message, and the average rate between the Atlantic and Pacific coasts was over \$6.00, the reduction of the maximum rate to \$5.00 was not followed by any apparent loss of revenue. On the contrary, it was evident that the increase in the number of messages more than made up for the reduction in rates. But whether this increase resulted more from the reduction than from the natural tendency of the business to increase, cannot be positively stated. Subsequent investigation developed the fact that about 90 per cent. of the revenue from messages was derived from rates not exceeding \$2.50 per message, and in February, 1873, the maximum rate was reduced from \$5.00 to \$2.50. On July 1, 1873, the rates were still further reduced, and the tariff system simplified by making the rate uniform for like distances in all sections of the country, and by reducing the number of rates to ten (25, 30, 40, 50, 75, \$1.00, 1.25, 1.50, 2.00, 2.50).

The reductions in message rates made by this company during the past nine years have been greater in the aggregate than have ever been made upon the entire traffic of any other telegraph system, private or governmental, in the same period of time.

When, nearly six years ago, the British Government acquired possession of the telegraphs, a uniform rate of one shilling sterling was established. This was equivalent to an average reduction of about thirty-three per cent. of the rate previously in force, and the present rate is not materially less for like average distances than the rate now charged by this company.

Under the energetic management of Frank Ives Scudamore, Esq., C. B., extensive additions were made to the British telegraph lines, the most approved apparatus was introduced, and every department of the service was increased in efficiency. The result has been an enormous increase in the number of messages and a corresponding increase of revenue. But the expenses have increased in a still greater ratio, so that at the end of the last fiscal year, March 31, 1875, the deficiency in the sum required for the expenses of the year, including interest at the rate of three per cent. per annum upon the capital, was more than one million dollars.

The following table is taken from the report of a Special Commission appointed by the British Treasury to investigate the Postal Telegraph accounts, dated July 17, 1875:

Year ended—	Number of Messages.	Surplus of Income over Working Expenses.
March 31, 1871.....	9,850,177	£ 303,456 13 5
" 1872.....	12,473,796	159,834 12 8½
" 1873.....	15,535,780	103,120 2 8¾
" 1874.....	17,821,530	90,083 6 11¾
" 1875.....	19,253,120	36,725 0 0

As much stress has been laid upon the fact that the English rate is for a message of twenty words, instead of ten, as in this country (date, address and signature are sent free in both countries), it is proper to take notice of it in this connection. It appears, however, from the official report from which the above exhibit is taken, that, although the British public have the privilege of sending twenty words, this privilege is only par-

tially availed of, for, in an aggregate of more than eighteen millions of messages per annum, the average number of words per message was but seventeen. The inference is plain—that if the inducement to send so many words without extra charge had not been presented to every customer, by the twenty vacant spaces on the blank form on which every message was required to be written, the average number of words per message sent would have fallen below seventeen.

The result of Governmental operation of the telegraph in England does not differ essentially in results from Governmental management of other kinds of business, as compared with private; Governmental management of telegraphs, railways, canals, ship building, manufacturing and other kinds of business, is invariably more expensive and rarely more satisfactory in any respect.

THE ATLANTIC CABLES.

During the year covered by this report, the United States Direct Cable Company has continued its efforts to establish telegraphic communication by an independent line between Great Britain and the United States, and although these efforts were not successful until after the close of the fiscal year, the completion of the new line had been accomplished before the preparation of this report commenced.

In May last the Anglo-American Telegraph Company, owning three cables between Valencia, Ireland, and Sidney, N. S., via Newfoundland, and one between Falmouth, England, via Brest, France, and the Island of St. Pierre and Duxbury, Mass., reduced the rate for transatlantic messages from four shillings to two shillings sterling per word. When the United States Direct Company's cable was opened for business in September last, the rate was fixed by both companies at one shilling (twenty-five cents coin) per word.

During the period of about four months, while the two shilling rate was in force, the number of cable messages increased about thirty-five per cent. over the number transmitted during the corresponding period of the preceding year. The shilling rate had been in operation less than a month when the new cable failed; thereupon the Anglo-American Company restored the four shilling rate, in force prior to the reduction which it had made in May last.

Although, by the terms of a contract entered into five years ago, the cables of the Anglo-American Company connect exclusively with the lines of the Western Union Company, the latter has no voice in deciding what the rates for transatlantic messages shall be. This company receives a portion of the tolls on cable messages between New York and European stations, which tolls are fixed by the Anglo-American Company.

As the Western Union Company has been severely censured on account of the advance in cable rates, justice seems to require this statement of the facts. This company has no more power to fix the rate for a cable message to Europe than we have to fix the rate for passage by steamer across the Atlantic. It is proper to add, however, that, on receipt of notice of the intention to advance the rate from one shilling to four shillings per word, an earnest request was sent to the Manager of the Anglo Company in London to have their action reconsidered, and the rate fixed at two shillings a word. Our request was declined on the ground that the revenue at the reduced rates had proved entirely inadequate to insure the permanent maintenance of the cables and the expense of operating them, and afford the proprietors any return upon their investment.

IMPROVED APPARATUS.

It has been known for years all over the world that signals could be transmitted through a wire much more rapidly by machinery than by hand, but the attempt to utilize this fact by the substitution of machinery in the transmission of messages, for the key in the hand of the operator, has never been successful, for the reason that the process is not economical either in respect to time or labor. A single message can be transmitted and copied in less time by the hand (Morse) process than by any other (except by the printing telegraph, which, for well understood reasons, is not adapted to general use). What the public requires is that each message shall have immediate despatch, and they have no other interest in knowing that, by waiting a while, the mere act of transmitting the signals which represent their messages can be performed by a beautiful process at an extraordinary rate of speed, except to know what to avoid.

The transmission and copying of a message at the other end of the circuit by the hand (Morse) process are simultaneous acts, both of which can be accomplished in as short time as a message can be prepared for transmission by the so-called automatic process, and both of which can be performed in less time than a message can be translated after it has been transmitted by the automatic process. So that, when the admirers of this mode have proved conclusively that the act of transmission by their process takes no time at all, they prove too much, because even then the time during which a message must inevitably remain in their hands is twice as

long as is necessary with the other process. We have, therefore, declined to introduce processes, whatever their advantages otherwise might be, the substitution of which for those we now use would inevitably increase the time required for the delivery of a message at its destination.

The duplex and quadruplex apparatus, of which previous mention has been made herein, are fully realizing the expectations formed a year ago and set forth in my last annual report.

As the assertion has been frequently published that this company does not control the patents for the quadruplex apparatus, it is proper to state here that the process known by that name was developed by Thomas A. Edison, assisted by George B. Prescott, the electrician of the company, while Edison was fulfilling an agreement made with me to perfect improvements upon the Stearns duplex apparatus owned by this company; and that subsequently a written contract for the sale of the quadruplex patents to this company was executed by both inventors, and the sum of ten thousand dollars paid thereon.

It is true that, in face of these facts, one of the parties deliberately undertook to deprive the company of that which he had sold to it, by giving subsequently a pretended title to another party; but the right of this company to own and control exclusively that which it has purchased in good faith and partly paid for, will not, we think, be seriously disputed to the extent of a legal trial.

On account of the conflicting claims which have been set up, no patents covering the quadruplex apparatus have yet been issued in this country; but it is believed that such issue must take place during the coming season, and the control by this company of the quadruplex method be thereby made complete. Careful attention is constantly being given to the subject of improvement in telegraphic modes and apparatus, and neither pains nor expense will be spared to secure for the company the use of whatever will tend to promote the efficiency of the service.

Respectfully submitted,
WILLIAM ORTON, President.

Destruction of the Virginia, Nev., W. U. Office.—Personals.—Bulls.

SAN FRANCISCO, CAL., Sept. 27.

TO THE EDITOR OF THE TELEGRAPHER.

ON the morning of Sept. 3d a fire at Virginia City, Nev., destroyed the Odd Fellows' building, a portion of which was occupied by the Western Union Telegraph Office, interrupting all eastern wires for several hours. Virginia being a repeating point, and as no suitable location could be procured for an office, the operators were transferred to Reno, where the repeating was formerly done; Geo. Senf, manager, Davy Crawford and McPhee remaining at Virginia to look after the business of that office, which was soon reopened in the Douglas building on C street. The operating room is on the third floor, and the receiving department on the first floor, business being carried back and forth between the two rooms by messengers. The Company loses about \$2,000 by the fire. All the repeaters and duplex instruments having been destroyed, necessitated the relaying of all eastern business at Reno for two or three days, until instruments could be forwarded from this city.

During the recent panic business was very heavy on all the lines, especially the Overland—eight hundred messages having been sent and received in one day on that wire. The election, coming as it did right on the heels of the panic, made it very lively for the boys (and girls), and, as we are not used to hard work out here, was not very highly appreciated.

I neglected in my last to mention the appointment of Mr. Len. W. Storrer as cashier W. U. Telegraph office, vice H. C. Lee, resigned; a deserved promotion, Len. having worked long and faithfully for the company. Mr. F. Drake takes Mr. Storrer's former position as secretary to Genl. Supt. James Gamble. Mr. C. B. Lamb, formerly of Cincinnati, has accepted a situation in the W. U. office, and it is understood he is to be appointed night chief operator about October first, Mr. A. Venton returning to his old place on the day force. Mr. M. S. Bacon is working for the A. & P. at Winnemucca, Nevada. Harry M. Bennett, one of the boys who struck the bonanza last winter, and let it go again, is also working in the same office. The irrepressible Ned Pierson is working for the A. & P. at Ogden, and sends the night report way through to Los Angeles in his usual inimitable style. On the first of October *The Telegraph*, a local paper, prin-

cipally devoted to the interest of the American District Telegraph Co., will make its first appearance. It will be under the management of, and edited by Mr. B. R. Bates, manager W. U. Telegraph office, Oakland, Cal.

The Electrical Construction and Maintenance Co. have a fine assortment of telegraphic and other electrical instruments on exhibition at the Mechanics' Fair now being held in this city. The W. U. have opened a branch office in the Pavilion, Miss Eliza Brodie being in charge, and the way she gets after the "S. F." operators for not answering up promptly is a caution.

Salaries are on the decline in California, the supply of operators being greatly in excess of the demand; \$110 being now the standard in the W. U. office, instead of \$120 as formerly; the last of the \$120 men being reduced on the first of September. You have our sympathy, "Stanley," and we think it's a "very small salary for a very large family."

Your correspondent, "Ben Broese," has a very exciting story in THE TELEGRAPHER of September 11th. Any one who has read it will see at once that "Ben" has travelled. For instance, he says, "The track was only visible for about a dozen rods, and was then lost from view in a dense forest." Now this is very rich, and can be appreciated by any one who has ever crossed the plains. Now, "Ben" give us a rest on the dime novel romances, and take that great and good man's advice, and "Go West" before attempting any more of the same sort.

Here are the very latest from the W. U.: Col. U. S. A. Co. Bank, for Coluso Co. Bank, and E. C. Lipsie, Windmill Co., which needs no explanation; and coming as it does so soon after the E. C. Tipz, Windmill Co. of Chicago notoriety, which appeared in THE TELEGRAPHER, is a terrible warning to all the boys to subscribe for our paper and keep posted.

ROMEIO.

The Chicago Western Union Office Management.—The Other Side of the Story.

CHICAGO, ILL., Oct. 6.

TO THE EDITOR OF THE TELEGRAPHER.

"THERE is always two sides to a story." For some time past your paper has contained communications from several correspondents (purporting to represent the majority of the telegraph fraternity here who labor for the Western Union Company), who have endeavored to make it appear that widespread dissatisfaction exists with the new management of the Western Union office. Such is not the case, and from personal knowledge and intimate relations, coupled with numerous conversations with at least nine tenths of the employés here, I am prepared to say that the fraternity hailed with delight the change, as from *serfdom* to manhood, at the time it took place, and have had no cause to regret it. Because the old management was never attacked, you must not suppose that everything was pleasant for the employés under the old regime. Men were called up at that time and reprimanded for the slightest offences, not in well chosen words by those in charge, but *with oaths!* It was a difficult matter to get permission to hire a substitute on any occasion then unless "you were in the ring." I distinctly remember the case of a young man who wanted to accompany his cousin (a little girl too young to travel alone) to her dying mother, and presented a substitute in every way qualified to do his work, who, even after explaining the urgency of the case, was refused permission to leave, and had to appeal to the Superintendent of the District for relief.

A certain set of men could always get relief without substitutes even, and not only have their regular time go on but their extra also. The majority of the employés under the management then were treated more like dogs, or mere machines, than like human beings. Now the change from that management to the present was like that of Egyptian night to noonday's sun, and the only ones who find fault with the present management are a few sore heads, who either belong to "the old ring" or their allies, which are very few in number.

No doubt your readers will say, Why this tirade upon the old management now? Why was the matter not ventilated then? Because, first, a change was expected soon by those who were willing to expose such things, and again, because the majority were afraid to do anything of the kind. The nearest any correspondent came to attempting it being "Occasional," in his communication entitled, "Are Rules made for the Observance of all Employés, or only for those beneath a certain rank?" There is no such petty tyranny existing as your correspondents, "Harkaway" and "Beeswax," would have your readers believe; and you cannot find a single operator in this Western Union office who can truthfully say that they are treated as they were by the former management. It is necessary to make these comparisons to inform your readers just how we were treated previously; and show also that some men really don't know when they are well treated. The rigor and severity with which we were previously treated was such that it

created a feeling of downright insubordination, and, as soon as the new management was inaugurated, like a lot of school children, we all tried to see how far we could go without being punished. The result was that we had to be reminded of our duties, and it was done without oaths or insult. There are a set of men in every large office like this that always know more than their superiors. When a new order is promulgated they read and study it, not to learn and obey, but to find fault with it, and those who were obliged, in obedience to their superiors' orders, to have it posted up. They try to ridicule the grammatical construction; they mark the large words, "one word;" talk boldly of what they would do if they were managers, etc.

Such men will shirk work and stoop to little tricks, inside as well as outside the office, which should make any honest man blush. It is just on account of such men that orders have to be originated, and those of us who do engage with the company to earn our bread and butter honestly, have to obey rules that were never made on our account, just because we are associated in business with such fellows. What is the duty now of order-loving, law-abiding men in such a case? Would it not be far better to seek to elevate those who cause such orders to be originated, so that there would be no necessity for them, than to join the mob and cry, down the management?

Let us look at these orders that seem to be troubling "Harkaway." The "perfect labyrinth of doings," as far as concerns the new manager's orders, or those posted since his advent, are nine in number:

- 1st. Regarding copying through messages on city blanks.
 - 2d. Sending business direct on certain lines.
 - 3d. Specials received at a repeating office for Chicago must be taken by Chicago office regardless of the time of day it is offered by the repeating office.
 - 4th. B. C. & U. report received after 30 must be manifolded and sent to the different papers.
 - 5th. Figures in R. R. messages of which no account is kept need not be written out.
 - 6th. Operators must keep in hearing of their instruments.
 - 7th. Instead of copying a cable when repeated back, underscore the words carefully and put the time on the back.
 - 8th. Seven hours to constitute a night's work hereafter; and,
 - 9th. Operators cannot be seen during business hours, except in urgent cases, by permission from the Superintendent's office.
- No. 2 don't concern operators at all. All the other orders on the bulletin board were there before, and have simply been taken down, condensed, and printed over with the type-writer, with the new manager's name attached.
- Orders are never promulgated unless there is a necessity for them. No. 7 has lessened the operators' work on a repeated cable, from having to write out every word on a separate sheet and keep his eye on the original at the same time, to that of underscoring the words and timing it on the back.

There are not half a dozen night men who did not hail with delight the posting of order I call the 8th, and they haven't changed their mind—several day men have changed off with night men. I have made two hours extra when third from last on nights when there was no stick at all. No. 9 is signed by Col. Wilson, District Superintendent, and the new management cannot properly be blamed for that. I fail to see "the system that falls but little short of slavery inaugurated by the new management."

After cause for the dissatisfaction mentioned in the latter part of "Harkaway's" first letter was removed, he then makes that fact the basis of his remarks for his next letter, seemingly not willing to be satisfied with anything. The night men now get paid for *forty-nine* hours' work during the week, the same that the day men have to work *fifty-seven* hours for! This concession being made them on account of having to perform service after night, and every night, while the day men perform theirs in six days in daylight. In view of that fact "Harkaway" would have your readers think that we are ungrateful enough to be dissatisfied, and ask pay for the Sunday night we get off when we don't work. I suppose he would "kick" if he was obliged to come around every Sunday and get off soon as we could be spared, as was the case a few years ago, and want pay for the whole night or seven hours. "What's the sauce for the goose is sauce for the gander." If the company will pay us extra when we get stuck, we have no right to expect them to pay us when we don't work, or by courtesy are given a night off for rest and recreation, whether it is Sunday or not. There is no justice in asking such a concession. The Morse register was not set up as a part of the system of espionage, as he would have us suppose, but merely for the purpose of ascertaining how the fast writing of today carried and printed on a register, as compared with the old fashioned heavy writing that was in vogue in the

days of registers and paper operators. Every operator of experience is aware that no fast writing, although easy to read and copy by sound, no matter how perfect the characters, will copy perfect on a Morse register. It was never designed for such work, and the only way it can be made to copy such writing, so as to be read at all, is to assist the action of the register by hurrying the paper through at a faster rate than the momentum of the weight and machinery would carry it of its own accord.

It would have been much better to have waited until some chief did try his writing, and request him to "space his letters more," etc., etc., and then record it as a matter of fact, than to surmise that such would be the case.

His concluding paragraph savors so much of prejudice that it needs but a passing glance to understand the motive that prompted its inception. "Beeswax's" communication is rather a rehash of "Harkaway's," and looks as if the same author had a hand in its make up; but if he really don't know that managers only carry out the orders of their superiors, he should be informed that it is not necessary for them to have "temerity" enough to read them over when they come into the operating room, as they know their contents before the operators know of their existence. In conclusion, I don't believe the facts exist to warrant such a sweeping denunciation of the whole management of this office, as has been made by these correspondents. There may be individual cases where operators have had differences with the chiefs or assistants, that in some cases amounted to a suspension for the time being of the operator, but such differences so far have been adjusted without, in a single instance to my knowledge, the operator having to lower himself in any degree from the standard of manhood.

FAIR PLAY.

The Official Journal Criticised.

MITCHELL, IOWA, Oct. 9.

TO THE EDITOR OF THE TELEGRAPHER.

In the *Journal of the Telegraph*, Sept. 15th, is described a duplex system, in which occurs: "Now instead of of the wire *a*, if a second battery of 100 cells is connected between the point *a* and the ground, with its positive pole likewise to the line, its current will exactly neutralize that of the battery *E*" (of same number cells, "in the short circuit, etc.") Now how is it that only about one year ago, in a somewhat similar arrangement, the relay received the full force of the second battery in the short circuit, according to the *Journal*, while we are now told by the same authority that "this circuit may be neutralized as in the former case," etc., and that "precisely the same result will follow as in the first instance" (first above quoted), "there will be no current whatever in the wire *b*, and a relay inserted in it would remain entirely unaffected," etc.? I have the temerity to believe that, arranged as the *Journal* describes it, a current will flow to the point *a* from the second battery in the first instance; and in the second case *too*, currents of equal effect upon relay, flow through wire between *b* and earth in *opposite* directions, and therefore do not move relay armature; but I do not have the presumption to say the system lately described is "totally unoperative," simply because I differ with some of the theories advanced in its description.

S. J. M. BEAR.

Personals.

Mr. WILL B. RICE, chief operator of the O. & C. R. R., Albany, Oregon, wishes to be informed through the columns of THE TELEGRAPHER of the present address of Mr. Charles Utley, who two years ago was operator at St. Mary's, on the P. & E. R. R.

Mr. ROBERT LIVINGSTON has resigned his position in the Kansas City, Mo., Western Union office, and is visiting at Cherry Valley, N. Y.

Mr. CHARLES H. PATCH, who recently accepted a position with the Western Union Co. at Kansas City, Mo., has resigned on account of ill health, and returned to Des Moines, Iowa.

Mr. C. D. HAY, late of Austin, Texas, has accepted a position on the night force of the St. Louis, Mo., Western Union office.

Mr. R. J. NICOD, of the St. Louis, Mo., Western Union office, has resigned, and returns to Milwaukee, Wis.

Mr. GEORGE MILLER, late of Omaha, Neb., has been appointed extra operator on the St. Louis, Iron Mountain and Southern R. R., St. Louis, Mo.

Mr. W. B. JONES, late of the H. & St. Jos. R. R. office at Palmyra, Mo., has accepted a position with the Western Union Company at Quincy, Ill.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

A Special Premium for Subscribers to "The Telegrapher."

THE summer season is about over, and we expect that the friends of THE TELEGRAPHER will now renew their efforts to increase its list of subscribers.

It has been our custom for years past to share with those who kindly interest themselves in obtaining subscriptions by offering valuable premiums.

We propose this season to excel our former liberality in this direction. We desire to offer something of real and permanent value. We have accordingly made arrangements by which we are enabled to offer to the person obtaining 60 subscribers for one year, at the regular subscription price, \$2 per year, or their equivalent in shorter subscriptions, a

No. 1 WEED SEWING MACHINE; for 65 subscribers a

No. 2 WEED SEWING MACHINE, and for 70 subscribers a

No. 3 WEED SEWING MACHINE.

The price of these machines is respectively \$60, \$65 and \$70.

The machines will be boxed and shipped without extra charge.

This affords an excellent opportunity for female telegraphers, or for telegraphers who have wives or relatives that need these exceedingly useful machines, which are in every respect first class, to obtain them at comparatively little trouble or expense.

Send in subscriptions as obtained, and they will be credited until the necessary number to entitle the sender to the desired premium is obtained.

To prevent disappointment, should any canvasser eventually fail to obtain the requisite number for a machine, they will be allowed other premiums proportionate with the amount collected, or, if preferred, 20 per cent. in cash on such amount. To whom shall we send the first machine?

Atlantic Cable Tariffs.—Why the Recent Advance was Unavoidable.

In writing last week of the recent advance of the Atlantic Cable tariff from one shilling to four shillings per word, we spoke of the reduction to one shilling as too radical to prove profitable. We felt it to be our duty to say what we did in reply to the indignant comments of many newspapers upon this action of the Anglo-American Company, and the denunciations of that company as unscrupulous monopolists, who eagerly embraced the opportunity afforded by a temporary suspension of competition to practice an unjustifiable imposition upon the public.

We are not the special advocates or defenders of the Anglo-American Company, or in fact of any other telegraph company—THE TELEGRAPHER occupying an entirely independent position, and favoring telegraphic competition, whether in land or ocean telegraphs. It is, however, absurd and unjust that any telegraph company should be required or expected to engage permanently in the business at unremunerative rates. Telegraphy, like other business, is entered into to make money, and if this cannot be done at one rate or price, it is inevitable that that it shall be increased sooner or later.

It should be borne in mind, also, that there is very little analogy or comparison between cable and land lines, as regards their respective cost or tariffs. If, for instance, a line is constructed between two points on land, the cost of construction will include the price of poles and wire. If in process of time another line is required to accommodate an increase of business, it can be put upon the same poles at a comparatively small additional expense, and so on for a considerable number of wires. The original cost of such a line is small compared to the expense of manufacturing and laying a cable, and the amount of business which can be transmitted over it, even with the ordinary apparatus, is from four to six times that which can be sent over a long ocean telegraph cable.

An automatic telegraph cable, which accommodates but one wire, laid and in working order, costs from five millions to seven millions of dollars. If the business increases beyond the capacity of the single wire, a new cable must be laid, at very nearly if not quite as great a cost as the first, and so on indefinitely as the business is developed. In the matter of maintenance, also, the same disparity is realized. If a land line is broken it can be speedily repaired at a comparatively small expense. If a cable is broken, or interrupted from any cause, it can only be repaired at a large expense, and after a suspension of its use for weeks and sometimes months—and a steamer fitted up with costly appliances has to be employed for its recovery and repair. It will thus be understood that very low cable tariffs, such as were temporarily established as an experiment, are impracticable unless the stockholders are prepared with a self-sacrificing spirit, which is not to be expected, to defray a portion of the expenses of the business out of their own pockets.

Another factor enters into this calculation, which should not be lost sight of, and that is, the perishable and uncertain character of cable telegraph property. From the very nature of such property, sunk, as it is, in the bottom of the ocean, and recoverable and repairable only at large expense, a considerable reserve must be provided for maintenance and depreciation. The Anglo-American Company has four live cables, besides one which has been broken for a long time—but which it is hoped may ultimately be recovered—and the 1858 cable, which has been definitely abandoned. These cables more than suffice for the business offering, and conse-

quently, even if one or two of them are temporarily interrupted, the public generally hear nothing about it. The Direct Cable Company having but one cable, when that was broken, was obliged to suspend business and notify the public of the misfortune. One or more of the Anglo-American cables are interrupted every year, and the company is compelled to keep repair steamers in constant readiness to recover and repair the broken cables; and this is a large item in its annual budget of expenses.

It has also been thoroughly demonstrated that very low rates for cable messages does not develop the business as rapidly as upon internal lines. Sir JAMES ANDERSON, two or three years ago, prepared tables, which were reprinted in THE TELEGRAPHER at the time, showing the different rates of tariff which had been established on the principal cable telegraph lines and their result, which proved that very low rates for such business were impracticable, if it was to be remunerative, and also that the increase of cable messages from a reduction of tariff was not commensurate with such reduction. The recent experience of the Anglo-American Company has further demonstrated the correctness of Sir JAMES ANDERSON'S tables and conclusions. Some figures in this connection will be found instructive and interesting. The accounts of the Anglo-American Company show that the daily average of traffic receipts for the last week of the two shilling tariff was £1,233.

For the last seven days of the one shilling tariff, in competition with the Direct Cable, £754.

For the six days after the competing cable was broken, when it had the entire business between Europe and America, £978.

For the first week after the return to the four shilling tariff, £2,234.

The increase of messages upon the reduction from four to two shillings was 35 per cent.; and upon the further reduction to one shilling 49 per cent. over the four shilling rate.

These figures are suggestive, and for practical value are worth more than columns of vituperation and denunciation of alleged monopolies.

Cable telegraph business should pay, in addition to operating expenses, 10 per cent., as a reserve fund for maintenance and depreciation; and in view of the uncertain and perishable nature of the property, 10 per cent. dividends to the shareholders cannot be regarded as more than reasonable. As a matter of fact, the Anglo-American paid but 5 per cent. dividends last year without competition, and its prospects are certainly not improved for the present year. It has sunk a half million of dollars at least in its experiments with reduced tariffs, and it has competition with the Direct Cable to encounter, although for the present temporarily suspended through the misfortune of the Direct United States Cable Company.

A consideration of the facts above stated will show the unreasonable character of the assaults which have been made upon the management of the Anglo-American Company for the recent advance of its rates, and the impracticability of profitable maintenance of the reduced rates. Whether the present tariff is as low as can be profitably maintained we are not prepared to say, but that the permanent maintenance of the one shilling rate would prove unprofitable and ruinous to both companies we have always felt assured.

We hope that the Direct Cable will soon be in working order again, and the public have the benefit of reasonable competition, and such a tariff as experience has shown to be just and equitable to the investors in ocean telegraph property and the public.

The Western Electric Manufacturing Co.'s New Advertisement.

In our advertising columns will be found a new advertisement of the Western Electric Manufacturing Company, to which we call attention with much pleasure.

This Company has acquired a prominence in the manufacture of electrical and telegraphic apparatus of every description in the West, by the excellence of its work and the extent and completeness of its manufactory and

machinery. It is probably the largest manufacturing company in this specialty in the country, and its works are excelled only by the shop of the Western Union Telegraph Company in this city. Those who are in want of any description of electrical or telegraphic apparatus or supplies will do well to send for their new catalogue and price list.

The Western Union Annual Report.

We print this week, in full, the Annual Report of President ORTON to the stockholders of the Western Union Telegraph Company, submitted to them at the meeting held on Wednesday, the 13th inst., for the election of directors for the ensuing year.

This is one of the most important and interesting telegraphic documents of the year, and our readers will require no excuse from us for occupying so much of the present issue of THE TELEGRAPHER in presenting it to them promptly. We have not space to comment upon or review the report this week, but shall probably have something to say about it in our next issue. In the meantime the statements, suggestions and arguments contained in the report are worthy of careful consideration from all who are interested in telegraphy either as stockholders, employés or patrons.

In consequence of so much of our space being occupied by Mr. ORTON'S report, we are compelled to omit several columns of correspondence, besides other interesting matter intended for publication this week. We will give place to the favors of our correspondents and contributors as speedily as possible, and in the meantime they must exercise patience, as we are obliged to do in regard to our own matter, which is unavoidably postponed.

The Telegraph.

Annual Meeting of the Western Union Telegraph Company.

The annual meeting of the Western Union Telegraph Company was held at noon on Wednesday last, the 13th inst., at the Executive office of the Company in this city, the President, Mr. ORTON, presiding. The report of the President, which will be found in full elsewhere was read and received, and ordered to be printed.

The Board of Directors for the ensuing year was elected without opposition, as follows: (\$25,800,000 of the stock of the company being polled:)

Messrs. William Orton, James H. Banker, Alonzo B. Cornell, Harrison Durkee, Norvin Green, Joseph Harker, Edwin D. Morgan, Augustus Schell, W. R. Thorn, C. Vanderbilt, Frank Work, Chester W. Chapin, Wilson G. Hunt, David Jones, C. Livingston, James Milliken, Levi P. Morton, John Duff, O. H. Palmer, Geo. M. Pullman, E. S. Sanford, John Steward, Moses Taylor, Daniel Torrance, W. H. Vanderbilt, W. B. Vermilye, E. S. Wesley, D. O. Mills, E. D. Worcester.

Inspectors of Election.—Geo. B. Prescott, Leonard Cox, Wm. Arnoux.

The American District Telegraph Company.

The annual meeting of the American District Telegraph Company was held at the executive office of the company, No. 62 Broadway, on Tuesday, the 12th inst. Forty-two thousand and eighty-eight shares were voted on, and the following gentlemen elected directors for the ensuing year: Messrs. E. W. Andrews, A. B. Cornell, Townsend Cox, A. W. Greenleaf, John N. Gamewell, H. L. Hotchkiss, Charles Lawson, A. H. Laffin, and H. T. Jenkins.

The annual report of the President, Mr. E. W. Andrews, was read, which showed the company to be in an increasingly prosperous condition, and its prospects for the future excellent. The business of the company is constantly increasing, and the ratio of cost of operating to gross receipts diminishing, as the organization of its system is such as to make it relatively less expensive to do an increased business. There has been during the past year an increase of instruments over the previous year of 793. On the 1st inst. there were in actual use 3,517 instruments, against 2,724 last year. The average increase of earnings has been 227 per cent., against an increase of expense of 103 per cent. The company operate twenty-three district offices, and experience has demonstrated that there is a steady increase of the business of a district the longer it is in operation. The increase of earnings per instrument per annum was reported as follows: 1873, \$64.66; 1874, \$73.19; 1875, \$83.18. As the public become accustomed to the use of

the system and aware of its advantages and convenience, they use it more frequently, and the result is an increased average of earnings per instrument.

In addition to its system and property in this city, the company holds a large amount of stock in companies organized for its introduction elsewhere, which has been received as a royalty for the use of the patents held by the company, and which it is confidently believed will, at a not distant day, become a source of revenue from dividends and very valuable.

The National Telegraph Company.

BUT little has been heard recently in regard to the new National Telegraph Company, whose organization at San Francisco, Cal., and announcement of its intention to construct a telegraph system which should cover the country, caused quite a sensation in telegraphic and business circles. It was even reported that the financial difficulties of California had caused the abandonment of the project, and the return to the stockholders of the ten per cent. paid in on their subscriptions.

The arrival of Mr. A. A. COHEN, the President of the Company, in this city on Thursday of last week, however, has revived the public interest in the enterprise.

Mr. COHEN states that the enterprise has not been abandoned, but is certainly to be carried out as originally proposed. It is, he says, too late to begin the work of construction the present season, as was intended when the company was organized the first of July last. The fall and winter season will be utilized in preparing for the commencement of operations in the spring, which will be made as early as practicable. The full detail of the work has not yet been determined upon. Much of this has to be settled before commencing the work of construction, so that it may be done systematically and economically. He states, however, that much has already been done toward the arrangement of the several departments and the transportation of the requisite supplies over the railroads.

The delay which has been experienced was caused by the financial derangements in California, and but for this the work would have been well under way by this time. The company suffered no pecuniary loss, the \$750,000 which was placed in the hands of the late Mr. RALSTON as Treasurer of the company having been made a special deposit in the Bank of California to the credit of the company.

In reference to a purchase of the Atlantic and Pacific lines as the nucleus of the system of the National Company, Mr. COHEN states that last spring he made an offer to purchase the wires of that company. His offer was to buy the entire property of the company at a rate 20 per cent. in advance of that at which, at that time, the stock was held on the street, to be paid for in money, and within five days, providing the stock was placed in the possession of the purchasing party. This offer was refused. The National Company is yet ready to purchase the property of the A. and P. Co. for what it is worth.

Mr. COHEN speaks highly of the fidelity of the management of the Western Union Telegraph Company, of which he has long been a heavy stockholder, but he and his associates think the time for doing business as they have done it has passed away; and that the public have now arrived at an era when cheap telegraphy is as much a necessity as cheap postage, and it is proposed to start the new enterprise upon that basis.

In regard to the rates to be charged, he says that these have not yet been fully determined upon. At any rate, a ten word message across the continent will not cost more than \$1; and the new company have views on this matter tending far below the now existing rates. With the present improvement in telegraphy—and the new company hope to secure such as may prove adaptable—the capacity of the telegraph line and of the telegraph operators will be largely increased, and the rate at which both may be worked to their fullest capacity is the rate that must prove the most profitable to the telegraph company to charge. They will proceed upon the principle that while the expenses will not be materially increased, the low rate will be the one to bring the company the greatest net receipts. This is now the general basis of business in California—low rates and a large amount of business.

Mr. COHEN expects to remain in this section of the country for two or three weeks, and while here will make such arrangements as may facilitate the enterprise in which he is pre-eminently engaged.

Foreign Telegraphic Notes.

THE West India and Panama Telegraph Company's Santiago-Jamaica cable has been repaired. Telegrams may, therefore, again be sent to the Isthmus of Panama, the West Indies, British Guiana, and Cayenne, via New York, instead of via Lisbon and Pernambuco.

The India Rubber, Gutta Percha and Telegraph Works

Company have received a message from Mr. Gray, announcing the successful completion of the Iquique-Caldera section of their West Coast of South America cables. This places Peru in telegraphic communication with Europe.

An important question as to the law of copyright in newspaper telegrams has lately been debated in the Supreme Court of Melbourne. The proprietors of the *Argus* pay a large sum for the purpose of obtaining the latest telegrams from Europe. Any newspaper proprietors who may wish to publish the telegrams so obtained can do so by paying a contribution towards the expenses incurred. The proprietor (Mr. Luke) of the *Gipps Land Mercury* made an agreement to pay for the right of republishing the telegrams. This agreement was carried out for several months, when Mr. Luke cancelled it. The European telegrams received by the *Argus* were however, republished in another form, as from a Melbourne correspondent of the *Mercury*, with the preliminary words "It is reported," "The news about town is." This was considered a breach of the copyright which the proprietors of the *Argus* possessed in the telegrams, and as there was another newspaper at Sale that did contribute towards the expenses of the receipt of the telegrams, a suit was instituted in the Equity Court to restrain Mr. Luke from republishing the telegrams. It was argued for the defendant that as the telegrams were matters of news any one could republish them without breach of the Copyright Act. Mr. Justice Molesworth held, however, that the plaintiffs had a property in the telegrams, and that no one could republish them without the permission of the persons to whom they had been sent in the first instance. An injunction was therefore granted to restrain the defendant from publishing the telegrams.

The Isle of Man Cable was successfully laid on the 19th September, between the old landing place at St. Bees, near Whitehaven, and near Ramsay, in the Isle of Man. Communication was reestablished on the 20th ult., after many months' interruption.

The manufacture of the New Zealand Cable is steadily progressing, and arrangements are being made for its shipment; the *Hibernia* and *Edinburgh* will be employed on this work. The first vessel will be dispatched early in October, whilst the second will follow early in November. The total length of cable being manufactured is 1,370 knots. The core consists of 107 lbs. copper, and 140 lbs. gutta percha, of Willoughby Smith's improved manufacture. There are four types of cable—10 miles of shore end, 59 miles of intermediate, 300 miles of deep sea of the Mediterranean type—a solid covering of No. 13 galvanized homogenous iron wire, protected with yarn and compound—and 1,000 miles of special deep sea cable; this type consisting of 9 strands of hemp, alternating with 9 No. 13 galvanized homogenous iron wires, the whole being well protected with compound.

At a meeting of the Board of the Anglo-American Telegraph Company held lately, it was resolved to pay an interim dividend of £1 per cent., free of income tax, for the quarter ending the 30th of September, payable on 1st of November, leaving an estimated cash balance of £13,000, in addition to £25,000 placed to reserve.

The Indo-European Telegraph Company notify that the Singapore-Batavia cable is restored, and that messages for Java and Australia are accepted as usual, via Teheran.

The Postal Telegraph Scheme.

THE Cincinnati delegates to the National Board of Trade in their Report to the Chamber of Commerce, recommend the Chamber to use whatever influence it might have with members of Congress to the end that the General Government may purchase the existing lines, and manage the whole telegraph business of the country. A resolution was offered, in opposition to this, declaring that the Chamber does not commit itself in favor of the project of a national postal telegraph.

The Bastet Magnetic Engine and Battery.

FOR many years scientific men have known that mechanical power could be derived from the agency of electricity, and have anticipated the development and utilization of electricity as a motive-power. Although some discredit has been thrown upon this field of engineering through the many failures of honest experimentors, but more through the absurd pretensions of men whose desire was solely to deceive the public and so obtain money from deluded purchasers of shares in their enterprises, others, who are both scientific and practical, as well as honest, have still labored on in full faith that the time would come when a practical, cheap, and effective electromagnetic engine would be produced, certain that when this desideratum was secured the public would not be slow in giving it their patronage.

While a fair measure of economy in the consumption of materials during the time of working has been sought

for this class of engine, this has not been the chief consideration. The fact that consumption ceases immediately when electric engines are stopped, and only begins again when they recommence running, enables them to compete in economy with small steam-engines employed for intermittent work, under the boilers of which consumption must progress more or less during intervals of working. The principal benefit secured by the use of electricity as a motor is its convenience. With such excellent batteries as are now constructed, all the attention needed to run an electro-magnetic engine for from two weeks to three months is simply the turning of a button or switch by which the electric circuit is made or broken.

In Mr. Bastet's invention both the engine and battery have received attention, and both have been simplified to an extent which seems to meet all requirements. Each cell consists of an external glass vessel, the horizontal cross-section of which is oval, an interior porous vessel of corresponding form, a zinc plate bent into the proper form to be placed in the space between the internal porous cup and the external glass vessel, two carbon plates placed in the porous cup, and dilute sulphuric acid in both the porous cups and the glass vessel, there being added subsequently in the porous cup about four ounces of a peculiar liquid compounded by Mr. Bastet, and sold to consumers. Four of these cells thus made up form a battery sufficient to drive an engine having a power equal to the propulsion of a sewing-machine doing ordinary work. Such a battery will require a renewal of zincs once in about six months.

The magnets are made of flat bars with broad poles, and are so arranged that an equal number of them are always acting upon the rotating-wheel. This wheel is composed of spokes radiating from a central hub or shaft. To the outer ends of the spokes armatures are attached, placed at right angles with the spokes and parallel with the axis of the wheel. To the shaft of this wheel is attached a circuit-breaker of peculiar construction. It is a wheel made of wood, with copper pieces inserted at intervals in its perimetry; these copper pieces are connected with the ends of the wires which form the helices surrounding the electro-magnets, so that the circuits are made or broken at proper intervals. Upon the surface of the circuit-breaker wheel roll small brass wheels, which are pressed down by coiled springs; the wires forming the continuation of the circuit are connected with the metallic bearings of the brass wheels. Whenever the wheel rolls over the wooden surface the circuit is broken; whenever they roll over the copper surface the circuit is closed. There are no fine adjustments necessary, and no complications calculated to puzzle even the most ignorant operator. If the directions given for the renewal of the battery be observed, it is difficult to see in what way the machine could become inoperative except through breakage in some part, which could not occur in the proper working of the machine. No skill or practical knowledge which cannot be imparted in a few minutes is required to successfully run one of these engines. The battery can be placed in a small box in the cellar or closet, or wherever it is most convenient to have it. A small brake, or button, is attached to the sewing machine at any convenient place for the operator, and by simply moving this so as to close the circuit, the machine starts, and it is stopped by simply turning the button back again. The machine can also be given a fast or slow motion, perfectly under the control of the operator.

The connections are made as follows: one wire connects the zincs in the battery to the motor, two wires connect the carbons in the battery to the brake, and the brake-wire goes back to the motor. There is no possible danger connected with the use of this machine, and one supply of the acid solution will, it is claimed, do the work of a family on a sewing-machine from one to four weeks without the necessity of renewal. The cost of renewing is only twenty-five cents.

Dr. Rich, a prominent dentist of this city, informs us that he has used one of these electro-magnetic engines for three months without having to renew his battery for that time. He considers it indispensable for dentists' use, and says it is just what they have been wanting for years. The engine has also been applied to many other kinds of work. Messrs. Mason & Hamlin, well-known manufacturers of reed organs in this city, have one of these motors attached to a parlor-organ at their warehouses, where we had the pleasure of seeing it perform its work admirably. Its size is only 18 inches in diameter, and it is attached directly to the handle of the organ, so that by simply moving the button the player can start, stop, and regulate the wind without any inconvenience. In this application there seems to be nothing objectionable, while there must be an additional charm to the practice of the instrument. The engine can be made an ornament to the parlor, can be kept in order for a merely nominal expense, and is highly recommended by the above well-known firm for this purpose.

On a visit to the extensive organ manufactory of Messrs. Jardine & Son, of this city, we found that the Bastet magnetic engine had been applied there to blow a church organ, and it demonstrated that it has sufficient power for the purpose. This engine works automatically.

When the bellows is full it stops working; when the wind becomes in a measure exhausted, it starts itself, so as to keep a full supply of wind at all times. The machine is started and stopped in the same way as with the sewing machine and parlor organ. Messrs. Jardine & Son have given this motor a fair trial, and are prepared to recommend it to the public.

Having thoroughly examined the working of the engine, we believe it to be efficient, economical, practical, and durable, and the best motor yet offered to the public for most of the purposes to which it is applied. It requires no engineer, there are no fire risks in connection with its use, and no danger of explosions. The power is steady, reliable, and instantaneously put in operation. It may be successfully applied not only for purposes already described, but for running lathes, printing presses, fans, &c.—*American Artisan.*

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Sept. 21, 1875, and bearing that date.

168,004.—**PRINTING TELEGRAPHS.**—Thomas E. Edison, Newark, N. J., assignor to the Gold and Stock Telegraph Company, New York, N. Y. [Filed June 1, 1874.]

1. Two electro magnets in the electric circuit, with an armature moved between their cores in consequence of reversing the polarity of the pulsations, such armature actuating the lever and type wheel, in combination with the lateral cores of the electro-magnet and the armature that operates the printing lever, as set forth.

2. The arrangement of the type wheel lever and armature between two electro magnets, and an armature and lever at one side of the type wheel, operating an impression pad at the opposite side of the type wheel, substantially as set forth.

168,059.—**ELECTRIC RAILWAY SIGNALS.**—H. W. Spang, Reading, Pa. [Filed Mar. 17, 1875.]

1. The combination of one or more insulated sections of railway track, a main or primary battery and commutator, circuit changing relay magnets, and local or secondary batteries, an electric signaling apparatus, and intermediate conductors between the foregoing, arranged and operated for producing a series of signals in said signaling apparatus, or a single signal by a series of reverse currents, substantially as described.

2. The combination of insulated section A of railway track, battery B, commutator C, relay magnet M, levers l l', metallic points p p', p² p², battery B', wires 5, 6, 9, 10, 11, 12, 8, and L, and electric signaling apparatus H, arranged and operated substantially as described.

3. The combination of two insulated sections of railway track, A A', main or primary battery B, commutator C, relay magnet M, levers l l', metallic points p p', p² p², battery B', wires 5, 6, 9, 10, 11, 12, 13, 14, 8, and L, electric signaling apparatus H, and relay magnet M', battery B', ground plates G G', and intermediate conductors connecting the two sections A A', all arranged and operated substantially as shown and described.

4. The combination of signal disk X, shaft oz, toothed wheel Z, escapement j, lever J, and poles i i' of an electro magnet, substantially as described.

5. Relay magnet M, having levers l l', which are insulated from each other and vibrate respectively between metallic points p p', p² p², in combination with battery B', signaling apparatus H, and intermediate conductors of a local or secondary circuit, substantially as described.

6. Magneto-electric inductor B', the armature D' of which and wire coil are vibrated by lever L' between magnets S N, in combination with the rails of a railway track, substantially as and for the purpose set forth.

7. Geissler tube U, in combination with an induction coil, in which the primary current of battery B' is opened and closed by lever l' of relay M', oscillating between metallic points p p', as described.

8. An insulated section of single track railway, having arranged at each end thereof a main or primary battery and commutator connected with a polarized relay magnet at the end of section opposite the end where the battery is, each of said relays controlling an electric signal at a distance from it, substantially as described.

Married.

WEEKS—ASHLEY.—At Greenville, N. J., Oct. 12, 1875, at Grace Church, by the Rector, Rev. James M. Coe, Mr. HARVEY KELSEY WEEKS, of Danville, Vermont, to Miss ELSIE ELIZABETH, youngest daughter of Mr. J. N. Ashley.

BOGART—SMYTHE.—At the residence of the bride's parents, corner Thirty-first street and Prairie avenue, Chicago, Ill., Wednesday, Sept. 29, 1875, by the bride's father, Rev. W. H. Smythe, Mr. W. F. BOGART to Miss NELLIE J. SMYTHE, of the Metropolitan Companies' lines, main office, Chicago.

A GREAT REDUCTION IN PRICES!

I am now making a speciality of my PHIL. SHERIDAN SOUNDER AND KEY, and am manufacturing them in large quantities, so that I am able to offer them to the public at a very low figure.

PHIL. SHERIDAN, \$4.00.

The above cut represents a beautiful little Sounder. It is made of the best material and highly finished. It has a heavy lever, full sized magnets, and altogether is a first class instrument. The magnets are wound with green silk insulated wire.

A PHIL. SHERIDAN KEY TO MATCH, PRICE, \$2.00,

is a first class Key in every respect. It is highly finished, has large platinum points, strong lever, friction circuit closer, spring adjustments, etc., etc. As a Learner's set they have no equal, as they are regular Telegraph Instruments, same as are used on all railroad and commercial lines.

And I will sell the Key, Sounder, 1 full sized Callaud Battery, 1 lb. Blue Vitriol, 1 Double Connector, 1 Book of Instructions, 15 feet Connection Wire, etc., making a complete outfit for office use, for only \$7.50. These instruments will be made to work on a circuit from a few feet to five miles at the same price, and will be sent to any address on receipt of price, or will be sent C. O. D., subject to inspection. Don't fail to send for my Descriptive Circular and Prices. Address,

A. B. LYMAN,
91 1/2 SENECA STREET,
CLEVELAND, OHIO.

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE.

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article or office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection, introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDERS now

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

The Tendencies of the Times.

BY DOUBLE SIX.

THE tendencies of the times are, telegraphically speaking, very discouraging. It has been said by a correspondent in these columns that the Western Union Telegraph Company have proven it to be possible to pay good dividends without reducing the pay of its employes. Now, while willing to accord to that corporation its full measure of praise for abstaining from a sudden and general reduction in its pay rolls, we are unwilling to allow the above statement to pass as an unqualified fact. It is true that while some other companies have materially lowered the salaries of their employes, the Western Union has not (except recently in the South, where unwarrantably large salaries were being paid) made any such sudden curtailment of expenses. It is nevertheless an undeniable fact that it is the settled and determined policy of this company to gradually lower its rates of compensation to the cheapest possible standard. The natural outgrowth of such a policy is apparent to every thinking mind. The business must inevitably fall into the hands of an inferior class of operators. Men of spirit and ability will not brook any such invasion of their rights. Their rights, we say, because we maintain that a man whose abilities would in some other line of business command a certain salary, say \$100 per month, is rightfully entitled to that amount in return for his services. It is a fact that the actual result of this policy is, that one by one the best and most valuable men—those whom above all others the company can least afford to lose—are dropping out of the ranks to engage in more lucrative business, and their places are being filled up with a cheaper class of talent (if such workmen can properly be said to be possessed of that article). The consequence of this lack of capacity in many of the cheap operators is that "hulls" are multiplied until their numbers exceed those of the "cattle on a thousand hills;" press despatches are garbled, until the printers groan in anguish of spirit, and pray for the return of those good old days when report was received on paper and copied by their own reporters, when such men as A. S. Brown handled the key, and men of like ability stood along the line to receive the news.

It is possible that to some minds the immense increase of our business, and the consequent demand for a greater number of operators, might seem to justify the employment of a cheaper class of men. That this is a fallacious idea we believe it easy to prove. No one will attempt to argue that the class of telegrams which occupy the wires to-day are of less importance than those which were transmitted ten or fifteen years ago. Quite the reverse is the fact. The business of to-day is, taken as a whole, vastly more important than that of former years, and therefore it calls for—not cheap labor, but the employment of a still more responsible and intelligent class of men than it was ever entrusted to before. The interests of the business public cannot afford such a policy, and if telegraph companies persistently disregard the best interests of their patrons, the end is not difficult to imagine. They will be "weighed in the balance and found wanting," and their kingdom will be taken from them. We feel justified in thus criticising a policy which we have shown to be so diametrically opposed to the interests of the public, and ruinous to those of the better class of Morse telegraphers.

While the subjects of fast telegraphy and other increased facilities for the transaction of business are being agitated, it would be well to consider, in connection therewith, whether or not there cannot be effected an improvement in the men as well as in the apparatus. No money is spared in procuring the best of machinery; would it not be a sensible idea to open the money bags a trifle wider, and thereby encourage and retain some of the most valuable *animated* machinery?

Observation has shown us that operators, as well as telegraph companies, have certain tendencies peculiar to the times, which are likewise open to criticism. A Chicago correspondent of THE TELEGRAPHER recently noticed a class of operators who take no interest in the business. The class is a numerous one, and is being in-

creased yearly by the policy above mentioned. When a young man fixes upon a trade or profession, he does so with the intention of making it his life business, and if he be a man of spirit and ambition, all his energies are devoted to his work; he strives to master its every detail, and does not rest satisfied until he has fitted himself to hold the highest position which the trade or profession holds forth. How is it with a great many of our profession? They enter the business with the professed purpose of abandoning it as soon as something better presents itself. They have no desire to learn any more than is actually necessary for them to know, in order to draw their pay. They say, "Of what use is it for me to 'burn the midnight oil' in studying the science and practice of telegraphy; I am not going to make this my business. I can do better in almost anything else, as soon as I get a little start." The spectacle of a constantly diminishing scale of salaries is not one likely to check this feeling, or to inspire a young man with ambition to excel in this business. There is precious little glory connected with it, and men generally work for the money, so if that is not forthcoming there is generally a change of base effected.

The remedy for this evil is twofold. In the first place, if it is to be remedied at all, telegraphic corporations must adopt a different policy toward their employes; men of character and ability should be properly appreciated and encouraged, while incompetent men, and those who "take no interest in the business" should be kicked out to make way for better men. It strikes us also that morality needs a little encouragement. It is hardly creditable to the intelligence of a corporation having vast public and private interest confided to its care, to hear one of its officials state that "we do not hire men for their morality, but to work." On the other hand, operators can do much towards bettering their condition by making themselves worthy of advancement. It is not to be expected that a man will be advanced unless he is qualified for and worthy of promotion. Some months ago there was considerable talk in the various telegraphic papers about the necessity of a more thorough education for telegraphers. The official organ of the W. U. intimated that in the future more would be required of a man than the mere ability to send and receive messages. The actual state of affairs in relation to this subject is this: in so far as our observations have extended, we have found that telegraphic officials are not at all anxious to advance the standard of education of those below them. The fact is, that the man who attempts to learn more of the business is snubbed and treated as an intruder upon pastures not his own. There is a seeming fear that the servant may come to know more than his master, and therefore his efforts are, if possible, nipped in the bud. Of course this rule, like all others, has its exceptions. There are undoubtedly large numbers of young men of talent and ambition in our profession who, if properly encouraged and assisted, would in a few years make themselves invaluable to the company which was so fortunate as to possess them. Suitable libraries, a reasonable number of hours of labor, and a justly graded scale of salaries would do much, very much, towards effecting this much to be desired end. But why waste time in advocating such improvements as these? Telegraph companies will probably go on economizing (?) until they have run the business, like their wires, into the ground, and then—well, perhaps by that time the readers of this will all be gone where telegraphers are not, and where "troubles" are unknown.

The Anglo-American and Direct United States Cable Companies.

THE half yearly meeting of the Anglo-American Telegraph Company was held at the London Tavern, in London, October 1st.

The report states that the total receipts from the 1st of January to the 30th June, 1875, including a balance of £3,683 carried over from the last account, amounted to £288,637. The total expenses of the half year, including income tax, repair to cable, and depreciation of cable stock, amount to £47,570. One quarterly dividend at the rate of 5 per cent. per annum, free of income tax, was paid on the 1st of May, 1875, absorbing £87,500, leaving a balance of £153,566, from which a second quarterly dividend at the same rate of 5 per cent. per annum, amounting to £87,500, was paid on the 1st of August, 1875, leaving a balance of £66,066 (including £32,301 surplus cable) to be carried forward to the next account. The falling off in the traffic receipts for the first six months in 1875, as compared with the corresponding period in 1874, amounting to £67,720, is to be attributed partly to the continued depression of the American trade, but chiefly to the reduction of the tariff to 2s. per word, which came into operation on 1st of May, 1875. This reduction, announced in the last report of the directors, and unanimously approved by the proprietors at their meeting in April, resulted in a considerable diminution of receipts. The hopes which were entertained by many that low rates would produce remunerative results have

not been realized, for, although a large increase in the number of messages was obtained, the experiment, so far, seems to shew, on the contrary, that a low tariff cannot produce a reasonable dividend. The competing company, which opened its cable for public business on the 15th of September, announced a tariff which necessitated a still further reduction, and a rate of 1s. per word was adopted, as being the most simple and convenient under the circumstances. The result, as at present ascertained, confirms the opinions expressed in the last paragraph. Four of the company's cables are in complete working order and condition, and the messages, although greatly increased in number, continue to be transmitted with punctuality and accuracy. The directors regret to have to announce the resignation of his seat at the board of Mr. E. J. Halsey, a gentleman who has always shown great zeal and activity in the interests of the company.

The chairman, Lord Monck, in moving the adoption of the report, referring to the reduction of the tariff first to 2s. and afterwards to 1s., and the competition with the Direct Cable Company, said:

"He hoped they would not imagine that he spoke with the slightest feeling with respect to this question of competition, for he could assure them there was nothing further from his mind, as he looked upon the matter not as a question of feeling, but as one of *£ s. d.* What he meant to say was this, that he knew there were some gentlemen among the Direct Cable shareholders, and a very large portion of the community at large, who thought a low tariff would bring them such an accession of business as would enable them to pay a good dividend, whereas with the 4s. tariff they were not making anything worth talking of. His own opinion never ran in that direction, but still the board felt bound to shew these gentlemen that a 1s. tariff would neither pay them nor the Anglo-American Company itself. The result of the company's experience was to show that before they could recoup themselves what they lost by a reduction of the rate, they must have such an increase in the number of messages as would virtually clog with traffic the four cables belonging to the company. That was a thing to be avoided, inasmuch as the slightest disarrangement was calculated to damage not only the traffic but the character of the company in respect to its efficiency. That was a lesson worthy to be laid to heart. The directors have proved that neither the company nor its competitors can make a profit on the 1s. tariff, even when working at high pressure.

* * * * *

If those who were connected with the Direct Company were possessed of common sense, as they were undoubtedly possessed of great common sense, they must admit that a low tariff will not pay them. They had too, he hoped, satisfied the public that they should not expect that the company should do business for them at a loss. Having arrived at this conclusion, they felt when the direct cable was broken, and the reins were again in their own hands, that they were bound to return to the 4s. tariff which had given them a good income in the past, and which would give them the same in the future. He wished now to say a word with respect to the interest of the public in this matter of long sea cables. They had heard a great deal about fresh and fresh competition, and when the Anglo-American board adopted the shilling tariff, he met a gentleman who said to him, 'You are going to crush the Direct Cable Company, and that is a generous policy.' But he could assure the meeting that the directors did not entertain any such views, nor was it possible they could, inasmuch as the smallest traffic would be sufficient to enable them to go on paying their working expenses."

The chairman further stated, in reply to questions in regard to the current rumors in regard to the negotiations between the directors of the two companies, that "He had heard of rumors of negotiations between this and the other company, but he had not heard anything about negotiations."

A shareholder inquired whether the directors intended to again reduce the tariff in the event of the new competition on the part of the Direct Cable being revived.

The Chairman: "Certainly not."

After some further discussion the ordinary routine business was disposed of, and the proceedings terminated in the usual manner.

Arrival of "Clix" in Arizona.

THE family of Ex-Gov. Coles Bashford, of Wisconsin, now Secretary of Arizona, arrived here on Monday from Los Angeles, Cal., by Jim Bonos' stage. This arrival includes a son-in-law of the Governor, W. E. Smith, Esq., who comes to take a partnership in the house of L. Bashford & Co. On and after Nov. 1st the firm will consist of L. Bashford, R. H. Burmister, W. C. Bashford and W. E. Smith. The old firm has always done a leading business in this part of the Territory, and with their new acquisitions to the proprietorship, their now fire-proof stores, and new and very heavy stocks now on the way, the new firm must of necessity do an increased amount of business.—*Arizona Weekly Miner.*

Poor Prospects for Telegraphers on the Pacific Coast.—The New National Telegraph Co.—Personals.—California Plug Factories.

SAN FRANCISCO, CAL., Oct. 1.

TO THE EDITOR OF THE TELEGRAPHER.

"ROMEO" anticipated me in giving to you the "Personals" and changes on this coast. He omitted, however, the most important changes. He did not mention the number of operators out of employment in this city, nor the reduction of salaries, nor the poor prospects that operators who leave the East have to find employment. That would be more acceptable news for the many who have come here to drag around town, or go poleing hogs, or mind sheep to protect themselves, than personals.

The situation here is anything but flattering or promising—I might say panicky, but, unlike the Bank of California, there is a poor show indeed for a resumption of the good old days when men were paid first class salaries, and San Francisco boasted of not having a plug within its walls. Now plugs are at a premium. There are at this moment fourteen operators in this city out of employment, the majority of whom claim to be first class. Most of these operators have come direct from the East, anticipating immediate employment, because a few inferior men who preceded them found employment, because they arrived at a time when things were badly mixed in this office. These men, of course, wrote to their friends of their good fortune, which is one of the reasons why operators were allured hither. I hope these lucky ones will be as willing to support their—soon to be—starving brethren as they were to entice them here, for starve they inevitably will if they wait for situations as telegraph operators. The telegraph companies cannot be blamed for this, but they naturally take advantage of the situation to reduce wages. The Atlantic and Pacific have not as yet attempted to either reduce wages or the force, but the Western Union have done both. Mr. Vandenberg, of the Atlantic and Pacific and Central Pacific Railway Telegraphs, says if all the operators on his division wanted to leave to-morrow he could have their places filled inside of forty-eight hours. Judge, therefore, if this is a good field for telegraphers. I am also inclined to believe that the rumor put on foot about the National Telegraph Company and their gigantic undertaking was another cause why operators flocked to this coast. Operators should not be such silly fish as to jump at every crumb thrown into the stream of rumor. The National Company is—or rather was—got up for the sole purpose of depressing Western Union stock, at a time when money was tight and the market panicky. The prospectus of that company was so transparent that an ordinary observer could see the undertaking was too stuporous for completion within the time specified. Besides, California capitalists, and more especially the projectors of this scheme, are not the men to place millions of dollars in an enterprise which does not promise quick returns. Notwithstanding that, I would be glad to see it consummated. I must simply say that operators must look elsewhere for brighter prospects than to the National Telegraph Company.

There was a time when it was a credit to be an operator—when those who learned the art at least possessed a common English education. Now mark what follows. The unfortunate being who possesses any claim towards enlightenment or common intelligence hangs his head with shame when a boy not yet out of his teens, or a big ignorant haymaker, who writes a hand worse than the late Mr. Greeley, or maybe as ignorant of the English grammar as of current events, is pointed out as receiving the same wages and doing the same work—but how different. I must not warm to this subject lest I should grow rude and tell the truth, which, though it pleases God, sometimes grievously offends men. Therefore, as long as the powers think that ignorance is akin to intelligence, and are satisfied withal, I have nothing to say.

It is but just to say, however, that the officers of the Western Union here evince an interest in providing situations for operators from the East, even by sometimes sacrificing their oldest and best tried men, but then it cannot be expected, when the influx like at the present time is great, that they could accommodate all, no matter how willing they might be. Among the fortunate emigrants was Mr. F. Drake, who has been appointed private secretary to Mr. Gamble.

Mr. C. S. Lamb (late clerk in Mr. Williams' office, Cincinnati,) has been appointed chief operator of the San

Francisco office. Although some may consider it an injustice to remove an operator to make room for the latter gentleman, and that as capable and as trustworthy men could be found here, yet neither Mr. Lamb nor Mr. Drake can be blamed for being fortunate. I, for one, bear them no ill will, but wish them success and speedy promotion, if they deserve it. I will not allude to the changes that have taken place, nor to the causes which led thereto, but confine myself to the present state of affairs, which, notwithstanding that we are somewhat down in the mouth at the inclination to reduce salaries, etc., we cannot but look for a gleam of hope when we see honest ability, untiring energy, and sterling worth appreciated in the appointment of Mr. Charles T. Dozier to the management of San Francisco office. This gentleman has risen beyond the sphere of a mere telegrapher by being a close and attentive student. He is a thorough electrician, and is engaged in putting up a quadruplex of his own invention, which promises to be a successful improvement to that now in use. To these qualifications add a fine idea of manly honor, a genial good temper and a generous heart, and you have our manager. We were pleased when he was appointed, for he deserved it. Mr. Lamb being a stranger, unknown and untried, I cannot undertake to criticise save from external appearances. *He looks honest.* Our force consists of three very pretty and intelligent young ladies—Miss Fannie Littlejohn, Miss Susie W. Peck and Miss Rose Thomas. The male force consists of Messrs. William Foley, Arscott Venton, Edward Somerville, Joseph H. Thatcher, Wm. F. Archibald, Horace Jones, Chas. H. Boynton, James O'Toole, Q. A. Stephenson, William H. Glover, C. J. Lawson, Frank Medina, Jr., John H. Powers, and T. S. Cunningham, Mr. H. H. Smith and Mr. Sheldon having been compelled to resign on account of reduction of force. Mr. Smith was immediately employed by the Atlantic and Pacific over all those who had applied before him; that company evincing a very commendable spirit, preferring "a dell they ken to a dell they dinna ken." The telegraphic department of Heald's Business College, as well as the Western Union School at Oakland, are under the supervision of Mr. Jas. Gamble, who is president of both institutions. They seem to find plenty of applicants, and the chief qualification required is the spondulix, in the shape of \$50. *The Telegraph*, a sheet published in the interest of the institution in Oakland, claims thirty-five students have already graduated from there, sixteen of whom got situations. I believe Heald's is doing equally as well. I have no objection to these schools personally, but I think there is room for improvement by having first class competent men to teach, and require of the candidate a general knowledge of the English language, as in many cases these questions are totally ignored, although some students, like Miss Littlejohn, are accomplished and intelligent; yet have I seen those who, to use the language of our illustrious William (Foley), "wrote a hoof like a hired man." The majority of the graduates and pupils are ladies, and I should not be surprised if, in the course of three years, that male operators were few and far between. I would not—or cannot—be so ungallant as to wish anything adverse to the ladies. The telegraph offers a good field, where they can find pleasant, remunerative and honorable employment, and I hope men will turn their eyes towards something else which will be more in tune with their sterner and rugged natures, and which may ultimately be a more remunerative business than telegraphy has proved itself to be, and where a man may at least hope for something better, after ten or fifteen years of faithful service and good behavior, than *Irish promotion* or a reduced salary. "Nothing extenuate nor ought set down in malice." C.

Mr. Orton's Annual Report Reviewed.

TO THE EDITOR OF THE TELEGRAPHER.

IN looking over the published annual report of the President of the Western Union Co., in the last number of your journal, I was forcibly struck with the statement of that gentleman (than whom there is no higher authority in telegraph matters, *except upon points which he has not investigated*, as, for instance, automatic telegraphy, which, judging from his published conclusions, must be a sealed book to him) to the effect that notwithstanding the Western Union Co. solved the question of *cheap telegraphy* three years ago by the introduction of the then somewhat antiquated duplex system, and then again, a year ago, solving it a second time by introducing the quadruplex system, belonging though, unfortunately, to a rival Telegraph Co., there is "no profit from the transmission of (10 word) messages at the rate of twenty-five cents, even within the short distance of twenty-five miles, which is the limit of that rate." In the same paragraph the President informed his shareholders that it costs the company "an average of 37 cents per message," of which twenty-one cents per message was required to pay the cost of "operators and messengers' wages," and five cents per message was absorbed in the "maintenance of lines."

The candid manner in which Mr. Orton practically

admits the utter inability of the Morse, duplex and quadruplex systems in use by the W. U. Co. to compete with the automatic system, is commendable, even at this late day, and notwithstanding the disingenuous manner in which, in a subsequent paragraph of his report, he seeks to disparage automatic telegraphy, by asserting that "a single message can be transmitted and copied in less time by the hand (Morse) process than by any other." Obviously, we who have devoted six years to the development of automatic telegraphy, did not spend our time and money with reference to a "single message." If the public have no occasion to use a telegraph line except occasionally to transmit a "single message," the Morse or other more simple and still less expensive systems would answer all necessary purposes. But the advocates of the automatic system have contemplated something more than "single messages"—something more than hundreds or thousands of messages every hour of the day and night, and it is to be hoped that when the President of the W. U. Co. next addresses his shareholders he will tell them what he proposes to do when the business of telegraphing is quadrupled in numbers of messages, and each message quintupled in the number of words—for this is what automatic telegraphy foreshadows in the near future.

Accepting Mr. Orton's undoubtedly correct statement that it costs the W. U. Co., or any other Telegraph Co. worked by the Morse system, at least "21 cents per message (of 10 words) for operators and messengers' wages," let us see what it will cost the company having the control of the automatic system.

Whilst it would be perfectly practicable to send 1,000 words per minute over any fairly good single wire, in circuits worked by the W. U. Co., we will assume that the automatic wire is only utilized to the extent of 500 words per minute, or 30,000 words per hour, or 300,000 in 10 hours. If we assume that the messages average 20 words each, we should have a total of 15,000, which, at 21 cents each, aggregate \$3,150 for the day's work.

To accomplish these 15,000 messages in 10 hours by the automatic system, we should require the assistance of—

- 15 Perforators,
- 12 Copyists operating the Type Writer,
- 12 Readers or Translators,
- 2 Transmitters and Receivers.

Total 41 Automatic operators.

With our perfected machines, girls can perforate, copy and translate as accurately and as rapidly as can be done by the class of operators employed by the W. U. Co. It may therefore be safely assumed that \$82 would afford liberal salaries to the 41 operators, and the usual sum paid to messengers is 3 cents per message, so the cost figures would stand—

For Operators' salaries.....	\$82.00
For Messengers' fees.....	450.00

Total cost for 15,000 messages... \$532.00
or less than 3½ cents per message, against Mr. Orton's 21 cents.

And yet Mr. Orton assures his shareholders that the W. U. Co. cannot afford to use machinery, in preference to hand labor, because the former is "neither economical as to time or expense!"

In every annual report of the distinguished President of the W. U. Co. since 1869, he has taken care to condemn automatic telegraphy because of the necessary delay of messages, and yet it would be impossible for any one to show a particle of reason why 15,000 messages should not be perforated, transmitted, translated and copied, at the rate of 1,500 messages per hour, using one wire, with even more reliability than 60 messages per hour, for 10 hours consecutively, could be sent over one wire by the Morse system.

Whilst we easily perforate, transmit and copy an ordinary business messages in 60 seconds or less, it is probably true that if only a single message was to be sent, it might be completed in three or five seconds less time by the Morse system than it could be by the automatic, but where a volume of business on any one line exceeds about 50 or 60 messages per hour, then the automatic system is supremé.

A line doing a light business, with few or many offices, can be worked more economically and to far greater advantage to the patrons by the automatic than it can be by the Morse system, but of course automatic telegraphy will mean, when it gets into the hands of those who have sense to appreciate its excellencies, *cheap telegraphy and an enormous increase in volume.* Automatic telegraphy means 50 word messages and not over four rates, the lowest 25 cents and the highest one dollar, prepaid by stamps, and at these rates the Automatic Company can make very large profits, whilst the W. U. Co., with all its possible advantages, could not earn one half of its current working expenses. Automatic telegraphy will soon cause fearful "cracks" in the Tall Building, and I expect to live to see the rats escaping from every story. D. H. CRAIG.

The Foote and Randall Automatic Telegraph Inventions.—Caustic Reply to Anti-Humbug.

NEW YORK, Oct. 11.

TO THE EDITOR OF THE TELEGRAPHER.

IN my communication of the 2d inst. I find there is an error, which I beg you will correct. The first paragraph in the second column of page 236 should read: "Their system differs from the 'L. E.' system, in that the L. E. system is worked on an open and closed circuit principle, while the F. and R. system is worked by polarity or alternating currents, etc."

I notice, also, in your last issue an article signed "Anti-Humbug." FRAUD would certainly have been more correct.

I desire to say in reply, that "Anti" will have to thrust again before he "pricks the bubble," as F. and R.'s "bubbles" (?) are pretty solid, and if he does not know it, let him inquire. I presume, however, he does, for it is evident from his article that he did not have any facts to deal with, the assertions made evidently being for a sinister motive. I desire, also, to say to "Anti" that it is an easy matter to make assertions without proof under an assumed name, to make sarcastic remarks, to circulate "respectable rumors" of unknown origin, and to quote from *in cog.* "eminent legal gentlemen," but where are your facts, "Anti-Humbug?" What do you know about things you never saw or scarcely ever heard of?

Now, as regards "reissues," let me tell you that such shining lights (?) as the electricians, patentees and managers of the Aut. Tel. Co. positively asserted, "that we could not work any circuit," "that it was impossible to change the poles of a battery as we pretended to and get any result therefrom on a line." Others, more brilliant than those cited, asserted, "That it was impossible," "that the reverse current could not and did not pass over the circuit." How is that, Aunty? But what's funny about it is, that these people, who have proved how totally ignorant they were of what F. and R. were doing, now turn around and talk about "reissues," and further, in my last communication I especially set forth—after stating what had been done by F. and R. in April, proof of which I can furnish—that by an invention, improvements, etc., since made by F. and R., they could transmit and receive at double the speed then obtained.

Now, inasmuch as those inventions, etc., though patented, are not yet issued, and it is presumed not generally known of or about outside of the Patent Office, I cannot understand how any "eminent legal gentleman" can know any thing regarding "their novelty or legality" or prior claims.

Now, I do not want to trespass on your columns, or in fact waste much time on Anti-Humbug, but I would like to repeat for his edification, he takes to it so kindly—

1st. That at a test made in April, 1875, between New York and Boston, of the Little-Edison and Foote and Randall Automatic systems, the former obtained a speed of 340 words per minute, and the latter 480 words per minute.

2d. That by a new system since invented, F. and R. can double the speed then obtained by them without any increase in operating or other expense.

3d. Their system differs from the Little-Edison as heretofore set forth; and further, neither Little nor Edison ever worked, at least never patented any chemical automatic system worked, or that could work by polarity or alternating currents, nor has any one else to my knowledge, and that is one reason, perhaps, F. and R.'s patents were allowed "with but slight examination," because they were new.

4th. As regards the "F. and R. Perforator," which is "a mere vision of the future visionary hopes of those inflated gentlemen," I would say to "Anti-Humbug" that if he will call on F. and R. they would possibly be able to convince him that it is not all a vision.

But if he feels very bad, they will disclaim the Perforator, and furnish half a dozen good mechanics, either of which will produce a Perforator at short notice, notwithstanding it took his friend, that great inventor (?) Edison, several months, at an expenditure of several thousand dollars to make one, and not then until he had borrowed the inventions of Messrs. F. J. & G. H. Grace, for proof of which I refer to those gentlemen.

5th. That, although he knows (?) that "in claiming a special chemically prepared paper," F. and R. claim "something they never possessed of their own"—very gentlemanly—I repeat that if we do not possess a chemically prepared paper of our own, we certainly do not desire to borrow any belonging to him or his friends.

6th. And in conclusion I would say that F. and R. are desirous of proving the assertions set forth in relation to their inventions, and they challenge "Anti-Humbug" and his friends to an investigation of their patents and systems by three or more experts chosen in the usual way, it being provided only that their decisions shall be made public through THE TELEGRAPHER and other scientific journals.

CHARLES A. RANDALL.

A Telegraphic Musical Composer.—Personals, etc.

BOSTON, MASS., Oct. 11.

TO THE EDITOR OF THE TELEGRAPHER.

AS is usually the case, telegraphic news is meagre, and as I wish to keep within the circle of the telegraph and its employes in my correspondence, I must forego a portrayal of the autumnal glories of fields and sky and their gorgeous coloring, after the manner of some, leaving its beauties to be depicted by worthier pens than mine.

Boston deservedly holds the front rank in æsthetic matters among the American cities, and the Boston Telegraph office contains considerable musical talent of no mean order. Only last week a delegation of Odd Fellows passed our office, headed by the 5th Regiment Band, who played the "Battalion March," composed by Mr. J. H. Milliken, an operator in this office. The march is bright, enlivening and a great favorite with all the bands of Boston, who have placed it in their repertoire of choice quicksteps; and it is not unlikely that Broadway will soon resound with its pleasing melody, rendered by some of New York's famous bands. The style of the march is much like that of the celebrated Ninth Regiment quickstep, having many odd effects in its composition, and lacking none of the fine melody and general vivacity of the above named march. The different changes of the march have offered opportunities for the unique and graceful variations that the composer has improved on in a masterly manner, especially in the introduction to the "Trio." The old conventional style is here entirely ignored, except, of course, in the observance of the time. The tenor drums have a sharp roll, which gives way to a duet by the two ponderous "E" flat bass horns, who perform a very deep and odd measure, finally ascending the scale in chromatics which develops the time admirably, and launches the full band into the trio with a burst of harmony really thrilling, which makes us poor toilers wish that we could march behind such music, knowing that we should never tire of its beauty.

The Fifth Regiment Band is composed of amateurs, nearly all being young men who pursue various occupations on State street, and having been fortunate in securing the services of Claus, the celebrated European Bandmaster, they have by their success proved themselves to be no mean rivals even to Harry Brown's (formerly Gilmore's) famous band, and it is the opinion of the majority of the people of the "Hub" that they are second to none in the city. New York office should produce a like organization; it would be pleasant and profitable winter evenings, with a trifling expense, opening a new experience in life to many which would prove attractive, entertaining and ennobling to the participants.

Mr. Stanford has developed his natural genius for the fine arts in the direction of crayon drawings. I have had the pleasure of seeing several exceptionally fine specimens of this gentleman's work in crayon portraiture.

I am glad to be able to say that Mr. H. J. Pettingill, our all night manager, who has been ill for some weeks with typhoid fever, is convalescing, and will be with us once more before long.

"Bull" Noyes is in his accustomed place this morning. We understand that he essayed to move a stove in his domicile, thereby inflicting so severe an injury on his spinal column as to necessitate his absence from his "throne" for several days.

The season of vacations being about over, all are in their accustomed places.

Mr. Pond has returned from his Eastern tour and looks more rosy than ever, and Fitchburg stock is high in consequence.

The rumors relative to an early removal of the main office have received some confirmation from similar statements in the Boston papers.

Up to this writing there has been no further developments in the rapid sending rivalry. More anon.

ARISTIDES.

The "Centennial" Excitement.—Telegraphic Arrangements, etc.

PHILADELPHIA, PA., Oct. 3.

TO THE EDITOR OF THE TELEGRAPHER.

IT is not improbable that even beyond the limits of this staid and quiet city of fraternal affection rumor has reached of our coming Centennial celebration. Ay! how we are going to celebrate the coming event of the one hundredth anniversary of our national independence, and the grave old town is going quite mad over it. Philadelphia has never before had an offspring in any field of enterprise of which she has been so proud, and fond, and happy, as of this Centennial Fair. Well, in truth she well may be proud of it, and happy. She is going to produce a mammoth and all wonderful show, and the whole world is coming to see—and get fleeced. There is not, I confidently assert, one man, woman, or child, with so much as a single grain, or atom, or mote of ambition in, about, or around them but faithfully believe they are to make their fortunes inside of the next twelve months. In

truth, I think partly that way myself. The infection is contagious, and I sometimes fancy myself going mad in the popular course. How we are going to attain just what we desire and expect many of us have no very clearly or well defined idea. For one, I find myself sitting abstractedly, with my thumbs in my vest pockets, expecting that somebody or some vast concourse of people are going to come and thrust something upon me; and I doubt if I am alone in my illusion. Well, I hope they will.

As a natural result of so much protracted anticipation we have "Centennial" already applied to everything that is capable of sustaining an application. And let me turn to you individually now and ask you if you do not think "centennial" is a real nice and good word? It looks well painted in large red and green and black letters on an awning in juxtaposition to "oysters," or "deviled crabs," or "dry goods," or "tombstones." And seeming to understand this, the enterprising dealer prefixes it to whatever he may have to dispose of. We have "centennial hardware," and "centennial hollowware," and "centennial" ware of all kinds. Doors, windows, fronts, trucks, wheelbarrows, horses, cats, and dogs, and even small chickens are lettered "centennial" something. We have got used to this and do not mind it; but when I saw "centennial fruit" the other day I was led to reflect. I wondered whether the fruit was a century in developing to its present state, or whether it represented a second edition of something that had preceded a hundred years, or whether there was a good deal of humbuggery about it. I think I came nearest to the conclusion of the latter idea.

Well, now, this wonderful affair does not pass the telegraph entirely by. The telegraph is going to contribute a little to it, and is going to be represented there in quite a number of ways. The Western Union, and I do not know who all, are going to open offices on the grounds, and they likewise contemplate reaping a vast benefit. Operators in the city are ambitious for the distinction of working there, probably believing it is the last work they will ever have occasion to do. I have not learned just what preparations will be made for the business that will offer, but undoubtedly they will be ample. The grounds are located in Fairmount Park, on the west side of the Schuylkill, and wires will probably be constructed from there to the main offices of the companies; as it is hardly likely that the city wires would furnish the required facilities were they extended for the purpose. In short, telegraphers, as well as those of all other pursuits, are expecting quite a busy season of it, and a stirring up and impetus-giving renovation of the stagnation that has so long existed. May it be even so. MICAWBER.

Cable Soundings.

THE United States steamer Tuscarora, now at San Francisco, will sail from that port about the 1st of November on a cruise among the various groups of islands in the Pacific Ocean, for the purpose of taking soundings to ascertain the most advantageous route for a cable in those waters. The following is an extract from the orders issued to Commander J. N. Miller, who commands the vessel:

You will proceed from Oahu toward the Phoenix Islands, about 1,700 nautical miles, making soundings at the usual distances apart, and, wherever the bottom requires it, such additional soundings as may be necessary. You will make such examination of the Phoenix Islands and those adjacent as may seem advantageous for landing a marine cable. Thence you will proceed to Birouana, Western Fiji, or some other convenient island of that group, about 1,000 nautical miles, sounding as before. You will take up the line of soundings from the Western Fiji to Brisbane, about 1,500 miles, passing as close to the southeast end of New Caledonia as may be proper; thence proceed to Sydney; from Sydney you will proceed toward North Cape, New Zealand, making such soundings as you may think advantageous en route, and from that point toward the Fiji Islands, making soundings, with a view of laying a telegraphic cable between those points.

It is expected the Tuscarora will be absent about four months.

Telegraphy in Australia.

A FEAT of telegraphy was performed for *The Argus* and *The Australasian* on the arrival of the mail steamer at Adelaide. The letters of our London correspondents, comprising some 20,000 words, were transmitted from Adelaide by wire, and appeared in *The Argus* and in the country edition of *The Australasian* at least 36 hours before the R.M.S. Nubia can be expected to reach Hobson's Bay. It may be imagined that so great an addition to the ordinary work thoroughly tested the efficiency of the arrangements of the telegraph department, and acknowledgment is due for the energetic and successful manner in which the extra strain on the officials was encountered. —*The Australasian.*

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, OCTOBER 23, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5508.) 38 VESEY ST., New York.

G. & Co., Watts & Co., Western Electric Manufacturing Co., Williams, Charles, Jr., Wallace & Sons.

Some Notes of a Western Trip.

BUSINESS matters recently necessitated a visit to Chicago and Milwaukee, and some notes in regard to telegraphic matters in those cities may not be without interest to the readers of THE TELEGRAPHER. The brief time which other duties permitted us to devote to this journey prevented as full an examination of telegraphic affairs as could be desired, but the time was utilized as much as possible in visiting the telegraph offices and telegraphers of the two cities.

We found Chicago apparently as lively as ever, although we met here as elsewhere complaints of dull times and depression of business. Judging, however, from the amount of telegraph business being done, one would scarcely believe that the times were hard and business dull. We visited the Western Union main office in Chicago, and were received cordially and courteously by all the officials and employes with whom we came in contact. This is the headquarters of General STAGER, the General Superintendent of the Middle Division of the Western Union Telegraph Company. The ability and experience of General STAGER as a telegraph manager are well known and need no commendation from us. His division is managed in a most excellent manner, and while the interests of the company whom he represents are carefully and energetically looked after, every effort is made to conciliate the public and secure the popularity of the company. In this he has been very successful, and in the West General STAGER is looked upon as the

embodiment of telegraphic ability, and he is deservedly popular with all classes. Col. J. J. S. WILSON is the District Superintendent of Western Union Telegraph Company at Chicago, and cooperates with General STAGER ably and faithfully in the administration of the affairs of the company.

Mr. C. H. SUMMERS is the electrician of the Middle Division, and the Western Union Company is fortunate in having the services of an electrician of so marked ability and intelligence. The value of the services of a good electrician cannot be overestimated, and in Mr. SUMMERS the company has secured one of the best and most practical electricians of the country.

Under the reorganization of the Western Union main office in Chicago, of which our readers have been fully informed, the deficiencies and abuses which had grown up have been thoroughly corrected and reformed, and that office is now admirably systematized and managed. The business of the office is enormous, but it is conducted so quietly and systematically that there is no confusion or unnecessary delay, and Mr. MAYNARD, the manager, and his assistant, Mr. F. W. JONES, have shown themselves to be the right men in the right places. While the discipline is of necessity strict, there appears to be a due regard to the comfort and convenience of the employes, and the new management is apparently generally satisfactory.

We also visited the Atlantic and Pacific Company's main office and headquarters of the Pacific Division. Mr. E. D. L. SWEET, the General Manager of the Pacific Division, has his headquarters at Chicago. We found him in his new and comfortable office, and were pleased to find him so well situated. The Atlantic and Pacific office, although not as extensive, of course, as the Western Union, is very well arranged and managed. We saw the automatic apparatus in operation at this office, and a large part of the business on the main circuits is done automatically. The employes generally, as well as the officials, speak highly of the automatic, and by means of it are enabled to do a much larger business with fewer wires than would otherwise be the case. We were much pleased with the Atlantic and Pacific arrangements, and were informed that business was good and improving. It is expected soon that the new line to St. Louis will be completed and in operation, and open a new and valuable territory to the Atlantic and Pacific Company.

We had not the time to visit the smaller telegraph offices in Chicago, but were informed that they were generally prosperous and well managed.

One of the most interesting objects in Chicago to a person interested in telegraph matters is the manufactory of the Western Electric Manufacturing Company. This is situated at No. 220 Kinzie street, a central and excellent location. An inspection of the various departments is very interesting. This is the largest establishment of the kind in the country, except the shop of the Western Union Company in this city.

The Western Electric Manufacturing Company is an incorporated company, General STAGER being the President, and it is under the immediate business management of Mr. E. M. BARTON, the Secretary, and Mr. GEORGE H. BLISS, General Agent. Mr. ELISHA M. GRAY, the inventor of GRAY'S Printer, the Electric Harmonic Telegraph, etc., is the Superintendent.

It would require too much space to give a detailed account of all the departments of this large concern, and in fact the brief time we were enabled to devote to its inspection scarcely qualified us to do so. The different departments occupy the entire large building, and are most completely equipped with the latest and best machinery. In this establishment everything that possibly can be done by machinery, and the best and most skilful mechanics are employed. An enormous amount of work is constantly being turned out here, and everything that may be desired in the way of electrical and telegraphic apparatus is manufactured and supplied. The manufacture of office, magnet and insulated wire is a specialty, and large quantities of all descriptions are con-

stantly being manufactured to supply the demand. The machinery for the manufacture of these wires is very complete. We were shown the wires in every stage of manufacture, and from the finest magnet to the largest insulated wires all appeared to be of the first quality as regards excellence and finish.

GRAY'S Printers are exclusively manufactured here, and large numbers of them are required to supply the demand throughout the country. Twenty-eight of these Printers were recently forwarded from the manufactory to fill an order from San Francisco.

The manufacture of Electric Annunciators is carried on extensively, and the annunciators of the company are deservedly popular. The W. E. Manufacturing Company have just contracted to put in an annunciator having 310 numbers for the Girard House at Philadelphia. Western Union Switch Boards, SHOLES and GLIDDEN'S Type Writers, etc., are also manufactured at this establishment. To show the extent of the business of the company we would state that at the time of our visit a part of the stock on hand consisted of 300 sets of MORSE apparatus, 100 GRAY'S Printers, and 500 Pocket Medical Electrical Instruments. Nearly all kinds of batteries are manufactured here, the consumption of zinc for battery purposes reaching 4,000 pounds per week.

This is also the headquarters for the manufacture of the Fire Alarm Telegraph Apparatus of Messrs. GAMEWALL & COMPANY, and we were shown a considerable number of boxes in the several stages of manufacture.

The Western Electric Manufacturing Company have also recently closed an arrangement with the Electric Railroad Signal Company of this city for the manufacture of the Electric Safety Signals for railroads, and have the exclusive management of the business West as the General Western Agents of the company.

Upon the invitation of our friend Mr. CHAS. H. HASKINS' the well known electrician, inventor, author, and General Superintendent of the Northwestern Telegraph Company, we visited the beautiful city of Milwaukee, which is his headquarters. Under Mr. HASKINS' excellent management the Northwestern Telegraph Company has attained a high degree of prosperity, and become one of the best managed telegraph enterprises in the country. Mr. HASKINS' geniality and personal popularity, as well as his ability as an electrician and practical telegraph manager, have proved very advantageous to the company whom he so well represents.

In Milwaukee the Northwestern and Western Union Companies jointly occupy the offices, and the business is here exchanged between them. The main office of these companies is in the Chamber of Commerce building, and they have besides an office in the Board of Trade, and six branch offices, well distributed for the accommodation of the business of the city.

The Atlantic and Pacific Company also have their main office in the Chamber of Commerce building, also an office in the Board of Trade, and a branch office in East Water street.

The Great Western Telegraph Company have also an office in the Board of Trade and another on Broadway, and another line, called the Board of Trade line, expressly, for the business between the Boards of Trade of that city and Chicago, under the management of Mr. ALLEN C. KNAPP, of Chicago, is in successful operation.

About three miles southwest from Milwaukee is established the Northwestern Branch of the National Asylum for Disabled Soldiers. Under the management of Gen. E. W. HINCKS this establishment has been improved and beautified, until it has become one of the handsomest places which it has ever been our fortune to visit. The inmates number 627, of whom nearly 500 were present at the time of our visit. The library of the institution contains some 3,000 volumes, and the reading room is supplied with 27 daily and 130 weekly newspapers and 37 magazines, all of which are in constant use by the inmates. Schools are taught, and telegraphy is among the branches which receive special attention. An excellent band of music has been organized among the inmates of the asylum, which gives concerts every Sunday dur-

ing the pleasant season, one of which it was our privilege to attend.

Gen. HINCKS is justly proud of the Home which has been so greatly improved during his administration, and his plans for further improvement are comprehensive and extensive.

It would have gratified us much to have been able to accept the urgent invitations of our telegraphic friends to remain longer with them, but imperative duties called us hence, and we were compelled to postpone until a future time further experience of western hospitality.

The United States Direct Cable.

THE Faraday sailed from London on Tuesday last for the purpose of repairing the direct cable. If she has even moderately good weather the work should be done and the cable in operation in the course of two weeks from that date, as it is broken in 60 fathoms of water only, and should be easily recovered and repaired.

We print elsewhere a condensed report of the recent half yearly meeting of the Anglo-American Telegraph Company, from which it will be learned that the reports of negotiations between the Anglo-American and Direct United States Cable Companies were contradicted by the Chairman, and the further statement was made that it was not intended to again reduce the tariff when competition was restored.

Experience has shown that even at the 2s. rate, and without competition, the business was not remunerative, and it is not probable that such low rates for Atlantic telegraphing will soon again prevail.

Memorial of the Late Vice-President Mumford.

A BEAUTIFUL memorial of the late GEORGE HART MUMFORD, Vice-President of the Western Union Telegraph Company, has recently been completed by Mr. G. ADOLPHUS STIMPSON. It consists of a superb volume of sixty-nine large quarto pages, containing the resolutions of the Executive Committee and Board of Directors of the Western Union Telegraph Company, and the Board of Directors of the International Ocean Telegraph Company, as well as those of his business friends and associates, in memory of their late associate.

Personals.

Mr. M. A. MCCOY has resigned the managership of the Buffalo, N. Y., office of the Atlantic and Pacific Company, and accepted a position as manager of the Omaha, Neb., office of the same company.

Mr. JAMES W. STACEY, ex-Sup't of telegraph at Topeka, Kansas, has been appointed to a position on the night force of the St. Louis, Mo., Western Union office.

Mr. CHARLES J. LAWSON, of the San Francisco, Cal., Western Union office, has resigned, to accept a position with the same company at St. Louis, Mo.

Mr. JOSEPH McILVAINE, of Leavenworth, Kansas, has accepted a position in the St. Louis, Mo., Western Union office.

Mr. WILLIAM L. JONES succeeds Mr. McILVAINE at Leavenworth, Kansas, Western Union office.

Mr. WILBER H. NORTHWAY, formerly of Chicago, Ill., has accepted a position on the night force of the St. Louis, Mo., Western Union office.

Mr. T. J. HERBEL, late of Denver, Colorado, has been appointed to a position on the day force of St. Louis, Mo., Western Union office.

Mr. CHARLES ANDRUS, manager of Hiawatha, Kansas, Western Union office, has resigned, and accepted a position with the Western Union Company at St. Louis, Mo.

Mr. JAMES P. McCLURE, of Cincinnati, Ohio, Western Union office, has exchanged situations with Mr. D. W. H. VOORHIES, of St. Louis, Mo., Western Union office.

Mr. CHARLES W. HART, late manager of Lawrence, Kansas, office, and Superintendent of Telegraph of the St. L., L. and W. R. R., has resigned and gone to Philadelphia to study medicine.

Mr. C. G. WRIGHT, of Lawrence, Kansas, has been appointed Manager of the Western Union office of that place, and Superintendent of Telegraph for the St. Louis, Lawrence and Western R. R.

Mr. CHARLES L. ROGERS, who has for several years been in charge of the Montreal Telegraph Company's interests at Utica, N. Y., has resigned, and is now located at Providence, R. I., engaged in other business.

Mr. CHAS. E. ARNOLD, of Lake George, has returned to his old place in the Albany, N. Y., Western Union main office.

Mr. J. W. CUMMINGS, of Albany, N. Y., Western Union office, has resigned, and is now subbing in Troy, N. Y.

Mr. JOHN SABINE, a well known old-timer, is subbing for Manager OWEN at Saratoga Springs, N. Y., for a few weeks.

Mr. FRANK A. GLIDDEN, late of the A. & P. Saratoga office, has been transferred to A. & P. main office, New York City.

Mr. W. D. CHAFFEY, of the Dominion Telegraph Company, at Peterboro', Canada, has accepted a position in the main office at Toronto, Ontario, Canada.

Mr. J. VELLEAU, of Toronto, has been transferred to the Peterboro' office of the Dominion Telegraph Co.

Mr. J. C. SMALL has resigned the secretaryship of the Dominion Telegraph Co.

Mr. DAVID EDWARDS, formerly W. U. repairer at Albany, N. Y., is now east on a visit. He returns in a few weeks to take the position of Assistant Superintendent of Repairs for the A. & P. at Sacramento, Cal.

The Telegraph.

By Cable.

SAILING OF THE FARADAY TO REPAIR THE DIRECT UNITED STATES CABLE.

LONDON, Oct. 19.—The steamship Faraday sailed today to repair the injury to the Direct United States Cable.

PROFESSOR WHEATSTONE ILL IN PARIS.

LONDON, Oct. 19.—6 A. M.—The Daily Telegraph this morning has a special from Paris stating that Professor Wheatstone is very ill with congestion of the lungs.

The Atlantic and Pacific Telegraph.

THE new line of the Atlantic and Pacific Telegraph Company is completed to East St. Louis, and in a few days the office in St. Louis will be open. St. Louis business is temporarily despatched by messengers from East St. Louis.

The new line between Pittsburgh, Pa., and Columbus, Ohio, is making good progress and will be completed before cold weather sets in.

The work of fitting up the new offices of the company in this city, at 145 Broadway, is well under way, and it is expected that they will be ready for occupancy about the 1st of November.

Business on the Atlantic and Pacific lines is said to be good and constantly improving. A good deal of work has been done during the last few months, not only in the construction of new lines, but in improving the condition of the wires formerly in use, and, as a consequence, the facilities are greatly increased, and the business of the company is better done, and to more advantage to the patrons of the company, as well as the company itself, than formerly.

Foreign Telegraphic Notes.

THE traffic receipts of the Anglo-American Telegraph Company were as follows:

Table with 2 columns: Date and Amount (£). Rows: Sept. 23d, 24th, 25th, 26th, 27th, 28th.

The directors of the Eastern Extension, Australasia and China Telegraph Company have declared an interim dividend for the quarter ending June 30, 1875, of 8s. per share, or at the rate of 6 per cent. per annum, free of income tax, and payable October 15.

The Western and Brazilian Telegraph Company an-

nounce that their cable is interrupted between Santos and Santa Catherina. The breakage is in very shallow water, and their repairing ship being on the spot, communication by cable will be restored in a few hours. In the meantime telegrams for the south will be transmitted over the Brazilian Government land lines in operation between Santos and Santa Catherina.

The Eastern Telegraph Company (Limited) announce the payment on the 14th inst. of an interim dividend of 2s. 6d. per share for the quarter ending 30th June last. The registers of transfers will be closed from the 7th to the 14th inst., both days inclusive. The company also announce that the coupons on the Six per Cent. Debenture Bonds will be paid on the 15th October next at the bank of Messrs. Glyn, Mills, & Co., of Lombard street, E. C.

Telegraphic and Electrical Brevities.

THE Western Union Company is paying the principal and accrued interest on its bonds, maturing November 1st, 1875, upon delivery of the bonds at the office of the Treasurer.

The new railroad telegraph line from Troy to Whitehall is complete.

The military telegraph line connecting Fort Clark, Fort Concho and San Antonio, Texas, has been completed, and is working.

The Southern and Atlantic Telegraph Company have opened a new office at No. 110 Front street, near Wall, for the better accommodation of their customers in that vicinity. This office will communicate by direct wires with the other stations on the Southern and Atlantic lines.

The New Punta Rasa Cable.

THE new cable of the International Ocean Telegraph Company between Key West and Punta Rasa, Florida, was successfully laid and completed on Monday the 11th inst. This cable was laid from the Western Union steamer "Professor Morse." Mr. Theophilus Smith, assistant to Sir Samuel Canning, the engineer employed to superintend the construction and laying of the cable, had charge of the work, being assisted by Mr. Hellings, manager of the Key West office, and Mr. Wm. Mackintosh, foreman of repairs in the New York district.

The insulation of the new cable is excellent, tests showing a resistance of 360 megohms per knot.

The Italian Telegraphs.

THE reports of the Italian Telegraph Service show that its development has very largely increased since 1861, when the present constitution of the empire was established. The following extracted statistical table of comparison will briefly show the increase:

Table comparing telegraph statistics in 1861 and 1873. Columns: 1861, 1873. Rows: Length of lines, Length of wires, Number of offices, Number of instruments, Gov't messages per annum, Private messages.

Death of Professor Wheatstone.

A CABLE despatch from Paris, announces the death in that city of the eminent English electrician, Prof. Charles Wheatstone. The deceased was born at Gloucester, England, in 1802.

Prof. Wheatstone obtained a world wide reputation by his numerous scientific works, and more especially by his eminence as an electrician and telegraphic inventor. It has been claimed for him that he was the inventor of the electric telegraph, but this is erroneous, though he undoubtedly contributed to its practical development.

He was one of the judges appointed for the department of light, heat and electricity at the Paris Exhibition of 1855, and at its close he was decorated with the Cross of the Legion of Honor. In 1868, he was appointed professor of physics in the Royal College of London. He had been ill for some time, and his decease was expected.

Sudden Death of an Operator.

MR. ALBERT MUIR, late agent of the Dominion Telegraph Company at Woodstock, Ont., died suddenly of heart disease, on the 17th inst. He was sitting at breakfast, apparently in good health and spirits, when he suddenly dropped his head upon the table, and expired in a few minutes without uttering a word. The young man was greatly esteemed by all who knew him, and his obliging and genial disposition had won the respect and confidence of business men. He had only been in charge of the office a few months and the company's business was largely increased under his efficient management.

"Hearse" vs. "Horse."

On the day of the terrible tragedy at Gowanda, a Buffalo coroner was notified by telegraph, and requested to repair to the spot for the purpose of making an investigation. On reaching White's Corners he found that Coroner Sherman had also been notified and had started for Gowanda. Properly concluding that one coroner would be sufficient, the Buffalo official was about to start on his return to the city, when a telegram was placed in his hands. This telegram requested him to get a hearse and carriage and proceed to Gowanda without delay. Accordingly he hired a conveyance for himself, together with a hearse and a man to drive, and started.

Night was approaching and the weather was threatening, but our coroner went boldly on, as did also the man with the hearse. Presently the rain began to fall, and ere long it came down in buckets full. The coroner got thoroughly drenched and the hearse became very damp. The procession—as becomes a procession in which a hearse takes part—would have presented a dimly mournful appearance had there been light enough to see it. Meantime the rain came down thicker and faster, and there was a good deal more of it. Human nature could not endure this sort of thing for any considerable length of time, and it was finally agreed between the Coroner and the driver of the hearse to pull up and wait till daylight. Accordingly a stop was made at Eden Corners.

Bright and early in the morning the journey was resumed, and in due season a triumphal entry into Gowanda was made. The strange figure presented by the vehicles and the individuals they carried of course created considerable excitement in the village. The coroner felt a proud consciousness of having performed his duty, despite the difficulties by which he was surrounded and beset—and was happy within, though he was yet considerably damp without.

His promptness and perseverance were duly commended; but wherefore—that was what the people of Gowanda wanted to know—wherefore should he have taken the trouble to bring a hearse all the way from White's Corners? The answer was, of course, that he had simply complied with the request made by telegraph, viz: "to get a hearse and carriage," etc. But nobody had sent him any such telegram. Then the coroner, to the end that the discomfiture of those about him might be sudden and complete, produced the document, which, sure enough, read: "Get a hearse and carriage," etc. Recourse was then had to the original copy of the despatch, in the telegraph office, which was found to read:

"Get a HORSE and carriage!" etc.

We have no report of the addresses which were subsequently delivered by the coroner, the hearse driver, and others interested.—Buffalo Commercial.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS.

NEW YORK, October 11, 1875.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Sept. 21, 1875, and bearing that date.

168,018.—MAGNETO-ELECTRIC MACHINES.—Otto Heikel, Jersey City, N. J. [Filed June 5, 1875.]

1. The magneto-electric machine, containing helices that are connected together and combined with the circuit wires, cores and stationary magnets, arranged substantially as set forth, to produce a continuous circulation of the electric current in one direction, as specified.

2. The revolving core a, contiguous to the stationary magnets, in combination with the helices, arranged in respect to the core, substantially as set forth, to induce a continuous current flowing through the helices, as set forth.

168,058.—ELECTRIC RAILROAD SIGNALS.—H. W. Spang, Reading, Pa. [Filed Dec. 22, 1873.]

1. The combination of a primary signal and a secondary signal or indicator, included in or operated by the same circuit of electrical conductors, when the movements of the secondary signal are dependent upon or controlled by the reversal of a battery current through said circuit, effected by the movement of the primary signal, substantially as herein set forth.

2. The combination of primary signal S, circuit changer C, one or more galvanic batteries, intermediate conductors, and a polarized electro-magnet, which operates or controls a secondary signal or indicator, substantially as described.

3. The combination of shaft D, signal S, spring H', and wheel H, having in its periphery the curved faced notches r, substantially as and for the purpose set forth.

For the week ended Sept. 28, 1875, and bearing that date.

168,143.—AUTOMATIC TELEGRAPH KEYS. L. S. Crandall, New York, N. Y. [Filed Aug. 21, 1875.]

1. An automatic telegraph key composed of a series of pivoted spring keys or levers, provided with cam or contact pieces of varying shape, corresponding to the Morse character of their letters, in combination with projecting arms of a common transmitting shaft, spring pawl, ratchet wheel, and insulated metal tongue, the keys, shaft and ratchet being connected to one pole, the tongue to the other pole of the battery, to transmit messages by mechanical means, substantially in the manner and for the purpose set forth.

2. The shaft provided with a series of cam operated arms, D, and a single pawl arm, having a spring reactor, as and for the purpose set forth.

3. In automatic telegraph keys, the spring keys or finger levers, provided with cam or contact pieces having step shaped projections and intermediate extensions, for producing the required feed of the ratchet, and the dwell at points of contact and non-contact, substantially as specified.

168,349.—PRINTING TELEGRAPHS.—Elisha Gray, Chicago, Ill. [Filed June 1, 1874.]

Improvements on Gray's former Patent No. 192,907.

1. In a printing telegraph instrument, the separable and yielding points h and h', one in constant electrical connection with the press magnets and one pole of the battery, and the other in like connection with the other pole and the type wheel magnets, in combination with a yielding separator or circuit breaker, controlled substantially as specified, for the purposes set forth.

2. The combination of the polarized relay I, having its helices in the main circuit, the points m and m' on opposite sides of corresponding points on the polarized armature, the Morse armature I', and its lever, provided with the points or pin k, and actuated by the relay magnet, and the points l and n on opposite sides of the pin k, these several points being arranged in the circuit of the local battery, substantially as and for the purposes specified.

3. In combination, substantially as described, the separable points h and h', arranged in the circuit of the type wheel magnets, an automatic circuit breaker operating in connection with the said points, the separable points k and n arranged in the circuit of the printing magnets, and controlled by the main current, all operating together in a printing telegraph instrument for the purpose of leaving the local circuits broken when the instrument is at rest.

4. The main battery circuit or wire carried to the diagonal insulated points of the pole changer, in combination with the insulated tongues attached to the type wheel lever, one of the said tongues being electrically connected to the sunflower of the primary instrument, and the other to the sunflower of the secondary instrument, substantially as specified, and for the purposes set forth.

5. The pole changer A, consisting of the insulating points a' a'', e and e', in combination with the type wheel lever provided with the insulated springs c and c', all arranged substantially as specified, with relation to each other and the circuits, for the purposes set forth.

6. The sliding, yielding, and vibrating arm E, provided with a wedge shaped insulator block on one end, and engaging at the other end a screw or worm on the type wheel shaft, in combination with the yielding points h and h', arranged in the type wheel circuit, and with a releasing arm carried by the printing mechanism, substantially as and for the purposes set forth.

7. The combination of the polariz d relay and the Morse armature, in connection with the points l and n arranged in the local circuit, substantially as and for the purposes specified.

Married.

GAY.—BLINN.—At Georgetown, Colorado, Oct. 1, 1875, by the Rev. D. H. Mitchell, Mr. JOHN GAY, Manager of the Western Union Telegraph Company's office at that place, to Miss CARRIE I. BLINN.

A GREAT REDUCTION IN PRICES!

I am now making a speciality of my PHIL. SHERIDAN SOUNDER AND KEY, and am manufacturing them in large quantities, so that I am able to offer them to the public at a very low figure.

PHIL. SHERIDAN, \$4.00.

The above cut represents a beautiful little Sounder. It is made of the best material and highly finished. It has a heavy lever, full sized magnets, and altogether is a first class instrument. The magnets are wound with green silk insulated wire.

A PHIL. SHERIDAN KEY TO MATCH, PRICE, \$2.00,

is a first class Key in every respect. It is highly finished, has large platinum points, strong lever, friction circuit closer, spring adjustments, etc., etc. As a Learner's set they have no equal, as they are regular Telegraph Instruments, same as are used on all railroad and commercial lines.

And I will sell the Key, Sounder, 1 full sized Callaud Battery, 1lb. Blue Vitriol, 1 Double Connector, 1 Book of Instructions, 15 feet Connection Wire, etc., making a complete outfit for office use, for only \$7.50. These instruments will be made to work on a circuit from a few feet to five miles at the same price, and will be sent to any address on receipt of price, or will be sent C.O.D., subject to inspection. Don't all to send for my Descriptive Circular and Prices. Address,

A. B. LYMAN, 91 1/2 SENECA STREET, CLEVELAND, OHIO.

THE LECLANCHÉ BATTERY.

THE WORLD RENOWNED Open Circuit Battery.

NO ACIDS!

NO SULPHATE OF COPPER! DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED TO Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHÉ BATTERY COMPANY, No. 40 West 18th Street, or L. G. TILLOTSON & CO., Sole Agents, 8 Dey Street, New York.

BRADLEY'S
APPARATUS FOR
ELECTRIC MEASUREMENT,
 COMPOSED OF HIS
Tangent Galvanometer and Rheostat.
 (Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment.
 Invaluable to experts or students in electrical science.

APPARATUS COMBINING
WHEATSTONE'S BRIDGE,
 Also **GALVANOMETERS** for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED
NAKED WIRE HELICES,
 for Electro-Magnets, wound to any given size and resistance.
 Manufacturers of Telegraphic and Electrical Instruments supplied at low rates.
 For prices and pamphlet descriptive of apparatus, apply to
L. BRADLEY,
 9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF
SIEMENS' UNIVERSAL GALVANOMETER
 Resistance Coils, Submarine Cables.
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,

 by Mr. WALTER O. LEWIS, remaining, may be had of THE
 TEL. GRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

WESTERN ELECTRIC MAN'FG CO.
220 Kinzie Street,
CHICAGO, ILL.
 CELEBRATED
PRIVATE LINE OUTFIT.
THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.
 This instrument is mounted on an iron base and finely finished.
 It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.
 This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.
 With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.
 Private Line Outfit, complete.....\$10 00
 Instrument only..... 8 00
 Bliss Reservoir Battery, per cell..... 2 00

DISCOUNT.
 A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.
 In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.
Liberal terms to Agents.

Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,

104 Centre Street,

NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury, Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection. Introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by any one.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SOUNDER made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Original Articles.

The Central American Telegraphs.

By a TELEGRAPH OPERATOR.

WHEN the California trade, fifteen or more years ago, was partially diverted from the Isthmus of Panama to the then new route of Nicaragua, it became necessary to insure speedier and more sure means of communication for the guidance of the steamers of both oceans than the facilities at that time afforded, and from this want arose the first telegraph line of Central America. Exclusively devoted to company's business or wants of passengers, connecting no important towns, with the close of the line of transit the telegraph was allowed to go to ruin. Today a few old fashioned porcelain insulators attached to the gigantic trees of mahogany or cedar, dispersed throughout the route, or remains of rusty wire affording trellises for innumerable vines of the country, and a former operator in the garb of a stage driver and owner, are the only remains of the first attempt at telegraphs in Central America.

SALVADOR.

The Republics of Central America were not fully aware of the immense benefits accruing from the electric telegraph until within the past nine years. A motion was at that time made in the Salvador Congress for the construction of the first telegraph line, and two years later the work commenced by the building of twelve leagues of line. The lines have since rapidly increased, until now the State controls 600 miles of line with 30 offices, uniting the principal towns with the capital, and extending to the boundary of Guatemala on the north and Honduras south. The total cost for construction, tools, and equipage has been, up to August 1, 1875, \$83,075; for repairs and ordinary expenses, \$26,000. The receipts the past year were \$28,118.62, exclusive of Government business, which is free. The instruments were furnished by C. T. & J. N. Chester, and L. G. Tillotson & Co., of New York.

The operators are natives of the country, generally intelligent, and under the guidance of their superintendent, Mr. Maury, are capable of reading by sound. The telegraph being in its infancy, comparatively little is known of the laws applying to electrical science; a simple ambition to understand the practical working of the instruments is considered sufficient, although I can say with truth their standard of knowledge is much higher than in the other republics. In the eastern department of the state bad insulation, combined with the small diameter of the wire, renders repeaters of 300 ohms' resistance necessary.

The salary paid by the Government for operators averages from \$50 to \$75 monthly, more or less, according to the location of the office rather than skill of the manipulator. The tariff is 25 cents for ten words throughout the State.

GUATEMALA,

four years since, followed the lead of Salvador, by a decree of 300 miles of line, extending from San Jose on the Pacific through the principal towns to the capital, and thence to Champerico on the Pacific. The price paid was \$150 per mile, the Government furnishing the posts. The wires have gradually extended, and there are at present 457 miles in working order, connecting all the principal towns on the Pacific coast, also uniting with the wires at Salvador south, and a contract has lately been made for the construction of 300 miles more to bring the Atlantic department in telegraphic circuit. The tariff is 25 cents for ten words for any part of the Republic. The cash receipts average some \$1,000 monthly. This with the Government business shows a very creditable amount of work. The number of offices is 25. Salary of operators \$60 to \$100 monthly. Instruments from Tillotson & Co., New York. As the Government appears satisfied with their lines and management, I leave them in that happy state

"Where Ignorance is bliss," etc.,

leaving comments for the future electricians "to be," should the failing of the "chief" allow the craft the advantages of self-improvement in their occupation.

Galvanometers, testing, etc., are here unheard of, and not the slightest idea is entertained of any of the princi-

ples of the science, or endeavors to have them understood, for fear, as the intellectual head of the department informed me, "of getting too much in their cabeza."

COSTA RICA.

With the railroad construction mania in Costa Rica four years ago came up also the subject of the construction of telegraph lines; and the question once broached to Congress, a contract was given for a line from Punta Arenas to the capital, a distance of ninety miles, embracing ten offices. A line is also under way from San Jose, the capital, to Port Limon on the Atlantic. The expense of this line was heavy, as in some places iron posts were necessary, and Brooks' patent iron insulators substituted for the glass. It cost the Government \$25,000. The English alphabet is here used. Tariff 40 cents for 10 words. "No foreigners need apply."

NICARAGUA

issued a decree in March last for the construction of 200 miles of line connecting the two Pacific ports and principal towns with the capital, and at the close of 1876 will probably be in communication with Costa Rica on the south, as this Republic (Costa Rica) has officially offered to build the wire necessary in its own State to insure the connection, should Nicaragua extend its line to the frontier of Costa Rica. On the north it extends to Chinandego. From this town to La Union, Salvador will be the only link remaining to unite the five Republics by telegraph, and open a country of 2,500,000 people to the benefits derived. The recent overtures made by three of the Republics for a Central American Confederation, if carried, will do much toward completing the beginning.

While the South American Republics have for six years past agitated the uniting of South America with the Old World, North America and the West Indies, the project is at this moment being carried into execution on the Pacific under the management of the West India and Magnetic Telegraph Cable Co., of London, and one cable has already been laid between Brazil and Lisbon, and the third is in course of submerging between Brazil and Jamaica. The Central American Republics have been wrapped in a cloak of happy seclusion, amazed at the strides made in this branch of scientific civilization within the past few years, and the main question has lain dormant. This question is the construction of a cable to bring the world within a day's call of Central American wants.

There are two routes of no great distance, either of which would be serviceable at a reasonable expense. One embraces a cable from Port Limon, Costa Rica, to Aspinwall, a distance of 250 miles or less, connecting with the cable of the W. I. & P. Co., of London. The other from a point in Honduras to the Island of Cuba, a distance of 250 miles, connecting with the wires of the International Ocean Telegraph Co. and Western Union Telegraph Co., of the United States, as also here with the wires of the W. I. & P. Co., traversing the West Indies. This latter route would necessitate the building of 200 miles of wire in Honduras.

The cost of cables is not so great but that the Central American States, with their patriotism, and the intelligence distinguishing them, assisted, perhaps, by foreign capital, could soon lay them.

There are many laughable incidents connected with the telegraph construction here, and yet not so very funny to the contractors financially interested. I refer to the silly notion entertained by the ignorant class as to the mission of this new improvement. At the beginning of the work in Costa Rica, the hundreds of cartmen engaged in the transportation of coffee saw in the telegraph the means of transportation of their cargo, and no chance of breaking insulators was allowed to escape—"Competition is the life of trade" not being duly appreciated. The crowds congregated at their night bivouac, over their smoking bowl of coffee and tortillos, related with laughs and carambas their exploits of the day in breaking "inkstands" (i. e. insulators), to the infinite delight of the listeners.

The adoption of Brooks' patent paraffine insulator remedied this, while time and legal enactments have overcome the practice of using the telegraph wire for clothes lines, or for repairing broken carts, harness, etc.

In Nicaragua, while waiting at an intermediate station for a change of horses, I overheard with some amusement the explanation given by the landlady as to the uses of a telegraph service, and the numerous "Santisimo Maria" expressed as their imagination pictured the sacks of coffee going hopping and skipping over the posts, followed by bags of sugar, sandwiched now and again by passengers, while native cartmen with hungry mien looked on in wonder at the usurper of their bread, would be changed to some stronger expressions should misfortune ever compel them to be a telegraph operator.

SUBSCRIBE FOR THE TELEGRAPHER.—More valuable and interesting information and instruction in regard to telegraphy and telegraphic affairs is contained in THE TELEGRAPHER than any other publication.

The English Press on the Reduction of Atlantic Cable Rates.

WITH reference to the recent reduction in Atlantic Cable rates, the London *Observer* of Sept. 26th, says: "The returns of the Anglo-American Company since the introduction of the shilling tariff have abundantly proved that the theory that the reduction in price will lead to a corresponding increase in messages is a fallacy. Sir James Anderson, in his interesting volume on 'Telegraph Statistics,' had always maintained the contrary principle, and the facts have thus far fully justified his conclusions. It is not surprising that under these circumstances the shareholders of the two companies have impressed on their boards the desirability of coming to an agreement without loss of time. Every day implies the loss of £1,000, for which the public will doubtless have to pay in the future in the shape of higher rates than before the commencement of the competition * * *

All experience has, in fact, demonstrated that commercial undertakings cannot be carried on for any length of time without a sole regard to the interests of the shareholders, and that such pretensions as that of destroying a monopoly, and giving the public the benefit of cheap telegraphy, are simply clap-trap put forth for interested purposes. The cable service between this country and America is so admirably performed that it takes less time to receive an answer to a message from New York than from Paris. Yet three of the five cables actually working are fully sufficient for the traffic. It can therefore suit the interest of nobody except the contractors to lay down any more cables on the bed of the Atlantic; but, at the same time, the Direct United States Company must feel that as long as it owes one cable only it is not in a sound position. It has, therefore, been suggested that the two companies should treat on the basis of an agreed proportion of traffic accruing to each company, whether their cables are in working order or not, and that a joint repairing and renewal fund should be set aside for the purpose of keeping the cables of both concerns in an efficient condition. The various conventions of the Anglo-American secure to it a monopoly of the entire Continental traffic, and of all messages not specially directed to go by another route in England. It will, therefore, always obtain the bulk of the traffic, and then valuable privileges justify in some measure the addition to the original capital in the shape of bonus shares. Before the reductions of the tariff the normal income of the Anglo Company was about £700,000, and this amount, after deducting £250,000 annually for working expenses, and reserves and repairs, is sufficient to pay dividends at the rate of about 5½ per cent. on the capital of the two companies. With six cables and a practical monopoly—which the public cannot wish to be interfered with as long as the tariffs are not unreasonably high—such dividends would render the shares of both undertakings a very desirable investment."

In an article on the same subject the *Daily Telegraph* of the 29th ult., says: "The Direct Company had no right to expect immunity from the risks attending submarine enterprise, and we imagine the most sanguine shareholder must now regret that the occasion offered for a working agreement with the rival line within the last few days was not promptly seized. The chance has been lost, and the Anglo-American Board is left in possession of the field, with full license to tax the public to the top of their bent. With traffic receipts of little more than £5,000 a week, it was not likely so tempting an opportunity would be left unimproved, and accordingly we learn, without the least surprise, that the company will at once raise the tariff to what may be termed a paying point—that is, apparently, sufficient to yield the modest dividend of 4 per cent., or thereabouts, which seems now to constitute the highest aim of Atlantic shareholding ambition."

A Valuable Discovery.

SOME of the young people in this city who have been learning the telegraphic alphabet on the pocket sounding machines to prepare themselves to operate when the business telegraph is established, have arrived at the interesting discovery that the new medium of communication is available within easy hearing distance, without the use of a wire. What will they not do with it? Imagine a Binghamton Romeo standing under his Juliet's window and pouring out his words of love in a series of clicks; or again, a backward pupil, confronted with the dreaded examination paper, clicks out the question, and some better informed schoolmate clicks responsively the answer, and the examination is passed with flying colors. But there is no need to suggest the extent to which the idea may be carried out: Young America will find out for itself.—*Exchange*.

A French scientist has invented a new fish bait. A bottle is lowered into the water and lighted by electricity, and the fish are to follow it into the net.

Chilly Experience.—Personals.—Bulls.

ALBANY, N. Y. Oct. 26.

TO THE EDITOR OF THE TELEGRAPHER.

AFTER the horse is stolen put a lock on the stable, or rather, after your men are half frozen for weeks, and threatened with the epizootic all around, then put in your heating apparatus. For nearly a month we have been suffering for some kind of a heater—steam, hot water, electricity, in fact, almost anything short of a volcano that would have raised the temperature of the operating room would have been hailed with delight, but nothing of any kind made its appearance. Sunshiny days we got along very well, but when clouds mantled the azure depths of the firmament and intercepted the refulgent rays of old Sol, then our troubles began. It didn't require much of an effort to give a man the cold shoulder on those days. It was amusing at times to observe our chief operators, those who, above all others, should not be affected by any changes in temperature, backed up against a table, and with chattering teeth, plunging their hands down into their pockets in the vain endeavor to appear comfortable and at ease, but it was no go, "cold weather doth make shiverers of us all." [After Shakspeare—a long way]. There are, however, better times in prospect, as our heater has arrived and is now being put in. It is the hot water style, the same which was in use in the old office, with the addition of radiators, of which there are six in the operating room, each nine feet long and containing nine pipes, and one in the manager's upstairs office, six feet long, with seven pipes. The radiators are so arranged that the hot water may be cut off from each one separately, thus making it a very simple matter to regulate the temperature of the room. The apparatus is furnished by Baker, Smith & Co., of New York, and is similar to that used in the old N. Y. office at 145 Broadway.

The *Albany Sunday Press* has the following:

"Mr. M. J. Bartley, a former well known Albanian, now one of the rising young merchants of Fairplay, Colorado, is in town. His many friends will be glad to learn that since his residence in the far West his health has been greatly improved."

Mr. Bartley was formerly connected with the N. Y. C. & H. R. R. telegraph in this city.

The *Press* also has the following:

"Mortimer Walrath, an employe of the Western Union Telegraph Company, met with a painful accident during the past week. A party of men were at work felling poles, one of them having the large end resting upon the track, as a train was approaching. Walrath seized hold of it, and, by exerting himself to the utmost, managed to spring the pole away until the last car neared him, when his strength gave out, and the last step of the last car tore a finger from his hand."

The injured hand was dressed by a country doctor, who did the job in such a bungling manner that Mr. Walrath was obliged to come to Albany and have the finger re-amputated.

The city line dept. in New York office, sometimes sends out messages which are—well, to be charitable to the ladies, we will say slightly mixed. The following is a specimen: "New York. To P. Ronal, Lombardy st., Albany." (Mr. Ronal does business in the lumber dist.) "W. B. Wemple's" was stopped before it had gone far and made into "W. B. Wemples & Sons." A message passed through here recently calling for a "sitificut of deposit." Will some classical scholar translate it?

DOUBLE SIX.

Corrections.—Personals.—Manager Maynard's New Copying Ink.—The Western Electric M'g Co.'s New Pocket Relay.—New Arrangement for Night Work Satisfactory, etc., etc.

CHICAGO, Oct. 10th.

TO THE EDITOR OF THE TELEGRAPHER.

AS the minister before beginning his sermon generally reads the notices on his desk, in like manner before I hash up the news to you I wish to make some corrections.

Firstly, in my communication of the 8th, in speaking of Mr. Paul Bossart's accepting a regular position with the A. & P. Company, I am made to say he resigned his place on the extra force of the W. U. and accepted a situation on the regular force of the W. U. Also, in same communication, the *sex* of Mr. Foote's heir is re-

corded of the *gentler* and *weaker* kind, when it should have been "a son," of which Dell is very proud. The mistakes are all my own I am inclined to think. I was probably "rushed" by my thoughts, and "couldn't put it down fast enough." Mr. George York, of the Western Union office of this city, was to-day made the happy father of an eight pound daughter, first baby—score one for George.

The Western Union folks have for some time been working duplex direct to Baltimore, through duplex repeaters at Pittsburg, two operators here doing both the Pittsburg and Baltimore business. To-day the same arrangement was effected with Louisville duplex repeater in at Indianapolis, two operators here doing the business for both Indianapolis and Louisville. Our old time friend "Billy" Wallace has gone out of telegraphy for the present, and has engaged in other business. Messrs. Frank Farley, — Haight and Geo. Miller, the two latter just from Omaha, were in town this week looking for sits. Mr. Farley intends going South shortly, Mr. Miller to St. Louis, and — Haight to New York. Miss Snell, of the Metropolitan Company, this city, has resigned and accepted a position as operator with the Western Union Company, at Racine, Wis. Henry John has been transferred from the Metropolitan Hotel office of the Metropolitan Co. to same company's office on 12th street, near the river.

Mr. O. S. Denise some time ago resigned and sold out his news stand and cigar store at the Western Union office in the Central Hotel, opening an office for the A. & P. Company, on commission, a few doors south of the hotel on Market street, and also started a new stand and cigar store at that point. He did not like the location, however, and has returned to his former love, the Western Union, having charge of the Barnes House office of that company on the west side, in connection with his cigar and news store there.

Mr. W. Em. Browne is the enterprising operator who relieved Mr. Lowther (who has gone into other business) at the Grand Pacific Hotel W. U. office, this city. "Em" also takes a turn at the extra work nights every now and then in the main office.

Misses Bessie De Lange and M. T. Fitzpatrick, of the Metropolitan City Lines, have been assigned to duty in the main office (W. U.) on the Metropolitan Co.'s lines, while Miss Jennie Fox has been promoted to a position on the W. U. Dubuque way wire, W. U. main office.

The old original "Jack" Riley and Mr. Null, old timers, travellers, etc., formerly of the N. Y. W. U. office are in the city subbing for the W. U. Messrs. C. H. Kelly ass't night manager, W. U. office, and C. W. Jones, manager Metropolitan Co.'s lines, have returned from a ten days' vacation (looking very much refreshed), and resumed their respective duties.

I understand Manager Maynard, of the Western Union, has been experimenting for some time on a new style of ink, his own invention, which would copy without blurring, and which would not blur on the original (after drying) from the touch of the hand before it had been copied. He has so far succeeded that the company here intend adopting it shortly. In color it is a nice shade of violet, and flows from the pen freely. It seems to dry into the paper quickly, but at the same time is easily brought out upon the impression sheet, the finest hair mark coming out plain, the heaviest shaded letter copying without a blur, and as many as five copies being made from one writing, *not at one impression*, but in five successive ones. It is certainly a great improvement over the ink now used, and it is claimed freezing will not destroy its properties. It has been reduced with water nearly one half and still retained its copying qualities. It is equally good for ordinary writing as there is nothing in it that will glue or stick the pages of written matter together should the precaution to use the blotter freely be neglected, as is the case with other copying inks. It has also been used on the tapes of Gray's Printer and Sholes & Glidden's Type Writers as successfully as on the Western Union office blanks.

It is not often I feel like going out of the way as a gossip recorder to puff up any particular kind of telegraph instrument, etc., but the superior quality of the Pocket Relay manufactured by the Western Electric Manufacturing Company of this city (a cut of which appears on the advertising page V of THE TELEGRAPHER) is being so highly spoken of here by all telegraphers who have used it or seen it used that it seems an act of justice to call the attention of your readers to it. It is certainly one of the finest finished, nicest sounding little instruments I have ever seen.

The boys are wondering what has become of "Pant-a-loon" of Milwaukee. We would have more of him. Tease him out.

The following answer to "Davy" Anderson's challenge to the W. U. boys in Cincinnati to meet a nine from this city on the "Diamond field," is very suggestive. I give you the answer *verbatim* as handed me by one of the W. U. boys: "Every one here too *darned lazy* to play ball. Can scrape up a nine that can beat the world drinking beer or playing faro."

Our "Check" says the reason operators are generally

men of small stature, "is because they very often have to get right down to their work, and it would hurt a big "fellow" to do that. He wants to know "if those fellows who done that *fast receiving* years ago had their blanks all fixed like he has to fix mine for me." If so he don't want to go to the Centennial with me.

I understand the Western Union night men are loud in their praises of the new hours. They are now being paid for the "noon hour," and seven hours constitutes a night's work. If a man is "let off" on account of not being needed before he has worked seven hours the time lost is charged against the hours he works extra after completing the seven hours on other nights. It is a change that has long been needed. When a man gets "stuck" now he gets paid for it.

The new Western Union receiving blanks are the same shape as the counter blanks, but have not got figures at the right hand side, nor ruled lines like the A. & P., and the boys claim they like them much better without them. There is one objectionable feature, however, the name of the firm doing the printing is placed in the lower left corner of the blank, right where operators have been in the habit of writing the check of the message, and if the message is long the printing is in the way. It could just as well be above the line at the top of the blank on either side, and be entirely out of the way, as to be stuck down in that corner in the way of the check. No doubt the officials having the printing in charge will see to this.

It is said there is not a Western Union office in the country that has so many operators in it *who know everything* as the Indianapolis, Ind., office. They know all about it before they are told. They are the fastest senders and the finest receivers, according to their belief, in the world. Here's a sample of *how* they know it. One of the Western Union boys working the duplex here tonight sent "B" a few "Reds," and waiting some time for an O. K. (as there was only business enough at that time to keep one side busy) and not getting it inquired if he had got those "Reds," when the man at "B" replied, "Oh! I was waiting for you to close your key."

The cattle market is rather dull at present, but here's a few choice ones I must dispose of before I close: "Genuine" for "Gen'l Supt.," "Guise D" Waterbury for "Mrs. E. D." Waterbury, "Van Stone," Ill, for "Evanston," Ill, by the W. U. boys, the latter by an old one, and D. P. Dyer "and Qusatty," St. Louis, for D. P. Dyer, "Esq., U. S. Atty.," and "Come quick, Sarah has 'tipped over,'" for "Come quick, Sarah has typhoid fever," by the A. & P. men, the latter and the choicest of the lot by an "old timer" who *don't* take any interest in THE TELEGRAPHER. It's a bad case of guessing. Let's "sing the doxology" and "cut out." OCCASIONAL.

Regular Telegraphic Correspondence Desirable.—Forest Fires and Hot Times for Telegraph Repairers.—Personals, etc.

ALBANY, OREGON, Oct. 6.

TO THE EDITOR OF THE TELEGRAPHER.

I AM pleased with the suggestion made by "Micawber," of Philadelphia, in a recent issue of our paper, regarding regular correspondence from all parts of the country, and I am, for one, very much in hopes the boys will come to time on this subject, as a steady correspondence would be very desirable, and be welcomed by all. This could very easily be accomplished if we would *only* think so. The communications need not be a huge, dry, multiplication of jawbreakers, and elaborate apologies for writing, but they should be composed of short, terse sentences, replete with interest. I have tried to do my best, and propose in future to keep up my lick. Of course our facilities for news and interesting articles are far inferior to those of our friends in the East, but as a "lastly" to this already too long article, I will venture an assertion that if all (in proportion to facilities) would do as well as the Pacific coasters regarding subscriptions and letters, friend Ashley would rise up and call him blessed! and, like "Micawber," I feel disposed to return thanks unto "Occasional," "Western Union," "Double Six," and others for past favors and ask a continuance in future.

A force of men started out from Portland a week ago Monday to place the O. S. N. Co. line in thorough repair for an early connection with the Nevada & North Telegraph Co.'s line at Walla Walla. Mr. Platt Burr, the Supt. of the latter line is now on the ground rushing the building, and it will not be many weeks until I can announce to you the completion of this line to San Francisco—"opposition" to W. U.

During the past month or so, extensive forest fires have played sad havoc with the wires of both the W. U. and O. S. N. Co., up the Columbia River, as both lines run for some distance through dense forests, and the repairers can emphatically declare they have been having a "hot old time."

I hear some rumors about some more telegraph extension, but as they are hardly substantial enough to warrant publication, I will await further developments.

Another good telegraphist has quit the ranks to engage in other business. I refer to our old time, tried friend, Jim

Reed, at Halsey, who has resigned to accept a position as travelling agent for M. Gray, the noted music dealer of the Pacific coast. Side by side have we worked for four years, and we are truly sorry to have Jim leave us, but as he has secured a No. 1 position, and can do much better, we will put on sackcloth and grin it. Farewell, Jim; if any of the boys can ever get enough ahead, I know they will patronize you when purchasing pianos and other musical "fixings."

Another martyr has come into existence. Who? Why, Charley Wheeler, at Shedd's Station. Its a fine bo—gir—no—boy—I be-le-i-ve—any way "it" weighed 12½ lbs., and Charley goes around at night peeling his shins in the dark hunting for the matches, preparatory to a grand hunt for that "soothing syrup." Ain't "Web-foot" glad he ain't a martyr, and that he did not succumb to Hymen's importunities! for it would be just his luck to get caught prowling around after syrup and sich like. Let's return thanks!

I hear rumors of some more "lightning showers" (that's an "occidental" phrase), contemplating matrimony. If these come off there will be a chance for something more from
WEBFOOT.

A Telegraphic Scare and Stampede.—Personals.

BOSTON, MASS., Oct. 20.

TO THE EDITOR OF THE TELEGRAPHER.

THE roof of the Western Union main office, 109 State street, having sunk from its original and proper position, it was deemed prudent to elevate it, and insert an additional support to prevent a possible catastrophe. Accordingly the carpenters went to work Monday morning, Oct. 18th, raising the roof by means of a *jack-screw*. During this process an ominous crackling was heard above, and the truss which supports the roof seemed ready to give way and cause our precipitation with the debris to the basement. The operators, with blanched cheeks and lips, and a *beam* in their dilated orbs, sat heroically at their desks amid the presaging crack of the weakening timbers till the carpenters, fearing disaster, fled from their labors. Then and not till then did panic seize on the majority of these brave telegraphers. With one common impulsive they rushed frantically to the staircases, animated by a pardonable eagerness to breathe the free air, unsurrounded by shabby walls or threatened by falling roofs; and not till they felt the firm pavement beneath their feet did their usual presence of mind return to them. Then, watching the building and its walls more intently than ever before, they ascended the stairs leading to the operating room which they had so lately deserted, with trembling limbs and many forebodings of danger ahead.

There were a few notable exceptions to this general heroism. John Whitaker sat in his usual place at the Portland duplex receiving messages when all around had fled. John Milliken exhibited a bravery worthy of a Jem Bludsoe, sticking manfully to his post, and under the protecting *Ægis* of St. John he was prepared for the worst.

Joe Hoags continued to manipulate the uncertain mechanism of the metropolitan quadruplex with as easy a grace as if no danger hung overhead.

Phillips clutched his table with despairing energy, fondly hoping that if his fears were realized his devotion to his desk would save him from harm. Randall, the stoic, sat immovable as a statue, while O'Connor sought the crystal shelter of a skylight for protection. But all bravery is thrown into the shade by Tom Davin's demeanor on this trying occasion. This heroic soul, furtively glancing at the creaking roof, was the last man to leave his post of duty, but was the first to reach *terra firma* at the bottom of the stairs. How he succeeded in making this brilliant record, or how many jumps he took in his descent, will probably never be known. With wonderful agility he fled up Broad street to some haven of rest vouchsafed to those noted for heroic deeds. Jules Guthridge also withdrew from the dangerous edifice in a very lively manner, not at all *scared*, only some, one wanted to see him *down stairs*. Chief operator Henderson attempted to cheer the drooping hearts and to inspire courage in the swiftly retreating knights of the key, but without much success. Stanford, Weaver, Dennett, Wilson and Magee were also distinguished by bravery of a judicious kind, almost equalling Davin in their efforts to escape from the expected crash.

Messrs. Davin and Guthridge did not grace the operating room with their presence for several hours after the panic had subsided.

On Tuesday the city inspector of buildings paid us an official visit for the purpose of reporting on the condition of the telegraph building, and it is said that, although he did not consider it absolutely unsafe for occupancy, he ordered more supports for the roof to be placed in the operating-room, and the erection of efficient fire escapes for the safety of the employés in case of a conflagration. These measures, it is to be hoped, will have the effect to prevent the recurrence of telegraphic stampedes in the

future. The conundrum of the office now is, who gave the information about the building to the City Hall authorities, and speculation is rife as to whether it was given by one of the frightened telegraphers or some outside party.

A new arrival is Mr. Green, late of the Perry House office, Newport, R. I., who works Mr. Bishop's hours, the latter gentleman taking Mr. Griffith's hours, who has been promoted to the second press wire nights. Mr. H. J. Pettingill has sufficiently recovered from his severe illness to be able to be on duty again, working days, Mr. D. B. Grandy filling his place nights until he is fully restored to health.

Mr. J. C. Shorey manages the Concord wire now, that circuit being more in accord with his well known *penchant* for heavy work than the wire he has been working. More anon.
ARISTIDES.

The Management of the Chicago Western Union Office.

CHICAGO, ILL., Oct. 13.

TO THE EDITOR OF THE TELEGRAPHER.

I PRESUME to speak only for myself; yet, from numerous comments and observations by many of the Chicago operators, I am inclined to believe that the late bitter complainings by Messrs. H— and B— are far from meeting general approval or endorsement. It seems to me unjust, and in no way a strong point, to attempt, by sweeping, careless assertions, to condemn our management without a favoring exception, and that such assertions are hardly warranted by the present state of affairs here. It is, perhaps, too much to expect that every manager, chief or operator has a heart overflowing with the milk of human kindness, or a head weighty with the wisdom of a Solomon. The nature of his business does not require a charity Christian, nor a capacity broad. Man has ever been known to be a warlike animal. He "kicked" upon his advent into the world; and unless he meets some unusual divine influence or miraculous "toning down," he is quite sure to "kick" all through life; and, at last, upon his departure therefrom.

There are employed here somewhere over a hundred men and boys, whose antecedents are as varied as their numbers, and who sprung from heaven knows where. Is it not hoping against the natural order of things to think that perfect harmony can ever reign where so many of these beings are caged in close confinement? One has only to "stir up" the menagerie at any time to witness a commotion oftentimes threatening indeed.

I am impressed with the belief that, altogether, this office is, in all its departments, very ably managed. Its electrical geniuses are many and active, and appear well up with the times. It may be that upon one occasion or another, some assistant preserver of order has shown a lack of discretion and good taste, so far as to compromise his dignity, and call down upon himself the just indignation of the dissenters; but, generally, I have been pleased in noticing a disposition upon both the side of the managers and of the operators, working to the end that all may run as smoothly and peaceably as possible. In short, I cannot recollect a time when the business of this office was done upon a system insuring more of promptness and satisfaction; nor a time when good feeling and good fellowship prevailed to a wider extent.

As intimated in the beginning, I do not pretend to represent the "idea" of the office. I have simply relieved my mind of an honest opinion upon a subject that has, since the outburst by H— and B—, created, in some quarters, quite a sensation. Nor do I write to deter any one from going upon the war-path who may think it worth his while so to do.

I will end by remarking that we should not allow chronic grumblers to play upon our sympathies, nor should the really oppressed need an earnest champion.
RANDOM.

Additional Appointments.—A Railroad Accident and Extra Work, etc.

PHILADELPHIA, PA., Oct. 18.

TO THE EDITOR OF THE TELEGRAPHER.

WE are still pursuing our usual occupations, notwithstanding that Jack Frost has paid us several visits, and as we gather round the attractive feature of the office (the stove), we regret that summer has so soon passed away.

We have had an addition made to our lines, which I call "The Great Eastern," but my brother operator in this office declares that "Jackass" line would be more proper; be that as it may, the line extends from the office at Burks and American streets to Front and Willow streets office; the intermediate offices being, one in the scale house on American street below Berks, where Mr. Dougherty attends to the weighing of cars and telegraphing; next is the one at the milk depot, Third and Thompson streets, where A. Hopkinson reigns, and the other at

or near Second street and Germantown road, where Barney Peterson is located. The object in putting up this line is, our freight depots being at Front and Willow streets and vicinity, we haul all freight from Berks street to the freight depots with mule teams and shifting engines, and there being only a single track between Third and Thompson, and Second and Germantown road, the operators at the two latter places have to keep one another informed of anything in the way, so as to prevent up and down trains and teams from meeting on the single track, and prevent delay, as there is a curve between the two places, and it is therefore impossible to see if anything is coming up or going down. The office at the scale house is to send all weights of cars and other messages from the despatchers for the freight agents to Front and Willow streets office.

On the night of the 5th inst. several of the boys, including myself, were favored with night-work by having a "pile up" of box cars between Ashbourne and York Road, about seven miles from the city, at some places being piled up three story high, so that a box car fell down on the wires, and of course took them along down and made a good ground for our wires; so I was of as much use as a wooden man, and no more, for the time being. The accident happened at about 8 o'clock, and the wires all being down, we received no report until an engine came back from the wreck and gave us the account, when in about fifteen minutes thereafter an engine and car with men left for the wreck, taking with them the other operator from this office, and then sent for me, and as I was at a lecture that evening, they easily found me. Well, at about 11 o'clock one of the wires was made O. K., and after the first little rush of biz was over, and the wire not otherwise engaged, we kept one another awake by cracking jokes, etc., but when the clock sounded two o'clock A. M. I resorted to the lounge in the office, and was soon in the land of dreams. It is stated as a fact that at one place where there were three box cars on top of one another an Irishman was in the top one stealing a ride, and, after the occurrence, he put his head out of the car and wanted to know *why they were stopping and what was the matter?* He afterwards remarked that he had often stolen his ride, but that was the last time he would ever steal a ride. Fortunately no one was seriously injured. The aforementioned accident rendered it necessary for my fellow operator to work from 7.30 A. M. Tuesday until 6.30 P. M. Wednesday without any sleep whatever. That is the kind of men needed in such cases.

The Perkiomen Railroad having been completed, this company has opened a ticket office at Allentown, Pa., appointing Charles Eckert & Son as agents.

Do any of your readers wish to take lessons in drilling? If so, let them call at our office on J. Cooke (not Jay, but our messenger), who occasionally favors us with the exhibition free gratis.

Business is very brisk at present in our coal and freight departments, rendering it necessary for many of the men to work extra.
EX-PROF.

Resignation of a British Columbia Telegraph Manager.

WE are very sorry to announce the resignation of Mr. Meyer, the gentleman who has been for the past year in charge of the telegraph office in this city. Mr. Meyer is a first class operator, and has in his intercourse, public and private, gained friends from every quarter. He leaves shortly to visit his friends in Europe, and we trust to see him at an early day once again established amongst us. We are confident we but speak the sentiment of the community when we state that, for uniform courtesy and civility to all, the gentleman we write of possesses them in a degree not easily to be found in persons filling so responsible and trying a position. A successor is looked for within the next week or two.—*Victoria (Vancouver's Island) Daily Standard.*

The Electric Light as a Military Signal.

THE roof of the Siemens-Halske factory at Berlin, was recently the scene of a series of experiments with the electric light, which filled all the streets in the vicinity with a crowd staring with astonishment at a supposed wonderful natural phenomenon up in the clouds. The apparatus, which gave a light so powerful that ordinary writing could be read by its illumination at a mile distance, was arranged with an inclosed mirror, so that the rays were projected against the clouds, which served as a screen. In front of the mirror the signals were made, and these were repeated, of course on a gigantic scale, in the clouds. The light is to be adopted by the German army for night signaling.

The Globe Telegraph and Trust Company announce that the interim dividends for the quarter ending the 18th inst. will be 2s. per share on the preference, and 3s. per share on the ordinary shares, both payments being at the rate of six per cent. per annum.

THE TELEGRAPHER MAY BE HAD at the news stand in the Receiving Office of the Western Union Telegraph Company, corner of Broadway and Dey street, where it is regularly on sale.

A Special Premium for Subscriptions to "The Telegrapher."

The summer season is about over, and we expect that the friends of THE TELEGRAPHER will now renew their efforts to increase its list of subscribers. The subscription list has been very well sustained during the summer, but as the days of vacations and excursions are over, we look for the usual increase of interest in the only truly independent telegraphic journal published.

It has been our custom for years past to share with those who kindly interest themselves in obtaining subscriptions by offering valuable premiums.

We propose this season to excel our former liberality in this direction. We desire to offer something of real and permanent value. We have accordingly made arrangements by which we are enabled to offer to the person obtaining 60 subscribers for one year, at the regular subscription price, \$2 per year, or their equivalent in shorter subscriptions, a

No. 1 WEED SEWING MACHINE;
for 65 subscribers a

No. 2 WEED SEWING MACHINE,
and for 70 subscribers a

No. 3 WEED SEWING MACHINE.

The price of these machines is respectively \$60, \$65 and \$70.

The machines will be boxed and shipped without extra charge.

This affords an excellent opportunity for female telegraphers, or for telegraphers who have wives or relatives that need these exceedingly useful machines, which are in every respect first class, to obtain them at comparatively little trouble or expense.

Send in subscriptions as obtained, and they will be credited until the necessary number to entitle the sender to the desired premium is obtained.

To prevent disappointment, should any canvasser eventually fail to obtain the requisite number for a machine, they will be allowed other premiums proportionate with the amount collected, or, if preferred, 20 per cent. in cash on such amount. To whom shall we send the first machine?

The Annual Report of the President of the Western Union Telegraph Company.

CIRCUMSTANCES have delayed our attention heretofore to the report of President ORTON to the stockholders of the Western Union Telegraph Company, presented at their annual meeting on the 13th inst., and we do not now propose to treat of it at any great length. There are, however, some features of it to which it is proper that we should briefly refer. The report makes a very satisfactory exhibit of the business of the company for the year ended June 30th last. The company has been prosperous, and the statement of receipts and profits shows the dividends declared to have been fairly earned.

The statistics of the growth of the company's property and business during the nine years which have elapsed since the consolidation of the principal telegraph lines of the country, show an increase of 57 per cent. of line and 110 per cent. of wire, and 156 per cent. in the number of offices and stations. The number of employes of the company is not stated in this report. During this time the number of messages has increased 192 per cent.; the rate of tolls has decreased 51 per cent.; and the gross receipts have increased 46 per cent. This very fairly represents the development of the telegraph business in this country during that time. In referring to the increase of 192 per cent. in the number of messages transmitted, while the mileage of wire has increased but 110 per cent., Mr. ORTON says: "The ability to make so large an increase in the carrying capacity of the wire is due in part to improvement in the conductivity and insulation, and in part by the introduction of the duplex and quadruplex apparatus. * * * By means of this apparatus, during the past year, the company has had the use of more than 30,000 miles of what may be called *phantom wire*, which has cost nothing to provide," etc. This "phantom wire," we apprehend, when the amount expended in developing and endeavoring to secure the title to the quadruplex apparatus is taken into account, will be found to have been as expensive as *real wire* would have been.

The report treats at some length of the tariff rates and the reductions which have been made from time to time by the management of the company. It is not to be disputed that the Western Union Company has made material progress in cheapening the cost of telegraph service to its customers, and the management of the company deserves more credit for what has been done in this direction than it usually receives. The rates have been reduced as rapidly and as radically as was consistent with a due regard to the interests of the stockholders, and the proper maintenance and efficiency of the service. The fact which is stated, that with all the improvements that have been made, the average cost of each message to the company is 37 cents, fully demonstrates this fact. That a further reduction in the higher rates is yet possible is probable, and it is understood that Mr. ORTON personally favors a further reduction at an early day.

The assertion that "The reductions in message rates made by this company during the past nine years have been greater in the aggregate than have ever been made upon the entire traffic of any other telegraph system, private or governmental, in the same period of time," should be qualified.

In making this statement we think Mr. ORTON has spoken without due examination of the facts. While we are disposed to accord to the Western Union Company all the credit to which it is entitled for its reductions of tariff during the last nine years, we scarcely be-

lieve that the facts will bear out the assertion. The reductions of tariff by the Atlantic cable companies (now represented by the Anglo-American Company) have certainly been greater, for from \$100 gold for 10 words the rate has been reduced to 25 cents gold *per word*, and now stands at one dollar gold *per word*; above which there is no likelihood of the price being again advanced. It may be said that there is no analogy between the Western Union and a cable system, and that Mr. ORTON intended only to refer to the lines of a similar character to those of his company, that is, aerial lines. But even with this exception we think an examination of the figures will show that the reduction made by the Montreal Telegraph Company, which from a series of rates ranging from 30 cents to about \$3 for ten words, has reduced its tariff to a uniform charge of 25 cents for all the stations on its line, is greater in the aggregate, and it has continued to pay dividends notwithstanding. No doubt telegraph lines are more cheaply worked in Canada than in the United States—in fact, such must be the case, for unless the average cost of messages to the company were less than 37 cents, there could not be much profit on a 25 cent tariff.

The reference to the failure of the postal telegraph system of Great Britain is *apropos* and instructive. With an enormous development of the business, the relative increase of cost has brought the postal telegraph in debt more than a million of dollars for the last fiscal year.

It is well known that THE TELEGRAPHER does not agree with Mr. ORTON in his estimate of the automatic telegraph system, and we had intended to have criticised this part of the report, but as our correspondent, Mr. D. H. CRAIG, in the last number of this paper, has discussed the subject in reply to Mr. ORTON's statements at length, we will not further trouble our readers upon the matter.

In conclusion, we would congratulate Mr. ORTON, and the company which he so ably manages, upon its prosperous condition, and hope that it may continue to be in the future not only successful, but maintained and operated for the best interests of the public as well as of its shareholders and employes.

A Trip to Boston and Providence.

WE have recently enjoyed a brief visit to Boston and Providence, and were much gratified at the cordiality with which we were received by the telegraphers in those cities. The fact that six years of our life were spent in telegraphic service in Boston, and that our first introduction to telegraph service was in Providence, naturally adds to the interest which we feel in the telegraphs and telegraphers in those cities.

We had but little time to devote to the telegraphic fraternity, but our call at the Boston office of the Western Union Company was very pleasant. Mr. G. F. MILLIKEN, whom we left in the Boston office fifteen years ago, still remains; and is growing gray in the service as manager of that office. But few of those who were associated with us then now remain; but WILLIAM MARTIN, in the receiving office, and Messrs. DAVIS, BARRETT, and one or two others, reminded us of old times and scenes of long ago, when we were companions and co-laborers for the old American Telegraph Company.

At Providence Mr. H. CARPENTER BRADFORD still represents the Western Union Telegraph Company with that grace, dignity and fidelity which are inseparable from his nature. Mr. BRADFORD is looked upon by the public in Providence as the embodiment of the telegraph, and so highly is he appreciated by his fellow citizens, that for the past two years he has been elected to a responsible position in the municipal administration of the city. Time seems to treat him kindly, and although he is not sufficiently portly of person for an Alderman, yet as a Common Councilman he has achieved marked success.

We availed ourselves of the opportunity to visit the works of Mr. EUGENE F. PHILLIPS, at No. 20 Conduit street, who is well known as the manufacturer of patent insulated wire, and rubber covered and insulated wires, electric cordage, etc., of every description. Mr. PHILLIPS

was absent, but Mr. REED, who has immediate charge of the manufactory, showed us through the establishment. The works are equipped with the best machinery for the manufacture of insulated wires, and the business has grown into extensive proportions under the able business management of Mr. PHILLIPS.

The superior quality of the PHILLIPS wires is well known to those who have occasion to use them, and the active and increasing demand for them attests the estimation and appreciation in which they are held. The factory covers a considerable extent of ground, and the machinery provided is ample to supply promptly any quantity of wires to satisfy the demand therefor.

In addition to the wire business, Mr. PHILLIPS manufactures the best gas tight gas tubing made, either in this country or in Europe, and the demand for this tubing comes not only from all parts of the United States but also from foreign countries, to which considerable quantities are exported. Improved and very beautiful and expensive machinery is employed in the manufacture of the tubing, as well as of the electric wires. Everything appeared to be thoroughly systematized throughout the establishment, and the utmost efficiency and economy employed to turn out work not only superior in quality, but at reasonable and satisfactory prices.

Fatal Accident to Mr. Frederic Hudson.

MR. FREDERIC HUDSON, who for thirty years was connected with the *New York Herald*, on Wednesday afternoon of last week met with an accident which in a few hours resulted in his death. While crossing in the carriage of and with his friend Judge KEYES, the crossing of the Middlesex or Concord branch of the Boston and Lowell Railroad at Concord, the carriage was struck by the cars, and Mr. HUDSON was entangled in and carried with the debris some distance, when the whole was thrown down an embankment some ten or fifteen feet. Judge KEYES succeeded in jumping from the carriage, and escaped without serious injury. Mr. HUDSON, when taken from the wreck, was not supposed to be fatally, although severely injured, and was taken home; but about half past nine o'clock P. M. he commenced vomiting blood, and it became evident he was injured internally. Vomiting of blood continued at frequent intervals, and at five o'clock, Thursday morning, he died.

As the managing editor of the *Herald*, Mr. HUDSON was intimately associated with telegraphic affairs. He was one of the originators and organizers of the Associated Press of this city, and from the first introduction of the electric telegraph fully appreciated its value and importance to journalism.

He was a man of great ability as a journalist, and the wonderful success of the *Herald* was largely due to his labors. Of a most kindly disposition, and with a just and equitable mind, while at the same time a strict disciplinarian, he made friends of all who were associated with him in the service of the *Herald*.

Several years since he retired from his connection with the *Herald*, to devote himself to the care of an invalid wife, and has since resided at Concord, Mass., where he met his death. He was universally beloved by his townsmen, and the news of his death cast a gloom over the village, and has caused a universal expression of grief and regret from all who knew him, which is his highest eulogium.

He was between 56 and 57 years of age at the time of his death, and was in the prime of life and usefulness when he was called so suddenly from existence. He leaves an invalid wife and a son to mourn the great bereavement which has so unexpectedly come upon them.

It has been said, "Of the dead speak nothing but good;" but there is naught but good that any one can speak of the deceased. He had no enemies living, and no man ever more fully deserved the good and kindly words which have been called forth by his death.

An independent and popular telegraphic journal—THE TELEGRAPHER.

A Caution to Operators.—Don't Go to California!

EVERY letter that we receive from California or the Pacific coast, whether intended for publication or not, speaks of the over supply of telegraph operators in that section of the country. A letter from a telegrapher in San Francisco, dated the 17th inst., begs us to warn telegraphers who are contemplating going to the Pacific coast not to do so, unless they have situations assured before starting. Many telegraphers who have been induced to emigrate to California in the expectation of securing good situations and better salaries than at the east, are now there without employment, and many of them without the means of subsistence or to return home, or expectation of any except from their friends in the east.

A fact stated by another correspondent gives a good idea of the situation, viz: that Mr. VANDENBERG, the Superintendent of the Atlantic and Pacific Telegraph Company, asserted that if every operator in his employ should leave he could fill their places without difficulty in forty-eight hours.

Telegraphers owe it to their fellows now on the Pacific coast not to further over-stock a market already so excessively supplied with telegraphic labor.

We understand that there are in operation two telegraphic "plug" factories in California, under the presidency or patronage of the General Sup't of the Western Union Telegraph Company. We should suppose that there would be but small show for the graduates of these so-called telegraph schools, and that to receive pay from them for tuition in a business which is already over supplied with labor, must be very much like obtaining money under false pretences, for, of course, each of the pupils enters the school with the intention and the understanding that the business, when learned, will be remunerative. It isn't a good time now for plug factories anywhere, especially in California.

The Atlantic and Pacific Telegraph Company.

THE executive offices of the Atlantic and Pacific Telegraph Company in this city will to-day be removed from 198 Broadway to the rooms which have been fitted up for occupancy at No. 145 Broadway. It is not expected that the operating and other departments will occupy their new quarters for a week or ten days yet. We shall, as soon as this is done, print a description of the new offices, which will be superior in every respect to any heretofore occupied by the company. No labor or expense is being spared to make the new quarters admirably fitted for the increasing business of the company, which imperatively requires more adequate accommodations than have heretofore been provided.

The new lines of the company are being energetically pushed forward, so as to have them ready for use before cold weather sets in. A large amount of work has also been done during the present season in improving the insulation and conductivity of the old wires of the Atlantic and Pacific and Franklin lines, and they are now in better condition than ever before.

In consequence of the refusal of the St. Louis Bridge Company to allow the wires of the Atlantic and Pacific Company to be maintained across the bridge, that company having an exclusive contract with the Western Union Company, a cable will be temporarily laid across the river to establish connection with St. Louis. The Atlantic and Pacific Company, however, claim, under the National Telegraph Act of 1866, the right to use the bridge for telegraphic purposes, it having been established as a post road, and this right they propose to enforce legally, having commenced a suit against the Bridge Company for that purpose; but pending the decision of the courts in their favor, will make the connection by cable as above stated.

The National Telegraph Company.

THE National Telegraph Company, of California enterprise, continues to attract attention among telegraphers as well as the public, and Mr. COHEN, the President, is yet

in New York, but will in a few days return temporarily to the Pacific coast.

Mr. COHEN objects to the statements of our San Francisco, Cal., correspondent "C," in a communication published in the last number of THE TELEGRAPHER, in regard to that enterprise, as not being correct. He denies that the object of the promoters was to depress Western Union stock, and asserts that the company intend to go on and build the proposed telegraph system. As his company did not invite telegraph operators to California, or promise them employment upon any terms, it can hardly be justly blamed for any rush of that class to the Pacific coast.

It is not proposed to commence the construction of lines before next spring, but the intervening time will be utilized in perfecting the preliminary arrangements. It is expected by the National Company to obtain such legislation from Congress during the winter as will authorize the use of the post-offices and postal officials, wherever it is desirable for the transaction of the telegraph business of the company, upon some proper rate of compensation to the Government, and by this means considerably reduce the cost of the telegraphic service—which is essential, if the business is to be done upon the scale of charges proposed by the National Company. We think it very doubtful, to say the least, whether any such legislation can be obtained, as neither the people or Congress have so far manifested any overweening desire to engage in the telegraph business, either directly or indirectly. A Government or Postal telegraph, either directly owned by the Government, or owned or worked in partnership with other parties, is not desirable, and we hope the National Company will abandon the idea of any connection of Government, or Government officials, as such, with its enterprise.

Personals.

Mr. N. B. WALKER, lately of Ottawa, Ill., has retired from the telegraph business to engage in farming, at Sedgewick City, Kansas.

Mr. CHARLES H. POND has accepted a position with the Western Union Co. at New Orleans, La.

Mr. CHARLES POPE has been appointed extra operator in the St. Louis, Kansas City and Northern R. R.

Mr. JAMES W. SHRYOCK is subbing in the Western Union office at Cheyenne, W. T.

Mr. ROBERT IRWIN, the comedian and transmitter, has been transferred from the day to the night force of the St. Louis, Mo., Western Union office.

Mr. HARMON BYERS, of Troy, Kansas, has accepted the managership of the Western Union office at Barnum's Hotel, St. Louis, Mo.

Mr. JOHN WILKIE has left the Jackson R. R. Co.'s telegraph service at Caution, Miss.

Mr. ALLEN SCHURG, formerly assistant operator and agent of the No. Pa. R. R. Co. at Souders, Pa., has been appointed agent and operator of the same company at Jenkintown, Pa.

Mr. M. D. ZENOTT has been appointed agent and operator of the N. P. R. R. Co. at Souders, Pa., to fill vacancy caused by the promotion of Mr. ALLEN SCHURG.

Mr. FRANK NICHOLSON, formerly of Troy, N. Y., has accepted a position with the Montreal Telegraph Co. at Utica, N. Y.

Mr. SAM'L. Q. SEVIER, of the New Orleans, La., Western Union office, has resigned, to engage as travelling agent for a prominent grocery house of that city.

Mr. CHARLES H. PATCH, from the north, has accepted the vacancy in New Orleans, La., Western Union office, caused by the resignation of Mr. SEVIER.

Mr. C. H. SMITH, formerly of the New Orleans, La., Western Union office, and late of the Western Union main office, in New York, is an addition to the force of the former office.

Mr. W. P. DENNETT has been appointed to a position with the Western Union Company, at Vicksburg, Miss. An increase of force.

Mr. A. G. TAYLOR, of the Western Union, Galveston, Texas, has been made night chief operator.

Mr. WM. THOMS, an old timer, is an increase to the Western Union force at Galveston, Texas,

The Telegraph.

Foreign Telegraphic Notes.

THE erection of the Encla telegraph line in Western Australia is proceeding satisfactorily.

The New Zealand Cable is to be laid before May next.

The traffic receipts of the Anglo-American Telegraph Company for

Table with columns for dates (Sept. 29, Oct. 1, 2, 3, 4, 5, 6, 7) and amounts in pounds (£) ranging from 460 to 2,650.

The traffic receipts of the Brazilian Submarine Telegraph Company for the month of September, 1875, were £9,544, against £8,238 for the corresponding period of 1874.

The number of messages transmitted over the Cuba Submarine Telegraph during the month of September last was 2,072, estimated to produce £2,000, against 1,797 messages, producing £1,802 in the corresponding month of last year.

The traffic receipts of the Direct Spanish Telegraph Company for the month of September, 1875, were £1,547, against £1,245 in the corresponding period of last year.

The traffic receipts of the Eastern Telegraph Company for the month of September, 1875, were £30,176, against £28,208 for the corresponding month of 1874.

The traffic receipts of the Eastern Extension, Australasia and China Telegraph Company for the month of September last were £18,080, and for the corresponding period of 1874, £18,163.

The traffic receipts of the Great Northern Telegraph Company for the month of September last were 392,089 francs, and for the corresponding month last year 425,931 francs. Total traffic receipts from January 1 to the 30th of September last, 3,186,948 francs, and for the corresponding period of last year, 3,328,040 francs.

The accounts of the Brazilian Submarine Telegraph Company, though not finally audited, show a profit for the year ending 30th of June sufficient to enable the directors to recommend a final dividend of 2s. 6d. per share, making with previous distributions five per cent. per annum, and carrying to reserve the sum of £40,000. The dividend will be payable on the 28th inst.

The report of the Eastern Extension, Australasia and China Telegraph Company for the half year ending June last states that the gross earnings have amounted to £110,754, and the working expenses, including maintenance of cables, to £28,473, leaving a balance of profit of £82,280. An interim dividend of 1½ per cent. has been paid, and it is now proposed to distribute a further one of 1½ per cent., leaving £22,355 to be carried forward. The greater portion of the 3,200 debentures authorized to be issued for the purpose of laying the cable between Sydney and New Zealand has been taken up. The report further states, and it is anticipated, that the cable will be laid early next year.

At a meeting of the Board of the West India and Panama Telegraph Company it was resolved to recommend to the shareholders, at the approaching general meeting, the declaration of a dividend of 7s. 6d. per share, on account of arrears of dividend on first preference shares to 30th of June, 1875.

The steamship Edinburgh was to leave Portland on the 10th inst., carrying the shore ends of the New Zealand cable, and the Hibernia is expected to follow about the end of the month with about 1,000 miles length of deep sea cable. On the arrival of the latter the two ships will proceed to lay the cable, which will connect the ports of Sydney and Wellington. The total length of cable being manufactured is 1,370 knots. Last week Sir Julius Vogel visited the works of the Telegraph Construction Company, and inspected every process of the manufacture, which is progressing most satisfactorily.

The Panama Star and Herald, of Oct. 16th, says: We are officially informed, under date of 15th inst., that the break in the cable, between Key West and Punta Rasa has been repaired, and that messages are now forwarded without any extra delay. The following is a new schedule of rates from the Isthmus:

Table with columns for destinations (Havana, U. S. E. of Mississippi, U. S. W. of Mississippi, Canada) and rates per word, ranging from \$1 12 to 1 45.

For Great Britain and France the Anglo-Cable Company's tariff is to be added, which is \$1 per word, to the east of Mississippi rate.

The traffic receipts of the Western and Brazilian Telegraph Company for the five weeks ending October 1, were £10,360, showing an increase of £1,124 over the corresponding period of last year.

Telegraphic and Electrical Brevities.

THE Galveston, Texas, Western Union office is now one of the most important and profitable in the South. The relaying for almost the entire State of Texas is now done at Galveston.

The Signal Service Telegraph line from Wilmington to Smithville, N. C., mouth of Cape Fear river, a distance of twenty-five miles, has been completed.

An incendiary fire at Mahoney Plains, Pa., at two o'clock Sunday morning, the 24th inst., destroyed the Western Union Telegraph office. The telegraph instruments were saved.

At St. Louis, Mo., on Saturday last, the 23d inst., the Atlantic and Pacific Telegraph Company stretched a wire on the bridge to connect their lines with that city, and shortly afterward the bridge company cut it down. The telegraph company claim the right to use the bridge under an Act of Congress, but the bridge company, having a contract with the Western Union Company granting them the exclusive right to use their structure, refuse to allow the Atlantic and Pacific folks to go on it.

It is proposed to establish a system of fire alarm telegraph in Long Island City immediately. It is estimated that the work can be done for \$5,000.

The United States Military telegraph line was completed and connected to Fort Concha and McKavitt, Texas, 575 miles from Dennison, Oct. 20th.

Quotations of Telegraph Stocks at N. Y. Stock Exchange.

Showing Lowest and Highest Prices each day during week.

Table with columns for dates (Oct. 21-27) and stock prices for Western Union, Atl. and Pac., Amer. Dist., and Gold and Stock.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Sept. 28, 1875, and bearing that date.

168,144.—AUTOMATIC TELEGRAPH KEYS.—S. L. Crandall, New York, N. Y. [Filed Aug. 21, 1875.]

1. An automatic telegraph key for mechanical transmission of messages, constructed of a series of sliding spring keys, representing the letters of the alphabet, and connected by spring pawls and ratchet wheels with a corresponding number of revolving wheels, with partially insulated circumferences, and with spring tongues or riders in contact therewith, said wheels being connected to one pole, while the tongue is connected to the other pole, substantially as and for the purpose specified.

2. The combination of two sliding spring keys, having spring pawls, with one transmitting wheel, provided with ratchet wheels placed in opposite direction to each other, for the purpose of coupling keys having letters with reversed Morse characters, substantially as shown and described.

168,185.—ELECTRIC CIRCUIT BREAKING CLOCK WORK.—David Rousseau, New York, N. Y., assignor, by mesne assignments, to Wm. F. Smith and S. Samuels, same place. [Filed Aug. 13, 1875.]

The circuit breaking train of wheels acts only at the time when, in the course of the revolution of a pin wheel in the time-keeping train, the pins have advanced sufficiently to allow the escape of an arm projecting from a spindle of the circuit breaking train.

1. The arm a, combined with the rotary wheel d, and intermittently rotating wheel h, to constitute a circuit breaker, substantially as herein shown and described.

2. The combination of the mainspring B, which rotates the wheel d, with the mainspring C, arm a, and circuit breaking wheel h, substantially as herein shown and described.

168,242.—TRANSMITTERS AND RECEIVERS FOR AUTOMATIC TELEGRAPHS.—Thomas A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed Jan. 26, 1875.]

1. The transmitting drum f and receiving drum e upon the same shaft, in combination with the receiving and transmitting stylus or rollers n o and a clutch b, for connecting either one drum or the other to the shaft b, as set forth.

2. The two contact rollers i and i', applied to the transmitting drum, one at each side of the roller n or stylus, in combination with the wire d, to guide the advancing end of the strip of paper, as set forth.

3. The roller z1, removable from the shaft c, and revolved by friction, and containing points, in combination with the receiving drum e and yielding roller n2, substantially as set forth.

For the week ended Oct. 5, 1875, and bearing that date.

168,364.—ELECTRIC ANNUNCIATORS.—Saml. H. Beckwith, Utica, New York. [Filed April 1, 1875.]

The alarm and all the indicators controlled by one electro-magnet, through which circuits pass from all the points to be signaled from. Magnet is revolved by clock work.

1. The combination in an annunciator of a series of indicating or numbered cards or signs and a single electro-magnet controlling the same, with intermediate mechanism, for the purpose of causing the proper sign or number to appear on sounding an alarm or call, substantially as set forth and described.

2. The combination of a revolving electro-magnet, an armature lever, a drag spring, and a system of keys for the purpose of announcing an alarm or call by the appearance of annunciating cards indicating the place from whence the alarm or call proceeds, substantially as set forth and described.

3. The revolving electro-magnet provided with the armature lever C2 and drag spring G, in combination with the cut-off I3, the automatic switch M, and the clock work, whereby the breaking of the circuit at the switch causes the clock work to move and revolve the magnet, and the circuit is automatically closed to stop the same, substantially as set forth and described.

4. The keys D D1, etc., in combination with the armature lever C2, the conducting plates E E1, etc., and the horizontal notched springs h, substantially as set forth and described.

5. The cams L carrying the annunciating cards N, in combination with the horizontal springs h1, rods I and K, chains or cords m', and keys D D1, etc., substantially as set forth and described.

6. The conducting plates E E1, etc., in combination with the drag spring G, the armature lever C2, and the automatic switch M, substantially as set forth and described.

7. The cut-off I3, constructed as described, in combination with the automatic switch M, the revolving electro-magnet, the drag spring G, and the armature lever C2, substantially as set forth and described.

8. The cut-off I3, in combination with the crank F, substantially as set forth and described.

9. The automatic switch M, composed of the sheath n and punger p, provided with the metal pins r r and the metal plates s s', in combination with two circuits to the annunciating apparatus, substantially as set forth and described.

168,379.—CIRCUIT CLOSERS FOR RAILROAD SIGNALS.—Lloyd B. Dennis, Sandusky, Ohio. [Filed June 26, 1875.]

Lever C, operated by train, forces B B apart. The combination, with spring clamp B B', holding together the ends of circuit wires A A, of the lever C, adjacent spring D', rod D, and superposed spring E, all arranged substantially as and for the purpose specified.

168,466.—SOLUTIONS FOR CHEMICAL TELEGRAPHS.—Thos. A. Edison, Newark, N. J., assignor to himself and Geo. Harrington, Washington, D. C. [Filed Jan. 26, 1875.]

In a chemical solution for telegraphic paper, the combination of a proto-salt of iron with a vegetable astringent and a conducting salt, substantially as set forth, in order that the mark may be made by electrolysis, as set forth.

168,467.—RECORDING POINTS FOR CHEMICAL TELEGRAPHS.—Thos. A. Edison, Newark, N. J., assignor to himself and George Harrington, Washington, D. C. [Filed Jan. 26, 1875.]

A recording point formed of metallic ruthinium in a chemical telegraph, substantially as set forth.

WILLIAM BROWNLEE, Dealer in CEDAR TELEGRAPH POLES. OFFICE, FOOT OF SHELBY STREET. DETROIT, MICHIGAN.

THE POCKET GALVANOMETER. PRICE REDUCED.

The Pocket Galvanometer manufactured by LENNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to J. N. ASHLEY, 38 Vesey street, New-York. P. O. Box 5,503.

THE LECLANCHÉ BATTERY. THE WORLD RENOWNED Open Circuit Battery. NO ACIDS! NO SULPHATE OF COPPER! DOES NOT FREEZE! Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED to Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS, LECLANCHÉ BATTERY COMPANY, No. 40 West 18th Street, or L. G. TILLOTSON & CO., Sole Agents, 8 Dey Street, New York.

BRADLEY'S
APPARATUS FOR
ELECTRIC MEASUREMENT,
 COMPOSED OF HIS
Tangent Galvanometer and Rheostat.
 (Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment.
 Invaluable to experts or students in electrical science.

APPARATUS COMBINING
WHEATSTONE'S BRIDGE,
 Also **GALVANOMETERS** for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED
NAKED WIRE HELICES,
 for Electro-Magnets, wound to any given size and resistance.
 Manufacturers of Telegraphic and Electrical Instruments supplied at low rates.
 For prices and pamphlet descriptive of apparatus, apply to
L. BRADLEY,
 9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF
SIEMENS' UNIVERSAL GALVANOMETER
 Resistance Coils, Submarine Cables,
 AND EVERY VARIETY OF
ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.
DAVID BROOKS, Proprietor,
22 SOUTH TWENTY-FIRST ST.,
PHILADELPHIA.

THE ELECTRIC.
 A "CAN'T-DO-WITHOUT-IT"
 Journal of Telegraph News and Gossip, published semi-monthly.
 Correspondence of Telegraphical interest solicited.
SUBSCRIPTION PRICE:
 Per year, \$1.20.
 Single copies, 5 cents.
 Specimen copies furnished gratis on appll ation.
 All communications should be addressed to
HAYES AND MOXON,

ST. LOUIS, Mo.

LEWIS' TELEGRAPH MANUAL.
 A few copies of the last edition of
THE TELEGRAPHIC MANUAL,
 by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

WESTERN ELECTRIC MAN'FG CO.
 220 Kinzie Street,
CHICAGO, ILL.
 CELEBRATED
PRIVATE LINE OUTFIT.
 THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.
 This instrument is mounted on an iron base and finely finished.
 It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.
 This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.
 With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....	\$10 00
Instrument only.....	8 00
Bliss Reservoir Battery, per cell.....	2 00

DISCOUNT.
 A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.
 In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.
Liberal terms to Agents.
WESTERN ELECTRIC M'FG CO.,
CHICAGO, ILL.

TO ELECTRICIANS.
BASTET'S NEW IMPROVED BATTERY
 is the most powerful, constant and durable power in the market; never crystallizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.
PRICE LIST.
 No. 1 Cell, \$5.00.
 No. 2 " 10.00.

Washington, D. C.,
Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION OF CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THREE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

CHARLES T. CHESTER,
104 Centre Street,
NEW YORK,

TELEGRAPH ENGINEER,

AND MANUFACTURER OF

INSTRUMENTS,

BATTERIES,

AND EVERY DESCRIPTION OF

TELEGRAPH SUPPLIES.

BUNNELL'S PATENT REPEATER.

These instruments are now made in two different styles, at \$120 and \$135 a set, consisting of two Relays, two Sounders, two Keys and Governor.

JONES' LOCK SWITCH-BOARD,

a most compact and reliable Switch, forming a clean spring-locked connection between any number of wires, occupying for each different connection only one square inch of space, and though made of the largest size, not subject to the warp and contraction of wood-work.

EXCLUSIVE AGENTS OF

A. G. DAY'S

KERITE,

OR

COMPOUND RUBBER COVERED WIRE

SUBTERRANEAN & AERIAL WIRES,

OF THE

HIGHEST INSULATION.

We are now prepared to furnish, after an experience of three years, an Insulated Wire which can be buried in the earth or exposed to rain and sun, or to the vapor of acids, without injury. Professor SILLIMAN, who has exposed it to the most destructive agencies, finds that it remains uninjured in an atmosphere of ozone, which would destroy gutta-percha in a few hours. It exceeds glass or any other known substance as a non-conductor

We have made special arrangements to furnish this article for office purposes at a reduced rate.

ALSO, TO FURNISH

IRON CLAD CABLES

of the usual size, with KERITE COVER, believing that it will exceed, in insulation for submarine purposes, ANYTHING HITHERTO MANUFACTURED.

We shall be happy to furnish estimates for any amount and size of cable, which will be found to compete with any other construction, both in quality and price.

We manufacture the Genuine ELECTROPOION BATTERY, with Patent Platina Connection. Introduced by us eight years since; also, THE ALPHABETICAL OR DIAL TELEGRAPH, now extensively used in this and other cities for private lines, being easily and quickly learned by anyone.

We offer for sale, among other novelties, a SOUNDER that will work practically with a single DANIELL cell, a BATTERY that does not require to be taken down but once a year, and the very best MAIN LINE SQUANDERS made

Our CATALOGUE, embracing a large amount of new matter and description, is now ready for distribution.

Our Prospects.

[By NIHIL NAMELESS.]

I.

We young folks seldom think at all, Our pathway is so lined with flowers; Advancing years no terrors bring, So smooth the moments weave the hours. So grandly rides the climbing sun We think not of declining ray— So deep the draught of morning joy We take no thought of closing day.

II.

Could we but see with thoughtful eye The clouds that darken future years, The pinching want, the friendless age, How hope would dwindle into fears— How oft, instead of thoughtless laugh, Would fall the deep and hopeless groan, As dark before our forward glance We see our gray haired selves alone.

III.

I had a dream the other night, Which was not all a common dream; The men and places all seemed strange, And still 'twas a familiar scene. I stood among a busy throng Of strangely intermingled men— Some young, some old, some weak, some strong, Some meek and mild, some smart and vain.

IV.

I mused in silent pensive mood, And listened as they thronged around; The noisy click soon shaped itself Into the "giant's" well known sound; The messages poured in apace, The men were urged to greater speed, And as the orders passed along, I looked to see who held "the reed."

V.

I thought I saw among the men The very man to hold the sway— His silver hair and wrinkled brow Bore witness he had "had his day" Of labor. Surely, now his toil Has met the recompense deserved, And now he governs for the men For whom so many years he served.

VI.

But no; when orders came along The old man meekly bowed his head; No officer was he, I saw— From other lips the orders sped— He was a servant still, whose life Had been devoted thus to toil For those who now, in his old age, Repay his work with greater toil.

VII.

And standing spruocely in the midst I saw a boy, whose beardless cheek Proclaimed his youthfulness, no less Than glossy locks, so straight and sleek; His hair, so smoothly in its place, Was parted true with girlish care, As though the lack of brains compelled An equal weight each side of hair.

VIII.

A sharp rebuke dropped from his lips— Upon the silver head it fell— The old man answered not a word, He knew the consequence too well. The boy was master, he was man— His daily bread hung on a breath— To answer was to "lose his job," To lose the job was simple death.

IX.

A pert young master, just from school, Whose father owns a lot of stocks, Had claimed the right to order there, An got it through his father's "rocks." 'Tis ever thus with worth, I thought— Merit is crowded out by cheek— Desert goes meekly to the wall; Gold is mighty, virtue weak.

X.

To "point the moral" yet remains— I would I could "adorn a tale;" As thus we meet the future dark Let wise resolves in time prevail.* Old age will come, and poverty As surely come as silver hair, Unless we heed the lesson stern And "spend not till we have to spare."

* See "Talks" of "Yoorn," in Electric.

XI.

An old age rendered desolate Will be the more tormenting, friends, Should the dark path o'er which we've trod Have led our feet through "keno" dens. The draughts we drink in future years Of joy or woe will sweetened be, If, after all, we backward look, And only earnest effort see.

XII.

"Spend not when you should spare," young man, Nor "spare when you should spend," Secure the early part of life And then enjoy the end. "Let him who puts the armor on" Withhold the boastful scold; For safer is the man who waits Till he "puts the armor off."

CINCINNATI, O., Oct. 31st.

Progress of American Telegraphy.

ACCORDING to the recent annual report of the Western Union Telegraph Company, this great corporation has now in operation 72,833 miles of telegraph line, 179,294 miles of operating lines, and 6,565 offices. Its receipts for the past year were nine and a half millions of dollars, expenses six and a half millions, nearly— net profits over three millions. Over seventeen millions of messages were transmitted, the cost of which to the company was 37 cents per message. This is rather cold comfort for new companies that would like to compete with the Western Union by a reduction of the rates. Rather dismal, also, for the advocates of Government telegraphy, who propose a uniform charge of 25 cents for each message, being the rate now in vogue in England, where the telegraphs are worked by the Government at a great annual loss.

Our British cousins are a little apt to think that what they don't know about telegraphy isn't worth knowing. But the truth is they have not as yet learned the A B C of rapidity in the business. In this respect the American telegraph engineers are in advance of other nations; nor is this very surprising, since both the telegraph works and telegraph experiences of individual nations are diminutive when compared with those of the United States.

For example, the length of all the telegraph lines in the United Kingdom is only 23,878 miles, while, as shown above, a single company in this country is now working more than three times that length.

Another reason for the advanced situation of telegraphy in this country is the fact that there are thousands of telegraph operators and electricians here who, under the stimulus of our patent system, are constantly studying how they may improve instruments or make discoveries by which the operation of the line and adjuncts can be improved, quickened, or made more economical. Their success is astonishing, and in one branch is illustrated by the report of the Western Union Company, which shows that, by the employment of the new duplex and quadruplex instruments, they have greatly reduced the expense of transmission, besides increasing the capacity of the lines.

If our telegraphs were in the hands of Government officials there would be less striving or competition for excellence, and little encouragement, we fear, would be offered for the discovery of new improvements.

The recent invention of Elisha Gray, heretofore described by us, by which sixteen or more messages may be transmitted each way, at one time, over one wire, promises wonderful results in the future. It indicates that the time is coming when household and private telegraph lines will become as common as the existing method. It is one of the peculiarities of Mr. Gray's remarkable method that, while sixteen different persons may use the wire, none of their messages need interfere with or become known to any of the other users, save the sender and his designated correspondent.

A new organization, entitled the National Telegraph Company, with a capital of \$25,000,000, has been organized in California, and it is to be hoped that it will meet with success. But this it can only hope to achieve by improving the existing service. If it can send messages as promptly, at no greater prime cost than that now paid by the present companies, it may secure a share of the business. But this will be up hill work in the face of the admirable management of companies like the Western Union, which are constantly striving to improve every branch of their service, and quick to adopt every practical improvement that inventors present.—Scientific American.

The Society of Telegraph Engineers.

THE ordinary general meetings of the Society of Telegraph Engineers will recommence in London on the 10th of November. It is stated that the President of the Society, Mr. Latimer Clark, will give the annual soiree towards the end of November.—The Telegraphic Journal.

The Telegraphers' Mutual Benefit Association.

RECEIPT OF ASSESSMENTS.

NEW YORK, October 26, 1875.

ASSESSMENT No. 79.

25, 29, 38, 52, 54, 65, 67, 72, 80, 89, 95, 121, 141, 142, 143, 144, 146, 172, 176, 177, 183, 184, 185, 186, 187, 189, 190, 191, 193, 197, 198, 201, 202, 215, 220, 235, 247, 254, 267, 276, 286, 302, 342, 346, 349, 351, 367, 378, 379, 380, 383, 392, 393, 394, 416, 426, 431, 467, 476, 526, 532, 549, 552, 554, 576, 586, 587, 592, 603, 604, 605, 661, 671, 685, 695, 697, 705, 721, 729, 734, 735, 750, 751, 756, 808, 815, 831, 855, 858, 874, 880, 883, 886, 908, 916, 932, 978, 998, 1001, 1013, 1023, 1039, 1047, 1054, 1071, 1074, 1076, 1081, 1088, 1090, 1147, 1148, 1175, 1177, 1182, 1196, 1225, 1226, 1232, 1276, 1295, 1304, 1329, 1358, 1364, 1365, 1385, 1390, 1391, 1400, 1402, 1403, 1404, 1410, 1417, 1440, 1444, 1454, 1455, 1456, 1484, 1498, 1505, 1506, 1507, 1508, 1518, 1522, 1554, 1555, 1556, 1557, 1568, 1569, 1570, 1582, 1589, 1598, 1594, 1620, 1630, 1656, 1670, 1707, 1708, 1721, 1723, 1729, 1735, 1736, 1773, 1775, 1791, 1810, 1811, 1812, 1815, 1847, 1869, 1881, 1916, 1919, 1928, 1942, 1945, 1947, 1950, 1965, 1972, 1987, 2019, 2021, 2024, 2025, 2029, 2044, 2055, 2057, 2091, 2113, 2114, 2138, 2143, 2151, 2154, 2162, 2172, 2180, 2181, 2200, 2201, 2202, 2204, 3205, 2206, 2212, 2213, 2214, 3216, 2236, 2241, 2242, 2243, 2257, 2265, 2269, 3272, 2279, 2281, 2282, 2283, 2288, 2289, 2295, 2296, 2297, 2298, 2299, 2305, 2310, 2313, 2314, 2316, 2317, 2318, 2321, 2330, 2331, 2333, 2334, 2385, 2336, 2337, 2344, 2348, 2354, 2355, 2356, 2358, 2367, 2372, 2373, 2374, 2375, 2378, 2379, 2385, 2388, 2392, 2393, 2403, 2431, 2434, 2438, 2439, 2441, 2435, 2448, 2451, 2453, 2465, 2467, 2472, 2474, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507.

ASSESSMENT No. 78.

39, 84, 148, 171, 206, 228, 248, 252, 280, 316, 344, 350, 361, 441, 482, 556, 557, 569, 701, 710, 722, 733, 781, 783, 786, 802, 809, 825, 836, 838, 842, 873, 904, 906, 926, 944, 980, 1000, 1002, 1014, 1016, 1041, 1057, 1069, 1105, 1106, 1107, 1108, 1109, 1110, 1112, 1113, 1115, 1117, 1119, 1120, 1122, 1123, 1125, 1131, 1141, 1238, 1251, 1255, 1256, 1281, 1283, 1284, 1285, 1286, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1366, 1405, 1415, 1421, 1427, 1430, 1432, 1433, 1465, 1479, 1574, 1476, 1481, 1497, 1513, 1528, 1529, 1530, 1573, 1586, 1597, 1616, 1649, 1663, 1666, 1677, 1700, 1701, 1718, 1737, 1746, 1747, 1750, 1751, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1769, 1771, 1785, 1802, 1813, 1828, 1863, 1864, 1895, 1982, 2004, 2023, 2040, 2083, 2085, 2112, 2145, 2171, 2196, 2211, 2215, 2226, 2227, 2253, 2266, 2267, 2284, 2286, 2293, 2324, 2325, 2326, 2351, 2360, 2369, 2380, 2381, 2382, 2398, 2401, 2425, 2446, 2463, 2470.

(The following should have appeared in last TELEGRAPHER):

ASSESSMENT No. 77.

169, 182, 429, 490, 495, 496, 497, 499, 500, 503, 505, 506, 507, 508, 1104, 1553, 1712, 1743, 1744, 2115, 2132, 2150.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

The Perils of Australian Telegraphy.

THE South Australian Register of July 14th last publishes an account of the murder of the station master at Daly Waters, of the Port Darwin telegraph line, by the savages. It says:

"About three weeks ago Mr. C. H. Johnston, the station master at Daly Waters, telegraphed for permission to proceed to the Roper River, in order to look after some Government horses and cattle which were known to be straying in that locality. The necessary sanction having been given, he started in company with Messrs. Daer and Rickards and one or two blacks. Nothing more was heard of the party until Tuesday, July 13, when Messrs. Daer and Rickards returned to Daly Waters with the report that they had been attacked by the natives, and that Mr. Johnston had been murdered. It appears that the attack was made on the 29th of June—Mr. Johnston being speared on the left side of the abdomen. Situated as they were, his companions could do little for him with such a dangerous and probably poisonous wound. The poor fellow lingered till the following day, when, as the telegram informs us, he 'died easily.' Both Daer and Rickards were wounded, the former on the nose and the latter on the breast, but not seriously. They managed to reach the station, though in a very exhausted condition. With this second painful evidence of the savagery of the aborigines in the interior, it is to be

hoped that the utmost care will be taken by the authorities to keep the officers of the various stations as near home as possible. The recovery of a few horses is nothing to the life of a faithful servant; and although in this case the suggestion emanated from the person who lost his life, still, with regard to any such proposed future expeditions, a firm refusal, except under very special circumstances, should be given by the superintendent of telegraphs, and this we are sure, after the tragedy which has just been enacted, he will be careful to do. Mr. Johnston entered the telegraph service in September, 1872, when he was appointed an operator on the overland line. He was stationed at the Katherine, and in May last was transferred to Daly Waters."

Annual Meeting of the American Electrical Society Adjourned.—Distinguished Telegraphic Visitors.—Rumored Resignation and Appointment.—Resignation of Asst. Manager Sholes and Promotions.—Painful Accident to Mr. Louderback.

CHICAGO, ILL., Oct. 23.

TO THE EDITOR OF THE TELEGRAPHER.

THE annual meeting of the "American Electrical Society" was called to order on Wednesday, the 20th inst., at 3 P. M., Col. J. J. S. Wilson in the chair. The Recording Secretary, C. S. Jones, not being present, W. C. Long was, by unanimous vote, requested to act as such *pro tem*. The meeting was held in Room 9, Union Bank building, Gen. Supt. Stager's office. As it was understood, by notices issued and sent to the different members by mail, that it was the wish of the executive committee that the business of the annual meeting be postponed until the third Wednesday in November, so as to give more time to fully prepare for such an important meeting, it was rather understood that very little if any business would be transacted on the regular day for the annual meeting. It was not generally understood, however, that the meeting would be held in the afternoon, as it had been the custom to hold the meetings in the evening, beginning at seven P. M. On this account very few members were present, not enough for a quorum, and as no business could be transacted, the meeting was immediately adjourned until the third Wednesday in November.

This city has been honored recently by quite a number of telegraphic visitors, prominent among whom were Prest. Orton from New York, Supt. Gifford, W. U., Syracuse, N. Y., and Manager Stumm, of W. U., Cleveland, Ohio; the latter accompanied by several ladies. They all visited the points of telegraphic interest, especially the W. U. office and surroundings. Miss Jennie Harding, formerly of the W. U. Chicago office, now of the W. U. Buffalo, N. Y., office, is also in the city, and paid the W. U. office a visit, making new and renewing old acquaintances. Jennie is as handsome as ever, but regrets very much that she don't get to see THE TELEGRAPHER in "Bu," as she did when at "Ch." Where are those gallant youths of Buffalo? Mr. M. C. Bristol, Supt. Construction, W. U., Indianapolis, is also in the city.

It is rumored here that Mr. Fox, of the W. U., Detroit, resigns on the first prox., and Mr. Corbett takes his place. Mr. W. H. Mixer, formerly of Aurora, C. B. & Q. R. R., now has charge of the general telegraph offices of that company in this city in conjunction with his duties as chief operator of the Chicago division of that company. Mr. M. is an old and faithful employé, and the company have done well in promoting him. Mr. Chas. Lee has charge of the telegraph office at the general baggage rooms of the C. B. & Q. R. R. in this city. Mr. L. has seen considerable service out on the line, and is the right man in the right place. Mr. Samuel Smith, an old P. & A. repairer, is now repairing for the W. U. R. R., from Racine to Rock Island, and a branch road in Iowa, with headquarters at Racine. "Sam" is trying to operate enough so as to test with the chiefs while out on the line, and has made quite a good operator out of himself.

On Saturday, the 16th ult., Mr. C. G. Sholes' resignation as second assistant day manager of the W. U. main office in this city took effect. Mr. Plum, next in rank, takes Mr. Sholes' place, while Mr. Pettit succeeds Mr. Plum as third assistant, and Mr. "Ed" Whitford takes the position of assistant Board of Trade manager, made vacant by Mr. Pettit's promotion. Thus the old men

here are being rewarded for their faithfulness, one by one, according to ability and length of service.

Mr. Sholes' resignation, I am sorry to state, was caused by his health failing him, he having had several hemorrhages of the lungs the past six months. His physician has forbidden his doing any kind of work the coming winter. He goes to New York city to try the effect of the salt water breezes, and hopes by spring to be so far recovered as to engage in other business. Should his hopes not be realized, he may go to Europe—or probably west to Colorado. Mr. Sholes leaves many warm friends. He was known under the old management as a rigid disciplinarian, but very impartial in his dealings; ever ready, in his kind-hearted unostentatious way, to help the boys if it was possible to do so, and at the same time serve the company faithfully.

Early this last summer Mr. D. H. Louderback, one of the W. U. receiving clerks here (formerly of Philadelphia), met with a painful accident while hunting, receiving a charge of bird shot in the face from a companion's gun. I was requested at the time not to mention the fact, and as I supposed the correspondents of the other telegraph papers had been requested likewise, I refrained from doing so, as Mr. L.'s Philadelphia friends, especially his parents, would be very anxious till they saw him in a fair way of recovery. Now, however, the accident has become a matter of news. Mr. L. repaired to Philadelphia as soon as able, and remained there under skilful surgical treatment, nursed by kind friends, until a short time ago, when he returned to Chicago, and was welcomed to his accustomed position. One of his eyes, however, is still so severely injured as to make it too painful for him to pursue his vocation, and indeed, it is feared he may yet lose his right eye. Accordingly, he has for the present resigned, and accepted an offer with the Western Electric Manufacturing Company, of this city. Any of the fraternity or others desirous of purchasing telegraph goods can do so to no better advantage than by addressing Mr. L.

The "Quad" arranged on Mr. Jones' plan (of the W. U. here) has been put in successful operation between here and Cincinnati.

OCCASIONAL.

Telegraph and Postal Combination.

TO THE EDITOR OF THE TELEGRAPHER.

IN your editorial remarks last week, in relation to the future of the National Telegraph Co. of San Francisco, you deprecate the idea of any possible connection between that company and the Postal Department of the Government. Your editorials upon the propositions of Mr. Hubbard, and the commendations of the simpletons in and out of the U. S. Senate, who have favored his views upon the subject of postal telegraphy, have always appeared to me sound and logical, but I fail to see any real force in your objections to what is understood to be the views of the President of the National Co.; and I suspect that your well grounded objections to the impudent propositions of Mr. Hubbard, who has aimed at cheap telegraphy for the people at the expense of the people's Government, has led you to condemn Mr. Cohen's views without giving to them the consideration which their importance merits.

As I understand Mr. Cohen's views, the National Telegraph Co. propose to cover the country with a network of wires of large conductivity, and of the very best materials, and enter into binding obligations to the Government to serve the public with a reasonable degree of promptness, with not over three or four rates of tariff, to be prepaid by stamps, and ranging from ten cents to one dollar per message of 20 words or less. Surely, it is the duty of the Government to do what it can, without loss or any possible embarrassment, to help the people to secure cheap and reliable telegraphy; and if the National Co., with a capital of \$25,000,000, is prepared to guarantee the low rates of tariff, and the greatly improved quality of lines and system proposed, and only asks that the P. O. Department may be permitted to supply to the telegraph company such office accommodations as it can yield without inconvenience or extra cost to the Department, why should not Congress cordially and promptly assent to Mr. Cohen's proposals? It is reported that he also wants the P. O. Department to deliver and collect (through the street letter boxes) telegraph messages; but for this service Mr. Cohen proposes to pay the Department a liberal consideration in cash for each message delivered, and for each message collected and handed over to the Telegraph Co. So, in fact, the arrangement, as a whole, may be even advantageous, pecuniarily, to the P. O. Department, at the same time that the public are served with telegraphic facilities at from 50 to 75 per cent. less expense than they are at the present time.

It may not be known to you, as it is to me, that this subject of coöperation (to the extent above indicated) was fully investigated and warmly commended by the late P. M. Gen. Cresswell, in the early days of automatic telegraphy (1870), but unfortunately the automatic system, at that stage, was turned over to the management of an executive officer whose highest aspiration was, for the succeeding five years, to use the system for

his personal advantage, and no rational or honest attempt was made to utilize the system, independent of, or in conjunction with the Post-office Department.

During the five years (since 1870) that automatic telegraphy has been manipulated by him, other very valuable systems of telegraphy have been developed, in part at least, and at the present moment probably no one can say what system of telegraphy will be used by the National Company, but it may very safely be predicted that Mr. Cohen and his associates will adopt the best system that money can purchase. I have an abiding faith that it will be found that the automatic system possesses advantages over ALL other systems, equal to at least 50 per cent., yet if there is a better system, I sincerely hope it may be found and be adopted by the National Co. The time has fully arrived for cheap telegraphy and a general abandonment of antiquated ways and old fogy methods of intercommunication.

Mr. Orton, the able manager of the Western Union Co., has stated officially and unequivocally that the actual cost to that well appointed and exceedingly well managed company, for telegraphing 10 word messages in short circuits of even twenty-five miles, is over 25 cents per message—and substantially the same results have been developed in England, under the Government's excellently well managed lines. Now, then, let me repeat my inquiry: If this large and powerful California Telegraph Company will satisfy the Washington Government of their earnestness and sincerity in proposing to build a network of superior lines throughout the country, and serve the public correctly and with reasonable promptness with 20 word messages in short circuits for 10 cents, and in longer circuits for 25, 50, and 100 cents, provided the Post-office Department will cooperate with them, so far as it may without pecuniary loss or inconvenience, why should not Congress grant the concessions prayed for, and thus confer the greatest possible boon upon its constituents? I pause for your reply.

D. H. C.

A Fallen Angell.—Telegraphers Returning from Vacation.—The Ladies Dissatisfied.—Personals.

CHICAGO, ILL., Oct. 4.

TO THE EDITOR OF THE TELEGRAPHER.

SEE here, "boss," you don't want to be calling "Jerry" Mereness "Jemmy," as you did in my letter of Aug. 28th; 'twon't do; can't have it.

Our Angell has flown. He and Lathrop at "Bx." were having too much fun on that city line, and some of the conversation didn't suit Miss Veazey. The "boss" switched on his loop at the "Throne," listened to it a couple of days, and making out a case of a violation of that famous rule "Occasional" has been going crazy over, they concluded not to wrestle with the Angell any more until daybreak, but they let him go, contrary to Jacob's mode of doing. You see I know a little something about the Bible. Well, this is kind 'o hard on Ed., to shove him out for the first offence, after so many years' continuous service for the company. Ed.'s a good boy (worse to himself than any one else), and we're sorry to see him go. The boys are wondering what they are going to do with Lathrop. Well, there's no use in kicking, boys; business is business—relation or no relation, as the feller said when he married his rich mother-in-law—and law is law, and when the Grand Mogul says you've got to git, why git you got to git, whether it's first time you're bad or not.

Chief operator Stone, of the Baltimore and Ohio R. R. line, favored our office with a visit on the 1st, and inspected the new "quad," etc. "Om." begins to look like an old man, with his long chin whiskers.

Hazleton has got tired running around the country, and has joined the "floater" gang in our office. Quite a joke is told on "Hazy." He had several ladies out for lemonade while sojourning at McGregor. When he gave the boy his order for three lemonades the boy asked him, loud enough for the ladies to hear, "If he'd have a stick in one of them?" Although the ladies knew nothing about "sticks," still Hazy indignantly replied "Certainly not," at the same time giving "the wink" to the boy. When the lemonades came in, the "stick" was so large that one of the ladies remarked she thought she smelt liquor, while the other one wondered why Mr. "H.'s" lemonade was so much darker than the others. This was too much for "Hazy." He immediately wanted to know of the boy why he put that liquor in his lemonade when he told him not to do so. This, of course, revealed the "stick" biz to the ladies, and when the boy replied "Well, you winked at me, darn you," "the ways that are dark and the tricks that are vain" in the average young man of to-day, was very plainly manifested to the young ladies, who insist upon inquiring of "Hazy" at every opportunity "if he don't want a lemonade with a stick in it." Benson, who has been on the sick list, has recovered, and changed places with Riley, of the night force. Mr. Haake, who has been doing the Illinois Central lines during Mr. Avery's visit in New York State, has again taken his place on the city lines,

Mr. Avery returning and taking hold of the Ill. Central again. Mr. Harry Garner, who has been on the sick list for the past month, has resumed work again on the extra force, days. He seems to have a decided preference for the wire on the table alongside of Miss Phelps. Jim Petit has returned from his visit to Wis., and is ready to rush Board of Trade "biz" around the office, or draw your profile, just as necessity demands. Henderson makes it lively at "Qu," but he has a hard time getting that repeater adjusted, which "Q." Lithgoor tells him is at "Cb," and is the reason why he don't get him, "Q.," clearer. "Tommy" Knox and "Charlie" Thayer have changed places on the second New York duplex and "Smith" report days. Dennis and Hall have changed off, Dennis going on Pittsburg and Baltimore duplex, and Hall on Davenport wire. Strong and Bloomhoff have also changed places, the former taking Bloomington wire, the latter Springfield. Mr. J. N. Crittenton, "Nute," known over the wires as "T.," took quite an extensive vacation, going around by the lakes and back through Michigan, recently, and returned looking fifty per cent. better for his trip. It has always been understood that the operators in this office were not allowed to do anything during business hours except that which related to their duties at the key. After Mrs. O'Connor's return from Ireland, she gave such glowing accounts of how the lady operators were allowed to knit, sew, embroider, crochet, etc., while on duty, if not busy, some of our girls thought they would try it on as long as there was no order posted up about it. Accordingly they began on Bristol board, making book marks, "Remember me," etc., and their little hearts, no doubt, leaped for joy at the thoughts of how happy they would make their little "fellers" when they finished them. It went on for two or three days, till the management noticed the little dears, when a wet blanket, "so to speak," was, figuratively speaking, "as it were," thrown on the proceeding, and they were informed it could not be allowed. This, coupled with the fact that since the business has increased so much recently they have been kept like the men until six o'clock (they used to get off quarter before six), makes them think the management is real mean. They say the boys are so "boisterous" in the elevator they can't go down with them, and they spit tobacco juice all over the floor of the elevator, consequently it makes a difference of a half an hour with them, as they now wait until all the boys but "Strong" go down. Miss Nellie J. Smythe (*i. e.*) Mrs. W. F. Bogart, and Misses Bessie DeLang, M. T. Fitzpatrick, and Miss C. M. Kent, are the latest additions to the metropolitan force in the main office here; while Miss Ada Patrick has been transferred to "S." office, corner Van Buren and Canal sts.; Miss "Sue" Musgrove to the Dubuque and Freeport Way; and Miss Jennie Fox to the Dubuque Local: Mr. Whitcomb taking one side of Cincinnati duplex. Mr. J. N. Ashley, publisher of THE TELEGRAPHER, paid our office a visit on Saturday, and left this P. M. for New York.

WESTERN UNION.

The Relative Value of Automatic Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE read, and with great interest, the various arguments for and against automatic telegraphy that have appeared from time to time in your paper, but never believed that I should ever feel called upon to enter into the discussion. Since reading Mr. D. H. Craig's letter in the last issue, I, however, do feel called upon to enter my protest against such vast and base misrepresentations as his communication contains, and in justice to the profession I have followed for five years, uphold that which he seeks to bury. In this high sounding and well penned letter much stress is laid upon the "single message" to which President Orten alludes in his annual report. I wish to ask Mr. Craig what goes to make up the vast business done daily if it's not the "single message?" Now, let us glance down further and review, if not revise the statement "whilst we easily perforate, transmit and copy an ordinary message in sixty seconds or less." To me this all looks well on paper and in print, but you and I all know that no such work ever was or ever can be accomplished by the automatic, "easily" or otherwise, and Mr. Craig, I think, is the first and only man who claims it. I have had one year's experience in the system, and am ever ready to concede to it superiority over the Morse in certain circumstances, such as reduced number of wires, etc., and this is all that any one can claim after watching it closely for the length of time covered by my experience. All these arguments in favor of the automatic may look very well in a theoretical point of view, written and clothed in beautiful language. Now, let us consider whether it is sustained by practical tests.

Six months ago there was delivered to an office which works both Morse and automatic 1,620 words of press matter; 813 words were handed to a Morse operator, and 807 to an automatic force of three perforators simultaneously. When the Morseite had finished and his copy was ready to be delivered, the automatic force were just ready to transmit their portion, which was done, 'tis true

in quick style, but it was not till twenty minutes after the Morse operator had written his last word that the matter was all ready to deliver. What more proof can any one ask than this as to the merits of automatic telegraphy? or does it appear to any sound minded man in the light of rapid telegraphy, or, in fact, economy, when this proves four operators at one end and four at the other end—a total of eight against two? The above contest was in every way a fair and impartial one, and the writer can furnish proof of it.

It would appear that Mr. Craig puts no limit to the capacity of an automatic circuit. It has been proven that Philadelphia, Baltimore and Washington cannot do their business on one wire, and Philadelphia has been given another circuit. Does any one suppose that there are 15,000 messages sent and received from the above named cities in a day? Certainly not; and not over 1,000 are sent now. Why is it that the automatic system fails within 14,000 of doing what Mr. Craig's claim calls for? Certainly not through bad management or from the want of its proper development.

I could and would much like to present more facts, but will not at this time, and will close by the remark that I have seen and heard of Mr. Craig's prophecies before now, and would not advise any of the employes at the W. U. building to resign on account of the forthcoming "crack" in its massive walls. I hope that this will find favor in your sight, and that it will be read by my friend Mr. Craig in all friendliness, in all sincerity and in all justice.

OPERATOR.

A Defence of the Telegraphic Fraternity.

NEW YORK, Oct. 18.

TO THE EDITOR OF THE TELEGRAPHER.

I HAVE been wondering, ever since your editorial on the status of the representative telegraph operator was published, why it was that no one took up the cudgel in defence of this much abused class, and as other and nobler pens have refused their assistance, it behooves the subscriber as a duty, as well as a pleasure, to perform it. Now, Mr. Editor, granting that your remarks hold good in the main as to a very large majority of operators, still I think you are rather too sweeping in your assertions. The men who are chosen as our superior officers are not as a class of as good material as *might* be got out of the ranks. True, they may be well up in electrical matters, but many of them are deficient in a dignity of character that should also, methinks, be as requisite to help them as the performance of their numerous duties. As it is now, there is no particular honor attached to the position of chief operator in a large, or manager of a branch office; and as for salary, it varies little from that of the grade below them—in many instances being less even than a first class wire manipulator commands. What is the consequence? Those of the fraternity who have any ambition exercise it in outside studies, and save their money to invest in business for themselves. The number of telegraphers engaged in other employments that were brought into service during the strike proves this. Not until the telegraph companies offer some inducements to their operators will they be enabled to find thorough electricians to fill the posts of responsibility. Those who are fitting themselves for a professional life in pursuing a course of study in their leisure hours, have no time for electrical matters. They are generally quiet, unassuming gentlemen, who attend to their duties in perhaps a machine-like way, because they are tired and sick of it, and therefore help to give the false impression that they too are part and parcel of "the gang." On the other hand, there is too much tendency to rank a man according to the class of work he turns out, and just because he is incapable of fast transmission or receiving, or makes a bad copy, it is too often the case that he gets the credit of being a "darned fool," especially if he has too small an opinion of his accusers to try and correct the impression. No! if the corporations really seek for excellent talent they have simply to put up the premium, and I'll warrant that proper stuff will be forthcoming.

CANDOR.

Further Introduction of the Jones Quad.—Telegraph Business between Chicago and Milwaukee.—Thieves Raiding on Chicago Telegraphers.—Personals, and a Bull.

CHICAGO, ILL., Oct. 12.

TO THE EDITOR OF THE TELEGRAPHER.

THE quadruplex of Mr. Jones, of the Western Union of this city, still continues to give satisfaction. A set has been arranged to take the place of the St. Louis main and Board of Trade duplex sets, between here and St. Louis, and will probably go into operation to-day. Telegraph business is not quite so lively as it has been, still I am told the different companies are all doing well. The Board of Trade Telegraph Company, between here and

Milwaukee, is so ably managed that it is a perfect success. The business between here and Milwaukee is simply enormous. The Western Union keeps two sets of duplex going all the time. Jones' "Quad," will come in good on that route. The old Great Western Company seems to have got a new lease of life, and is doing a good business between here and Milwaukee also; while the A. & P., like the Board of Trade Company, being a "new broom" between here and Milwaukee, of course, come in for a fair share of the business.

Some sneak thief or thieves, who made themselves acquainted with the habits of the night operators in the Western Union office (*i. e.*, leaving their coats and hats in the coat room at the west side of the operating room), slipped around through the coal furnace and battery rooms from the head of the main entrance stairs, a few nights ago, and placing themselves in position to watch the boy in charge of the coat room through an open window, watched their chance while he stepped out to get a drink at the ice cooler, and stole the two coats hanging nearest the window, which was raised, making off with them. The theft was not discovered until the boys started for lunch nearly an hour afterwards; then the boy remembered hearing steps in the battery and furnace rooms, but thinking it was the janitor or one of the chiefs, paid no attention to it, as the noise ceased shortly after he came from the water cooler.

The coats belonged to old "Jack" Riley and Sam Bracker, who recovered them in a day or two afterwards at a pawnshop, kept by a gentleman who was well enough acquainted with the boys to know the coats, who, after getting the coats from the thieves, tried to arrest them, but not being able to get a policeman soon enough, they ran away before he could get hold of them.

Mr. William Hopkins, of the Western Union repair gang here, who had his right foot severely injured by a stick of timber (with which a derrick was being built to raise a large pole) falling on it last July, has so far recovered as to resume his work and enliven the boys with his funny stories.

"Ed." Whitford, of the Western Union office of this city, has been off on a few days' vacation, and brought his wife and baby back from Michigan with him. "Ed." says it's lots of fun to travel with a woman and baby and look after their baggage. After he got the baby carriage, one valise, and a Saratoga trunk checked, he *only* had the following few things to take care of: three baskets, one carpet bag, one crock of butter and two pots of flowers, besides his cane and overcoat. Mr. L. L. Childs and the renowned traveller, "Charlie" Patch, are the latest acquisitions to the Western Union "sub gang." Here's a bovine which we must charge to one of the Western Union "ops.": "Geo. L. Oarrinop, Bowling Green, N. Y., for Geo. L. Carey, No. 6 Bowling Green, N. Y."

The following conversation in the street elevator entrance to the Western Union office a few mornings ago, serves to elucidate how the pure and beautiful idea conveyed by our purer and more beautiful English may be perverted: 1st Messenger Boy—"Had a route this morning?" 2d Messenger Boy—"No, I had 'er out last night."

OCCASIONAL.

Pugilistic Telegraphers.—The Chicago Office Correspondents.—Personals.

CHICAGO, ILL., Oct. 18.

TO THE EDITOR OF THE TELEGRAPHER.

SOME of the boys are getting pugilistic and I shall have to advertise them if they don't let up. "Fair Play" kind o' stirs up "Harkaway," and draws his thread through "Beeswax" as if he meant to take enough along to keep the thread of his discourse from getting tangled. Well, the majority of the boys say it's all true as Gospel. 'Tain't none of my funeral, one way or the other, but let's have facts, boys—facts without any dressing on them.

Armstrong (old Dad) is becoming quite a billiard player, but he gives the boys too much discount. Tom Weller and McRobie are "bosses," too. Jake Tollman is "bustin'" all the faro banks, just like he did the Bank of California. Merveise is over in the hospital corner now, working the "Bx" local. Lester is on 1st N. Y. duplex again with Mereness. Tatge, the lady killer, is on the "W" local, and Minor, "Gm.," works the Burlington and Keokuk wire. Fisher hugs the Buffalo Dock. "Cord" has had a sick spell in the family but is back again with us. Miss L. Veazey is on the Fort Wayne and Eph Martin floats. Lawson is on the new Cedar Rapids, Clinton and Boone wire. Mr. Solder is our new metropolitan operator. Charlie Patch just stayed here long enough to smile on us, worked two days extra, then hid himself away to the sunny South—New Orleans being the objective point in the

WESTERN UNION.

A Detroit, who has taken a great interest in the fate of Donaldson, thinks that balloonists should have a telegraph attachment to the car, so that in case of any fatal accident they could at once inform the anxious public.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, NOVEMBER 6, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5503.) 38 VESEY ST., New York.

INDEX TO ADVERTISING PAGES.

Table listing advertising pages for various companies like American Fire Alarm and Police Telegraph, Am. Compound Telegraph Wire Co., etc.

THE TELEGRAPHER MAY BE HAD at the news stand in the Receiving Office of the Western Union Telegraph Company, corner of Broadway and Dey street, where it is regularly on sale.

The National Telegraph Company and its Proposed Connection with the Post-office Department.

OUR correspondent, "D. H. C.," replies in our correspondence columns at some length to our remarks in the last number of THE TELEGRAPHER, in depreciation of a proposed connection of the National Telegraph Company of San Francisco with the Post-office department.

While we concede the force of his argument, yet we fail to be convinced of the propriety of the proposed connection of a private enterprise with a leading department of the Government.

He proposed to use the offices and machinery and personnel of the postal department to receive, transmit and distribute the messages for his company, for which the Government was to retain a certain proportion of the receipts.

The primary object of all telegraph companies is, or should be, to make money for its stockholders. It is a question, then, whether this profit shall be derived from legitimate charges for the business or from a contribution in some shape from the National Treasury.

It inevitably follows that any telegraph company that shall secure such aid from the Government will crush out and destroy all competitors. Thus a telegraph monopoly will be established, and this is what, in the interests of the public and telegraphic employes, it has been one of the objects of THE TELEGRAPHER to prevent.

Undoubtedly the late Postmaster General CRESSWELL favored the scheme proposed in connection with automatic telegraphy in 1870. He was also fanatically in favor of a Government ownership of the telegraphs of the country, and made it the pet measure of his administration of the Post-office Department.

Any such arrangement as that proposed by the National Telegraph Company or Mr. HUBBARD leads inevitably and eventually to the assumption by the Government, in connection with, and as a part of the Post-office Department, of the ownership and control of the telegraphs of the country.

If the National Telegraph Company or any other telegraph company or combination can, by the adoption of improved methods of working, or by more economical management, reduce the cost of telegraphic facilities so as to reduce the charges for telegraphic service, that is a proper and legitimate method of competition, and its competitors must succumb to the operation of business principles, unless they can likewise effect similar advantageous and economical arrangements.

The result of the postal telegraph experiment in Great Britain, as well as in other European countries, has shown that Governments cannot perform telegraph service satisfactorily to the public except by taxing those who do not use the telegraph to make up the pecuniary deficiency.

If the promoters of the National Telegraph Company

of San Francisco depend upon Congressional legislation for the realization of their schemes, we do not think we shall soon see their promised telegraph system in operation.

We do not say this from any antagonism to that company. On the contrary, it has our best wishes for the establishment of its lines and complete success, practical and pecuniary; but, in our opinion, the sooner its managers and promoters eliminate from their plans and calculations anticipated special legislation in their favor, the sooner will they realize the accomplishment of their legitimate purposes.

The Telegraphers' Mutual Benevolent Association.

WE would again remind our readers of the Annual Meeting of the Telegraphers' Mutual Benefit Association, which will take place at the Western Union Telegraph office in this city on the 10th instant.

During the year there have been but eight deaths—a very small percentage—and it is one of the cheapest forms of life insurance known. A surplus fund of \$7,000 has accumulated in the treasurer's hands, so that the amount payable at the death of a member, which is limited to \$1,000, is available without waiting for collections of dues in each case.

It is hoped that the members of the Association resident in this vicinity will make it a point to be present, and that large delegations from abroad will also attend.

Through this Association telegraphers can make provision for those dependent upon them for support, in case they should be taken away, which will greatly mitigate the distress which, under the most favorable circumstances, must result from such an event, and relieve them, until they have time to make the necessary arrangements for future support, from the pecuniary necessities which are apt to press so heavily upon the bereaved.

We heartily commend this Association to all telegraphers. Its membership should be reckoned by thousands instead of hundreds. We are all liable to be suddenly called away from life, and it will relieve us of much anxiety if we are assured that those we leave behind, when deprived of our care and labor, will not suffer, as they must, unless some adequate provision be made for them.

New Advertisement of Mr. Charles T. Chester.

THE new and extended advertisement of Mr. CHARLES T. CHESTER, of No. 104 Centre street, which will be found in our advertising columns, is worthy the special attention of all who may have occasion to purchase any description of electrical or telegraphic apparatus.

As will be seen from the advertisement, in addition to the regular telegraphic apparatus and supplies many specialties may be found at CHESTER'S, such as Dials and Printing Telegraph Instruments, for private and municipal lines, which are patented, and which contain many valuable features and improvements; Electro-Mechanical Gong Strikers, for Railway Signals and Fire Alarm purposes; Non-interference Street Box, for fire alarm purposes, etc.

In fact we have not space to call attention, as we would

like to do, to all the novel and useful articles offered, and would advise those intending to purchase to call at 104 Centre street, or send for a circular, which contains full descriptions and prices.

Webfoot Surprised.

Mr. W. B. RICE, of Albany, Oregon, who is well and favorably known to the readers of THE TELEGRAPHER as WEBFOOT, has again been surprised. We say "again," because he was once before surprised at reading his obituary in THE TELEGRAPHER some years before he was prepared to "shuffle off this mortal coil," some graceless rascal having imposed upon us with a false report of his decease. This time the surprise was of a more pleasant character. We copy the following account of the complimentary affair from the Albany, Oregon, *Daily Morning Call*, of Oct. 20th.

We would say here that WEBFOOT fully deserves the esteem and popularity which he enjoys with the Oregon and California members of the fraternity, and we hope he may enjoy it for many years to come.

"The numerous friends of W. B. Rice, the chief lighting manipulator, gave him a surprise party last Monday evening at the residence of Dr. Rice. Billy came very near spoiling a good thing by putting in an appearance on the noon train, he having been at Salem all the week, and was not expected home until the evening express train came in, and in order to carry out the programme, the Doctor had to take a buggy and hustle Billy off up to Corvallis, under the pretence of going on a professional tour. Billy says he could not for the life of him think why the Doctor wanted him to go with him to Corvallis. They returned in the evening and the surprise was a success. Music and singing and a sumptuous supper was the order of amusements. It was quite late before the surprisers adjourned, having spent a glorious evening. We regret our inability to be present."

Gamewell & Co. Capture Another City.

MESSRS. GAMESWELL & Co. have just finished the introduction of their system of Fire Alarm Telegraph in the City of Newport, R. I. The system has been fully tested by the municipal authorities and accepted, and is now in full operation.

There has been great opposition on the part of some of the citizens of Newport to the introduction of the Fire Alarm Telegraph on account of the expense, but although so recently established the opposition is completely done away with, and it would require a large amount of money to induce even the former opponents to agree to a removal of the new Fire Alarm Telegraph system.

The Telegraphers' Ball.

THE attention of our readers is called to the notice from the President of the New York Ball Association, which will be found in our advertising columns. It is intended to make this the most enjoyable and successful social entertainment which has as yet taken place in this city. A full attendance of the members of the Association is desired at the meeting to be held in the auditor's office of the Western Union Telegraph Company (fifth story of the Western Union building), on Monday evening, the 15th instant, in order that the necessary arrangements may be perfected.

Personals.

Mr. ROBERT IRWIN has been transferred from the St. Louis, Mo., to the Galveston, Texas, Western Union office.

Mr. JOHN F. STANSIFER, of St. Louis, Mo., has been appointed to a position in the Dallas, Texas, Western Union office.

Mr. JOHN C. HANCHETT, a well known telegrapher of St. Louis, Mo., has been appointed night manager of the Omaha, Neb., Atlantic and Pacific office.

Mr. C. E. RIEHLE, of the Terre Haute, Ind., Western Union office, has resigned, and accepted a position on the night force with the same company at St. Louis, Mo.

Mr. FRANK FARLEY has been appointed to a position in the Shreveport, La., Western Union office, *vice* JOHNNY MORRIS, resigned.

Mr. WILBUR H. NORTHWAY, of the St. Louis, Mo., Western Union office, has resigned.

Mr. EDWARD L. PARMELEE, of the St. Louis, Mo., Western Union office, who, accompanied by his wife, has been visiting at Havana, Ill., for the past two weeks, has returned to St. Louis, much improved by his brief vacation.

Mr. JNO. MORRIS, of Shreveport, La., has been appointed to a position in the St. Louis, Mo., Western Union office.

Mr. HENRY LUCKING, of the St. Louis, Mo., Western Union office, has been appointed manager of the Cape Girardeau, Mo., office of the same company.

Mr. A. G. FOX has been reappointed manager of the Atlantic and Pacific office at Auburn, N. Y., which position he resigned about a year since to engage in other business.

Mr. CHARLES L. ROGERS, manager of the Montreal wires at Utica, N. Y., has resigned that position and accepted a situation with the American Screw Co., at Providence, R. I.

Mr. FRANK NICHOLSON has been appointed manager of the Montreal wires in Utica, N. Y., office, *vice* Mr. CHAS. L. ROGERS, resigned.

Mr. F. D. FARRINGTON, has been appointed night inspector of the American District Telegraph Company in this city.

Mr. W. H. SMITH has been appointed battery man for the American District Telegraph Company in this city.

The Telegraph.

The Direct United States Cable Recovered.

THE steamship Faraday, whose departure from London for the purpose of repairing the Direct United States cable was duly reported in THE TELEGRAPHER, reached the location of the break in the cable and on Sunday last, recovered the eastern end and buoyed it, and on Monday the western end, which was also buoyed. The cable on both sides of the break was found to be in good condition. It was expected to have got the cable in working order again by Wednesday last, but a heavy northeast gale accompanied by flurries of snow came on, which prevented splicing on that day.

The cable was successfully repaired on Thursday morning. It was found after fifteen months' submergence in absolutely as perfect condition as when manufactured. The break, which was found in 70 fathoms of water, was apparently caused by either an anchor or a grapnel.

The Atlantic and Pacific Telegraph Company.

THE work of fitting up the new offices of the Atlantic and Pacific Telegraph Company at 145 Broadway has been pushed vigorously forward. The executive offices were removed to their new location on Saturday and Sunday last, and are getting fixed up in good shape for business. The Receiving, Operating and Delivery Departments are expected to be ready for occupancy to-day. The arrangement of all the offices is most convenient for the transaction promptly, easily and satisfactorily, of the business of the company.

The new line from Pittsburg, Pa., to Columbus, Ohio, is being vigorously carried forward, and is expected to be completed about the first of December.

A cable has been laid across the river at St. Louis, to be used temporarily to establish connection with that city direct, until the right to use the bridge for crossing the wires of the company can be enforced.

American District Telegraph Company.

THE American District Telegraph Company, on Saturday, Sunday and Monday last, preceding the election on Tuesday, assorted and delivered, in addition to their regular business, and without an increase of the messenger force usually employed, 300,000 unaddressed and 45,000 addressed circulars. A contract has been entered into by the company for delivering one million cards on New Year's day in this city, and negotiations are pending for the delivery of a large number in Newark, Elizabeth and Paterson, N. J., and other suburban cities.

The office of Assistant Superintendent of the American District Telegraph Co. has been abolished, and the duties heretofore pertaining to that office will hereafter devolve upon the Superintendent.

The work of connecting the instruments of the American District Telegraph Company in this city has been contracted for with Mr. C. H. DuBois, at a fixed rate per instrument.

Foreign Telegraphic Notes.

THE traffic receipts of the Submarine Telegraph Company for the month of September, 1875, amounted to £10,014, and for the corresponding month of the preceding year to £9,682, showing an increase of £332.

The Eastern Telegraph Company, in connection with the Eastern Extension, Australasia and China and Brazilian Submarine Telegraph Companies, state, in their circular for the month of September last the latest dates of messages received in London from India, China, Australia, etc., by the direct cable route of the Associated Companies, which continued working with uniform speed and efficiency, that the average time the messages occupied in transit had been from Calcutta seventy minutes, and from Bombay fifty-five minutes. The Eastern Extension Company's Cable between Singapore and Batavia had been restored, having been interrupted for repairs during the first half of the month. The Indian Government lines between Ahmedabad and Deesa were swept away by floods, and all communication with India and the East (excepting to Kurrachee) by the land route was in consequence interrupted from the 20th to the 28th of September, between which dates the whole of the Indian traffic passed over this company's lines.

Since the nomination of Yaver Pacha as Director of the Telegraph and Postal Department of Turkey, and Mr. Scudamore's arrival at Constantinople, the postal and telegraphic administrations have displayed great activity.

A new telegraph code has been compiled by Mr. Geo. Ager, LL.D., for the use of bankers, merchants and ship owners. The code is written in accordance with the St. Petersburg Telegraph Convention, each code word not exceeding eight letters, and is intended for use privately as well as publicly; also providing a method for insuring the correctness of a message.

A curious statistical table has been drawn up in France showing the distribution of letters and telegrams per head in different countries. Switzerland is first in both classes, the telegrams averaging eight for every 100 inhabitants; in France there are twenty-three letters to every 100 inhabitants; in England 20 1-12th, and in the United States nineteen. In England there are fifty-four telegrams for every 100 inhabitants, in Holland fifty-one, in Belgium forty-seven, in the United States thirty-two, in Germany thirty-one. France ranks tenth, and Russia last, with one.

The Western and Brazilian Telegraph Company (Limited) have received the following telegram: "Communication between Santos and Santa Catharina restored. Test perfect." This again gives direct communication with Monte Video, Buenos Ayres, and the West Coast of South America.

The liquidator of the Panama and South Pacific Telegraph Company announces that, all the moneys owing to the company having been collected, he is enabled to declare a further return of 15s. 9d. per share to those shareholders who have paid up £2 10s. per share, and a return of 7s. 2d. per share to those who have paid only £1 per share, being the proportion due to them after deducting interest at the rate of 5 per cent. on the allotment money due the 31st January, 1870, not paid by them.

Telegraphic and Electrical Brevities.

THE *Portchester* (N. Y.) *Journal* says: "The Franklin Telegraph Co., at their office, next to the *Journal* office, have more than doubled their business in this village since Mr. Geo. Fowler was appointed operator, and the office removed from King street.

An Associated Press despatch from Key West, Florida, dated Nov. 1st, states that the Western Union cable steamer, Professor Morse, sailed that morning for New York, having completed laying the new cable between Key West and Punta Rasa and repaired and restored the second cable. This restores telegraphic communication by duplicate cable with Havana and other West India Islands, and with the South American telegraph systems through the new cable from Demerara to Para, and from Para to Pernambuco, connecting with established lines to Rio Janeiro, Montevideo and Valparaiso.

Oregon Indians Opposed to Telegraphs on their Reservations.

SEVERAL times mention has been made of the opposition of the Indians at the Umatilla reservation to the work of opening a road and building a line of telegraph through the grounds included in the limits of the reservation. The line has been completed as far as Baker City, and in constructing it through to Walla Walla it is found necessary to cross the lines of the reservation. For some reason the Indians are bitterly opposed to the work going forward, on the ground that they regard it as an encroachment. Justly considering the maguotic telegraph one of

the most potent levers of civilization, these noble red men of the primeval forest think they have seen quite enough of American civilization to suit them. They, therefore, have arrayed themselves in direct and open hostility, and declare not a pole shall be planted or a wire stretched across the *illike* donated them by Uncle Sam. When trouble was at first menaced, the department at Washington was notified of the opposition of the Indians. Orders were forwarded at once authorizing the construction of the line, as proposed, through the reservation lands. But it appears from recent events that the "Lo's" are up in arms, and do not propose to regard the instructions given by the Government. The following despatch, received here yesterday from Walla Walla, will serve to indicate the spirit of resistance among the Indians:

"L. McManis, who is just in from Weston, reports that the Indians, to the number of 30 or 40, armed, came to the camp of the men engaged in building the new road and telegraph line over the Blue Mountains last night, and drove them off, threatening to kill them unless they left at once, which they did, having no arms with which to defend themselves, and leaving all their tools and provisions."

Immediately on receipt of the telegram, Mr. Platt Burr, Superintendent of Construction, who is now in this city, went to the headquarters of the Department of Columbia, and apprised Col. H. Clay Wood, who is acting temporarily as commander of the department during the absence of Gen. Howard, who is now at the Dalles, *en route* for Portland, and the latter was notified by telegraph of the condition of things. He sent a despatch at once to Col. Elmer Otis, who has charge of the troops at Walla Walla, authorizing that officer to protect the men engaged in opening the road and building the line from the threatened attack, at all hazards. This may be regarded as the termination of the anticipated difficulty, as the Indians will scarcely have the hardihood to openly resist the military power of the Government.—Albany, Oregon, *Daily Morning Call*.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address P. L. POPE, Elizabeth, N. J.

For the week ended Oct. 5, 1875, and bearing that date.

168,385.—DUPLIX TELEGRAPHS.—Thomas A. Edison, Newark, N. J. [Filed Jan. 26, 1875.]

In "bridge system" uses in the artificial line additional helix 14 and resistance 12, to more perfectly balance static discharge of line.

The electro-magnets *h* and *l*, placed in the bridge circuit between the sending instrument and the line and artificial lines, respectively, in combination with the second artificial line 12 13 and the helices 14 around the cores of the electro magnet *l*, for the purposes set forth.

168,451.—INDUCTION COILS.—J. R. Chislett, Plymouth, England. [Filed July 14, 1875.]

For regulating, in conjunction with the soft iron core, the strength of current.

1. The combination of the conical spiral electro-magnetic coil D, constructed as described, with the soft iron core E, substantially as described and shown.
2. The combination of the conical spiral electro-magnetic coil D, constructed as described, with the soft iron core E and the graduated scale, substantially as described and shown.

168,465.—SOLUTIONS FOR CHEMICAL TELEGRAPHS. Thos. A. Edison, Newark, N. J., assignor to himself and Geo. Harrington, Washington, D. C. [Filed Jan. 15, 1875.]

Treats aniline solution with nitric acid till nearly colorless. Uses tin stylus. Oxygen evolved at stylus point forms protoxide of tin, which reduces the aniline to its original state while the current is passing.

A chemical solution for telegraphic paper containing aniline in a colorless, or nearly colorless condition, substantially as set forth, in order that the mark may be made by electrolysis, as specified.

168,470.—CIRCUIT CLOSERS FOR ELECTRICAL BURGLAR ALARMS.—Lewis Finch, Brooklyn, N. Y. [Filed Nov. 19, 1874.]

Two circuit closers arranged, as shown, in a frame, the movement of either sash closing the circuit.

In combination with the pivoted circuit openers and closers I, having the cam levers *g*, and wings *h*, the springs *k*, and the elastic tongue *K*, and all arranged within the box frame H, having openings on opposite sides for the outward movement of the cam levers, as herein shown and described.

168,548.—ELECTRICAL MARINE ENGINE GOVERNORS.—Christopher C. Wolcott, Washington, D. C. [Filed Sept. 7, 1875.]

Making and breaking an electric current, due to motion of vessel, controls the force operating the throttle valve of engine. The motion of vessel brings the mercury in the receptacle *m* in contact with the screw *f*, thus making circuit, and bringing the armature *J* in contact with the magnets. The armature draws back the rod *G*, steam is admitted to the rear of the piston, and the arm *a* closes throttle to prevent "racing" of engine. Upon receding of the mercury from screw *f*, the circuit is broken, armature released, and the piston returns to its original position.

1. A marine governor, in which the making and breaking of an electric circuit, due to the motion of the vessel, is made to control the force applied to operate the throttle valve, substantially as set forth.
2. As a medium through which the motion of the vessel is caused to make and break an electric circuit, the receptacle *M* containing a supply of mercury, and having adjustable attachments, *e* and *f*, for receiving the wires.
3. In combination with a throttle valve of a steam engine a steam, air, or other engine for operating the valve of the said engine, all substantially as specified.
4. A cut-off motion, in which the making and breaking of electric circuit, due to the engine, is made to control the force applied to operate the cut-off valve, substantially as set forth.

For the week ended Oct. 12, 1875, and bearing that date.

168,560.—MAGNETO-ELECTRIC MACHINES.—Louis Drescher, New York, N. Y. [Filed Oct. 13, 1874.]

Utilizes the secondary or "extra" current produced at the momentary interruptions of the primary induced current. Adjusts the commutator cams about the axis of the helix, thus altering the position with relation to the poles, the electro-magnet, and varying the intensity of the current.

1. Segmental commutator cams *u v*, embracing arcs of different degrees, combined with the helix *r*, tangential insulated springs *G G'*, and electrical conductor *C' d'*, of a magneto-electric machine, substantially as and for the purpose herein set forth.
2. In a magneto-electric machine, constructed substantially as herein described, wherein a primary circuit may be established at will between the opposite poles of the helix, through the commutator cams, their springs, and a conducting medium between the springs, the combination of electrodes, the one connected directly with one of the cams independently of the springs, and the other with any given point of the aforesaid primary circuit, whereby a second circuit may be established, which shall be automatically closed at each semi-revolution of the helix, at the moment the primary circuit is opened, all substantially as and for the purpose herein set forth.
3. In a magneto-electric machine, constructed with a revolving helix, the combination of the commutator cams which open and close automatically the circuit induced in the coil, with a collar encircling the shaft or arbor of the helix, substantially as and for the purpose herein set forth.
4. A magneto-electric machine, constructed substantially as herein described, to deliver both primary and secondary electric currents from the same helix, in manner as herein set forth.

Born.

McMICKING.—At Victoria, B. C., August 19, 1875, to the wife of R. B. McMicking, Superintendent B. C. Telegraph, a son of 12 pounds weight.

Married.

JACKSON—BALDWIN.—In East Orange, N. J., on the 14th ult., at the residence of the bride's father, by Rev. Dr. Hadden, Mr. CHARLES A. JACKSON, of Chicago, Ill., to Miss LILLIE M. BALDWIN, daughter of Mr. A. J. Baldwin.

THE TELEGRAPHERS' BALL.

A very important and general meeting of the subscribers to the "TELEGRAPHERS' BALL FUND" will be held in the Auditor's Office (5th floor), Western Union Building, on MONDAY EVENING, November 15th, at 5.30 P. M.

The assessment comes due on that night, and as we propose having the invitations out by the first of December, each subscriber will see the necessity of their paying up. We also desire to submit a report of the action of the Committee of Arrangements thus far.

A full attendance, either in person or by proxy, is therefore earnestly requested.

Any subscriber unable to attend this meeting will please remit to J. H. LYMAN, Financial Secretary, 197 Broadway, on or before the above date.

D. W. McANEENY, Pres't. N. Y. T. B. A.
New York, Oct. 29th, 1875.

THE LECLANCHÉ BATTERY.

THE WORLD RENOWNED
Open Circuit Battery.

NO ACIDS!
NO SULPHATE OF COPPER!
DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED to Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHÉ BATTERY COMPANY,
No. 40 West 18th Street, or
L. G. TILLOTSON & CO., Sole Agents,
8 Day Street, New York.

BRADLEY'S APPARATUS FOR ELECTRIC MEASUREMENT,
COMPOSED OF HIS
Tangent Galvanometer and Rheostat.
(Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING
WHEATSTONE'S BRIDGE,
Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED
NAKED WIRE HELICES,
for Electro-Magnets, wound to any given size and resistance.

Manufacturers of Telegraphic and Electrical Instruments supplied at low rates.

For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

SIEMENS' UNIVERSAL GALVANOMETER

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,

22 SOUTH TWENTY-FIRST ST.,

PHILADELPHIA.

TO ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystallizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

No. 1 Cell, - - - \$5.00.
No. 2 " - - - 10.00.

L. BASTET,

619 Broadway, New York.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of **THE TELEGRAPHIC MANUAL,** by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,
 MANUFACTURER OF TELEGRAPH INSTRUMENTS,
 104 CENTRE STREET, NEW YORK.

BATTERIES of every description for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the **CHESTER PIN DIAL** (patented), designed expressly for **POLICE and LAW TELEGRAPHS**. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell cut out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,
 for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,
 for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,
CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH;
 so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,
REGISTERS, RELAYS, CALL BELLS,
 and every description of Central Office apparatus, at most reasonable prices.
Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN,"
 in which the spring takes the place of the weight, is enclosed in a metal and glass case; is noiseless in its action, and of great beauty and finish, and is specially recommended to *Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.*

ELECTRO-SURGICAL APPARATUS
 OF EVERY VARIETY AND DESCRIPTION.

HOTEL ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns: Grand Union, Saratoga; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y.; Willard's Hotel, Washington, D. C.; Galt House, Louisville, Ky.; Teft House, Buffalo; and many others. *Proprietors and keepers of Hotels most liberally deal with.*

THE "COUNTING ROOM BELL MAGNETS,"
 for communicating instantly to clerks and employés, by means of a keyboard, in any desired place.

ALSO,
BELL MAGNETS AND PUSH BUTTONS,
 for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$5.00 upwards.

Sole Agent of the
WILSON ELECTRIC GAS LIGHTING CO
 for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for
LIGHTING FACTORIES, MILLS, ETC.
 By simply pushing a button on his bench the operator lights a section of burners.
 Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

P. O. Box 2766,

104 CENTRE STREET.

JUST OUT.
 NEW AND ENLARGED EDITION OF
SMITH'S
MANUAL OF TELEGRAPHY

CONTAINING
 Complete Directions for Self-Instruction in Telegraphy,
 Instructions for Building and Operating
SHORT LINES OF TELEGRAPH,
 Diagrams showing the manner of connecting wires, batteries
 instruments, &c.
 Descriptions and cuts of all forms of telegraph instruments,
 batteries, &c.
 Cuts, descriptions and prices of the

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The **Automatic Repeater**, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The **Automatic Signal Boxes**.

Third—The **Electro-Mechanical Bell Strikers**, adapted to produce the full tone of the largest church or tower bells.

Fourth—The **Electro-Mechanical Gong Striker**, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE and RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the **UNITED STATES and CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES and the DOMINION of CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The coöperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

WESTERN ELECTRIC MAN'FG CO.

220 Kinzie Street,

CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished. It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

Private Line Outfit, complete.....\$10 00
Instrument only.....8 00
Bliss Reservoir Battery, per cell.....2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

On Quadruplex Telegraphy.

By F. L. POPE.

THE simultaneous transmission of two telegraphic communications in opposite directions upon the same wire, now known by the name of duplex telegraphy, dates back to the year 1853. The first to conceive of its possibility as well as the first to carry the conception into practical effect, was Dr. Wilhelm Gintl, Director of State Telegraphs in Vienna, Austria. He describes his method in a paper read by him before the Vienna Academy of Sciences on the 9th of June, 1853, and in July of the same year it was put in practical operation between Prague and Vienna.

In March of the following year Carl Frischen, a telegraphic engineer of Hanover, Germany, improved upon Gintl's plan, by making use of a branch current from the main battery for compensating the effect of the outgoing current upon the home relay, instead of a local current employed by Gintl. This is unquestionably the most important improvement which has been made in duplex telegraphy from the time of its original invention by Gintl down to the time of the addition of the condenser by Stearns, in 1872. Frischen used a differential relay having helices composed of two equal and opposing wires, and an artificial or rheostat line equal in resistance to the main line, substantially as they are used at this day. His first practical experiment was made between Hanover and Göttingen on the 26th of May, 1855.

The labors of Frischen, and of Siemens and Halske, of Berlin, who during the same year, independently but subsequently worked out a method almost precisely similar to Frischen's, brought the system of simultaneous transmission in opposite directions to a state of perfection which answered a very good purpose upon the comparatively short lines, and at the slow rate of transmission in vogue at that day.

The success of these ingenious inventions gave an entirely new direction to the minds of the host of enterprising electricians on the continent of Europe, and during the following year, 1855, the problem of simultaneous transmission in the same direction, which naturally suggested itself as the next step in the progress of invention, was solved with more or less success by the independent labors of Dr. J. B. Stark, of Vienna, Dr. Werner Siemens, Dr. August Kramer and A. Bernstein, of Berlin, and Dr. J. Bosscha, Jr., of Leyden; each of these inventors having published a full account of his method in the latter part of 1855 and the early part of 1856. At least two of them, Stark and Bosscha, clearly saw that the successful solution of the difficult problem of simultaneous transmission in the same direction included, as a necessary consequence, the solution of the problem of quadruple transmission also; for a knowledge of the invention of Gintl, as perfected by Frischen, was all that was needed to show that it was equally applicable either to a single or a double telegraph in one direction. In the first published description of his method, dated at Vienna, October 31, 1855, Stark concludes as follows:

"With the method of double transmission in the same direction we may also combine that of counter transmission (gegenseprechen), and hence arises the possibility of simultaneously exchanging four messages upon one wire between two stations, which will, however, hardly find any application in practice."

This is unquestionably the earliest published suggestion of what is now known as the quadruplex system.

Dr. Bosscha, in a description of his system read before the Royal Academy of Sciences of Holland, on the 27th of October, 1855, and published in their transactions, Vol. IV, p. 101, not only makes the same suggestion, but sets forth in detail a method of accomplishing the result. Having described his method of double transmission in the same direction, he says: "Now, if we wind each of the receiving relays with two wires, and divide the current at the sending station, according to the plan of Siemens and Halske (Frischen), through the two coils of the home relay in opposite directions, then it becomes practicable for both stations to transmit at the same moment,

without their own relays being affected by their own transmitted currents, and in this manner it is possible to send four signals simultaneously through one wire. This solves the problem in its largest generality."

Thus Stark and Bosscha, as early as 1855, both recognized the indisputable fact that the production of a successful method of quadruplex transmission depended solely upon the successful solution of the problem of double transmission in the same direction. If this could be accomplished, it becomes a mere matter of mechanical detail to combine with it Frischen's or any other system of counter transmission.

It has been stated that methods of double transmission in the same direction were worked out independently, but almost coincidentally, by a number of inventors during the year 1855. The ingenious and active German electricians, recognizing that the accomplishment of this result was the key to simultaneous quadruplex transmission, had diligently labored at the problem. Let us now consider the results of their labors.

In any system of simultaneous double transmission in the same direction two keys are required at the sending station, and at least four different electrical conditions of the line must be provided for, one for each of the four following cases:

1. When the first key is closed and the second key open.
2. When the second key is closed and the first key open.
3. When both keys are closed.
4. When both keys are open.

The methods of Stark, Siemens and Bernstein (No. 1), though varying in detail, were arranged upon one general principle, the four electrical conditions of the line being as follows:

1. A positive current having a strength of 1.
2. A positive current having a strength of 2.
3. A positive current having a strength of 3.
4. No current.

The methods of Bernstein (No. 2), Bosscha and Kramer, and at a later date those of Schreder (1860) and Maron (1862), were arranged upon another and better principle, as follows:

1. A positive current having a strength of 1.
2. A negative current having a strength of 1.
3. A positive (or negative) current having a strength of 2.
4. No current.

There are two serious difficulties, leaving minor ones out of consideration, which are inherent in every system of simultaneous double transmission in the same direction. In the first place, when either key is passing from its front to its rear contact, it causes a momentary interruption of the signal which is at the same time being transmitted by the other key.

Neither Stark nor Siemens suggested any means of overcoming this difficulty. Bosscha and Kramer made use of a device originally invented by Gintl,* viz., that of keeping the battery constantly in the main circuit, but shunted by the key, so that when the latter was depressed the short circuit was broken and the current flowed to line, but when raised the battery was again short-circuited. This plan effectually disposed of the difficulty in question, but was injurious in its effect upon the batteries. Bernstein, however, hit upon the method now in use, that of providing each of his keys with a spring so arranged as to close the front contact at or before the time of interrupting the rear contact. This difficulty was, therefore, effectually removed as early as 1855. The second difficulty is a still more serious one, and arises in the following manner: In the simultaneous operation of the apparatus there must, of necessity, frequently be a change from a positive to a negative condition, or *vice versa*, of the line, and of the relays or receiving instruments, consequent upon the movement of a single key; yet it is evident that the reversal of the magnetic polarity of a receiving instrument by the action of one key must interfere with a signal which is being given upon it at the same time by the action of the other key. This difficulty is met with, in some form, in every arrangement of the receiving instruments. Stark employed three neutral relays, adjusted to varying degrees of sensitiveness, in one arrangement, and two polarized and one neutral relay in another, as did also Bosscha and Kramer. Bernstein used a single relay with three armatures, of varying adjustment. Neither Stark nor Siemens suggested any method of remedying this serious defect, and, judging from his published paper on the subject, the latter evidently considered it an insurmountable one. Bosscha, Bernstein and Kramer, by making use of different modifications of the same principle—that of operating the recording instrument or sounder by the opening of a shunt circuit, as the first and last had already done with the main batteries, and by working from the rear instead of the front contact of the receiving relay—theoretically succeeded in surmounting this obstacle. Practically, however, the method of operating a register or sounder by closing and breaking a shunt is a very unsatisfactory one.

It not only exhausts the local battery with great rapidity, but the demagnetization of the iron cores takes place with far less rapidity when the battery is cut off by a shunt, even of very small resistance, than when it is completely interrupted by breaking the circuit in the usual way, and this renders it impossible to receive and record the telegraphic signals with the rapidity that is necessary in modern telegraphy.

When these methods came to be tried on lines of a length exceeding 100 or 150 miles, the interference of the static discharges was superadded to the already existing difficulties, and for these reasons the results were, on the whole, so unsatisfactory that the subject remained in abeyance for many years. The subsequent labors of Schreder, Wartmann, Maron, Schaak and Zetsche, between 1855 and 1865, though exhibiting great ingenuity and research, added little or nothing of practical value to what had already been done by the earlier inventors in the same field.

The revival of the duplex system in America, and its extensive introduction into practical use, both in this country and in Europe, resulting from the improvements of Joseph B. Stearns—notably his method of compensating the effects of the static discharge from the line by the application of the condenser, which was made known in the winter of 1871—2—once more turned the attention of electricians to the problem of simultaneous transmission in the same direction.

In a paper published in the *Philosophical Magazine* of June, 1873, Oliver Heaviside, of Newcastle-on-Tyne, England, pointed out, as Stark and Bosscha had done before him, that the invention of a system of simultaneous transmission in the same direction furnished at the same time the solution of the problem of quadruple transmission. He says: "It is theoretically possible to send any number of messages whatever simultaneously in one and the same direction upon a single wire. Now, by combination with a null duplex system it becomes obviously possible to send any number of messages in the other direction while the opposite correspondences are going on, and without interference. Thus the working capacities of telegraphic circuits may be increased indefinitely by suitable arrangements. * * * From experiments I have made I find it is not at all a difficult matter to carry on four correspondences at the same time—namely, two in each direction, and if we may suppose the growth of telegraphy will be as rapid in the future as it has been in the past, it seems not improbable that multi-telegraphy will become an established fact."

During the summer of 1874, T. A. Edison, of Newark, N. J., while engaged in conjunction with George B. Prescott, electrician of the Western Union Telegraph Company at New York, in experimenting upon Stearns's duplex apparatus, with a view of introducing certain modifications and improvements therein, devised a system of simultaneous transmission in the same direction which differed materially in principle from any of its predecessors, and which was destined to furnish the basis of the first practical solution of the curious and interesting problem of quadruplex telegraphy.

The distinguishing principle of this method consists in combining together two distinct and unlike methods of single transmission in such a manner that they may be carried on independently upon the same wire, and at the same time, without interfering with each other. One of these methods of single transmission is used principally in England, where it is known as the double current system, and the other is the single current or open circuit system, used on the continent of Europe. In the double current system the battery remains constantly in connection with the line at the sending station, its polarity being completely reversed at the beginning and at the end of every signal without breaking the circuit. The receiving relay is provided with a polarized or permanently magnetic armature, but has no adjusting spring, and its action depends solely upon the reversals of polarity upon the line, without reference to the strength of the current. In the single current system, on the other hand, the transmission is effected by closing and breaking, or increasing and decreasing the current, while the relay has a neutral or soft iron armature, provided with a retracting spring. In this system the action depends solely upon the strength of the current, its polarity being altogether a matter of indifference.

It will therefore be apparent that, by making use of these two distinct qualities of the current, viz., polarity and strength, two sets of instruments may be operated at the same time on the same wire. This method possesses, moreover, the important practical advantage that the action of each of the two receiving relays is perfectly independent. Each receiving operator controls his own relay, and can adjust it to suit himself without interfering with the other—a peculiarity that none of the former methods possessed. As soon as this method was practically worked out, it became at once obvious that any of the different methods of simultaneous transmission in opposite directions already in use might be applied to it, as Stark, Bosscha, and others had long ago pointed out, the result of which would be a practical system of quadruplex transmission. This was shortly afterwards

* Brix's Journal, II, 224.

* Brix's Journal, II, 136.

done upon the lines of the Western Union Telegraph Company between New York and Boston, a distance of 240 miles, and both the bridge and the differential system of duplex working were tried in combination with it, with excellent results. When, however, the apparatus was experimentally tested on a circuit of about 450 miles, the effects of static induction became very strongly marked, and it was found that these could be more conveniently compensated in the bridge than in the differential system. The former was, therefore, decided upon as being better suited to the usually existing conditions than the latter.

The diagram shows the quadruplex apparatus as arranged upon the bridge plan.

T_1 is a double current transmitter or pole-changer, operated by an electro-magnet, local battery e_1 , and finger key K_1 , in a manner well understood. The office of the transmitter T_1 is simply to interchange the poles of the main battery E_1 with respect to the line and ground wires, whenever the key K_1 is depressed; or, in other words, to reverse the polarity of the current upon the line by reversing the poles of battery E_1 . By the use of properly arranged spring contacts, s_1 s_2 , this is done without at any time interrupting the circuit. Thus the movements of the transmitter T_1 cannot alter the strength of the current sent out to the line, but only its polarity or direction. The second transmitter T_2 is operated by a local circuit and key K_2 in the same manner. It is connected with the battery wire 12 of the transmitter T_1 in such a way that when the key K_2 is depressed the battery E_1 is enlarged by the addition of a second battery, E_2 , of two to three times the number of cells, by means of which it is enabled to send a current to the line of three or four times the original strength, but the polarity of the current with respect to the line of course still remains as before, under control of the first transmitter T_1 .

At the other end of the line are the two receiving instruments R_1 and R_2 . R_1 is a polarized relay with a permanently magnetic armature, which is deflected in one direction by positive and in the other by negative currents, without reference to their strength. This relay consequently responds solely to the movements of key K_1 , and operates the sounder S_1 by a local circuit from battery L , in the usual manner. Relay R_2 is placed in the same main circuit, and is provided with a neutral or soft iron armature, and responds with equal readiness to currents of either polarity, provided they are strong enough to induce sufficient magnetism in its cores to overcome the tension of the opposing armature spring. The latter, however, is so adjusted that its retractile force exceeds the magnetic attraction induced by the current of the battery E_1 , but is easily overpowered by that of the current from E_1 and E_2 combined, which is three or four times as great. Therefore, the relay R_2 responds only to the movements of key K_2 and transmitter T_2 .

The same difficulty which had baffled former inventors arises, however, in this connection. When the polarity of the current upon the line is reversed, during the time in which the armature of R_2 is attracted to its poles, the armature will fall off for an instant, owing to the cessation of all attractive force at the instant when the change of polarity is actually taking place, and this would confuse the signals by false breaks if the sounder were connected in the ordinary way. By the arrangement shown in the figure, the armature of the relay R_2 makes contact on its back stop, and a second local battery, L_2 , operates the receiving sounder S_2 . Thus it will be understood that when relay R_2 attracts its armature, the local circuit of sounder S_2 will be closed by the back contact of local relay S ; but if the armature of R_2 falls off it must reach its hack contact, and remain there long enough to complete the circuit through the local relay S , and operate it before the sounder S_2 will be affected. But the interval of no magnetism in the relay R_2 , at the change of polarity, is too brief to permit its armature to remain on its back contact long enough to affect the local relay S , and

through the agency of this ingenious device the signals from K_2 are properly responded to by the movements of sounder S_2 .

By placing the two receiving instruments R and R_1 in the bridge wire of a "Wheatstone balance," according to Stearns's patent of Nov. 12, 1872, and duplicating the entire apparatus at each end of the line, the currents transmitted from either station do not affect the receiving instruments at that station. Thus in figure 1 the keys K_1 and K_2 are supposed to be at New York, and their movements are responded to only by the receiving relays R_1 and R_2 at Boston. The duplicate parts which are not lettered operate in precisely the same manner, but in the opposite direction with respect to the line.

In applying this system of quadruplex transmission upon lines of considerable length, it was found that the interval of no magnetism in the receiving relay R_2 (which, as above stated, takes place at every reversal in the polarity of the line current), was greatly lengthened by the action of the static discharge from the line, so that the contrivance of the local relay S was not sufficient to overcome the difficulties arising therefrom. A rheostat or resistance, X_1 , was therefore placed in the bridge wire with the receiving instruments, R_1 and R_2 , and shunted with a condenser c , of considerable capacity. Between the lower plate of the condenser and the junction of the bridge and earth-wire an additional electro-magnet, r , was placed, acting upon the armature lever of the relay R_2 , and in the same sense. The effect of this arrangement is, that when the current of one polarity ceases the condenser c immediately discharges through the magnet r , which acts upon the armature lever of relay R_2 , and retains it in position for a brief time before the current of the

transmission in opposite directions was for the first time rendered practicable upon long lines by the combination therewith of the condenser, the first step was accomplished. It now only remained to invent an equally successful method of simultaneous transmission in the same direction, which, as we have seen, was done in 1874. The application of one or more of the existing duplex combinations to the new invention to form a quadruplex apparatus followed as a matter of course.

Thus it is clear that the merit of the invention of 1874 consists in its having furnished us with a new, and what is more important, a practical method of simultaneous transmission in the same direction, applicable to long lines, and not in the mere application thereto of one or more of the known duplex systems, to form a quadruplex, which in itself would no more constitute an invention, in the sense contemplated by the patent law, than would the application of the duplex principle to the printing or dial instrument instead of the Morse, with which it was first used.

As its uses become more and more extended, the quadruplex is constantly undergoing modification and improvement in its minor details, with a view to render its manipulation more simple and easy, and to enable it to be worked direct between the most widely separated points with the utmost speed and certainty. Some of these modifications are very ingenious and interesting, and will probably form the subject of a future article.

D'Infreville's Duplex Telegraph.

BY HUGH NELSON.

THOUGH the duplex invention has lately been rather

thrown in the shade by its "big brother," the quadruplex, it still remains, and, for a year or two at least, is likely to remain the most reliable means of working off business between large cities, especially when such cities are more than 250 miles apart. If an ordinary Morse circuit between two large cities can carry 350 messages a day, on which the company make a profit, an arrangement by which the capacity is increased to 700 must of necessity give two profits, while the capital has not been increased except by the extra cost of instruments, which, in comparison with the cost of construction and maintenance of another wire, it is not

NEW YORK.

LINE

BOSTON

opposite polarity arrives, and thus serves to bridge over the interval of no magnetism between the currents of opposite polarity.

It will be seen that the combination of transmitted currents in this method differs materially from any of those used in previous inventions. They are as follows:

1. When the first key is closed and the second open..... - 1
2. When the second key is closed and the first open..... + 3 or + 4
3. When both keys are closed.... - 3 or - 4
4. When both keys are open..... + 1

Here we discover another very important practical advantage in the system under consideration, which is due to the fact that the difference or working margin between the strength of current required to produce signals upon the polarized relay and upon the neutral relay respectively may be increased to any extent which circumstances render desirable. Within certain limits, the greater this difference the better the practical results, for the reason that the range of adjustment of the neutral relay increases directly in proportion to the margin. The ratio of the respective currents has been gradually increased from 1 to 2 to as high as 1 to 4, with a corresponding improvement in the practical operation of the apparatus.

From what has been said, therefore, it will be seen that before it became possible to produce a quadruplex apparatus capable of being worked at a commercial rate of speed upon long lines, it was essential that its component parts should have arrived at a certain stage of development. When, in the early part of 1872, simultaneous

necessary to take into account.

There are at present working successfully in this country five different systems of duplex: 1st and 2d, the differential and bridge systems of Mr. Stearns; 3d, the polarized relay system of Mr. Haskins; 4th, the system of Mr. D'Infreville; and 5th, Mr. Gerritt Smith's arrangement, lately described in THE TELEGRAPHER. The systems of Mr. Stearns have also been described in THE TELEGRAPHER and other papers. No description, however, has appeared of Messrs. Haskins and D'Infreville's inventions. The former arrangement is working very successfully on the North Western Company's lines between Milwaukee and St. Paul. I hope Mr. Haskins will soon give the fraternity a description of it through your columns. No one can do it better.

All the foregoing systems, except the D'Infreville, use condensers for counteracting the effect of the return current. In Mr. D'Infreville's system condensers are not necessary, the current of charge and discharge being rendered harmless by an arrangement of electro-magnets. Messrs. D'Infreville and Haskins also dispense with transmitters, only ordinary keys being used in their arrangements. The D'Infreville requires no instruments (with the exception of rheostats) which cannot be found in every telegraph office.

In the description of Gerritt's Smith's duplex arrangement, given in THE TELEGRAPHER and Journal of the Telegraph a few weeks ago, it is stated that in this, as in all other systems of duplex, it makes no difference whether the batteries at each end are placed with similar or dissimilar poles to the line. The writer of the article cannot be acquainted with the D'Infreville system or he

would not have written the foregoing. In the D'Infeville system the batteries *must* oppose each other, and, if I am not mistaken, I think that in Mr. Haskins' system they *must not* oppose, but be placed in same way as in an ordinary Morse circuit.

In both of Mr. Stearns' systems, and I should suppose in Mr. Haskins' also, it is possible to work other lines from the batteries used for the duplex. I understand, however, this is not generally done. In the D'Infeville system this cannot be done with advantage, and I think the same remark will apply to Mr. Smith's arrangement.

In these days, however, of sulphate of copper batteries, this cannot be considered a very serious objection. In the diagram two stations are shown arranged for duplex on Mr. D'Infeville's plan. The line is 7,500 ohms resistance.

A A' and B B' are ordinary relays of 200 ohms resistance.

E E' are ordinary Morse keys, with the circuit closer removed.

D D' are main batteries, of equal strength, with similar poles to line. The current from each battery passes through receiving relays A A' to the line, only a very small portion of it going through the shunts formed by the rheostats and recording relays. Of course, as the batteries oppose each other, both receiving relays remain open. By depressing key E we close relay A'. The current from battery D is now short circuited through recording relay B and rheostat C, 300. The current from battery D' coming over the line also takes the same route to the ground, and relay A' at once closes. Relay A, however, remains open, owing to the current coming from battery D', meeting with a sufficient quantity of current from battery D (which leaks past the point F) to balance it. This balance is obtained by varying the resistance in rheostat C, marked 300, so that when key E is closed (the key at the other end being open) the armature of relay A does not move. Relay A' being thus closed, let us see how relay A can be closed from the other end of the line. We close key E', battery D' being thus short circuited, the current, which before went over the line to preserve the balance at relay A is cut off, and the small portion of current which leaked past point F now goes on to point H, and thence through rheostat C, 5,000, and key E, to the ground, and relay A closes. Relay A', which had already been closed, is kept so by the leakage current, which acts same way as at the other end. It is thus shown that no matter in what position the keys may be, the relays are always ready to respond to the writing from the other end.

The return current is neutralized by the recording relays B B' as follows: When the line is at rest it is charged with a current of the same polarity from each battery. When the key at either end is closed the current in the line would, in discharging through the receiving relay, make a false signal; at the same instant, however, the recording relay, through which a strong current is passing, sends out an inductive current, which, running in an opposite direction to the current that produced it, meets and effectually kills the discharge current. On raising either key the line is again charged, and this current is again neutralized by the current given out by recording relay on being demagnetized. The strength of these inductive currents can easily be varied to suit any line or condition of line, by using relays of different resistances and size of core. The arrangement shown in the diagram has been working between Toronto and Montreal, on the Dominion Telegraph Company's lines, a distance of nearly 400 miles, for the last year, and is giving good satisfaction. One hundred and forty cups, of ordinary sized gravity battery, is used at each end.

The New Offices of the Atlantic and Pacific Telegraph Company.—No. 145 Broadway, New York, again a Telegraphic Centre.

AS was announced in THE TELEGRAPHER some time since, the Atlantic and Pacific Telegraph Company has leased and fitted up for its main and executive offices in this city a portion of the building at No. 145 Broadway, and of the building adjoining, so long occupied by the Western Union Telegraph Company as its headquarters. The corner of Broadway and Liberty street is historical telegraphically, and it is fitting that after having been remodelled and furnished with all modern conveniences and facilities it should again be occupied for telegraphic purposes.

The premises heretofore occupied by the Atlantic and Pacific Telegraph Company at 198 Broadway were very poorly adapted to telegraphic purposes. The receiving and a portion of the executive offices were in the base-

ment, which was dark and very insufficiently ventilated. A part of the executive offices were located in the third story, and communication between them was difficult, and not conducive to the prompt and easy transaction of business. In fact, until the recent change the companies competing with the Western Union Company have always been badly located, and their accommodations in this city inadequate and unsuitable.

Immediately upon the accession of General T. T. Eckert to the executive management of the company he determined to secure better accommodations, and this would have been sooner accomplished but for the difficulty of securing a proper location, which should afford the necessary room and facilities for an advantageous arrangement of the several departments, and at the same time serve the customers of the company most satisfactorily, and by the severe and protracted illness which compelled a suspension of his active management of the affairs of the company for so long a time.

In the meantime, the building which had so long been the home of the Western Union Company, had been thoroughly remodelled internally; new and wide staircases and passage ways superseded the narrow and dingy ones which had formerly been in use, an elevator put in, and the rooms had been reconstructed, and the whole building, and that of the one in the rear which is connected with it, handsomely painted inside and out. It was evident to Gen. Eckert and his associates that this was just the place in every respect that was required for the future location of the headquarters of the principal competitor of the Western Union Company. A lease of the first floor fronting on Broadway, the basement, and of rooms in the rear of the main building on the second floor, was secured, and these have been fitted up in the best manner for the purposes for which they are to be occupied. The work has been done under the personal direction and supervision of General Eckert, and the result is most creditable to him. The Atlantic and Pacific Company, and especially its employes, are to be congratulated on the excellent accommodations and location

which has been obtained, and will doubtless find business steadily and rapidly increased by the change which has been made.

Upon entering the main office from Broadway a very handsomely fitted up space is seen in front of the receiving and delivery counter. For the accommodation of customers a desk is provided for writing messages, on the left of the room, where ample facilities are afforded patrons for that purpose. This desk is divided into several compartments, each being separated by a partition, so that privacy is secured to each customer.

The counter over which messages are passed, and communication with the representatives of the company had, is of elegant design and finish, and most conveniently arranged. Large plate-glass windows have been put in—the receiver's window being in the centre, the delivery window on the left and the cashier's on the right.

The room in the rear of this counter is used as the operating room, and the view from the front office is very pleasing and satisfactory. The operators can be seen busily engaged in sending and receiving messages, and the click of the sounders is rather confusing to the ear of the uninitiated, though perfectly understood by the operators.

The old familiar corner which our lamented friend, John Horner, so long occupied, is so changed that he would scarcely recognize it were he permitted to revisit the place.

Leaving the front office, let us enter the operating room. There is but one entrance for the entire staff, which is through a small anteroom in the rear of the operating room, where the doorkeeper will be placed to note the incoming of those entitled to admission, and exclude those who have no business inside. Passing through this anteroom into the operating department, the first object which attracts the attention is the handsome switch board, which has been especially made for its present location and use, on a new and especially effective plan. This switch board was designed by General Eckert, and he has introduced in it many new and useful improvements, which

greatly enhance its value, while at the same time simplifying it. This switch has a capacity for sixty wires, and as many instruments and loops as may be needed can be connected by means of it, as desired.

This switch was built by Messrs. L. G. Tillotson & Co., at their shop in Centre street, and certainly does them credit by the excellence and beauty of the work. It is a fact worthy of notice, as showing the capacity and extent of the facilities of this firm for the construction of electrical and telegraphic apparatus, that this switch was made and delivered, complete in every respect, in six and one half days. Such a job would ordinarily occupy four or five weeks' time, but it was needed in a hurry, and Tillotson & Co. were able to do the work, and do it well, too, within the brief time mentioned.

Between the switch board and the counter in the front part of the room are placed fourteen quartette tables, of what are known as the Western Union style, each table being divided into four compartments by glass partitions, and accommodating fifty-six sets of instruments. The sixteen tables in front are devoted to the city department of the company, which has grown to be a very important branch of the service. Miss Donovan is in charge of this department. The remaining forty sets of instruments are for the general business of the company. The eight sets next the switch being arranged for automatic working.

The Atlantic and Pacific are using the automatic system quite extensively and with good results. In a room in the rear of the operating room eleven punchers are in active use, and eight sets of automatic transmitters are employed. The automatic apparatus is generally used on the main routes, and enables the company to accommodate a large amount of business (nearly all the press reports being sent and received automatically), which it would be difficult to dispose of satisfactorily with its present number of wires otherwise. The managers of the company speak highly of the efficiency of the automatic system, and say that they find it more advantageous the longer it is worked. It is proposed to still further introduce the automatic system upon the lines as the increase and development of the business shall require increased capacity.

Mr. Wm. J. Dealey, who for a number of years had charge of the cable room of the Western Union Telegraph Company, is manager of the operating department, with Mr. Samuel H. Edwards as day chief operator, and Mr. Philip P. Hauff as night chief operator.

Mr. Charles S. Shriver has charge of the receiving and delivering departments.

In the sub-basement is located the delivery department, which is in charge of Mr. A. W. Smith, from whence messages are distributed by boys handsomely uniformed. As the entrances

to the basement are from the outside of the building, the boys are entirely removed from contact with the upper rooms.

The supply department is also located in the basement, and is in charge of Mr. Edward C. Cockey.

The battery room is in the rear of the delivery and supply departments.

Passing up stairs to the story above the operating room, in the rear building, we come to the rooms occupied by the executive officers of the company, comprising six in all. These rooms all communicate with each other, enabling President Eckert, who occupies the corner room, to confer as will with each of his subordinate officers.

To the left of the President's office is the office of the Treasurer, where the transfer books are kept, and where the Auditor, Mr. E. T. Mackey, may be found. The Directors' room is beyond this.

In the President's room will also be found Mr. Albert B. Chandler, the Secretary and Assistant Manager; and Mr. Alfred Nelson, the Treasurer of the Company, has a desk in this room at present.

Opening out of the President's room is the office of Mr. D. H. Bates, the General Superintendent of the Atlantic Division of the Company.

The offices of Mr. D. Doren, Superintendent of Construction and Repairs; of Mr. James G. Smith, Superintendent of the First Division; of Mr. William H. Weed, Superintendent of the Midland Division, and of Mr. Maurey Smith, Superintendent of the Metropolitan Division, will also be found located in these rooms.

These rooms have been neatly carpeted and fitted up, and furnished with all necessary conveniences for the transaction of the executive business of the company, and during business hours present a very busy appearance, which would indicate that the officials of the company do not by any means find their positions sinocures.

The offices of the American Press Association, which uses the wires of the Atlantic and Pacific Company very extensively, have also been removed to rooms in the upper story of the same building.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

The Direct Cable Again in Operation.—Reduction of the Cable Tariff.

THE fact was briefly announced in THE TELEGRAPHER last week that the Faraday had succeeded in repairing the break in the direct cable, off the Newfoundland coast, and that the cable was again in good working order.

The direct cable was reopened for business on Saturday, the sixth instant, and has been well patronized since, and is now doing a good business again. The tariff was fixed at 75 cents, gold, per word, which is 25 cents less than the rate made by the Anglo-American Company after the new cable was broken.

It is, perhaps, not to be regretted that the lower rates were temporarily established, as the result demonstrated

the fact that they were inadequate, and could only be maintained at a heavy and ruinous loss to the companies.

The changes of the tariffs are fully set forth in the advertisement of the Direct Cable Company, which will be found elsewhere in this paper.

Attempts have been made in certain quarters to disparage the new cable, on account of the difference in its construction from other Atlantic cables which have been laid. These attempts are not warranted by the facts, and arose either from a failure to understand its construction, or from a desire to disparage the enterprise without regard to the facts.

The cable was subjected to thorough and constant tests during and after its manufacture. It was thoroughly tested by Sir Wm. THOMSON, whose eminence and ability as an electrician and electrical engineer are well known, so late as Sept. 16th and 17th, with the following results: Insulation resistance of the whole cable of 2,420 knots in 2d and 3d minutes, 2 1/2 millions SIEMENS units, or 5,445 millions per knot; from 4th to 24th minute, 3 1/2 millions, or 8,470 millions per knot.

Copper resistance of whole line, 7,300 Siemens units, or 3.02 per knot.

Electrostatic capacity of whole line, 991 microfarads, or 4,095, say 41 per knot.

SIR Wm. THOMSON'S tests proved the cable to be in perfect condition as to insulation, and showed its electrostatic capacity and copper resistance to be so small as to give it a power of transmitting messages, which, for a transatlantic cable of so great length, is a very remarkable and valuable achievement.

It is to be hoped that, after the delays and misfortunes which have been experienced by the Direct Cable Company, that they have at last surmounted the difficulties which have beset the enterprise, and will now enjoy the reward of their perseverance and energy.

Duplex and Quadruplex Telegraphy.

WE print this week an article "On Quadruplex Telegraphy" from the able pen of Mr. F. L. POPE, which will be read with much interest. There has been a great desire for the publication of a full and accurate description of the quadruplex system which has been adopted and introduced by the Western Union Telegraph Company, which heretofore it has not, for reasons connected with the complications in regard to the ownership of the patents, been deemed advisable to make.

In his article Mr. POPE has given a concise, correct and complete history of duplex and quadruplex inventions, from that of GINTL to the present time, which has not heretofore been done, and has traced the development of the quadruplex from that time until it has become a practical and valuable telegraphic system.

We also print a description of the duplex invention of Mr. D'INFREVILLE, now extensively used on the lines of the Dominion Telegraph Company of Canada, prepared by Mr. HUGH NEILSON, Superintendent of that company, an electrician of much ability, under whose direction and supervision this duplex has been introduced upon the lines of that company.

Mr. D'INFREVILLE'S patent has also been purchased by the Atlantic and Pacific Telegraph Company for its lines, although we believe it has not as yet been introduced practically upon the lines of that company.

It has also been adopted by the Southern and Atlantic Telegraph Company, and is now being introduced for practical use upon its lines.

In consequence of the space occupied by these articles, we have been obliged to omit the favors of our correspondents in the present issue; but for this the great value and importance to the telegraphic interests of the duplex and quadruplex inventions will no doubt be regarded as a sufficient excuse. We shall next week give correspondents

a chance to be heard, and present their favors as rapidly as possible to our readers.

Appreciation of and Interest in The Telegrapher.

THE appreciation of the importance of THE TELEGRAPHER as an independent telegraphic journal, and interest in its success, of which we are constantly receiving assurances, are exceedingly gratifying to us. While it might make the paper more popular with a certain class of telegraphers if it were devoted more entirely to telegraphers' gossip and light reading, yet we are assured that it is much more useful and beneficial to the fraternity conducted upon the principle adopted and adhered to for several years past. Its aim is not merely to interest and amuse but also to instruct the practical telegraphers of the country, and better fit them to discharge their duties intelligently, and to occupy, satisfactorily to themselves and their employers, the more responsible and lucrative telegraphic positions.

Our corps of correspondents and contributors is the best and largest that any telegraphic publication has ever had, and additions to the number of new correspondents is made every week. We are especially proud of this department of the paper.

In its "Personal" column may be found a very complete record of the movements and location of telegraphers all over the country.

As THE TELEGRAPHER is a thoroughly independent journal, its columns are open to the fullest and freest discussion of all matters of telegraphic interest. In it every person can be heard on any telegraphic subject, it being understood that while we afford room for a general expression of opinion or statements of fact, we are responsible only for such as are editorially approved or endorsed.

While the favor with which the paper is received is most gratifying, its circulation is not as large as it should be. It has been increasing of late, but not as rapidly as could be wished. The small sum at which it is afforded brings it within the means of every telegrapher, and it should be taken and read by every telegrapher who has any regard for his profession or desire to advance in it. The season of the year has come when subscriptions should come in freely. Will not the friends of the paper, those who desire that it shall be liberally sustained, make a special effort during the next few weeks to secure additional subscribers and readers to their representative sheet? In this way they will increase the influence of the paper, and enable us to make it even more complete, satisfactory and advantageous to the fraternity. A general effort of the known friends of THE TELEGRAPHER throughout the country could easily double its circulation before the New Year. Shall we have it?

The Atlantic and Pacific Telegraph Company's New Headquarters.

THE removal of the main and executive offices of the Atlantic and Pacific Company in this city from 198 Broadway to the building so long occupied by the Western Union Company, at 145 Broadway, is in every respect an excellent change. The offices previously occupied were not in

a good location, the receiving and a portion of the executive offices were in a basement which was badly ventilated, and in which it was necessary to use gaslight most of the time, and the general appearance and arrangement was such as to give an unfavorable opinion to outsiders.

No spot could have been selected, or premises better located and arranged than those to which the offices have been transferred. The prestige which it acquired from having for so many years been the telegraphic headquarters of the country, was an important consideration. The offices are all well lighted and ventilated, and have been very handsomely and conveniently fitted up under the personal direction and supervision of President ECKERT, and reflect credit upon the company.

We are informed that the result of this change is already shown by a marked increase in the business received on the counter. We heartily congratulate all concerned on the change.

Personals.

Mr. GEORGE B. HAVENS, for the last year manager of the Western Union Telegraph office at Mingo Junction, Ohio, and Mr. GEORGE BUCKINGHAM, operator in the same office, started October 25th for Valparaiso, Chili, via New Orleans and the Isthmus. They expect to engage in telegraphy in South America.

The Telegraph.

Telegraphic and Electrical Brevities.

The best method of amalgamating zincs is said to consist in immersing the zinc in a liquid composed of nitrate of mercury and hydrochloric acid, which is prepared by dissolving one ounce of mercury in five ounces of aqua regia (nitric acid one part, hydrochloric acid three parts), and adding five ounces hydrochloric acid.

The cable steamer Mina sailed last Saturday from Halifax to repair the St. Pierre and Duxbury cable, which is broken.

Telegraphic communication with Camp Grant, Arizona Territory, by the United States military line, was established on the 9th inst.

The Western Union cable steamer Professor Morse, which recently laid the new cable between Key West and Punta Rasa, Florida, arrived at New York on Monday last, six and a half days from Key West. The new cable was successfully laid without difficulty. After laying the new cable the old one was taken up, and several miles of new cable substituted in place of the damaged sections, so that there are now two good cables in operation between Key West and Punta Rasa.

Unsuccessful Rascality of a Telegraph Operator.

At Fort Scott, Kansas, on Tuesday morning, the 9th inst., W. J. Philpot, night operator at the depot, was found lying on the floor of the ticket office with his hands tied, and gagged with a railway spike, fastened with a piece of telegraph wire. He seemed to be insensible when found, but soon after became conscious, and said that two men came into the office, struck him senseless, and then bound and gagged him. The office was robbed of all the money it contained, about \$126. Mr. Luly, the agent, charged Philpot with taking the money and binding and gagging himself, in order to deceive the public. Philpot acknowledged it, and told where the money would be found. He was arrested and lodged in jail to await examination.

Flattering Testimonial to A. Leonard Meyer, late Manager, Victoria, British Columbia, Western Union Telegraph Office.

VICTORIA, BRITISH COLUMBIA, }
October 16th, 1875. }

To A. Leonard Meyer, Esq., Manager Western Union Telegraph Co., Victoria.

We, the undersigned, learning that you are about to leave the Province, having had frequent occasion during the eighteen months you have managed the telegraph office in Victoria to transmit and receive telegraphic messages, have much pleasure in testifying to your business habits and careful attention to the duties of your office, as well as to the courtesy you have on all occasions exhibited.

While expressing our regret that you are leaving Victoria, we feel confident that your habits and character

will always command congenial and remunerative employment, and we offer you our best wishes for your future success.

- JOHN ASH,
Provincial Secretary of British Columbia.
- ROBERT BEAVEN,
Chief Commissioner of Lands and Works.
- W. J. ARMSTRONG,
Minister of Finance and Agriculture.
- W. C. WARD,
Manager Bank of British Columbia.
- ALEX. MUNRO,
Hudson Bay Company.
- HENRY RHODES & CO.,
Agents P. M. S. S. Co.
- WILLIAM CHARLES,
Hudson Bay Company.
- WELCH, RITHEB & CO.
- MOODY, NELSON & CO.
- EDGAR MARVIN,
STHALSCHMIDT & CO.
- FINDLAY, DURMAN & BRODIE.
- J. GOODFELLOW,
Manager Bank of British North America.
- TURNER, BEETON & TUNSTALL.

[We have much pleasure in giving insertion to the above.—ED. STANDARD.]—*The Daily Standard.*

Defalcation of the Cashier of the New York Office of the Western Union Telegraph Company.

It has transpired that Mr. Leonard Cox, the Cashier of the Western Union main office in this city, has appropriated to his own use some \$13,000 of the money of the Company, which has been lost in stock speculations. Of course he expected that profitable operations would enable him to replace the amount abstracted, but, as is generally the case, the losses constantly increased the deficiency. The abstraction was covered by falsification of his accounts, which was ultimately detected, and Mr. Cox made a full confession of the facts in the case.

Mr. Cox has heretofore enjoyed the fullest confidence of his superior officers, and was very popular with the public and his associates. It is not known what action will be taken by the company in the case, but it is probable that the friends of Mr. Cox will make good the amount of the deficiency.

O. S.—“Twelve minutes, five seconds!”
N. M.—“Did you break?”
O. S.—“Break? Y break? Been here goin’ on nine years and ain’t broke yet!”
N. M.—“Um, you’s a pretty good operator I guess!”
They part with mutual satisfaction.

Proceedings of the Chicago District of the Telegraphers’ Mutual Benefit Association.

ONE of the most interesting meetings the members of the Telegraphers’ Mutual Benefit Association of the Chicago district ever held, took place in the Gold and Stock Telegraph Company’s rooms on Sunday, October 31st. It was well attended, and that, too, by the representative men of the association of this district; a fact which will be plainly discernable by glancing at the names of those present in person and by proxy, as mentioned in the Secretary’s Report, a copy of which has been furnished and forwarded you for publication. The meeting throughout was noted for the spirit of cool deliberation and fairness with which all questions were discussed. The members of this district have great reason to be proud of the gentlemen they have secured as delegate and alternate delegate—Gen. Stager being well known as a man well posted in insurance matters, as well as of large experience in all branches of executive work, and of that class of business men with which a delegate would have to deal.

The alternato, Mr. F. J. Loesch, of the Western Union Book-keeping Department, of this city, is a young man of sterling integrity and a young lawyer of rare ability, and should it be necessary for him to represent the association at the coming convention, on account of Gen. Stager not being able to be present from any cause, the district would be ably represented. The following is the Secretary’s report of the business transacted at this meeting: * The meeting was called to order at 11:20 o’clock A. M.,

by unanimously requesting Mr. F. J. Loesch to act as chairman.

Mr. Lomasney declining to act as secretary, Mr. W. C. Long was elected to act in that capacity.

There were present, in person, the following members: F. W. Jones, Agent of the Chicago District of the Association; Allan C. Knapp, R. W. Chapman, E. L. Armstrong, T. O. Cord, O. W. Hamilton, D. T. Francis, E. Lomasney, C. H. Kelly, F. J. Loesch and W. C. Long. By proxy there were present: J. L. Martin, C. H. Summers, C. H. Rudd, H. W. Plum, F. N. Benson and S. G. Lynch, without special instructions; C. B. Cobb and George B. Simpson, who mentioned Gen. Anson Stager as their choice for delegate, and C. T. Whittenhall and J. M. Kelsey, who declared their preference for alternate delegate to be Mr. F. J. Loesch; all represented by Mr. F. W. Jones.

Mr. Loesch, on taking the chair, thanked the gentlemen for the honor conferred, and remarked, that as we all understood the object of this meeting principally to be an election of a delegate to represent us at the coming convention of our association in New York, and the passing of appropriate resolutions as instructions to the delegate, remarks on that point were probably unnecessary, and nominations for delegates would now be in order. Accordingly Gen. Anson Stager was nominated without opposition, and after it being explained to the members present that the general expected to be in New York on other business about the time of the holding of the annual meeting, and would take great pleasure in representing us, was unanimously elected.

Mr. F. J. Loesch was then nominated, and elected without opposition, as alternate delegate.

A motion was made that the expenses of our delegate be borne by the members of the district, *pro rata*, and that a local assessment be levied for that purpose when the amount was known.

Considerable discussion arose on this motion. Mr. Cord strenuously opposing all local assessments, as he was of the opinion that all expenses should be defrayed out of the general fund.

The Chairman made some well timed remarks, showing that it was impossible to meet such expenses out of the general fund, Messrs. Jones, Chapman, Francis and Long following with a few remarks, sustaining the motion, the former explaining that as we put nothing in the treasury for the purposes this motion was intended to provide for, we could not reasonably expect to draw any out. Mr. Cord finally withdrew his objections, and after some general remarks, in which all participated, and all agreed that there should be some provision made for such purposes by the association at New York, the motion was passed.

Mr. Jones being requested to tell us something about the status of our association, made the following statement in lieu of one recently received from Secretary Holmes:

From Nov. 11, 1874, to Oct. 22, 1875 (date of statement).	
Cash on hand Nov. 11, 1874.....	\$9,515 95
“ Rec’d for assessments.....	12,417 16
“ “ applications.....	165 00
“ “ interest on investment.....	175 00
W. U. Tel. Co.’s Gift (cash).....	1,000 00
Sale of Desk.....	15 00
Total.....	\$23,288 11

Paid out—	
To heirs deceased members.....	13,450 00
For printing.....	204 35
“ postage.....	161 76
Refunded.....	13 50
Salary.....	458 26
Due on 78 and 79.....	2,000 00
Total.....	\$16,287 87
	\$16,287 87

Reserve..... \$7,000 24
Assessments called for, 10; number of deaths, 8; number of members, 1,250.

Mr. Jones, by request of some of the members, also gave a brief history of the last annual convention, and how he arrived in New York just in time to get a western man on the executive committee, and how the south then tumbled in and got a Southern man on that committee also.

A motion was then made that our delegate be instructed to use his influence to have the present western member of the executive committee (Mr. C. H. Summers) appointed to that position again for the ensuing year. Carried unanimously.

A brisk discussion in regard to having all the members inside the territory of a district deal directly with the agent of that district, and not with the general officers at New York, and in regard to having the whole country districted, was had, which subsequently took the form of a motion as follows: “That our delegate be in-

structed as above, and also to use his influence to have the wording of the assessment notices in regard to remittances changed, so that members would neither feel it obligatory or optional to correspond direct with the general officers, and thus lighten their burdens, and, at the same time, systematize the business of the association." This motion was carried.

It was then moved "That, as we had worked so harmoniously under the present constitution, and everything seemed to be in satisfactory shape, that we instruct our delegate to oppose any material change in the constitution as it now stands, and thus save a bill of expenses for printing new constitutions." Pending this motion remarks were made by the chairman and others regarding the assigning of certificates for debt, as in an ordinary insurance policy, some holding that it could be done, others that it could not, and some were in favor of having the constitution changed so it could be made assignable. It was finally decided, however, that as long as the association had no legal existence, it was best not to complicate our simple, good, and beneficent association, as at present a member could change his heirs or his beneficiary as often as necessary. The question was accordingly called, and the motion instructing our delegate to oppose any material change in the constitution, carried unanimously. Some general remarks were then indulged in, showing the good the association had done and the cheapness at which it had been done, the members having had one thousand dollars' insurance for about eight dollars per year. Mr. Jones here took occasion to say that he was proud to be a member and an agent of such an association, and that he considered it an honor to be connected with it.

A unanimous vote of thanks was tendered Col. J. J. S. Wilson for the use of the Gold and Stock Co.'s room, when a motion to adjourn prevailing, the meeting adjourned at 12:45 P. M. FRANK J. LOESCH, Chairman. W. C. LONG, Secretary.

Quotations of Telegraph Stocks at N. Y. Stock Exchange.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Oct. 12, 1875, and bearing that date.

168,614.—ELECTRIC GAS LIGHTING APPARATUS.—Reuben Chamberlain, Hartford, Conn. [Filed May 25, 1875.]

Escapement stops vibrated by armature lever, releasing and stopping motive power for turning the cock.

1. The combination of the escapement wheel i, provided with the spurs v', with the vibratory escapement fork n n' hung on an axis at right angles to the shaft or axis of the escapement wheel, all operating substantially as shown and described.

2. The combination of the escapement wheel i, vibratory fork n n' hung on an axis at right angles to the shaft or axis of the escapement wheel, plug shaft s, gas cock r, burner u, armature lever o, electro-magnet k, and conductors w w', all operating substantially as shown and described.

For the week ended Oct. 19, 1875, and bearing that date.

168,893.—MAGNETO-ELECTRIC MACHINES. Jim Billings Fuller, Brooklyn, N. Y. [Filed July 30, 1875.]

The currents induced meet and combine at the commutator spring, pass through the external circuit to the other commutator spring, and thence back through the intermediate coils. The tapering poles are designed to prevent abrupt falling off of the magnetic force.

1. The combination of the arms a, the coils b, and the sectional commutator c, when the ends of the wire forming said coils are connected together, and to the commutator, substantially as set forth, said coils being caused to revolve between or near alternately opposite magnetic poles, developing electric waves or currents in said coils, and the currents developed being received and discharged continuously at the points in the wire forming said coils nearest said poles, or where the magnetic force is strongest.

2. The magnetic poles h, and h', having points or angles tapering toward the neutral magnetic point, substantially as and for the purpose specified.

Married.

SMITH—MARSHALL.—On Wednesday, Nov. 3d, 1875, at the M. E. Church, Mechanicville, by the Rev. W. M. Wicker, WILLIAM J. SMITH, Manager Western Union Telegraph Office at East Albany, N. Y., to BLANCH M. MARSHALL, daughter of the late Allen C. Marshall, of Mechanicville, N. Y.

THE DIRECT UNITED STATES CABLE COMPANY,

16 BROAD STREET,

NEW YORK, Nov. 6, 1875.

This Company's Cable is now repaired and open for business. The following is the new tariff to Great Britain, Ireland and France:

Table with 2 columns: Location, Price. Includes New York City, British Columbia, South Africa, etc.

The tariffs beyond Great Britain remain the same as given in THE TELEGRAPHER of Sept. 25, with the following exceptions:

Table with 2 columns: Location, Price. Includes Scilly Islands, Mossel Bay, Colesberg.

Telegrams from Lima (Peru) can now be prepaid to their destination.

Table with 2 columns: Route, Price. Includes London to Valparaiso, Valparaiso to Lima.

Messages for all other Stations on West Coast of South America only can be prepaid as far as Buenos Ayres or Monte Video, and forwarded thence by private agent of sender to destination.

SPAIN—The rate to Spain, via Santander, has been reduced to \$1.75; via Falmouth remains the same, viz., \$2.00.

The Turkish Telegraph Administration will not accept private telegrams written in cipher or secret language. The Siberian route to Japan and China is interrupted; messages to be accepted via Falmouth or Tientsin only.

Messages via Direct Cable are received at all the offices of the Atlantic and Pacific, Franklin, and Southern and Atlantic Telegraph Companies in the United States, and at all offices of the Dominion Telegraph Company of Canada, and at the Direct Cable Office, 16 Broad street, New York.

GEO. G. WARD,

Superintendent.

THE TELEGRAPHERS' BALL.

A very important and general meeting of the subscribers to the "TELEGRAPHERS' BALL FUND" will be held in the Auditor's Office (5th floor), Western Union Building, on MONDAY EVENING, November 15th, at 5.30 P. M.

The assessment comes due on that night, and as we propose having the invitations out by the first of December, each subscriber will see the necessity of their paying up. We also desire to submit a report of the action of the Committee of Arrangements thus far.

A full attendance, either in person or by proxy, is therefore earnestly requested.

Any subscriber unable to attend this meeting will please remit to J. H. LYMAN, Financial Secretary, 197 Broadway, on or before the above date.

D. W. McANEENY,

NEW YORK, Oct. 29th, 1875. Prest. N. Y. T. B. A.

THE LECLANCHE BATTERY.

THE WORLD RENOWNED Open Circuit Battery.

NO ACIDS! NO SULPHATE OF COPPER! DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED to Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHE BATTERY COMPANY,

No. 40 West 18th Street, or

L. G. TILLOTSON & CO., Sole Agents,

BRADLEY'S

APPARATUS FOR

ELECTRIC MEASUREMENT,

COMPOSED OF HIS

Tangent Galvanometer and Rheostat.

(Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING

WHEATSTONE'S BRIDGE,

Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED

NAKED WIRE HELICES,

for Electro-Magnets, wound to any given size and resistance. Manufacturers of Telegraphic and Electrical Instruments supplied at low rates. For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

SIEMENS' UNIVERSAL GALVANOMETER

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,

22 SOUTH TWENTY-FIRST ST.,

PHILADELPHIA.

TO ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystallizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

Table with 2 columns: Cell No., Price. No. 1 Cell \$5.00, No. 2 Cell \$10.00.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by MR. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,
 MANUFACTURER OF TELEGRAPH INSTRUMENTS,
 104 CENTRE STREET, NEW YORK.

BATTERIES of every description for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the **CHESTER PIN DIAL** (patented), designed expressly for **POLICE and LAW TELEGRAPHS**. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell cut out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,

for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,

for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,

CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH;

so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,

REGISTERS, RELAYS, CALL BELLS,

and every description of Central Office apparatus, at most reasonable prices.

Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN"

in which the spring takes the place of the weight, is enclosed in a metal and glass case; is noiseless in its action, and of great beauty and finish, and is specially recommended to *Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.*

ELECTRO-SURGICAL APPARATUS

OF EVERY VARIETY AND DESCRIPTION.

HOTEL ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns: Grand Union, Saratoga; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y.; Willard's Hotel, Washington, D. C.; Galt House, Louisville, Ky.; Tefft House, Buffalo; and many others. *Proprietors and keepers of Hotels most liberally dealt with.*

THE "COUNTING ROOM BELL MAGNETS,"

for communicating instantly to clerks and employes, by means of a keyboard, in any desired place.

ALSO,

BELL MAGNETS AND PUSH BUTTONS,

for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$3.00 upwards.

Sole Agent of the

WILSON ELECTRIC GAS LIGHTING CO

for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for

LIGHTING FACTORIES, MILLS, ETC.

By simply pushing a button on his bench the operator lights a section of burners.

Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

JUST OUT.

NEW AND ENLARGED EDITION OF

SMITH'S

MANUAL OF TELEGRAPHY

CONTAINING

AMERICAN FIRE ALARM AND POLICE TELEGRAPH.

GAMEWELL & CO., Proprietors, 62 BROADWAY, NEW YORK.

- J. W. STOVER, General Agent and Superintendent. L. B. FIRMAN, Chicago, Ill., General Agent for the West and North-West. TELEGRAPH SUPPLY AND MANUF'G CO., Cleveland, Ohio, Special Agents for the Middle States. J. R. DOWELL, Richmond, Va., Special Agent for Virginia and North Carolina. J. A. BRENNER, Augusta, Ga., Special Agent for Georgia and South Carolina. L. M. MONROE, New Canaan, Conn., Special Agent for New England. ELECTRICAL CONSTRUCTION AND MAINTENANCE CO., San Francisco, Cal., Special Agents for California, Oregon and Nevada.

THIS SYSTEM OF FIRE ALARM & POLICE TELEGRAPH WITH A CENTRAL OFFICE, OR UPON THE AUTOMATIC PLAN,

is now in operation in the following Cities, to which reference is made for evidence of its great

SUPERIORITY, VALUE AND UNIFORM RELIABILITY.

- Albany, N. Y., New Orleans, La., Alleghany, Pa., New Bedford, Mass., Boston, Mass., New Haven, Conn., Bridgeport, Conn., Newark, N. J., Buffalo, N. Y., Nashville, Tenn., Baltimore, Md., Newton, Mass., Chicago, Ill., Newport, Ky., Cincinnati, Ohio, Omaha, Neb., Columbus, Ohio, Philadelphia, Pa., Cambridge, Mass., Pittsburg, Pa., Charlestown, Mass., Portland, Maine, Chelsea, Mass., Peoria, Ill., Covington, Ky., Providence, R. I., Detroit, Mich., Portland, Oregon., Dayton, Ohio, Paterson, N. J., Elizabeth, N. J., Pawtucket, R. I., Fall River, Mass., Quebec, L. C., Fitchburg, Mass., Reading, Pa., Fond du Lac, Wis., Rochester, N. Y., Harrisburg, Penn., Richmond, Va., Hartford, Conn., St. Louis, Mo., Halifax, N. S., St. John, N. B., Hyde Park, Ill., St. Paul, Minn., Indianapolis, Ind., Springfield, Mass., Jersey City, N. J., San Francisco, Cal., Kalamazoo, Mich., Savannah, Ga., Lansingburg, N. Y., Syracuse, N. Y., Louisville, Ky., Somerville, Miss., Lowell, Mass., Terre Haute, Ind., Lawrence, Mass., Troy, N. Y., Lynn, Mass., Taunton, Mass., Manchester, N. H., Toledo, Ohio, Mobile, Ala., Toronto, Canada, Montreal, Canada, West Roxbury, Mass., Milwaukee, Wis., Washington, D. C., Minneapolis, Minn., Worcester, Mass., New York City,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communciated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

OF

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a snficiant vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM

AND

POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution therefor of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

WESTERN ELECTRIC MAN'FG CO.

WHOLE No. 488.

My Sounder.

You have fretted me so long
With your everlasting song,
Your monotonous clatter and clatter,
You brazen brassy thing,
Of you I now would sing
In a way that will teach you "what's the matter."

It is true, without a doubt,
You're the greatest gossip out,
As many have learned and know to their sorrow;
You will gabble night and day
In your own peculiar way,
And find always something new for the morrow.

If the words that you have said
'Bout the living and the dead
Could work a change in your normal condition,
I am feeling free to tell
You would rattle down in—well,
You would soon learn the mysteries of perdition.

[From *The New Dominion*.]

Wooing by Wire.

A TELEGRAPH SKETCH.

"I DON'T see how any one can write such nonsense, and then get credit for being clever, and understanding human nature?" exclaimed Miss Sunnidale, shutting the book she had been reading with a protesting bang. "I don't believe one word of it! Do you, Dick?"

The question was addressed to her pet canary, and he answered with his usual accommodating chirp, which might be interpreted to mean yes or no, according to the questioner's wishes.

It was *Vanity Fair* she had been reading, and this is the passage which provoked her indignant exclamation: "Old or ugly, it is all the same, and this I state as a positive truth: A woman with fair opportunities, and without an absolute hump, may marry whom she likes."

Now, poor little Miss Sunnidale had reason to doubt this comforting assertion. She had not the shadow of a hump, and if it had been possible for her to marry whom she liked, she would not have been thirty years old and still a spinster. Her idea of Paradise was to have a little home of her own, no matter how humble, with a dear, good husband to love and live for. Long and patiently had she waited for the lord of her life to appear, but still he came not. Love, with all its gladness and grief, with all its sweet tumult and pain, was to her but a beautiful myth—a fairy tale; but *without* the less did she dream of it, and long for it; for her poor, innocent little heart was as romantic as that of any young school miss. Poor, lonely, little old maid! No wonder, then, that she differed from Thackeray in his estimate of woman's power to marry whom she liked.

She did not believe in the modern "Woman's Rights" movement, and although she had been earning her own living, bravely and uncomplainingly, for nearly twelve years, it was not from any desire to be independent that she did so, but simply because she had no one to earn it for her. None of her near relatives were living, and, though naturally of a cheerful and sociable disposition, she had always been very much alone in the world. Most of her life had been spent at school teaching in a country town, and wearisome enough she found it, trying to train the minds of her rustic pupils. Anxious for a change, she determined to learn telegraphy, and for this purpose made arrangements with the operator, Mr. Wylie, to instruct her in the mysteries of the art, and let her practice in his office after school hours. She had been practising most perseveringly for over two years, and was now a pretty fair sound operator, but, unfortunately, could not get a situation. After sending in about half a dozen applications, which always met with the same discouraging reply, "No vacancies at present," she began to despair of ever getting an office, and tried to settle down contentedly to school teaching. But she had no taste for it, and found it irksome. With telegraphy it was different. She felt sure she could succeed at that, for her heart was in it. To her there was an interest—a fascination about it. It was so much pleasanter than going over, day after day, and year after year, the same dull lessons, with duller children. It was the height of her ambition to be put in charge of a nice little office of her own. But she did not expect to get it, for, as she

sometimes plaintively declared, Dame Fortune seemed to have a grudge against her, and never would let her have anything she set her heart upon.

However, the fickle goddess at length decided to make a little variety in the programme of Miss Sunnidale's life, by granting her wishes.

The day after that on which this veracious narrative opens, she went down to the office, and told the operator she had decided not to waste any more time practising, as there seemed to be no hope of getting a situation.

"Well," said he, "I was just going to advise you to apply for this office. I am about to give it up and go back to farming, and will ask the superintendent to let you take my place, if you wish."

Of course she did wish, and he wrote without delay. In a few days the answer came back, authorizing him to transfer the books, etc., to her. She soon found a substitute to take her place at school, and in less than a fortnight she was in formal possession of the office.

There were not so many lady operatives in those days as there are now, and when it was flashed down the line that a lady had charge of "Sg" office, there was quite a little excitement in most of the other offices over it. Some of the operators signified their approval of it, in telegraph vernacular, by voting it "immense;" others less gallant felt that the presence of a lady on the line would be a restraint upon their freedom of (telegraphic) speech, and they would no longer be able to vent their wrath on offending brother artists in their accustomed style, which was often more forcible than elegant.

Tom Gordon was manager of the next office on that line, and when he heard of the appointment he scarcely knew whether to be pleased at the novel idea of having a lady to work with, or to resent the innovation of a woman presuming to engage in what he considered man's work. After due consideration he came to the conclusion that it would not be likely to affect the fact to any great extent whether he resented it or not, so he philosophically resigned himself to fate, determined to make the best of it.

That evening, when Phil Burke, operator on the opposition line, dropped in, as his custom was, to compare accounts, and tell about the wonderful amount of business "our Co." did, Tom cut him short by complacently observing:

"Oh, we know all about that, but we're one ahead of you yet, old man! We can boast of a young lady operator on our line!"

"You don't say so!" exclaimed Phil, with an incredulous air.

"Fact, sir!" said Tom, laconically.

"Is she good looking?" inquired Phil, deeply interested.

"Guess so—she sends well."

"What in the wide world has her sending to do with her looks?" quoth Phil, impatiently.

"Well, perhaps not a great deal, but as I haven't seen her yet it's all I have to judge by. It's one great point in her favor, at all events, for it would set me crazy to listen to her if she handled the key in the nervous, jerky style some girls do."

"She seems to have made a pretty good impression on your tender young heart," remarked Phil, mockingly. "Take my advice, old fellow—be careful you don't get caught."

"I was reading in a paper, the other day, of a fellow who fell in love with a 'sister operator' whom he had never seen, and only became acquainted with by talking to over the wire. He rashly proposed, she as rashly accepted, and they saw each other for the first time upon the wedding day. Rather risky business, I should think!"

"Well, of course, matrimony is a risky speculation altogether, but my opinion is that he stood as good a chance of getting a wife that would suit him under those circumstances as any other. You can form quite as good an estimate of a girl's character and temper by working and talking with her over the line as by being personally acquainted with her; better, perhaps, for you take her on her merits alone, and are not prejudiced by her appearance. Now, it is a well known fact that a pretty girl's beauty blinds us to her intellectual deficiencies and faults of temper, while, on the other hand, we are too apt to do homely women injustice by taking it for granted that their characters are as unattractive as their faces. I have a theory of my own—"

"Oh, bother your theories!" broke in Phil, irreverently. "You are the prosiest old preacher I ever knew. Every time a fellow asks you a simple question you trot out a perfect legion of facts, fancies and theories, mixed up promiscuously, in a way that is fearful to contemplate. Better cut the matter short, and put your theory into practice, by persuading the fair unknown to change her name to Mrs. Tom Gordon."

"I might think seriously of doing so," answered Tom, with imperturbable good nature, "only the trouble is, the cash valuation the company puts on my services is barely enough to keep me in segars, much less enable me to indulge in the luxury of a wife."

"Economize, my boy, economize! You might have

been a wealthy man by this time if you had not indulged in so many extravagant habits."

Which, indeed, was partly true, for Tom's salary was good enough, if only he had not been so careless about money matters. Handsome, generous, pleasure loving, and with no one but himself to think of, he never took the trouble to save, having, as he said, no object for so doing. This "having no object" had been the great drawback to Tom's success in life all along. He was clever enough to have made his way in the world, if he could only have been brought to feel that it was worth while trying. But he allowed himself to drift along, carelessly, aimlessly, making little use of the splendid talents nature had given him. The ability was there, but the stimulant was lacking. In short, he was a man who needed to have a good loving wife dependent on him, in order to develop the noblest part of his nature, and keep him from degenerating into a selfish, lazy "good-for-nothing."

Little Miss Sunnidale has been in possession of her office about a week, and already the place wears a tidier and more cheerful aspect than it used to do under the old masculine regime. It isn't much of an office, to be sure—only a wee corner of a book store, partitioned off, but it is pleasant and cosy. On the floor is a bit of pretty, fresh looking carpet. The ugly, ink stained counter, and the equally ugly desk on which the instruments stand, are neatly covered with green baize. At the window stands a mammoth geranium, perfectly gorgeous in its array of scarlet blossoms. Dick's cage hangs beside it, and Dick's sweet voice answers cheerily back to the monotonous click, elick of the sounder.

There has not been much doing all day, and the busy little woman, who cannot bear to sit idle, is wishing, for the fiftieth time, that somebody would come in with a message to send, or that one of the other offices would call her up to receive one. Her wish seems likely to be granted, for presently she hears the instrument tick off her office call, "Sg, Sg." Thinking some one had a message for her, she made haste to answer, but instead of a message comes the rather abrupt inquiry:

"What is your name, please?"

With her usual simple frankness, she answers, "Mildred Sunnidale."

"Odd name, but pretty," remarks her unknown querist. "How do you like your new office?"

"Oh, very much, now that it is cleaned up, and re-furnished, and is no longer redolent of segars," she replies. "What office are you in?"

"In 'Ch' office," is the answer. "My name is Tom Gordon."

Before she has time to make a fitting response to this interesting bit of information, an ill-natured fellow, away down the line, rudely breaks in, and without even taking the trouble to say, "Excuse me," as telegraph etiquette demands, jerks out, "To Sg. Here, take this," and begins sending a message in his usual rapid, unintelligible style. Now, this operator is the one drawback to Mildred's satisfaction with her new occupation. It always makes her nervous to have to copy from him. He 'sends' so fast, and gets so cross if she fails to catch it.

She strains every nerve in her anxiety to get the message correctly, and, having got as far as the signature without a "break," is beginning to congratulate herself, when bang! goes the door, effectually drowning the sound of the instrument, and causing her to lose a word. She asks him to repeat the signature, and after a series of impatient "Oh's!" he condescends to do so. She makes frantic efforts to catch it, but fails, and is obliged to ask him to repeat it, whereupon he becomes abusive, and savagely snaps out:

"Oh, get away, and let an operator take your place that can copy a message without 'breaking' at every word."

The poor little spinster is terribly frightened, and meekly replies:

"Please repeat it again, and I will try to get it this time."

But, as is the nature of bullies, her very meekness emboldens him to be still more tyrannical and impertinent.

"No, I'll be hanged if I will," he replies. "I'll report you to the superintendent, and get him to send some one to relieve you."

Tom Gordon is listening to it all, his handsome face flushed with generous indignation at the unmanly display of tyrannical ill-nature. He now thinks it time to interfere.

"See here, Pugh, you mean coward," he says, hotly, "Do you know it is a lady you are working with? Don't let us have any more of that nonsense, or I'll report you for using insulting language and wilfully delaying business."

"Who asked you to interfere?" retorts the irate Pugh, defiantly. But still he evidently thinks it best to heed the warning, for he repeats the signature, so that Miss Sunnidale gets it without further trouble.

And when she begins to express her gratitude to her self-elected champion for taking her part so kindly, he cuts short her thanks by saying simply:

"It makes me feel ashamed of my sex to hear a man speak roughly to a woman. If any of these operators do

so again, it won't be my fault if they are not punished for it."

And from that day kind-hearted Tom makes it his business to see that she is respectfully treated by every one on the line. He seems to consider her under his especial protection, and she—well, she thinks him a perfect hero, and worships him from afar. They fall into a daily habit of wishing each other "good morning" and "good night," and sometimes, when the line is not busy, their friendly greetings lengthen out into pleasant little chats.

And so it comes to pass that they gradually learn a great deal about each other's habits, tastes and opinions, and begin to feel acquainted.

Although he, like most of his sex, is not at all in the habit of under-estimating his own importance, it would surprise him to know what a large portion of Miss Sunnendale's thoughts are devoted to him. And the poor little old maid, who has never been made much of by anybody since those far-away days before her mother died, would scarcely credit, should any one tell her, how much he speculates about her, and how often he wonders whether she is as nice as she seems to be over the wire. For he finds her very interesting—so different from any of the rest of his rather numerous lady acquaintances. She has so many quaint little ideas, and such odd, original ways of expressing them. To him there is a certain fascination about her old-fashioned simplicity, which would seem almost childish but for the sound common sense she displays along with it. He knows she is a lady—no one could work with her long without discovering that. And when, as sometimes, she has occasion to speak seriously on serious thoughts, she does it so earnestly and bravely, yet so unassumingly, withal, that he feels a sort of involuntary reverence for her simple faith and pure, childlike nature, and is conscious of a dim longing to lead a better, loftier life than he has been doing.

Ah, if all women were but brave enough to use the mighty influence they possess over men to good purpose, by helping them cultivate the good that is in them, instead of encouraging them, actively or passively, in their follies and wrong-doings, how much better the world would become.

And so the days pass by, quietly and peacefully, as some people's days have a way of doing. The winter melts into spring, the spring into summer, and, little by little, Tom and Mildred grow very friendly with each other.

He often wonders if she is pretty, and if she has a pleasing voice, for Tom is rather sensitive about voices. It makes him shudder to hear some girls talk. Is she fair or dark? Tall or petite? And what kind of eyes has she? At last a happy thought comes to him. He will get her to exchange photographs.

(To be Continued.)

Absurdities of Telegraphic Censorship in France.

THE Paris correspondent of the *New York Herald* writes as follows of the absurdities of the censorship of messages on French lines: "Among the despatches which the administration of telegraphs in Paris have thrown into the waste paper basket this year, and refused to deliver because their contents were unintelligible to the gifted creatures employed in the department, is one very touching and ingenious. Here is the text of it: 'Third Epistle of St. John, verses 13 and 14.' In opening the Bible, and following these indications, at verse 13 will be found the following words: 'I had many things to write but I will not with pen and ink write unto thee.' The 14th verse, also, is thus composed: 'But I trust I shall shortly see thee, and we shall speak face to face. Peace be unto thee. Our friends salute thee. Greet the friends by name.' It will be thus seen that by the simple indication in the text of the despatch there is effected a notable economy of words; and perhaps some heart may have ached grievously enough because the absurd fears of official dunces prevented its delivery. Nothing can be more ridiculous, useless and mischievous than this censorship of telegrams which has now sprung up all over Europe. For it is clear that the least experienced of conspirators would arrange between themselves some cypher which would make their plots appear harmless in the eyes of a telegraph clerk, and none but innocent persons are ever likely to be molested by the censorship. Indeed, it is a favorite amusement of boys who have more money than wit to go and worry a telegraph clerk with a message which frightens him out of his wits, and then, after disturbing all the big wigs of the department, they show that it is only a joke. An acquaintance with the common French name of Bataille is quite a delight to the jesters of this description, for the telegraph clerks cannot maintain that M. Bataille's name and Mlle. Victoire's may not be used in a telegram without a prefix."

Unpolarized electrodes are obtained by using amalgamated zinc and a weak solution of zinc sulphate. If there be free sulphuric acid, it should be neutralized by carbonate of zinc. Common zinc may also thus be used

No notice will be taken of anonymous communications.

Mr. Craig's Reply to "Operator."

TO THE EDITOR OF THE TELEGRAPHER.

AS YOU have thought "Operator's" communication worthy of publication, it seems proper that I should reply to its childish and utterly preposterous statements, lest my silence should be accepted as an admission of their correctness.

I pass over "Operator's" defence of President Orton's annual report, as being not of the least importance to me. My criticism of that document needs, as yet, no defence, and certainly no retraction.

Your correspondent is greatly in error in supposing that I ever make any random statements concerning the possibilities of my pet system of telegraphy. What I have said before I repeat now, and can sustain by proof whenever it becomes important to do so. Notwithstanding "Operator's" doubts and reckless statements about the possible speed of automatic telegraphy, repeated instances have occurred where we have perforated a business message of full average number of words, and telegraphed the same to Washington, where the same messages have been reperforated and retransmitted to New York all inside of sixty seconds, and this can be done any time with operatives of even moderate practice.

"Operator" relates, with apparent seriousness, that some months ago half of a report of 1,600 words was given to a Morse operator, and the other half was divided between three perforators to prepare for automatic transmission, and your correspondent asserts that it required as much time for the three perforators to get their 800 words ready to telegraph, as it did the Morse operator to telegraph and copy his 800 words ready for delivery.

I do not permit myself to believe that "Operator" states a deliberate untruth, and I shall pass his very extraordinary statement without other comment than to copy some official figures, which were attested by high officials of the General Post Office Department, and of the W. U. Co. and others, in 1874, on the occasion of telegraphing the President's message from Washington to New York. The W. U. Co. had accomplished the feat of telegraphing the message of 11,000 words, over eight wires, in sixty minutes, which was heralded as "a feat unparalleled in the annals of telegraphy." The sixteen operators employed were the cream of that company's 5,000, and they averaged twenty-three words per minute. This enables me to fix the time (strangely omitted from "Operator's" statement) in which the 800 words to which "Operator" refers, was transmitted, as thirty-five minutes, as it is not to be presumed that any higher speed was attained by his *Morseite* than was attained in the test of the President's message above referred to.

Now, if it is true, as "Operator" asserts, that his *Morseite* finished his 800 words before the three perforators had finished their part of the work, it necessarily follows that they averaged less than eight words per minute; and yet, in the noted test of telegraphing the President's message above referred to, ten perforators, most of whom had had very little experience, averaged twenty-five words per minute, and, of course, three of them would have perforated 800 words in less than one third of the time in which it was possible for "Operator's" man to have telegraphed his 800 words. I may also say that, as long ago as 1872, Mr. Prescott, the electrician, and several other officers of the W. U. Co., were present in the office of the Automatic Co., and witnessed a boy, who had worked the perforating machine less than a year, perforate 135 words per minute, at which rate of speed he, alone, would have perforated the 800 words in six minutes.

I do not believe there are many Morse operators "in an office which works both Morse and Automatic," who will accept "Operator's" incredible twaddle as entitled to the least consideration, and I am quite sure that the responsible officers of "Operator's" company know that his statements are destitute of every shadow of truth or probability.

"Operator" refers to the fact that the A. & P. Co. have given a special wire to the Philadelphia and New York business, as evidence that the business of New York, Philadelphia, Baltimore and Washington cannot be transmitted over one automatic wire, though the whole business, he says, does not exceed 1,000 messages per day—this childish and tricky statement being intended to discredit my estimate of 15,000 messages per day as the fair working capacity of one good automatic wire. Now, I do not suppose there is one messenger boy, six months from the bogs of Ireland, employed by the A. & P. Co., who could not inform "Operator" that very much of the telegraph business between New York

and Philadelphia is the business which results from speculations in gold and stocks—a class of business which the W. U. Co., with its numerous and exceedingly well managed and skilfully operated wires, performs with very remarkable quickness—the time being counted by seconds—and which, of course, cannot be had at all by the A. & P. Co. unless they so arrange their circuits as to admit of their having wires and operators in readiness to receive and execute it at a second's notice. One of the messenger boys to whom I have referred, will inform "Operator" that, if messages are going or coming over the single automatic wire to or from Washington or Baltimore, the New York office cannot, at the same time, send messages to Philadelphia, and though the wire might not be pre-occupied but a moment or two, yet even that delay would be fatal to the speculator's messages between New York and Philadelphia.

In the near future, and, I judge, long before "Operator" will have arrived at years of discretion, we shall see, under improved telegraphic management, thousands of messages where we now see hundreds, and messages of fifty words where there are now ten; and when that time comes, "Operator" will, possibly, have a faint idea of the aim and of the utility of automatic telegraphy. His mind is now, obviously, incapable of taking in or giving out anything above childish or tricky statements, which can deceive no one who is not as ignorant and short-sighted as he appears to be.

D. H. CRAIG.

The Delaware and Hudson Canal Co.'s Telegraph System.—New Western Union Wires.—Reconstruction of the W. U. Lines on

Harlem R. R.—A Telegrapher

Elected to the Assembly.—

Bulls, &c.

ALBANY, N. Y., Nov. 9.

TO THE EDITOR OF THE TELEGRAPHER.

WHEN the Delaware and Hudson Canal Co. secured the control of the Albany and Susquehanna railroad, a few years ago, they also obtained the exclusive management of the telegraph which was connected with it; this consisted of one wire between Albany and Binghamton, a distance of 142 miles. This wire terminated in the Western Union office at this place, and also at Binghamton, and business was sent and checked direct by the Western Union. When the D. & H. Co. assumed the control of this line its connection with the Western Union was broken, and its through business transferred to the Atlantic & Pacific Company; shortly afterward a second wire was put up between Albany and Binghamton, and the company commenced doing commercial business on its own hook, in addition to its regular railroad telegraphing. Later the D. & H. gobbled up the Rensselaer and Saratoga Railroad, in connection with which a wire was in use, owned by the Western Union and leased to the railroad company. Last spring steps were taken to extend their telegraph system by the erection of a new two wire line north of Albany. These two new wires have recently been completed and are now working, one terminating at Ticonderoga, on the New York and Canada railroad, and the other at Rutland, Vermont. The main office of the company in this city is located in the old Susquehanna depot on Steamboat square, presided over by Mr. C. S. Fales.

It also has branch offices at the A. & S. freight house, foot of Green street, Maiden lane passenger depot, Lumber street and Delavan House. A new and handsome set of poles have recently been put up on Broadway, between Steamboat square and State street, by this company.

The completion of the two new northern wires above mentioned gives the Western Union another wire between Albany and Whitehall, which will prove very useful, as the northern business is very heavy during the summer. The wires of the Western Union between New York and Albany via the Harlem railroad, nine in number, have been thoroughly overhauled and put in first class order. Formerly they were on two sets of poles, but the wires are now transferred to one set of new poles and entirely reinsulated with glass, regular Western Union pattern. The work is now nearly completed, only a few days more being required to finish it. Two northern wires, which were formerly insulated with what is known as the block insulator, are being reinsulated with glass between Eagle Bridge and Rutland, Vt. The glass seems to be the insulator in this part of the country. There is some talk of introducing the American District Telegraph system in Troy, N. Y. I have been unable to learn anything very definite about it, but as the Trojans are a wide-awake community, they will no doubt sooner or later have all the modern improvements in their little city. (They don't take THE TELEGRAPHER up there or I wouldn't dare to say "little city.") The right to introduce the system in this city was purchased some months ago by an Albanian, but nothing more has been done about it as far as can be ascertained.

The following is recorded as warning to all telegraph operators to beware of politics:

Mr. Alfred Leroy, formerly manager of the Cohoes, N. Y., Western Union office, a practical operator, was elected to the Assembly from the fourth district of Albany County at the late election.

Manager W. O. Shelley of Rome, N. Y., has had another young operator added to his family, who is destined to be one of the heavy men; he tipped the scales at eleven and three quarters first time trying.

I have a few city liners in my note book which must be disposed of soon or your correspondent will be gored to death. "S. Sanford, A. M. Sterdam, N. Y." Mr. Sanford is not a master of arts unless perhaps it be the art of making carpets, and his address is usually Amsterdam, N. Y. ("That's the way it came.")

"You had boor come" was transformed into "You had better come" on being repeated. "Wm. P. Cowin" went through a similar operation and came out "Wm. P. Irwin." A message addressed "Berth Adams, Mass.," was returned for better address, which came in the shape of "North Adams, Mass." DOUBLE SIX.

Changes in the San Francisco Western Union Office.—A Cruel Joke.—Personals.

SAN FRANCISCO, CAL., Oct. 19.

TO THE EDITOR OF THE TELEGRAPHER.

CHANGES are still the order of the day in the Western Union office. On September 1st, it being considered necessary to reduce the operating force, Mr. Henry A. Smith (brother of "Cliz") was informed that his services were no longer required, and with his usual luck he went to work next day for the A. & P. Co., in this city, filling the vacancy caused by the appointment of Mr. R. M. Talbot as manager of the Stockton office. Smithy always was lucky, and in anything from a game of "Pedro" to securing a first class situation, he is bound to win.

The San Francisco and Pacific Stock Exchanges resuming business on the 5th, necessitated increasing the force again, and Mr. J. B. Sheldon, of snipe catching notoriety, who, through some misunderstanding about his leave of absence, had been enjoying (?) an extended vacation, was reinstated in his old position, and is now correspondingly happy. On the 9th Mr. Chas. H. Boynton resigned, to accept a position with the A. & P. at Virginia City, Nevada. The W. U. lose one of their best men, and the opposition may well be proud of their acquisition. Mr. Thos. Hunt, recently night report man at Los Angeles, fills Mr. Boynton's place in the San Francisco office, and Mr. Jake Smith and his "celebrated trick dog" succeeds Mr. Hunt at Los Angeles. Mr. Chas. J. Lawson has resigned his position in the San Francisco office, and started east on the 16th, to accept a situation in St. Louis, leaving behind him a host of friends and—his blonde moustache; may success go with him, is the wish of all who have made his acquaintance during his brief visit to the Pacific coast. Mr. Geo. W. Bender, Supt. of Telegraph, Indianapolis, Cin. and Lafayette R. R. Co., spent a few days in the city last week, and left on the steamer "Mohongo" for San Luis Obispo, to visit his old friend J. B. Bennett, of the W. U. office at that place. George is not "on a bender," as our funny man suggested, but is simply on a flying trip to see the country, and expects to return east in a few days. Jimmy O'Toole was agreeably surprised, upon signing the pay roll for September, to find his salary raised to 100 dollars, and a happier boy than James could not be found in California. Some cruel jokers had one of the office boys tell him Mr. Jaynes (Supt.) wished to see him, that he had been paid 25 dollars too much by mistake. Jimmy's lower jaw dropped about two inches as he slowly and sadly wended his way down the stairs, at the foot of which the boy, becoming fearful of the consequences, informed him of the joke, and O'Toole made the fastest time on record getting back to his wire again, with a grin on his face which would have done credit to the great Billy Emerson.

There are a great number of unemployed operators in the city at present, and more coming; a few by railroad, but the majority on foot, and that's the way they will have to go back, as there are no situations vacant, and the boys out here, as some one has remarked, "seldom die and never resign." ROMEIO.

Election Experiences of the Western Union Chicago Employees.

CHICAGO, Ill., Nov. 14.

TO THE EDITOR OF THE TELEGRAPHER.

I were well if in a man's election the people found some sure relief; that in one thief's detection but elect another thief.

THE above true bit of poetry is from the pen of our "Smith" report. Mr. A. L. Baker. Mr. Baker has given us some real gems in the way of verses, the choicest of which, I am sorry to say, he has not put on

record in the "Smith" book, having sent them to friends in various parts of the country; however, what few I have will be given to your readers, who will doubtless appreciate them as much as we have. I enclose you with this letter a few verses by him, entitled "My Sounder," written a few evenings since during the various "let ups" on report. Many of us have seen the time when we, too, have (in our mind) consigned our sounder to that bottomless place suggested by Mr. B. Whether he is right or not in regard to an election the majority of men in this office do not question. It matters little to any of them who the lucky candidates are, so long as they have a vote, and are allowed time to go to the polls. This was most beautifully illustrated at the late election in this city, when the men were given time to go to the polls, thus giving them a chance to beat the company out of a few hours' work (and vote for the man that paid the most), and how well, too, did they improve each shining hour! Eddie Dorval, with several others (who had no vote at all, but claimed they had), might have been found at Pratt's, playing billiards for several hours. Billy Walsh came back with his face looking like a lobster—'twas from walking, of course. The gang from McDonald's stronghold (north side), Armstrong, Whitford, Meserve, Drandolph, Anderson, A. J. Long, and others, must necessarily go with each other to their various precincts, and consume three hours and forty-five minutes in so doing. 'Twas a bad part of town, but didn't they have the "Lion-hearted Dad" with them; what had they to fear; who dare step on their collar buttons; and A. J., wasn't he there, too, anxious to be classed as a "Muldoon." No one else should be allowed to fight while he was there to do it for them. Did he not knock down and drag out three judges before they even had a chance to say—Drink! Of the number of times they "repeated" your correspondent has not been informed, but to judge from the hilarity manifested by several of them, it would appear quite considerable. Dad's spirits rose with the occasion, and, when his vote was challenged, and it was necessary to make affidavit, I am told that he delivered one of the finest forensic efforts ever listened to in this city. Had he not lived here since the time Moses was found in the bulrushes of Chicago river, or since the time that Adam and Eve spilt the apple? So overpowered, astounded, and surprised were the judges that they immediately told him it would be necessary for him to verify his affidavit. Now, ye shades of Milwaukee avenue, this was too much; to be spurned in this manner by a lot of Democratic judges was more than Dad could stand. The air becomes impregnated with blasphemous oaths; he marshals his gladiators around him; blood is about to flow. A. J. cries for gore, when, lo! and behold, Whitford appears upon the scene. A glad smile quickly lights up their countenances, and their wrath is instantaneously appeased by the sight of a case of pop and two or three pounds of Limburger cheese that he had skimmed from an old Italian woman. Their spirits ascend upwards, and they return to the office. It was laughable to see the spouter of political rights after his return. Not satisfied with getting rid of a superfluity of it outside, he had to continue it after reaching the office. The position he took was a study for an artist; he planted both elbows on a table before which Col. Wilson happened to be sitting, and, I have no doubt but what the Col. appreciated the few remarks, for he left a few seconds after our genial friend had started to interview him. This eloquent orator continued his diatribe until about 2 P. M., when his power of elocution gave out, and he subsided into a somnambulant state. Messrs. Stanberry and Bracken whiled away a couple of hours very pleasantly in attending the counter for their "three ball" friend on West Madison street while he was out collecting. Our "Herzegovinian" friend Blumhoff has not yet fully recovered from the effects of having voted for the Boss, therefore we have been without his blooming countenance for the past few days. There are several others who abused this privilege so kindly given them by Manager Maynard, of whom I should like to speak, but I fear my letter is already too long, and therefore will wait for another opportunity, and not spoil my BONANZA.

Indian Opposition to Telegraph Construction.—Telegraphic Arrangements at the Oregon State Fair.—A Telegraphers' Baby Takes Second Prize.—Inspection of Western Union Lines, etc.

ALBANY, OREGON, Oct. 26.

TO THE EDITOR OF THE TELEGRAPHER.

FURTHER trouble is threatened with the Umritilla Indians regarding the construction of the Nevada and North Telegraph Line across their reservation. When it was first mentioned the Government at Washington was notified about the opposition of the Indians, and orders were promptly issued to the department here, authorizing the construction of the line, but when the

construction party reached the reservation they were met by thirty or forty armed "Sewasbes," who drove the men off, by threatening to kill them unless they departed at once; the party considering discretion the better part of valor, retreated, leaving their tools and provisions. As soon as Platt Burr, the Supt., who was in Portland, heard of the facts, he applied to headquarters for a force of soldiers, which was immediately ordered from Fort Walla Walla. We have nothing further, but presume the building will go on, as the Indians will hardly have the temerity to resist the soldiers.

The Oregon State Fair this year was a grand success as regards people present and money, both greatly exceeding the highest estimates. To facilitate the movement of trains necessary to transport the thousands attending the fair, the Oregon and California R. R. Co. were compelled to put in an office on the fair grounds depot, and as chief operator we were compelled to be present. Our office was in a board shanty, knocked together for the occasion, on the railway platform, and accessible to the crowd, continually asking questions regarding arrival and departure of trains; and by their frequently mistaking it for a whiskey shop, had many calls for "whiskey and cigars." Col. Brandt, Supt.; Geo. Crow, Ticket Agent, and myself, manfully strove to answer the multitude of questions until our jaws failed to work, and we had to tumble. The W. U. Co. put in an office in the Pavilion on the the grounds, for the transaction of commercial business, with Mr. L. G. Adair as operator—"Panhandle," as he is familiarly called, from the fact that he hails from the road east bearing that name. By the way, I had a pretty good joke on friend Adair, at times, as many of the visitors to the fair were from the parts of the State where telegraphs and railroads are unknown, and these, after satisfying their curiosity by examining the engines and cars, would drop around by my window and want full explanation regarding the workings of the "telegraphs." Not wishing to be bothered, even had I the time, I most kindly (?) told "our country cousins" that the W. U. Co. had most liberally and accommodatingly erected an office inside the grounds, and placed a gentleman in charge for the sole purpose of explaining to all wishing information just how it was done—"this gentleman would take pleasure in explaining fully. This generally had the effect of starting 'em in search of Adair and the "other office."

Before closing the fair subject, I might mention that in the "Baby Show" A. F. Wheeler, manager, W. U. Telg., Salem, with the help of his wife and baby, got away with second premium for the "handsomest darling." Gus declares it an outrageous piece of prejudice that he did not get the blue ribbon, and hints that bribery was used. 'Tis too bad, especially as this is the first baby from all that marrying which the Oregon telegraphers indigned in so strongly some time since.

Mr. F. H. Lamb, Superintendent, and John A. Crouch, general repairer, W. U. Telg. Co., have just returned from a trip of inspection over the W. U. line, from Portland to Yreka, Cal., and report it A No. 1 for this winter's service.

Mem.—John Crouch is not married; neither is "Webfoot," notwithstanding the damaging reports extensively circulated to the contrary. Some time ago they tried to have Webfoot dead; failing in that, the next best thing was to marry him, and that reception party tendered him on his return last Monday evening was for him alone, and not for two, as was imagined. Well! well! if they keep on, they will sure enough either kill me or get me married, and I am getting so I don't care which—one is as good as the other, and "mighty" little difference between the two.

Tom Sheridan, of Roseburg, has just been elected City Treasurer by a handsome majority over his opponent. Good for Tom. Telegraph talent always wins.

Confidentially.—Tom and I are going to play "Tweed" on 'em, but until arrangements are perfected, you may continue to hear from WEBFOOT.

A Relay in Danger.

CHICAGO, ILL., Oct. 26.

TO THE EDITOR OF THE TELEGRAPHER.

HERE is a good one from a country artist and speaks for itself:

"To Mr. Sweet, Chicago. "Please send me copper and zinc at once. These are all eat up. My relay will be ruined if I don't have them. (Signed), G. WRIGHT." Live and learn should be his motto. MORE SHON. DOT.

To Correspondents.

PRISCILLA.—Your attention is called to the notice at the head of our correspondence columns, in regard to anonymous communications. If you will send us your name we will print your communication, otherwise it must share the fate of all anonymous contributions.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, NOVEMBER 20, 1875.

THE TELEGRAPHER: PUBLISHED EVERY SATURDAY at 38 VESEY ST. ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$3.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. Commissions in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for four subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

J. N. ASHLEY, Publisher,

P. O. Box 5603.) 38 VESEY ST., New York.

THE TELEGRAPHER MAY BE HAD at the news stand in the Receiving Office of the Western Union Telegraph Company, corner of Broadway and Dey street, where it is regularly on sale.

The Over-supply of Telegraphic Labor.

It has long been evident that there is an over-supply of telegraphic labor. Never before within our recollection have there been so many telegraphers seeking situations as at the present time.

In telegraphy as in other lines of business the tendency of compensation is to decline, and however unpleasant this fact may be, it must be looked squarely in the face, and those concerned must make up their minds to meet it with as much equanimity and philosophy as possible.

telegraphic aspirants has yearly increased in a much greater ratio than the demand for their services. If it were not for the depletion of the telegraphic ranks from telegraphers abandoning the business to engage in other employments, the excess would be even larger than it actually is, and the scale of compensation would be even less than at present.

Notwithstanding the excessive supply of telegraphic labor, the work of adding to the number seeking to obtain a livelihood by telegraphy goes on with undiminished vigor. In addition to those who learn in telegraph offices, numerous plug factories all over the country continue to inveigle new victims by their lying representations of the demand for telegraph operators, and the lucrative situations which graduates furnished with their worthless diplomas will easily secure.

It is very easy, it may be said, to indicate an evil, but much more difficult to find a remedy therefor. The only effectual remedy for the over-supply of telegraphic labor is, for the present, and until the demand absorbs the present supply, to stop learning additional operators. Telegraphers can do much in this direction by stating plainly and truthfully to those contemplating engaging in telegraphy the present situation, and inducing them to devote their time to some other business.

A Telegraphic Story.

WE commence in the present number of THE TELEGRAPHER a telegraphic story, "Wooing by Wire," which appeared originally a few weeks since in The New Dominion, a literary paper published at Hamilton, Canada.

This story is from the pen of our lively and interesting correspondent "Jo," of Toronto, whose contributions to our columns have been read with so much interest. In this story our correspondent has exhibited a talent in another department of literature which shows her versatility and ability, and promises well for her future as a writer.

Annual Meeting of the Telegraphers' Mutual Benefit Association.

WE print in this paper a full report of the annual meeting of the Telegraphers' Mutual Benefit Association, held in the Western Union Telegraph Building on Wednesday evening, the 10th inst. This report should have appeared last week, but was omitted, with other interesting and valuable matter, in consequence of the crowded condition of our columns.

It will be seen from the reports of the Secretary and Treasurer that the Association is in a prosperous condition, and that good progress has been made during the year towards the accumulation of the reserve fund of \$10,000 which was resolved upon at the previous annual meeting. Only eight deaths of members have occurred during the past year, which is certainly a very small percentage in a membership of over 1,200, and shows that much care and discretion is exercised in the admission of members, as well as that the telegraphers, as a whole, are a healthy body.

We cannot speak too highly of the value and usefulness of this Association, affording as it does prompt relief and assistance to those who are deprived by disease and death of the support of those upon whom perhaps is

their sole dependence. Through the aid received from the Association great good has already been done, and every telegrapher should avail of its beneficent provisions for those who are liable to be deprived of their dependence at any time. In no other way can this provision be so cheaply secured. It should be remembered that this is not a charity or eleemosynary institution. Each member contributes to its funds and purchases the benefit, which certainly none will desire to avail of so long as it can be avoided.

The excellent financial condition of the Association is evidence that it has been excellently and economically managed. We trust that the present year will witness a large addition to its numbers.

The Madras and Penang Cable Broken.

ATTENTION is called to the notice of the Direct United States Cable Company in regard to the interruption of the Madras and Penang Cable, and the forwarding of messages to China, Japan, the Straits Settlements and Australia.

Telegraphers' Mutual Benefit Association.

ANNUAL MEETING.

THE annual meeting of the Telegraphers' Mutual Benefit Association was held in the Western Union Telegraph Building at 7:30 P. M. Wednesday, November 10th. A large delegation was present. Mr. J. W. Tillinghast, of Buffalo, was appointed Chairman, and Mr. William Holmes, of New York, Secretary. The following are the reports of the officers:

REPORT OF THE SECRETARY.

During the year ending to-day there have been eight deaths of members, viz:

- E. S. Springsteen of New York. John Stalcup of Washington. Wm. F. Muchmore of Astoria, L. I. Wm. Lee Allen of Key West, Fla. Walter M. Tenny of Toronto, Ont. John Trevor of Rochester, N. Y. Abraham Kern of Cincinnati, Ohio. Charles H. Vawter of Sumner, Ill.

The number of new members admitted was 174—and the number dropped from the roll 111. Present membership roll contains 1,269 names. Forty-two applications for readmission to membership were made during the year, all but three of which were accepted. Eleven of the applicants were in arrears for less than \$5 each. The remaining twenty-eight paid the \$5 for back assessments required by By-Law II.

In the first year of the association, when its members numbered less than 350, there were but two deaths—a ratio of 1 to 175.

Table showing membership statistics for the second 8 months, with ratios of 1 to 81, 1 to 100, 1 to 108, 1 to 87, 1 to 66, 1 to 67, and 1 to 158.

FINANCES.

Table of financials: Balance Nov. 11, 1874 \$9,515 95; Received assessments 13,106 16; applications 174 00; Gift W. U. T. Co. 1,000 00; Sale of desk 15 00; Interest on investments 350 00; on deposits 238 60; Profits on sale of bonds 15 00.

Total 24,414 71 \$24,414 71

Of this amount there has been paid the following:

Table of disbursements: Heirs of A. R. Walsh \$1,000 00; T. A. English (to balance) 850 00; J. B. Dillon (to balance) 850 00; C. B. Matthews (to balance) 1,000 00; A. G. Martin 900 00; E. B. McDill (to balance) 1,000 00; W. C. Haven 1,000 00; E. S. Springsteen 1,000 00; John Stalcup 1,000 00; W. F. Muchmore 1,000 00; W. L. Allen 1,000 00; W. M. Tenny 1,000 00; John Trsvor 1,000 00; Paid Secretary's Salary 500 00; Paid for printing 206 85; Paid for postage 179 58; Refunded 25 50; Due heirs of Abraham Kern and C. H. Vawter 2,000 00.

Total 16,361 93; Leaving a reserve fund of 8,052 78

Of this fund \$6,867 75 were expended in the purchase of bonds drawing interest at seven per cent. on \$7,000. The balance, \$1,137 38, with the \$2,000 due the heirs

of Kern and Vawter, is on deposit with the Treasurer of the Western Union Telegraph Company, leaving \$46 65 cash on hand.

WILLIAM HOLMES, *Secretary*.

Mr. James D. Reid, the Treasurer, refers gratefully and appreciatively to the generous and wise, though unexpected gift to the association of \$1,000 received from the President of the Western Union Telegraph Company, in testimony of that company's appreciation of the value of the association.

The association, he says, has its foundation in two great facts: First, that death is certain; second, that death not only puts out the light of a human life, but leaves tears and sorrow, and often want behind it. The report continues:

"Immediately on receiving this gift the Executive Committee met, and finding that the reserve fund approximated \$4,000, and that funds on hand not yet payable could be used to make, with the gift, \$5,000, ordered the investment of that sum in 7 per cent. bonds, which was at once done. Since that time the surplus fund has increased so much that \$2,000 more have since been similarly invested, and a balance yet remains as a cash fund of \$1,137 38—a most gratifying condition, surely, in which to meet at our annual gathering to-night.

Another gratifying fact has been the very limited number of deaths during the year. Of the eight which have occurred since your last annual meeting two were violent; one by accident, C. H. Vawter, of Sumner, Ills.; the other, John Trevor, of Rochester, by murder while performing his duty. One death has occurred which the Executive Committee decline to provide for. This was the case of C. B. Schultz, of Moniteau, Mo., who had been a member only thirty days when he died, and of whom it seems evident that the application was false. The case is left to your action, should you deem it best to examine it and order action therein. Another claim awaits settlement. Abraham Kern, of Cincinnati, made his mother his heir. She died before him, but he made no change in the heirship. The brothers claim the money, but it is withheld until an order of a competent court decides their right to it.

The efficiency of the association and the small death rate are greatly due to the increased carefulness and intelligent attention of the agents who have, without exception, very faithfully attended, without compensation, to the laborious duties devolving upon them.

I beg to raise the question whether a member allowing himself to fall into habits of notorious intoxication should not, on the appeal of two members, be liable to be dropped from membership.

I also suggest the propriety of declaring a dividend to members of long standing, as the funds may justify, after the maximum surplus has been reached. Something seems due to those who, for a certain term of years, have steadily paid their dues. Perhaps after another year some plan having this in view may be devised.

I recommend that on our next annual gathering arrangements be made for a dinner at some suitable place, where the delegates and the New York members can meet each other on familiar terms, and where good speakers and good music may make the occasion one of cheerfulness and animation.

I have only to add a word of gratitude for the success of the year, and the hope that we may all meet again as happy as now when another year has closed upon us. Never has the association had so reliable a membership, or had opened to it so fair a promise of prosperity and usefulness."

After the reading of the report, Mr. Loesch, of Chicago, was appointed a committee to investigate personally the case of C. B. Schultz at Moniteau, Mo.

On motion of Mr. Loesch, of Chicago, it was

Resolved, That all members be earnestly requested to make their remittances for assessments and other purposes through the agent nearest them.

It was thought that this would lead to a more perfect representation of the association at the annual meeting, and to a closer fraternization of the members. By a system of districts, the members could occasionally hold meetings among each other, and discuss points of interest as these might arise.

The election of officers and Executive Committee resulted as follows:

JAMES D. REID, *Treasurer*.

WILLIAM HOLMES, *Secretary*.

Executive Committee.

JOHN B. VAN EVERY, T. G. SINGLETON, W. A. SCHRAM, C. H. SUMMERS, of Chicago, and J. M. CROWLEY, of Augusta, Ga.

On motion of Mr. John Fuller, of Easton, it was

Resolved, That the salary of the Treasurer be two hundred and fifty dollars per year.

It was *resolved* that a committee of three be appointed to examine the Treasurer's account, and publish a statement of the surplus in hand, and how invested.

Messrs. S. B. Gifford, John Fuller, and T. P. Scully were appointed such committee.

After which the meeting adjourned.

Personals.

Mr. JOHN E. STOCKMEYER, late agent and operator at Carlisle, Ill., has been appointed agent for the Ohio and Mississippi and S. and J. S. E. Railroads at Flora, Ill.

Mr. EDWARD A. KEENE has resigned his position with the Western Union Company at St. Louis, Mo., and goes to Titusville, Pa., for a brief visit, after which he will probably accept a position with the same company in New York.

Mrs. A. VIRGINIA CARR has been appointed manager of the Western Union office at Shawneetown, Ill.

Mr. CHARLES E. DODD, of the Western Union Kansas City, Mo., office has resigned to accept a position on the Atchison, Topeka and Santa Fe R. R. at Emporia, Kansas.

Mr. W. H. BANCROFT has been appointed Sup't of the St. Louis, Lawrence and Western R. R., also Sup't of telegraph. Mr. BANCROFT is an old and well known telegrapher. He was division operator of the 3d and 4th divisions of the Atlantic and Great Western R. R. at Galion, Ohio, for several years.

Mr. FRED. MAYNARD has accepted a position as night operator for the New Orleans, St. Louis and Chicago R. R. at Canton, Miss., *vice* Mr. JOHN WILKIE.

Mr. W. L. J. JENNINGS, of New York, has accepted a position on the day force of the Washington, D. C., Western Union office.

Mr. GEORGE E. MILLARD, late of Chicago, Ill., has been appointed Chief Operator of the St. Louis, Mo., Atlantic and Pacific office.

Mr. J. W. ZIEGENFUST, formerly of Omaha, Nebraska, has been appointed to a position in the Shreveport, La., Western Union office.

Mr. J. GROFF has been transferred from Mobile, Ala., to Chattanooga, Tenn., Western Union office.

Mr. WILLIS WOLF, of Tuscumbia, Ala., has accepted the position in the Mobile, Ala., Western Union office, vacant through the transfer of Mr. GROFF to Chattanooga, Tenn.

Mr. GEO. W. SAWYER, of the cable department, New York Western Union office, goes to Washington on or about the 1st of December, to assist in disposing of the additional business caused by the convening of Congress.

Messrs. WATERBURY and KING, of Albany, N. Y., Western Union office, were in New York last week, and attended the T. M. B. A. annual meeting as Albany delegates.

Mr. I. C. HENDRICKSON has been appointed transfer agent of the Western Union Telegraph Company at New York, in place of Mr. LEONARD COX, removed.

The Telegraph.

Special Meeting of the Franklin Telegraph Company.

A SPECIAL meeting of the stockholders of the Franklin Telegraph Company was held at Boston on Tuesday last. The object of the meeting was to receive the report of the Committee of Stockholders appointed at a previous meeting, to examine and audit the accounts of the company in connection with the Atlantic and Pacific Telegraph Company, a minority of the stockholders believing that the company had not been fairly dealt with by the Atlantic and Pacific.

The committee made quite a voluminous report, the gist of which was that they had proceeded to New York and thoroughly and carefully examined the accounts, from the time that the business of the two companies had been practically under one management, and so far as the accounts went found that they had been correctly kept. The earnings of the line from April 30, 1871, to Sept. 1, 1875, were \$1,135,516, and the expenditures \$1,026,953. The gross yearly receipts are now \$300,000, and the report states that the expenses need not exceed 80 per cent. of the receipts.

The report criticised some things in connection with the management of the business of the company heretofore since its connection with the Atlantic and Pacific Company. The report was referred to the President and Secretary, with instructions to have it printed for distribution to the stockholders. The petition of a minority of the stockholders for the dissolution of the Franklin Telegraph Company and sale of its property was argued on a demurrer before the Supreme Court at Boston, on Tuesday. The petitioners claim that their interests can be protected only by a dissolution and sale of the property.

Eldred has shown that wires are elongated when transmitting currents.

The Southern and Atlantic Telegraph Company.

ON Tuesday evening last a committee of the New York Cotton Exchange, headed by Mr. Henry Hentz, the President, had a conversation lasting for some time over the Southern and Atlantic Telegraph Company's line, with Mr. J. R. Dodge, the statistician of the Agricultural Department at Washington, D. C., on the subject of the report on the cotton crop.

A new office has been opened by the Southern and Atlantic Company at Blackstock, S. C., on the Charlotte, Columbia and Augusta R. R., with Miss Mary Ormond as manager.

Severe Storm on the Line of the Union Pacific Railroad.—The Western Union Wires Badly Damaged and Communication Interrupted.

AN extraordinary storm set in on Saturday night last along the line of the Union Pacific railroad west of Green River. Sleet fell in such quantities as to heavily load the telegraph wires, and so much snow as to block the trains for some time. The wires of the Western Union Telegraph Company were badly broken, and communication was interrupted, but finally restored Tuesday forenoon.

The wires of the Atlantic and Pacific Telegraph Company are reported not to have been broken or communication interrupted except for a short time, caused by a cross with the railroad wires, which was speedily removed, and by means of its lines telegraphic communication was maintained with the Pacific Coast.

The weather is reported as intensely cold, the thermometer at Cheyenne having marked 16° below zero at Cheyenne. The storm and excessive cold made it difficult to repair the lines, but by the energy of the employes of the Western Union Company the repairs were effected as soon as it could possibly be done, and communication re-established.

New York Telegraphic Notes.

AN arrangement for indicating the floor upon which the elevators are is being attached to the steam elevators in the new Western Union building.

Next week Boston and Philadelphia will work direct over one side of the New York, Philadelphia and Baltimore quadruplex, Western Union. A quadruplex repeater will be put in at New York, so that one side between New York and Boston can be used for local business, while the other side works through to Philadelphia, over the Philadelphia and Baltimore quad. Thus a circuit of three wires with two sets of quad. repeaters will be working continually between Boston and Baltimore, and doing the work of 12 wires if necessary. Gerrit Smith's new instruments and bugless relay will be used.

A despatch to Reuter's Agency in New York states that the telegraphic cable between Madras and Panang is broken, and communication east interrupted.

Atlantic Cable Notes.

THE Duxbury and St. Pierre cable is still broken, the steamer sent out from Halifax for that purpose not having yet succeeded in repairing the break.

An interruption on the land lines east temporarily suspended communication by the Anglo-American cables on Wednesday last.

The Direct United States Cable is working satisfactorily, and is receiving a good share of patronage since it was reopened to the public.

A Professorship of Telegraphy.

A COURSE of instruction intended for the higher class of telegraphic employes has recently been established in the Polytechnic Institute of Dresden, Saxony, the Professorship of which has been accepted by Dr. Karl E. Zetzsche, of Chemnitz. Dr. Zetzsche was formerly an operator in the Austrian telegraph service, but about the year 1858 he removed to Chemnitz, where he became a successful teacher of mathematics and natural philosophy. It is, however, as a critical and historical writer on the electric telegraph that Dr. Zetzsche has become more especially distinguished. In addition to numerous essays in various scientific periodicals, which he has published from time to time, he is the author of a number of standard works, which have given him a deservedly high reputation. Among those may be mentioned *The Copying Telegraph*, *The Type Printing Telegraph* and *The Double Telegraph*; *The Catechism of the Electric Telegraph*; *A Short Sketch of the History of the Electric Telegraph*, and quite recently, *The Development of Automatic Telegraphy*.

The Polytechnic School of Dresden has already, under Prof. Zouner, acquired a high standing in many branches of learning, which will without doubt be enhanced by the appointment of a Professor of such ability as Dr. Zetzsche.

Telegraphic and Electrical Brevities.

A SET of duplex was recently put up in the Houston, Texas, Western Union office.

On Thursday, the 25th inst. (Thanksgiving Day), and on Saturday, December 25th (Christmas), and on Saturday, January 1st (New Year's Day), office hours of the Western Union Telegraph Company will be from 8 to 10 o'clock A. M., and from 4 to 6 o'clock P. M., except at repeating stations and at principal offices, which will be kept open as usual, but with such reduction of force as circumstances may permit.

The new railroad telegraph line from Troy to Whitehall, N. Y., has been completed.

The Indians are very thankful for the telegraph poles on the prairie. They formerly had to ride a long distance to find a place to chain a prisoner to while they tortured him.

The Telegraphers' Mutual Benefit Association.

- 8, 51, 61, 70, 74, 76, 97, 101, 108, 112, 120, 129, 134, 154, 156, 158, 160, 164, 171, 188, 208, 218, 227, 230, 245, 248, 257, 278, 279, 280, 281, 282, 283, 285, 334, 341, 350, 353, 356, 357, 360, 362, 364, 381, 382, 398, 402, 405, 406, 411, 412, 413, 418, 425, 463, 478, 510, 511, 512, 533, 548, 561, 566, 569, 573, 574, 577, 584, 590, 597, 600, 601, 618, 642, 648, 649, 655, 659, 660, 662, 663, 664, 665, 667, 669, 678, 680, 694, 717, 723, 724, 728, 730, 733, 769, 772, 780, 790, 791, 803, 812, 820, 821, 823, 848, 870, 876, 897, 905, 927, 931, 938, 939, 942, 949, 954, 957, 959, 963, 964, 979, 992, 995, 1005, 1030, 1031, 1033, 1034, 1038, 1046, 1050, 1055, 1058, 1063, 1069, 1072, 1101, 1139, 1190, 1210, 1211, 1233, 1234, 1237, 1238, 1241, 1248, 1267, 1268, 1269, 1270, 1288, 1290, 1292, 1294, 1307, 1309, 1311, 1312, 1313, 1314, 1315, 1317, 1318, 1319, 1320, 1321, 1322, 1336, 1353, 1354, 1355, 1356, 1372, 1376, 1406, 1415, 1428, 1438, 1439, 1457, 1458, 1482, 1483, 1484, 1500, 1515, 1532, 1537, 1542, 1546, 1560, 1576, 1580, 1590, 1596, 1605, 1607, 1608, 1625, 1634, 1637, 1639, 1652, 1655, 1658, 1660, 1661, 1662, 1665, 1667, 1676, 1678, 1684, 1687, 1688, 1692, 1695, 1696, 1709, 1710, 1713, 1714, 1724, 1728, 1732, 1745, 1765, 1766, 1767, 1787, 1788, 1789, 1795, 1796, 1797, 1804, 1823, 1824, 1835, 1837, 1838, 1839, 1840, 1841, 1844, 1845, 1857, 1858, 1859, 1860, 1863, 1874, 1877, 1889, 1911, 1913, 1914, 1934, 1943, 1946, 1951, 1953, 1958, 1968, 1978, 1992, 1993, 1997, 1999, 2000, 2001, 2005, 2010, 2012, 2022, 2027, 2028, 2033, 2035, 2036, 2041, 2045, 2053, 2065, 2072, 2074, 2075, 2092, 2108, 2118, 2119, 2120, 2123, 2125, 2131, 2136, 2137, 2142, 2145, 2156, 2157, 2167, 2175, 2183, 2184, 2185, 2187, 2191, 2192, 2195, 2196, 2211, 2220, 2224, 2225, 2230, 2231, 2233, 2234, 2237, 2238, 2245, 2246, 2252, 2254, 2255, 2263, 2271, 2273, 2280, 2291, 2292, 2301, 2304, 2323, 2327, 2340, 2341, 2342, 2350, 2357, 2361, 2366, 2368, 2369, 2394, 2401, 2416, 2419, 2423, 2426, 2429, 2435, 2437, 2443, 2446, 2452, 2462, 2466, 2473, 2476.

ASSESSMENT No. 78.

- 5, 27, 51, 237, 238, 242, 246, 258, 451, 453, 455, 457, 801, 1028, 1080, 1153, 1207, 1600, 1609, 1657, 1715, 1716, 1731, 1786, 1973, 1974, 1976, 2037, 2128, 2177, 2320, 2328, 2353, 2475.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POSE, Elizabeth, N. J.

For the week ended Oct. 19, 1875, and bearing that date.

168,919.—PRINTING TELEGRAPHS.—George M. Phelps, Brooklyn, N. Y. [Filed March 25, 1875.]

Type printer controlled by a perforated fillet of paper.

1. The combination of a paper feeding mechanism, punching mechanism, and mechanism for stopping the movement of the feed at distances proportionate to the relative distances between the successive types to be printed, so as to compose in a strip of paper a message that can be used in transmitting for a printing telegraph.

2. The combination of a type wheel and punch in a telegraphic composing instrument, so that the letter represented by the perforation is printed simultaneously with the perforations, as set forth.

3. The range of pins i, operated by keys, the revolving type wheel a, shaft a', and arm e, in combination with the paper feeding mechanism, punch, and punch actuating devices, brought into operation when the type wheel is stopped, substantially as set forth.

4. The combination, with a type wheel and punching, feeding, and stopping mechanism, of an additional paper feed, actuated independently of the motion of the type wheel, substantially as and for the purposes set forth.

5. A telegraphic transmitting strip of paper, perforated with holes at distances apart proportionate to the relative distances of the characters required on a type wheel, and with additional length between the perforations, to allow for the time during which the type wheel is detained in printing, substantially as set forth.

168,949.—PRINTING TELEGRAPHS.—Charles J. Wiley, New York, N. Y. [Filed April 6, 1875.]

For shifting the printing from one to the other of the type wheels, and vice versa.

1. The type wheel a, connected to and revolving upon a circular bearing upon the lever b, and the second type wheel e, similarly connected to the lever a, in combination with the shifting cam k, that acts upon the levers, and the means for raising the type wheel that is not in action off the paper, as set forth.

2. The two type wheels independent of the shaft by which they receive a step-by-step movement, and sustained by levers, in combination with the mechanism for printing and for moving the levers by the motion of the printing lever, substantially as set forth.

169,057.—ELECTRIC CLOCKS.—D. F. Sweet, Hastings, Mich., assignor of one half his right to Homer Moul and J. Lee Reed, same place. [Filed Sept. 14, 1875.]

Circuit is closed to the electro-magnet through an elbow lever swung into contact with a set-screw by means of a pin projecting from the balance-wheel, which pin, in the motion of the armature toward the magnet, takes against a spring attached to elbow lever. As the armature nears the magnet, the pin escapes from the spring and the circuit is broken. The tension given to the spring of the balance-wheel in this forward motion of the armature carries the armature back to the other limit of its swing.

In an electric clock, the combination of the toothed wheels C1, C2, and C3, cams f, f', hands B1 B2 B3, armature lever D, arms k k' and pawls h1 h2 h3, balance wheel H, having spring I, pin m, springs s, arm J, and set-screw p, all constructed and arranged substantially as and for the purposes herein set forth.

Born.

STOCKMEYER.—At Dayton, Ohio, Nov. 8, 1875, to Mr. JOHN E. STOCKMEYER, Agent of the Ohio and Mississippi R. R. at Flor. Ill., a s u, 10 1/2 pound s.

NOTICE.

Communication with China, Japan, the Straits Settlements and Australia is interrupted owing to the cable between Madras and Penang being broken, and the Nagasaki Cable not being yet repaired.

Telegrams for these countries will be posted from Point De Galle or Rangoon to Penang or Singapore, whence they will be telegraphed to their destination.

The tariff remains unaltered.

GEO. G. WARD, SUP'T.

Direct United States Cable Co.

THE LECLANCHE BATTERY.

THE WORLD RENOWNED Open Circuit Battery.

NO ACIDS! NO SULPHATE OF COPPER! DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED to Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHE BATTERY COMPANY,

No. 40 West 18th Street, or

L. G. TILLOTSON & CO., Sole Agents,

8 Day Street, New York.

BRADLEY'S APPARATUS FOR ELECTRIC MEASUREMENT,

COMPOSED OF HIS Tangent Galvanometer and Rheostat. (Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING WHEATSTONE'S BRIDGE, Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED NAKED WIRE HELICES, for Electro-Magnets, wound to any given size and resistance.

Manufacturers of Telegraphic and Electrical Instruments supplied at low rates. For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

SIEMENS' UNIVERSAL GALVANOMETER

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,

22 SOUTH TWENTY-FIRST ST.,

PHILADELPHIA.

FOR ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystallizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

No. 1 Cell, \$5.00. No. 2 " 10.00.

L. BASTET,

619 Broadway, New York.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of THE TELEGRAPHIC MANUAL, by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,
 MANUFACTURER OF TELEGRAPH INSTRUMENTS,
 104 CENTRE STREET, NEW YORK.

BATTERIES of every description for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the CHESTER PIN DIAL (patented), designed expressly for POLICE and LAW TELEGRAPHS. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell cut out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,

for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,

for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,

CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH;

so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,

REGISTERS, RELAYS, CALL BELLS,

and every description of Central Office apparatus, at most reasonable prices.

Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN"

in which the spring takes the place of the weight, is enclosed in a metal and glass case; is noiseless in its action, and of great beauty and finish, and is specially recommended to Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.

**ELECTRO-SURGICAL APPARATUS
 OF EVERY VARIETY AND DESCRIPTION.**

HOTEL ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns: Grand Union, Saratoga; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y.; Willard's Hotel, Washington, D. C.; Galt House, Louisville, Ky.; Tefft House, Buffalo; and many others. *Proprietors and keepers of Hotels most liberally dealt with.*

THE "COUNTING ROOM BELL MAGNETS,"

for communicating instantly to clerks and employes, by means of a keyboard, in any desired place.

ALSO,

BELL MAGNETS AND PUSH BUTTONS,

for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$3.00 upwards.

Sole Agent of the

WILSON ELECTRIC GAS LIGHTING CO

for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for

LIGHTING FACTORIES, MILLS, ETC.

By simply pushing a button on his bench the operator lights a section of burners.

Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

104 CENTRE STREET.

P. O. Box 2766.

JUST OUT.

NEW AND ENLARGED EDITION OF

**SMITH'S
 MANUAL OF TELEGRAPHY**

CONTAINING

Complete Directions for Self-Instruction in Telegraphy,
 Instructions for Building and Operating

SHORT LINES OF TELEGRAPH,

Diagrams showing the manner of connecting wires, batteries instruments, &c.

Descriptions and cuts of all forms of telegraph instruments, batteries, &c.

Cuts, descriptions and prices of the

- West Roxbury, Mass.,
- Washington, D. C.,
- Worcester, Mass.,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

- First**—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.
- Second**—The Automatic Signal Boxes.
- Third**—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.
- Fourth**—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the **UNITED STATES** and **CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY, RELIABILITY and **ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES** and the **DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in **Fire Alarm and Police Telegraphy**, upon application as above.

WESTERN ELECTRIC MAN'FG CO.

220 Kinzie Street,
CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.
THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished. It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

- Private Line Outfit, complete.....\$10 00
- Instrument only..... 8 00
- Bliss Reservoir Battery, per cell..... 2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

WHOLE No. 489.

Original Article.

Chicago Poetical Squibs.

By "OCCASIONAL."

INTERSPERSED among the time notes of "more" and "out" of copy, in the record book of our artist who takes Smith report, I find the following poetical gems. First he takes in his surroundings, and then, with a sigh, exclaims:

"This office is a place, you know,
That most of us would gladly shun;
Yet, somehow we must come and go
As regularly as the sun."

The lines further along seem to indicate that he had "lost his grip" upon the last pay day:

"This fact you may have known before,
You may have felt it from a boy,
'Tis inconvenient to be poor,
And hug a curse without a joy."

Then again he appears to be grasping at the problem of life:

"More and out" is the nightly refrain;
'Tis so with the most that life can boast,
Its pleasures come and end again,
Hardly sooner gotten than lost."

Next he deals with a correspondent of THE TELEGRAPHER:

"Some Cockney bull eatin' nobby
Declares, in a way that's a sin,
That 'Harkaway's' bulletin hobby
Is good, but a little too thin."

Then the man with the euphonic name is immortalized:

"That word that I would place the first
Of all sad words that I have heard,
Is 'Smith,' for 'tis the very worst
That e'er my mortal bosom stirred."

At 12:30, A. M., a member of the *other* family is handed down to posterity in the following manner:

"Some might choose, in an hour like this,
To rest their weary bones,
But I prefer the rarer bliss
Of worrying 'Nip' Jones."

The flattering eulogy is continued "thusly:":

"Morse's ghost cannot control
The hand of this bad sender,
But sure 're-morse should seize the soul
Of such a mad pretender."

Then another bard "chips in" with this epigrammatic "Rap-sody" on "Tommy" Knox.

"Our day report man *sometimes* breaks,
But does it in a way that takes;
His every move the art betokens,
First he 'Knox' and then he 'opens.'"

After which one of "Tommy's" friends, who probably feels aggrieved at the plainness of the above, cautions the writer in this wise:

"Hard knocks will win most lasting fame,
Tom "keep this fact in view,
From what I know of Knox's name
He soon will knock the socks off you."

In the New York press record only one verse is found, probably the bards had "dug" all out previously for the "Smith" record, leaving only the following:

"He who may chance to struggle here
For glory, or his stomach's sake,
Can only live, with naught to fear,
While he can manage not to break."

One of our artists being requested to furnish a specimen of his "copy" (as he received report) to an eastern brother, does so by indulging in the following rhetorical strain:

"It was a cold, dark morning. The city streets were swept by a bitter wind, which drove before it clouds of dust, and tearing riotously on shook awnings and blinds, as it came dashing down Clark street, sending some of its flying eddies through the rattling windows of the south side Police Court room. A dreary place at best, it was rendered more than usually so by the gloom outside, the wail of the wild breeze, and its chill breath, which contended successfully against the little heat coming from a newly lighted fire in a rusty stove, and triumphing over it, filled the room with currents of air that made the miserable prisoners shiver in their wretched garments."

After which he "al"-lows the muso to possess his soul with the following result:

"Above, in a business sort of way,
Is the 'hand' I use for every day;
While in this little verse you will see
The 'hand' I would use for love and thee."

[From *The New Dominion*.]

Wooing by Wire.

A TELEGRAPH SKETCH.

(Concluded from page 277.)

SO ONE day, when there is a lull on the line, he calls her up and artfully remarks:

"I have been getting some new pictures taken."

"Are they good?" asks Mildred.

"Yes, splendid," he modestly replies. "Best I've ever had."

And then he waits, expecting her to say she would like to see one. But she only asks:

"When did you have them taken, and how did you manage to leave the office long enough to sit for them?"

Tom is covered with confusion and feels himself a swindler, for the pictures have been lying in his desk since last Christmas, and she would naturally suppose, from the way he spoke, that they had only just been sent home from the artist's. In order to get out of the dilemma gracefully he ingeniously ignores the first part of her question, and answers the second:

"Oh, I got Phil Burke to run the office for a few hours. He is able to manage two offices when he likes to exert himself, you know."

He has not time to say more, for some one is waiting to get business off. But he does not give up the notion—it is not his way to do that. He begins casting about in his mind for some other way of accomplishing it. By-and-bye he forms a bold resolution.

"That's it," he exclaims. "I'll send her my photo, and ask her to return me hers."

He is not afraid she will refuse—no one ever does refuse Tom anything he sees fit to ask.

Next day Miss Sunnidale receives a letter, with the picture of a very handsome man enclosed, together with a little note. The note is beautifully written, but carelessly worded.

"I take the liberty of sending you my photo," it runs. "Please return the compliment by first mail."

She is surprised and perplexed. What does it mean? It is something new for her to receive a note from a gentleman, still more a picture. She scarcely knows whether to be pleased or offended. He is very nice looking, but the note sounds cool and conceited. What right has he to send his picture without asking permission?

Then the spirit of mischief enters in and takes possession of the little lady.

She gets a dainty sheet of note paper, and demurely writes thereon: "Many thanks for the compliment. I return it by first mail, as requested."

This she encloses in an envelope, together with the picture he sent, addressed it to him, and drops it in the post-office without delay.

He only lives ten miles away, and it is now nine o'clock—it will reach him by noon. So she quietly sits down to await developments.

Tom is furious when he receives it—just at first. He is not used to being snubbed, you see.

But presently the humor of the affair forces itself upon him, and he laughs heartily.

"It just serves me right," he reflects. "It was rather impudent of me to send it. Well, she knows how to hold her own, at all events, for all she seems so simple."

But still Tom feels rather sore about it, and never speaks a word to her all day. When evening comes, instead of wishing her good night, as usual, he goes off without a word.

In the meantime Mildred is waiting and wondering what he will say. She expects him to take it good-humoredly, and perhaps make some half laughing apology. But as the day passes away, and he gives no sign, she grows anxious, and wonders if he is very angry about it. However, he will be sure to call her up to say good night, and then they can have a little laugh over it.

When night comes and she finds that he has gone away without calling her, her foolish little heart sinks within her. She closes up the office, and walks slowly to her boarding house, feeling very wretched.

She doesn't want any tea, she says, when her landlady knocks at her bedroom door, to announce that it is ready.

During the hot summer night that follows she tosses up and down restlessly, sorrowfully, and finally cries herself to sleep.

Of course it wasn't right—it was very undignified and silly; but don't be hard on the poor little creature. Her's was such a lonely life—her heart was so hungry for friendship, and Tom had been very kind to her. How could she help feeling sorry she had offended him?

Next day Tom relents—he bids her good morning.

She answers quietly, pleasantly, just as usual. Not for worlds would she have him think that she had noticed last night's neglect and been troubled by it.

Then Tom says, "I owe you an apology for sending that note yesterday, but I did not think you would be so hard-hearted as to snub me quite so unmercifully."

"Oh, I'm sure I never thought of snubbing you," she protests, very earnestly, "I only meant—"

But she finds a difficulty in explaining what she did mean, so naively adds, "I simply obeyed orders. You told me to return it, you know."

"But you knew well enough what I meant," say Tom. "I've a great notion to send it back to you again. Would you think me very presumptuous if I did?"

No, she would not think him presumptuous. And her heart flutters strangely.

"Would you send me back one of yours?" continues Tom, craftily following up his advantage.

But to this she answers not a word. She is thinking, "Would he want it if he knew I was thirty years old, and so dreadfully plain?"

Next day the handsome picture comes back to her again. She does not return it this time. She takes it home, instead, and dreams over it.

But Tom has hard work to persuade her to send him hers. And, at length, when she does so, she tells him very honestly that he must not think it is like her, for her pictures are always a grand improvement on the original.

It is true that she makes a very good picture. The large brown eyes show off to full advantage, the "tip-tilted" nose takes a more classic outline, and you would never suspect that her hair was red. But, on the other hand, her gentle, womanly expression is not enhanced by the photographer's art, and you miss the wondrous sweetness of her smile.

He has an album full of pretty girls' pictures at home, but none of them ever received so much attention from him as this. He looks at it again and again, studying every point of view, and at last, when no one else is in the office, consistent Tom, who has a great contempt for "softness," and was never known to act the "spooney" in his life, casts a furtive glance around, as if afraid of being seen, and then actually raises the poor little spinster's picture to his lips! After which he blushes furiously, calls himself a soft head, and tries to make believe he is only stroking his moustache with the card.

Presently he calls Miss Sunnidale, and asks her if she will remain a little while after office hours, as he has something to tell her.

She consents, and during the rest of the day keeps wondering what it can be.

And at night, when business is over, and the line is quiet and still, he cautiously cuts off all the offices on the other side of him, by putting on the ground wire, so as to guard against listeners, calls "Sg," and begins to tell it.

It is only the old, old story over again—the story of heartfelt respect, of undying love. But to Mildred it sounds strangely new, and strangely sweet.

It is hard—O, so hard! to put it away from her, but she does it bravely, firmly.

When he vows to love her, and be true to her all life long, and asks her to plight her troth to him in return, she answers:

"No, it is not me you love, but some ideal assemblage of virtues of your own creation, which you fancy I resemble. When you saw me, and discovered your mistake, you would repent your bargain. Why, I am an old maid, with red hair!"

She makes the announcement slowly, as though conscious that she is thereby demolishing every vestige of romance connected with her in Tom's imagination, and feeling sadly reluctant to do it.

Tom laughs. It is so funny of her to think it such a dreadful thing to have red hair!

He solemnly declares that red is his favorite color in hair, and as for her being an old maid—well, the more aged she is the more sense she is likely to have. He tells her he doesn't set much value on a pretty face. It is her good qualities he is in love with—her purity of heart, her nobility of mind, her sweet, unselfish disposition. With her to help him he could live a better, nobler life than he could ever hope to do alone. She would be his good genius, his guardian angel—restraining him from evil, encouraging him in good.

But the little woman is inexorable. She holds steadfastly to her point, and refuses to engage herself to a man whom she has never seen, and she won't tell him whether she likes him or not.

Tom is in despair, and at last asks if he may drive over on Sunday and see her.

She agrees to that, and hastily bids him good night, half suspecting that it is all a wild dream, out of which she will awaken presently and laugh at her own folly.

It is three whole days till Sunday, and Tom and Mildred both think that days never dragged themselves out to such an interminable length before since the world began.

It comes at last, the longed for, yet dreaded Sunday. Mildred rises early, though she knows he cannot be here for some hours yet. She is too restless to lie still.

Very anxiously she gazes into the glass and sees a woe face, with a feverish flush on the cheeks and eyes glowing like stars.

The day is going to be intensely hot, and she arrays herself in a fresh white muslin, cool and dainty looking, with pale blue ribbons at the throat.

Again she stares earnestly into the glass, sees that her dress is very becoming, feels conscious that she is looking her best, and is glad. Then comes the reaction. Something tells her it is not quite fair to make herself look better than usual. So she takes off the pretty white dress a little sadly, and dons a quiet dove colored silk, that makes her look like a little Quakeress.

A perfect simpleton!

Well, perhaps so. But she knows very little of the ways of the world, and is true to her own idea of honesty. After all, there are many things worse than being a simpleton.

She fastens a bunch of pansies and mignonette in her bosom, and, book in hand, descends to the parlor to await his coming.

About an hour afterwards she hears a knock at the door, and then a tall, fine looking man, with wavy brown hair, and eyes of the deepest, darkest blue, is shown in.

He stands before her, clasping her little hand in his, respectfully yet tenderly.

And this is Tom? She looks up to him without a word, wondering wistfully if he is very much disappointed in her.

If he is he does not show it. He picks up the book she let fall on his entrance and passes some remark about it. Soon they are engaged in an animated discussion of books and authors. After a while he skilfully manages to bring the conversation around to the point where they dropped it the other evening. He wants her to tell him if she thinks she could learn to love him, now that she has seen him.

The tall-tale flush spreads swiftly over her cheeks and brow, and she begins to tremble. But she wilfully refuses to answer just yet. She will see—she will tell him some other time—she must get ready for church now—the bells are ringing.

So they go to church together, and mingle their voices in prayer and praise. After that they take a quiet pleasant ramble through the cool shady lanes, then go home and have lunch, and another delightful long chat in the quaint old parlor. The kind hearted landlady, with whom Mildred has boarded for years, is "glad that Miss Sunniddle has got a beau at last—and such a likely looking gentleman, too. But if she should get married and go away the place will seem very lonesome without her."

It seems quite probable that she will get married, too, for when Tom leaves for home there is a tiny ring gleaming on the little old maid's finger, and a bright, happy look in her face, which makes her seem ten years younger and almost pretty.

Some weeks afterwards, when Phil Burke rushes into the office, and excitedly demands if it is true that he is going to marry the operator at "Sg" office, he calmly answers, "Yes, I have taken your sensible advice, and put my theory into practice by asking her to become Mrs. Tom Gordon. It may be a very risky way of choosing a wife, but I'm satisfied I've made a good hit of it. She is as good as gold—the best little woman that ever lived; and I don't believe that I would ever have found it out except by working with her over the line."

Phil congratulates his old friend very heartily, but is still rather doubtful of the advisability of "wooing by wire."

As for Mildred, she no longer disputes Thackeray's assertion that a woman may marry whom she likes. Her prince has come at last.

Annual Meeting of the American Electrical Society.—Its Excellent Financial Condition.—Honorary Members Elected.

—The Constitution and By-Laws Amended.

CHICAGO, ILL., Nov. 18.

TO THE EDITOR OF THE TELEGRAPHER.

The American Electrical Society held their first annual meeting yesterday in parlors Nos. 1 and 3 of the Grand Pacific Hotel, in this city. It was one of the most interesting the Society has ever held. The harmonious feeling which has characterized all of the meetings held since the organization of the society (over a year ago), was unusually noticeable. The members began to assemble at the hour set for the meeting (10 A. M.), but it was 11:40 before it was called to order. The President of the society, Gen. Anson Stager, presided.

C. S. Jones, Recording Secretary, read the minutes of the organization meeting of 1874, which were approved.

There was a large attendance of members present, prominent among whom were Col. J. J. S. Wilson, Gen. Anson Stager, C. S. Jones, G. H. Thayer, E. B. Chandler,

S. L. Robinson, C. H. Summers, Wm. Henry Smith, E. P. Warner, J. P. Towler, E. M. Barton, L. B. Firman, M. G. Kellogg, Dr. E. A. Hill, M. L. Lawson, W. C. Long, H. C. Maynard, Chicago; B. T. Howard, Chas. Ross, Columbus, Ohio; N. Hueker, J. W. Tillingham, Buffalo, N. Y.; E. P. Wright, Cleveland, Ohio; Geo. T. Williams, B. H. Johnson, Cincinnati, Ohio; O. H. Booth, Mansfield, Ohio; Charles O. Rowe, Pittsburg, Pa.; E. Sholes, Dubuque, Iowa; Hugh Neilson, Toronto, Canada; C. H. Haskins, Alfred Weller, Milwaukee, Wis.; George E. Simpson, Aurora, Ill.

The Treasurer's report, which was read and accepted, showed that with the balance in the treasury fund, and when yearly dues were paid and new members qualified, the society would have nearly six hundred dollars available funds.

The following gentlemen were elected members of the society: Martin Ryan, Editor *Protection Advocate*, Actuary and Director *Ryan Life Insurance Company*; E. P. Whitford, Assistant Board of Trade Manager, W. U. Telegraph Co.; A. G. Stolbrand, Manager A. & P. Telegraph office; Samuel J. Smith, Private Secretary to Gen'l Supt. Sweet, A. & P. Telegraph Co.; Dr. G. C. Somers and A. J. Long, all of Chicago; and R. T. Howard, of Columbus, Ohio.

A number of scientific papers, that had been read at the monthly meetings, were read by title, and ordered printed in book form, with cuts and diagrams representing the various subjects treated therein.

Dr. Hill read the following communication from William Sooy Smith, Chairman of the Committee on Physical Phenomena, of the United States Testing Board:

"CHICAGO, Nov. 17.—*Dr. Edward A. Hill:* The Committee on the United States Board to test iron, steel, etc., for physical phenomena, desires to interest those whose tastes or pursuits lead to a study of thermal, electrical, magnetic, and galvanic phenomena, in the work which this Committee has in hand.

We hope that careful observations, made with such delicate instruments as you may be able to suggest, employed in ways which you may be able to point out, will lead to most important discoveries.

We believe, for instance, that when a bar is subjected to a tensile or compressive strain, constantly increasing, at the instant that the strain passes the limit of elasticity of the metal and produces a permanent set or change of dimensions of the bar, the molecular disturbance that takes place will be accompanied by a development of heat and electricity in some form which can be observed. The value of such observations in our work, which is of a national character, will be very great, and I venture to ask the assistance of your organization in devising the proper methods and appliances for making them.

Yours very truly, WILLIAM SOOY SMITH."

An interesting discussion followed the reading of the letter, and was participated in by several members of the society, who showed a hearty desire to assist in the proposed work, which, however, is no new idea with advanced electricians.

A committee to consider the matter was appointed by the chair, on the motion of Wm. Henry Smith, as follows: C. H. Summers, Dr. E. A. Hill, Gen. A. Stager, Chicago; C. H. Haskins, Milwaukee, and Thomas Henning, Buffalo.

A committee, consisting of C. H. Haskins, A. Weller and W. C. Long, were appointed to draft resolutions of respect to the memory of Dr. J. N. Lapham, late State geologist of Wisconsin, and a member of the society, who died of heart disease at Manitowoc, Wisconsin, a short time since.

The committee subsequently reported the following resolutions, which were adopted:

Resolved, That this society has sustained a severe loss in the death of Professor J. N. Lapham of Milwaukee, an eminent scientist, and a most exemplary citizen.

Resolved, That the Recording Secretary convey to the family of the deceased the expression of the heartfelt sympathy and respect of the members of this society in this their bereavement.

Letters of regret on account of inability to attend on account of pressing business engagements, were read from Messrs. Parenteau of Terre Haute, Dickey of Omaha, and others, who pledged their earnest support to any action taken by the majority, which should establish the society on a firm foundation, and promised to work energetically for it in the several localities where they resided. The Executive Committee made a very full and satisfactory report of what they had done during the year, and although some fault had been found because the papers read before the monthly meetings of the society had not been printed and distributed to the members, the committee were of the opinion that the society would uphold them for not rushing into print every month with but a meagre amount of matter for publication, and give them the credit of acting wisely in husbanding the documents until the end of the year, as they had done, and thus be able, with the large number of interesting papers which have been read before the society during the past year, to form a book of great value and interest to electricians.

The society resolved itself into a Committee of the Whole, with Gen. Stager in the chair, to consider the report of the Special Committee on Amendments to the Constitution. Each article was taken up separately, and after a great deal of discussion an amended constitution and by-laws was adopted. The committee rose, and reported to the society, and their report was adopted with but one dissenting vote, that of a member represented by proxy.

In the amended constitution and by-laws the holding of monthly meetings was abolished. Hereafter the society will meet annually at such place as the Executive Committee may determine. Auxiliary societies will be formed in the various cities throughout the country. Papers coming before these auxiliary societies will be referred to the annual meetings of the main body.

On invitation, the society enjoyed a "Grand Pacific" dinner—your correspondent doing ample justice to a square meal for once. The society having adjourned at 2 P. M. for the purpose above mentioned, they did not assemble again until 7½ P. M., when the next order of business was taken up. Messrs. Haskins, Booth, Neilson, Wright and Williams were appointed a Committee on Nominations.

After consultation, they reported the following ticket, which was balloted for and unanimously elected: For President, Anson Stager, of Chicago; First Vice-President, C. H. Haskins, of Milwaukee; Second Vice-President, Geo. B. Prescott, of New York; Third Vice-President, Harvey P. Dwight, of Toronto; Fourth Vice-President, John Van Home, of New York; Fifth Vice-President, I. N. Miller, of Chillicothe, Ohio; Sixth Vice-President, E. P. Wright, of Cleveland; Seventh Vice-President, J. J. Dickey, of Omaha; Corresponding Secretary and Librarian, F. W. Jones, of Chicago; Recording Secretary, C. S. Jones, of Chicago; Treasurer, E. B. Chandler, of Chicago; Executive Committee, C. H. Summers, J. J. S. Wilson, Wm. Henry Smith, G. H. Bliss, F. H. Tubbs, all of Chicago; Directors, W. W. Smith, of Indianapolis; S. D. Field, San Francisco; George T. Williams, Cincinnati; C. O. Rowe, Pittsburg; R. C. Clowry, St. Louis; N. Hueker, Buffalo; Hugh Neilson, Toronto; O. H. Booth, Mansfield, O.; J. W. Tillingham, Buffalo; W. C. Long, Dr. E. A. Hill, Chicago; A. Hayward, Vincennes; E. Sholes, Dubuque; C. W. Ross, Columbus, Ohio; M. C. Bristol, Cincinnati.

The Committee on Nominations also proposed the following as honorary members: Z. G. Simmons, Kenosha, Wis.; Wm. Orton, New York; T. C. Mendenhall, Columbus, Ohio; J. D. Layng, Pittsburg; Cyrus W. Field, New York; Thos. Swinyard, Toronto; Sir Hugh Allan, Montreal; Dr. N. Green, New York; A. B. Cornell, New York; Moses G. Farmer, Salem, Mass.; J. D. Caton, Marvin Hughtit, Chicago; Joseph Henry, Washington, D. C.; J. H. Wade, Cleveland.

These gentlemen were unanimously elected, and the Recording Secretary directed to notify them.

Gen. Stager was nominated and elected by acclamation, and the Secretary directed by a unanimous vote to cast the vote of the society for him as such before the nominating committee retired, thus showing the appreciation of the members for the able manner in which the General had conducted the affairs of the society during the past year. The nominations for officers, Executive Committee and Directors were so judiciously made that there had to be but one ballot cast for the whole ticket, thus saving a great deal of valuable time. The honorary members were elected one by one, and all received unanimous votes. In notifying members of their election, the Recording Secretary was directed to quote from the constitution and by-laws as to how they should qualify.

Mr. Haskins took the chair temporarily, and stated that he had had a conversation with Gen. Stager, and the latter had urged more earnest work among the members, and offered, rent free, a room in the Western Union Telegraph building for one year, for library and other purposes.

Gen. Stager expressed the hope that at the end of the year a larger room would be procured, and suitable books obtained for the library.

Mr. Chandler recommended that the works of the English society be procured.

The Directors withdrew and decided to hold the next annual meeting in this city, on the third Wednesday in October, 1876.

This was a unanimous decision, although the Chicago members of the Directory were willing and rather anxious that some other city should have the honor. The other members insisted that Chicago was the place, and that after the auxiliary societies had got fairly to work in the other cities, and showed by a year's work that they were ready and willing to hold a successful annual meeting of the main society, then it would be time enough for some of them to aspire to that honor. The Directors' report was concurred in unanimously by the society.

The thanks of the society were tendered to Mr. Turner, manager of the Grand Pacific Hotel, for the very comfortable accommodations furnished the society, and for the courtesies extended the members.

The society then adjourned at 9:25 P. M.

OCCASIONAL.

Telegraph and Postal Combinations.

TO THE EDITOR OF THE TELEGRAPHER.

"If this large and powerful California Telegraph Company will satisfy the Washington Government of their earnestness and sincerity in proposing to build a network of superior lines throughout the country, and serve the public correctly and with reasonable promptness with 20 word messages in short circuits for 10 cents, and in longer circuits for 25, 50, and 100 cents, provided the Post-office Department will cooperate with them, so far as it may without pecuniary loss or inconvenience, why should not Congress grant the concessions prayed for, and thus confer the greatest possible boon upon its constituents?"

I have read, with much interest, your consistent and able editorial "in deprecation of a proposed connection of the National Telegraph Co. of San Francisco with the P. O. Department," in which you aim to refute my arguments in favor of such a connection or combination.

Whilst conceding the plausibility and even the cogency of your general arguments against the Hubbard bill and all other sharp schemes of the past to enlist the General Government, financially, in telegraph companies or telegraph speculations, which have found few advocates in this country amongst disinterested people of average shrewdness, you will permit me to say that your answer to my direct inquiry (which I ask you to reprint at the head of this letter) is much more an answer to the fraudulent Hubbard bill than an answer to my direct inquiry.

After stating the objectionable features of the Hubbard bill, in which 999 out of every 1,000 sensible and disinterested citizens of the country are in full accord with you, you ask, with your usual complacency, "Is not this precisely what the National Company propose to do?" To which I answer, there is not, to my apprehension, the least similarity in the proposals of Hubbard and what I understand are the proposals of Mr. Cohen, on behalf of the National Company.

In the first place, Hubbard proposed no considerable lower rate of tariff for ordinary messages, to be sent only at the convenience of his bogus company, than the W. U. Co. have voluntarily adopted for all classes of messages; whilst it is well known that the Hubbard gang of needy speculators contemplated, and their bill was so drawn as to give them the power to force the business community to pay even a much higher tariff than is now charged for any class of messages by the W. U. Co.

In the second place, Hubbard's bill contemplated that the Government should pay to his company nearly the entire running expenses of the telegraph lines, except the single item of operatives' salaries. Competent experts have estimated that under the Hubbard bill the P. O. Department would have contributed to Hubbard's bogus telegraph company at least two millions of dollars per year more than the Government could have possibly received, and yet the actual tariff rates contemplated were not more favorable to the business public than those voluntarily conceded by the W. U. Co.

In the third place, the Hubbard bill contemplated an odious monopoly of the intercommunication of the country through the strong arm of the National Government, which was to be dragged into the support of a gang of totally inexperienced and needy political hucksters, with nothing in the world to trade upon except what they carried in their brassy faces and oily tongues.

Now, I do not understand that there is a single feature in this Hubbard picture that bears even the slightest resemblance to the Cohen programme—hence, with all possible respect for your opinions, I do not think your reply to my inquiry is really an answer to it, beyond the admitted fact that you have always been consistent with your present attitude in protesting against any connection whatever between the Government and the telegraph.

I agree with you that the National Government ought not to listen to any idea of favoritism to one telegraph company over another, and I do not understand that Mr. Cohen has contemplated such a state of things.

The W. U. Co. and all the present opposition lines in the country are in accord in demanding rates of tariff which Mr. Cohen and his associates believe to be from 50 to 75 per cent. above the necessary rates for a new and strong company, which should adopt all the best of the modern improvements in line building and line working.

Whilst the W. U. Co. shows the utter impossibility of its doing 10 word messages over circuits of even 25 miles at a cost of 25 cents, by any method of line building or line working that they think proper to adopt, and whilst the managers of the A. and P. Co. go back upon their public promises, and put up their rates at the dictation of and to correspond with the W. U. Co., and the managers of the S. and A. Co. betray their constituents by conspiring with the W. U. Co. to keep up the present apparently exorbitant tariff between New York and New Orleans, Mr. Cohen, backed by \$25,000,000 of capital, presents himself before the public, and, appreciating telegraph improvements which others have not seemed to have sense to understand, goes on deliberately to make his arrangements to cover the country with a network

of superior telegraph lines, which he asserts are to be built the ensuing year, regardless of what Congress may do or fail to do—and, meantime, he offers, as I understand from reliable authority, to give ample pledges to the Government that his company will serve the public at rates from one half to seventy-five per cent. less than the rates now demanded by the W. U., A. and P. and S. and A. combination companies, with the provisos indicated in the question at the head of this letter.

For form's sake, perhaps, the Government would think it proper, before accepting Mr. Cohen's offer, to tender the proposed arrangement to the W. U. Co., which alone, of all the present companies, has or is likely to have the means to comply with the Cohen programme; but of course such a tender would be a mere idle form, for it cannot be presumed that Mr. Orton would be willing to bankrupt his company by serving the business public at less than half the actual cost of doing the business.

I do not think you have, nor that you can, by fair argument, sustain your position that the Government should, in no contingency of circumstances, have any business relations with any telegraph company. The Government, through all its departments, necessarily allies itself with individual citizens and with individual companies for the promotion of the public good. The P. O. department deals with you upon better terms than it does with me. You, as a large patron of the newspaper mail, are permitted to send a half pound weight of your journal for the same charge as I am required to pay for a single ounce of your printed sheets.

If two railroads run out of this city, both passing through the same towns and terminating at Buffalo, obviously the P. O. Department would deal with that one of the roads for the transportation of the mails, etc., which would serve the Government and the citizens best and upon the most economical terms.

I contend that the well established principles which, by universal consent, have obtained recognition in all parts of this country, between the Government and the citizens, will justify and commend the connection which is understood to have been proposed to the P. O. Department by the California Company. If that company will hand over to the P. O. Department 20 or 30 millions of telegrams per year, and prepay the same, I do not see why the department should not undertake the job of delivering them, nor can I imagine a reason why the P. O. Department should not do that work for Mr. Cohen at much less than the ordinary charges for delivering single letters, as well as to permit you, because you deal with the department in a wholesale way, to send through the mails eight ounces for the same sum as I, a small dealer, have to pay for one ounce.

Mr. Cohen also asks the Government to collect for his company messages through the street letter boxes at a fixed sum per message. Why should they not do this? The P. O. messengers can collect the telegrams without loss or delay, and the revenue derived for the service would go far to compensate them for all their services to the department; but, above all, the citizens would be largely accommodated at the least possible expense by the facilities asked for by Mr. Cohen.

Such a connection as that contemplated would be greatly facilitated by having the telegraph and Post-office under the same roof, and hence Mr. Cohen properly asks that the department will sanction the occupancy of the Post-office premises, wherever it can be done without detriment to the operations of the postal service.

It can hardly be necessary to say a word upon the subject of a monopoly of the telegraph business of the country. If Mr. Cohen has \$25,000,000 in gold at his back, as he distinctly alleges, and has a system of telegraphy which will enable his company to transmit 20 word messages 250 miles for 10 cents per message, and longer distances at proportionately low rates of tariff, it is difficult to imagine how such a company is to be prevented from monopolizing the telegraph business of the country, whether the company is recognized by the Government or not.

D. H. O.

Mutual vs. Individual Benefit.

TO THE EDITOR OF THE TELEGRAPHER.

ON reading the report of the Treasurer of the Telegraphers' Mutual Benefit Association, rendered at the annual meeting held Nov. 10th, at the Western Union Telegraph Co.'s building, I was surprised to see that a motion had been made by Mr. John Fuller, of Easton, Pa., making the salary of the Treasurer of the Association two hundred and fifty dollars per year.

As a member of the Association, I would like to ask for what consideration this sum was voted. The Secretary's report says that there have been eight deaths during the past year. It is, I presume, necessary for the Treasurer to sign, officially, the order for the payment of insurance in these cases. His report may have taken him an hour to write, and I must say that two hundred and fifty dollars seems to me too much for this service.

According to the best of my recollection, one of the reasons why the office of Secretary was made a salaried one, was in consideration of the fact that Mr. Reid's health

would not permit of his doing the detailed work of Treasurer, and he was prevailed upon to retain the position in order to promote a confidence, and to insure the faithful carrying out of the purpose of the Association, with the understanding that the Secretary should relieve him of the labor connected with the office. This he does. The sinking fund of ten thousand dollars was instituted that the interest arising therefrom might be used to pay the Secretary's salary and other necessary expenses. This interest, at seven per cent., would amount to seven hundred dollars. The Secretary's salary and incidental expenses more than consumed this amount, as per annual report. In the face of this we are to incur an additional expense of two hundred and fifty dollars, which must necessarily come out of the assessments.

The Association was started with the understanding that there should be no salaried officers, but the work developed seemed to make it eminently just that the Secretary, who performs all the labor, should receive some compensation. That the amount awarded is sufficient is clearly demonstrated by the fact that others beside the present incumbent were desirous, at the last election, of having the position.

Now, if we are going to establish the precedent of paying the Treasurer, it may open the way, at the next annual meeting, to increase this salary, and, the ball once set in motion, who can say where or when it will stop, or into what excess it may drift us?

Another thing that presents itself, as we review the subject, is, what is to be the final disposition of the sinking fund as the money accumulates? Will it attract the attention of the greedy to such an extent that salaried offices will make the assessments excessive, thereby causing members to drop out, and when this is done sufficiently to indicate the want of success of the Association, will the remaining members pass a resolution pronouncing it a failure and divide and pocket what remains? I don't feel any grave apprehension on this subject, but, when encroachment commences, one naturally inquires, where will it end?

In the Treasurer's report I find a suggestion that a dinner be given, on the occasion of the next annual meeting, to the delegates and New York members. Being myself a New York member, I find myself in accord with this suggestion. I don't exactly see how this is to be provided for—whether it may be considered necessary to reduce the sinking fund or to assess the members; but, as the Treasurer is silent as to the ways and means, he doubtless believes that a timely motion could be made to cover this deficiency.

How members outside of New York may relish the idea of contributing to this suggested junketing on the part of our worthy Treasurer, time alone will tell. As for myself, as I said before, I should like it. I think I could eat and drink the full value of my assessments, and in view of being one of the dined and wined, would further suggest that the assessments upon the death of a member be made two dollars instead of one—one dollar to go to said member's heirs, and one dollar as a dinner fund, to celebrate the occasion. This, under the present membership, would give us \$1,269 for the dinner, which could be used as follows:

The dinner to be given at Delmonico's, at say ten dollars a plate; probable number of members present not to exceed one hundred. Gilmore would furnish the music for two hundred and fifty dollars, just the amount of the Treasurer's salary, leaving to be divided among the waiters nineteen dollars. Speeches could be made, and a general "feast of reason and flow of soul" prevail; the merits of the deceased being fully discussed and resolutions of condolence passed and sent to the bereaved family and friends.

Let us consider this, and exchange opinions on the subject at our next annual meeting.

INQUIRER.

A Scientific Problem for Solution.

TO THE EDITOR OF THE TELEGRAPHER.

WILL some of the scientific readers of THE TELEGRAPHER harmonize the two following electrical laws, which are laid down in most of the text-books on electricity: First, "When the sides of a Wheatstone bridge or balance are proportional in resistance no current will flow across the bridge wire."

Second—"Electricity will follow every route open to it."

Please explain why it is that, when the sides are, say for example 10 : 1 :: 500 : 50, the portion of the current which has passed the 500 resistance should return to the battery or the earth, as the case may be, through the resistance of 50 instead of taking the shorter route across the bridge wire and through the smaller resistance of 1. We can understand why an instrument placed in the bridge wire will remain unaffected, but that the wire is absolutely free of current does not seem so clear.

W. B.

Electricity is *shocking* to tako, and, telegraphically speaking, a little of it may go a long way.

Telegraph and Postal Combination.

WE print in our correspondence columns a communication from D. H. C. on the subject of the proposed combination between the Post-office department and the new National Telegraph Company, in reply to our remarks on the subject in THE TELEGRAPHER of the sixth instant. Our correspondent is not satisfied with our argument against the connection proposed, and claims that our remarks were "much more an answer to the fraudulent HUBBARD bill than an answer to my (his) direct inquiry," which he repeats as the text of his communication.

In our previous article on this subject we conceded that it is one upon which much may be said upon both sides, and certainly our correspondent has demonstrated this fact most fully.

We do not know that we can add anything to what we have heretofore urged in opposition to this scheme, that will be more satisfactory to our correspondent than has already been said. If the National Company has secured any system by which it can do telegraph business at anything like the rates mentioned by our correspondent, it certainly does not need the aid of a connection with and use of postal facilities to insure its success. No existing company could compete with it

successfully, and it would necessarily, without such aid, in a short time, ruin the present telegraph companies and secure a monopoly of the business.

Our objection to this, as to all telegraph schemes which seek to enlist the aid of the Government to carry them out, is vital, and as we have repeatedly stated, we are on principle opposed to Government aiding one business enterprise, with which it has no legitimate connection, in its competition with a similar enterprise. There is no argument that will apply to a Government intervention to cheapen telegraphic communication that is not equally cogent for such an intervention to cheapen railroad communication, or anything else in which the whole country is interested.

The objection to such intervention, in any such case, is that it is improperly connecting the Government, which is established for certain specified purposes, with business enterprises and competitions between its citizens, who jointly contribute to its support in the administration of its legitimate function. It leads indirectly but surely to a Government ownership and management of the telegraphs of the country, and as we are opposed to this on principle, for the same reasons we oppose any indirect method of reaching such a result.

We do not see the relevancy of the argument of our correspondent, that because the Government transports newspapers for publishers to subscribers at less rates than it transmits matter of the same class for the general public, it may properly enter into partnership in telegraphic enterprises to cheapen telegraphic services. The Government monopolizes the postal business of the country, and makes a distinction between wholesale and retail customers. Whether this is right or not is a question which does not enter into this discussion. It does not aid an express company in the transportation of certain matter, so as to enable it to underbid its competitors in the business, but fixes a price for its own services, to which we are all obliged to submit, whether or no. In contracting for the transportation of the mails by railroad, the Government, of course, where there are competing roads, makes use of the one which will do its business the best and cheapest. In this it exercises the same discretion that our correspondent or any other customer would do, and in this respect it stands on the same footing as other customers. It no further aids the road in its competition with its rival than do other patrons, and contributes no more to its success. If the post-offices were used for the sale of tickets for such road, and for doing all or a large part of its business except the actual transportation, at rates below these at which such services and facilities could be had by the rival of such an enterprise, the comparison might be more apropos.

We have opposed the HUBBARD schemes, as we oppose that now under consideration, without special reference to the details of either, upon the same grounds and upon the same principle as we have and do oppose a postal or Government telegraph, pure and simple. As between such a temporary indirect connection of the Government with the telegraph, we should prefer the immediate assumption by the former of the entire and direct ownership and management of the telegraph system of the country. In that case the existing telegraphs would be taken by the Government upon some fair valuation, and thus the owners and employes would be at least partially protected in their interests.

We have perhaps devoted more space to the discussion of this subject than was necessary, as from the small favor with which it has been received by the public, and especially in view of the financial failure of the British postal telegraph, there is very little chance of its being favorably entertained either by Congress or the people. If the National Telegraph Company really means business, its promoters may as well make up their minds to go ahead without expectation of aid from Congressional action. If they have secured the advantages claimed, they may count upon success in any event; if they have not, their prospects cannot be considered as sufficiently promising to warrant the investment of twenty-five millions of capital.

Atlantic Cable Tariffs.

WE print in another column a communication from Mr. OLYPHANT, the chief representative of the Direct United States Cable Company in this city, to the New York Herald, on the vexed subject of Atlantic cable tariffs, which is worthy of consideration. The Herald which knows more about telegraphs, as well as all other business, than those engaged in it, has been very persistent in urging a reduction to, and continuance of a low tariff for cable messages, and has not been complimentary to the Direct Cable management for its increase of tariff from 25 to 75 cents a word upon the restoration of communication through its cable. It asserts that 25 cents a word will pay any cable company better than a higher rate, if it will only stick to it long enough. It makes this assertion in face of the fact, which has been frequently stated and is well known, of the limited capacity for the transmission of signals of long submarine cables, which would insure bankruptcy to any company at a 25 cent tariff, even if it had its cable fully occupied with business.

It is a noticeable fact that, notwithstanding its unreasonable and unreasoning urgency for a very low cable tariff, the proprietor of the Herald has never sent a message by the new cable through whose competition lower rates have been secured. It is attempted to excuse this on the ground that the Herald is bound, by contract of the Associated Press to use the Anglo-American cable for its news despatches. If the writer will investigate the matter he will ascertain that no such contract exists, and that a portion even of the Associated Press cable despatches come over the Direct Cable.

We are satisfied, from such investigation as we have given the subject, that 75 cents is a reasonable charge for Atlantic cable telegraphing, and that no company can, with due regard to the interests of its shareholders, adopt a lower rate, until the capacity of the cables for business can be largely increased.

Mr. Henry H. Ward Appointed Cashier of the Western Union New York Office.

MR. HENRY H. WARD has resigned the situation of Treasurer of the Gold and Stock Telegraph Company, which he has filled with much credit to himself and advantage to the company, and accepted the appointment of Cashier of the New York office of the Western Union Telegraph Company, vacant through the removal of Mr. LEONARD COX. The qualifications of Mr. WARD for this position are of a high order, and his integrity and reliability unquestionable. He has filled various important positions in the telegraph service for many years past, and always to the complete satisfaction of his employers, and all with whom he has had business relations or dealings. Of strict and unswerving integrity, and always courteous and gentlemanly demeanor, he will be in his present as in former situations efficient and popular, and we congratulate the managers of the Western Union Company upon their selection of him to fill so important and responsible a position.

Severely Afflicted.

DIPHTHERIA is prevalent in this city and vicinity at the present time, and is proving very fatal, especially to young children. The announcement of the loss by Mr. R. M. MATTOCK'S, operator in the Cotton Exchange office in this city, of the Western Union Telegraph Company, of two beautiful infant children from this fell disease, will insure him and his afflicted wife the heartfelt sympathies of their many friends among the telegraphic fraternity. The little girl was taken with diphtheria two weeks previous to her death, and it was supposed was out of danger, when she was attacked with diphtheretic croup on Thursday morning of last week, and in a few hours her life was closed. The little boy was taken with diphtheria on Wednesday, and died Friday evening. They were both buried on Monday last in Rosedale Cemetery, at Orange, N. J.

If the sympathy of friends and acquaintances in their

sudden and severe affliction can comfort or console them, it is extended to them sincerely. May they be spared further affliction, for certainly their cup of sorrow is full to overflowing.

Personals.

Mr. CHARLES BENNETT has resumed work for the Western Union Company at the New York main office. He is on the 12 to 9 trick.

Mr. WM. J. LEWIS has been transferred from the 12 to 9 to the regular night trick, in the New York Western Union main office.

Mr. ALVAN S. LOCKE has resigned his position in the New York Western Union main office, and returns to his farm in Kansas, which he was obliged to leave temporarily last year, on account of the destruction of crops by the grasshoppers.

The Telegraph.

Pneumatic Tubes to be Laid by the Western Union Telegraph Company.

THE Western Union Telegraph Company has for some time had under consideration the subject of substituting some method of transmitting messages from and to its New York City offices, which should enable it to dispense with all or a large part of the poles which have become so objectionable in the streets of the city. In London pneumatic tubes have come into very general use for this purpose and have been found to work quite satisfactorily.

With a view to testing the feasibility of this method of communication here, the company has decided to put down an experimental system of pneumatic tubes from the main office at the corner of Broadway and Dey street to the office at No. 14 Broad street, through Broadway and Wall street, and also through Maiden lane to 134 Pearl street office.

At the meeting of the Board of Aldermen on Thursday of last week the Mayor transmitted a communication from the Western Union Telegraph Company, to which he requested immediate attention. He recommends the cooperation of the Common Council in taking away the suspended telegraph wires and placing them under ground, and also the passage of a resolution providing for an experiment in that direction. The letter from the Western Union Company submitted the following resolution, which was passed after some debate, with an amendment that the work should be done at the expense of the corporation soliciting the privilege and under direction of the Commissioner of Public Works:

"Resolved, That the Western Union Telegraph Company is hereby authorized to lay down tubes and wires for telegraph purposes in the streets between the main office of the company at the corner of Broadway and Dey street and its office at No. 14 Broad street, through Broadway and Wall street, and also from its main office aforesaid through Maiden lane to 134 Pearl street, such tubes, not exceeding fourteen in number, and wires to be laid three feet below the pavement; the work of removing and restoring the street surface to be done subject to supervision by the Department of Public Works."

In regard to this matter President Orton made the following statement a few days ago to a representative of the *New York Tribune*:

"No one," said Mr. Orton, "has yet succeeded in devising a method by which rapid communication can be made over wires submerged for a long distance, but for a short distance it can no doubt be done. Our object is to experiment upon this question, and see what improvements can be made. Besides other objectionable features of poles on which to stretch the wires, they are very expensive, costing from \$15 to \$25 each before they are set in the ground. Wherever we can secure the right of way through the crowded parts of the city, we carry the wires over the tops of houses; but this right of way cannot always be secured, as was the case down Chatham street, and from there to the main office. It is just as much to our interest as that of the public to place the wires entirely away from all obstructions, where this can be done without retarding the rapidity with which messages may be sent. Another difficulty which we wish to overcome is that experienced in sending messages to the different branch offices in this and other large cities as quickly as desired. It costs just as much, so far as the operating expenses are concerned, to send a message from the main office to Broad street as from here to Chicago, while time is lost in sending by carriers. The object of the pneumatic tubes is to remove this difficulty, by enabling us to send the message received in the main office to any of the branch offices in less time than it would require for the operator to repeat it. Two tubes will be laid, one for sending and the other for receiving messages; but we have not yet fully determined upon what method we

shall operate the tubes. A very great improvement in regard to this matter, I understand, has been made in England within the past two or three years."

The D'Infreville Duplex on the Southern and Atlantic Company's Lines.

THE duplex invention of Mr. D'Infreville, of which an illustrated description was published in THE TELEGRAPHER of the 13th inst., has been successfully introduced upon the line of the Southern and Atlantic Telegraph Company, between Washington, D. C., and Charleston, S. C. It works well, and practically doubles the capacity of the line between these points, as each circuit can be worked fully up to the speed of the single circuit previously operated over the wire.

Mr. D'Infreville is personally superintending the introduction of his duplex on this line and instructing the operators in its management. It will be soon introduced on other circuits of this company, which has purchased the patents for the territory which it covers.

Annual Meetings of Telegraph Companies.

THE annual meeting of the stockholders of the Southern and Atlantic Telegraph Company, for the election of a Board of Directors for the ensuing year, and such other business as may properly come before them, will be held at the executive office of the company at 51 New street, in this city, December 2d, prox.

The annual meeting of the stockholders of the International Ocean Telegraph Company will be held at the office of the company, in this city, on the 7th of December, prox.

Foreign Telegraphic Notes.

NEW SOUTH WALES has been the first to adopt the automatic system of telegraphy. In Australia and New Zealand there are at the present time 30,000 miles of telegraphic lines, which have cost nearly half a million of money. New South Wales has 8,000 miles of wires, Victoria 5,600, and other colonies less. The number of messages transmitted in this colony last year numbered about half a million, and augmented the public revenue to about £40,000. In New South Wales messages are now sent daily from Wentworth to the Gulf of Carpentaria, a distance of nearly 4,000 miles, for the absurdly small sum of 2s.

The sum of £1,193,000 8s. 2d. was expended in the last financial year in Great Britain on account of the postal telegraph service.

The Direct Spanish Telegraph Company notify that, from and after November 1st, the rate between London and any station in Spain will be seven shillings for a message of twenty words.

The half yearly accounts and balance sheet of the Brazilian Submarine Telegraph Company to the 30th of June last showed the total earnings of the company for the half year to be £68,778, and the working expenses £11,055, leaving a balance of £57,723; to this was added £19,811, the undivided profit to 31st of December last, making a total of £77,534. After deducting income tax, £481, there remained a balance of £77,053. A third interim dividend, amounting to £16,250, had been distributed since the last accounts were presented, leaving £60,803 for appropriation. The directors therefore recommended the declaration of a final dividend of 2s. 6d. per share, free of income tax, making a total dividend of 5 per cent. for the year, which would absorb £16,250, leaving a balance of £44,553. Of this amount £40,000 had been placed to a reserve fund, and £4,553 was carried forward.

The extension of the telegraph communication from the capital of the French penal colony in New Caledonia to the principal villages and government depots is being pushed forward vigorously, and a large staff is engaged along the route of the proposed line, from Canala to Uraï. This will be an expensive work, as the wires are to run through a dense forest and cross the main range at a height of about 2,500 feet above the sea.

The Hibernia, with the second portion of the New Zealand cable, was to leave England in the early part of November.

The cable between Santos and Santa Catarina having been repaired, direct telegraphic communication with La Plata is restored.

The government of Western Australia propose to expend £28,500 in the construction of a line of telegraph to South Australia. The line will extend from Albany to Eucla.

Mr. F. C. Wobb, who has lately returned to England from successful cable operations on the Brazilian coast, has had conferred on him by the Emperor of Brazil the honor of a Knight Officer of the Order of the Rosa.

The Indo-European Telegraph Company state that the average time in transit between London and India, *via* Teheran, of all outward messages to India, including messages for Penang, Singapore, China, Japan, Java and Australia, during the week ended 22d October, was 51 minutes.

The report of the British Postal Telegraphs just issued shows that the gross revenue last year was £1,160,000 and the expenditure £1,051,000, leaving the sum of £109,000 applicable to the payment of interest upon the capital raised for the purchase of the telegraphs by the State. There has been a large increase in the amount of postal telegraph business of the year, the number of messages (exclusive of newspaper telegrams) having last year been above 19,000,000, or about 10 per cent. more than in 1873. On one occasion, when an important debate took place in Parliament, and when, in addition, there was an unusual number of interesting occurrences in different parts of the country, nearly 440,000 words were transmitted from the central station in London in a single night.

President Avellanca has inaugurated the new telegraphic cable that connects Buenos Ayres with the island of Martín García.

The telegraph cable between Suez and Aden is broken, and messages for India and the East beyond Egypt are forwarded *via* Teheran.

The cable between England and the Scilly Islands is again interrupted.

The Pernambuco-Para telegraph cable is broken.

Communication *via* Siberia to Japan, China and Australia, has been restored.

Telegraphic and Electrical Brevities.

THE holiday hours for the offices of the Atlantic and Pacific and Franklin, and the Southern and Atlantic Telegraph Companies, will be the same as those already announced for the Western Union offices—that is from 8 to 10 o'clock A. M., and from 4 to 6 o'clock P. M., except at repeating stations and principal offices, which will be kept open as usual but with reduced force.

The Southern and Atlantic telegraph office at Atlanta, Georgia, has been removed two doors below its former location. The new office has been very neatly and tastefully fitted up by the mauager, Mr. W. A. Benton.

The new line of the Atlantic and Pacific Telegraph Company, from Pittsburgh, Pa., to Columbus, Ohio, is approaching completion. It is expected to be done by December 10th, and will afford an important and valuable addition to the facilities of the company.

The Atlantic and Pacific Telegraph Company have asked from the Board of Aldermen permission to lay pneumatic tubes from their main office in this city, No. 145 Broadway, to No. 8 Broad street, and in other parts of the city. The communication was presented on Tuesday last, and referred to the Committee on Streets.

The Direct Cable.

THE success of the *Faraday* in picking up and repairing the Direct Cable is one of the most wonderful things imaginable. On the 19th ult. the *Faraday* left Britain for Placentia Bay. On Sunday, 1st inst., sighted Cape Pine, took observations, found position correct, dropped grappling irons, and in ten minutes had the two ends on board, and undergoing repair. The *Faraday* called off our harbor on Saturday, and, after a short delay, proceeded to Britain.—*St. John's* (Newfoundland) *Chronicle*.

[From the *New York Herald*.]

Cheap Telegraphy.

THE DIRECT UNITED STATES CABLE COMPANY,
LIMITED, NO. 16 BROAD STREET,
New York, Nov. 18, 1875.

To the Editor of the Herald.

YOUR article in this morning's issue on cheap telegraphy contains some comments on a circular recently issued by me, to which I trust that your sense of justice will give me an opportunity of replying, as they are calculated to mislead the public. You remark, in the first place, that "We find the direct cable charges as much per word for the transmission of despatches from America to Europe as the other line." Had you said that you "found that the other line now charges as little per word as the direct cable," you would have presented the case more accurately. On Saturday, the 6th inst., "this company" opened for business at seventy-five cents a word, our opponents' rates being at the time a dollar, and it was not until we had commenced business at the reduced rates that the opposition announced their intention of adopting our tariff, which they did

shortly after. It is thus evident that this latest reduction, by which the public save twenty-five cents a word, was entirely due to the action of the Direct United States Cable Company. You then go on to state that the managers of this line will discover, "as has been discovered by the managers of all other telegraph companies, that the cheapest rates, in the long run, will bring more business, and consequently inure to the greater profits of the owners."

Permit me to call your attention to the fact that this has not been discovered by the managers of any cable company, and the statistics of the Anglo-American Company for over ten years go to show that the most paying rate, as between five dollars a word and twenty-five cents, is a dollar and a half a word.

Again you say, "Thus far the promise to reduce rates is little more than a promise." I have shown that it is a promise worth just twenty-five cents a word to the public. And you conclude, it would "be a stroke of genius for Mr. Oliphant's company to send messages over the ocean at a shilling a word." This stroke of genius has been already attempted, in the hope that it might be considered such by the public, but they utterly failed to appreciate it, and in no instance more conspicuously than in that of the *Herald*. Though this exceptional rate was due entirely to this company, the *Herald* did not support their efforts by sending a single message over their cable, and I would suggest that to taunt a company for not establishing low rates, and when it does establish them to refuse to support it, is a course not calculated to advance the cause of cheap telegraphy.

I am yours faithfully, L. OLIPHANT.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Oct. 26, 1875, and bearing that date.

169,087.—FIRE ALARM TELEGRAPHS. S. Chester, Elizabeth, N. J. [Filed May 5, 1875.]

For use at central station. Each electric impulse from fire alarm box, through an electro-magnet, releases a clock work, which gives one rotation to cylinders, closing a circuit to smaller alarm bells. The clock work also operates a paper punching device, from which the paper is fed under transmitting styles to closing circuits to other larger alarm bells, by means of another clock work, also released by electro-magnet. At the conclusion of every complete signal, a third clock work is released, by means of which momentary flash of increased battery current is introduced into a signal box circuit.

1. The combination of a prime motor and train, an electro-magnet controlling the same, a revolving cylinder or cylinders causing on rotation a change or changes in the connections of one or more electric circuits, a perforator, and a train of wheels, giving uniform motion to the strip to be perforated, substantially as and for the purposes set forth.

2. The combination of a perforator, two or more sets of devices for removing the perforated strip therefrom, and moving at different rates of speed, and two or more electric circuits controlled by the operation thereof, whereby the signals upon one circuit are repeated over other electric circuits at different rates of speed for different circuits, substantially as and for the purposes set forth.

3. The combination, with a prime motor and train, and an electro-magnet controlling the same, as electric circuits, and two or more insulators or circuit closers rotated by a prime motor, and throwing into circuit at one period during rotation an extra amount of battery, whereby the electro motive force in the circuits is increased, substantially as and for the purposes set forth.

4. The combination, with any instruments carrying several sets of motors designed to cause paper or other material whereon impressions have been made to repeat electric impulses over several circuits, at various rates of speed, of a device connected with any other part of a running gear of such instrument, to successively render these several motors inoperative, by removing the pressure of the frictional roller or equivalent at specific periods in such manner that the paper or equivalent will cease to be moved thereby, so soon as the impressed portion has been carried past a fixed point, but that it shall continue to be carried by the succeeding motors, substantially in the manner and for the purpose hereinbefore described.

5. The combination of a rack and pinion, with the supporting wheels W¹ W², having a portion of the periphery cut down to a smaller diameter, and provided with arms for moving the rack in one direction, a connecting lever and pinion connected to one wheel and train, and imparting a rocking movement to the wheels, whereby, upon their movement in one direction, the rack is allowed to drop away from the pinion, but is held to engagement therewith on their movement in the other direction, substantially as and for the purposes set forth.

6. The combination, with the two independent motive trains, one of which is controlled by an electro-magnet, or a rack and pinion, connected with the trains, and controlling one thereof, whereby the motion of the first causes the release of the second, substantially as and for the purposes set forth.

7. The combination, with two independent motive trains, a rack and pinion connected therewith, and acting to release the second upon the movement of the first, of an extra magnet, and devices operating to allow the continuance of motion of the second train, after the motion of the first train has ceased, substantially as set forth.

8. The combination, with two or more batteries, or divisions or series of batteries, of the automatic circuit closer or breaker, to change the connections of the batteries, and thereby vary the electro-motive force of the circuits, or any of them, substantially as and for the purposes set forth.

Died.

MATTOCKS.—At Lafayette, N. J., on Thursday, Nov. 18th, of diphtheritic croup, JENNIE, aged 5 years and 4 months; and on Friday, Nov. 19th, CHARLIE, aged 2 years and 6 months, children of Mr. B. M. MATTOCKS, operator for the Western Union Telegraph Company at the Cotton Exchange office in this city. They were both buried at Rosedale Cemetery, Orange, N. J., on Monday last.

JAMESON.—At Rutland, Vermont, Nov. 19th, of brain fever, W. C. JAMESON, formerly an operator in the Rutland office, and latterly a conductor on the Harlem Railroad.

THE DIRECT UNITED STATES CABLE COMPANY (LIMITED).

SUPERINTENDENT'S OFFICE,
New York, Nov. 24th, 1875.

NOTICE.

The Suez-Aden cable is interrupted. Messages for India and all parts of the East beyond Egypt to be sent via Teheran.

The cable between England and Scilly Islands is interrupted. Messages to be addressed "Post Penzance," from whence they are despatched free of postal charge.

The P rambuco-Para cable is also broken.

Communication has been restored, via Siberia, to Japan, China and Australia.

During the interruption of the Suez-Aden cable, telegrams for Aden and places beyond can only be forwarded by "Indo-European," via Teheran.

The rate to Aden is the rate to Bombay..... \$10.00
To which must be added, for 20 words or less..... 9.72

Total charges to Aden..... 19.72
And for every additional 10 words or fraction thereof: 4.86

Telegrams to Peru can now be prepaid to their destination. The rate to be collected is the rate "London to Valparaiso," \$65.00 twenty words or less, to which must be added the following rates:

"Iquique," 10 words..... \$12.15
Each additional word..... 1.21
Arica, 10 words..... 18.22

THE LECLANCHÉ BATTERY.

THE WORLD RENOWNED
Open Circuit Battery.

NO ACIDS!
NO SULPHATE OF COPPER!
DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED TO Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHÉ BATTERY COMPANY,
No. 40 West 18th Street, or
L. G. TILLOTSON & CO., Sole Agents,
8 Dey Street, New York.

BRADLEY'S APPARATUS FOR ELECTRIC MEASUREMENT,
COMPOSED OF HIS

Tangent Galvanometer and Rheostat.
(Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING

WHEATSTONE'S BRIDGE,

Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED

NAKED WIRE HELICES,
for Electro-Magnets, wound to any given size and resistance.

Manufacturers of Telegraphic and Electrical Instruments supplied at low rates.

For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

SIEMENS' UNIVERSAL GALVANOMETER

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,

MANUFACTURER OF TELEGRAPH INSTRUMENTS,

104 CENTRE STREET, NEW YORK.

BATTERIES of every de cription for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the CHESTER PIN DIAL (patented), designed expressly for POLICE and LAW TELEGRAPHS. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell cut out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,

for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,

for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,

CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH;

so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,

REGISTERS, RELAYS, CALL BELLS,

and every description of Central Office apparatus, at most reasonable prices.

Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN"

in which the spring takes the place of the weight, is enclosed in a metal and glass case; is noiseless in its action, and of great beauty and finish, and is specially recommended to Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.

ELECTRO-SURGICAL APPARATUS

OF EVERY VARIETY AND DESCRIPTION.

HOTEL ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns: Grand Union, Saratoga; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y.; Willard's Hotel, Washington, D. C.; Galt House, Louisville, Ky.; Tefft House, Buffalo; and many others. Proprietors and keepers of Hotels most liberally dealt with.

THE "COUNTING ROOM BELL MAGNETS,"

for communicating instantly to clerks and employés, by means of a keyboard, in any desired place.

ALSO,

BELL MAGNETS AND PUSH BUTTONS,

for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$3.00 upwards.

Sole Agent of the

WILSON ELECTRIC GAS LIGHTING CO

for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for

LIGHTING FACTORIES, MILLS, ETC.

By simply pushing a button on his bench the operator lights a section of burners.

Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

Fire Alarm and Police Telegraphs

- First**—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.
- Second**—The Automatic Signal Boxes.
- Third**—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.
- Fourth**—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

Only **PERFECT, COMPLETE** and **RELIABLE** System

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the **People, Municipal Authorities,**

AND THE
PRESS

throughout the **UNITED STATES** and **CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY, RELIABILITY and **ECONOMY**

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES** and the **DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THERE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

THE TELEGRAPHER
A JOURNAL OF
ELECTRICAL PROGRESS.

J. N. ASHLEY, PUBLISHER.

SATURDAY, DECEMBER 4, 1875.

VOL. XI. WHOLE No. 490.

Edison's New Moonshine.

T. A. EDISON, of Newark, N. J., has made a discovery which, he claims, will revolutionize telegraphy. He claims to have discovered a new force, similar to electricity, possessing its efficiency, without being subject to many of the influences which affect the latter.—*N. Y. Tribune, Nov. 29.*

On another page an account is given of what appears to be a very remarkable discovery in electrical science and telegraphy. It is claimed that a new kind of electricity has been obtained, differing from the old in several particulars, and notably in not requiring for transmission that the conducting wire shall be insulated. While the reality and value of this discovery can only be ascertained by further experiment, it may here be mentioned that there is nothing inherently improbable about it. The difference claimed between the new and old electricities is scarcely greater in kind than between polarized and non-polarized light, or between ordinary iron and that which has been so changed by contact with platinum that the strongest nitric acid fails to attack it. A genuine discovery of the sort would be of inestimable service in cheapening the telegraph, cable-rates would soon be permanently reduced, and the unsightly poles that now disfigure our cities would quickly disappear.—*N. Y. Tribune, Nov. 30.*

NEW DISCOVERY IN ELECTRICITY.

Experiments of T. A. Edison.—Possibility of Sending Messages by Wires or Cables which are not Insulated.

T. A. Edison, of Newark, N. J., an electrician and inventor, has just made a discovery, alluded to in yesterday's *Tribune*, which, it is expected, will throw new light on the nature of electricity, and possibly manifest the existence of a hitherto unknown natural force. On the night of Nov. 22, while Mr. Edison and his assistant, Charles Batchelor, were experimenting in their laboratory, they made a discovery which is recorded as follows in their journal:

"In experimenting with a vibrator magnet, consisting of a bar of Stubbs's steel, fastened at one end and made to vibrate by means of a magnet, we noticed a spark coming from the core of the magnet. This we have often noticed before in relays, in stock printers, when there were iron filings between the armature and core, and often in the new electric pen. Always supposed it was inductive electricity, but happened to notice it when it seemed so strong that we suspected it might be something more than induction. Acting on the supposition, we found that by touching any portion of the vibrator or magnet with a piece of metal we got the spark. We then connected a wire to the end of the vibrating rod, and got a spark by touching a piece of iron to it."

The experimenters were led to try the effect of different metals in drawing off the spark, and soon found that cadmium was the most effective for their purpose. A bar of this metal was placed across the magnetic coil of the electric instrument, and a long wire attached to it. The electric circuit was thus drained of its current, which passed through the cadmium and the subsequent wire into a gas pipe, and so into the earth. Notwithstanding this interruption of the continuity of the circuit, it was found that when any metallic substance was brought into contact with the gas pipe, or with the intervening wire, a white spark was evolved with unusual brilliancy. Then it occurred to Mr. Edison that possibly this spark might be the manifestation of some unknown force acting simultaneously with electricity. Accordingly he applied to it the tests by which the presence of electricity is detected, and was surprised to find that the testing instruments gave no indication of the electric presence. A delicate gold leaf electroscope was undisturbed by the new manifestation, conclusively proving either that electricity may manifest itself in entirely new phases, or that under certain conditions it gives birth to a new and distant force. Mr. Edison has named the new principle "etheric force." This discovery was put to test by various experiments, and the following results obtained: That the new force is non-polar, radiating in straight lines like heat; that it is capable of transmission to indefinite distances through an uninsulated wire; that it is not affected by the ordinary non-conductors of electricity, as glass, etc.

and that it is retroactive, the spark being obtainable when the wire is turned back so as to touch itself. Mr. Edison is of the opinion that it can be made to manifest itself otherwise than by the spark, and that it may be derived from heat independently of electricity.

In order to put it to a severe test, he connected a wire from his laboratory with the ordinary telegraph wire, and by permission of the telegraph company, was enabled to make a circuit extending from New York to New Brunswick, N. J., both ends terminating in his laboratory. After passing through this great extent of wire the electric current was diverted, the cadmium wire attached, and a series of sparks evolved as readily as though the circuit had been only a yard long. The practical value of this discovery consists in its manifestation of the possibility of sending messages over cables or wires not insulated. Instead of employing poles and glass insulators it seems to be necessary only to make an attachment to the railroad track or to a wire laid in the earth, and the message can be as readily transmitted as by the present process. The expensive insulated cables now used for ocean telegraphy can be rivaled by cables of much cheaper construction, and in other ways the present cumbersome apparatus necessary for utilizing electricity may be avoided.—*N. Y. Tribune, Nov. 30.*

THE ALLEGED NEW DISCOVERY IN ELECTRICITY.

On Monday night T. A. Edison, the Newark electrician, continued his experiments in connection with his discoveries, an account of which was published in *The Tribune* of Tuesday. He is now perfectly satisfied that the new force discovered by him is different from electricity. A Leyden jar, charged with the etheric force, and strips of paper soaked in iodide of potassium and subjected to the etheric current, failed to indicate the presence of electricity. The galvanometer and electroscope also failed to indicate its presence, yet when the metallic test was applied signal sparks gave evidence of the presence of electricity. It made a vigorous flash of light, and yet it produced no sensation on the hand or tongue. Mr. Edison claims that the new force is not electricity. He is making an apparatus by which the sparks can be produced under the glass of a microscope of very great power. He then hopes, by the aid of the spectroscope, to be able to study more closely the nature of the scintillations, and the etheric power will be investigated by other appliances which he is now developing. He is also trying to obtain the new force without electric aid from a simple magnet, and believes that he will yet be able to produce it by means of heat.—*New York Tribune of Dec. 1st.*

The Legal Liabilities of Telegraph Operators.

It is desirable, in every business, that each individual employed should be fully aware of the responsibilities, etc., which attach to his position, and the exact relation which he bears to his employers. This is more especially to be desired where the employer is a corporation. It is peculiarly applicable to the telegraphic corporations, and it is somewhat remarkable that a matter of such moment and importance to the fraternity has not heretofore engaged the attention of telegraphic journals. We have but little hesitation in stating that not more than one fourth of the employes of the telegraph companies have a definite idea of their liabilities for the errors which are constantly occurring, and which are unavoidable, as human nature is prone to err, and a telegraph operator is only human. For years past it has been the custom of the W. U. Co. to hold operators, between whom an error is located, responsible for the tolls, or other damages, claimed by the public from the company, and, having the power to withhold from said operators' monthly pittance the amount claimed (of course, this is in cases where the damages are not great), the operator calmly submits to this extortion, as he has no alternative, and though mentally cursing his luck, lets the matter drop. The company, being almost the only one in the country, holds the reins of power, and if an operator is disposed to "kick" with prodigious earnestness against the extortion, he quickly discovers that he must subside, for "his place can easily be filled, you know."

We would call the attention of our brothers—the telegraphic fraternity—to a few interesting facts on this subject, viewed from a legal standpoint. In the first place, no corporation can hold its employes responsible for its failure to perform what it receives compensation for performing, for it must be borne in mind, an operator is a minute portion of a huge machine, to be used in his particular capacity, wherever the company may desire. For his services he receives, or engages to receive a stipulated salary; if he fails, in the eyes of his superiors to render complete satisfaction, he is discharged, and another machine put in his place at the will of the company. *They cannot hold the machine responsible for any error of whatever nature.*

Second: The company proposes to the public, for a certain remuneration, to perform certain things, and of course assume all the attendant risks of "bulls" or delays of any nature. The operator has no share in the transaction, either directly or indirectly, and it is not

just that he should be compelled to assume risk for which his employer is paid.

When an employe receives a voucher for \$100 for a month's services, and receives in cash only \$75, because he has been so unfortunate as to become involved in some bull, he is, legally viewing the case, being imposed upon, in that he does not receive the stipulated amount due him for services rendered.

It would be advisable, in our opinion, for all operators in the service of the company to make notes of the amounts doctored from their salaries on account of errors, with nature, time, and locality of the errors, and, when circumstances may permit, present the bill to the company; and should the payment be refused, they can recover the full amount, with interest, in a suit at law. It would be well also to pay only under protest amounts charged for errors, be they "bulled checks" or errors of any other nature.—*The Electric.*

Nibzy's Conundrum.

BY GNIMMUC.

Do you know Knibbs? H. Royal Knibbs? Royal is a character in his way. H. R. is foud of conundrums. In fact, I may say he revels in them, and originates atrocious ones himself. The other day he came round at the meeting, and propounded the following:

"Why is the business on a stormy night like a second hen's egg?"

M. D.—(He isn't a medical doctor, neither is he a mule driver, nor yet a Marylander) said: "What second hen do you refer to? Eggs-cuse me if I am impatient, Royal."

Cunny took the cue from this eggsactly, and laughed uproariously, whereupon Knibbs remarked, "I mean the second egg of the first hen."

K. (which stands for kicker) remarked very sagely that a hen never laid but one egg at a time.

Knibbs here began to grow impatient, and, after telling the gentleman aforesaid not to be so mulish, told his *tail* anew. Said he, "Gentlemen, these remarks are very irrelevant to the subject. What I want to propound is—" "Why is the business of the telegraph on long wires of a stormy night like the second egg that a hen produces in a given period of time?"

While His R. was taking breath after this unusual effort of language, B. of E. (burst of eloquence, so to speak), the "noisy man," whose name indicates a vessel, though he doesn't bark, came to the front, and suggested that it was because it was laid over.

"Although I can't help but admit that that is very good," said Royal, "it is not the correct answer."

As all then gave it up, Knibbs chuckled all over, and put forth the correct solution: "Because it is relayed."

Double You Bee, who had been very quiet all this while, here broke forth into his inevitable, "Ah, George! you are so large and so common all the sparrows in the Park know you. I will not associate with you."

Having finished his little speech, like our noble President, he again subsided into obscurity.

The kind youth objected to the genuineness of the article on the score that Philadelphia always insisted in putting in repeaters.

The friend of *Bos*, who is always more or less *Keene*, was in this case rather thick-witted, and insisted on a full explanation, so Nibzy—that's what we call him for short—counting on his fingers, interrogated the interrogator thusly:

"If the hen lays one egg, and then lays another egg, isn't the second one re-laid?"

The man whose eyes are partially blinded to the full meaning of the word "bulletin," and thinks himself a second Sothorn, nearly broke up the gathering with— "I—f—fancy he has you th—th—there."

The party whose name bears somewhat of a distant resemblance to that of an ex-Governor of the Empire State, thought that this conundrum *laid over* the deck for any he had ever heard.

Royal then referred to the old story of the darkey preacher, who told one of his listeners to sit down on his questioning the truth of his parson's statement, that God made Adam out of clay and loaned him against the fence to dry, and said their numerous doubts were like those of the colored auditor. Whereupon the fat man wanted that explained too. "Well," said Knibbs, "the son of Ham wanted to know who made the palings, if Adam was the first man, and the preacher said—

"Such questions would knock the wind out of the soundest theology. Sit down!"

"So with you. You are altogether too particular, and knock the wind and stuffing out of my egg story."

After a little more "clim" on various subject the meeting broke up.

In one of the recent terrible thunder storms in France 596 sheep were killed, out of a flock of 1,800, by one flash of lightning.

Correspondence.

Duplex and Quadruplex Telegraph Inventions of Mr. Moses G. Farmer.

TO THE EDITOR OF THE TELEGRAPHER.

FROM THE TELEGRAPHER of November 13th, 1875, I quote as follows: "We print this week an article on quadruplex telegraphy, from the able pen of Mr. F. L. Pope, which will be read with much interest. There has been a great desire for the publication of a full and accurate description of the quadruplex system which has been adopted by the Western Union Telegraph Co., which heretofore it has not, for reasons connected with the complications in regard to the ownership of the patents, been deemed advisable to make. The objection to such publication has now been removed (?), and we lay before our readers to-day the only correct and full description of this system which has yet been given. In his article Mr. Pope has given a concise, correct and complete (?) history of duplex and quadruplex inventions, from that of Gintl to the present time."

The injustice of the above, so far as I personally am concerned, is too glaring to be passed by unnoticed.

The facts in connection with my interest in duplex telegraphy are as follows: In August, 1855, I read before the "American Association for the Advancement of Science" a paper describing a method by which four messages could be simultaneously transmitted over one wire, all of them in the same direction, or part in one direction and part in the opposite direction.

On the 31st of August, 1858, a patent for duplex transmission was issued to me, in which patent the very device now used in the quadruplex for reversing the direction of the main current, without interrupting the continuity of the circuit, was fully described.

The said patent was extended in August, 1872, and was reissued February 16th, 1875. In said reissue occur the following words: "I claim, . . . 3d, in combination with instruments for sending and receiving messages simultaneously upon one wire, a key or device arranged to transmit signals by reversing the direction of the main battery current, without interrupting the continuity of the main circuit."

5th. In instruments for simultaneous transmission and reception of messages over one wire, the combination at each station of an accessory magnet or coil, an accessory battery, the receiving main circuit magnets, and batteries with the means of reversing the direction of the current of each of the main batteries, substantially as set forth."

The invention described in my patent, No. 21,329, above referred to, was successfully worked, even in its then crude state, upon a wire connecting Portland, Me., with Boston, Mass., for two or three days in the early part of Dec., 1858; as I find, by reference to my diary, that on the 3d of Dec., 1858, several messages were transmitted simultaneously over this wire, and the operation of the instrument in Boston was witnessed by Mr. J. S. Bedlow, Mr. W. T. Eddy, and Mr. Geo. F. Milliken. Others were present whose names I do not remember.

The instruments were worked on several other circuits in the latter part of the year 1858.

These were the first duplex instruments ever worked successfully between two distant stations in this country. This occurred, too, about ten years before Mr. Stearns introduced his instruments upon the Franklin line between Boston and New York.

The successful and unauthorized use by the Western Union Telegraph Company of my device in their present quadruplex system, shows that, had there existed in 1858-9 in this country a demand for any duplex system, the instrument capable of satisfying that demand had been invented, patented, and worked successfully by the undersigned,
MOSES G. FARMER.

U. S. Torpedo Station, Newport, R. I., Nov. 26, 1875.

The Defects and Deficiencies of Automatic Telegraphy.

TO THE EDITOR OF THE TELEGRAPHER.

THE general tenure of Mr. D. H. Craig's letter in your issue of November 20th, in reply to my communication of a few weeks ago, hardly demands an answer from me, relying as he does on personal abuse to refute the facts I presented at that time, and I therefore consider my point gained. Would I were as able to fight him with my pen as I flatter myself I am in facts. I will, however, reply to such parts of his letter as need correction, trusting to your indulgence to overlook any want of flowery language which looks so fine in print. The first question asked Mr. C. was with regard to the single message. This he nimbly glides by, and does, as most any ordinary man would do, "Gives it up." The idea that a message was

perforated, transmitted, copied, re-perforated and re-transmitted inside of sixty seconds, as also the cream of the W. U. Co.'s operators only being able to average 23 words per minute, is so absolutely absurd and ridiculous that it needs no comment whatever. The time so strangely omitted in giving the result of the contest with 1620 words—kindly inserted by your correspondent—was omitted purposely, as I was one who participated in the trial, my bump of self-praise not being fully developed.

Now let us examine the 135 words per minute perforated by a boy [statement of Mr. Craig]. We will average the words at 5 letters each, which makes a total of 675, or 11½ letters per second. Now, is it possible for any human being to manipulate their hands or arms through 6 inches of space 11 times in a second? Is it even possible for a Morse operator to make 11 dots on a key in a second? I leave it for you and your readers to answer. Now we will glance at the same rehashed statement that we have heard so much of with regard to the President's message, sent in 1872, as a fair test of the automatic system. Allow me to enlighten those uninformed. The message was perforated in Washington and copied in New York daily from three to six days previous to the trial. No one knows but those interested how many hundreds of words were submitted, under the disguise of freshly prepared work, that was in reality work performed hours or days before, thus deceiving those gentlemen who lent their names to the Automatic Co. as witnesses of the contest in good faith.

I construe Mr. Craig's explanation of the cause of another circuit being assigned to Philadelphia as a modification of his previous statement that 15,000 messages could be handled on an automatic circuit. Philadelphia has always had a special wire for his broker business, and attempted to send his ordinary business on the same automatic circuit as Baltimore and Washington, with what success you already know. Now let us call on the "responsible officers of my Co." for their experience. You will find that they, in their own good judgment, have long since found the distinction between theoretical views and practical application of the automatic system, and are governing themselves accordingly. They are now working automatic in conjunction with Morse, finding the automatic, as conceded in my former communication, a perfect success during prostration of wires, storms, etc.

As I said in the beginning, I am not able to compete with Mr. C. in theoretical views and there fine expression on paper, but I do profess myself willing to prove what I claim, or try to, at least. My hopes never aspire to convert Mr. Craig into the ranks of the only true system of telegraphy yet practiced; but by the statement of facts I wished to counteract the false impression your correspondent seeks to make upon the untutored minds of those who do not know the merits and demerits of automatic telegraphy, and I trust I have accomplished this. And now, having a desire to make Mr. Craig "treat, trade or travel," I hereby challenge him to select from the automatic forces three of its best perforators, three of its best copyists and two operators; I, in turn, to select two Morse operators, and with one thousand words of the same manuscript, and in the presence of competent and impartial judges, finally settle this long disputed question.

As he closes with still another prediction "in the near future," etc., will you allow my "silly," "tricky" and "ignorant" brain to make one also? I predict, "in the near future," the complete annihilation of automatic, except for the use of press and matter that can stand almost indefinite delay; and I very much fear that to bring it to the perfection claimed by its loving friend, he and his talented messenger boy will have to return to the bogs of Ireland and spend another six years in experiments. In closing, allow me to express my thanks for his hopes of my soon arriving at years of discretion, and the hope that at his age I shall exercise it together with common sense fully as much as he does. OPERATOR.

A Caustic Reproof of "Western Union" by a Chicago Female Operator.

CHICAGO, ILL., Nov. 9.

TO THE EDITOR OF THE TELEGRAPHER.

IT is my turn to speak now. Heretofore I have been merely a looker on, watching the actions of that brilliant (?) young man, "Western Union." In the issue of THE TELEGRAPHER for the 6th inst. he became a little too personal, and among "the little dears" he may find some not quite as tame as he thinks they are. There is not one lady in this office who cares to have her name mentioned in the columns of any paper whatever, and we cannot take up a copy of THE TELEGRAPHER but that we see some remark about some lady in this office. "Western Union" may not mean any disrespect whatever, nevertheless if such remarks are continued, the Chicago ladies will soon be known all over the universe, and their names be used as a by-word and jest. My opinion is, and the others agree with me, that it is not consistent with the strict rules of etiquette to address a lady by her given name, and I also think it the height of impudence to en-

close said name in quotation marks. If a lady's intimate friends address her by her given name, a perfect stranger has no authority to violate the privilege given to those friends only. One of the ladies remarked the other day, "I am not ashamed of my name, but I do hate most awfully to see it quoted in THE TELEGRAPHER." "W. U." says, "the ladies say the management is real mean." If he wants to strike at the management himself why don't he come out and say what he thinks about it, and not beat around the bush or try to whip it across the ladies' shoulders? I doubt the veracity of that statement of his. I don't think there is a lady in the office that ever used such an expression; on the contrary, they think the management superior to what it formerly was. I would not say any more about Angell if I were you, "W. U.;" any man that uses or did use such vulgar and profane language on a wire next to one worked by a young lady ought to be discharged. If you think the manager is not justified in doing as he did, maybe you could suggest another way of clearing the office of such nuisances. How fortunate for Angell that he has still one friend that clings to him in the days of adversity, and one heart that truly mourns because he is not here—

"Though lost to sight, to memory dear."

Kuwo, all ye people, this man ("W. U.") by his associates, and if they be such as Angell, may their fate be the same. Allow me to correct you, "W. U." We do not have to stay until six o'clock every night—we get off at five three eights out of the six—and will you explain to us how you know we stay half an hour after the boys go down? Do you peep into our lunch room at six thirty to see if any of us are there? How grateful we ought to be to one who interests himself so much in our behalf. How kind! but then some folks are naturally kind hearted, and are never appreciated in this world. The elevator stops running at six ten—ten minutes after we are relieved—and we usually go down in the elevator, every one of us. I think a little more study in the rudiments of arithmetic would be beneficial. You miscalculated this time. If "the boys" were not "boisterous" it would not be in the power of ladies to say so, and no lady wants to go down or come up in an elevator where tobacco smoke is puffed in her face, and where the men are not particular whether they spit tobacco juice on her dress or on the floor. A lady cannot wear a dress one week in this office but what it becomes filthy with the tobacco juice which some of the men and boys spit on the floor and sides of the paper boxes, notwithstanding the fact that spittoons are furnished, one to every table. The hall leading from the entrance to the elevator and the sidewalk in front of the door is a disgrace to any establishment where there are so many who call themselves gentlemen (save the mark!).

We do not care how much tobacco they use or how they use it; but we do ask them, "please not to spit on the floor quite so much hereafter." One more correction. "W. U." That lady did not return from Ireland until August, and in April I noticed several young ladies doing tating, etc., so it was not her "glowing accounts" that induced them to try it again. You have been using your eyes for no purpose whatever, and before you speak of book marks again, learn the difference between Bristol and common perforated cardboard. A suitable motto for you would be, "Attend to your own business." Will not some one be kind enough to work it for him? Some of the men in this office seem to take special delight in commenting upon and criticising the actions of the ladies, and frequently using their names in a light and ungentlemanly manner. Oh, for the good old days when we had an apartment to ourselves, where none like "W. U." dare put his foot. A majority of the ladies in the office will not subscribe for a paper which contains nothing but silly, nonsensical trash in connection with their own office. They can, every one, enjoy a joke when played upon them, but when it becomes a standing one they will not endure it. THE TELEGRAPHER has degenerated very much within the last year; it is totally unlike the paper of two years ago; and we hope the paper of two years hence will be as much superior to the one of to-day as the one of to-day is inferior to the one of two years ago. Until then, or until the Chicago correspondents cease using the names of the ladies so familiarly, THE TELEGRAPHER will cease to circulate among us. PRISCILLA.

Thanksgiving Privileges.—Good Advice to Correspondents.

CHICAGO, ILL., Thanksgiving Day.

TO THE EDITOR OF THE TELEGRAPHER.

THE Western Union Company shortened the force, as usual, to-day, to allow all ample time to partake of the traditional bird. Beams of satisfaction are noticeable upon the countenances of those who have put in an appearance since the close of the day.

"Bonanza" appears in a fair way to be scalped for the careless manner in which he wrote up some of the operators who went to the polls on election day.

Probably the fact that he has not yet been positively located is all that saves him. It will be most charitable to believe that he was only prompted by a spirit of malicious mischievousness, and that he did not feel withheld from wandering as far from the golden rule as his imagination might lead him.

It is hoped that the fraternity will not thereby gain the impression that our voters went seriously beyond the limits common upon such occasions.

It may not be out of place to write here that correspondents should consider well before indulging in personalities to which they would hesitate to append their names. They thus assume an advantage that should not be claimed, unless, perhaps, in cases of extreme emergency or oppression, where decapitation might be the result of their being known, and then let every line be ruled by "the truth and nothing but the truth." THE TELEGRAPHER is our "stand-by," and presumed to be a friend to us all, and we should work to the end that it may never appear in any different light. Its editor is not in a position to always be able to judge precisely what is best to be published or suppressed. While it is ready to give all a hearing, as far as consistent with our well-being, we should not subject it to condemnation by flooding it with acrimonious stuff, or any element that would tend to bring it into disfavor. It is understood there are operators, particularly among the ladies, who sit in fear that the next issue of THE TELEGRAPHER may contain mention of their names, facetious or otherwise, to their confusion or mortification. Let this feeling be dispelled, and let all take up the paper, confident that there is nothing therein to their discredit, and much therein for their benefit.

Let us not make it possible that there shall come a day when it shall cease to be an earnest protector of our rights, privileges and respectabilities; for, in such an event, it might be shown that we were hardly worthy its protection.

B.

A Valuable but Dangerous Instrument Table Invention.—A Plan to Duplex, Quadruplex and Automaticise Telegraph Operators.

HAMILTON, ONT., CANADA, Nov. 25.

TO THE EDITOR OF THE TELEGRAPHER.

AS I have not inflicted anything on you for some time, it strikes me that I might do so now, so here goes, "for the good of the fraternity," you know. It did not take me long to discover that the quartette tables were not suitable to all offices, and with a view to obtain an improvement I offer the following thoughts:

In Canada, and no doubt in many of the States, you find a city or town conveniently situated between two or more larger places. The wires run through that office, perhaps in three or four directions, giving a large number of instruments, while the staff is regulated according to the amount of local business transacted. We will suppose there are sixteen instruments and four operators, no one wire paying to detail an operator specially to it. Such an office is difficult to work, and while each operator's aggregate of messages may be small, yet the amount of running around, waiting, watching, etc., is great, and still it does not appear in the monthly returns. Those four men would prefer to do double the work on one wire each, but they must do business as it offers, when and where they can.

Now, I hold that one man cannot advantageously run a quartette table, so I have invented one (patent not yet applied for) embodying the following ideas: The operator is in the centre of the table, like the hub of a wheel, his three or four instruments surrounding him; the glass partitions which are in the centre of the quartettes are placed around the outside or circumference of the table, with divisions radiating towards the centre, to better divide the sound. The operator sits on a revolving stool with a high back, and by a slight motion can place himself in front of any instrument. In large offices, where steam power is used, these stools might be attached by shafting, the motion being arrested by operator's foot.

So far my model works well, but unfortunately a trifling accident occurred the other day. The operator was let in by the chief, who only can release him. The operator in question signalled the chief to be released, but, carelessly leaning slightly out of the perpendicular, his right ear came in contact with the edge of the table as his seat "descended" to let him out. The ear was picked up and was sewed on by a skillful surgeon. "Tom" has the sympathy of the boys. The bandages have not yet been removed, so we don't know how it will be. One fellow unfeelingly suggests, in case the organ does not take root, that it would make a splendid door mat. Orders have been given to sit erect when being "inducted" or "discharged," and those who cultivate projecting ears are advised to "pin them back."

I have read with great interest the progress made within the last few years to increase the capacity of wires. Duplex, quad, multiplex and automatic appear to come on us thick and fast, but while they are really wonderful inventions or discoveries, the price of tele-

graphy cannot well be reduced, in Canada, for instance, until messages can be copied off cheaper than by present methods. To increase the capacity of a wire four to twentyfold keeps down capital account, but the other items, wages, etc., are in proportion to the amount of work done. To solve this problem I am devoting my leisure, and as you may be able to assist me I will take you into my confidence. I once heard of an operator, years ago, who claimed to be able to send on two wires at once, and receive on another by aid of a copyist. The thing appeared so absurd that we did not credit the fellow. Just like the rumors about duplex telegraphy a few years ago. Had we not tried to send two messages at once, and what was the result? Crashing, smashing, swearing "it could not be did; tell that to the marines, old boy, you can't fool me." Now, I have reached the stage that I am prepared to sink all my previous theories which I acquired so laboriously, and I am now prepared to test every theory. If that triplex operator is alive now I would like his cooperation.

I desire to get up a duplex operator, and, if successful, I propose to duplex each side of him, and work him quad. Should success crown my efforts, I shall then turn my attention to "automatic" the next fellow who turns up and applies for a job. Any one who will volunteer in the interest of science and *pro bono publico* to be experimented upon will be liberally dealt with, when patents are secured and sold at least once. I presume condensers will be required, but have not yet decided how or where to attach them. I feel jubilant over this idea: if the quad. is worth a quarter of a million dollars a year to the Western Union, what would not a method of "quading" the operator be worth, to say nothing of the value of the "automaticised" operator to the Atlantic and Pacific or to Craig and Little? I stand aghast at the idea, but I am reminded that all things are transitory, and I will not anticipate what is in store for me. I reserve calculations and formulæ for my next.

B.

Presentation to Mr. Sholes from his Friends in Chicago Western Union Office.

CHICAGO, ILL., Nov. 30.

TO THE EDITOR OF THE TELEGRAPHER.

WHEN it was ascertained that Mr. Sholes was about to resign his position in the Western Union office here, some of the older men, headed by Mr. James E. Pettit, decided to make him some suitable testimonial. Accordingly a subscription paper was started and considerably over one hundred dollars raised. Owing to the peculiar condition of Mr. Sholes' health, his friends were at a loss to know what would be most suitable, but they finally decided that (as nothing could be of more pleasure to him than the regaining of his health, now so much impaired) the most fitting present would be that which would assist him to purchase such things as would tend to assist him in regaining it, viz., money. A great many, knowing Mr. Sholes' sensitive nature, were fearful that such a tender might be looked upon as an insult, and strongly opposed such a course, but the majority ruled, and delegated Mr. Pettit to do up the presentation business in that original manner which only "Jim" can command. He immediately put the plan into execution (Mr. Sholes being in Milwaukee at the time) by purchasing a fine morocco portmonnaie and having the following inscribed upon it: "Presented to C. G. Sholes by his friends of the Chicago office W. U. Tel. Co." Inside the portmonnaie the testimonial, amounting to something over one hundred dollars in greenbacks, was placed, and, together with the following letter, written by Mr. Pettit, left at Mr. Sholes' residence:

"Chicago, Oct. 23, '75.

"C. G. Sholes—Friend Cass.

"On severing your official connection with us we wish to make a testimonial to you, in appreciation of the many sterling qualities you have exhibited in your official intercourse.

"Bearing in mind the cause of your leaving us, permit us to tender to you the enclosed, and allow us to be instrumental in gaining for you that priceless boon—a return to perfect health.

"Wishing a speedy recovery, believe us to be ever your well wishers.
Your Friends of 'Ch.'"

The testimonial was very unexpected to Mr. Sholes, as also was the kindness of the company here in retaining his name on the pay roll until the end of the month; the two together making him a purse of nearly one hundred and eighty dollars; and being that much better off than he expected to be, he was, of course, very much rejoiced. Immediately on his return from Milwaukee he indited a reply in Mr. Pettit's care, of which the following is a copy:

"Chicago, Ill., Oct. 26, '75.

"To my Friends in 'Ch.'

"On my return home from Milwaukee, yesterday, I found awaiting me your gift, with its kind accompanying letter.

"Words fail me when I try to express my feelings. I am like the party who, when toasted at a public dinner, responded in this wise, 'My friends, a morbid desire for originality prevents my saying this is the proudest moment of my life, and as it does not occur to me to say anything else, I am afraid I must take my seat.'

"I thank you deeply and sincerely. It needed not this reminder to cause me to carry with me lively recollections of the old office, and pleasant and lasting remembrances of my fellow operators; but it is peculiarly gratifying to me at this time to receive a token of your friendship, as it shows me that, in your opinion, my energies were not misdirected—my motives not misunderstood while discharging the duties of my late position.

"Again I thank you, one and all. Believe me, sincerely your friend.
C. G. Sholes."

I am happy to say that up to the present writing Mr. Sholes has not had a hemorrhage since he left the office, clearly showing what the direct cause of his ailment was—*i. e.*, confinement. He is just starting for your city, and will, no doubt, as soon as sufficiently rested, give you a call. From present indications his hopes of a speedy recovery will be realized, and none of his many friends can more devoutly wish for such a consummation than

OCCASIONAL.

The Scientific Problem.

TO THE EDITOR OF THE TELEGRAPHER.

BEFORE attempting the task of "harmonizing" the two electrical laws which your correspondent, W. B., says are laid down in most text books on electricity, will he have the goodness to inform us in what text book he found his second law, viz., "Electricity will follow every route open to it?" This may be true in one sense, but it certainly will not follow a route in which the resistance is infinite, *i. e.*, in which the circuit is open; nor one in which there exists an opposing current of equal electromotive force; nor one in which the electrical potential at the end of the route is the same as that of the current at the entering point, which is the case with the bridge wire when the four sides of the balance are in proportion.

P.

Odd and Ends.

PHILADELPHIA, PA., Dec. 1.

TO THE EDITOR OF THE TELEGRAPHER.

THE general despatcher of this road being at the milk depot office, whose office signal is "D," sent the following message to "X:": Send a shovel, poker and scuttle to "D." The call for Doylestown also being "D," but on a different line, and of more prominence than the former named "D" office, they were sent to Doylestown. In the meantime, it getting cold, the despatcher again sent a message: "Send a shovel, etc., to D." Again they were sent to Doylestown, and not receiving the articles, after waiting a few days, he then called on the person having charge of those materials, and demanded an explanation. The reply was, "I sent them to Doylestown, as you told me to, in the market car." That settled it.

On the 21st and 28th ult. we had a sort of D. H. train, allowing all employes to ride free without a pass, and the agent's clerks, etc., made a good turn out, a few returning with "champagne on the brain."

A slim young lady (of 200 lbs. avoirdupois) called on our Bingen operator the other day, and handing him a letter, asked in an exciting manner, "Gade dar brief nuch udder is dar delegaff shun gouga." He is often greeted with such customers and remarks, and he therefore follows the maxim to "laugh and grow fat." A letter received at the post-office at the above named place bore the inscription, "deliver impossibly."

One of our former conductors, who wanted to "show off," sent a message saying, "I cannot impossibly come." He made one "show off" too many, and so he takes a rest.

"Mill, Mill, the paper is run out, come quick, and get the rest by sound." Now "R," don't get too "excited." Does "R" know what freight flats are, or did he mean foreign flats? Wonder if Andy prefers colts to cows, as that is the way he had it in a message. "C. N." insisted upon it being cider; upon looking at the tape it proved to be order. He is, however, improving, but he don't count his dots right, and therefore made a ridiculous signature the other day, saying "Sig. A. Hell," when it should have been "Sig. A. Sell."

Miss Maggie Duff is now located at Third and Chestnut, in this city; Mrs. Diekel occupies her former position at Broad and Coates streets.

Boys, don't say hard times prevent you from taking THE TELEGRAPHER, when I have an operator on the list who receives twenty-five dollars per month, buys his clothing, pays board and his washerwoman regularly, and lives in this city.

Ex-Prof.

To Correspondents.

KNIGHT TEMPEAR.—Your note of the 25th November received, but the communication to which you refer has never come to hand.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS
OF THE
TELEGRAPHIC FRATERNITY.

SATURDAY, DECEMBER 4, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

Duplex and Quadruplex Telegraphy.—Mr. Farmer's Inventions.

WE publish in another column a communication from Mr. FARMER, in which he takes exception to our remarks in relation to Mr. POPE's article on quadruplex telegraphy, published in THE TELEGRAPHER of November 13th. It was certainly very far from our intention, and we think we may safely say, that of Mr. POPE also, to do injustice to any person. In our editorial remarks, by an oversight plainly apparent to any one taking the trouble to read the article referred to, we spoke of Mr. POPE's article "as a complete history of duplex and quadruplex inventions." It does not claim, nor was it intended to be, either a treatise on, or a history of duplex telegraphy. Its sole object was to trace the progress and development of the so-called quadruplex apparatus, as now used in this country, and all reference to duplex inventions was purposely omitted, except in so far as seemed absolutely essential to throw light on the particular subject in hand. Mr. POPE informs us that he was acquainted with the invention described in Mr. FARMER's paper of 1855, to which he refers in his communication, but it contained no principle in common with the quadruplex apparatus of to-day, and consequently did not, properly speaking, form the starting point in the chain

of development which he was endeavoring to trace. It was, doubtless, for this reason that he said, in reference to STARK's proposition of 1855, that it "was unquestionably the earliest published suggestion of what is now known as the quadruplex system."

Mr. POPE also attempted to show, what we believe to be the fact, that each of the so-called quadruplex inventions is founded on some particular method of double transmission in the same direction, and that the conversion of any one of these into a quadruplex, by using it in connection with some previously existing duplex system, could not of itself constitute a legitimate invention.

Mr. FARMER's invention, patented in 1853, and reissued in 1875, does not claim the pole changing continuity preserving key as new *per se*, but only "in combination with instruments for sending and receiving messages simultaneously upon one wire." EDISON, in 1874, used the same key, but in combination with instruments for sending two messages in the same direction upon one wire. This, in fact, constituted the gist of his invention. The application to this of one of the existing duplex systems was an afterthought, and, according to Mr. POPE's view of the subject, was not a true invention when considered by itself. The question whether such an application does or does not embody or infringe upon specific combinations previously invented or patented by others, is altogether a distinct one, the discussion of which did not necessarily, as it seems to us, fall within the scope of Mr. POPE's article. If it had in reality formed a part of Mr. POPE's plan to trace the development of what is now known as the duplex system, the omission of any reference to the early labors of Mr. FARMER in this now fruitful, but then almost unknown field of discovery, would have been simply unpardonable. With this explanation we feel sure that Mr. FARMER will acquit the writer of the article, as well as ourselves, of any intentional injustice towards him, while our readers, being now in possession of all the facts, can readily form their own conclusions in regard to the matter.

Another Great Discovery of the Professor of Duplicity and Quadruplicity.

"HERE we are again!" is the familiar exclamation of the clown as he tumbles head first into the circus ring. Similarly EDISON, the great professor of duplicity and quadruplicity, once more astonishes the editor of the *New York Tribune*, and through the columns of that newspaper acquaints the world of another great discovery, which is to "revolutionize telegraphy" and cheapen telegraphic communication to such an extent that it will be cheaper to use the telegraph than the mail.

The professor is not certain as yet whether his discovery is of a new kind of electricity, which has hitherto been overlooked by electricians, or a bran new force, similar to electricity but developed by it, and which possesses all the advantages and none of the disadvantages for utilization of that subtle and difficult to be managed fluid or force. The modesty of the great professor is striking in thus diffidently distrust'ng his intuitive perceptions, but it is only a temporary hesitancy, which will soon yield to further development. Not knowing its character, or exactly the quality of his new "What is It?" does not prevent the professor from naming it, as its merchantable value largely depends upon a name, and he has accordingly christened it, "etheric force"—a very excellent and taking appellation. We would diffidently suggest to the professor and his astounded friends whether this is not the force with which the celebrated PAINE motor was run a few years ago, and that perhaps after all his title to this as well as other of his inventions is not likely to be called in question by PAINE, or some other party, who has used it before him, effectually to extract dollars from gullible investors?

We have been aware that for the last two or three months the professor has been hard up, and have been confidently looking for some new development of his genius which should again immortalize his name and replenish his exhausted exchequer, and it is evident that

our watching and waiting was not without reasonable expectation of reward. This new "discovery" affords another excellent chance for semi-scientific capitalists to invest what means PAINE and EDISON have heretofore left them; and our knowledge of human nature, and of the *guideless* and *taking* characteristics of the professor, assures us, and may assure him that investors in the new moonshine will not be sought in vain. That "the fools are not all dead" is the great fact upon which such inventors and discoverers trade. As this seems to be a recent development of the professor's genius, we do not suppose that an interest in the discovery has been sold or promised to more than three or four parties as yet, so that the field is open for all who have more money than wit to invest the former. *Vive la humbug!*

Appointment of Mr. J. D. Reid Treasurer of the Gold and Stock Telegraph Company.

IT affords us much pleasure to record the appointment of Mr. J. D. REID as Treasurer of the Gold and Stock Telegraph Company, in place of Mr. H. H. WARD, whose resignation, to accept the position of Cashier of the Western Union Telegraph Company in this city, has already appeared in THE TELEGRAPHER.

Mr. REID's long and prominent connection with telegraph interests, and his acknowledged ability and courtesy, qualify him to serve in his new position with credit to himself and satisfaction to the company and all who may have business with its treasurer.

Personals.

Mr. R. J. HEWETT has been transferred from Osage City, Mo., to the Train Dispatcher's office of the Atlantic and Pacific R. R. at St. Louis, Mo.

Mr. EDDIE DENNIS, of the Chicago, Ill., Western Union office, has been absent for a week's recreation, and has returned reinvigorated, as it seems, from his improved appearance.

Mr. FRANK FARLEY is employed in the Western Union office at Shreveport, La.

Mr. C. E. REHLE, lately of Terre Haute, Ind., has been appointed to a position on the night force of the St. Louis, Mo., Western Union office.

Mr. CHARLES E. DODD has resigned his position with the Western Union Co. at Kansas City, Mo., to accept a situation at Emporia, Kansas, with the A. T. and S. F. R. R.

Mr. W. H. BANCROFT has been appointed Superintendent of the St. Louis, Lawrence and Western R. R., also Superintendent of Telegraph at Lawrence, Kansas.

Mr. FRANK GWYNN is engaged in constructing a telegraph line from Houston to Harwood, Texas.

Mr. W. H. BENTON has resigned his position with the Western Union Co. at Macon, Georgia.

Mr. F. G. BEACH has resigned his position with the Atlantic and Pacific Telegraph Co. at Cleveland, Ohio, to engage in other business.

Mr. A. V. CARR has been appointed Manager of the Western Union office at Shawneetown, Ill.

The Telegraph.

The Pneumatic Tube Experiment.

THE preparations of the Western Union Telegraph Company for their experiment with pneumatic tubes for connecting their main and certain branch offices, in the lower part of the city, are nearly completed. The contracts for laying the tubes has already been signed, and operations will be immediately commenced, and the tubes are expected to be ready for use about the first of the new year. There will be two tubes, each of which will consist of a lead pipe having 2 1/4 inches inside diameter, encased in an iron pipe, having an interior diameter of three inches, the latter being designed as a protection to the lead. The cylinders of the air pump for compressing and exhausting the air in the tubes have a diameter of 35 inches. Messages from the main office will be despatched by means of compressed air through one of the tubes, while those to be returned to the central office will pass through the other tube, by exhausting the air—the engine, pumps, and valves all being placed in the central office. The carriers are made of gutta percha, covered with felt cloth, the forward end being sufficiently enlarged to fill

the tube, and thus prevent the passage of air in either direction beyond the carrier. It is estimated that the time occupied in sending a message from the central office to the office in Broad street will be about 25 seconds, while the arrangement will be such that one carrier, if necessary, can immediately follow another.

The Atlantic and Pacific Telegraph Company.

Mr. E. D. L. SWEET has resigned the position of General Superintendent of the Atlantic and Pacific Telegraph Company. Mr. Sweet retains his connection with the company as its second Vice-President and Director, and will, it is understood, continue active in its interests.

Mr. Charles A. Tinker, formerly Manager of the Washington, D. C., office of the Western Union Telegraph Co., but for the last two or three years Chief Train Despatcher and Superintendent of Telegraph of the Central Vermont Railroad lines, has resigned that position, and has been appointed to succeed Mr. Sweet as General Superintendent of the Atlantic and Pacific Division. Mr. Tinker took charge of the division on the first instant. Mr. Tinker is a young man, but has shown good executive abilities in the various telegraphic situations which he has filled, and has had much telegraphic experience, and will doubtless prove an excellent General Superintendent.

New York Telegraphic Notes.

PERHAPS one of the most exhilarating and enthusiasm-inducing sights of a large and well behaved office like New York, on a dull night, is the appearance of a steady going pounder of brass sedately marching up an aisle with a wrong checked message in his hand, and a slip of paper pasted or pinned upon his back, bearing the laconic yet suggestive words, "No bugs here"—or, perchance, "Here I go, what do you want?"—or again, "I want to be an angel," etc., placed there by some mischievous biped of the distributing genus employed in the room. The poor pounder never finds the man he is looking for till he has gone all over the office, and been greeted with smiles at every turn. He soon takes in the joke, however, and is as quiet as if he had got a cold by drinking from a damp glass. Another pleasant diversion of the force is to besmear with tobacco juice one side of an envelope well filled with blanks and sealed, and addressed to some operator in another part of the room, and holding the soiled side down, pass it carelessly to the next operator, who makes a pointed and scriptural remark, expressive of unmitigated disapproval, and drops it while a crowd gathers, and shouts of "What's the 18, Jim?" re-sound to the delight of the old salts, who are suddenly restored to gravity and decorum by the distant cry of a chief, "Are you busy?" or, perhaps, that of some more conscientious plume, who calls out, "Answer Chicago." Let a chief look for a man, or some wire need answering, and a crowd collected for joking purposes fades away like a beautiful summer's dream, and instantly every man is apparently industriously working as if his honor, reputation, or situation depended on it.

Advices from Chicago say that Johnny Kemps was married a day or two since, and that Jerry Mereness has gone home suddenly, on account of his father's death.

Messrs. D. B. Burnett and Sam. Wallace now take Western press on alternate nights at Chicago; mean while the Chicago end of our first duplex with that place suffers for the want of a solid man in Sam's place.

Good scheme, that billiard tournament among the boys. Messrs. Landy, Sprague, Merrill, Mitchell, Risdon and Horn, of the W. U. night force, are about to settle it among themselves who is the best player, and who will be entitled to a certain amount of money in the pool, after a series of thirty games shall have been played. The tournament is expected to last about a week, and much interest is manifested therein already. The players are about equally matched as far as known, and there seems to be fun ahead. Next week's paper will give a graphic account of the several successes and reverses experienced by the boys.

Mr. Jas. H. Lyman, manager Downer's efficient clerk, has gone the way of the world, and now spends his evenings happily at homo with his wife. Joy be with them.

Smith's new quad. is now used on the Albany circuit with great success.

The Atlantic and Pacific Telegraph Co. Sued for Infringement of the Page Patent.

A COMPLAINT was recently filed in the United States Circuit Court in this city by the Western Union Telegraph Company, against the Atlantic and Pacific Telegraph Company, for infringement of the Page patent. The reply of the defendants will among other points claim that Prof. Page was not the first inventor of the device which his patent covered, and for which an action for infringement is brought; that he practically abandoned

his inventions to the public, and that the special act of Congress under which his patent was issued did not authorize a patent covering these devices, and that, therefore, in any event the patent is void, so far as it applies to apparatus employed in telegraphic operation.

Messrs. Porter, Lowery, Soren, and Edward Dickerson appear for the Western Union, and Messrs. Leonard Myers and Everett P. Wheeler represent the Atlantic and Pacific Telegraph Company.

The American District Telegraph.

THE printing department of the American District Telegraph Company in this city during the last year consumed about 200 reams of paper, and printed upwards of a million call tickets, and a great quantity of other blanks and miscellaneous matter. The most remarkable feat of moving and entirely refitting five district offices and opening two new ones was accomplished in six weeks without inconvenience to the business. The average duration of a cell of battery in the American district lines is over seven months, and the cost of material consumed is \$1.11 per cell. Only one man is required to keep in order 1,077 cells. The average weight of copper (chemically pure) deposited per cell is three-quarters of a pound, and its value from 60 to 80 cents per pound.

Over 3,000 messengers have been employed since the company commenced business. During the last year 1,334 were hired and 585 resigned, principally to engage in other business. The average number of messengers constantly employed during the year was 427, of this number 116 are officers, and do not perform messenger services. The average monthly pay rolls for messengers was \$7,800, or about \$93,600 for the year. The total amount lost by the company through accident, embezzlement, or dishonesty of messengers, does not exceed \$100 per year.

The total number of calls delivered was 1,107,454. Of these 580,886 were American district, and 526,568 Western Union.

During the year 1,890,600 circulars, wedding cards, etc., were delivered, and the total time occupied in their delivery was 10,890 hours. The largest delivery was made on Nov. 2d, 145,000 having been delivered on that day.

The Third District (No. 6 Broadway) is the largest and contains about 500 instruments. The fluctuations of the service in this district are very great; notwithstanding a regular force of about 50 boys is employed, it frequently occurs that an extra detail of 80 boys is obliged to be made to meet the calls upon it. The greatest number of calls ever received in one hour was 100; for six consecutive hours calls have been received at the rate of 63 per hour, or more than one a minute. The company have recently added to their printing department an improved quarto medium Gordon press.

Foreign Telegraphic Notes.

DIRECT telegraphic communication is now established between Martin Garcia and Buenos Ayres. The new telegraph was inaugurated by the Minister of War asking the President of the Republic to send the first message. Mr. Charles Burton, the Director General of Telegraphs, Mr. Crowley, Electrician of the Torpedo Division, and nearly all the Foreign Ministers were present.

With the object of providing Indian students with a channel for the free exchange of ideas and the discussion of all questions relating to electricity, a bi-monthly magazine has been started, under the title of *The Indian Telegraphic Journal*.

Finding it impossible to organize in so short a time the exhibition of all kinds of electrical and telegraphic apparatus, announced to be opened in Paris in December, the promoters have postponed the opening of the exposition until July, 1877, when it will be opened at Palais de l'Industrie. Count Halez d'Arros has been appointed Director-General, and the President of the French Republic is at the head of a Committee of Patronage.

Telegraphic messages for North America are now received at postal telegraph offices in the United Kingdom, for transmission by either the Anglo-American Telegraph Co. *via* Valencia, or by the Direct United States Cable Co. *via* Ballinskelligs.

The Hibernia, with the remainder of the New Zealand cable, has left the Thames. She was unfortunate enough to run ashore in a fog, but got off without damage.

The traffic receipts of the Direct Spanish Telegraph Company for the month of October were £1,550, against £1,386 in the corresponding period of last year.

At the adjourned meeting of Hooper's Telegraph Works, the report of the committee of investigation was adopted, and it was proposed to raise about £50,000 on debentures.

The receipts of the Submarine Telegraph Company for

the month of October, 1875, amounted to £10,918, against £9,910 for the corresponding month of last year.

The traffic receipts of the Great Northern Telegraph Company for the month of October amounted to 387,084 francs, against 420,885 francs last year; and the total traffic receipt, from 1st January to 31st October, amounted to 3,574,032 francs, against 3,748,925 francs last year.

The Eastern Telegraph Company's receipts for the month of October amounted to £35,750, against £32,853 in the corresponding period of 1874; and those of the Eastern Extension, Australasia and China Telegraph Company to £19,604, against £16,584 for the corresponding period last year.

The *Telegraphic Journal* states that "Mr. Moxon has introduced, on the Lancashire and Yorkshire Railway, a new right and left Morse printing apparatus. The characters are not made in dots and dashes, but in dots only, on different lines, in what is known as Steuheil's alphabet. The messages as recorded are very compact and legible, and there can be no doubt that considerable speed is gained. It is of use in a busy single needle circuit, for it is worked by the same means and the same alphabet as the single needle instrument."

Legislation for the Telegraph.

THE new constitution which is to be submitted to the people of Alabama for their approval some time during this month contains the following section in relation to lines of telegraph within that state:

"Any association or corporation organized for the purpose, or any individual, shall have the right to construct and maintain lines of telegraph within this State, and connect the same with other lines, and the general assembly shall, by general law of uniform operation, provide reasonable regulations to give full effect to this section. No telegraph company shall consolidate with, or hold a controlling interest in the stock or bonds of any other telegraph company owning a competing line, or acquire, by purchase or otherwise, any other competing line of telegraph."

The New Zealand Telegraph.

THE Eleventh Annual Report of the Acting Commissioner of the New Zealand Telegraphs, for the year ended the 30th of June last, states that during the year 917,128 messages were transmitted—an increase of 164,299, or more than 17 per cent. over the previous year. Taking into account the value of general government messages transmitted (£13,679 10s. 9d.), the total earnings of the department for the year amount to £69,536 12s. 3d., which, after deducting the cost of the signal department, maintenance of lines, etc., leaves a balance of £9,460 13s. 4d. as interest upon the capital expended.

During the past year 456 miles of new lines, carrying a single wire, have been erected, and 988 miles of wire have been added to the original lines, making a total addition of 1,444 miles of wire.

There are now opened to the public throughout the colony 127 stations, 21 of which have been opened during the past year.

At the close of the year 2,986 miles of lines, carrying 6,626 miles of wire, were in circuit, showing an increased mileage upon the previous year in line 456, and wire 1,444.

The numerical strength of the department, including linesmen and inspectors, on June 30, 1875, was 509, against 388 of the previous year.

The duplex system of telegraphy, mentioned in the last annual report, has been in successful operation on the No. 3 wire in the Cook Strait cable since June 18, 1874, and the advantage of speedy communication consequent thereupon has been very obvious. Instruments are now ready, and the system will be immediately introduced on the No. 3 wire north to Napier, and on the No. 3 wire between Blenheim and Christchurch. With the additional wires erected between Napier and Wellington, it is anticipated that this will greatly facilitate the transmission of the increasing work now offering. It is proposed to introduce shortly the automatic system on some of the longer circuits, instruments for this purpose having just arrived from England.

The British Postal Telegraph.

In the report of the British Postmaster General for 1874, it is stated that "there has again been a large increase in the amount of postal telegraph business, the number of messages (exclusive of newspaper telegrams) having last year been above 19,000,000, or about 10 per cent. more than in 1873. In the number of postal telegraph offices there was, however, no material change, owing in great measure to the fact that—previous to its commencement—the telegraph system had previously been extended to all places in the kingdom of considerable size. Although the year has not been signalized by any

material changes in the mode of carrying on the telegraph service, numerous minor improvements have been effected, which have enabled the department to afford increased facilities to the public, and in many cases materially to lessen the cost of working. Of these, the principal have been the further application of the system of 'duplex' telegraphy, and the more general use of the so-called 'sounder' instrument—a form of apparatus greatly in favor in the United States."

There has again been a large increase in the rental from private wires, the sum having risen from about £47,000 to about £53,000, or about 12 per cent.

ASSESSMENT No. 79.

5, 19, 39, 59, 84, 100, 103, 114, 122, 136, 139, 206, 228, 252, 316, 328, 366, 371, 441, 456, 482, 516, 556, 557, 617, 652, 690, 701, 710, 712, 722, 781, 783, 786, 800, 802, 809, 836, 838, 871, 904, 906, 926, 929, 934, 944, 980, 1000, 1002, 1014, 1016, 1041, 1057, 1085, 1099, 1105, 1106, 1107, 1108, 1209, 1110, 1112, 1113, 1115, 1117, 1119, 1120, 1122, 1123, 1125, 1131, 1141, 1152, 1167, 1194, 1224, 1251, 1255, 1256, 1266, 1277, 1281, 1283, 1284, 1235, 1286, 1339, 1340, 1342, 1344, 1346, 1348, 1349, 1350, 1351, 1352, 1366, 1405, 1412, 1421, 1426, 1427, 1430, 1432, 1433, 1437, 1465, 1469, 1471, 1474, 1476, 1481, 1497, 1513, 1528, 1529, 1530, 1571, 1572, 1573, 1586, 1597, 1600, 1603, 1616, 1619, 1626, 1632, 1649, 1653, 1657, 1666, 1672, 1690, 1691, 1700, 1701, 1704, 1733, 1737, 1746, 1747, 1750, 1751, 1753, 1754, 1755, 1756, 1757, 1758, 1759, 1760, 1769, 1771, 1785, 1798, 1799, 1802, 1809, 1813, 1828, 1854, 1895, 1915, 1922, 1924, 1926, 1982, 2004, 2015, 2023, 2083, 2085, 2112, 2141, 2171, 2190, 2221, 2226, 2227, 2248, 2253, 2266, 2267, 2275, 2277, 2284, 2286, 2293, 2300, 2324, 2325, 2326, 2349, 2360, 2395, 2397, 2698, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2425, 2432, 2433, 2456, 2457, 2458, 2459, 2460, 2461, 2463, 2470, 2471, 2475.

ASSESSMENT No. 78. 1490.

Members of the Association who look to THE TELEGRAPHER for receipt of assessments paid will please take notice that an acknowledgment of the receipt of one assessment should be taken as a receipt for all previous assessments.

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 31st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Oct. 26, 1875, and bearing that date.

169,077.—ELECTRIC BURGLAR-ALARMS A' D ANNUNCIATORS. Joseph T. Bedford, New York, N. Y. [Filed July 9, 1875.]

Breaking of circuit at door or window releases an armature, which allows a swinging plate, covering an indicator, to fall. Circuit to alarm completed through a spring, which is held out of contact with the armature lever, through which current passes by the swinging covering plate when in its normal position. The armature lever of the alarm and the circuit breaker are also novel features.

- 1. The switch X, composed of the cam shaft Z2, the cam Z1, the spring plate Z, and the wires x y z, connected respectively with the wires K K2, and the negative wire of the operating battery C, constructed and operated as and for the purposes set forth.
2. The combination of the distributing and returning wires of battery C, and the connecting wires of battery C', the binding screws, the armature magnet J1, and the spring I4, substantially as and for the purpose described.
3. The double acting spring I4, in combination with the lever of the alarm bell, and with the screws i a, constructed and operated substantially as and for the purpose specified.
4. The combination of the cover P, having tail piece o and hook p, the spring N, the rod E2' and bar e', constructed and operated substantially as and for the purpose specified.
5. The circuit breaker, consisting of the plate B1, the spring R2, and the plate R3, substantially as described.
6. The spring R2 fastened to the plate I4 which covers it, and bent as shown, so as to avoid much cutting away of the sash, in combination with the plate R3, substantially as herein described.

7. The combination of the springs N and Q and indicator covers P, whereby a simultaneous operation of the said indicator covers and a closing of the circuit for the alarm magnet is effected, substantially as hereinbefore specified.

For the week ended Nov. 2, 1875, and bearing that date.

169,387.—APPARATUS FOR LIGHTING LAMPS BY ELECTRICITY.—J. A. Voisin and P. Dronier, Paris, France. [Filed May 1, 1874.]

The sheath or case carries the conducting wires leading from the battery to the platinum coil and lamp to be lighted. The combination, in an apparatus for producing a flame of light by means of electricity, of the sheath or case f', provided with an isolating or resinous substance, wires d d', tubes b b', and the platinum wire or strips z, all as shown and set forth.

169,506.—MAGNETO-PRINTING TELEGRAPHS.—George L. Anders, Boston, assignor to E. B. Welch, Cambridge, Mass. [Filed March 25, 1873.]

- 1. The type wheel of a printing telegraph instrument, operated or controlled by currents from a magneto-generator, without the use of a relay or galvanic battery.
2. The combination of a type wheel and printing mechanism placed in the same circuit, and both operated or controlled by currents from a magneto-generator without the use of a relay or galvanic battery.

Born.

BARRETT.—At East Somerville, Mass., Nov. 27th, to Mr. JAMES C. BARRETT, operator in the Boston, Mass., Western Union Telegraph office, a daughter.

Married.

OSTRAND—PHELPS.—At Watertown, N. Y., Nov. 24th, by Rev. Mr. Bruce, Mr. DEXTER VAN OSTRAND to Miss AGNES PHELPS, all of Watertown.

THE AUTOMATIC FIRE SIGNAL TELEGRAPH CO.,

OF THE CITY OF NEW YORK.

General Superintendent's Office, 206 Broadway, N. Y.

NEW YORK, Nov. 26th, 1875.

EUGENE F. PHILLIPS.

Dear Sir: For eighteen months I have used your Rubber Insulated Copper Wire. During this time I have had strung several thousand feet, and it has not failed to give perfect satisfaction. I have yet to learn of the first instance where the insulation has cracked or peeled. I send you herewith a short section of this wire that has, for the time above mentioned, been constantly exposed to the weather—drawn tightly three times around a "Rubber Hook Insulator." It is as perfect as the day it was put up, save where I have, since it was taken down, cut the insulation to give it a closer examination.

Yours, &c., J. E. FENN, Gen'l Supt.

THE POCKET GALVANOMETER. PRICE REDUCED.

The Pocket Galvanometer manufactured by LENNERT & DECKER, finely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to

J. N. ASHLEY, 38 Vesey street, New York. P. O. Box 5,503.

THE LECLANCHÉ BATTERY. THE WORLD RENOWNED Open Circuit Battery.

NO ACIDS! NO SULPHATE OF COPPER! DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED TO Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHÉ BATTERY COMPANY, No. 40 West 18th Street, or L. G. TILLOTSON & CO., Sole Agents, 8 Dey Street, New York.

BRADLEY'S APPARATUS FOR ELECTRIC MEASUREMENT, COMPOSED OF HIS Tangent Galvanometer and Rheostat.

(Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING

WHEATSTONE'S BRIDGE, Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED

NAKED WIRE HELICES, for Electro-Magnets, wound to any given size and resistance.

Manufacturers of Telegraphic and Electrical Instruments supplied at low rates. For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

SIEMENS' UNIVERSAL GALVANOMETER

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,

22 SOUTH TWENTY-FIRST ST., PHILADELPHIA.

TO ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystallizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

No. 1 Cell, \$5.00. No. 2 " 10.00.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of THE TELEGRAPHIC MANUAL, by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,

MANUFACTURER OF TELEGRAPH INSTRUMENTS,

104 CENTRE STREET, NEW YORK.

BATTERIES of every description for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the **CHESTER PIN DIAL** (patented), designed expressly for **POLICE and LAW TELEGRAPHS**. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell cut out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,

for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,

for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,

CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH;

so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,

REGISTERS, RELAYS, CALL BELLS,

and every description of Central Office apparatus, at most reasonable prices.

Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN"

in which the spring takes the place of the weight, is enclosed in a metal and glass case; is noiseless in its action, and of great beauty and finish, and is specially recommended to *Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.*

ELECTRO-SURGICAL APPARATUS OF EVERY VARIETY AND DESCRIPTION.

HOTEL ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns: Grand Union, Saratoga; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y.; Willard's Hotel, Washington, D. C.; Galt House, Louisville, Ky.; Tefft House, Buffalo; and many others. *Proprietors and keepers of Hotels most liberally dealt with.*

THE "COUNTING ROOM BELL MAGNETS,"

for communicating instantly to clerks and employés, by means of a keyboard, in any desired place.

ALSO,

BELL MAGNETS AND PUSH BUTTONS,

for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$3.00 upwards.

Sole Agent of the

WILSON ELECTRIC GAS LIGHTING CO.,

for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for

LIGHTING FACTORIES, MILLS, ETC.

By simply pushing a button on his bench the operator lights a section of burners.

Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

104 CENTRE STREET.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

- First**—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.
- Second**—The Automatic Signal Boxes.
- Third**—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.
- Fourth**—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the **UNITED STATES** and **CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES** and the **DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and

their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in **Fire Alarm and Police Telegraphy**, upon application as above.

WESTERN ELECTRIC MAN'F'G CO.

220 Kinzie Street, CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished. It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Oufit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.

- Private Line Oufit, complete.....\$10 00
- Instrument only..... 8 00
- Bliss Reservoir Battery, per cell..... 2 00

DISCOUNT.

A discount of twenty per cent. will be allowed when remittance accompanies the order. Remit by express, registered letter, postal order or draft.

In ordering state length of line, so that the resistance of instruments may be proportioned accordingly.

SEND FOR CIRCULAR.

Haskins's Duplex Telegraph.

SINCE the first patent was taken out in this country for duplex telegraphs by Moses G. Farmer, in 1858, nearly forty other patents, including reissues, have up to this time been granted in the United States for inventions of this kind, mostly within the past five years. We have from time to time published in THE TELEGRAPHER diagrams and descriptions of several different methods of duplex telegraphy, including most if not all of those which have been employed in actual telegraphic service in this country, with the exception of the one which forms the subject of the present article.

The apparatus we are about to describe was invented in the early part of 1874 by Mr. C. H. Haskins, General Superintendent of the lines of the North Western Telegraph Company at Milwaukee, Wis. It is one of the simplest in principle, as well as one of the most effective in operation, of the numerous inventions of the kind now before the public. The novelty of the invention may be said to consist principally in the peculiar manner in which the receiving relay is constructed and operated, and we will, therefore, give a somewhat detailed description of this part of the apparatus before attempting to explain the general principle of operation.

The accompanying illustration is an end view of the relay, the connections and other parts of the apparatus being shown on a small scale and in outline, for convenience of explanation. The relay consists of two spools or helices, A A₁, which are placed parallel to each other, and connected together at the point 2, so as to form a continuous circuit from 1 to 3, precisely in the same manner that the helices of an ordinary relay are arranged. Instead, however, of connecting the two cores together by means of a yoke piece or back armature, so as to form a single electro-magnet, as is usually done, semicircular pole pieces of soft iron, C and C₁, are attached to each end of the core of each helix. Therefore each core, with its pole pieces and helix, in reality constitutes a distinct electro-magnet, having four poles, the two poles at one end having always a magnetic polarity opposite to the two poles at the other end, whenever a current is passing.

Between the two helices A A₁, and parallel to them, is a shaft or axis d, carrying at each end a permanently magnetic bar n s, which may be termed a polarized armature. In the drawing, n represents the north pole and s the south pole of one armature, the former being at the top and the latter at the bottom. The position of the armature at the other end of the axis is exactly the reverse of this, the south pole being at the top and the north at the bottom. These armatures are arranged as shown in the figure, their poles being situated directly between the poles C C₁ of the electro-magnets which face each other. A contact arm e, rigidly attached to the axis d, projects upward at a point midway between the two polarized armatures, and is provided with a contact point. The arm e plays between the adjustable stops f and f₁, the latter being insulated, and opens and closes the local circuit of the receiving sounder in the same manner as an ordinary relay. An adjustable spiral spring s₁ retains the armature in the position shown in the figure, the local circuit being open when no current is passing. The coil A is mounted in a frame a, which slides in a bed plate b, and is capable of being moved by means of the screw h to or from the other coil and the armature. Thus it will be seen that the adjustments are virtually the same as in the ordinary relay.

The arrangement of the connections is indicated in outline in the figure. The main batteries at each end of the line are placed with their unlike poles towards each other, precisely as in the usual arrangement for a Morse circuit. When both keys are at rest, the main line is to ground at each end through both helices A A₁ of the relays, and also through the resistance r. The key merely serves, when depressed, to connect the battery to the main line at a point between the helices of the relay.

There are but three different electrical conditions of the line possible when this apparatus is working, which are as follows:

I. When the home key is open and the distant key closed. If each battery consists of say 100 cells, the resistance of the line is 1000 ohms, rheostat r 1200, and relay helices 200 each. The strength of current in this case will be $1000 \div (200 + 1000 + 400 + 1200) = 0.35$. This current will go to earth at the home station through both helices of the relays, and the force acting upon the armature n s in opposition to the spring s₁ will be $0.35 + 2 = 0.70$ when the distant key is closed, and nothing when it is open.

II. When the home key is closed and the distant key open. The current from the home battery divides at the point 2, and to avoid complexity we will assume that the battery has no internal resistance. The strength of the current going to line will be $1000 \div (200 + 1000 + 400 + 1200) = 0.35$; which will therefore act in one coil A₁ of the home relay in opposition to the spring s₁ with a force of 0.35. The other branch of the current going through the rheostat at the home station, has a force in A of $1000 \div (200 + 1200) = 0.71$, which is double that of the current going to line, and acts in the same direction with spring s₁. Thus the armature of the home relay is held still with a force of 0.36 whenever a current is sent to line.

III. When the home and distant keys are both closed. In this case the line current, in consequence of both batteries being on, becomes $2000 \div (200 + 1000 + 200) = 1.66$; which acts upon the coil A₁ upon the line side, but is opposed by the current in A on the rheostat side in both relays. This, as in the former case, amounts to 0.71. Therefore, the effective force acting upon each armature in opposition to the spring, to give a signal, will be $1.66 - 0.71 = 0.95$.

Thus, in this arrangement we would have, under the conditions stated, an effective force acting upon the armature n s, varying from 0.70 to 0.95. It will at once be seen that this great margin enables the operators to work freely over escapes and changes of resistance in the line, which would be impossible in the case of most of the other systems. Thus, in the case cited, in order to dis-

turb the balance of the sender's relay, so as to give him back his own signals, the resistance of the line must be diminished sufficiently to increase the strength of current from 0.35 to 0.71—more than double—which would require a very heavy leakage. In practice, the resistance of the rheostat r is made a constant quantity, all necessary adjustments being effected precisely as in an ordinary instrument, and with no more inconvenience.

The condenser c may be applied when necessary, in the manner shown in the figure, for the purpose of neutralizing the static discharge. This is effected in this apparatus by causing the condenser to discharge directly into the line wire, so as to destroy the charge coming therefrom, instead of the usual arrangement in a differential duplex, which consists in discharging both the line and the condenser into the earth through the opposing coils of the relay.

This improved duplex was patented by Mr. Haskins in the United States on the 24th of August, 1874. It has been used for two years with great success upon the lines of the North Western Telegraph Company, including some long circuits, like that between Milwaukee and St. Paul. By a recent improvement the apparatus is now operated without the use of a condenser, or analogous device for neutralizing the static discharge, even upon the longest circuits ordinarily worked. Any further information respecting this invention will be cheerfully furnished by Mr. Haskins, who may be addressed at Milwaukee, Wis.

Knox's Prayer.

By "BE," Chicago.

O! thou fast sender, do not make me
Lose my now most "brilliant" name;
Thy fast transmitting makes me break thee,
And "Knox" away my hopes of fame.

A New Agency Discovered!—The Electric Telegraph Outdone!—Something that will Overturn all the Railroads and Explode the Present System of Steamships!

[From the New York Moon of Nov. 31st.]

WE hasten to lay before a breathless and eager public the full details of a new and wonderful discovery, which, in its sublime possibilities,

TRANSCENDS THE LIMIT OF HUMAN INTELLECT!

This magnificent invention or discovery was accidentally made while the inventor,

MR. TOMCAT E. ADISON,

was experimenting with a common Morse key in one of our large telegraph offices, in order to ascertain what in thunder made it stick so. In the course of his investigations it became necessary to attach a gum band to the rear screw of the key. This operation, common enough in itself, unexpectedly led to the

GRANDEST RESULTS!

Accidentally releasing the hand, it instantaneously quitted the key, rebounded, and struck the astonished inventor with tremendous force

SQUARE IN THE FACE!

He at once commenced an inquiry into this strange result. Placing one end of the gum band in his message hook, he inserted the end of a pen-holder in the other. Then, quickly releasing it, the pen-holder was thrown with violence

ACROSS THE OFFICE,

a distance of some seventy-five feet. He then left the office very suddenly, and has since been engaged in the development of this new power, which he names

ETHEREO-GUMELASTIC FORCE.

This morning we despatched a reporter to Hoboken, where the inventor resides, for the purpose of getting a full description of the workings of this new and surprising agency.

The distinguished inventor, Mr. Adison, was discovered hard at work in his laboratory, which is at the very top of one of the commonest boarding houses in Hoboken. He was dressed in a torn coat, extremely dirty shirt, and wore one boot and one shoe. This eccentricity is a common accompaniment of genius. The laboratory has a sloping roof, touching the floor at one side. Various strange and wonderful apparatus encumbered the room, some of which bore an astonishing resemblance to old trunks, dilapidated furniture and antiquated hoop skirts. At one end of the apartment an assistant was engaged in a curious experiment with a black junk bottle and a broken tumbler.

The inventor was husily employed in stretching an immense ruhher hand, fastened by one end to a nail in the ceiling. He placed a small iron hall in the loop of the band, pulled it out to its extremest length, then suddenly released it. The hall was projected with frightful velocity through the sash and out into the air, where it described a parabolic curve, finally passing through the plate glass window of the shop opposite.

"This is but a small example of what may be done with this powerful agency," Mr. Adison observed.

There is not sufficient room in our paper to give a full account of the wonderful things the inventor claims may be done by means of this power. We, however, subjoin a few of the most astonishing. By the use of a gum hand of sufficient size, he says he can hurl a car filled with freight or people from New York to San Francisco,

SHEER ACROSS THE CONTINENT,

in less than twenty seconds! Hollow iron balls containing messages may be sent from

BOSTON TO LONDON

in less than a tenth of the time it now requires. Armies in the field will be scattered like leaves by a force a thousand times greater than gunpowder.

The mind fails to grasp the extent of this stupendous discovery. It will certainly revolutionize all existing systems of travel and communication. Rapid transit will then become a reality. A man of business will step into his arial chariot down town and be with his family in less time than it takes to tell it.

We leave the subject thus. Words cannot do justice to it, and no honors can be too great to pay to the distinguished inventor.

The President's Message and Cable Telegraphs.

In his annual message to Congress the President treats at some length the subject of ocean cable telegraphy. He says:

"The electric telegraph has become an essential and indispensable agent in the transmission of business and social messages. Its operations on land and within the limit of particular States is necessarily under the control of the jurisdiction within which it operates. The lines on the high seas, however, are not subject to the particular control of any one government. In 1869 a concession was granted by the French government to a company

which proposed to lay a cable from the shores of France to the United States. At that time there was a telegraphic connection between the United States and the Continent of Europe (through the possessions of Great Britain at either end of the line), under the control of an association which had, at large outlay of capital and at great risk, demonstrated the practicability of maintaining such means of communication. The cost of correspondence by this agency was great—possibly not too large at the time for a proper remuneration for so hazardous and so costly an enterprise. It was, however, a heavy charge upon a means of communication which the progress in the social and commercial intercourse of the world found to be a necessity, and the obtaining of this French concession showed that other capital than that already invested was ready to enter into competition with assurance of adequate return for their outlay. Impressed with the conviction that the interests, not only of the people of the United States but of the world at large, demanded or would demand the multiplication of such means of communication between separated continents, I was desirous that the proposed connection should be made. But certain provisions of this concession were deemed by me to be objectionable, particularly one which gave for a long term of years the exclusive right of telegraphic communication by submarine cable between the shores of France and the United States. I could not concede that any power should claim the right to land a cable on the shores of the United States, and at the same time deny to the United States or to its citizens an equal right to land a cable on its shores.

The right to control the conditions for the laying of a cable within the jurisdictional waters of the United States, to connect our shores with those of any foreign State, pertains exclusively to the government of the United States, under such limitations and conditions as Congress may impose. In the absence of legislation by Congress, I was unwilling on the one hand to yield to a foreign State the right to say that its grantees might land on our shores, while it denied a similar right to our people to land on its shores, and, on the other hand, I was reluctant to deny to the great interests of the world and civilization the facilities of such communication as were proposed. I therefore withheld resistance to the landing of any cable on condition that the offensive monopoly feature of the concession be abandoned, and that the right of any cable which may be established by authority of this government to land upon French territory, and to connect with French land lines and enjoy all the necessary facilities or privileges incident to the use thereof, upon as favorable terms as any other company, be conceded. As the result thereof the company in question renounced the exclusive privilege, and the representative of France was informed that, understanding this relinquishment to be construed as granting the entire reciprocity and equal facilities which had been demanded, the opposition to the landing of the cable was withdrawn. The cable, under the French concession, was landed in the month of July, 1869, and has been an efficient and valuable agent of communication between this country and the other continent. It soon passed under the control, however, of those who had the management of the cable connecting Great Britain with this continent, and thus whatever benefit to the public might have ensued from competition between the two lines was lost, beyond having the greater facilities of an additional line and the additional security in case of accident to one of them. But these increased facilities and this additional security, together with the control of the combined capital of the two companies, gave also greater power to prevent the future construction of other lines, and to limit the control of telegraphic communication between the two continents to those possessing the lines already laid.

Within a few months past a cable has been laid, known as the United States Direct Cable Company, connecting the United States with Great Britain. As soon as the cable was reported to be in working order the rates of the then existing consolidated company were greatly reduced. Soon, however, a break was announced in this new cable, and immediately the rates of the other line, which had been reduced, were again raised. This cable being now repaired the rates appear not to be reduced by either line from those formerly charged by the consolidated companies. There is reason to believe that large amounts of capital, both at home and abroad, are ready to seek profitable investment in the advancement of this useful and civilizing means of correspondence. They await, however, the assurance of the means and conditions on which they may safely be made tributary to the general good. As these cable telegraph lines connect separate States, there are questions as to their organization and control which probably can be best if not solely settled by conventions between the respective States. In the absence, however, of international conventions on the subject, municipal legislation may secure many points which appear to me important, if not indispensable, for the protection of the public against the extortions which may result from a monopoly of the right of operating cable telegrams, or from a combination between several lines.

First.—No line should be allowed to land on the shores of the United States under the concession from another power, which does not admit the right of any other line or lines formed in the United States to land and freely connect with and operate through land lines.

Second.—No line should be allowed to land on the shores of the United States which is not by treaty stipulation with the government from whose shores it proceeds, or by prohibition in its charter, or otherwise to the satisfaction of this government, prohibited from consolidating or amalgamating with any other cable telegraph line, or combining therewith for the purpose of regulating and maintaining the cost of telegraphing.

Third.—All lines should be bound to give precedence in the transmission of the official messages of the governments of the two countries between which it may be laid.

Fourth.—A power should be reserved to the two governments, either conjointly or to each, as regards the messages despatched from its shores, to fix a limit to the charges to be demanded for the transmission of messages.

I present this subject to the earnest consideration of Congress. In the meantime, and unless Congress otherwise direct, I shall not oppose the landing of any telegraphic cable which complies with and assents to the points above enumerated, but will feel it my duty to prevent the landing of any which does not conform to the first and second points as stated, and which will not stipulate to concede to this government the precedence in the transmission of its official messages, and will enter into a satisfactory arrangement in regard to its charges."

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondent. Our columns are open to free discussions on all telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

Personals.—A Liberal and Satisfactory Arrangement.—A Telegraphic Artist's Production.—Complimentary Presentation to a Female Telegrapher.

CHICAGO, ILL., Nov. 10.

TO THE EDITOR OF THE TELEGRAPHER.

AMONG the visitors to this city the past week was Mr. Nichol, manager of the W. U. Telegraph Office at Hennepin, Ill. On the 26th he called at the W. U. office and was shown around the room by Manager Maynard.

Mr. W. A. Gardner is the operator in charge of the telegraph office in the general freight office of the Illinois Central Railroad in this city; Mr. Whitehead having been promoted to a position in the "out" freight department. Mr. Gardner, I understand, is also a fine phonographer and a perfect gentleman.

The following duplicate of a letter from Supt. Wilson to Manager Maynard was posted in the Western Union office here to-day:

"CHICAGO, November 1st, 1875.

"H. C. MAYNARD, ESQ., Manager.

"Dear Sir—In consideration that employes in your department shall hold themselves in readiness to perform any reasonable extra service the company may require from time to time, compensation for such extra service will be made on the following basis:

"The rate per day to be computed from the monthly rate with the Sundays deducted; eight hours during the day and seven by night to constitute a day's "extra service," with an additional allowance of ten per cent. to the regular monthly pay. When supplying vacancies, extra pay will be only equal to the deduction made from the absent pay.

"Yours, respectfully,

"J. J. S. WILSON, Supt."

This makes quite an advance for the extra work done by regular men over the prices ever paid here by the company; fifty cents an hour being the highest ever paid heretofore in the palmiest days of extra work.

Mr. J. P. Mansfield, who, with his brothers, owns a fine farm in Winnebago County, in this State, and who, on account of poor health, has been rusticated there for the past five months, has again returned to his old place in the Sherman House Western Union office, in this city, improved in health, and as ready to wait on customers or smile on a friend as ever.

Mr. A. L. Kissinger, who has served a good apprenticeship as an old R. R. operator on the C. B. & Q., has given up R. R. telegraphing for the present and accepted a position with the Metropolitan Company in Skinner's Hotel, this city.

Mr. D. E. Risdorph is the gentlemanly night manager in the M. C. R. general R. R. telegraph office in this city, and Mr. I. C. Showerman keeps things from getting

tangled there during the day. This is one of the prettiest and most tidily kept office of the kind in the city.

Miss Allie Ward is the latest addition on the Metropolitan force in the Western Union main office in this city. Miss Fitzpatrick, of the same force, had the misfortune to lose her mother, who died in Canada recently, a very amiable lady. Miss F. has the heartfelt sympathy of the fraternity in this section.

Probably no gentleman's departure from Chicago telegraph circles in a long time has caused the regret which was felt when Mr. Paul Bossart resigned his position on the day force of the A. & P. office to accept a position with the Western Union in Pittsburg. Paul seems to be a universal favorite wherever he goes.

I have been presented recently a crayon sketch of Mr. Cuthbert, of the A. & P. office here, as executed by one of the artists in that office, picturing Mr. C. as he appears promenading one of the west side streets with his Mary Jane. She looks happy and so does he. She carries her poodle under her right arm, while with her left she lovingly clutches C.'s right. The cane C. carries in his left hand is a beauty. I would send you the picture, but I am afraid the dog might gnaw through the envelope and eat the cream of the joke.

In these days of selfishness, etc., it is refreshing now and then to hear of a case of deserved esteem like the following, which I clipped from the South Bend, Ind., *Morning Herald* of the 22d ult. The lady mentioned is a cousin of Mr. Samuel Bracken, of the W. U. office in this city:

"Miss Rebecca Bracken, the lady telegraph operator at Niles, on the M. C. R. R., was yesterday made the recipient of a very fine A. No. 1 Elgin gold watch, presented to her by the freight conductors of the middle division of the road. On the inside was engraved: "To Miss R. Bracken, from the freight conductors of the middle division, M. C. R. R." Miss Bracken possesses that rare talent among operators generally of civility to all; a civil question will insure a courteous response. She has been long and favorably known on the road, and is highly esteemed by the officers and respected by the men. May she ever enjoy her popularity and live long to hear the tick of her handsome present. *Vive la Beck.*

OCCASIONAL.

Marriage of Sup't Van Ostrand.—Gerritt Smith's New Quad.—Interruption of Telegraph Communication.

ALBANY, N. Y., Nov. 30.

TO THE EDITOR OF THE TELEGRAPHER.

ANOTHER happy man—one of the fraternity, too. Take courage, ye bachelors. Go and do likewise—if the opportunity offers. Mr. Dexter Van Ostrand, Superintendent of the Rouse's Point and Oswego District of the Montreal Telegraph Co., on Wednesday, November 24th, took unto himself, as a better half, Miss Agnes Phelps, daughter of Mr. Geo. B. Phelps, of Watertown, N. Y.

Mr. Van Ostrand was originally from Evans' Mills, N. Y., and was for several years manager of the Watertown, N. Y., office. About two years ago he was appointed Superintendent of the above named district of the Montreal Co. Van is well known as one of the finest operators in the country, and is altogether a gentleman whose social and business qualities challenge esteem and respect from all who have met or had to do with him in any capacity.

His numerous circle of telegraphic friends will feel sincere pleasure to know that the lady of his choice is in every way worthy, and that more brilliant prospects were scarcely ever vouchsafed to matrimonial voyagers.

Among the numerous and choice presents was a solid silver jelly bowl and ladle, and a set of solid silver forks from the gentlemen in Mr. Van Ostrand's district. The ceremony took place at the residence of the bride's parents on Stone street. The happy couple are to occupy a newly fitted and furnished residence in Watertown, N. Y., immediately upon their return from an extended tour to New York, Washington and elsewhere.

And now that this new duplex has been placed before your readers, there yet remains a few items which are clamoring for notice. The first is, we have a new quad. The last Edisonian bridge quadruplex, of which we can learn, has at last stepped down and out, to make room for the superior arrangements which have recently been invented. And, by the way, quads. seem to be multiplying like toads after a summer shower. (No disrespect to the quadruplexism intended by the comparison.)

We hear of the invention of new quads, from the banks of the sacred Gauges to the azure waters of Lake Michigan. This one, which has now dawned upon us in material shape, is known as Mr. Gerritt Smith's bugless and bridgeless *ne plus ultra extrabus goodabus quadabus*. When it is adjusted properly it is a success, and makes all the boys scramble for a chance to receive on it, owing to its somewhat complicated mechanism. The following notice, couched in the well known language of our former manager, C. S. Jones, is posted on the table:

"HANDS OFF THE BRASS."

Another fact which pleases us, but is of no particular in-

terest to any one else, unless it may be to make 'em jealous, is that our heater pipes and radiators are real gilt edged, bronzed in the finest style, and look well—simply gorgeous; in fact they appeared so fine, when the workman was laying on the gold, that some of the boys got out their watches to have them transformed into gold chronometers.

On Monday, Nov. 29th, a heavy wind prostrated all of the W. U. wires on the central route between Albany and Utica. The break occurred at 8:30 A. M., and communication was more or less interrupted until late in the afternoon. The heavy wind broke down poles in all directions, and caused considerable delay to business. At the time of this writing the thermometer stands about 7 degrees below zero, and all the W. U. wires on the Harlem route, between Albany and New York, and also between Albany and Boston, are broken; caused, probably, by the extreme coldness of the weather. Two little bulls and we are done: "A. McLark" when corrected, read "A. M. Clark," and "Mr. Edward Barould" read—well, "M" stuck to it, "that's the way it came," and so you will have to imagine what it is should have been

DOUBLE SIX.

Visitors.—Telegraph Pedestrian Achievements.—The Book-keeper's Department of the Chicago Western Union Office.

CHICAGO, ILL., Nov. 20.

TO THE EDITOR OF THE TELEGRAPHER.

AMONG the noted telegraphers who visited our city recently were Mr. Johnson, manager of the St. Petersburg, Pa., Western Union office. He was shown the wonders of the W. U. main office by the gentlemanly W. U. managers here.

Pedestrianism is all the rage here now. Everybody has got the fever, even our friends. Chas. Catlin, chief receiver, and G. B. Simpson, manager of the book department of the Western Union office, seem to be afflicted with it. No one wonders that George can walk fast and well, for he's built like a race horse; but how Charlie can manage to carry that "corporation" along at the pace he does, is a source of wonderment to the oldest inhabitant. On Sunday, the 7th inst., they walked from Chicago to Englewood and return, coming back by way of the Union Stock Yards, a distance of 18 miles; and on the 24th ult. they walked from Chicago to Evanston and return, a distance of 24 miles. I have not been able to obtain the exact time made, but I understand it was such as might put some of the professionals even to shame.

As the Western Union book-keeper's department is one of the main departments of the Western Union service here, I have taken the pains to write it up, thinking, no doubt, it would be interesting to your many readers elsewhere to know how the leading telegraph company arranges its book-keeping work here.

Mr. G. B. Simpson is the head book-keeper, and in charge of the room. Mr. De Alton Clark is in charge of error desk, assisted by Mr. C. T. Whittenhall, who also looks after the tariff books. Messrs. J. M. Kelsey, L. Baker, F. J. Loesch, and R. W. Chapman, post the registry books into the ledger. Mr. W. Ed. Bell foots books and checks off Northwestern and Metropolitan. Mr. J. S. Wilson, Jr., looks after the C. N. D. S. Mr. E. W. Lattey, though by no means a dead head, looks after that business, and sees that no one steals a pass. Mr. Arthur Gray is Northwestern man. Mr. Leslie Voorhees is Metropolitan book-keeper, and takes a turn at the key on stated evenings by way of amusement, and to put in a little extra. The registry force consists of Mr. Jos. Uhrig, champion sorter and lightning registrar, he having booked 7 pages in 55 minutes. Mr. John Richard James, who also figures the specials, and Messrs. F. D. Willis, B. C. Richards, and Charley Frendeuberg—the three latter all new men. Mr. T. G. Colburn books the board of trade business. Mr. Con. Olson, who can dance a jig or do a highland fling with the next one, counts specials and takes a hand at anything he sees to be done; and Master Eddie Lynch always answers promptly to the call of "check."

OCCASIONAL.

Personalities in Correspondence.—A Filthy Habit Abandoned.

NEW YORK, Dec. 6.

TO THE EDITOR OF THE TELEGRAPHER.

YOUR Chicago letter from "Priscilla" (a very well written article, too, by the way) reminds me that I also have something to say concerning the ungentlemanly conduct the fair writer refers to. I'm glad that one of the "weaker sex" has had the courage to come into the arena with such a fierce opponent. Take care, Miss Priscilla, that his filth does not contaminate you, however, more than your words of truth can shame him. I'm surprised to hear that in Chicago office they have not yet adopted the New York plan of prohibiting spitting. The chewing still goes on here, sad to say. I gave up the

filthy practice when I came into the office; not because I felt forced into it, but because a lady friend wanted me to. She got around me by telling me I was a perfect gentleman in every other respect, and this nice little bit of flattery couldn't be refused, so I succumbed, and am not sorry for it. I advise all the rest to follow my noble example, assuring them that in this case it is not similar to the fable of the fox who lost his tail in the trap and wanted all the rest to cut theirs off to be like him. "Priscilla," I greet you. Here's my hand for assistance in all war waged against defamers of your sex.

CANDOR.

An Excuse that Wouldn't Work.—An Error of "Occasional."—The Force of Habit.

CHICAGO, ILL., Oct. 29.

TO THE EDITOR OF THE TELEGRAPHER.

The shades of night were falling fast
As 'round and through the aisles he pass'd;
A man who carried (holding like a vice)
A book, and on it this device—
"Lost and extra time."

MR. EDITOR: That man was Mr. Cobb. There was going to be a rush and he wanted some of the day men to work extra. He was around trying to press every one but the ladies, and as he's married he "dassent" do that. You've hear'n tell of "Jack" Riley, not "N. Y." Jack, "The Traveller," but *our* Jack. Since Jack got on days he has become wealthy—not any extra, if you please, in his. As he saw "Lost and Extra" bearing down on him, all sails spread, etc., he began wondering what kind of a stand-off he'd give Cyrus this time, as he had about exhausted the ordinary stock of headaches, sore arms, engagements, etc. A happy thought strikes our hero. It wasn't Whitford, Billy Walsh nor Hoffman, and consequently it didn't hurt him or "A. M." I'll come the poverty dodge on him, says Jack to himself.

"Well, Jack, I guess you'll have to work to-night," says Cyrus. "You haven't worked extra in a good while."

"Well, I would just as soon work extra to-night as not," replied Jack, "but I ain't got a cent, and if I go home at six I can walk, or some of the boys will help me out on the street car; and if I worked extra I would miss them going home and have to walk away out on the west side."

Cyrus didn't put his finger alongside his nose exactly, but kind o' left a blank space on the extra list, and walked away with that knowing look of his. Just as Jack was putting on his overcoat at 6 P. M., and chuckling over the dodge he gave Cyrus, he was handed a nickel by that gentleman and mildly informed he would lend him that and place him on the extra list. This was too much for Jack; he sent out for a sandwich and took in the extra.

"Dear me, who is that nice, pleasant looking young man sitting there," asked one of our young ladies a few evenings ago, as we passed a group of them in the office, pointing to the seat occupied by the signal observer.

"Why, don't you know?" one of the others replied; "that's Mr. Clifford."

"Why no! I thought he wore side whiskers and a moustache?"

"So he did, but he has changed to those little side whiskers, and that makes his moustache appear so much larger," replied her companion.

"Why, he's a real—"

I was obliged to pass on for fear I would be detected eavesdropping and lose my *incognito*; but oh! "Clif" "Clif," you're too bad.

"Occasional" has made a mistake of a week in the age of Mr. York's baby. It was born a week earlier than he has given it credit for, and if I'm any judge of babies, and I guess I am, George has reason to be proud of it, as it's one of the prettiest babies on the west side.

Mr. Samuel Bracken has been transferred from the night to the day force, the transfer taking place about the same time as "Jack" Riley's.

Probably the force of habit is no better illustrated than in the way "Qn" office is run. The boys say "Q" was so accustomed to being inquired of why he was late in the main office, that he gets before his pocket looking glass if he's a minute late and (being manager, clerk, operator, etc., all combined himself) lectures himself for hours on account of being late. WESTERN UNION.

Life in the United States Signal Service.

TO THE EDITOR OF THE TELEGRAPHER.

HOPING that a few notes from this section will not be considered *mal à propos*, I will undertake to tell you something of signal life. By signal life I mean we are all signal service U. S. A. operatives.

Our line extends from Denison, Texas, on the north, to Ft. McKavitt, some 380 miles. At Jacksboro there is a line running north to Ft. Sill, Indian Territory, 80 miles north of Jackson. On this line we have some 10 offices,

with a stock of fair operatives. Our chief business is the interception of cattle, horse, and other kind of thieves, and dangerous characters generally. Though we do a good share of ordinary business, our best time is made when a few Indians break from the restraints of the reservation. Not long since the noted horse thief, Joe Hodner, was liberated from jail at Jacksboro by force, through some of his friends. He fled west and cut the wire five miles west of Jackson. Some 20 miles further west, he met the repairman, and told him where to find the trouble, but added not to be in any great hurry to repair it, for if he did he would only have to cut it again. The repairman left, and when he was out of sight, Hodner lassoed an insulator and cut the wire twice more, and then rode off laughing.

These are only some of our troubles, as the greasers make a practice of cutting the line every time they think of it, and they are seldom forgetful when devilry is concerned.

We are enlisted for a period of 5 years, and you can't well imagine what a great reformer it is. As we are only private soldiers, we are subject to punishment for neglect of duty, or whenever an officer believes we need it.

One man, ex-operator at this place, has been in the guard house for 3 months for taking a jamboree to the detriment of the service. His duties now are to drive a cart, and haul garbage from the officers' quarters. The most of us are old W. U. men, and could generally make fair salaries in the East, till the d— tempted us to roam and try our luck in Texas. Mr. King, of New York, is now at Denison; Mr. Partrick, of Philadelphia, at San Antonio; Mr. Milburn, of Washington, at some Mexican town opposite Ft. Duncan; Mr. Cundall, of N. Y., at Ft. Concho; and Lengthy Shock, at Graham. They say he is "long" for Texas (some six feet five); Sergeant (dubbed General) Rowley is in charge of us, and is stationed at Denison. The wire was completed from Ft. Clark to Ft. Duncan to-day.

Our pay is fair, but for goodness sake, boys, don't come here. "Oh, to be once a free born American, and not to have a fostering Uncle Sam." More when needed.

VOLCANO.

"Emma." A New Telegraphic Drama.

BY GNIMMUC.

ACT 1ST.—*Scene First.*—Operator receiving a telegram, which reads as follows after copied:

"Brooklyn, Oct. 1st.

John F. Brown — West 41st st., N. Y.:

Meet me at the same place at the usual time to-morrow. (No Sig.)

11 paid. EMMA."

Scene Second.—American District messenger boy delivering the above. Brown not at home. His wife receipts for same, tears off envelope, and, after reading contents, faints conveniently into the arms of a—cousin. (Curtain falls to weird music.)

ACT 2D.—*Scene First.*—Parlor of Brown immediately after his arrival. Stormy interview between man and wife. He tries to explain that that is a usual method his partner has of telegraphing, but she points to the truth-telling "Emma," and demands an instant and satisfactory explanation. This he is unable to give, and, seizing his hat, rushes frantically out.

Scene Second.—Same telegraph office. Brown rushes in and inquires for man who received that despatch, as he wishes to skin him alive. Mild looking youth steps to front, and inquires reason for the great row. Telegram produced, and the word "Emma" after check pointed out. Brown wants to know if that ain't a nice trick to play him? Operator laughs, and tells him that what he (Brown) supposes to be a lady's name is merely the signals of the sending and receiving operators, and that the message had no signature. Disgust and confusion on the part of offended party; a roar from the company's employees. (Curtain falls to lively music.)

A Matrimonial Incident.

At a certain hotel, not a hundred miles from Hamilton, there dwelt an heiress possessed of about \$35,000, who, when it was made known that she commanded so many shekels, became the attraction of several marriageable young men, more especially a certain book-keeper in a wholesale establishment. The prize was worth looking after, and the gay ledger keeper was not to be deterred from making an effort to secure that valuable acquisition to a man's happiness. He courted the fair one and she reciprocated his feelings until she found out that he had another string to his bow, very attractive but not possessed of much lucre. The result was that he got the "mitten" from the heiress, who in a few days after married a more worthy young man, honorably employed by a telegraph company, who nobly won her heart, hand and dimes.

THE TELEGRAPHER

DEVOTED TO THE INTERESTS OF THE TELEGRAPHIC FRATERNITY.

SATURDAY, DECEMBER 11, 1875.

THE TELEGRAPHER:

PUBLISHED EVERY SATURDAY at 38 VESEY ST.

ELEVENTH VOLUME.

TERMS OF SUBSCRIPTION.

One Copy, One Year, - - - - - \$2.00.

INVARIABLY IN ADVANCE.

Single Copies Five Cents.

SPECIMEN COPIES FORWARDED FREE on APPLICATION.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT. COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any person sending the names and money for FOUR subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Communications must be addressed to

THE TELEGRAPHER MAY BE HAD at the news stand in the Receiving Office of the Western Union Telegraph Company, corner of Broadway and Dey street, where it is regularly on sale.

The New Volume of The Telegrapher.

Two numbers after the present will complete the Eleventh Volume of THE TELEGRAPHER. The Twelfth Volume will commence with the number for January 1st, 1876.

THE TELEGRAPHER has long maintained the position of the leading telegraphic journal of the country, and for several years of its publication it was the only paper of its class in the United States. It has been the aim of its several publishers and editors to improve it from time to time, as opportunity offered, and it has reached its present status only by long continued and unintermitted effort.

The prospects of the paper for continuance and usefulness were never better than at the present time. It enters upon its Twelfth Volume vigorous and prosperous, and

with every reason to anticipate a brilliant and successful future.

With the expiration of the volume a large number of subscriptions expire, which it is hoped will be promptly renewed. The commencement of a new year and volume affords an excellent opportunity to solicit and obtain new subscriptions, and we trust that every friend to the paper, and all who deem its continuance as an independent telegraphic journal desirable and essential, will exert themselves to secure it even a more general circulation among the telegraphic fraternity than heretofore.

All subscriptions received between this time and the beginning of the new volume will be commenced from that number, the intervening numbers being furnished free to such subscribers.

It is desirable that subscriptions should be sent in as early as possible, that we may know how large an edition to print during the next year, as usually the supply of some numbers is exhausted, and those subscribing later, and desiring to begin their subscriptions with the volume, cannot be supplied with complete files.

We anticipate a considerable increase of circulation next year, and hope the accessions to our subscription list will be made promptly.

Fertility of Inventions and Inventors.

ALTHOUGH SOLOMON has declared that there is nothing new under the sun, it is certain that if his assertion be accepted as indisputable, that there is in these later years a marvellous activity in reviving as new old devices. In respect to electricity and telegraphy this is especially true. All who are connected with telegraphic management are constantly and forcibly convinced of this fact, for they are continually besieged by inventors and discoverers, each of whom is confident that he or she has invented or discovered some new and inestimably valuable and important improvement, which cannot fail to augment the dividends of any company which shall secure it, and insure wealth and prosperity to all who may become interested in it.

The necessity which has arisen, from competition and the great increase of telegraph business, for increasing the rapidity of telegraphic communication, and more fully utilizing the capacity of telegraph wires and apparatus, has called out a remarkable development of inventive genius. The managers of telegraph companies are constantly besieged by persons who, as they suppose, have made important and valuable inventions to accomplish this. This involves a great deal of patient labor, investigation and experiment on the part of those who are charged with the responsibility of telegraph management, for it is not safe to summarily reject these supposititious improvements, as they may turn out to have merit, and if adopted, perhaps to prove advantageous. We believe that, as a general rule, the telegraph managers are disposed to afford the necessary facilities for such experiments, and investigations necessary to demonstrate the value of such inventions, notwithstanding the fact that most of them prove to be either of no value or merely reproductions of inventions already known and frequently covered by existing patents.

The recent announcement that the Western Union and Atlantic and Pacific Telegraph Companies proposed to try the pneumatic tube system for the transmission of communications between city offices, has brought down upon their officials a new class of inventors and inventions. The new Western Union building, and the office of Mr. GEO. B. PRESCOTT, the electrician of the company, has been beset early and late by inventors of pneumatic tube systems, each of whom had not the slightest doubt but that his particular system was the best, and the only one which could be adopted to advantage. Specimens of tubes of all descriptions and sizes encumbered the offices, and the time of the electrician was largely taken up in listening to the explanations and representations of the different inventions and inventors. Some of these inventions were not without merit, while others were simply absurd. One man, particularly, proposed to substitute hydrogen gas for condensed air, his theory being that compressing the air would cause it to congeal and be the means of greatly interrupting and delaying the passage of the boxes, which difficulty would be obviated by the use of hydrogen gas. How the gas was to be provided was not stated, but it was suggested by some one in the office that the gas evolved from the batteries might be collected and used for this purpose. Upon questioning the astute inventor it was discovered that he knew nothing about the operation of pneumatic tubes in London, where they have been in use for years, or of the degree of compression at which air would be likely to congeal.

The climax was reached, however, at last, when a man one afternoon entered the building, staggering under a heavy load of pipe of the size of sewer pipes, which he had brought for inspection and adoption. With difficulty his load was got up to the third floor of the building, and for some time the inventor was too much exhausted by his labor in transportation to enter upon a description of the advantages of his system, which, it is scarcely necessary to say, were not sufficient to warrant its adoption. As it has been extensively published that the pipe and apparatus to be used have not only been decided upon, and already described in THE TELEGRAPHER and other newspapers, but contracted for, the influx of pneumatic tube inventions has measurably abated, and in this respect the telegraph officials are having a rest.

We have no desire to decry and discourage electrical or telegraphic inventors or inventions, but it would undoubtedly save much expenditure of time, study and money, and prevent severe and discouraging disappointment, if inventors would take means to inform themselves of what has already been accomplished in the direction in which they desire to work. The world is indebted to inventors for the progress which has been made, and every person who really makes a useful improvement in mechanics or the arts should be encouraged and rewarded as a benefactor.

President Grant on Cable Telegraphs.

THE session of Congress commenced at Washington on Monday last, and the Annual Message of the President was delivered on Tuesday. The only allusion to telegraphic matters in the message was to cable telegraphs, which are treated of at some length. We print in full this portion of the message, which will be read with interest.

To the first three recommendations of the President there is no exception to be taken, but the fourth, that "a power should be reserved to the two governments, either conjointly or to each, as regards the messages despatched from its shores, to fix a limit to the charges to be demanded for the transmission of messages," is one which, if adopted, may seriously imperil the value of cable telegraph property. The President evidently considers the present charge of 75 cents (gold) per word for the transmission of communications over the Atlantic telegraphs as excessive, and the ignorant and interested clamor of customers for low and unremunerative rates would be very likely to affect the action of any commission to regu-

late such charges unfavorably to the interests of the cable companies.

It is for the interest of the proprietors of cable telegraph lines to do the business at the lowest rates consistent with the relative cost of doing the business. If competition be maintained, it may safely be left to regulate charges, which, in such case, are not likely to be excessive.

We think the President is in error in supposing that a large amount of capital in this country is ready to seek investment in cable telegraphy. There certainly has thus far been no indication of a desire on the part of American capitalists to invest in cable telegraphs, but quite the contrary. If the power to regulate charges for cable telegraph service should be obtained by the governments, as recommended by the President, it would doubtless prevent any further investment of capital in such enterprises connected with the United States.

The Telegraphing of the President's Message.

THE transmission of the President's message by telegraph from Washington is one of the principal telegraphic events of the season. This year the message was forwarded as usual over the Western Union wires for the Associated Press, and over the Atlantic and Pacific wires for the American Press Association. The message contains about 13,000 words, and the Western Union transmitted it on 18 wires in 31 minutes. Although only three wires were used by the Atlantic and Pacific, one of which was equipped with automatic apparatus, the whole message was transmitted and manifolded for delivery in 77 minutes, and was furnished to the papers of the American Press Association in time to get a portion of it in their first editions. It appeared in these papers in good shape, while it was badly bulled in the Associated Press journals. Who was to blame for this we are not informed.

But for the inexperience of the Atlantic and Pacific official in regard to automatic apparatus, who had the matter in charge at Washington, and consequent delays, that company would, most undoubtedly, have made much better time.

Taken altogether, the feat for both companies was very creditable.

The Reduction of Western Union Salaries.

THERE has been some commotion among the employes of the Western Union Telegraph Company this week, in consequence of a report that there was to be a general reduction of salaries. This was confirmed in the communication made by Mr. ORTON to the Directors at their quarterly meeting, held on Wednesday last. The scale of reduction is to be as follows:

On salaries not exceeding per year \$600, no reduction.	
Over \$600 to \$1,200 per year, 5 per cent.	
" \$1,200 to \$2,500 " " 10 " "	
" \$2,500 to \$5,000 " " 15 " "	
" \$5,000 to \$7,000 " " 20 " "	
" \$7,000 " " 25 " "	

This reduction was entirely unexpected, as the reports showed that the financial condition of the company was good.

We have not time or space to comment on this important movement this week, but shall probably consider it more at length hereafter. It is understood that a similar reduction, to take effect at the same date, January 1st, prox., is to be made by the Gold and Stock Telegraph Company.

Haskins's Duplex Telegraph Invention.

WE print this week a description of the duplex invention of Mr. CHARLES H. HASKINS, the General Superintendent of the North Western Telegraph Company. The scientific and practical ability of Mr. HASKINS as an electrician and telegrapher are generally known and recognized; and of the many important telegraphic inventions which he has made, his duplex is probably the best. He has discovered a method of working the duplex successfully without the use of a condenser, thus avoiding complications with other patents. This duplex, with the latest improvements, is used upon the lines of the North

Western Telegraph Company, and is available for other telegraph companies whose business may require duplexing their lines.

A Bradley Galvanometer For Sale Cheap.

WE would call attention to the advertisement of a set of BRADLEY'S Apparatus for Electric Measurement, offered for sale at a very low price. This apparatus is one of the best ever made by Dr. BRADLEY, is in perfect order, and is offered for sale because the owner has no further use for it. It is an excellent opportunity to obtain a first class apparatus at a low price.

Personals.

Mr. C. D. HAY has resigned his position in the St. Louis, Mo., Western Union office on account of ill health.

Mr. WM. N. MANLEY has resigned from the Houston, Texas, Western Union office, and accepted a position on the night force of the same company at St. Louis, Mo.

Mr. D. C. BLEAKNEY, manager of the Western Union office at Houston, Texas, has resigned, and is succeeded by Mr. DAVID HALL, formerly manager at Shreveport, La.

Mr. W. S. TAYLOR, late manager of the Marshall, Texas, W. U. office, has been appointed manager of the Shreveport, La., office of that company.

Mr. T. W. FURGASON, late manager of the Shawneetown, Ill., Western Union office, has been appointed manager of Marshall, Texas, office of the same company.

Messrs. JOHN RILEY and JOHN BELL have been appointed to positions on the day force of the St. Louis, Mo., Western Union office.

Mr. FRANK BOHLE has been appointed manager of of the Western Union office at the Cotton Exchange, St. Louis, Mo.

Mr. JAMES W. HOLLOWAY, a well known telegrapher of Cleveland, Ohio, was in St. Louis on 19th of November.

The Telegraph.

By Cable.

THE ATLANTIC CABLE COMPANIES AND THE TARIFF RATES.

LONDON, Dec. 4.—There has latterly been a rumor that the Anglo-American Cable Company desires to augment the present rates of telegraphic tolls between Europe and America.

The Daily News to-day, in its financial article, has the following paragraph on what presumably relates to this rumor: "The Board of Directors of the Direct United States Cable Company yesterday refused to accede to certain demands of the Anglo-American Telegraph Company relative to tariffs. The result will probably be a renewed contest between the rival companies and a low tariff."

The Western Union Telegraph Company.—Quarterly Dividend Declared.—A Proposed Reduction of Salaries.

THE regular quarterly meeting of the General Committee of the Western Union Telegraph Company was held yesterday at the office of the company. President Orton presented the following report:

EXECUTIVE OFFICE,
WESTERN UNION TELEGRAPH COMPANY,
NEW YORK, Dec. 8, 1875.

To the Directors.
The Executive Committee submit the following statement concerning the operations of the company for the current six months:

The gross receipts for the quarter ended September 30 were.....	\$2,671,805 93	
Expenses.....	1,762,652 45	
Net profits.....		\$909,153 48
The gross receipts for the current quarter ending December 31, inst. (estimating the December business), are.....	\$2,538,160 26	
Expenses.....	1,694,531 84	
Net profits.....		843,628 42
Total profits for the half year.....		\$1,752,781 90
The amount required for two quarterly dividends of two per cent. each is.....		1,351,200 00
Deducting which from the profits for the half year leaves a balance of.....		401,581 90
Deduct for six months' interest on the bonded debt and for sinking fund accruing during the same period.....		275,000 00
Leaves a net balance of.....		\$126,581 90
The excess of net profits for the current half year over the same period for 1874 is.....		94,451 48

In view of the foregoing statements, the Executive Committee recommend the adoption by the Board of Directors of the following:

Resolved, That a dividend of two per cent. from the net earnings of the three months ending December 31 be, and the same is hereby declared payable on the 15th day of January next.

Resolved, That for the purpose of such dividend the stock books be closed at three o'clock on the afternoon of the 20th inst., and be reopened on the morning of the 17th of January.

The committee also report that a further reduction of the expenses of the company is to be effected by carrying out a plan recommended by the President, whereby the compensation payable to all officers and employes of the company, in excess of the rate of \$600 per annum, is to be reduced, on and after the 1st day of January next, on a sliding scale, from twenty-five to five per cent.

WILLIAM ORTON, President.

Annual Meeting of the Southern and Atlantic Telegraph Co.

THE annual meeting of the Southern and Atlantic Telegraph Company was held at the executive office of the company, 51 New street, in this city, on Thursday, December 2d, for the purpose of electing a Board of Directors to serve during the ensuing year, and transacting such other business as might properly come before it. About 12,000 shares of the capital stock was represented, being more than half the outstanding stock of the company.

The President of the company, Mr. Charles W. Blossom, was called to the chair, and Mr. C. C. Blossom appointed secretary.

The report and statement of the President of the operations of the company, during the year ending Sept. 30th, was presented. The report showed the company to be in a more prosperous condition than at any previous time in its history, and that its lines had been extended to the principal places in the south, and that its business was increasing and profitable. To accommodate the increasing business of the company the duplex telegraph system of Mr. D'Infreville had been adopted, and was found to work satisfactorily and advantageously.

The following gentlemen were then elected directors of the company for the ensuing year: Messrs. Charles W. Blossom, Henry Hentz, Francis Morris, Mathew Maury, Mayer Lehman, Charles M. Fay, Amerton Yale, T. T. Bryce, Philip Tabb, Seth B. French, Frederick Zerega, Ernest Bayer, B. G. Arnold, Lucius Hopkins, Eckstein Norton, J. T. Hanemann, Henry Morgan, Wm. Woodward, Jr.; A. B. Graves, L. M. Calvoceossi, New York; Robt. N. Gourdin, Savannah, Georgia; J. B. Lafite, J. T. Doswell, New Orleans, La.; John B. Palmer, Columbia, S. C.; F. E. Stollenwerk, Mobile, Ala.; John W. Durr, Montgomery, Ala.; C. H. Strong, Atlanta, Georgia; Geo. H. Hazlehurst, Macon, Georgia; W. J. Middleton, Charleston, S. C.; W. F. Herring, Augusta, Georgia.

On motion, it was unanimously

Resolved, That the thanks of the stockholders be and are hereby tendered to President Charles W. Blossom for the attention given to the business of the company, and for the able manner in which he has conducted its affairs; and, be it further

Resolved, That this resolution be entered upon the minutes of this meeting.

New York Telegraphic Notes.

THE President's message was handled last Tuesday by the Western Union Company in a marvellously rapid manner. Eighteen wires were used in getting it from Washington, the time occupied in receiving it being, on an average, 30½ minutes. The quickest time was made by Baldwin and McCarthy, both finishing in 28 minutes. It was sent east to Boston, Hartford, New Haven, Worcester, Springfield and Providence on eight wires, and also west to Chicago on eight wires, four of which went by the Pittsburg route, and four by the Central route via Buffalo. The arrangements throughout were most complete, and by the time it was received from Washington, Boston and Chicago had nearly a third of the whole message. The copies made by the operators receiving were unsurpassed in the history of the annual spurges made in this direction, and the time beats anything yet made in Morse telegraphy.

The President's message was transmitted by the Atlantic and Pacific Telegraph Company from Washington over three wires, one automatic and two Morse. Owing to lack of experience more time was occupied than would be the case on a repetition of the effort. About 9,000 words were sent by automatic, and the balance by the two Morse wires. The whole time occupied, from the commencement until the last of the message was ready for delivery, was 77 minutes. Six operators, nine punchers, and fourteen copyists were employed.

Annual Meeting of the International Ocean Telegraph Company.

THE annual meeting of the International Ocean Telegraph Company was held at the office of the company in the new Western Union building in this city on Tuesday, the 7th instant.

The statement presented to the stockholders of the business of the company for the past year exhibits gross earnings of \$303,000, and net earnings \$190,000.

The Board of Directors was reelected, viz: Messrs. Wm. Orton, Norvin Green, A. B. Cornell, Cambridge Livingston, Edwards S. Sandford, Augustus Schell, Harrison Durkee, Cyrus W. Field and James H. Scrymser. The majority of the stock of this company is owned by the Western Union Telegraph Company.

The Atlantic and Pacific Telegraph Company.

Mr. JAMES G. SMITH, Superintendent of the Franklin and Atlantic and Pacific Companies between Boston and Washington, has resigned that position, and retires from the service of the companies at the end of this month.

Mr. W. C. HUMSTON, District Superintendent, west, has removed his headquarters from Detroit, Mich., to Cleveland, Ohio.

Foreign Telegraphic Notes.

ADVICES from China, via San Francisco, to Nov. 3d, states that the telegraph builders have again been driven from their work near Foochow, and the Amoy officials protest their inability to control the populace.

At the second meeting of the Institution of Civil Engineers in London, the paper read was "On the Pneumatic Transmission of Telegrams," by Mr. R. S. Culley and Mr. R. Sabine. The paper showed that there are twenty-four pneumatic tubes in London, of an aggregate length of nearly eighteen miles, four tubes in Liverpool, three in Dublin, five in Manchester, three in Birmingham, and one in Glasgow. The general opinion that pneumatic was more costly than electric transmission was shown to be erroneous, as the total expense of the former in London was barely two thirds of the amount which would have been required to pay the salaries alone of the clerks needed under the latter, irrespective of the cost of wires and instruments. The paper then went on to prove that the smaller the tube, consistent with proper conveyances for messages, the greater the power and more economy in working.

It has recently been announced that a joint stock company has been formed in London, with a capital of one million dollars, for the manufacture of Gramme's magneto-electrical machines, which, it is confidently expected, will be widely applied to the production of light, to the electro deposition of metals, and to various chemical manufactures, etc.

The Telegraphic Billiard Match.

THE agitated question of premiership in the handling of the ivories among the telegraphers of this city, and among whom there are many fine players, was settled last week. Something of this nature has long been mooted, and has many times fallen through; but it has transpired at last, and most successfully, too. There are few professions of as confining a nature as telegraphy which can boast of more really fine billiardists, and the late exhibition of skill but makes good this assertion.

As was announced last week, Messrs. Merrill, Mitchell, Landy, Sprague, Horn and Risdon met at Reeves' billiard rooms, on Broadway, Wednesday, D. c. 1st, at 2:30 P. M., and arranged preliminaries.

The French, or 3-ball carom game was played, the first game being between Merrill and Sprague, resulting in a victory for the latter by a score of 75 to 64, 75 being the game. Best runs—Merrill, 31; Sprague, 26 and 23.

The second game was a closely contested one between Risdon and Horn, the former choking Horn off by 9 points only. Runs—Risdon, 27; Horn, 24.

The third game was between Landy and Mitchell, and was rather uninteresting to those present, as Landy seemed to have it all his own way. Mitchell was a little off, and scored but 47 to the winner's 75. Landy's highest was 28; Mitchell's, 25.

The fourth game of the day was between Risdon and Sprague, and was full of interest, from the fact that there were no wide gaps in the score, the men playing so evenly that they were rarely, if ever, more than 4 points apart. Risdon pulled up ahead by one, and scored his 75 when Roscoe was on his 74th.

The fifth and last game of the day was between Sprague and Mitchell, and resulted in a quick victory for Mitchell by a score of 75 to 42.

The second day found the men on hand eager for the fray. All the force who were off, or could get off, were on hand too.

Landy and Sprague opened, the former winning the game by 30 points; Mitchell and Horn followed, the lat-

ter being defeated by a score of 75 to 48. Landy then defeated Horn, 75 to 63, as also did Merrill by 30 points. The last game of the day was between Landy and Risdon, when the former scooped Risdon in to the tune of 75 to 41.

The third day the excitement ran high. Mitchell and Landy had each won four games, and both were confident of victory. Merrill and Landy played the first game: Merrill winning by a score of 75 to 41, thus making him even with the best scores, and giving him a good show for first money. He played Risdon next, and defeated him quickly by a score of 75 to 40. Sprague and Horn next had the table, and the latter was again laid under, 75 to 49. The remaining two days were interesting and exciting to those participating.

Mitchell and Landy played the last game, they having led each other on the whole number of games won. It was a hot fight, as the first and second money was at stake. Landy played his usual strong game, and was as cool as possible—so also was Mitchell, but not quite equal to his antagonist in skill it seemed, for Landy took the first money by 22 points, leaving Mitchell to roll up the second heap. The affair all through was most harmonious, pleasing and successful, and nothing occurred to mar the fun. There was a great deal of skill displayed, and none participating need blush for their record. The following is the

GIBSON.—At Maysville, Ky., Friday evening, October 29, 1875, the wife of Mr. JOHN B. GIBSON, telegraphic operator, of a daughter.

FOR SALE.

A fine set of Bradley's Apparatus for Electric Measurement, consisting of three pieces, galvanometer, bridge and rheostat; warranted in perfect order. Cost \$250; will be sold for \$150.

Address,

H. V. H., P. O. box 5278, New York.

THE LECLANCHÉ BATTERY.

THE WORLD RENOWNED

Open Circuit Battery.

NO ACIDS!
NO SULPHATE OF COPPER!
DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED TO Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHÉ BATTERY COMPANY,

No. 40 West 18th Street, or

L. G. TILLOTSON & CO., Sole Agents,

8 Dey Street, New York.

BRADLEY'S APPARATUS FOR ELECTRIC MEASUREMENT, COMPOSED OF HIS TANGENT GALVANOMETER AND RHEOSTAT.
(Patented January 7th, 1873.)

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING

WHEATSTONE'S BRIDGE,

Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED

NAKED WIRE HELICES,

for: Electro-Magnets, wound to any given size and resistance.

Manufacturers of Telegraphic and Electrical Instruments supplied at low rates.

For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

SIEMENS' UNIVERSAL GALVANOMETER

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRIC APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,

22 SOUTH TWENTY-FIRST ST.,

PHILADELPHIA.

TO ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystallizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

No. 1 Cell,	- - - - -	\$5.00.
No. 2 " "	- - - - -	10.00.

L. BASTET,

619 Broadway, New York.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,

MANUFACTURER OF TELEGRAPH INSTRUMENTS,

104 CENTRE STREET, NEW YORK.

BATTERIES of every description for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the **CHESTER PIN DIAL** (patented), designed expressly for **POLICE and LAW TELEGRAPHS**. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell out out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,

for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,

for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,

CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH ;

so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,

REGISTERS, RELAYS, CALL BELLS,

and every description of Central Office apparatus, at most reasonable prices.

Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN"

in which the spring takes the place of the weight, is enclosed in a metal and glass case ; is noiseless in its action, and of great beauty and finish, and is specially recommended to *Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.*

ELECTRO-SURGICAL APPARATUS

OF EVERY VARIETY AND DESCRIPTION.

HOTEL-ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns : Grand Union, Saratoga ; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y. ; Willard's Hotel, Washington, D. C. ; Galt House, Louisville, Ky. ; Tefft House, Buffalo ; and many others. *Proprietors and keepers of Hotels most liberally dealt with.*

THE "COUNTING ROOM BELL MAGNETS,"

for communicating instantly to clerks and employes, by means of a keyboard, in any desired place.

ALSO,

BELL MAGNETS AND PUSH BUTTONS,

for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$5.00 upwards.

Sole Agent of the

WILSON ELECTRIC GAS LIGHTING CO.,

for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for

LIGHTING FACTORIES, MILLS, ETC.

By simply pushing a button on his bench the operator lights a section of burners.

Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

104 CENTRE STREET.

P. O. Box 2766.

- Toledo, Ohio,
- Toronto, Canada,
- West Roxbury, Mass.,
- Washington, D. C.,
- Worcester, Mass.,

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

OF

FIRE ALARM TELEGRAPH

IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original *FARMER & CHANNING PATENTS*, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE

PRESS

throughout the **UNITED STATES AND CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES AND THE DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THESE CAN BE NO QUESTION.**

The cooperation of **TELEGRAPHERS** in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in **Fire Alarm and Police Telegraphy**, upon application as above.

Original Article.

Momentous Discussion.

By GNIMMUC.

THE salary question came before the meeting at its last conclave, and various were the opinions expressed on all sides.

Bime, 33, ventured to suggest that it would have been better for the majority to have reduced the force instead of the salary.

Sig. Rossi hereupon remarked that the first speaker's force didn't seem to have been reduced any, so that he still was head and shoulders in the majority.

Mons. Coax said it being evidently a forcible reduction, he did not see that the gentlemen gained anything by their hair-splitting arguments.

Knibbs, seeing a hot time ahead if the discussion be allowed to run in that rut, changed the current of thought by asking O. K. Fib what was going to be his little economy.

Fib, aggrieved and astonished, exclaimed, "Economy! Don't ask me. Beer sull five cents, and lunch tickets gone up!"

Mickzer here wanted to know why the lowest cut was different from the segars they would presently be smoking?

All being too thickheaded for this, the answer came, "because one is five per cent., and the other one cent per five."

Knibbs said this was nearly as good as "what's the difference between a high toned young lady of their acquaintance and the stipend alluded to?"

The answers were various, one being, "because she is flighty;" another, "because she's here to-day and gone to-morrow;" but the true one was given, "one is airy Sal, and the other sal-ary."

The prize-fighter then inquired if she was a miss. Roxy said, "yes, if you spell it with a y and a lisp, myth."

Knibbs propounded a new conundrum. "Why is the discoverer of *etheric force* like a patent cough mixture?"

Cunny, cute as ever, came to the front with the answer, "because he (it) is Tom Edison (tar medicine)," and it was pronounced the best contribution of the evening.

The man whom Shakespeare makes Hamlet mention in the first line of his famous soliloquy, called them back to the original question, and proposed they should strike; but there being no one willing to be struck, the plan was abandoned.

A lively sally of wit from the P. P. (Paripatetic Puster) to the effect that all things were not going as *Merrily* as might be wished, but that there was no use *Warren* against the powers that be, caused H. R. Knibbs to nearly *Borst* with laughter, which so much agitated the company that the meeting broke up.

The Telegraphers.—Action of the Cincinnati Meeting.

A MEETING of the employes of the Western Union Telegraph of this city was held Sunday forenoon, at eleven o'clock. There were some seventy-five persons present, including G. T. Williams, Superintendent Seventh District, F. A. Armstrong, manager, and other officials. Mr. George Gilliland was called to the chair, and Mr. C. E. Higdon appointed secretary. The object of the meeting was to take action upon the proposed general reduction of salaries of all employes exceeding \$600 per annum. Animated speeches were made by Messrs. Y. T. Williams, F. A. Armstrong, Newton, Mattoon, Furr, Hockett, McKenna, Hall, and a number of others. The unanimous feeling prevailing was that of presenting an earnest but respectful remonstrance against the reduction. A committee of five, composed of Messrs. McKenna, Waddell, Hockett, Dunlap and Hall, was appointed to draft resolutions. The committee retired, and soon after returned with the resolutions. The discussion then was chiefly upon the technical wording and effective phraseology of the various preambles and resolutions, but without ma-

terial dissension in views. After one or two minor amendments, the following preambles and resolutions were unanimously adopted:

Whereas, We are informed by the despatches of the Western Associated Press that at a meeting of the Board of Directors of the Western Union Telegraph Company, held recently, a general reduction of salaries of all employes of this company was decided upon, to take effect January 1st, 1876; and

Whereas, The published reports of the financial condition of the company show a healthy condition of its business, and do not indicate the necessity of such reduction; and

Whereas, The expenses of living are not less than six years ago; that among those of us who have families to support our necessary expenses are not decreasing; and

Whereas, We believe, as a class, we are poorly compensated for the responsible duties performed, and many of us having become veterans in the service of said company, we do not believe said resolution an act of justice; and while we have no intention of taking any action that would embarrass the business of the company or the public at large, we earnestly ask a reconsideration of the action of said Executive Board, believing that the true interests of the company will not suffer in consequence, and that a feeling of harmony may be cultivated and fostered between the employers and employes to the mutual advantage of both by the said reconsideration; therefore,

1. We would respectfully request that you will join with us in procuring an anulment of the action referred to.

2. That these resolutions, as passed at this meeting, be submitted to George T. Williams, Superintendent, and be circulated in the Seventh District for signatures of the employes.

J. A. MCKENNA, O. J. WADDELL,
J. E. HOCKETT, S. M. DUNLAP,
J. C. HALL, Committee.

Similar meetings were held in Chicago, St. Louis, Nashville, Memphis, Washington, and various other large offices over the country, and it is hoped by those interested that they will have due effect with the Directors.—*Cincinnati Enquirer*.

[From the Cincinnati Commercial.]

The Trouble with the Telegraph.

THE recent action of the Executive Board of the Western Union Telegraph Company, after declaring their usual quarterly dividend of two per cent., in passing a resolution to reduce the salaries of all employes from five to twenty-five per cent., is creating much excitement among their employes in all parts of the country. Unlike the strike of six years ago, the movement for an emphatic protest includes superintendents and office managers as well as operators. In the southern division a large reduction of salaries was made last summer by the superintendent, who acted upon his own responsibility, and at the same time promised that no further reduction would occur. Now the action of the Executive Board fails to sustain him, and he is considerably exercised over it. The appliances of the company furnish ample means for concerted action on the part of the employes, who are busily communicating over the wires regarding the situation, and have called a meeting in their respective offices for to-morrow morning, to unite in a firm and emphatic protest against this action of the company. While the hot-headed ones talk "strike," there are enough left of those with cooler judgment who have not forgotten their failure in January, 1870, and it is hardly probable that the business of the country will be again embarrassed as it was then. It might also be mentioned that the quarterly dividends of the company amount to 8 per cent. per annum on the stock, which was quoted yesterday at 76½—equal to 10 1-3 per cent. per annum. The stock advanced 1½ per cent. on the strength of this new move by the company.

Proceedings of the Western Union Chicago Employes Upon the Proposed Reduction of Salaries.

CHICAGO, ILL., Dec. 13.

TO THE EDITOR OF THE TELEGRAPHER.

IMMEDIATELY upon the receipt of the Associated Press despatches from New York, a few days ago, announcing the contemplated reduction of salaries on a sliding scale of from 5 to 25 per cent. on all salaries over \$600 per annum by the Board of Directors of the Western Union Telegraph Company, the Western Union operators of this city began to stir themselves to action, and, although nothing looking towards a strike was hinted at, there was a firm determination to manfully protest against the proposed reduction. The matter did not take shape, however, until the following circular, which emanated from Washington, D. C., and which was sent from there to New Orleans and thence to Cincinnati, west and south, to Chicago, and from Chicago to New York, was received. The circular read as follows:

"The following is being distributed from Washington. If approved, spread:

"There is a great deal of indignation among all hands regarding a proposed reduction of salaries, to take effect Jan. 1. It is proposed to call a meeting at every office of all employes of this company to protest in the strongest manner against it. Our manager here advises that this should be done at once, and meetings should be held not later than Sunday next, and the result of the meeting be sent to the Board by the Managers of the respective offices.

"This includes all grades of employes, from superintendent to janitor, and the executive committee should understand that it means business.

"It is thought united action in this way will have a telling influence. This course is approved by managers at all leading offices north, south and west, and simultaneous meetings will be held at all points on Sunday morning.

"We would like to have you all fall in line and do the same. We are advised that the best thing, and in fact the only thing to be done, is to make a bold, decided stand against it, and protest in a firm but respectful manner, and there is a strong chance that united action on our part will effect a repeal of the order. Please do what you can to have meetings held at all points and cooperate."

A letter was then drawn up addressed to Manager Maynard, requesting him and his assistants to be present at a meeting to be held Sunday morning, the 12th inst., at 10 A. M.; also requesting him, for them, to invite Gen. Stager, C. H. Summers, and Gen. Stager's staff, Col. Wilson and his assistants, Manager Felton and his assistants, and the employes of his department to meet with them for consultation.

Permission was obtained from the owner of the building occupied by the Western Union Company to meet in Room 31. A favorable reply from Mr. Maynard being received through their representative, Mr. Stanberry, the following notice, by permission of the management, was posted on the office bulletin board and copies sent to the afternoon papers. It was also posted in the receiver's and book-keeper's rooms. It read as follows:

"NOTICE.—All operators and others interested in the proposed reduction of salary are earnestly requested to be present at a meeting to be held in this building to-morrow (Sunday morning) at 10 o'clock.

"The object of this meeting is to exchange views upon the subject of reduction, and to take such steps as, after consultation, may be deemed necessary.

"It is expected the heads of departments will be in attendance.

"Chicago, Dec. 11, 1875."

At the meeting yesterday morning there was a large attendance of operators. Every one present was convinced that the step contemplated by the company was harsh and uncalled for, and all were desirous that a strong protest should be drawn up at once, but there was scarce an operator in the room who hinted at a strike as a means of retaining their present salaries. After a great deal of discussion it was

RESOLVED TO PROTEST,

and to suggest to the Board of Directors that the "present system of filling up vacancies at reduced salaries sufficiently guards the interests of the company."

The meeting was called to order by Mr. W. C. Long, and, on motion, Mr. A. L. Baker was elected chairman, and Mr. H. Stanberry, secretary.

On motion of Mr. Long, a deputation was sent to Col. Wilson, district superintendent, and Mr. Jones, assistant manager, to request their presence at the meeting. These gentlemen came in shortly after this notification.

The chairman said

THE OBJECT OF THE MEETING

was to learn the general feeling among the operators in regard to the proposed reduction of salaries. It was not, he thought, proposed to make any general protest until something more definite was learned relative to the matter. Remarks from gentlemen present would be in order.

Mr. Whitcomb explained how the circular from Washington got to Chicago.

Mr. Long said some of the older operators had thought it advisable to go slow. It had been decided to hold the present meeting, and to ask the presence and counsel of the general and district superintendents. If any action were necessary, they wanted it to be taken in proper form and after due deliberation.

Col. Wilson, district superintendent, upon invitation, favored the meeting with his views upon the subject. He said he had been advised to be present, and would like to hear an expression of opinion before saying anything. No official information has been received of the reduction. The receipts have fallen off very largely of late, and there would seem to be some reason for making a reduction; but the matter was simply a rumor, and scarcely properly before them at present. In reply to a despatch to Gen. Stager, who was in New York, he replied that he had not seen the Washington circular, and advised the operators to go slow rather than act on a rumor. He had attended the meeting on invitation, and not as a participant. It seemed to him rather early to take any action in regard to this matter. He could not see that anything would be accomplished by it. Any threat or menace to the company, as matters stood, would be poor policy. Besides, the company would not be swayed by threats. If they had taken the step, they had acted with some good motive, for they have every reason to study the interests of the employes as well as their own. If the report should prove to be correct, the question will then come up whether their action is not proper in view of the state of business affairs in the country. In reading the Associated Press despatch, it seemed to him that the intention had been to spread the reduction as lightly as possible on the operators—much more so than on the officers of the company. He did not believe there was any question but that the company, if they had decided upon this reduction, had acted upon a principle which, if understood, would probably be satisfactory to everybody.

Col. Wilson went on to show that the receipts of the company had decreased to a great extent during the past few weeks, and that the directors must make a corresponding reduction in expenses. It was better, he thought, to make a slight reduction all round than to cut down expenses by the removal of individuals. He had been practicing economy in the office for some time, but it appeared that his efforts were not sufficient in that direction. It had been stated that the rate of salary paid telegraph operators was higher than any other business in the country, but, of course, a higher order of talent was required than for most branches of industry. There was not another office in the United States which was in such complete harmony as the Chicago office, and he would regret if anything should occur to disturb it.

The Secretary thought the reduction of salaries ought to be

LEFT IN THE HANDS OF THE SUPERINTENDENTS,

who were better qualified to judge where a reduction could be made than the directors.

Col. Wilson.—All corporations make these reductions occasionally. If any one has found bed rock, I should like to know where it lies. [Laughter.]

In reply to a suggestion of an operator that the company had been paying large dividends, Col. Wilson said that for several years everything had been expended in extension and repairs, and the stockholders were now anxious to have some return for their capital.

Mr. Long, to show the meeting that the Chicago office was not the only one moving in this matter, read a protest just agreed upon at a similar meeting in Baltimore. He thought the Board of Directors ought to have left this matter entirely to the discretion of superintendents and managers, and they should not be surprised if they received a strong protest. He knew of no other class of men, after serving an equal number of years in, and making a study of a business, who were so poorly remunerated as telegraphers. There was ground for a protest.

Mr. Armstrong expressed himself in favor of protesting, but would oppose a strike. He struck five years ago and got sick of it. [Laughter.]

Mr. Long said it was distinctly understood that a strike was not in view. He thought proper resolutions pro-

testing against the reduction, would be entitled to consideration and would receive it from the directors. He suggested the organization of some kind of society—an open one, and without any thought of resorting to a strike. At least a permanent organization might be had, consisting of a president and secretary who should have the power of calling meetings in case there should be necessity for them.

A suggestion that nothing be done rashly, or until General Stager's return, was heartily adopted.

Mr. Whitford said if they intended protesting it ought to be done very quickly. There was no sense in waiting until the reduction was made.

The following despatch, which had just been received from Peoria, Ill., was read:

"PEORIA, Ill., Dec. 12.—We propose to send in about the following. See if you think it is about correct, and answer quick.

We, the undersigned, comprising the entire force of W. U. T. Co. in this city, in meeting assembled, decide that—

Whereas, The executive committee and directors have decided to reduce our salaries on a sliding basis of from 25 to 5 per cent; and

Whereas, The said W. U. T. Co. are doing a larger business than they ever did before; and

Whereas, The said Western Union Telegraph Company are scarcely paying many of their employes enough to live on at present, the undersigned included; and

Whereas, The great responsibility that hangs on our shoulders being so greatly in excess of any other business; therefore, be it

Resolved, That we, the undersigned, do respectfully request the said executive committee and directors to let the salaries remain where they are at present, or increase them to such an extent that its employes can live as well as men in other employment; also,

Resolved, That we respectfully notify the said executive committee and directors of this company that we will not willingly submit to this reduction, but will do all in our power to have our salaries adjusted, so that each man will feel that he is not a slave to monopoly; also,

Resolved, That if the said executive officials resist our appeal, which we make in all due respect, that we shall find other employment and

LEAVE THE SERVICE.

Resolved, That a copy of these resolutions be forwarded to President Orton forthwith, and we respectfully request his decision as early as possible.

E. B. MEYERS,
E. P. DELANO,
F. DELANO,
A. ALLEN,
FRANK GUILL,
PETE ROWE."

The reading of this was received with laughter and applause.

The question of forming an organization was then debated, and Col. Wilson said that it was of course their right to protest or object if they choose, but a great many persons were attracted to organizations of the kind proposed, and undue excitement was created, which was neither to the interest of the employer or employes.

The chairman said that when the news was received, there was a widespread disposition to take a decided stand against the reduction, but, upon maturer consideration by the older men, it was thought advisable to quietly submit.

A number of gentlemen present expressed themselves of the opinion that it would not be improper to pass a resolution requesting the directors to rescind the order. If the operators were reduced, they would lose considerable interest in their work, and there was no knowing what might follow. There were not men enough to supply the demand if they should all leave the business.

The Chairman.—From information I received I regard the proposed reduction of salaries as a fixed fact, not to be withdrawn on account of any protests originating with the operators alone. The Executive Board have undoubtedly considered well their action, and will hardly be moved to reconsider, and I believe the wisest course to pursue is that of

QUIET SUBMISSION.

It seems to me a misfortune to the operators that cannot be altogether consistent with the best interests of the company. I mean by this that a reduction now in the beginning of winter of the little more than plain living salaries of the Western Union employes will have the effect to deprive them of many of their expected comforts. And, what is more to be regretted, they will lose all confidence in any future advancement. With these discouraging prospects in mind, unrest and dissatisfaction must follow, and the general efficiency of the service of the company may be more or less impaired by the retirement from the business, as soon as practicable, of many of the best men to engage in pursuits more profitable. This may seem more likely when it is known that those most seriously affected are those who have worked long and faithfully for late promotions to lose all their pecuniary advantages by the reduction.

A despatch from Memphis, just received, was read, stating that the Western Union employes there had organized and wished the cooperation of the Chicago telegraphers.

Mr. Knox moved that they elect permanent officers, but take no decided action. When the reduction came, the officers could call a meeting without going to the trouble of circulating a petition.

The motion prevailed.

Mr. Long moved that the present chairman and secretary be made the permanent officers, and empowered to call a meeting upon the request of five operators. Carried.

Mr. Long then moved the appointment of a committee of five to draw up resolutions expressing the sense of the meeting.

Assistant Manager F. W. Jones paid a high tribute to the manner in which the operators here had performed their several duties during the great grain excitement and rush of business which we had just passed through here, and said he could safely refer to Superintendent, Colonel Wilson, who would agree with him that the work was done faithfully and well, the operators holding themselves in readiness to work early and late. He thought a protest would have a good effect, but in all the deliberations he counseled moderation.

Mr. Lattey submitted the following:

Resolved, That it is the sense of this meeting that a sweeping and indiscriminate reduction of salaries, such as is reported to be contemplated by the directors of the company, will entail considerable hardship on those who have long and faithfully served the company, and receives our respectful protest. Managers and superintendents may safely be empowered to use their discretion in filling up vacancies at prices such as the labor market may command.

Resolved, That a copy of these resolutions be forwarded through the proper channel to the Board of Directors.

Mr. Long pressed his motion for a committee, which could pass upon the resolutions presented. Carried.

It was some time before this committee was constituted and got to work. Several men were placed on it who declined serving, on the ground that any action was premature.

Mr. Loesch, one of the committee, fired up at these repeated declinations, and made a strong speech in favor of a prompt protest. It might be, he said, that the order was thrown out as a feeler, and would be quickly withdrawn if met with firmness on the part of the men. He quoted statistics to prove that the company was in a good condition, with increasing business. He would not countenance anything like a strike, but they should not submit tamely to a reduction.

This speech infused both courage and energy into the meeting, and the following committee was then got to work: Messrs. Lattey, Strong, Loesch, McRobie, and Hamilton.

After an absence of fifteen minutes, the committee brought in the following report, which was adopted unanimously:

THE RESOLUTIONS.

"*Whereas*, A report has been circulated through the Associated and New York Press to the effect that a sweeping reduction of salaries over \$600 of from 25 to 5 per cent. is contemplated by the Board of Directors of the Western Union Telegraph Company; therefore, be it

Resolved, That it is the sense of this meeting that the sweeping reduction of salaries contemplated will entail great hardship on those who have long and faithfully served the company, and we protest against it.

Resolved, That we consider the present system of filling up vacancies at reduced salaries sufficiently guards the interests of the company.

Resolved, That a copy of these resolutions be forwarded through the proper channel to the Board of Directors for their favorable consideration."

The meeting then adjourned, subject to the call of the President and Secretary, after passing a resolution to the effect that the permission of the management be obtained by the Secretary to forward the result of this meeting to all offices that had signified their desire to hear from us.

After adjournment, the chairman was notified of similar meetings in Cincinnati, Philadelphia and Springfield, Ill., in addition to those reported during the meeting; and copies of the resolutions also sent the chairman, which appear in this morning's dailies here, and will no doubt be sent to you from those places.

The editorial remarks of the editor of THE TELEGRAPHER of Saturday, the 11th inst., which were telegraphed to the papers last night, are very highly commended by the fraternity here.

This will set at rest all doubts regarding the reduction being simply a rumor. OCCASIONAL.

Ike Partington's New Discovery.

TO THE EDITOR OF THE TELEGRAPHER.

I RED last week in the papers about a new spark which that grate inventor Edison, of Newark, had

found, and was going to send messages with it. Now, Mr. Editor, I don't pretend to be much of an inventor, but I think I have found a spark as good as his'n, and if he can use it to send messages, he is welcome to it, cause I can't make it work worth a cent, and he has got a better chance to experiment, for he's got a *Gold Leaf Calsonimeter* and *I ain't*. The way I git my spark is this. First take a cat (a Thomas one is the best), hold the tail with one hand and rub the fur towards the ears with the other, and if the cat is in a dark place you will git a spark every time. No matter if the cat objects, science must be attended to—and the best way is to cut off her claws and tie up her mouth before commencing operations, 'specially if you've got no court plaster in the house. Now I think this must be a new invention, 'cause it ain't in none of Edison's patents, so I thought I would send it to your paper, and if it meets his i he can go for it, or anybody else that wants it. I shouldn't wonder if this discovery would be made to work on the complex. Just imagine, Mr. Editor, an operator at each end of a line rubbing the fur, or pulling the tail of a cat a few times to send messages both ways—what a saving of battery it would be. Cats don't cost nothing, and when the fur of one is worn off, it's easy to find another. Why, I've worn the fur off six different cats, trying experiments, and as I ain't succeeded in sending any messages yet, I thought I would turn it over to Mr. Edison, and see if he can't do something with it.

I've named this new discovery *Grimalkinism*, 'cause its from a cat. IKE.

P. S. Don't let Berg no 'bout this, he might block the whole thing. IKE.

Etheric Force.

TO THE EDITOR OF THE TELEGRAPHER.

THE professor's discovery is a wonderful thing, especially the retroactive part. In effect, it's like that gun, which,

"When aimed at duck or plover,
Recoiled and kicked its owner over."

Or like the old woman's remedy for constipation or—otherwise. It was peach bark. "Scrape it *down* and it'll physic ye! Scrape it *up* and it'll vomit ye!"

Every one has wondered how the professor could invent the quadruplex three or four times, and sell it each time. Bewildered heads have ached, trying to understand the secret of the professor's "greased lightning," that makes the stylus slip on the paper. Likewise, his exploits in automatic, by which seven million words per minute are sent on one wire, or one million on seven wires, indifferently, coming out at one end considerably faster than they were crammed into the other.

Also, the light and airy manner in which the professor has flitted from flower to flower in the electrical garden, touching with his magic wand the obscure buds here and there, and making them bloom forthwith like a rose.

And lastly, among these many wonders, his most astounding modesty!

No one could ever understand it.

But we do now! It is *Etheric Force!*

That it is that has assisted him through all these years of unappreciated wisdom.

And now the dear blessed man, in a spirit of pure philanthropy, has given it to the world without money and without price.

May he be wafted on the wave of his etheric force to that blessed niche in the temple of fame, where his two illustrious friends have already secured a permanent abiding place. Ye gods, what a trio!

Paine! KEELEY! EDISON!!

But the greatest of these is Edison!

MACK.

Telegraphic Matters at the Capital.—Telegraphing the President's Message.—The Reduction of Salaries.

WASHINGTON, D. C., Dec. 13.

TO THE EDITOR OF THE TELEGRAPHER.

THE opening day of Congress having come and gone, and the telegraph business just coming out of the stupor it has been in for the past summer months, perhaps no more fitting time could be had to assume the responsibility of giving you the news in telegraph circles.

The A. and P. have removed from their old quarters, No. 609 Penna. ave., and fitted up an office near Willard's Hotel, having their receiving office in the hotel. To do this it became necessary to rebuild their wires, supply new poles, etc., which has been done at considerable expense. They have also laid a new six-wire cable, connecting their wires with the Capitol, as required by law. In the Capitol their main office is in the room adjoining the room occupied by the W. U. as their press office. They have fitted up a new and very neat office in the corridor of the House and are soon to open an office in the Senate. Beside the Capitol, they have distributed about the city ten branch offices. Naturally, of course, long before Congress convened, the main topic of conversa-

tion was the forthcoming President's message. Speculations and rumors were rife as to how it would be handled, but when it became known that our energetic Superintendent, Mr. D. H. Bates, was to be present on the eventful day, all felt that it could get in no better hands, and that it would be handled as best suited his judgment. It was handled by ten perforators, two Morse operators, and twelve copyists, representing the automatic, and by six Morse operators (three sending and three receiving), representing that system. When the result was announced that our papers were on the street twenty minutes ahead of the W. U., all prejudice and sectarian feeling was laid aside and one and all congratulated each other and themselves.

The S. and A. still paddle their own canoe, the paddles manipulated by ten employes to the tune of a very heavy business, both night and day. Experiments on their lines with the D'Infreville duplex have proven very satisfactory, the duplex working well on six hundred miles of wire.

There is considerable excitement here to-day over the reports of meetings being held yesterday along the lines of the W. U., to take action in regard to the reported reduction of salaries. This calls to the writer's mind the discussion that appeared some time since in THE TELEGRAPHER in reference to a union of telegraphers for the protection of their interests; and it cannot but appear to me that the coming year of 1876, the one hundredth birthday of our independence as a nation, would be a most fitting and appropriate time for an organization expressive of our independence as a fraternity. One can hardly attach blame to the telegraph companies for employing the same class of men who will work for \$50 per month in preference to those who are worth double that sum. The hundreds who express themselves willing to work for nominal salaries may be forced to it from want of means of support; but would it not be better for their future interests to seek employment at other trades, and thus save depressing the interests of the thousands within the ranks. Unity of action is the key that will unlock the great barrier that has stood between us and our liberty for so long, and which, when once removed, will reveal to us the sweets of freedom and of independence which we all hope for, yet dare not demand.

I sincerely hope that those more able than I will give this subject their thoughts, and your readers the benefit of those thoughts, and that it may end in something more substantial than discussion.

But pardon me for straying so far from my subject. I have already consumed so much of your space that I shall be obliged as well as pleased to acquaint you with the inside workings of the several offices at a future day. OPERATOR.

Telegraphing the President's Message East.—Telegraphic Personals and Gossip.—The Reduction of Salaries.

BOSTON, MASS., Dec. 8.

TO THE EDITOR OF THE TELEGRAPHER.

ANOTHER year has rolled away and another presidential message has been transmitted to the people through the medium of the telegraph. The message was received in Boston on four single (way) wires and two quadruplex circuits, making eight in all. Messrs. Kelley, McMahon, McFarland, Davin, Hoogs, Beardslee, Colsou and Kettles receiving from Messrs. Wood, Habelstein, Brandy, McInroe, Robinson, Miller, Read and Largay, in New York. The time of transmission was one and a half hours, commencing at 1:30 and closing at 3 P. M. It was copied on manifold and sent to newspapers without being recopied by the Associated Press, as is usually done. Although the *Boston Journal* says the message was badly "mangled" in transmission, I am inclined to believe that the *Journal's* chronic grumbling propensities leads it to exaggerate, and I think the message was very well handled by the Western Union operators. I notice that the *Boston Globe* makes quite a splurge over the style in which the document was handled by the automatic process, but very wisely neglects to say how many persons were engaged in punching and copying. Presumably double the force was required than by the Morse method. Mr. D. B. Grandy was sent to Worcester to officiate there in a receiving capacity. A new arrangement is working with Philadelphia over one side of the new New York quadruplex. No regular operator has as yet been assigned to this circuit. There is considerable speculation as to who will be the lucky man.

It is said that in the spring time a young man's fancy turns to thoughts of love, etc., but in the case of telegraphers in Boston the poet seems to be at fault. Within the past few months several of the craft have been struck by the arrowy missiles of the blind and winged god, and have entered into matrimonial bonds. The gossips says quite a romantic attachment exists between a well known telegrapher and a young lady clerk in the ladies' department, and that the enamored swain will lead his fair innamorata to the altar on Christmas Eve.

Mr. C. D. Stanford is very busy filling orders for crayon portraits, in which department of art he is an expert. Mr. J. H. Milliken has composed a beautiful and suggestive waltz for the telegraphers' ball in New York next month. Messrs. J. J. Guthridge and J. A. McGee are making great progress in the study of elocution. Both these gentlemen display a great deal of in-born talent in this direction.

Mr. Green has been transferred from the main office to the Post-office.

Mr. J. B. Phillips, who has been very ill for some weeks with pleurisy, is now able to work part of the time. It is to be hoped he will soon fully recover his health.

The air is full of rumors regarding a cut down in salaries, founded on an article in the *N. Y. World*. I hardly think the company can, with justice, reduce salaries to a lower point than at present. During the past few years they have made sweeping indirect reductions in the operating department, and in many instances a still further reduction would cause a good deal of suffering among the never too well paid slaves of the key and spark. ARISTIDES.

How Western Union Employes Regard the Reduction.

NEW YORK, Dec. 11.

TO THE EDITOR OF THE TELEGRAPHER.

NOW that the reduction of salaries made by the Western Union Company for stock-jobbing purposes has been fully promulgated, would it not be well for telegraphers everywhere to seriously consider their position, and make some safe provision for their future protection?

For the present we do not see that the employes of the Western Union Company can do anything but remain passive. They are without organization, and, what is of far greater importance, they are without means. No concerted movement can therefore be made.

What is needed—and what can be had in every large city—is an organization or union with a central head controlling all minor organizations, proper officers, dues, etc. That telegraph men need a protective union is shown not only by the late reduction, but by numerous and unmerited abuses and indignities to which they are continually subjected by petty officers. The intelligence of the telegraphic fraternity cannot endure these things much longer, and something should be done speedily.

These questions deserve the earnest consideration of operators and telegraphers generally, and the experience of the past five years may teach them that this is, perhaps, only the beginning of the end. IVAN.

The Atlantic and Pacific Arrangements.—Personals.

ST. LOUIS, MO., Nov. 25.

TO THE EDITOR OF THE TELEGRAPHER.

ON the 9th instant the Atlantic and Pacific Telegraph Company laid their cable across the Mississippi by the St. Louis elevator to that of McCormick, Adams & Armington, directly opposite. The main office is at 210 North 3d street, and has been tastefully and well fitted up. The room is large, with high ceiling, marble floor, and plate glass front. There are two receiving counters, one from off Third street and the other from the large and spacious hallway. Both are surrounded by elegant and graceful counters surmounted with ground glass. The front part of the room is occupied as the operating department; the back part for delivery, book-keepers, &c., while in the extreme back part, elevated about three feet above the front office, and divided from it by a glass partition, is the manager's office. Branch offices have been opened "on 'Change," Southern Hotel, corner Secoud and Vine, and National Stock Yards, East St. Louis, and expect to open several more soon. Mr. Charles W. Hammond, one of the oldest operators and most expert electricians in the country, has been appointed manager; Mr. George E. Miller, chief operator; Messrs. W. H. Spencer, G. P. Menuir, C. M. Carr and Frank Castle, operators.

In the Western Union office Mr. Charles T. Day, of the "short horn," has been assigned to duty on New York "duplex," vice E. A. Keene, resigned. Mr. John W. Hayes, of the night force, takes the "long horn" days. Wm. J. Foy transferred from the "long horn" to the "short" one. Michael Tully has been promoted from the night to day force.

Business with both companies is good and steadily increasing. I almost forgot our friend Charles J. Lawson, who has returned to us from the Pacific coast with his hair full of gold dust and pockets lined with 20 dollar gold pieces, looking handsomer than ever, and has been assigned to duty on the second Texas wire, nights.

Here comes "Van," the Apollo, his face wreathed in smiles, his hand full of sealed envelopes, which means that one half of us are off for the day. With a nervous hand I draw—open. Oh, ye gods, 'tis "off!" So here I go to punish turkey &c. FORTUNATE.

THE TELEGRAPHER MAY BE HAD at the news stand in the Receiving Office of the Western Union Telegraph Company, corner of Broadway and Dey street, where it is regularly on sale.

The Reduction of Salaries.

THE announcement in the last number of THE TELEGRAPHER of the general reduction of salaries of the employes of the Western Union and Gold and Stock Telegraph Companies, determined upon by the managers of those companies, to take effect from and after the first of January next, has, naturally, caused much dissatisfaction among those interested. We have since learned that this reduction will also extend to the employes of the International Ocean Telegraph Company, of which, as well as the Gold and Stock Company, the Western Union Company holds a majority of the stock. This reduction causes the more surprise, as, from the financial condition of the companies, as exhibited in the recent reports, no necessity apparently exists for it in that respect.

This reduction has long been contemplated, but has been opposed, as we have reason to know, by the President, until such opposition was futile, and it has been carried finally by the action of the Executive Committee and the Board of Directors of the company, for reasons which are no doubt satisfactory to them, however unsatisfactory they may be to those who are injuriously affected. The executive officials of the company have been opposed to reduction, not especially because it would operate on

their own salaries, but because they realize the importance of securing and retaining in the service experienced telegraphic talent, and because they understand more fully than the directors can the injurious effect on the service of the universal dissatisfaction and demoralization consequent upon such action, and know that it will prove far more damaging than beneficial to the interests of the company eventually. They also know that telegraphic salaries, especially those of operators and subordinate employes, are not now by any means excessive, but rather, from the nature of the work required, if anything lower than they should be.

We are, of course, all aware of the business depression which has existed for over two years past, and the shrinkage in values which has been going on, inevitable in getting down from the inflation incident to great and protracted wars in all countries to a sound financial basis. Apparently, telegraphic interests have not heretofore suffered so much directly as others in this process, although it has undoubtedly retarded to some extent the development and increase of telegraphic business which would otherwise have been realized.

For some time past a gradual reduction of salaries has been going on, by filling at a lower rate of compensation situations that became vacant. To this but little objection has been made, as those who accepted the reduced compensation did so understandingly and under agreements voluntarily entered into. Recently also the salaries on the Southern lines of the company, where a higher standard prevailed than elsewhere, have been equalized and considerably reduced, and we believe the same is true of the Pacific Coast Division. The reduction comes particularly hard upon these employes, being in fact an additional slice off of salaries only recently reduced, and they accordingly feel specially aggrieved.

The exemption from reduction of employes where salaries are not in excess of \$600 per year, of course, narrows the effect of the measure, and so far as they are concerned they have personally no cause of complaint. The reduction upon operators, most of whom come within the five per cent. rate, is not excessive, if any reduction was necessary. But for the reasons above stated it is not generally regarded as necessary, and small as is the amount individually, many of them can but ill afford it.

The sliding scale adopted, reducing the higher salaries in larger proportion as they increase in amounts, may be regarded as the sugar coating to the bitter pill; but there are two sides to this even, and it is not perhaps as strictly just as may at first sight be supposed.

The schedule was prepared by Mr. ORTON, probably with the idea of making it as light as possible for the lower salaried men, with the understanding that those receiving the higher compensation could better stand the greater loss. A simple statement will, however, show that, although the intention was a good one, the result is not strictly just. If the higher salaried officials and employes have been receiving a larger proportionate compensation than their services entitle them to, it is of course right that they should be reduced to a greater extent, but we do not understand that this is claimed. It appears to be a species of agrarianism, which we imagine would hardly receive the approval of the wealthy gentlemen who compose the directorate of the Western Union Company if applied to them individually. Suppose the same principle were introduced in municipal taxation, and the tax assessors should assess Commodore VANDERBILT, for instance, because he holds five or ten millions of property liable to taxation in the municipality ten per cent., while JOHN SMITH, who owns only the house he lives in, is assessed only one per cent.; would not Mr. VANDERBILT regard this as unjust oppression and unjustifiable? We cannot perceive any difference in the principle governing this supposititious case and that adopted in dealing with the employes of their companies; if one is right certainly the other is. The justification for a larger proportionate reduction of the higher salaries of course must be that those receiving them can better afford the larger amount. Is it not also true that Commodore VANDERBILT can better afford to contribute more largely

in proportion to his means to municipal expenses than JOHN SMITH, whose whole property consists of his residence?

There is another aspect in which this general reduction should be considered, and that is its effect upon the service of the companies. Of course it was considered, in taking this action, that it must be submitted to, however unwillingly, on the principle that "half a loaf is better than no bread;" but it will tend to discourage and demoralize the employes. A superficial knowledge of human nature even would demonstrate that these employes, believing that their compensation has been unnecessarily and arbitrarily reduced, will not labor as earnestly, and with as much regard to the interests of their employers, as heretofore. The companies in question have had the pick of telegraph employes, because their service was regarded as the more permanent and reliable, and the scale of compensation, to the better class especially, has been more liberal than was easily obtained elsewhere. The reduction in working expenses, which has been shown in the financial statements, has been attributable in no small degree to the faithfulness and ability of the employes. The success of a telegraph company and its efficiency depend to a great extent upon the character and the good will of those who serve it. Of late there has been very little complaint or dissatisfaction, so far as their employes are concerned, with the management of the companies. Of course, there have been exceptions to this, but they have been local and exceptional. It is probable—in fact, it is evident—that such is not now the case, and the effect cannot but be unfavorable to the interests of the company; and it is not impossible that the financial results may fail to realize the anticipation with which the reduction was determined upon. It must be understood in this connection that we are not stating what *should* be, but what, from the frailties inseparable from human nature, it is *likely* to be.

Another unfavorable effect will be to drive out of the service many of the best telegraphers now engaged in it. They will naturally seek other employment less exacting and equally or more remunerative, and with better prospects in the future. It is a well-known fact that it is not the inferior and less desirable class of employes who go out of the telegraph service, but the better class, whose abilities create a demand for their services and command larger compensation in other employments. This class cannot well be spared, but they are the ones who abandon the business, and this action will, we fear, accelerate their withdrawal.

The Atlantic and Pacific Telegraph Company has already announced that it does not intend to follow the example of its rival and reduce the compensation of its employes. This will, even if the actual scale of salaries of that company be no higher than that of the Western Union, give its service the preference, as it will be considered that although less prosperous, it is doing all it can, and will not assess its employes to secure dividends to its stockholders.

In regard to the Gold and Stock Company, this reduction seems to be particularly unfortunate. In proportion to its business the number of its employes is not large, but they are men whose experience is of great value and importance, and, as we have reason to know, they have generally served the company with a zeal and fidelity which deserves recognition and reward. In this specialty, more than in commercial telegraphy, success is dependent upon the fidelity and zeal of its employes. Under the liberal management of its President, GEN. MARSHALL LEFFERTS, a corps of employes has been secured whose services are exceedingly valuable, and it is but justice to him to state that the reduction is not approved by his better judgment. Under the circumstances the Gold and Stock employes regard the reduction as peculiarly hard and unjust, and will submit to it only from necessity.

The action of the Boston and Providence Railroad Company recently, upon a similar proposition, is in marked contrast to that under consideration. For several years the B. & P. R. R. Co. has paid its stockholders annually

ten per cent. upon their stock. On account of the depression of business only nine per cent. was earned for the current year. At the annual meeting held a few weeks since, in view of the reduced earnings, a stockholder moved a reduction of the wages of its employes. Mr. CLIFFORD, the president of the company, opposed this in an earnest speech, saying the employes had served the company and the public honestly, intelligently and faithfully, and that their compensation was as low now as it ought to be, or they could afford to have it, and that it was better that the stockholders should submit temporarily to lower dividends, rather than make them up by assessing upon the subordinates the loss experienced from a general depression of business. Other leading stockholders also opposed it, and the proposition was finally withdrawn. Can there be any doubt as to the excellent influence of such justice and liberality upon the employes of the company and their future service?

For the above reasons, and for many others which we have not space to set forth, we cannot but regard the proposed reduction as an error which it would be wise to correct. We hear of protests and indignation among the employes of the company, of all grades and from all quarters, and some threats in regard to future action. We trust that they will be governed by wisdom and coolness and do nothing rashly. They have persistently refused in the past to do anything to protect themselves, and much as they may regret it now, they cannot improvise an organization which will be effectual. We sympathize with them in their trouble, and so far as THE TELEGRAPHER can aid them its columns are at their service. It cannot be said that the company has done this hastily or unadvisedly, for it has been under consideration for two years past, and every director who voted for it must of course have anticipated the storm which it has aroused, and have been prepared for it. Under these circumstances those who counsel hasty and violent action on the part of the employes either exhibit a lack of judgment or cannot be regarded as their real friends. The time may come when the directors will see that their action is injudicious even from the stand-point of the interests of the company, but it will not be until after the experiment of reduction has been fully tried. As the real friend of those interested, and despising a demagogical spirit which would seek to make temporary capital or popularity by urging them on to violent and hasty action, we counsel them to bide their time and do nothing rashly. Let them consult together and listen to the cooler-headed and wiser of their number, and be guided by them, and the final result will be far more advantageous and satisfactory than it otherwise would be.

The Telegraphic Director of the Centennial Exhibition.

It is announced that the position of Telegraphic Director of the Centennial Exhibition at Philadelphia has been tendered to, and accepted by W. J. PHILLIPS, Superintendent of the Police and Fire Alarm Telegraph of that city.

This is an excellent appointment, and the telegraphic and electrical department of the Exhibition will be efficiently and satisfactorily managed by Mr. PHILLIPS. His qualifications for the position are of the best character, and his extensive acquaintance with telegraphers and electricians will be of advantage to him and them, as well as to the interests of the Exhibition.

Mr. PHILLIPS was one of the first HOUSE Printing Telegraph operators, and put in operation the first HOUSE Printing Telegraph line established in this country, which connected New York and Philadelphia; and was the general manager of that line until 1855. In that year he resigned to take charge of the construction of the Police and Fire Alarm Telegraph of the city of Philadelphia, which was completed and put in operation in 1856. He was appointed Superintendent, and has been continuously in charge of that department from that time until now. He has also given attention to the construction of private telegraph lines, and is a joint inventor with Mr. W. P. PHELPS of what is known as the PHELPS and PHILLIPS'

printing telegraph instrument, which is largely in use in Philadelphia and elsewhere.

More recently, the American District Telegraph Company, of Philadelphia, was organized by Mr. PHILLIPS, and under his efficient management has become one of the most prosperous institutions in that city, and bids fair to rival New York, especially during the Centennial year, in the extent of its business.

From the above it will be seen that Mr. PHILLIPS brings to the honorable position tendered to him mature experience as a telegraphic engineer and electrician, which is supplemented by rare executive ability.

The Direct Cable Again Broken.

THE Direct United States Cable is again broken and communication suspended until it can be repaired. Ill fortune seems to pursue this enterprise to a degree which has scarcely been equalled by that of any other telegraph company.

This last break occurred at 4 P. M. on Friday, the 10th inst., and has been located between Tor Bay, Nova Scotia, and Newfoundland, 136 miles east of the former place. It is in shallow water, the depth in this vicinity varying from 50 to 70 fathoms, and it can be easily raised and repaired as soon as the Faraday can reach the spot. The break was caused probably by some vessel anchoring or dragging in the vicinity. The Direct Cable Company have offered a reward of £1,000 for the discovery of the vessel by which the break was made, and it is hoped that this liberal offer will secure the desired information.

Advices from London of the 14th inst. state that the Faraday will leave to repair the break in three weeks, or sooner if she can be got ready.

A Speculative Cable Charter Asked For.

In the United States Senate, on Wednesday, the 8th inst. Mr. Spencer, of Alabama, introduced a bill granting to W. Cornell Jewett and his associates charter rights for telegraph ocean communication between the Pacific coast of the United States and Asia. It grants to them all rights, favors and privileges necessary to lay, land and use, as well as operate, ocean cables on the Pacific coast of the United States, from some point or points in the Pacific Ocean. The associates of Mr. Jewett are not named in the bill.

Of course Mr. Jewett's associates are not named in the bill, for he has none. All he wants is something to trade on. It is about time that Congress was relieved from the consideration of such bogus applications for charters by persons who cannot command capital to build a mile of cable telegraph, and whose only object is to get privileges which they hope to compel capitalists to purchase of them.

Illness of Mr. David Brooks.

WE regret to learn that Mr. DAVID BROOKS, of Philadelphia, has been dangerously sick for the last three or four weeks. His disease is typhoid, complicated with rheumatic fever, and for some time his life was considered in great danger. Within the last two or three days, however, he has improved somewhat, and it is thought he is out of immediate danger, though it will probably be some weeks yet before he entirely recovers. His numerous telegraphic friends and acquaintances will sympathize with him and his family in their trouble, and hope for his speedy restoration.

The New York Telegraphers' Ball.

WE are requested to state that telegraphers outside of the city desiring tickets for the Telegraphers' Ball, which is to take place at Ferrero's Assembly Rooms, on the evening of January 21st, can be supplied on application to Mr. T. G. SINGLETON, Secretary of the New York Telegraphers' Association, Auditor's Department, in the New Western Union Building, corner of Broadway and Dey streets.

Personals.

Mr. JOHN BRAXTON, formerly of the Lumber District, Albany, N. Y., office is now stationed at Lake George, N. Y.

Mr. G. M. CHAMBERLAIN, who for thirteen years has been manager for the Western Union Company at Englewood, N. J., is now with the Atlantic and Pacific Company at the same place.

Mr. F. M. THOMPSON is operator on the Chicago, Ill., Metropolitan line, at the Metropolitan Hotel, and is doing a thriving business in connection with his cigar and news stand.

Miss SNELL, who has been at Racine, Wis., Western Union office for some time past, has taken a vacation for the winter and returned to her home in Chicago, where she was warmly greeted by her many friends.

Mr. E. PAYSON PORTER has given up his Telegraph college in that city, known as "Porter's National Telegraph College," and accepted a position as operator on the day force of the Chicago, Ill., Western Union office. Mr. PORTER says it's of no use to try to run an honest telegraph school as long as there are so many humbugs in that line in existence.

Mr. CHARLES ANDRAS, of St. Louis, Mo., has been appointed night report operator, Sedalia, Mo., Western Union office, *vice* Mr. Leuchtenmeyer, resigned.

Mr. MICHAEL HOLLOHAN, late Manager of Western Union office, Southern Hotel, St. Louis, Mo., has been appointed to a position on the day force at the main office of the same company.

Mr. J. E. CLARKE, train despatcher of the Cairo and St. Louis Railway, at St. Louis, Mo., has been promoted to the position of master of transportation of that road.

Mr. FRANK P. ROSS, of the cable department, Western Union office, New York, has resigned and gone to his home, Columbus, Ohio, to take charge of the night force in that office. New York thus loses one of her finest operators.

Mr. G. D. MERRILL is transferred to the cable department, *vice* Ross, resigned, and Mr. CHAS. H. DAVIS goes from the 12 to 9 trick to regular nights to fill Merrill's place on the Chicago wire.

Mr. FRED. RECTOR is back to New York again, and resumes his place on the day force, W. U. office.

The Telegraph.

By Cable.

A REWARD OFFERED FOR THE DISCOVERY OF THE VESSEL WHICH BROKE THE DIRECT CABLE.

LONDON, Dec. 15.—The managers of the Direct United States Cable Company in this city state that the recent breaking of their cable wire in the Atlantic cannot be accounted for in any other way than that the break was caused by some vessel, but whether from accident or design is not at present known, and they decline to express any opinion on the subject. They declare, however, that the cable on examination recently was in perfect order, and that considerable force must have been used to disarrange it.

The company offered a reward of £1,000 for the discovery of the vessel which broke the cable.

Election of Officers of the Southern and Atlantic Telegraph Company.

At a meeting of the board of directors of the Southern and Atlantic Telegraph Company, held Thursday, Dec. 9th inst., at the office of the company, 51 New street, in this city, the following officers were elected for the ensuing year:

Charles W. Blossom, President; Henry Hentz, Vice-President; C. C. Blossom, Secretary and Treasurer; G. H. Grace, General Superintendent.

Executive Committee.—Messrs. Henry Morgan, Amerton Yale, J. T. Hanneman, Meyer Lehman, and Francis Morris.

The President and Vice-President are also *ex-officio* members of the executive committee.

New York Telegraphic Notes.

As an inducement to the Western Union operators to familiarize themselves with the higher branches of the service, it is rumored in the operating rooms that any employes who can pass a satisfactory examination in

setting up and adjusting quadruplexes will be allowed a further reduction in his salary varying from "5 to 25 per cent," according to his proficiency.

It will be matter of surprise if the late move of the Western Union directors does not have the practical result of reducing the speed of transmission over their wires from "5 to 25 per cent." If they undertake to reduce employes down to the rate of wages prevalent in Europe they will be likely to get the same slow, inefficient and blundering service.

Laying of the Pneumatic Tubes Postponed till Spring.

In consequence of the lateness of the season it has been found necessary to postpone laying the pneumatic tubes which are to connect certain down town branch offices of the Western Union Company until spring. The work will be done as soon as the frost is out of the ground in the spring, so that it can be performed satisfactorily.

Serious Accident to a Lineman.

On Sunday, the 12th inst., while Dennis Donlay, one of a gang of Western Union linemen, was engaged in changing wires between Chatham and Albany, N. Y., the pole upon which he was working broke, precipitating him to the ground, a distance of some twelve feet. The ground was frozen hard, and Donlay struck on his heels, smashing the bones in a terrible manner, and giving his body a severe jar. He was conveyed to St. Peter's Hospital at Albany, where he now lies in a critical condition, having sustained severe internal injuries.

Foreign Telegraphic Notes.

The traffic receipts of the West India and Panama Telegraph Company amounted, in July, to £3,554 as compared with £2,884 in the corresponding period of 1874; and in August, to £2,992, as compared with £2,339 in the corresponding month last year.

The traffic receipts of the Brazilian Submarine Telegraph Company for the month of October, 1875, were £10,576, against £10,581 for the corresponding period of 1874.

The traffic receipts of the Eastern Extension, Australasia and China Telegraph Company for the month of October, 1875, were £19,604, against £16,584 for the corresponding period of 1874.

The receipts of the Submarine Telegraph Company for the month of October, 1875, were £10,918 1s. 11d., against £9,910 14s. 4d. for the corresponding period last year.

It is stated that it is the intention of all the foreign cable companies after the 1st of January, 1876, to receive only dictionary words of ten letters each, names of persons and places excepted. All words of more than ten letters will be charged double rates. This rule will be adopted in order to obviate the frequent mistakes caused by the use of cipher telegrams, which contain long, unintelligible or foreign words.

Not Inclined to the Military Service.

MR. P. KEARNEY, who has furnished us our dispatches for nearly a year, and our predecessor before us for ever so long, retires from the position of agent and operator at Prescott and Fort Whipple, in consequence of an order requiring all operators of the signal service and military lines to enlist in the army. This Mr. Kearney was unwilling to do. The service will be very fortunate if it finds another as gentlemanly and efficient in the position as Mr. K. He is one among ten thousand for correct business habits and all the moral and social accomplishments that go to constitute the gentleman. We sever our pleasant business relations with him with regret.—*Arizona Weekly Miner.*

New Patents.

OFFICIAL COPIES of any U. S. Patent issued since July 1st, 1871, including drawings, specifications and claims in full, sent free to any address for 25 cents each. Address F. L. POPE, Elizabeth, N. J.

For the week ended Nov. 2, 1875, and bearing that date.

169,509.—ELECTRIC RAILWAY SIGNALS.—E. E. Bean, Boston, Mass. [Filed Jan. 26, 1874.]

Battery and signal instrument on train; one pole of battery to ear h through metal of train—other pole to projection i on side thereof; posts at each section along track. Each post has magnet, whose circuit extends to a preceding or succeeding post, or both, and through a bent lever, s t, metallicly connected to ground. This lever is normally in such position that projection i bears it against it, closing circuit of signal on train if everything is clear. Projection i bears it to such position that lower end s is locked away from where the projection i of a succeeding train can touch it, as shown in fig. 5, until the train has sent back an impulse from another station.

1. In combination with a battery, its projecting pole i, and the operating levers s t, as described, an additional projection, v, on the engine or other moving part of a train, for the purpose set forth and described.

2. The stationary posts p p', with their electro-magnets q q', armature r r', rocking levers s t s t', springs x x, or their equivalents, and wires v v, in combination with a movable battery, as and for the purpose set forth.

4. The combination, with a switch or other movable part of a railway, of connections 2 7, receptacles 4 6, with their flexible diaphragms, support 10, and connecting pipe 5, or their equivalents, as and for the purpose set forth and described.

169,513.—ELECTRIC TELEGRAPHS.—Robert K. Boyle, New York. [Filed March 30, 1875.]

1. In a telegraphic apparatus, the combination of two induction coils, one in each terminus of the line, with a battery in the line of the telegraph, the current of said battery being closed continually over the line wire, and being made to act on the pen or stylus of a chemical writing instrument, while its force is alternately increased and then neutralized by the currents induced in the induction coils, whereby signals are recorded by breaks in the line drawn in the paper moving under the pen or stylus, as shown and described.

2. The combination, in a telegraphic apparatus, of induction coils B C, line battery A, circuit breaking armature F, local battery G, and induction coil E, substantially as and for the purpose set forth.

169,514.—ELECTRICAL INDUCTION APPARATUS.—Robert K. Boyle, Brooklyn, New York. [Filed March 16, 1875.]

In a series of induction coils, secondary helices connected to one conductor; primary helices alternately brought into action, so as to give a steady induced current.

The combination of a series of induction coils with one or more brushes or keys, and with a surface composed of alternating segments of a non-conducting and conducting material, either the keys or the surface being made movable, substantially in the manner and for the purpose herein shown and described.

169,529.—GALVANIC BATTERIES.—C. Duhem, Denver, Col. [Filed July 9, 1875.]

The supplementary electrode is hung on pivots, and by a lever arm can at pleasure be moved into contact with the positive plate, for the purpose of increasing the quantity of the current.

The application to any galvanic battery of a positive supplementary electrode, capable of being easily and quickly connected or disconnected with the positive plate of a battery within the liquid, as described.

Died.

Co K.—At St. Louis, Mo., Nov. 25th, 1875. Sarah, wife of T. P. Cook, of the Western Union Telegraph Company, of hemorrhage of the lungs.

THE POCKET GALVANOMETER. PRICE REDUCED.

The Pocket Galvanometer manufactured by LENNERT & DECKER, nicely finished and nickel plated, sent by mail to any part of the United States on receipt of ONE DOLLAR. To Canada, ten cents extra, to pay postage. May be seen at the office of THE TELEGRAPHER, and will be forwarded as above on application to

J. N. ASHLEY, 38 Vesey street, New York.

P. O. Box 5,503.

THE LECLANCHÉ BATTERY.

THE WORLD RENOWNED Open Circuit Battery.

NO ACIDS! NO SULPHATE OF COPPER! DOES NOT FREEZE!

Will last from six months to several years, WITHOUT RENEWAL.

IS ESPECIALLY ADAPTED TO Electric Bells, Hotel and House Annunciators, Burglar Alarms, Medical Apparatus and all kinds of Open Circuit Work. ADDRESS,

LECLANCHÉ BATTERY COMPANY, No. 40 West 18th Street, or L. G. TILLOTSON & CO., Sole Agents, 8 Dey Street, New York.

BRADLEY'S APPARATUS FOR ELECTRIC MEASUREMENT, TANGENT GALVANOMETER AND RHEOSTAT.

Widely known and used among telegraph companies for practical work; also in colleges and other institutions of learning as a means of instruction and scientific experiment. Invaluable to experts or students in electrical science.

APPARATUS COMBINING WHEATSTONE'S BRIDGE, Also GALVANOMETERS for special purposes designed and furnished at short notice.

BRADLEY'S CELEBRATED NAKED WIRE HELICES,

for Electro-Magnets, wound to any given size and resistance. Manufacturers of Telegraphic and Electrical Instruments supplied at low rates. For prices and pamphlet descriptive of apparatus, apply to

L. BRADLEY,

9 Exchange Place, Jersey City, N. J.

BROOKS' PATENT TELEGRAPH INSULATOR WORKS,

AND AGENCY FOR THE SALE OF

SIEMENS' UNIVERSAL GALVANOMETER,

Resistance Coils, Submarine Cables,

AND EVERY VARIETY OF

ELECTRO-METRICAL APPARATUS MANUFACTURED BY SIEMENS BROS.

DAVID BROOKS, Proprietor,

22 SOUTH TWENTY-FIRST ST.,

PHILADELPHIA.

TO ELECTRICIANS.

BASTET'S NEW IMPROVED BATTERY

is the most powerful, constant and durable power in the market; never crystalizes in the porous cup. This Battery, and Electrical Fluid to charge the same, is only sold at our store.

PRICE LIST.

No. 1 Cell, - - - \$5.00. No. 2 " - - - 10.00.

L. BASTET,

619 Broadway, New York.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of THE TELEGRAPHIC MANUAL, by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,

MANUFACTURER OF TELEGRAPH INSTRUMENTS,

104 CENTRE STREET, NEW YORK.

BATTERIES of every descrip on for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the CHESTER PIN DIAL (patented), designed expressly for POLICE and LAW TELEGRAPHS. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell cut out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,

for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,

for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,

CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH;

so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,

REGISTERS, RELAYS, CALL BELLS,

and every description of Central Office apparatus, at most reasonable prices.

Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN"

in which the spring takes the place of the weight, is enclosed in a metal and glass case; is noiseless in its action, and of great beauty and finish, and is specially recommended to Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.

ELECTRO-SURGICAL APPARATUS

OF EVERY VARIETY AND DESCRIPTION.

HOTEL ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns: Grand Union, Saratoga; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y.; Willard's Hotel, Washington, D. C.; Galt House, Louisville, Ky.; Teft House, Buffalo; and many others. Proprietors and keepers of Hotels most liberally dealt with.

THE "COUNTING ROOM BELL MAGNETS,"

for communicating instantly to clerks and employés, by means of a keyboard, in any desired place.

ALSO,

BELL MAGNETS AND PUSH BUTTONS,

for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$5.00 upwards.

Sole Agent of the

WILSON ELECTRIC GAS LIGHTING CO.,

for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for

LIGHTING FACTORIES, MILLS, ETC.

By simply pushing a button on his bench the operator lights a section of burners.

Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First—The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second—The Automatic Signal Boxes.

Third—The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth—The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only **PERFECT, COMPLETE** and **RELIABLE** System

FIRE ALARM TELEGRAPH
IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM
AND
POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. **GAMEWELL & CO.** are the owners of the original **FARMER & CHANNING PATENTS**, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM.

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the

People, Municipal Authorities,

AND THE
PRESS

throughout the **UNITED STATES** and **CANADA.**

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure **ANY POSSIBLE IMPROVEMENT** which shall increase the

EFFICIENCY,
RELIABILITY and
ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the **UNITED STATES** and the **DOMINION OF CANADA,**

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, **THREE CAN BE NO QUESTION.**

The coöperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

Reduction.

BY "BE," CHICAGO.

With lightning and awful mien
That depressing word "Reduction"
Has come, and been an earnest theme
Of many a rank discussion.

Upon this point all do agree,
We would choose to do without it;
But th' standing question seems to be,
"What 'ye going to do about it?"

Protesting plaints are all in vain,
How'er sanguine the reformer;
All the satisfaction he can gain
Is in the above rejoinder.

"Retrenchment" seems the only way
To fill in the vacant places;
And "policy," the "old heads" say,
Is to keep within the traces.

To "go slow and learn to peddle"
When we had form'd a rapid style;
And to work for a leather medal,
Appears hardly worth the while;

Yet, a necessity must teach us
When nothing certain can be done;
'Tis better halt a foot should reach us,
Than be loaing 'round with none.

A Death Message.

A Collision.

Th' night was dark on that distant shore,
The waves rolled on with mournful roar;
The lightnings flashed, the thunders roared,
The midnight clock the hour toll'd;
The tempest swept o'er hills and dales,
The whirlwinds rush'd thro' silent vales;
With fight the wild beasts sought their lair,
The lion king and timid hare
Were wont to lie down side by side,
As lightning gleamed through th' heavens wide;
On th' plains below ran th' midnight train
With whirlwind speed through blinding rain;
A wailing cry the tempest bore,
Th' rumbling train through th' darkness tore;
The engines met with dreadful clash,
The lightning leaped with vivid flash;
A shock was felt and all was o'er,
The tempest wail'd as't wail'd before;
A mournful wreck lay th' midnight train,
The billows surg'd with piteous strain;
The dead and dying together lay,
But who that picture can portray?
It makes the soul within us shrink
To gaze upon—yes, even think
Of many who that night were slain;
Death's icy hands, e'en on the plain.
In th' midst of life we are in death,
It's but one short, one fleeting breath;
Life's but a race that all must run,
Yet ended while 'tis scarce begun.

Your Son Killed.

Dead, did you say? our only lad,
The direful thought will drive me mad;
Alone, unwept for, no friend near,
Rendless, cold these words appear.
Dead, did you say? our only boy,
A father's pride and mother's joy,
Across the vale to world's unknown,
On death's dark wing's forever flown,
It cannot be; ne'er see him more.
Oh! fatal day he left our shore,
His manly form no more to view,
Our only child, adieu, adieu!

Buried To-morrow.

Behold that lonely cottage train,
It winds its way across the plain.
No friends are there to mourn the dead,
Dark strangers walk with solemn tread;
No pomp or grandeur there display'd;
No costly plumes the hearse array'd:
A lonely tree by the murmuring wave,
Is all that marks the stranger's grave.
He's passed away from earthly sight,
No more we'll see his shining light,
Till time has ceased and earth decay,
The mountains fall and pass away.

Ottawa, Canada.

J. A.

[From the New York Tribune.]

The New Electric Development.—Result of Physiological and Other Experiments.—Characteristics of the Alleged Force.—The Apparatus Used.

To the Editor of the Tribune.

SIR: On reading the account of the alleged discovery by Mr. Edison of a new force, it occurred to me that it would be well to submit it to physiological tests. I have spent several nights with Mr. Edison and his assistants, John Bachelor, experimenting in their laboratory, and have also experimented with Prof. J. E. Smith in the establishment of Mr. Chester, and also in my own office. I may say that I studied the phenomena without reference to any theory for or against the claim of Mr. Edison. The results of the physiological experiments are as follows:

1. The force is conducted by the human body. This was proved by taking hold of the conductor—a wire, iron bar or gas-pipe—that was in connection with the apparatus, evolving the force by one hand, and with the other touching the blade of a knife to a stove or block of metal. Sparks appeared, though somewhat smaller than when the force did not traverse the body. In some of these experiments, which were tried on several individuals, the body was insulated by a large block of paraffine six inches thick. When the distance for the force to travel through the body was reduced one half by making the connection at the back of the neck or in the mouth, a somewhat larger spark was produced than when the whole resistance of the body from hand to hand was included. It was clear, therefore, that the body conducted the force, though not so well as metals. A person standing on an insulator, with the conductor in hand, does not, on dropping the conductor, give any evidence of being charged; he can give no sparks to any other person or to any metal. I have also found it impossible to charge metals.

2. The force in passing through the body produces no demonstrable physiological effects. While we have the evidence of the sparks that the force is traversing the body, yet wherever directed it causes no sensation, not even on the tip of the tongue, no muscular contraction anywhere, no tremor, no erection of the hair, no flashes of light, no sour taste, no dizziness—in short, none of the usual physiological reactions of the different forms of electricity. Mr. Edison had supposed that in his own case contraction of the muscles of the tongue was produced when he applied the tip to the conductor, and his head did really move up and down as though the muscles were affected; but on my breaking the connection unknown to him, his tongue kept moving as before, synchronously with the respiration. It was a case of mind acting on body—he expected some effect, and unconsciously produced it himself. Mr. Edison and two of his collaborators were taken sick in various ways one night, and it was supposed that the illnesses were caused by the force, but in this also they were probably mistaken—mind acting on body or coincidences may account for their symptoms. It is certain that I have experimented many hours on several occasions with this force, and a considerable portion of the time it was passing through me or into me, and I was not unfavorably affected, nor were any of those employed in the establishment, including Mr. Edison and the others who fancied their illness was caused by it. What effect force evolved from a much more powerful apparatus, and passed through or into the body for a long time, may have primarily or secondarily, I cannot say. Some who tested the matter thought that a very slight tingling sensation was experienced on the tongue, but closer examination did not confirm this.

3. The force passed through a galvanoscopic frog either caused very slight contraction or none. The galvanoscopic frog is a test for electricity of exceeding delicacy. Dr. Wilkinson estimates it as 56,000 times more delicate than the most sensitive condensing electroscope. This experiment I repeated several times, as did also Mr. Edison and Mr. Bachelor. We tested the frog used in these experiments, and found it so sensitive that one electrotonic cell, placed in a circuit having a resistance of 400,000 ohms, or nearly 35,000 miles of telegraph wire, caused contraction, and yet it did not contract when this force was passed through it. That the force in these experiments passed through the frog (which was insulated) is proved by the spark that appeared at the distal end. In this experiment, the result of which was most remarkable and unexpected, all conceivable elements of error seemed to be excluded. Subsequently, with a different apparatus—a Ruhmkorff's coil—a contraction of the muscles of the frog was obtained. The experiment was made at the establishment of Mr. Chester. The same experiment repeated in New York gave the same result. Mr. Edison suggests that induction from the battery may explain the inconsistency of the results.

In a subsequent series of experiments made with Mr. Edison, contractions were obtained in the frog's leg, although the apparatus was most thoroughly insulated. As galvanoscopic frogs are susceptible to mechanical irritation, it was suggested that possibly the vibrations

from the apparatus communicated through the wire caused the contractions, and on using the key instead of the self-vibrator the same force caused no contractions. Returning to the self-vibrator, contractions appeared. When the wire connecting the apparatus with the frog was shortened the contractions increased in vigor. That the frog was susceptible to vibrations was shown by striking a very large tuning fork and touching it to the sciatic nerve, and sometimes contractions appeared when the vibrating fork did not touch the nerve, but was held at a distance of one half or three quarters of an inch from it. The conceivable element of error from induction had been excluded by perfect insulation; when the vibrations through the wire were excluded no contraction was seen; in proportion as the wire connected with the vibrating apparatus was shortened, in that proportion the contractions increased in vigor. There was no apparent escape from the conclusion that this force, as then and there produced, although it gave very distinct sparks, and could traverse long distances and overcome great resistance, yet did not affect the galvanoscopic frog. On testing this frog by the galvanic current it was found that one electrotonic cell, after going through a resistance of over one million ohms, or about 75,000 miles of telegraph wire, easily caused contraction. These experiments were made in the presence and with the co-operation of the well known expert in practical acoustics, Mr. Rebert Spice.

The apparatus for generating this force consists simply of a large self-vibrating electro-magnet, run by several (from 5 to 20) electrotonic cells. Considerable, but not enormous battery power is needed. The force can be obtained from any self-vibrating electro-magnet, or from an electro-magnet operated on by a key. All that is necessary is to connect a wire to the core of a magnet, or any metal in connection with it; or it may be generated by a piece of cadmium, or a copper rod surrounded by a helix of wire, placed in a battery circuit and interrupted by a key. Cadmium in this arrangement seems to give a somewhat better spark than any other metal, but it is not necessary to use it. The Ruhmkorff coil will answer very well, and it was used in the experiments at the establishment of Mr. Chester; but inductive electricity is thrown out from it to a degree that may complicate the experiment. The ordinary batteries used by physicians are not sufficiently strong to give the spark, at least according to any experiments thus far. Very fine iron wire, rubbed against rough iron, as a stove, file, gas pipe, or rusty knife, brings out the largest sparks. The batteries and all the appliances should be well insulated to guard against possible error from inductive electricity. To see the spark readily, when it is not large, the room should be somewhat darkened, or a hat on the hand may be held over the place where it is looked for; but large sparks may be seen in the light. Sparks are obtained by the edge of a knife or the end of a lead pencil drawn lightly along the wire or conductor. The spark is the only evidence we have of the existence of this force, since there is at present no other known phenomenon by which it can be detected or measured. It is supposed that electric force, acting on the apparatus above described, is transformed into this new force, which in turn is transformed into light, and thus we are enabled to detect its presence. These sparks have been seen, even if not noticed, by every one who has had much to do with batteries.

Out of a very large number of other experiments I may mention the following: I stuck a penknife in a large block of paraffine, and connected it with the battery, drawing the wire up and down the blade. No sparks appeared. When a long file was substituted for the knife, sparks were abundant and were kept up as long as the connection was made. Where, then, did the power go to? Into the air or the earth? I suspended them by silk rolls of wire of various sizes, and allowed them to strike against the connection. With small coils sparks rarely appeared, with the larger coils they were abundant. It would seem, therefore, that a certain size is necessary in the conductor in order to get the sparks. At one time we led the wire through a large vessel filled with water, and pieces of iron and bars of iron of various sizes were placed across its track and resting upon the wire, and the wire was wound round an iron press, and yet at the end the spark appeared. Mr. Edison took the wire out of doors, ran it along the ground and in a ditch on a rainy night, and brought it up stairs several rods from the battery, and the spark was seen by him, by his assistant and by myself in the dark box above described; but it was not constant, and required a nice adjustment of the carbon points to bring it out. Query: If this was ordinary electricity, where was the circuit completed? Can there be any circuit? The evidence is that the force indicated by the sparks coming from the apparatus above described is a new force, or, at least, a form of electricity not generally recognized.

First.—It gives no evidence of polarity, and cannot, by known laws of electricity, complete a circuit, and it does not decompose iodide of potassium—a test, as all electricians know, of exceeding delicacy. Mr. Edison

says that he passed the force through iodized paper for three hours, and no effect was produced. I tried this test, as also did Professor Smith, but not for a long time.

Second.—It has no demonstrable physiological effects. Electricity of any form giving such a spark as this would be felt on the tip of the tongue if touched lightly, even if no other physiological effects were appreciated. A current from 2,500 very small water cells is of such small quantity and high tension that it is little if at all felt on the tongue, as Professor Smith tells me, but it is not claimed that such a current would not respond to the other tests of electricity.

Third.—It will pass through insulators better than electricity. A dry, hollow glass tube, half an inch in diameter and two feet long, showing that it is not easily insulated, does not prevent the passage of the force. The spark weakens, however, after the force has passed through the rod, just as after it has passed through the body. In these tests the spark is studied at the point of contact of the sharpened ends of the lead pencils enclosed in a dark box with a small hole in the top.

Fourth.—It does not charge a Leyden jar nor deflect the needle of Thomson's mirror galvanometer. Mr. Edison tested these instruments by the force many times, and has performed the experiments in my presence. The great delicacy of Thomson's mirror galvanometer is well known.

Fifth.—The spark that comes from it resembles in appearance the spark that comes from dynamic electricity, and not the spark of inductive electricity, in a state of high tension. It scintillates, and does not jump through the air, but requires actual contact, and in that respect differs from the spark of inductive electricity. If it were inductive electricity at high tension it would jump through the air. The facts which favor the theory that the force may be some form of electricity are these:

First.—The spark resembles the electric spark, and especially that of galvanism of moderate tension.

Second.—It has a relative velocity apparently equal to that of electricity. At short distance at least it is practically instantaneous.

Third.—It is best conducted by metals, as iron and copper.

Fourth.—It is resisted by the same substances as is electricity; namely, glass, rubber and air, though in a much less degree.

The theory that it is electricity in small quantity and high tension is untenable, for its phenomena do not resemble those of very high tension electricity. To complete the circuit through air and earth it would be necessary for it to traverse immense distances; and experiment shows that a few inches of air resists, if it does not obstruct it. I have thought that it might be electricity in an electrostatic state, with air as a dielectric, as Thomson has suggested might be the case with atmospheric electricity; but this hypothesis does not seem to harmonize with all the phenomena or with the established laws of electricity, and it certainly cannot be demonstrated. If it be electricity it appears in an unrecognized form, and might, perhaps, be regarded as a new force, differing from magnetism, statical electricity and galvanism as much as they differ from each other.

If it be assumed that this force is inductive electricity, which returns to the battery by the same conductor on which it leaves it, as the water in a fountain returns to the spout whence it issues, then we have a hypothesis that would account for many if not all the phenomena. Electricity, thus travelling back to the magnet by the same road on which it leaves it, and being rapidly interrupted, would give sparks on passing between the breaks in the conductor; would not seek the earth any more than any other conductor until brought into direct terminal contact with it.

Electricity of this kind would not affect the galvanometer or charge the Leyden jar or manifest electrolytic powers, and might not cause contractions in the galvanoscopic frog, although it would be likely to do so, and it could be drawn off by good conductors at any part of the main conductor. It would give no evidence of polarity, and would be conducted by the human body, and might or might not produce physiological effects, according to its strength. It would be limited in the distance it would go by the force of the battery and the nature of the conductor. It would come only from interrupted currents, and it is noticeable that this force only appears when there is interruption in the current wherever it is derived.

The object of this communication is to request those who are accustomed to electrical and physiological investigation to repeat the experiments here recorded and to devise others. Unless some subtle sources of error have escaped our notice, and even our suspicion, these results will be obtained by all who, with proper apparatus, rightly pursue the same line of research. If any fail to obtain the spark from apparatus, as above described, it may be because the battery is too weak, or possibly too strong, so that the inductive electricity may appear to complicate the experiment. In the more delicate tests with the pencil points in the dark box, the points should be gently rubbed together for a long time,

and with various changes of position before deciding that no spark can be produced. The nature of this force can be made quite clear by comparing it with heat. Like heat it seems to radiate, but with incomparably greater velocity and to an incomparably greater extent. Like heat, also, it radiates unequally through different substances; it prefers metals, and apparently remains in them in preference to other substances; but, as has been stated, it passes readily into glass or the human body. It gives no evidence of polarity, although, like light and heat, it may yet be susceptible of polarization; and I have suggested the term apolic force (apolia) as preferable to etheric force, which Mr. Edison provisionally employs for the reasons mainly that the term ether has already been employed in physics and in medicine, and that want of polarity appears to distinguish this force from the different forms of electricity to which it is related.

With electricity under any of the known forms—magnetism, galvanism, induction, statical, atmospheric, and thermo-electricity—the idea of polarity is always associated, and this polarity, or force exerted in opposite directions, enters into all the phenomena. But this force, in its phenomena as thus far studied, does not suggest polarity. We draw it from the conductor as we draw water from a spout, or gas from a pipe. There is no more apparent need of a circuit through the battery, in the ordinary sense of the term, than there is when we draw heat from a stove by holding a metal in contact with it.

I have here discussed the subject as one of science purely, with the purpose of enlisting the cooperation of scientific men. It is possible that the discovery may be of the highest practical value also, but as yet there are in that direction only strong suggestions, no positive proofs. The subject was quite unfortunate, as it seems to me, in the manner in which it was introduced to the public. Newspaper reporters, who are not expected to be familiar with physics or physiology, have prepared, as best they could, most of the articles that have been published, with such fragmentary assistance as might be given by those engaged in the experiments, and while yet the results of some of the tests were undecided, and it was natural that there should be some confusion of statements, as well as positive blunders and unwarranted generalizations. It is not yet proved that the force is retroactive, or turns back on itself. It is true that where the wire is turned back on itself a spark appears at the extremity, precisely as it would do if the force were retroactive; but the spark probably indicates merely a branch current. The broad statement that the force does not seek the earth is not established and is probably untrue. It is not yet shown beyond possibility of error that the force as now generated can send sparks through the wires or through railway tracks for very long distances. Sparks have been received over half a mile of telegraph wire, and received outside of the earth circuit, and have been transmitted at the same time with messages through the circuit by the ordinary system of telegraphy. If coming experiments with different and more powerful apparatus shall show the possibility of sending sparks with great rapidity through the outer wires of the Atlantic cable, or through long land lines, the subject must command the attention of practical telegraphers. If important physiological or therapeutical effects can be produced by it, then physicians, and especially medical electricians, will make it a subject of thought. But at present the important questions presented by these experiments are mostly scientific in their character, and as such are suggestive in innumerable ways. In the public discussion of the matter two errors have appeared. Riess, the great German authority on statical electricity, has recently published a paper containing an account of researches on "weak sparks," which some one, unacquainted with either subject, has unwittingly confounded with these experiments. Again, this force is confounded or compared with the so-called "odic force" of Reichenbach, which was utterly a delusion. Sensitive people, when shut up in a dark room, as I have proved by many experiments, see whatever they are told to see, hear what they think they ought to hear, and experience any sensation that they expect to. The experiments of Reichenbach were worthless, for the reason that he did not eliminate the error that comes from the mind acting on the body. It is believed that the experiments here recorded are in the main both new and true, and that, whatever results may flow from them, they will be confirmed by all competent physicists and physiologists who feel sufficient interest in the subject to give it patient attention. In conclusion, I may say, in reply to the very natural suspicion of trickery, that Mr. Edison, to whom I was personally a stranger, gave me every possible opportunity to revise his experiments, assisted me in making new ones, submitted to any and every test suggested, and made no secret to any scientific inquirer of his apparatus or his methods. Although I at first deceived him and his assistants by cutting the wires, and in various ways, in order to guard against any possible deception, intentional or unintentional, yet it was very soon demonstrated that any precautions against trickery were superfluous. Many of my own experiments were made with Prof. Smith in the establishment of Mr. Chester, where the results were

as surprising as those made in Newark. There is probably not a large physical laboratory in the country that does not contain all the apparatus necessary for the study of these phenomena. GEO. M. BEARD, M. D.

New York, Dec. 6, 1875.

In a subsequent communication to *The Tribune*, dated Dec. 9th, Dr. Beard says in relation to the hypothesis that this force is inductive electricity:

"I may say, in addition, that in advancing this hypothesis I do not overlook the difficulties in the way of its acceptance. It may possibly be used as a working hypothesis, by the aid of which subsequent experiments can be guided and interpreted. Conceive, that with the opening of the current waves of force are, so to speak, shot out from the magnet or coil through a metallic conductor in connection with it, and that with the closing of the current waves return to the coil or magnet, and that this process takes place rapidly and continuously, so long as the interrupted current from the battery goes through the coil, and we have a theory that would perhaps make clear and consistent the experiment I have described. If this theory be the correct one, it will be found on further experiment that this force, whether it be called apolic force, as suggested, or inductive electricity in a non-polar state, will be limited, and demonstrably so, by the size of the magnet or coil and the battery power, and that with even good conductors of great length there will be found a point beyond which no spark appears. This question will be settled by experiments now in preparation. Prof. Smith is endeavoring to obtain this force from one pole of a very large number of galvanic batteries united for tension; if my hypothesis is correct, he will not succeed. Prof. Smith informs me that he has this afternoon made this experiment with 84 Smee's cells and failed. A statical charge may be obtained in this way which may go through long wires not connected with the earth, but there will be no continuous action of this charge, and it will conform to the ordinary laws of electricity. If this theory of the nature of this force is true, it will have no electrolytic effect on any chemical substance, although it may have a slight thermic or heating effect; and it will probably have, even when generated from larger coils, little, if any, physiological or therapeutical action. Experiments are now going on in all these directions, and it will soon be known how far these theoretical predictions will be verified."

A Drama in Two Acts.

Scene First.—Time, 2:45 P. M.; date omitted.

Trouble on Cincinnati Quad. Chief Operator Pettit rushes to 18; asks operator there, "Are you single?"

Lady operator.—"None of your business. (Bursts into tears.) I will report you immediately to the chief operator. Sign."

Jim signed, of course; and he's warned, too.

Young lady reports "L" to Mr. Johnson.

End of Scene First.

Interval of 15 minutes.

Scene Second and last.—Manager Maynard at Chicago end quad.; Chief Operator Johnson at Cincinnati end.

Chief Operator Johnson to M.—"What does your operator on 18 mean by asking our lady operator if she's single? She feels very much insulted."

Explanations follow; quad. is balanced; all serene. Happy denouement.

End of Drama.

Correspondence.

We do not hold ourselves responsible for the opinions of our Correspondents. Our columns are open to free discussions on all Telegraphic subjects, without distinction of person or opinion.

No notice will be taken of anonymous communications.

The Official Organ and the D'Infreville Duplex Invention.

NEW YORK, December 20.

TO THE EDITOR OF THE TELEGRAPHER.

THERE appears in the last number of the *Journal of the Telegraph* an article on "Duplex Telegraphy by constant currents," which contains certain statements in regard to the invention of my duplex telegraph system, recently described and illustrated in THE TELEGRAPHER, and imputations upon me as an inventor, which are not warranted by the facts, and to which I desire space in your columns to reply. I shall also send to the editor of the *Journal* a similar communication, which doubtless, in justice, will be printed in that paper, but as its next appearance will not be till January 1st, and it is desirable to make public the facts as soon as possible, I avail myself of your columns for that purpose also.

On February 12, 1873, two weeks before the date of

Mr. Winter's English patent, which is cited in the *Journal* as anticipating my invention, I deposited with Mr. William Stockmayer, Notary Public, 232 Avenue A, of this city, a description, sealed, and which is still in his possession with the seal unbroken, of two duplex telegraph inventions which I made some time before. One is the system for which I applied for a patent, on April 25, 1873. This will establish its validity under the United States patent laws, and at the most afford ground for no more serious charge than that of simultaneous invention by Mr. Winter and myself.

It was not until some time in the first part of the year 1874 that I knew of Mr. Winter's first method of duplex, which was shown to me in presence of Mr. Wm. N. Armstrong, my partner, by Mr. Geo. B. Prescott, the electrician of the Western Union Telegraph Company, described in the sixth edition of Mr. Culley's book, which he had just received from the author.

As Mr. Prescott failed to recognize the practical difference which existed between my system and that of Mr. Winter, I proceeded to perfect the second method, which I had invented in all its essential features while endeavoring to apply my first method practically to long lines.

My last patent, which contains in the drawing and in the specification an improvement on Mr. Winter's second system as printed in the *Journal*, which brought me the first knowledge of it, may be properly re-issued in accordance with the United States patent laws.

Geo. D'INFREVILLE,
Electrical Engineer.
129 Broad street, New York City.

Justice and Injustice, and their Results.

TO THE EDITOR OF THE TELEGRAPHER.

THERE is a wide-spread feeling of dissatisfaction among Western Union employes with reference to the proposed reduction of salaries. Superintendents, managers of offices, operators, and all alike, speak of the proposition in terms of earnest disapproval, and stigmatize it as an act of the grossest injustice. Nor is this feeling confined to employes whose pockets are to be depleted; almost the entire press of the country have spoken of the proposition in sharp tones of disapprobation. Such headings as the following in leading dailies have come to my notice: "Rich, but Stingy," "Rank Injustice," "Nett Earnings over a Million and a Half in Six Months," "Employes Proffered a Reduction Pill as a New Year's Gift," &c.

Under the circumstances there is not the shadow of an excuse in favor of the company. Were they poor and not earning money by the millions the case would be different, and I doubt if there would be heard a dissenting voice. What has become of the proposition to make the employes' interest identical with the employers? Does this look like it? Mr. Orton, please look upon this picture.

1st of January, 1876, your proposed reduction goes into effect. Employes who have served the best years of their lives in the employ of your company at barely living salaries, although they cannot do otherwise than submit to the power which screws them down and robs them of a portion of their just dues, become dilatory, a feeling of hatred is kindled, they take no interest in their employers' business, they cannot forget the hand that smote them, they curse the brain that conceived and the hands which put into execution this scheme. The employers' business suffers. It cannot but suffer, and in the end it will be an actual loss to the company rather than a gain.

Now look upon this other picture: 1st of January, 1876, salaries all increased on the same scale as the proposed reduction. Your gray-haired, faithful employe goes to his duties with a smile of love and gratitude, and his duty—aye, and more than his duty is performed with perfect cheerfulness. His employers' interests will not be allowed to suffer under any consideration. He will work all night with no word of fault-finding; he is prompt, correct, gentlemanly, and Mr. Orton has a warm corner in his heart.

How does Mr. Orton like the two pictures? Does he for a moment doubt that these pictures are correct sketches of the future? An increase of the salaries of employes on the 1st of January, 1876, in place of a reduction will put money into the company's coffers.

JUSTICE.

The Old Plan of Reducing Salaries More Objectionable than the Last.

TO THE EDITOR OF THE TELEGRAPHER.

THE resolutions adopted by the Chicago operators on Sunday the 12th inst., relating to the proposed reduction of salaries were, to say the least, of a decidedly weak character. The matter would scarcely merit ordinary attention were it not for the second resolution which read—"That we consider the present system of filling up vacancies at reduced salaries sufficiently guards the in-

terests of the company." This is simply a recognition of the right and justice of reducing salaries by the aforesaid pernicious "system"—a system which in effect is even more objectionable than an openly declared reduction. It may be a little slow, but it is certainly very sure, as its results have fully demonstrated within the past year or two. The Chicago men are so anxious to "guard the interests of the company" that they apparently lose sight of their own. Such unselfishness in this corrupt age of ours is certainly remarkable and may possibly be considered very pretty, but in my humble opinion it is extremely foolish. Doubtless, the members of the executive board will appreciate the consideration shown them by these gentlemen, though it is barely possible that they may slightly differ as to the correct meaning of the word "sufficiently." Let us hope, however, that they will listen to the kind suggestions of the Chicago men and instead of an open reduction favor(?) us by adhering to the "present system." Of course it amounts to the same thing in the end, but then it is done so quietly and politely that it is almost a pleasure to submit to the extortion. Won't some of the advocates of the "present system" please show up its beauties through the columns of THE TELEGRAPHER?

WOLVERINE.

Telegraphers' Balls, Past and to Come.—A Thieving Check Boy.—Additional Precantion.—Visit of a Former Chief Operator.—A Pleasant Affair.

CHICAGO, ILL., Nov. 30th.

TO THE EDITOR OF THE TELEGRAPHER.

WE are beginning to experience some winter weather. Navigation is almost closed and business is rapidly decreasing.

Hearing some talk recently regarding the starting of a Telegraphers' Club for the purpose of having one or more grand balls this winter, calls to memory the last Telegraphers' Ball held in this city. The following message head was used at that ball. "Chicago, Calumet and Oshkosh Telegraph Company. All messages taken by this company subject to the following terms: To guard against mistakes, the sender of a message should deliver it in person, if otherwise engaged, they should have it repeated six or eight times. For such repetition nothing will be charged, providing the office student be so far advanced as to be able to manage a register. And it is agreed between the sender of the following message and the company, that said company shall not be liable for interruptions in their office, or eruptions outside their office, nor for delays arising from the use of messages for kindling wood.

"Correctness in the transmission of messages to any point on the lines of this company can be insured by leaving provisions and articles of juvenile wearing apparel at the residence of the manager.

"The company will not be liable for damages in any case where Horace Greeley's chirography is concerned, nor for errors arising in the transmission of diagrams; neither will it be liable for damages arising from sudden in junctions and cross bills, and in no case will damages be adjusted unless the claim is presented previous to the delivery of message from which said damages arise.

"RIP VAN WINKLE, Prest.

"By Telegraph from . . . To . . ."

A wire was stretched around "Crosby's" Music Hall where the ball was held (this was, of course, before the "great fire" in December, 1869), and a great deal of telegraphing was done by the "knights of the key." Very few of the prominent ones of that day remain among us, but no doubt there's enough back bone left in the fraternity here to get up a club which could have fully as creditable a ball as this one was.

Since the theft of the two coats in the Western Union office here, it has transpired that an all night check boy, who was discharged a short time previously, has turned out to be a regular sneak thief. He and a lot of other sixteen to eighteen year old thieves having been arrested recently for robbing a jewelry and clothing store on the north side. They hired rooms on the south side, and were endeavoring to dispose of the goods when detected and arrested. It was thought at the time the coats were taken that some one must have been pretty well posted as to the habits of the "boys," etc., to make such a successful venture; and it is now readily conceded that he either was one of the party, or the thieves were instructed by him how to proceed. The W. U. Co., in order to protect their employes in the operating room from any further depredation of the kind, and at the same time, more fully provide for the observance of the rule prohibiting any one but employes from visiting the operating room without a permit from the superintendent, have had a heavy wire railing constructed and placed on top of the walnut railing at the head of the stairs leading to the operating room, in such a manner that it is almost impossible for any one to get up stairs that way without alarming the office. Two large doors of the same ma-

terial are placed at the head of the stairs, locked securely with a heavy padlock. In order that persons who have a right to enter the room may not be put to unnecessary trouble by mounting three or four flights of stairs (instead of coming up in the elevator), and finding the entrance to the room barred, an automatic signal bell, worked with a button from the outside of the door, has been placed in the office, which can be rang, and is immediately answered from the room. This precaution prevents mischievously inclined persons from meddling with the jars of gravity battery placed all around inside the entrance at the head of the stairs.

The meeting of the Telegraphers' Mutual Benefit Association of this district, called for Sunday last at 11 A. M., to hear the report of the delegates to the annual convention, was so poorly attended (there being but three members present) that no action was had in the matter.

Mr. Jones's system of quad, has been put in successful operation between here and Milwaukee.

Louisville and Indianapolis are also worked on this system—Indianapolis having in repeater there, works with Chicago on the one side, and on the same side with Louisville, while Louisville and Chicago are working on the other side. Chicago, Detroit and Buffalo work the same way, Detroit having in repeater for Buffalo. Prominent among the visitors here recently was Mr. F. S. Kent, now manager of Cairo, Ill., W. U. office. Mr. Kent was, years ago, a chief operator in the W. U. office here, when there were but ten wires in the office. His surprise can be imagined when he beheld over a hundred wires, working quads, duplexes and Morse wires. Fred likes a good story and can tell a joke about as well as the next best man. The boy whose duty it was to serve lunch from a neighboring restaurant to the boys then on duty with Fred here, was in the habit of calling him Fred Cent and had him down so on his book. I will have to reserve some of the jokes I've heard of Fred until another time, as this letter is too long already and I "Kent" tell you now.

The following, clipped from the *Chicago Tribune* of Sunday, shows how the boys, imitating the example of "WEBFOOT'S" friends are doing it. The "affair" took place a week ago Wednesday and was done very quietly.

"A pleasant affair—for the contemplation of young people certainly—was a wedding-party a few days ago at the residence of Mrs. Atteridge, when John M. Kemp and Miss Lizzie M. Atteridge were made one through the offices of the Church administered by the Rev. Mr. Taylor. There were a goodly number of friends present, and much rejoicing. The employes of the Western Union Telegraph Company everywhere wish 'Johnny' Kemp and his bride a happy life."

Unlike a great many of the boys who get married on the spur of the moment without any preparation, "Johnny" has a home for his accomplished bride, and immediately after the ceremony there was a house warming, and the happy couple are keeping house in their snug home on the north side like old married folks.

This "affair" occasioned "Johnny's" return to day work. "Fatty" Steward with whom he changed off some time ago going back on the night force again

OCCASIONAL.

Disagreeable Weather.—Transfer of the Baltimore and Ohio Railroad Lines to the Atlantic and Pacific Company.—Quad. Arrangements.

CHICAGO, ILL., Dec. 10.

TO THE EDITOR OF THE TELEGRAPHER.

WE have been having the most disagreeable spell of weather for the past week I ever witnessed here.

The Atlantic and Pacific Company have succeeded in getting control of the Baltimore and Ohio Railroad to build and operate their lines along that route. All the offices of the B. & O. in this city are now worked as A. & P. branch offices, instead of Western Union, as heretofore, and the wires of that road have been taken out of the W. U. office.

The Board of Trade W. U. office now sends and receives business from the main office through two tubes, one used for receiving alone, and the other for sending. The arrangement is new and novel, differing materially from the old method single-pipe arrangement.

By switching in a loop at the W. U. main office at Detroit, Detroit Dock Office sends business to Chicago on the quadruplex, "De" main office leaving his key closed and giving O. K. to the Dock for Chicago. The same arrangement was affected at Cincinnati with the Board of Trade and another branch office. The Cincinnati offices not only sending to Chicago, but by running them on a local loop attached to the local wire in the main office, they also receive from Chicago office on the "Quad."

OCCASIONAL.

It has been demonstrated that for all telegraphic purposes the English language is from 25 to 33 per cent. cheaper than the French, German, or any other language.

THE TELEGRAPHER.

A JOURNAL OF ELECTRICAL PROGRESS,
DEVOTED TO THE INTERESTS
OF THE

Telegraphic Fraternity and the Advancement
of Electrical Science and the
Telegraphic Art.

Published Every Saturday

AT

No. 38 VESEY STREET, New York.

TWELFTH VOLUME.

With the number for

JANUARY 1ST, 1876,

THE TELEGRAPHER will commence its TWELFTH VOLUME. It is, and will continue to be a thoroughly

INDEPENDENT TELEGRAPHIC NEWSPAPER,
bound to or in the interest of no TELEGRAPH COMPANY, CLIQUE
OR COMBINATION, but honestly devoted to the interests of
PRACTICAL TELEGRAPHERS.

Its columns are at all times open to the freest and fullest discussion of all questions of interest and importance to the Fraternity, or the Telegraphic Art and Electrical Science in connection therewith.

As heretofore, no LABOR, TIME, OR EXPENSE, warranted by the patronage received, will be spared to improve its character and add to its interest, and to sustain its reputation as the ONLY FIRST CLASS INDEPENDENT

ELECTRICAL AND TELEGRAPHIC JOURNAL
UPON THE
AMERICAN CONTINENT.

All the popular and valuable features of the paper will be retained and it will continue as heretofore to labor for the best interests of the TELEGRAPHIC FRATERNITY and the advancement of ELECTRICAL SCIENCE and the TELEGRAPHIC ART.

TERMS OF SUBSCRIPTION.

ONE COPY, ONE YEAR.....TWO DOLLARS
SINGLE COPIES.....FIVE CENTS
which includes Postage to Subscribers in the United States and Dominion of Canada.

RATES OF ADVERTISING.

One Square (twelve lines Nonpareil) each insertion.....\$1 00
One Quarter Column, each insertion..... 2 50
One Half Column, " "..... 4 00
One Column, " "..... 8 00

A Liberal Discount on Advertisements continued for four or more insertions, but no Advertisement inserted for less than ONE DOLLAR per insertion.

Specimen Copies will be forwarded free on application.

Telegraphers and others are desired to act as Agents in obtaining subscriptions, and will be allowed TWENTY PER CENT COMMISSIONS in lieu of Premiums or Club rates upon the amount of such subscriptions, which may be deducted from remittances when made.

Any persons sending the names and money for FOUR Subscribers, at the regular price of subscription, two dollars per year, will be entitled to receive an extra copy free.

SUBSCRIBERS CHANGING THEIR RESIDENCES, AND DESIRING A CHANGE IN THEIR ADDRESS, MUST ALWAYS SEND THEIR OLD AS WELL AS THEIR NEW ADDRESS.

Remittances for subscriptions may be made by mail, by post-office order or registered letter, at the risk of the Publisher, but no responsibility will be assumed for money sent without such precaution. On remittances of not less than FIVE DOLLARS the order or registration fee may be deducted from the amount.

Advertisements are solicited, and will be inserted at reasonable rates; but no Advertisement will be inserted for less than ONE DOLLAR per insertion.

All communications relating to or intended for THE TELEGRAPHER must be addressed to

J. N. ASHLEY, Publisher,
(P. O. Box 5503,) NEW YORK.

To Subscribers.

AS usual at the close of the year and volume a large number of subscriptions to THE TELEGRAPHER expire, Unless these are renewed the paper will be discontinued, and those who may fail to receive it will understand the reason.

We hope that few of these who are now receiving the paper will fail to renew their subscriptions promptly, and that they will also bring it to the notice of those who do not now receive it, and secure as many additional subscriptions as possible.

Prospectus of "The Telegrapher" for 1876.

We desire to call attention to the Prospectus of THE TELEGRAPHER for 1876, which will be found on this page. The commencement of a volume affords an excellent opportunity to obtain and begin subscriptions.

We hope that every person into whose hands this paper may fall will realize the importance of securing the widest and most general circulation possible for the next year, which is likely to be of more interest in telegraphic matters than the last two. There will probably be considerable extension of telegraphs and telegraphic facilities during the coming year, and those who are instructed in such matters will find THE TELEGRAPHER the only complete record thereof published.

The First Number of the New Volume.

THE first number of the new volume of THE TELEGRAPHER, which will be issued on Saturday next, will contain much valuable and interesting matter, some of which we are obliged to omit from the present issue on account of lack of room, including several communications on the "Reduction of Salaries." No telegrapher can afford to be without the paper, and to secure it, subscriptions should be sent in promptly so that we may know in time how large an edition will be required to supply the demand.

The Title Page and Index to Volume XI.

THE Title Page and Index to the Eleventh Volume of THE TELEGRAPHER will be issued with the next number. Should any who are entitled to and desire it fail to receive it they will be supplied on application.

To Our Correspondents.

IN consequence of the pressure upon our columns this week we have been obliged to postpone the publication of several interesting communications, including a reply to "Priscella" from "Western Union," and one from "Double Six," with other interesting matter, all of which will appear next week.

The Close of the Volume.

WITH this number of THE TELEGRAPHER the Eleventh Volume is closed. It affords us much satisfaction to be able to state that, notwithstanding the general depression in business has continued, and many newspapers have been forced to suspend publication, THE TELEGRAPHER has received a steady support, and enters upon its Twelfth Volume hale and vigorous, and with pleasant prospects of future prosperity and usefulness.

To those who have aided in its support by their patronage and efforts to increase its circulation, or by contributions to its columns, as well as to those who have kept its advertising columns so well filled, we avail ourselves of this opportunity to return our sincere acknowledgments. It is entirely dependant upon them for support, and THE TELEGRAPHER is the only publication of its class in the world, so far as we know, that has thus been permanently supported.

We have been cheered and encouraged in our labors and in our efforts to maintain a telegraphic journal of a high character, devoted primarily to the interests of the practical telegraphers, by the kind commendations which they constantly receive from those whose commendations are of value, as well as by practical co-operation. These have satisfied us that the paper is doing a good work, and that its publication is not in vain. That it shall even more in the future merit such commendation and support is the sincere and earnest desire of its publisher and editor.

The past year has, as many of our readers are personally aware, been one of great pecuniary depression, which has been continued now for over two years, and which has affected telegraphic as well as other interests. The compensation of telegraphic employes has been gradually diminished, and a diminution in the demand for telegraphic services has lessened the chances for remunerative employment. In this respect, however, we believe telegraphers have suffered less than many others, but yet much more so than is pleasant or satisfactory. The reduction of salaries by the Western Union Telegraph Company, to take effect with the new year, is not calculated to make its advent particularly happy. We sympathize with those who are affected by this reduction most sincerely. It demonstrates, however, the necessity for maintaining a journal in which they can be heard, and of a character which shall command the respect and secure a hearing from those in whose keeping their interests are to a great degree placed. Such a journal is THE TELEGRAPHER, and while a closer economy will no doubt be necessary in the year to come, it cannot advantageously be applied to a curtailment of its circulation and influence.

We have every reason to anticipate an even wider and more general circulation of the paper in the coming year, and that it may be assured, we look for the active and practical co-operation of telegraphers in every section of the country. Its past record is a guarantee of what it will be in the future. That it has constantly improved in character from the first year of its publication is generally conceded, and we do not mean that the coming volume shall be an exception in this respect.

With these brief remarks we close our journalistic labors for the year, and complete the volume with the satisfaction which arises from the knowledge that they have not been wholly in vain, and that THE TELEGRAPHER will enter upon the new year and volume firmly established in the regard and affections of the telegraphic fraternity as the exponent and promoter of its real and permanent interests and prosperity.

In closing we would improve the opportunity to hope that, notwithstanding adverse influences, our readers may, one and all, enjoy a MERRY CHRISTMAS, to be succeeded by a HAPPY NEW YEAR.

The Reduction of Salaries.

We print this week several communications in regard to the reduction of salaries of employes of the Western Union Telegraph Company, and have several more on file for insertion next week. Those affected do not seem to get reconciled to it, and the opinion is very generally entertained and expressed that this action of the directors of the company is, to say the least, a mistake, and that it is not likely to prove advantageous eventually.

We expressed our sentiments very fully on the subject last week, and have but little to add to what has already been written. We are yet of the opinion that the company might and should have found some other means of retrenchment, if a reduction of expense was absolutely necessary, which would have been less sweeping and general in its operations. Such a step is the last one which a great and prosperous corporation should resort to, and one which should only be considered when other means had failed if retrenchment was unavoidable.

It affords us pleasure to be able to give the fraternity a chance to be heard on the subject, and also to note that very little disposition is shown to indulge in violent denunciation or hasty action on their part. It is not too much to say that the telegraphers have done themselves honor by their attitude, and that they have secured the respect and sympathy of the business public to an unusual degree thereby. A reduction of income to many of them means a reduction of comforts for themselves and families which it comes hard to dispense with, and creates a necessity for greater economy where economy has necessarily always been the rule. We hope that better times will come soon, and that telegraphers and others will share in its advantages. Until then, or until some remedy can be devised, nothing can be done except to submit under protest, and look for other and improved chances.

The New Electric Development.

On our first page we print a communication from Dr. GEO. M. BEARD "on the result of physiological and other developments" of the newly discovered electrical manifestation which has been termed "etheric force," that will be read with much interest. It is the first article on the subject having any pretensions to scientific accuracy which has yet appeared, and its statements and suggestions are certainly worthy of consideration, and will doubtless lead to careful study of the phenomena in question, and further and more conclusive experiments to determine the actual nature and practical use, if any, of the alleged force.

The manner in which this matter was heralded to the public, and the well known character of the putative discoverer, has caused it to be received with less consideration than it otherwise would have been by scientists and telegraphic experts. That it has any practical value has not been demonstrated by any experiments which have as yet been tried. All the indications so far are that while it is a very curious development of some hitherto unknown property of electricity, it is, in fact, nothing more, and that its utilization for practical purposes is, to say the least, exceedingly problematical. If it can be utilized, it undoubtedly will be by some one or more of the numerous individuals who are now, or soon will be testing it and experimenting with it.

These sparks have frequently been observed heretofore, but seem to have been passed over without special notice, or regarded merely as a product of electricity or magnetism of a not essentially different nature from those already known. They are likely now to get all the attention and consideration that they really deserve.

We are not disposed to treat with indifference any electrical discovery, but the ridiculous suggestions evidently emanating from the professor of duplicity and quadruplicity that this was a new force destined to rev-

olutionize the telegraph system, solve the problem of cheap ocean telegraphy, enable insulated conductors to be dispensed with and the railroad tracks to be used for telegraphic purposes, etc., before anything was really known about it, have caused it to be received with incredulity and sarcasm by electricians and practical telegraphers. Had some more scientific and reputable person made this discovery, and, instead of rushing into print, carefully experimented with it to determine its nature, qualities and uses, it would doubtless have met with a very different reception. The well-known characteristic and unreliable scientific qualifications of the professor taint with suspicion, and justly so, this as well as other pretended discoveries of his, which prove generally to have been derived primarily from his extensive reading of electrical and telegraphic works of our own and European electricians and telegraphers.

L. G. Tiltson & Co. to the Front.

THOSE (if there are any) who have supposed that L. G. TILTONSON & Co. had become less enterprising than formerly, will see their mistake when they read their mammoth advertisement which is issued with this number of THE TELEGRAPHER. An examination of this announcement will demonstrate the fact that a stock of first-class telegraph goods to satisfy any demand may be found at their establishment, No. 8 Dey street, New York, and 54 South Fourth street, Philadelphia. Besides the usual telegraphic apparatus, material and supplies, numerous specialties are announced, manufactured and sold by this enterprising firm, which are worthy of special notice. We do not propose to enumerate these, but they will be found fully set forth and pictorially illustrated in the supplement which we print to afford space for this advertisement.

The advantage derived from liberal and judicious advertising is amply shown in the immense and increasing business of this successful firm, which is equally liberal in its dealings with customers. The present customers of TILTONSON & Co. will need no assurance of the fairness and liberality which characterises its dealings, but those who have not dealt with them heretofore may be certain of honesty and liberality, as well upon orders by mail or telegraph as upon personal application.

It should be mentioned in this connection, that this advertisement represents only one department of the business of the firm, as it is equally prominent as a dealer in railroad supplies, etc., as in telegraph goods.

The Direct Cable.

As will be seen from the cable despatch from London, the steamship Faraday sailed on Tuesday last for the location of the break in the Direct Cable. If she has favorable weather she ought to be able to get the cable in operation again within the next two weeks. The break is in shallow water, and can probably be easily repaired when the Faraday once reaches the locality.

Cedar Telegraph Poles.

As there is a prospect of considerable telegraph construction during the next year, the advertisement in this number by Mr. A. A. COLBY of Toronto, Canada, of cedar telegraph poles will be of interest. The poles furnished by Mr. COLBY are of superior quality, and delivered on very reasonable and advantageous terms.

A Cincinnati Electric and Telegraphic Manufactory.

THE manufacturing of electric and telegraphic apparatus and supplies, formerly carried on by JAS. T. GILL-LAND & Company, at No. 166 Race street, Cincinnati, Ohio, has been taken by Messrs. J. O. SHIRAS & Co., as will be seen from their advertisement to which we call attention, and bespeak for them a share of patronage. Their instruments and supplies will be found of superior excellence and at reasonable prices.

Personals.

MR. W. W. WELLS has been appointed master of transportation and superintendent of telegraph of the Rockford, Rock Island and St. Louis R. R.

MR. M. C. LAVEN, manager of the Dominion Telegraph Company, at Hamilton, Canada, has been appointed superintendent of the southwestern division of the same company. This is a good appointment and a deserved promotion.

MR. C. J. MCPHERSON has been appointed train dispatcher and superintendent of telegraph for the Illinois Midland Railroad.

MR. HARRIS, of the L. S. & M. S. wire, and Miss MUGROVE of the Freeport and Dubuque wire, in the Chicago, Ill., Western Union office, have exchanged places.

MR. BANGS has been promoted from the Metropolitan to the Western Union day force in the Chicago, Ill., office, and sends reports to Milwaukee as well as taking a turn at the way business all over the room.

MR. R. B. PEARSON, formerly of the extra force of the Chicago, Ill., Western Union office, has accepted the management of "Qr." branch office in connection with his position with the American District Company, which leaves him no time for extra work.

MESSRS. HAZLETON, GRAY, NULL and RILEY, have been relieved from the regular extra force nights of the Chicago, Ill., Western Union office, and take their chances to get work as they are wanted from time to time. Mr. HAZLETON intends accepting a position in the Atlantic and Pacific day force in the Chicago office of that company.

MESSRS. EVERHAM, CARROLL, HENDERSON, and CHILDS, have been assigned to regular night work in the Chicago, Ill., Western Union office.

MESSRS. AUSTIN, of the Western Union night force, and CUTBERT, of the Atlantic and Pacific night force at Chicago, Ill., are quite seriously ill.

MR. JAMES FISH, of the Chicago, Ill., Western Union day force, who was obliged to quit work some time ago on account of his lungs, has not been able to resume work yet, and is still with his friends in Wisconsin.

MISS ELLA GATELY has been added to the metropolitan day force in the Western Union main office, at Chicago, Ill., and Mr. TRUNKLE, on the night force.

MR. F. C. TALLEY is the obliging and gentlemanly operator in the Grand Pacific Hotel, Atlantic and Pacific office, Chicago, Ill.

The Telegraph.

By Cable.

THE DIRECT CABLE. THE FARADAY ABOUT TO PROCEED TO REPAIR IT.

LONDON, Dec. 20.—The steamer Faraday having completed her preparations for repairing the direct cable, cleared to-day for New Providence, Bahama Islands.

SAILING OF THE FARADAY.

LONDON, Dec. 21.—The steamship Faraday sailed to-day to repair the direct cable. She will proceed directly to the location of the break, and with good weather, no trouble or delay is anticipated after her arrival.

Proposed Extension of the Dominion Telegraph Lines.—The Directors Authorized to Issue Bonds.

A SPECIAL general meeting of the shareholders of the Dominion Telegraph Company was held at the head offices of the company, at Toronto, on Wednesday, the 15th inst., which was largely attended. The object of the meeting was stated by the President, Hon. John McMURRICH, to be to authorize the directors to raise additional capital by the issue of stock or bonds—or both, as might be deemed expedient, to the amount of \$300,000. This amount was required to pay for necessary extensions of the present system through the maritime provinces of the Dominion, and to connect directly with the direct cable at Tor Bay. For this purpose he offered the following resolution:

Resolved, That the directors of the company be, and they are hereby authorized, under the power conferred by the charter and amendments thereto, to increase the capital stock of this company by the sum of three hundred thousand dollars, making the full share capital one million of dollars; or the directors may, at their option, in lieu of so increasing the capital, borrow on the bonds or securities authorized by the charter a sum or sums, not exceeding the sum of three hundred thousand dollars,

or may increase the stock for part of the amount required and raise by the bonds of the company the balance.

Mr. Swinyard, the general superintendent of the company, by request addressed the meeting at some length on the necessity which existed for extending and completing the system of the company as proposed, and giving the details of the extensions proposed.

The additional capital was required, first, for the new line it was proposed to build from Montreal to Quebec, via the North Shore Railway. Secondly, for a new line from Quebec to Tor Bay and Halifax, in connection with the Direct Cable Company; and, thirdly, for a new line from Montreal to the boundary line, in direct connection with the Vermont International Telegraph Company's system, whereby direct communication would be established with Montreal, Boston, Portland, New York, and the Eastern States generally.

After some further amicable discussion of the proposition the resolution was seconded by the Hon. M. C. Cameron, and carried unanimously. The meeting then adjourned.

New York City Telegraphic Notes.

THE second eastern press wire, on which Filibuster the Mighty so extinguished himself, has again been started for the winter, and Thos. J. Tobin hands the matter cast "to" the boys, and does it in such a solid manner that the interposition of a four inch plank in the circuit would scarcely affect the adjustment of the relays.

Misses Emery and Salisbury have been transferred from the Montreal and Saratoga wires to the Albany quadruple, were it is said they are to remain all winter. They are, without doubt, the best lady telegraphers in the country, and make copies which compare favorably with the best in the W. U. office. This is a decided step towards putting female telegraphers on the heavy wires, and it is productive of the most satisfactory results so far. It seems that the time is not far distant when the brothers and sisters of the craft will be working side by side in New York office.

Establishment of the American District Telegraph in Troy, N. Y.

A COMPANY has been organized for the purpose of introducing the American district telegraph system at Troy, N. Y., and is now locating branch offices in various parts of that city. The headquarters and principal office of the company are in the new Savings Bank building. Mr. A. D. Collins, superintendent of the Fire Alarm Telegraph, has been appointed electrician of the new company.

The Reduction of Salaries.—Action of a Meeting of Western Union Employees at Springfield, Ill.

A MEETING of the employees of the Western Union Telegraph Company was held at Springfield, Ill., on Sunday the 12th inst., at which the following resolutions were adopted and forwarded to the president and executive committee at New York:

Whereas, It is the intention of the company, in the face of its prosperous and steadily increasing business, to materially reduce the salaries of its employees, and

Whereas, The year 1876 will, by reason of its being the Centennial and national campaign year, be especially prosperous to the company in the augmentation of its business, and will entail additional and more arduous labor on its employees without materially enhancing their compensation, and

Whereas, Employees are not now employed, worked or paid on any general system based on reasonable equality and justice, but are subject to local circumstances, and in consequence are paid all sorts of salaries, do all sorts of work, and at all sorts of hours, especially so in what are termed "way" or medium offices; therefore

Resolved, That for the above reasons there is not, in our opinion, any just or reasonable cause for the company to inflict these summary and wholesale reductions of salaries on its employees.

Resolved, That we firmly, yet respectfully, protest against these reductions.

Resolved, That our art being a special one, and essentially in the hands of one organization throughout the country, and we being without the advantages that other arts and trades possess, in having competition for our skill, intelligence and labor, the telegraph company should recognize these facts, and not indiscriminately curtail the incomes of such employees as has given many years to its service, and who have few or no hopes of promotion by reason of the compact consolidation of its labor.

Resolved, That before reductions of salaries are made, the status of the various employees of the company should be clearly defined, and their rank, duties, privileges and salaries should be placed in proper and equalized classifications, irrespective, as far as possible, of the localities in which they may chance to be situated.

Resolved, That as a necessary preliminary to carry out the resolution immediately preceding, a general system, embracing skill, experience, merit, term of service and faithfulness in the discharge of duty is essential.

Resolved, That, having been faithful in our service to the company in years past, we will continue faithful in the years to come.

LEWIS' TELEGRAPH MANUAL.

A few copies of the last edition of

THE TELEGRAPHIC MANUAL,

by Mr. WALTER O. LEWIS, remaining, may be had of THE TELEGRAPHER, 38 Vesey street, at fifteen cents each. Will be forwarded by mail postpaid on receipt of price.

CHARLES T. CHESTER,

MANUFACTURER OF TELEGRAPH INSTRUMENTS,

104 CENTRE STREET, NEW YORK.

BATTERIES of every description for TELEGRAPH and ELECTRO-PLATING purposes, best ENGLISH and AMERICAN TELEGRAPH WIRE, LINE TOOLS, INSULATORS, etc., etc. DIALS and PRINTING INSTRUMENTS for PRIVATE and MUNICIPAL lines.

Especial attention is called to the CHESTER PIN DIAL (patented), designed expressly for POLICE and LAW TELEGRAPHS. Works more than twice as fast as the Dial used at present for Police purposes, and with main battery only, thus doing away with the expense and care of local batteries. For call purposes a Bell Magnet is attached to each instrument by an Automatic Switch, so arranged that when the lid is closed the Bell is in circuit, and when opened the Dial is thrown in and the Bell cut out. Nearly every large city in the United States having a Police Telegraph is using the "Chester Police Dials," which have thereby earned a well established reputation for reliability and efficiency.

ELECTRO-MECHANICAL GONG STRIKERS,

for Railway Signals and Fire Alarm purposes, with Gongs ranging from 16 in., the engine house size, to 8 in., for house purposes. These are capable of striking very rapidly—at least two blows in a second. These vary in price according to size.

ELECTRO-MECHANICAL BELL STRIKERS,

for striking heavy bells, with hammers weighing as high as 200 lbs. These can also, if desired, be made to strike at "less than two seconds' interval." They are invaluable for Fire Alarm purposes, and can be furnished at very reasonable prices, varying according to size.

ALSO,

CHESTER'S PATENT NON-INTERFERENCE STREET BOX FOR FIRE ALARM TELEGRAPH;

so arranged that it is utterly impossible while one box is in operation to start another, thereby preventing any confusion of alarms.

ALSO,

REGISTERS, RELAYS, CALL BELLS,

and every description of Central Office apparatus, at most reasonable prices.

Particular attention is given to MUNICIPAL CONTRACTS.

THE NEW STYLE OF REGISTER, "THE EUROPEAN"

in which the spring takes the place of the weight, is enclosed in a metal and glass case; is noiseless in its action, and of great beauty and finish, and is specially recommended to Shippers, to whom the most liberal discounts are offered on every line of telegraph goods and supplies.

ELECTRO-SURGICAL APPARATUS

OF EVERY VARIETY AND DESCRIPTION.

HOTEL ANNUNCIATORS.

Simple, reliable, and never get out of order. The following Hotels are fitted with our improved patterns: Grand Union, Saratoga; A. T. Stewart's Hotel, corner Thirty-fourth street and Fourth avenue, N. Y.; Willard's Hotel, Washington, D. C.; Galt House, Louisville, Ky.; Teft House, Buffalo; and many others. Proprietors and keepers of Hotels most liberally dealt with.

THE "COUNTING ROOM BELL MAGNETS,"

for communicating instantly to clerks and employes, by means of a keyboard, in any desired place.

ALSO,

BELL MAGNETS AND PUSH BUTTONS,

for connecting Rooms or Stables to houses; very cheap. Nickel plated and best material and workmanship, from \$5.00 upwards.

Sole Agent of the

WILSON ELECTRIC GAS LIGHTING CO.,

for Halls, Theatres, Churches, etc., etc. Inducements offered to any persons obtaining contracts for lighting.

Something New for

LIGHTING FACTORIES, MILLS, ETC.

By simply pushing a button on his bench the operator lights a section of burners.

Very slight consumption of Battery, and very cheap.

SEND FOR A CATALOGUE AND PRICE LIST.

They contain no munificent offers of 20 % discount on prices 25 % in advance of the trade, but the net prices will be found to be reasonable and satisfactory to all.

P. O. Box 2768,

BRENNER, Augusta, Ga., Special Agent for Georgia and South Carolina. L. M. MONROE, New Canaan, Conn., Special Agent for New England. ELECTRICAL CONSTRUCTION AND MAINTENANCE CO., San Francisco, Cal., Special Agents for California, Oregon and Nevada.

THIS SYSTEM OF FIRE ALARM & POLICE TELEGRAPH WITH A CENTRAL OFFICE, OR UPON THE AUTOMATIC PLAN,

is now in operation in the following Cities, to which references made for evidence of its great

SUPERIORITY, VALUE AND UNIFORM RELIABILITY.

- Albany, N. Y., Alleghany, Pa., Boston, Mass., Bridgeport, Conn., Buffalo, N. Y., Baltimore, Md., Chicago, Ill., Cincinnati, Ohio, Columbus, Ohio, Cambridge, Mass., Charlestown, Mass., Chelsea, Mass., Covington, Ky., Detroit, Mich., Dayton, Ohio, Elizabeth, N. J., Fall River, Mass., Fitchburg, Mass., Fond du Lac, Wis., Harrisburg, Penn., Hartford, Conn., Halifax, N. S., Hyde Park, Ill., Indianapolis, Ind., Jersey City, N. J., Kalamazoo, Mich., Lansingburg, N. Y., Louisville, Ky., Lowell, Mass., Lawrence, Mass., Lynn, Mass., Manchester, N. H., Mobile, Ala., Montreal, Canada, Milwaukee, Wis., Minneapolis, Minn., New York City, New Orleans, La., New Bedford, Mass., New Haven, Conn., Newark, N. J., Nashville, Tenn., Newton, Mass., Newport, Ky., Omaha, Neb., Philadelphia, Pa., Pittsburg, Pa., Portland, Maine, Peoria, Ill., Providence, R. I., Portland, Oregon, Paterson, N. J., Pawtucket, R. I., Quebec, L. C., Reading, Pa., Rochester, N. Y., Richmond, Va., St. John, N. B., St. Paul, Minn., Springfield, Mass., San Francisco, Cal., Savannah, Ga., Syracuse, N. Y., Somerville, Miss., Terre Haute, Ind., Troy, N. Y., Taunton, Mass., Toledo, Ohio, Toronto, Canada, West Roxbury, Mass., Washington, D. O., Worcester, Mass.

The Distinctive Features of these Systems of

Fire Alarm and Police Telegraphs

ARE,

First-The Automatic Repeater, through which the apparatus may be distributed in a combination of circuits, and the entire system successfully worked, without the constant personal attention of either operators or watchmen.

Second-The Automatic Signal Boxes.

Third-The Electro-Mechanical Bell Strikers, adapted to produce the full tone of the largest church or tower bells.

Fourth-The Electro-Mechanical Gong Striker, for hose and engine houses, by means of which the location of the fire is instantaneously communicated to the members of each fire company.

These Features combined form the

Only PERFECT, COMPLETE and RELIABLE System

FIRE ALARM TELEGRAPH IN THE WORLD.

It is a sufficient vindication of the claims which are made by the Proprietors of these systems of

FIRE ALARM AND POLICE TELEGRAPHS,

that they have sustained the test of more than twenty years of practical use, and that the efforts which have been repeatedly made to supplant them by other inventions have

COMPLETELY FAILED;

the few instances in which municipalities have been induced to adopt other systems having demonstrated their insufficiency and unreliability, and resulted in their abandonment, and substitution thereof of the

AMERICAN FIRE ALARM TELEGRAPH.

Messrs. GAMEWELL & CO. are the owners of the original FARMER & CHANNING PATENTS, one of the most important of which has just been extended for seven years, and during the past seventeen years have spared no expense or effort to secure improvements, and the Systems are now covered by

MORE THAN TWENTY PATENTS.

The most important improvement which the Proprietors have adopted and introduced is the

AUTOMATIC SYSTEM,

the introduction and operation of which involves so little expense, compared to the benefit which it confers, that even small communities can profitably adopt and maintain it.

The American System of

FIRE ALARM AND POLICE TELEGRAPHS

has met with the universal approbation and commendation of the People, Municipal Authorities,

AND THE PRESS

throughout the UNITED STATES and CANADA.

NO EFFORT, TROUBLE OR EXPENSE

is spared by the Proprietors to obtain and secure ANY POSSIBLE IMPROVEMENT which shall increase the

EFFICIENCY, RELIABILITY and ECONOMY

of the system. They intend that, as far as possible, it shall be

ABSOLUTELY PERFECT!

The amount of property which has been saved from destruction, and the number of lives which have been preserved through the general adoption of this system, throughout the UNITED STATES and the DOMINION of CANADA,

CANNOT EASILY BE ESTIMATED,

but that, in every community where it has been introduced for any considerable length of time, they have been enormous, THERE CAN BE NO QUESTION.

The cooperation of TELEGRAPHERS in securing its introduction into their localities is cordially invited, and their efforts will be duly appreciated and compensated.

Any information desired in regard to the above system will be cheerfully and promptly furnished upon application at the office.

A pamphlet, setting forth more fully its advantages and superiority, has been printed, and will be supplied to Municipal Authorities and others interested in Fire Alarm and Police Telegraphy, upon application as above.

WESTERN ELECTRIC MAN'FG CO. 220 Kinzie Street, CHICAGO, ILL.

CELEBRATED

PRIVATE LINE OUTFIT.

THE BEST IN THE WORLD.

PRIVATE LINE INSTRUMENT.

This instrument is mounted on an iron base and finely finished. It gives a clear, loud sound. It is made to work on a line from a few feet to ten miles in length.

BLISS RESERVOIR BATTERY.

This battery took the first premium and a silver medal for force, constancy and economy at the Cincinnati Exposition.

With each "Private Line Outfit" is furnished one Private Line Instrument, one Cup Reservoir Battery, the necessary Chemicals, Wire for connections and a Manual.

PRICES.
